In 2009, the SEC revised its oil and gas reserves and resources estimation and disclosure requirements. The primary objectives of the final rule - *Modernization of Oil and Gas Reporting* (Release No. 33-8995) - were to increase the transparency and information value of reserve disclosures and improve comparability among oil and gas entities, including comparability between domestic registrants and foreign private issuers. The final rule for oil and gas reporting includes some specific disclosure requirements, including the disclosure of non-traditional resources, such as bitumen, shale, coalbed methane, as oil and gas reserves not mineral reserves, disclosure of proved undeveloped reserves, and the optional disclosure of probable and possible reserves.

In 2018, the SEC adopted new rules for entities in the mining sector. The new rules became effective for the first fiscal year beginning on or after 1 January 2021. The primary objectives of the final rule - *Modernization of Property Disclosures for Mining Registrants* (Release No.33-10570) - were to improve mining property disclosure requirements and policies by more closely aligning them with current industry and global regulatory practices and disclosure requirements, as embodied in the CRIRSCO standards. SEC Industry Guide 7 was rescinded, and these new mining property disclosure requirements were added as a new subpart of Item 102 of Regulation S-K under the Securities Act of 1933 and the Securities Exchange Act of 1934.²⁸ The CRIRSCO standards to be applied under this final rule, including classification of reserves and resources, is explained in section 2.3.1 below.

Despite both disclosure requirements having now been modernised, some key differences still remain. Some of these include:

- For oil and gas entities, the SEC does not allow the term 'resources' to be used in reports
- The SEC requirement for oil and gas entities is to use 12-month average prices under SEC Release No. 33-8995, to represent existing economic conditions to determine the economic producibility of oil and gas reserves for disclosure purposes whereas the SEC requirement for mining entities is to use a price for each commodity that provides a reasonable basis for establishing the prospects of economic extraction when assessing mineral resources, and that provides a reasonable basis for establishing that the project is economically viable when determining mineral reserves, which may be a historical or forward-looking price, as long as the qualified person discloses and explains, with particularity, his or her reasons for using the selected price, including the material assumptions underlying the selection

²⁸ *Modernization of Property Disclosures for Mining Registrants* (Release No.33-10570)

2.2 Petroleum reserve estimation and reporting

The *SPE/WPC/AAPG/SPEE Petroleum Resources Management System* (SPE-PRMS), which was first published in 2007, is the leading framework for the estimation and reporting of petroleum reserves and resources. It was prepared by the Oil and Gas Reserves Committee of the Society of Petroleum Engineers (SPE) and reviewed and sponsored by the World Petroleum Council (WPC), the American Association of Petroleum Geologists (AAPG) and the Society of Petroleum Evaluation Engineers (SPEE), and subsequently supported by the Society of Exploration Geophysicists (SEG), the Society of Petrophysicists and Well Log Analysts (SPWLA) and the European Association of Geoscientists & Engineers (EAGE).²⁹ The definitions and guidelines in the SPE-PRMS, which are internationally used within the oil and gas sector, deal with:³⁰

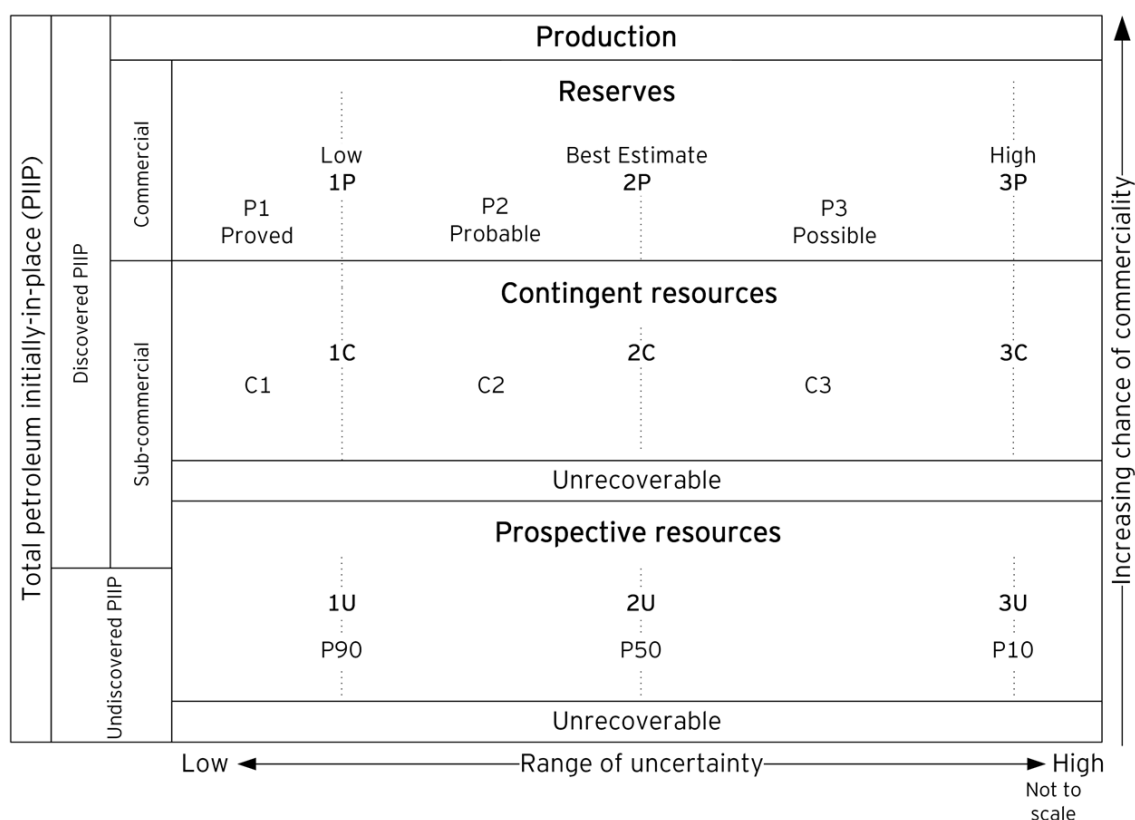

- Classification and categorisation of resources
- Evaluation and reporting
- Estimation of recoverable quantities

“Most of the major regulatory agencies have developed disclosure guidelines that impose classification rules similar to, but not directly linked to, the SPE-PRMS”, and most “... typically mandate disclosure of only a subset of the total reserves and resources defined in the SPE-PRMS. For example, the SEC specifies that only Proved Reserves should be disclosed”,³¹ but now allows for optional disclosure of Probable Reserves. In June 2018, the SPE Board approved the latest version of the SPE-PRMS, with two errata updates made in 2018 and 2022.

2.2.1 Basic principles and definitions

The following graphically presents the SPE-PRMS resources classification system:³²

Figure 2-1: Resources classification framework

29 SPE-PRMS, Petroleum Resources Management Systems, Society of Petroleum Engineers, 2007 (revised June 2018).

30 SPE-PRMS, Petroleum Resources Management Systems, Society of Petroleum Engineers, 2007 (revised June 2018).

31 [INFORMATION FOR OBSERVERS](#), Board Meeting: 22 June 2007, London, Project: *Extractive Activities research project*, Subject: *Comparison of Petroleum and Minerals Reserves and Resource Classification Systems (Agenda Paper 13A)*, IASB, pages 3-4. Available on the IFRS Foundation's website.

32 [INFORMATION FOR OBSERVERS](#), Board Meeting: 22 June 2007, London, Project: *Extractive Activities research project*, Subject: *Comparison of Petroleum and Minerals Reserves and Resource Classification Systems (Agenda Paper 13A)*, page 8. Available on the IFRS Foundation's website. And SPE-PRMS, Figure 1-1.

The horizontal axis reflects the *range of uncertainty* of "... estimated quantities potentially recoverable from an accumulation by a project, while the vertical axis represents the *chance of commerciality*, that is, the chance that the project will be developed and reach commercial producing status."³³

The SPE-PRMS defines proved, probable and possible reserves as follows:

- "Reserves are those quantities of petroleum anticipated to be commercially recoverable by application of development projects to known accumulations from a given date forward under defined conditions. Reserves must further satisfy four criteria: they must be discovered, recoverable, commercial, and remaining (as of the evaluation date) based on the development project(s) applied. Reserves are further categorized in accordance with the level of certainty associated with the estimates and may be sub-classified based on project maturity and/or characterized by development and production status."³⁴
- "Proved Reserves are those quantities of petroleum, which, by analysis of geoscience and engineering data, can be estimated with reasonable certainty to be commercially recoverable ... from known reservoirs and under defined economic conditions ... If deterministic methods are used, the term reasonable certainty is intended to express a high degree of confidence that the quantities will be recovered. If probabilistic methods are used, there should be at least a 90% probability that the quantities actually recovered will equal or exceed the estimate."³⁵
- "Probable Reserves are those additional Reserves which analysis of geoscience and engineering data indicate are less likely to be recovered than Proved Reserves but more certain to be recovered than Possible Reserves. It is equally likely that actual remaining quantities recovered will be greater than or less than the sum of the estimated Proved plus Probable Reserves (2P). In this context, when probabilistic methods are used, there should be at least a 50% probability that the actual quantities recovered will equal or exceed the 2P estimate."³⁶
- "Possible Reserves are those additional reserves which analysis of geoscience and engineering data suggest are less likely to be recoverable than Probable Reserves. The total quantities ultimately recovered from the project have a low probability to exceed the sum of Proved plus Probable plus Possible (3P) Reserves, which is equivalent to the high estimate scenario. When probabilistic methods are used, there should be at least a 10% probability that the actual quantities recovered will equal or exceed the 3P estimate."³⁷

The SPE-PRMS distinguishes between Contingent and Prospective Resources:

- "The term *Resources* as used herein is intended to encompass all quantities of petroleum naturally occurring on or within the Earth's crust, both discovered and undiscovered (recoverable and unrecoverable), plus those quantities already produced. Further, it includes all types of petroleum whether currently considered 'conventional' or 'unconventional' resources."³⁸
- "Contingent Resources are those quantities of petroleum estimated, as of a given date, to be potentially recoverable from known accumulations, but the applied project(s) are not yet considered mature enough for commercial development due to one or more contingencies." Contingent Resources have an associated chance of development. "Contingent Resources may include, for example, projects for which there are currently no viable markets, or where commercial recovery is dependent on technology under development, or where evaluation of the accumulation is insufficient to clearly assess commerciality. Contingent Resources are further categorized in accordance with the range of certainty associated with the estimates and may be sub-classified based on project maturity and/or economic status."³⁹
- "Prospective Resources are those quantities of petroleum estimated, as of a given date, to be potentially recoverable from undiscovered accumulations by application of future development projects. Prospective Resources have both an associated chance of discovery and a chance of development. Prospective Resources are further categorized in accordance with the range of certainty associated with recoverable estimates, assuming their discovery and development and may be sub-classified based on project maturity."⁴⁰

33 SPE-PRMS, p.2.

34 SPE-PRMS, p.3.

35 SPE-PRMS, pp.10-11.

36 SPE-PRMS, p.11.

37 SPE-PRMS, p.13.

38 SPE-PRMS, p.2.

39 SPE-PRMS, p.3.

40 SPE-PRMS, p.3.

Total petroleum initially-in-place (PIIP) is all quantities of petroleum that are estimated to exist in naturally occurring accumulations, discovered and undiscovered, before production. “*Discovered PIIP* is that quantity of petroleum that is estimated, as of a given date, to be contained in known accumulations before production.”⁴¹ “*Undiscovered PIIP* is that quantity of petroleum estimated, as of a given date, to be contained within accumulations yet to be discovered.”⁴²

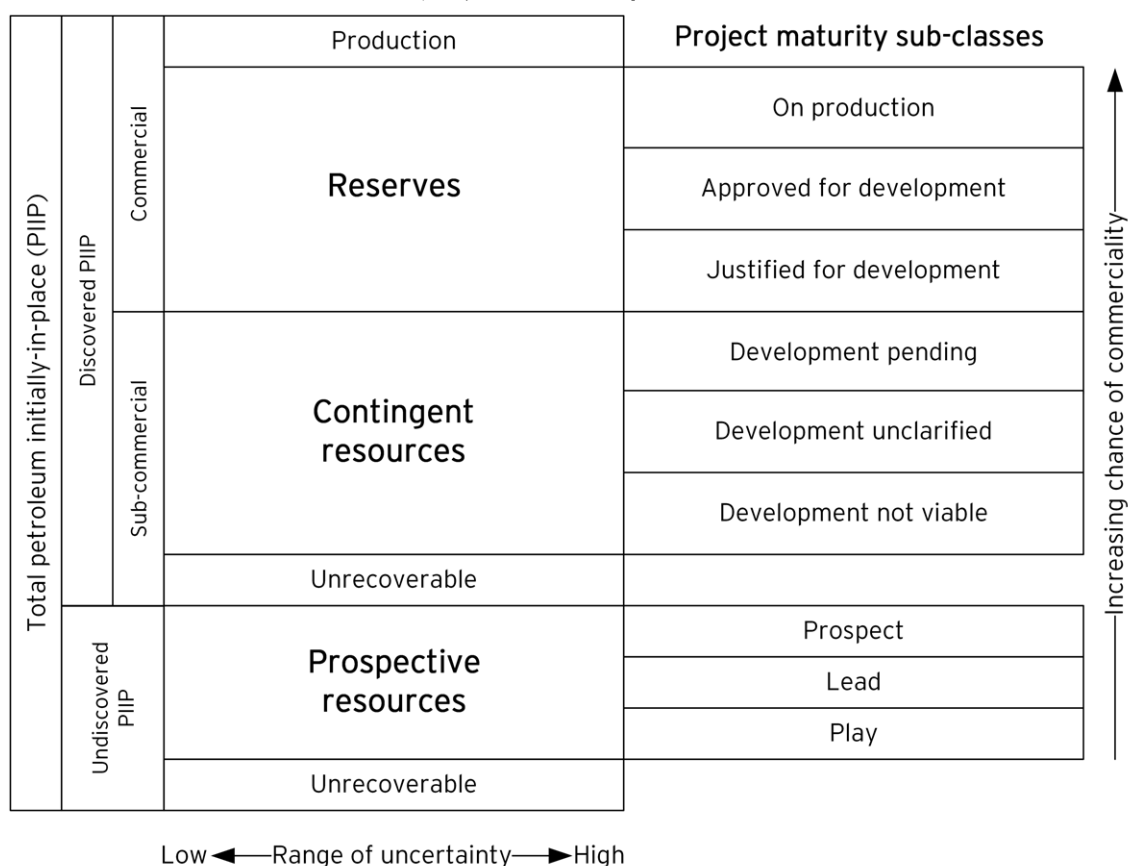

“*Production* is the cumulative quantity of petroleum that has been recovered at a given date.”⁴³

Unrecoverable Resources are that portion of Discovered or Undiscovered PIIP evaluated, as of a given date, to be unrecoverable by the currently defined project(s). “A portion of these quantities may become recoverable in the future as commercial circumstances change or technological developments occur; the remaining portion may never be recovered because of physical/chemical constraints represented by subsurface interaction of fluids and reservoir rocks.”⁴⁴

2.2.2 Classification and categorisation guidelines

The SPE-PRMS provides guidance on classifying resources depending on the relative maturity of the development projects being applied to yield the recoverable quantity estimates.⁴⁵

Figure 2-2: Sub-classes based on project maturity

As Figure 2-2⁴⁶ above illustrates, “development projects (and their associated recoverable quantities) may be sub-classified according to project maturity levels and the associated actions (business decisions) required to move a project forward to commercial production”.⁴⁷

⁴¹ SPE-PRMS, p.3.

⁴² SPE-PRMS, p.3.

⁴³ SPE-PRMS, p.3.

⁴⁴ SPE-PRMS, p.3.

⁴⁵ SPE-PRMS, p.7.

⁴⁶ SPE-PRMS, Figure 2-1.

⁴⁷ SPE-PRMS, p.7.

The SPE-PRMS also provides guidance on categorising resources, depending on the associated degrees of uncertainty, into the following cumulative categories:⁴⁸

- 1P denotes low estimate of reserves, i.e., Proved Reserves
- 2P denotes the best estimate of reserves, i.e., the sum of Proved plus Probable reserves
- 3P denotes high estimate of reserves, i.e., the sum of Proved plus Probable plus Possible reserves
- 1C denotes low estimate of Contingent Resources
- 2C denotes best estimate of Contingent Resources
- 3C denotes high estimate of Contingent Resources
- 1U denotes the unrisked low estimate qualifying as Prospective Resources
- 2U denotes the unrisked best estimate qualifying as Prospective Resources
- 3U denotes the unrisked high estimate qualifying as Prospective Resources

Additionally, guidance is provided on categorisation of reserves and resources related to incremental projects, such as workovers, infill drilling and improved recovery.⁴⁹

To promote consistency in project evaluations and reporting, the SPE-PRMS provides guidelines on the economic assumptions that are to be used, measurement of production, and resources entitlement and recognition,⁵⁰ and also provides guidance on the analytical procedures, and on the deterministic and probabilistic methods to be used.

2.3 Mining resource and reserve reporting

The *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves* (JORC Code) is prepared by the Joint Ore Reserves Committee (JORC) of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia. The JORC was established in 1971, the first edition of the JORC Code was published in 1989,⁵¹ with the most recent edition of the JORC Code issued in 2012. This version of the JORC code and associated ASX listing rules relating to the disclosure of reserves and resources by ASX listed mining and oil and gas exploration and production entities came into effect on 1 December 2013.

Subsequently, many jurisdictions have established similar national reporting standards. These include:

- Canada: *CIM Definition Standards on Mineral Resources and Reserves*, Canadian Institute of Mining, Metallurgy and Petroleum (CIM)
- Chile: *Certification Code of Exploration Prospects, Mineral Resources and Ore Reserves*, Instituto de Ingenieros de Minas de Chile (IIMCh)
- Pan-European Reserves Reporting Committee (PERC) in the United Kingdom, Ireland and Western Europe
- Peru: *Code for Reporting on Mineral Resources and Ore Reserves*, Joint Committee of the Venture Capital Segment of the Lima Stock Exchange
- South Africa: *South African Code for the Reporting of Exploration Results, Mineral Resources and Mineral Reserves*, South African Mineral Resource Committee (SAMREC)
- United States: *Guide for Reporting Exploration Information, Mineral Resources and Mineral Reserves*, Society for Mining, Metallurgy and Exploration (SME)

48 SPE-PRMS, p.37.

49 SPE-PRMS, pp.11-12.

50 SPE-PRMS, pp.13-19.

51 JORC Code, *Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves*, Joint Ore Reserves Committee of the Australasian Institute of Mining and Metallurgy, Australian Institute of Geoscientists and Minerals Council of Australia (JORC), 2004, para. 1.

In July 2006, CRIRSCO first published a generic International Reporting Template for reporting mineral resources and mineral ore reserves, modelled on those of the JORC Code, and the latest update occurred in November 2019. This reflects best practice national reporting standards but excludes national regulatory requirements. The template serves as a guide to national standard-setters that do not have a reporting standard or who want to revise their existing standard to an internationally acceptable form.⁵² “The system is primarily targeted at establishing international best practice standards for regulatory and public disclosures and combines the basic components of a number of national reporting codes and guidelines that have been adopted in similar forms by all the major agencies outside of the SEC. The classification is applied, with small modifications or extensions, by most mining entities for the purpose of internal resource management.”⁵³

In the United States, public disclosures of mineral resources and mineral reserves for mining entities are regulated by the SEC. As discussed in section 2.1 above, in 2018 the SEC revised its rules applicable to mining entities. The SEC rules, are intended to be substantially similar to those of other CRIRSCO-based codes, however they are not identical to any single CRIRSCO-based code. Also, they are aimed at eliminating overlapping disclosure requirements and providing one standard set of disclosure rules for mining registrants.⁵⁴

2.3.1 CRIRSCO International Reporting Template (November 2019)

Set out below are the main requirements of the CRIRSCO International Reporting Template (CRIRSCO Template) to the extent that they are relevant to financial reporting by mining entities.

2.3.1.A Scope

The main principles governing the operation and application of the CRIRSCO Template are transparency, materiality and competence. These are aimed at ensuring that the reader of a public report is provided with:⁵⁵

- Sufficient information that is clear and unambiguous (transparency)
- A report that contains all relevant information which investors and their professional advisers would reasonably require and would reasonably expect to find, to be able to form a reasoned and balanced judgement about the Exploration Targets, Exploration Results, Mineral Resources or Mineral Reserves being reported (materiality)
- Information that is based on work that is the responsibility of suitably qualified and experienced persons who are subject to an enforceable professional code of ethics and rules of conduct (competence)

A *public report* is a report “... prepared for the purpose of informing investors or potential investors and their advisors on Exploration Targets, Exploration Results, Mineral Resources or Mineral Reserves. They include, but are not limited to, annual and quarterly company reports, media releases, information memoranda, technical papers, website postings and public presentations”.⁵⁶ The CRIRSCO Template is applicable to all solid minerals, including diamonds, other gemstones, industrial minerals, stone and aggregates, and coal.⁵⁷ The CRIRSCO Template provides supplementary rules on reporting related to coal, diamonds and industrial minerals, due to the special nature of those types of deposit.

A public report should be prepared by a *competent person*, defined in the CRIRSCO Template as “... a minerals industry professional, who is a [National Reporting Organisation (NRO) to insert appropriate membership class and name of Professional Organisation (PO)] or other Recognised Professional Organisations (RPOs) with enforceable disciplinary processes including the powers to suspend or expel a member”.⁵⁸

57 CRIRSCO Template, 2.3.

58 CRIRSCO Template, 3.6.

2.3.1.B Reporting terminology

The general relationship between Exploration Results, Mineral Resources and Mineral Reserves can be summarised in the following diagram:⁵⁹

Figure 2-3: The general relationship between results, resources and reserves

The terms in the above diagram are defined as follows:

*“Exploration Results include data and information generated by mineral exploration programmes that might be of use to investors but which do not form part of a declaration of Mineral Resources or Mineral Reserves.”*⁶⁰ The CRIRSCO Template specifically requires that any information relating to Exploration Results be expressed in such a way that it does not unreasonably imply that potentially economic mineralisation has been discovered.⁶¹

*“A Mineral Resource is a concentration or occurrence of solid material of economic interest in or on the Earth’s crust in such form, grade, quality and quantity that there are reasonable prospects for eventual economic extraction. The location, quantity, grade or quality, continuity and other geological characteristics of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge, including sampling. Mineral Resources are sub-divided, in order of increasing geological confidence, into Inferred, Indicated and Measured categories.”*⁶²

- *“An Inferred Mineral Resource is that part of a Mineral Resource for which quantity and grade or quality are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade or quality continuity. An Inferred Resource has a lower level of confidence than that applying to an Indicated Mineral Resource and must not be converted to a Mineral Reserve. It is reasonably expected that the majority of Inferred Mineral Resources could be upgraded to Indicated Mineral Resources with continued exploration.”*⁶³
- *“An Indicated Mineral Resource is that part of a Mineral Resource for which quantity, grade or quality, densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors in sufficient detail to support mine planning and evaluation of the economic viability of the deposit. Geological evidence is derived from adequately detailed and reliable exploration, sampling and testing and is sufficient to assume geological and grade or quality continuity between points of observation. An Indicated Mineral Resource has a lower level of confidence than that applying to a Measured Mineral Resource and may only be converted to a Probable Mineral Reserve.”*⁶⁴

⁵⁹ CRIRSCO Template, Figure 1.

⁶⁰ CRIRSCO Template, 6.1.

⁶¹ CRIRSCO Template, 6.3.

⁶² CRIRSCO Template, 7.1.

⁶³ CRIRSCO Template, 7.4.

⁶⁴ CRIRSCO Template, 7.8.

- “A *Measured Mineral Resource* is that part of a Mineral Resource for which quantity, grade or quality, densities, shape and physical characteristics are estimated with confidence sufficient to allow the application of Modifying Factors to support detailed mine planning and final evaluation of the economic viability of the deposit. Geological evidence is derived from detailed and reliable exploration, sampling and testing and is sufficient to confirm geological and grade or quality continuity between points of observation. A Measured Mineral Resource has a higher level of confidence than that applying to either an Indicated Mineral Resource or an Inferred Mineral Resource. It may be converted to a Proved Mineral Reserve or to a Probable Mineral Reserve.”⁶⁵
- “Modifying factors are considerations used to convert Mineral Resources to Mineral Reserves. These include, but are not restricted to, mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and governmental factors.”⁶⁶
- “A *Mineral Reserve* is the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses, which may occur when the material is mined or extracted and is defined by studies at Pre-Feasibility or Feasibility level as appropriate that include application of Modifying Factors. Such studies demonstrate that, at the time of reporting, extraction could reasonably be justified.”⁶⁷
- “A *Probable Mineral Reserve* is the economically mineable part of an Indicated, and in some circumstances, a Measured Mineral Resource. The confidence in the Modifying Factors applying to a Probable Mineral Reserve is lower than that applying to a Proved Mineral Reserve. A Probable Mineral Reserve has a lower level of confidence than a Proved Mineral Reserve but is of sufficient quality to serve as the basis for a decision on the development of the deposit.”⁶⁸
- “A *Proved Mineral Reserve* is the economically mineable part of a Measured Mineral Resource. A Proved Mineral Reserve implies a high degree of confidence in the Modifying Factors. A Proved Mineral Reserve represents the highest confidence category of reserve estimate.”⁶⁹

The CRIRSCO Template contains more detailed guidance on how a competent person should decide on mineral resource and mineral reserve classification and contains a checklist and guideline for the preparation of public reports.

2.4 Disclosure of mineral reserves and resources

Mineral reserves and resources, or subcategories thereof, are a significant element in communications by mining entities and oil and gas entities to their stakeholders. IFRS accounting standards requires an entity to provide “additional disclosures when compliance with the specific requirements in IFRS accounting standards is insufficient to enable users to understand the impact of particular transactions, other events and conditions on the entity’s financial position and financial performance”. [IAS 1.17(c)]. IFRS does not specifically require mineral reserve and resource disclosures to be included in financial statements. However, disclosures regarding these mineral quantities will generally be relevant under IFRS to provide users with the information they need to understand the entity’s financial position and performance. For example, when reserves and resource quantities are used as inputs to impairment and/or depreciation calculations, financial reports may disclose the basis for the reserves and resources being included in the calculation.

As noted in section 2 above, entities have to use reserves data and sometimes resources data for a number of accounting purposes and the methodology should be consistent with the definitions in the IFRS *Conceptual Framework* for asset recognition.

How we see it

We believe that disclosures about mineral resources and reserves and the methodology used in their estimates would generally be necessary under IFRS for users to understand the entity’s financial position and performance. The extent of mineral and reserve disclosures within financial statements are generally qualitative not quantitative. Further information is typically disclosed outside of the financial statements, with the extent of such additional information dependent on jurisdictional requirements.

⁶⁵ CRIRSCO Template, 7.10.

⁶⁶ CRIRSCO Template, 4.7.

⁶⁷ CRIRSCO Template, 8.1.

⁶⁸ CRIRSCO Template, 8.7-8.8.

⁶⁹ CRIRSCO Template, 8.9-8.10.

In addition, if management uses different reserves and/or resources categories for different purposes, for example those used for investment appraisal purposes versus those used for impairment and depreciation calculations and/or rehabilitation calculations, this should be clearly identified in the relevant accounting policies.

In the absence of guidance under IFRS, entities not subject to the requirements of a national regulator could consider using the disclosure requirements of other standard-setters as a starting point in developing their own policies. The sections below discuss the disclosure requirements of several standard-setters for mineral reserve and resource quantities for oil and gas entities and mining entities (see sections 2.4.1 and 2.4.2 respectively below) and reserve values (see section 2.4.3 below).

However, while disclosure of information about mineral reserves and resources is clearly very useful, users of financial statements are encouraged to be aware that there is a variety of variances between the requirements of different jurisdictions. Therefore, comparisons between entities may be difficult or even impossible. In particular, the following aspects are important:

- *Proven and probable reserves* - The definition of reserves can vary e.g., the former OIAC SORP permitted disclosure of either 'proven and probable' or 'proved developed and undeveloped' reserves, whereas Accounting Standards Codification (ASC) Topic 932-235-50 - *Extractive Activities - Oil and Gas - Notes to Financial Statements - Disclosure* - requires disclosure of 'proved reserves, proved developed reserves and proved undeveloped reserves'.
- *Commodity price* - The quantity of economically recoverable reserves may depend to a large extent on the price assumptions that an entity uses. Differences often arise because the entity:
 - Uses its own long-term price assumption which, for example, was permitted under the former OIAC SORP.
 - Is required to use 12-month average prices, which is required by the SEC Release No. 33-8995 in the oil and gas sector.

Or

 - Is required to use a reasonable price, which is required to comply with the SEC's Regulation S-K subpart 1300 in the mining sector.
- *Royalties* - Royalties payable in-kind to the government or legal owner of the mineral rights may or may not be included in reserves.
- *Non-controlling interests* - Generally 'reserves' include all reserves held by the parent and its consolidated subsidiaries. While in many jurisdictions mining entities and oil and gas entities are required to disclose the reserves attributable to significant non-controlling interests, this is not always required.
- *Associates, joint arrangements and other investments* - An entity could have economic ownership of reserves through investments in associates and joint arrangements, equity interests (see section 7 below) or royalty yielding contracts (see section 5.7 below). Such reserves are generally not included in consolidated reserves but could have to be disclosed separately.
- *Production sharing contracts and risk service contracts* (see sections 5.3 and 5.5.1 respectively below) Frequently the mining company or oil and gas company does not legally own the mineral reserves and resources in the ground, i.e., the government retains legal ownership. A significant amount of judgement concerning the nature of the rights and economic interests of the entity could be required to determine whether the entity is the economic owner of any reserves or resources. Depending on the reserve reporting framework that the entity is subject to, such 'economic' reserves could or could not be included in reserves or resources.

In addition to those matters set out above, there could be other variances in the 'reserves' definition and disclosure requirements in different jurisdictions of which users of IFRS financial statements need to be aware of. Such differences could affect IFRS financial reporting directly.

2.4.1 Oil and gas sector

Many oil and gas entities are required to disclose information about reserve quantities in accordance with the rules and requirements of the stock exchange on which they are listed. However, those oil and gas entities that are not subject to the specific disclosure requirements of a stock exchange or other local regulator could consider the need to disclose reserves and resources information to provide users with the information they need to understand the entity's financial position and performance.

Entities could continue to consider disclosing the information previously required under the former OIAC SORP or could look to the example disclosures contained in the 2010 DP in section 1.3.4 above. Alternatively, entities could follow the disclosures required under ASC 932-235--0 - *Disclosure of Standardised Measure of Oil and Gas* (ASC 932-235-50), as required by SEC Regulation S-K.

2.4.2 Mining sector

Similarly, many mining entities are required to disclose information about reserve quantities in accordance with the rules and requirements of the stock exchange on which they are listed. Mining entities that are subject to the SEC rules and regulations will need to consider compliance with Regulation S-K subpart 1300. However, those mining entities that are not subject to the specific disclosure requirements of a stock exchange or other local regulator could still wish to consider disclosing the information required under SEC Regulation S-K subpart 1300 (which replaced Industry Guide 7). However, if an entity was to do this, they would need to understand not only the content of SEC Regulation S-K subpart 1300, but also the current interpretation of this content by the SEC's staff. While many of the definitions may seem familiar, the SEC staff's interpretations could differ considerably from those of regulators in other countries.

2.4.3 Disclosure of the value of reserves

As part of its work on the *Extractive Activities* DP and the subsequent Extractive Activities project (see section 1.3.4 above) the IASB staff considered whether a disclosure-focused approach might be appropriate in an extractive industries financial reporting standard. It is in this context that the DP noted that, "given the near unanimity of the feedback from users on the lack of relevance of either historical cost or current value accounting for reserves and resources, ... a disclosure-focused approach needs to be considered as one alternative in the discussion paper".⁷⁰

One of the key issues to consider before developing a disclosure-focused approach is whether disclosure of the value of mineral reserves should be a requirement. A secondary issue is whether the mineral reserves should be disclosed at their fair value or at a standardised measure of value, similar to the requirement under ASC 932-235-50 which is based on discounted net cash flows.

This disclosure requirement is not uncontroversial, as the 'standardized measure of oil and gas' (often abbreviated to SMOG) does not represent the market value of an entity's proved reserves. However, the standardised measure of the value of oil and gas reserves greatly reduces the impact of management's opinion about future development on the value calculated, e.g., the method prescribes the discount rate and commodity price to be used. While this may not take into account relevant insights that management may have, the advantage is that comparability of the disclosures between entities is increased. As illustrated in Practical example 2-1, some entities caution against over-reliance on these disclosures.

Practical example 2-1: BP p.l.c. (2022)	United Kingdom
bp Annual Report and Form 20-F 2022 [extract] Financial statements [extract] Supplementary information on oil and natural gas (unaudited) [extract]	
<p>Standardized measure of discounted future net cash flows and changes therein relating to proved oil and gas reserves</p> <p>The following tables set out the standardized measure of discounted future net cash flows, and changes therein, relating to crude oil and natural gas production from the group's estimated proved reserves. This information is prepared in compliance with FASB Oil and Gas Disclosures requirements.</p> <p>Future net cash flows have been prepared on the basis of certain assumptions which may or may not be realized. These include the timing of future production, the estimation of crude oil and natural gas reserves and the application of average crude oil and natural gas prices and exchange rates from the previous 12 months. Furthermore, both proved reserves estimates and production forecasts are subject to revision as further technical information becomes available and economic conditions change. bp cautions against relying on the information presented because of the highly arbitrary nature of the assumptions on which it is based and its lack of comparability with the historical cost information presented in the financial statements.</p> <p>...</p>	

It is clear that reaching agreement as to what constitutes useful and relevant disclosures about the value of mineral reserves is not straightforward and will be controversial. Still, in September 2008, the Board indicated support for the *Extractive Activities* DP to propose the disclosure of "a current value measurement, such as a standardised measure of discounted cash flows, and the key assumptions necessary for a user to make use of that measurement". This would not be disclosed if the minerals or oil and gas assets are measured on the balance sheet at fair value or some other current value measurement.

⁷⁰ [INFORMATION FOR OBSERVERS](#), Board Meeting: 22 June 2007, London, Project: *Extractive Activities research project*, Subject: *Possible principles for a historical cost accounting model that accompanies decision-useful disclosures of minerals and oil & gas reserves and resources* (Agenda Paper 15C), IASB, para. 6. Available on the IFRS Foundation's website.

In that case, an entity would provide disclosures similar to those required in the US (by ASC 820-10-50-1, 2, 3 - *Fair Value Measurements - Disclosures*).⁷¹ Accordingly, the DP concluded that:

- If the assets are measured at historical cost, then detailed information should be disclosed about their current value (either fair value or standardised measure) and how it was determined.
- If, instead, the assets are measured at fair value then detailed information should be disclosed about that fair value and how it was determined.

These proposals have not culminated in any changes to published IFRS accounting standards.

2.4.3.A ASC 932-235-50 - Disclosure of Standardised Measure of Oil and Gas

All entities engaged in significant oil and gas producing activities that report under US GAAP or are SEC IFRS filers are required by ASC 932-235-50 to disclose a standardised measure of discounted future net cash flows relating to proved oil and gas reserve quantities. There may also be non-US GAAP oil and gas entities who, while they are not subject to these specific disclosure requirements, still elect to refer to these when determining the reserves and resources information to provide to their users. ASC 932-235-50 is highly prescriptive and should be reviewed directly in full to ensure compliance with its requirements.

⁷¹ [IASB Update](#), September 2008, page 3. Available on the IFRS Foundation's website.

3 IFRS 6 *Exploration for and evaluation of mineral resources*

3.1 Objective and scope

The IASB's objective in developing IFRS 6, as noted in section 1.2 above, was restricted to making limited improvements to existing accounting practices for exploration and evaluation (E&E) expenditures. E&E expenditures are "expenditures incurred by an entity in connection with the exploration for and evaluation of mineral resources before the technical feasibility and commercial viability of extracting a mineral resource are demonstrable", while E&E assets are "exploration and evaluation expenditures recognised as assets in accordance with the entity's accounting policy". [IFRS 6 Appendix A].

IFRS 6 is limited to specifying the financial reporting for the exploration for and evaluation of mineral resources, which the standard defines as "the search for mineral resources, including minerals, oil, natural gas and similar non-regenerative resources after the entity has obtained legal rights to explore in a specific area, as well as the determination of the technical feasibility and commercial viability of extracting the mineral resource". [IFRS 6 Appendix A]. The standard also specifies when entities need to assess E&E assets for impairment in accordance with IAS 36 and requires certain disclosures.

An entity cannot apply IFRS 6 to expenditures incurred before the exploration for and evaluation of mineral resources (e.g., expenditures incurred before the entity has obtained the legal rights to explore a specific area such as prospecting and acquisition of mineral rights) or after the technical feasibility and commercial viability of extracting a mineral resource are demonstrable (e.g., development, construction, production and closure). [IFRS 6.5]. Furthermore, it deals only with E&E expenditures and does not provide guidance on other sector-specific issues that may arise during the E&E phase.

Equipment used in the E&E phase, e.g., property, plant and equipment and any other intangibles, such as software, are not in the scope of IFRS 6, instead, they are in the scope of IAS 16 or IAS 38.

3.1.1 Scope exclusions in other standards relating to the extractive industries

In the Basis for Conclusions on IFRS 6 the IASB confirmed that "...even though no IFRS has addressed extractive activities directly, all IFRS (including International Accounting Standards and Interpretations) are applicable to entities engaged in the exploration for and evaluation of mineral resources that make an unreserved statement of compliance with IFRS in accordance with IAS 1". [IFRS 6.BC6]. However, certain aspects of activities that occur in the extractive industries that fall outside the scope of IFRS 6 are excluded from the scope of other standards.

Various standards exclude 'minerals' from their scope, but the exact wording of the scope exclusions differs from standard to standard. Therefore, it would be incorrect to conclude that the same aspects of the extractive industries' activities are excluded from the scope of these standards:

- IAS 2 does not apply to the measurement of minerals and mineral products, "...to the extent that they are measured at net realisable value in accordance with well-established practices in those industries". [IAS 2.3(a), IAS 2.4]. The practice of measuring minerals and mineral products inventories at net realisable value is, in reality, relatively rare in many areas of the extractive industries although not unheard of.
- IAS 16 does not apply to "...mineral rights and mineral reserves such as oil, natural gas and similar non-regenerative resources". [IAS 16.3(d)]. In addition, the standard does not apply to "...the recognition and measurement of exploration and evaluation assets". [IAS 16.3(c)]. Equipment used in extracting reserves is within the scope of IAS 16.
- IFRS 16 does not apply to "...leases to explore for or use minerals, oil, natural gas and similar non-regenerative resources". [IFRS 16.3(a)]. However, leases including leases of right-of-use assets in a sublease of assets used for exploration or evaluation activities are in the scope of IFRS 16.
- IAS 38 does not apply to "...expenditure on the exploration for, or development and extraction of, minerals, oil, natural gas and similar non-regenerative resources" or to the recognition and measurement of E&E assets. [IAS 38.2(c), IAS 38.2(d)].
- IAS 40 does not apply to "...mineral rights and mineral reserves such as oil, natural gas and similar non-regenerative resources". [IAS 40.4(b)].

3.2 Recognition of exploration and evaluation assets

3.2.1 Developing an accounting policy under IFRS 6

When developing its accounting policy for E&E expenditures, IFRS 6 requires an entity recognising E&E assets to apply IAS 8.10. [IFRS 6.6, IFRS 6.BC19]. Hence, management is required to use its judgement in developing and applying an accounting policy that results in information that is relevant and reliable. [IAS 8.10]. However, IFRS 6 does provide an exemption from IAS 8.11 and 12, [IFRS 6.7, IFRS 6.BC17], which "...specify sources of authoritative requirements and guidance that management is required to consider in developing an accounting policy for an item if no IFRS applies specifically to that item" (the so-called 'hierarchy', see Chapter 3). In developing such a policy, IFRS 6 imposes a number of significant constraints on an entity's choice of accounting policy because:

- An entity needs to specify which expenditures are recognised as E&E assets and apply that accounting policy consistently (see section 3.3.1 below). [IFRS 6.9].
- Expenditures related to the development of mineral resources should not be recognised as E&E assets (see section 3.3.1 below). [IFRS 6.10].
- The requirement to apply IAS 16, IAS 38 and IAS 36 after the E&E phase affects the choice of accounting policies during the E&E phase. In January 2006, the IFRS IC clarified that "...it was clear that the scope of IFRS 6 consistently limited the relief from the hierarchy to policies applied to E&E activities and that there was no basis for interpreting IFRS 6 as granting any additional relief in areas outside its scope".⁷² For example, an entity may be able to apply the full cost method of accounting (see section 3.2.4 below) during the E&E phase, but it will not be able to apply that policy after the E&E phase.

The IASB believed that waiving these requirements in IFRS 6 would "...detract from the relevance and reliability of an entity's financial statements to an unacceptable degree". [IFRS 6.BC23].

3.2.2 Options for an exploration and evaluation policy

Entities active in the extractive industries have followed, and continue to follow, a large variety of accounting practices for E&E expenditure, which range "...from deferring on the balance sheet nearly all exploration and evaluation expenditure to recognising all such expenditure in profit or loss as incurred". [IFRS 6.BC17]. As mentioned earlier, IFRS 6 provides an exemption from IAS 8.11 and 8.12. The inference from this is that the standard 'grandfathers' all existing practices by not requiring these to have any authoritative basis. The Basis for Conclusions states that "...the Board decided that an entity could continue to follow the accounting policies that it was using when it first applied the IFRS's requirements, provided they satisfy the requirements of paragraph 10 of IAS 8 ... with some exceptions ...". [IFRS 6.BC22]. These exceptions in IFRS 6, described above, have a rather more profound impact than may be obvious at first sight and, in fact, instead of allowing previous national GAAP accounting policies, IFRS 6 effectively prohibits many of them.

There are several methods adopted by oil and gas entities (and modified by some mining entities) to account for E&E costs. These include successful efforts, full cost and area of interest accounting. These methods have evolved through the use of previous GAAPs and industry practice. While these terms and methods (or similar methods) are commonly used in the sector, none of these is specifically referred to in IFRS accounting standards.

We explore below each of these methods and consider to what extent they are compliant with the requirements of IFRS accounting standards.

3.2.3 Successful efforts method

The successful efforts methods that have been developed by different accounting standard-setters are generally based on the successful efforts concept as set out in US GAAP, under which generally only those costs that lead directly to the discovery, acquisition, or development of specific, discrete mineral resources and reserves are capitalised and become part of the capitalised costs of the cost centre. Costs that when incurred fail to meet this criterion are generally charged to expense in the period they are incurred. Some interpretations of the successful efforts concept allow entities to capitalise the cost of unsuccessful development wells.⁷³

⁷² [IFRIC Update](#), January 2006, page 3. Available on the IFRS Foundation's website.

⁷³ IASC Issues Paper, 4.18.

Under the successful efforts method, an entity will generally consider each individual mineral lease, concession, or production sharing contract as a cost centre.

How we see it

When an entity applies the successful efforts method under IFRS, it will need to account for prospecting costs incurred before the E&E phase under IAS 16 or IAS 38. As economic benefits are highly uncertain at this stage of a project, prospecting costs will typically be expensed as incurred. Costs incurred to acquire undeveloped mineral rights, however, must be capitalised under IFRS if an entity expects an inflow of future economic benefits. To the extent that costs are incurred within the E&E phase of a project, IFRS 6 does not prescribe any recognition and measurement rules. Therefore, it would be acceptable for such costs to be recorded as assets and written off when it is determined that the costs will not lead to economic benefits or to be expensed as incurred if the outcome is uncertain.

Deferred costs of an undeveloped mineral right may be depreciated over some determinable period, subject to an impairment test each period with the amount of impairment charged to expense, or an entity may choose to carry forward the deferred costs of the undeveloped mineral right until the entity determines whether the property contains mineral reserves.⁷⁴ However, E&E assets should no longer be classified as such “...when the technical feasibility and commercial viability of extracting mineral resources are demonstrable”. [IFRS 6.17]. At that time, the asset should be tested for impairment under IAS 36, reclassified in the statement of financial position and accounted for under IAS 16 or IAS 38. If it is determined that no commercial reserves are present, then the costs capitalised should be expensed. Costs incurred after the E&E phase should be accounted for in accordance with the applicable IFRS accounting standards (i.e., IAS 16 and IAS 38).

It is worth noting that with the emergence of unconventional resource E&E projects, such as shale, coal seam and tight oil or gas, the potential timeframe to determine the technical feasibility and commercial viability of a resource can be considerably longer than that of a conventional resource. This is primarily due to the scale of work required to determine the technical feasibility and commercial viability of these more complex and/or less accessible resources in a higher cost environment. Such feasibility determinations may include the drilling and analysing of a significant number of wells over an extended period of time. As such, the overall success of a drilling campaign targeting unconventional resources may not be determined until completion of the campaign - as opposed to the more common well by well basis that is often the case for conventional projects.

Therefore, the costs incurred on unconventional projects over an extended E&E campaign, may be carried forward under existing policies adopted, including capitalisation under a successful efforts policy that permits such treatment, until such time as the broader resource body is deemed to be either successful or unsuccessful.

How we see it

The essence of most successful efforts approaches is that costs are capitalised pending evaluation, and this would be acceptable under IFRS accounting standards.

⁷⁴ IASC Issues Paper, 4.20.

Practical example 3-1 below from the financial statements of Harbour Energy plc illustrates a typical successful efforts method accounting policy applied under IFRS accounting standards.

Practical example 3-1: Harbour Energy plc (2022)

United Kingdom

Annual Report & Accounts 2022 [extract]

Financial statements [extract]

Notes to the consolidated financial statements [extract]

2. Significant accounting policies [extract]

Oil and gas assets

Intangibles

Pre-licence costs

Pre-licence costs are expensed in the period in which they are incurred.

Licence and property acquisition costs

Licence and property acquisition costs paid in connection with a right to explore in an existing exploration area are capitalised as exploration and evaluation costs within intangible assets.

Licence and property acquisition costs are reviewed at each reporting date to confirm that there is no indication that the carrying amount exceeds the recoverable amount. If no future activity is planned or the related licence has been relinquished or has expired, the carrying value of the property acquisition costs is written off through the income statement. Upon recognition of proved reserves and internal approval for development, the relevant expenditure is transferred to oil and gas properties within development and production assets.

Exploration and evaluation costs

Once the legal right to explore has been acquired, costs directly associated with the exploration are capitalised as exploration and evaluation (E&E) intangible non-current assets until the exploration is complete and the results have been evaluated. If no potential commercial resources are discovered, the exploration asset is written off.

All such capitalised costs are subject to technical, commercial and management review, as well as review for indicators of impairment at least annually. This is to confirm the continued intent to develop or otherwise extract value from the discovery. When this is no longer the case, the costs are written off through the income statement.

When proved reserves of oil or natural gas are identified and development is sanctioned by management, the relevant capitalised expenditure is first assessed for impairment and, if required, any impairment loss is recognised, then the remaining balance is transferred to oil and gas properties within development and production assets. No amortisation is charged during the exploration and evaluation phase.

Farm-outs – in the exploration and evaluation phase

The Group does not record any expenditure made by the farmee on its account. It also does not recognise any gain or loss on its exploration and evaluation farm-out arrangements but re-designates any costs previously capitalised in relation to the whole interest as relating to the partial interest retained. Any cash consideration received directly from the farmee is credited against costs previously capitalised in relation to the whole interest with any excess accounted for by the farmor as a gain on disposal.

Property, plant and equipment – oil and gas assets

Oil and gas development and production assets are accumulated generally on a field-by-field basis. This represents expenditure on the construction, installation or completion of infrastructure facilities such as platforms, pipelines and the drilling of development wells, including E&E expenditures incurred in finding commercial reserves transferred from intangible E&E assets, as outlined in the intangible asset policy above, which is capitalised as oil and gas properties within development and production assets.

The initial cost of an asset comprises its purchase price or construction cost, any costs directly attributable to bringing the asset into operation, the initial estimate of the decommissioning obligation and, for qualifying assets, where relevant, borrowing costs. The purchase price or construction cost is the aggregate amount paid and the fair value of any other consideration given to acquire the asset.

An item of development and production expenditure and any significant part initially recognised is derecognised upon disposal or when no future economic benefits are expected. Any gain or loss arising on derecognition of the asset (calculated as the difference between the net disposal proceeds and the carrying amount of the asset) is included in the income statement.

Expenditure on major maintenance includes refits, inspections or repairs comprising the cost of replacement assets or parts of assets, inspection costs and overhaul costs. Where an asset, or part of an asset, that was separately depreciated and is now written off is replaced and it is probable that future economic benefits associated with the item will flow to the Group, the expenditure is capitalised. All other day-to-day repairs and maintenance costs are expensed as incurred.

Depreciation, depletion and amortisation (DD&A) of oil and gas assets

All costs relating to a development are accumulated and not depreciated until the commencement of production. Depreciation is provided generally on a field-by-field basis, using the unit of production method by reference to the ratio of production in the year and the related commercial proven and probable reserves of the field, considering future development expenditures necessary to bring those reserves into production.

When there is a change in the estimated total recoverable proven and probable reserves of a field, that change is accounted for in the depreciation charge over the revised remaining proven and probable reserves.

Acquisitions, asset purchases and disposals

Acquisitions of oil and gas properties are accounted for using the acquisition method when the assets acquired, and liabilities assumed constitute a business.

Transactions involving the purchase of an individual field interest, or a group of field interests, that do not constitute a business, are treated as asset purchases irrespective of whether the specific transactions involve the transfer of the field interests directly or the transfer of an incorporated entity. Accordingly, no goodwill and no deferred tax gross up arises, and the consideration is allocated to the assets and liabilities purchased on an appropriate basis.

Proceeds on disposal are applied to the carrying amount of the specific intangible asset or oil and gas property disposed of and any surplus is recorded as a gain on disposal in the income statement.

Decommissioning

A provision for decommissioning is recognised in full when the related facilities are installed. The amount recognised is the present value of the estimated future expenditure. A corresponding amount equivalent to the provision is also recognised as part of the cost of the related oil and gas property. This is subsequently depreciated as part of the capital costs of the production facilities. Any change in the present value of the estimated expenditure is dealt with from the start of the financial year as an adjustment to the opening provision and the oil and gas property. The unwinding of the discount is included as a finance cost.

3.2.4 Full cost method

The full cost method under most national GAAPs required all costs incurred in prospecting, acquiring mineral interests, exploration, appraisal, development, and construction to be accumulated in large cost centres, e.g., individual countries, groups of countries, or the entire world.⁷⁵ However, although an entity is permitted by IFRS 6 to develop an accounting policy without reference to other IFRS accounting standards or to the hierarchy, as described in section 3.2.1 above, IFRS 6 cannot be extrapolated or applied by analogy to permit application of the full cost method outside the E&E phase. This was confirmed by the IFRS IC in January 2006.⁷⁶

There are several other areas in which application of the full cost method under IFRS is restricted because:

- IFRS 6 requires E&E assets to be classified as tangible or intangible assets according to the nature of the assets. [IFRS 6.15]. In other words, even when an entity accounts for E&E costs in relatively large pools, it will still need to distinguish between tangible and intangible assets.
- While the full cost method under most national GAAPs requires the application of some form of 'ceiling test', IFRS 6 requires - when impairment indicators are present - an impairment test to be performed in accordance with IAS 36 (although in accordance with IFRS 6, E&E assets can be allocated to CGUs or groups of CGUs (which may include producing CGUs), provided certain criteria are met - see section 3.5.2 below for further information).
- Once the technical feasibility and commercial viability of extracting mineral resources are demonstrable, IFRS 6 requires that E&E assets shall no longer be classified as such and need to be tested for impairment under IAS 36 and reclassified in the statement of financial position and accounted for under IAS 16 or IAS 38. [IFRS 6.17]. This means that it is not possible to account for successful and unsuccessful projects within one cost centre or pool.

⁷⁵ IASC Issues Paper, 4.45.

⁷⁶ [IFRIC Update](#), January 2006, page 3. Available on the IFRS Foundation's website.

For these reasons it is not possible to apply the full cost method of accounting under IFRS accounting standards without making very significant modifications in the application of the method. An entity might want to use the full cost method as its starting point in developing its accounting policy for E&E assets under IFRS. However, it will rarely be appropriate to describe the resulting accounting policy as a 'full cost method' because key elements of the full cost method are not permitted under IFRS accounting standards.

In July 2009, the IASB published an amendment to IFRS 1 *Additional Exemptions for First-time Adopters* (*Amendments to IFRS 1*), which introduced a first-time adoption exemption for first-time adopters that accounted under their previous GAAP for "...exploration and development costs for oil and gas properties in the development or production phases ... in cost centres that include all properties in a large geographical area" (i.e., the full cost method).⁷⁷ Under the exemption, a first-time adopter may elect to measure oil and gas assets at the date of transition to IFRS accounting standards on a deemed cost basis (see Chapter 6), but does not permit continued application of the previous GAAP accounting policy.

3.2.5 Area-of-interest method

The area-of-interest method is an accounting concept by which "...costs incurred for individual geological or geographical areas that have characteristics conducive to containing a mineral reserve are deferred as assets pending determination of whether commercial reserves are found. If the area of interest is found to contain commercial reserves, the accumulated costs are capitalised. If the area of interest is found to contain no commercial reserves, the accumulated costs are charged to expense".⁷⁸

Some consider the area-of-interest method to be a version of the successful efforts method that uses an area-of-interest, rather than an individual licence, as its unit of account. Others believe that the area-of-interest method is more akin to the full cost method applied on an area-of-interest basis.⁷⁹ "Under the area-of-interest concept, all costs identified with an area of interest would be deferred and capitalised if commercial reserves are later determined to exist in the area. However, costs incurred up to the point that an area of interest is identified (prospecting costs) are often charged to expense by those who consider that they are applying the area-of-interest concept. Costs of individual unsuccessful activities incurred on a specific area of interest, such as drilling an exploratory well that finds no reserves, are accumulated as part of the total cost of the area of interest."⁸⁰

While IFRS 6 will often not permit all aspects of an area-of-interest method defined by a national GAAP, an entity that uses relatively small areas of interest may be able to implement the method in a meaningful way under IFRS. The area-of-interest method is more common in the mining sector than in the oil and gas sector. Still, there are some entities that apply the method to oil and gas activities.

Australia

Annual Report 2022 [extract]

Financial Statements [extract]

1.6 Notes to the Financial Statements [extract]

Resource assets [extract]

11 Property, plant and equipment [extract]

Recognition and measurement**Property, plant and equipment**

Property, plant and equipment is recorded at cost less accumulated depreciation and impairment charges. Cost is the fair value of consideration given to acquire the asset at the time of its acquisition or construction and includes the direct costs of bringing the asset to the location and the condition necessary for operation and the estimated future costs of closure and rehabilitation of the facility.

Right-of-use assets are measured at cost, less any accumulated depreciation and impairment losses, and adjusted for any remeasurement of lease liabilities. Refer to note 21 'Leases' for further details. Right-of-use assets are presented within the category of property, plant and equipment according to the nature of the underlying asset leased.

Exploration and evaluation

Exploration costs are incurred to discover mineral resources. Evaluation costs are incurred to assess the technical feasibility and commercial viability of resources found.

Exploration and evaluation expenditure is charged to the income statement as incurred, except in the following circumstances in which case the expenditure may be capitalised:

- the exploration and evaluation activity is within an area of interest that was previously acquired as an asset acquisition or in a business combination and measured at fair value on acquisition or
- the existence of a commercially viable mineral deposit has been established

...

3.2.6 Changes in accounting policies

Extract from IFRS 6

Changes in accounting policies

- 13** An entity may change its accounting policies for exploration and evaluation expenditures if the change makes the financial statements more relevant to the economic decision-making needs of users and no less reliable, or more reliable and no less relevant to those needs. An entity shall judge relevance and reliability using the criteria in IAS 8.
- 14** To justify changing its accounting policies for exploration and evaluation expenditures, an entity shall demonstrate that the change brings its financial statements closer to meeting the criteria in IAS 8, but the change need not achieve full compliance with those criteria.

The standard permits a change in an entity's accounting policies for E&E expenditures only if "...the change makes the financial statements more relevant to the economic decision-making needs of users and no less reliable, or more reliable and no less relevant to those needs". [IFRS 6.13]. In making such a change, an entity should judge the relevance and reliability using the criteria in IAS 8. [IFRS 6.BC49]. The entity should justify the change by demonstrating that the change "...brings its financial statements closer to meeting the criteria in IAS 8, but the change need not achieve full compliance with those criteria". [IFRS 6.14].

3.3 Measurement of exploration and evaluation assets

IFRS 6 draws a distinction between measurement at recognition (i.e., the initial recognition of an E&E asset on acquisition) and measurement after recognition (i.e., the subsequent treatment of the E&E asset).

The standard requires that upon initial recognition, E&E assets should be measured at cost, [IFRS 6.8], which is the same as the initial recognition requirements found in IAS 16, [IAS 16.15], and IAS 38. [IAS 38.24]. Therefore, the question arises as to what may be included in the cost of an item. The standard contains considerable guidance on this matter, under the heading 'Elements of cost of exploration and evaluation assets' (see also section 3.3.1 below).

After initial recognition, IFRS 6 allows one of two alternatives to be chosen as the accounting policy for E&E assets that it must apply consistently to all E&E assets, being either the cost model or the revaluation model. [IFRS 6.12].

Under the cost model, the item is carried at cost less impairment. Entities that apply the cost model should therefore develop an accounting policy within the constraints of IFRS 6 (see section 3.2.1 above). As a result, an entity will either develop an accounting policy based on the successful efforts type of method or area-of-interest type of method (see sections 3.2.3 and 3.2.5 above) - that requires capitalisation of E&E costs pending evaluation; or develop a policy similar to the full cost type of method, which capitalises all E&E costs (successful and unsuccessful), although it is not possible to continue using this method outside the E&E phase (see section 3.2.4 above).

The alternative is the revaluation model, which is not defined in IFRS 6 itself. Instead, the standard requires an entity to classify E&E assets as tangible or intangible assets (see section 3.4 below) and apply the IAS 16 revaluation model to the tangible assets and the IAS 38 revaluation model to the intangible assets (see Chapter 19 and Chapter 18). Practically, what this means is that E&E classified as intangible assets may not be revalued, since the IAS 38 revaluation model may only be applied to intangible assets that are traded in an active market. [IAS 38.72, IAS 38.75, IFRS 6.BC29, IFRS 6.BC30].

3.3.1 Types of expenditure in the exploration and evaluation phase

The standard requires an entity to determine an accounting policy specifying which expenditures are recognised as E&E assets and apply the policy consistently. [IFRS 6.9].

Extract from IFRS 6

- 9 An entity shall determine an accounting policy specifying which expenditures are recognised as exploration and evaluation assets and apply the policy consistently. In making this determination, an entity considers the degree to which the expenditure can be associated with finding specific mineral resources. The following are examples of expenditures that might be included in the initial measurement of exploration and evaluation assets (the list is not exhaustive):
- (a) acquisition of rights to explore;
 - (b) topographical, geological, geochemical and geophysical studies;
 - (c) exploratory drilling;
 - (d) trenching;
 - (e) sampling; and
 - (f) activities in relation to evaluating the technical feasibility and commercial viability of extracting a mineral resource.

In permitting geological and geophysical costs (G&G costs) to be included in the initial measurement of E&E assets, IFRS differs from US GAAP - ASC 932 - *Extractive Activities - Oil and Gas*, which does not permit capitalisation of G&G costs,⁸¹ and may differ from the requirements under other national standards.

IFRS 6 allows an accounting policy choice as to how to treat expenditures on administration and other general overhead costs; however, the chosen policy should be consistent with one of the treatments available under other IFRS accounting standards, i.e., expense or capitalise. [IFRS 6.BC28]. This is because there are inconsistencies between IAS 16 (which does not allow such costs to be capitalised), IAS 2 (which requires capitalisation of production overheads but not general administration) and IAS 38 (which only allows capitalisation if directly attributable to bringing the asset into use, otherwise capitalisation is prohibited).

Expenditures related to the development of mineral resources should not be recognised as E&E assets. Instead, the IASB's *Conceptual Framework* and IAS 38 should be applied in developing guidance on accounting for such assets. [IFRS 6.10]. IFRS does not define 'development of mineral resources, but notes that "...development of a mineral resource once the technical feasibility and commercial viability of extracting the mineral resource had been determined was an example of the development phase of an internal project". [IFRS 6.BC27].

81 ASC 932-720-25-1, Extractive Activities - Oil and Gas - Other Expenses - Recognition.

The timing of transferring expenditure from the exploration phase to the development phase is discussed in further detail in section 3.4.1 below.

How we see it

Entities need to develop an accounting policy on which expenditures are recognised as E&E assets and which expenditures are recognised as part of the development of mineral resources. While the above guidance is not a full definition, we believe that until a development is approved, accumulated costs are considered E&E assets and are accounted for under IFRS 6.

The standard specifically requires the application of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* to any obligations for removal and restoration that are incurred during a particular period as a consequence of having undertaken the exploration for and evaluation of mineral resources. [IFRS 6.11].

How we see it

Although IFRS 6 did not make a corresponding amendment to the scope of IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* which applies to such liabilities when they are recognised in property, plant and equipment under IAS 16, we believe that the interpretation can also be applied in relation to E&E assets. However, if the E&E costs were originally expensed, then the future costs of any related removal and restoration obligations must also be expensed.

Practical example 3-3 below from Glencore plc illustrates a typical accounting policy for E&E assets for a mining company.

Jersey

Annual Report 2022 [extract]

Financial Statements 2022 [extract]

Notes to the financial statements [extract]

1. Accounting policies [extract]

Property, plant and equipment [extract]

(ii) Exploration and evaluation expenditure

Exploration and evaluation expenditure relates to costs incurred in the exploration and evaluation of potential mineral and petroleum resources and includes costs such as exploration and production licences, researching and analysing historical exploration data, exploratory drilling, trenching, sampling and the costs of pre-feasibility studies. Exploration and evaluation expenditure for each area of interest, other than that acquired from another entity, is charged to the consolidated statement of income as incurred except when the expenditure is expected to be recouped from future exploitation or sale of the area of interest and it is planned to continue with active and significant operations in relation to the area, or at the reporting period end, the activity has not reached a stage which permits a reasonable assessment of the existence of commercially recoverable reserves, in which case the expenditure is capitalised. As the intangible component (i.e. licences) represents an insignificant and indistinguishable portion of the overall expected tangible amount to be incurred and recouped from future exploitation, these costs along with other capitalised exploration and evaluation expenditure are recorded as a component of property, plant and equipment. Purchased exploration and evaluation assets are recognised at their fair value at acquisition.

As the capitalised exploration and evaluation expenditure asset is not available for use, it is not depreciated. All capitalised exploration and evaluation expenditure is monitored for indications of impairment. Where a potential impairment is indicated, an assessment is performed for each area of interest or at the CGU level. To the extent that capitalised expenditure is not expected to be recovered it is charged to the consolidated statement of income.

Administration costs that are not directly attributable to a specific exploration area are charged to the consolidated statement of income. Licence costs paid in connection with a right to explore in an existing exploration area are capitalised and amortised over the term of the permit.

bp Annual Report and Form 20-F 2022 [extract] Financial statements [extract] Notes on financial statements [extract] 1. Significant accounting policies, judgements, estimates and assumptions [extract] Intangible assets [extract]	
<p>Oil and natural gas exploration and appraisal expenditure</p> <p>Oil and natural gas exploration and appraisal expenditure is accounted for using the principles of the successful efforts method of accounting as described below.</p> <p>Licence and property acquisition costs</p> <p>Exploration licence and leasehold property acquisition costs are capitalized within intangible assets and are reviewed at each reporting date to confirm that there is no indication that the carrying amount exceeds the recoverable amount. This review includes confirming that exploration drilling is still under way or planned or that it has been determined, or work is under way to determine, that the discovery is economically viable based on a range of technical and commercial considerations, and sufficient progress is being made on establishing development plans and timing. If no future activity is planned, the remaining balance of the licence and property acquisition costs is written off. Lower value licences are pooled and amortized on a straight-line basis over the estimated period of exploration. Upon internal approval for development and recognition of proved or sanctioned probable reserves of oil and natural gas, the relevant expenditure is transferred to property, plant and equipment.</p> <p>Exploration and appraisal expenditure</p> <p>Geological and geophysical exploration costs are recognized as an expense as incurred. Costs directly associated with an exploration well are initially capitalized as an intangible asset until the drilling of the well is complete and the results have been evaluated. These costs include employee remuneration, materials and fuel used, rig costs and payments made to contractors. If potentially commercial quantities of hydrocarbons are not found, the exploration well costs are written off. If hydrocarbons are found and, subject to further appraisal activity, are likely to be capable of commercial development, the costs continue to be carried as an asset. If it is determined that development will not occur, that is, the efforts are not successful, then the costs are expensed.</p> <p>...</p> <p>Costs directly associated with appraisal activity undertaken to determine the size, characteristics and commercial potential of a reservoir following the initial discovery of hydrocarbons, including the costs of appraisal wells where hydrocarbons were not found, are initially capitalized as an intangible asset. Upon internal approval for development and recognition of proved or sanctioned probable reserves, the relevant expenditure is transferred to property, plant and equipment. If development is not approved and no further activity is expected to occur, then the costs are expensed.</p> <p>The determination of whether potentially economic oil and natural gas reserves have been discovered by an exploration well is usually made within one year of well completion, but can take longer, depending on the complexity of the geological structure. Exploration wells that discover potentially economic quantities of oil and natural gas and are in areas where major capital expenditure (e.g. an offshore platform or a pipeline) would be required before production could begin, and where the economic viability of that major capital expenditure depends on the successful completion of further exploration or appraisal work in the area, remain capitalized on the balance sheet as long as such work is under way or firmly planned.</p> <p>...</p>	

3.3.2 Capitalisation of borrowing costs in the exploration and evaluation phase

IAS 23 *Borrowing Costs* requires capitalisation of borrowing costs that are "...directly attributable to the acquisition, construction or production of a qualifying asset as part of the cost of that asset". [IAS 23.8]. An E&E asset will generally meet the definition of a qualifying asset as it "...necessarily takes a substantial period of time to get ready for its intended use or sale". [IAS 23.5]. However, IAS 23 requires capitalisation of borrowing costs only when it is "...probable that they will result in future economic benefits to the entity and the costs can be measured reliably". [IAS 23.9]. Unlike IAS 23, IFRS 6 permits capitalisation of E&E assets even when it is not probable that they will result in future economic benefits.

How we see it

Unless an entity's E&E project has resulted in the classification of mineral resources as proven or probable, it is unlikely that future economic benefits from that project can be considered probable. In these circumstances, it is consistent with the requirements of IFRS 6 and IAS 23 to capitalise an E&E asset but not capitalise borrowing costs in respect of it.

3.4 Presentation and classification

E&E assets should be classified consistently as either tangible or intangible assets in accordance with the nature of the assets acquired. [IFRS 6.15]. For example, drilling rights may be presented as intangible assets, whereas vehicles and drilling rigs are tangible assets. A tangible asset that is used in developing an intangible asset should still be presented as a tangible asset. However, to the "...extent that a tangible asset is consumed in developing an intangible asset, the amount reflecting that consumption is part of the cost of the intangible asset". For example, the depreciation of a drilling rig would be capitalised as part of the intangible E&E asset that represents the costs incurred on active exploration projects. [IFRS 6.16, IFRS 6.BC33].

This assessment requires judgement, and we observe different classification practices across the mining industry and the oil and gas industry.

3.4.1 Reclassification of E&E assets

E&E assets should no longer be classified as such when “...technical feasibility and commercial viability of extracting a mineral resource are demonstrable”. [IFRS 6.17].

Determining when technical feasibility and commercial viability have been demonstrated may involve significant judgement, particularly in relation to complex assets or projects where feasibility assessment may be ongoing over an extended period of time; for example, Liquefied Natural Gas (LNG) projects, unconventional assets, large scale, technically challenging projects, or where significant upfront investment in long lead items is required.

How we see it

A final investment decision being approved is often a common signal that technical feasibility and commercial viability have been determined and accordingly capitalisation of costs as part of E&E assets is no longer permitted. However, absent this, other factors may also need to be considered, such as the booking of significant quantities of commercial reserves, approval of budgeted expenditure to commence commercial development activities or the actual commencement of expenditure on development activities.

It should be noted that both technical feasibility and commercial viability must be demonstrated before an asset can be transferred out of E&E. Activities that occur prior to this point which are aimed at assessing the viability of a resource, may still be regarded as E&E in nature and must be accounted for accordingly.

Before reclassification, E&E assets are required to be assessed for impairment individually or as part of a cash-generating unit and any impairment loss should be recognised. [IFRS 6.17].

3.5 Impairment

In some cases, and particularly in exploration-only entities, E&E assets do not generate cash inflows and there is insufficient information about the mineral resources in a specific area for an entity to make reasonable estimates of an E&E asset's recoverable amount. This is because the exploration for and evaluation of the mineral resources has not reached a stage at which information sufficient to estimate future cash flows is available to the entity. Without such information, it is not possible to estimate either fair value less costs of disposal ('FVLCD') or value in use ('VIU'), the two measures of recoverable amount in IAS 36. Therefore, without some sort of alternate impairment assessment approach, this would have led to immediate write-off of exploration expenditure.

Therefore, modifications were made to the impairment testing approach. Under IFRS 6, the assessment of impairment should be triggered by changes in facts and circumstances. However, once an entity had determined that there is an impairment trigger for an E&E asset, IAS 36 should be used to measure, present and disclose that impairment in the financial statements. This is subject to the special requirements with respect to the level at which impairment is assessed. [IFRS 6.BC37].

IFRS 6 makes two important modifications to IAS 36:

- It defines separate impairment testing 'triggers' for E&E assets.
- It allows groups of cash-generating units to be used in impairment testing. [IFRS 6.18, IFRS 6.19, IFRS 6.20].

3.5.1 Impairment testing 'triggers'

E&E assets should be assessed for impairment when facts and circumstances suggest that the carrying amount of an E&E asset may exceed its recoverable amount. [IFRS 6.18].

Under IFRS 6, one or more of the following facts and circumstances could indicate that an impairment test is required. The list is not intended to be exhaustive. [IFRS 6.20].

Extract from IFRS 6

- 20 One or more of the following facts and circumstances indicate that an entity should test exploration and evaluation assets for impairment (the list is not exhaustive):
- (a) the period for which the entity has the right to explore in the specific area has expired during the period or will expire in the near future, and is not expected to be renewed.
 - (b) substantive expenditure on further exploration for and evaluation of mineral resources in the specific area is neither budgeted nor planned.
 - (c) exploration for and evaluation of mineral resources in the specific area have not led to the discovery of commercially viable quantities of mineral resources and the entity has decided to discontinue such activities in the specific area.
 - (d) sufficient data exist to indicate that, although a development in the specific area is likely to proceed, the carrying amount of the exploration and evaluation asset is unlikely to be recovered in full from successful development or by sale.
- In any such case, or similar cases, the entity shall perform an impairment test in accordance with IAS 36. Any impairment loss is recognised as an expense in accordance with IAS 36.

Finding that an exploratory or development well does not contain oil or gas in commercial quantities (i.e., finding a 'dry hole') is not listed in IFRS 6 as an impairment indicator. If finding a dry hole marks the end of budgeted or planned exploration activity, indicator (b) above would require impairment testing under IAS 36. Similarly, if the dry hole led to a decision that activities in the area would be discontinued, indicator (c) would require that an impairment test be performed, and indicator (d) requires an entity to do an impairment test if it is unlikely that it will recover the E&E costs from successful development or sale. However, absent one of these indicators being met, in isolation, drilling a dry hole would not necessarily trigger an impairment test. For example, if the first well in a three well campaign is a dry hole, but the entity still intends to drill the remaining two wells, an impairment trigger may not exist.

3.5.2 Specifying the level at which E&E assets are assessed for impairment

When deciding the level at which E&E assets should be assessed, rather than introduce a special CGU for E&E assets, IFRS 6 allows CGUs to be aggregated in a way consistent with the approach applied to goodwill in IAS 36. [IFRS 6.BC40-BC47]. Therefore, an entity should determine an accounting policy for allocating E&E assets to CGUs or to CGU groups for the purpose of assessing them for impairment. [IFRS 6.21]. Each CGU or group of CGUs to which an E&E asset is allocated should not be larger than an operating segment (which is smaller than a reportable segment) determined in accordance with IFRS 8 *Operating Segments*. [IFRS 6.21]. See also Chapter 21.

Hence, the level identified by an entity for the purposes of testing E&E assets for impairment may be comprised of one or more CGUs. [IFRS 6.22].

3.5.3 Cash-generating units comprising successful and unsuccessful E&E projects

IFRS 6 does not specifically address whether successful and unsuccessful E&E projects can be combined in a single CGU (which will occur under full cost accounting and may occur under area of interest accounting). There are some issues to consider before doing this:

- Regardless of whether there is an impairment trigger (see section 3.5.1 above), IFRS 6 requires E&E assets to be tested for impairment before reclassification "...when the technical feasibility and commercial viability of extracting a mineral resource are demonstrable". [IFRS 6.17]. That means that the successful conclusion of a small E&E project and its reclassification out of E&E would result in an impairment test of a much larger CGU and possible recognition of an impairment loss on that larger CGU.
- Successful E&E projects should be reclassified as tangible or intangible assets under IAS 16 and IAS 38, respectively. [IFRS 6.15]. Therefore, a CGU comprising both successful and unsuccessful E&E projects would be subject to the impairment triggers in both IFRS 6 and IAS 36. This would significantly increase the frequency of impairment testing. [IFRS 6.20, IAS 36.8-17].
- An entity should carefully consider the consequences of including several E&E projects in a CGU, because the unsuccessful conclusion of one project would usually trigger an impairment test of the entire CGU. [IFRS 6.20].

3.5.4 Order of impairment testing

CGUs often contain other assets as well as E&E assets. When developing IFRS 6, Exposure Draft ED 6 *Exploration for and Evaluation of Mineral Resources* specifically stated that such other assets should be tested for impairment first, in accordance with IAS 36, before testing the CGU inclusive of the E&E assets.⁸² However, IFRS 6 does not specifically address this topic.

How we see it

Although IFRS 6 does not specifically address the order of impairment testing, we believe that as the impairment test is completed in accordance with IAS 36, and a similar approach is adopted as that applied to goodwill, the order of the impairment testing as set out in IAS 36 would apply. That is, an entity would test the underlying assets/CGU without the E&E assets first, recognise any write down (if applicable) and then test the CGU/CGU group with the E&E assets allocated.

3.5.5 Additional considerations if E&E assets are impaired

In some circumstances, an entity that recognises an impairment of an E&E asset must also decide whether or not to derecognise the asset because no future economic benefits are expected, as shown in Illustration 3-1 below.

Illustration 3-1: Impairment losses on E&E assets

Entity A's exploration activity in a specific area does not discover oil and/or gas resources. Therefore, A recognises an impairment of the cash-generating unit and derecognises the related E&E assets.

Entity B's exploration activity in a specific area leads to the discovery of a significant quantity of resources, but these are located in a complex reservoir. Therefore, at present the costs of extraction of the discovered resources do not justify the construction of the required infrastructure. Nevertheless, B's management believes that the surrounding area has strong potential to yield other discoveries on other geological structures and it is considered possible that the required infrastructure will be constructed in the future, although at this stage management has no plans to undertake further exploration activity. Entity B recognises an impairment of the E&E assets, but since it expects future economic benefits the related E&E assets are not derecognised.

If an entity concludes that production is not technically feasible or commercially viable, that provides evidence that the related E&E asset needs to be tested for impairment. It is also possible that such evidence may indicate that no future economic benefits are expected from such assets and therefore any remaining assets should be derecognised. When considering the two examples above, in Entity A's situation, no oil and/or gas resources were discovered and based on current plans, no future economic benefits were expected from the related E&E assets so they were derecognised. Whereas in Entity B's situation, while oil and/or gas resources were discovered, extraction was not commercially viable at this stage. So, while an impairment was recognised, the remaining assets were not derecognised as management did expect future economic benefits to flow from such assets.

Although IFRS 6 does not specifically deal with derecognition of E&E assets, the entity should derecognise the E&E asset because the asset is no longer in the exploration and evaluation phase and hence outside the scope of IFRS 6 and other asset standards such as IAS 16 and IAS 38 would require derecognition under those circumstances. Once derecognised, the costs of an E&E asset that have been written off cannot be re-recognised as part of a new E&E asset, so unlike an impairment, the write off is permanent.

3.5.6 Income statement treatment of E&E write downs - impairment or exploration expense

In some circumstances, it may be unclear whether an E&E asset is impaired, or whether a write off of unsuccessful exploration is required. In an unconventional project, or in circumstances where costs have been carried forward for some time pending determination of technical feasibility and commercial viability, judgement will be required in concluding on the most appropriate income statement presentation. Key considerations may include whether the objectives of drilling or other expenditure programs have been met, whether the indicative impairment triggers in IFRS 6 have been met, and management's future intentions for the asset.

⁸² ED 6, *Exploration for and Evaluation of Mineral Resources*, IASB, January 2004, 14.

3.5.7 Reversal of impairment losses

Any impairment loss on an E&E asset recognised in accordance with IFRS 6 needs to be reversed if there is evidence that the loss no longer exists or has decreased. The entity must apply the requirements specified in IAS 36 for reversing an impairment loss (see Chapter 21). [IFRS 6.BC48, IAS 36.109-123].

3.6 Disclosure

There are a range of disclosures required by IFRS 6 in order to identify and explain "...the amounts recognised in its financial statements arising from the exploration for and evaluation of mineral resources". [IFRS 6.23]. These are set out below. [IFRS 6.24].

Extract from IFRS 6

- 24 To comply with paragraph 23, an entity shall disclose:
- (a) its accounting policies for exploration and evaluation expenditures including the recognition of exploration and evaluation assets.
 - (b) the amounts of assets, liabilities, income and expense and operating and investing cash flows arising from the exploration for and evaluation of mineral resources.

Practical example 3-5 below from Tullow Oil plc's 2022 financial statements illustrates the disclosures required by IFRS 6.

Accounting Policies [extract]**(k) Intangible, exploration and evaluation assets and oil and gas assets**

The Group adopts the successful efforts method of accounting for exploration and evaluation costs. Pre-licence costs are expensed in the period in which they are incurred. All licence acquisition, exploration and evaluation costs and directly attributable administration costs are initially capitalised in cost centres by well, field or exploration area, as appropriate.

These costs are then written off as exploration costs in the income statement unless commercial reserves have been established or the determination process has not been completed and there are no indications of impairment.

Exploration and evaluation assets are tested for impairment when reclassified to development assets, or whenever facts and circumstances indicate impairment. An impairment loss is recognised for the amounts by which the exploration and evaluation assets' carrying amount exceeds their recoverable amount. The recoverable amount is the higher of the exploration and evaluation asset's fair value less cost to sell and their value in use.

Once commercial reserves are found, exploration and evaluation assets are tested for impairment and transferred to development assets. No depreciation and/or amortisation is charged during the exploration and evaluation phase.

All field development costs are capitalised as property, plant and equipment. Property, plant and equipment related to production activities is amortised in accordance with the Group's depletion and amortisation accounting policy.

Cash consideration received on farm-down of exploration and evaluation assets is credited against the carrying value of the asset. The excess amount over the carrying value of the asset is recognised as a gain on disposal of exploration and evaluation assets in the statement of profit or loss.

...

An entity should treat E&E assets as a separate class of assets and make the disclosures required by IAS 16 and IAS 38 for tangible E&E assets and intangible E&E assets, respectively. [IFRS 6.25, IFRS 6.BC53].

3.6.1 Statement of cash flows

IAS 7 *Statement of Cash Flows* states that only expenditures that result in a recognised asset in the statement of financial position are eligible for classification as investing activities. [IAS 7.16]. The IASB specifically notes that "...the exemption in IFRS 6 applies only to recognition and measurement of exploration and evaluation assets, not to the classification of related expenditures in the statement of cash flows". [IFRS 6.BC23B]. This means that an entity that expenses E&E expenditure will not be able to classify the associated cash flows as arising from investing activities.

4 Unit of account

One of the key issues in the development of accounting standards and in the selection of accounting policies by preparers, is deciding the level at which an entity should separately account for assets, i.e., what is the 'unit of account'? The definition of the unit of account has significant accounting consequences, as can be seen in the Illustration below.

Illustration 4-1: Unit of account - dry well

An oil and gas company concludes, based on a number of exploration wells, that oil and gas reserves are present. However, it needs to drill a number of delineation wells to determine the amount of reserves present in the field. The first delineation well that is drilled is a dry hole, i.e., no reserves are found.

There are two ways of looking at the cost of drilling the dry hole:

- The dry hole provides important information about the extent of the oil and gas reserves present in the oil field and should therefore be capitalised as part of the larger oil field.
- Or
- The dry hole will not produce oil in the future and in the absence of future economic benefits the costs should be expensed immediately.

This example suggests that assets or actions that have no value or meaning at one level may actually be valuable and necessary at another level.

The unit of account plays a significant role in:

- Recognition and derecognition of assets
- Determining the rate of depreciation or amortisation
- Deciding whether certain costs should be capitalised
- Undertaking impairment testing
- Determining the substance of transactions
- Application of the measurement model subsequent to recognition of the asset
- Determining the level of detail of the disclosures required

The decisions about the unit of account will consider, *inter alia*, cost/benefits and materiality, whether the items are capable of being used separately, their useful economic lives, whether the economic benefits that the entity will derive are separable and the substance of the transaction. To some degree the choice of the unit of account will depend on industry practice, as discussed below.

In Illustration 4-1 above, an individual dry hole might not be considered a separate asset because individual wells are typically not capable of being used separately, their economic benefits are inseparable, the wells are similar in nature and the substance of the matter can only be understood at the level of the project as a whole. However, in concluding on whether to capitalise or expense the cost of the individual dry hole as set out in Illustration 4-1 above, an entity will consider its specific accounting policy and its definition of the unit of account. This is discussed further in section 4.1 below.

4.1 Unit of account in the extractive industries

In the extractive industries the definition of the unit of account is particularly important in deciding whether certain costs may be capitalised, determining the rate of depreciation and in impairment testing.

Historically entities in the extractive industries have accounted for preproduction costs using methods such as:

- Successful efforts method
- Full cost method
- Area-of-interest method

These are discussed further in sections 3.2.3 to 3.2.5 above. A key issue under each of these methods is determining the appropriate unit of account, which is referred to in the industry as the 'cost centre' or 'pool'. In practice, entities would define their cost centres along geographical, political or legal boundaries or align them to the operating units in their organisation. The IASC Issues Paper listed the following, commonly used, cost centres that have been used pre-IFRS:⁸³

- The world
- Each country or group of countries in which the entity operates
- Each contractual or legal mineral acquisition unit, such as a lease or production sharing contract
- Each area of interest (geological feature, such as a mine or field, that lends itself to a unified exploration and development effort)
- Geological units other than areas of interest (such as a basin or a geologic province)
- The entity's organisational units

IFRS does not provide industry specific guidance on determining appropriate units of account for the extractive industries.

How we see it

We believe that in determining the unit of account, a logical place to start would be the legal rights and then apply the criteria discussed in section 4 above (i.e., cost/benefits and materiality, whether the items are capable of being used separately, their economic useful lives, whether the economic benefits that the entity will derive are separable and the substance of the transaction), to assess whether the unit of account is required to be larger or smaller. The other cost centres listed above might result in a unit of account that is unjustifiably large when viewed in the light of the factors influenced by the unit of account as set out in section 4 above.

The definition of 'unit of account' was considered in the *Extractive Activities* DP (see section 1.3 above). While the DP would not need to be considered in the context of the IAS 8 hierarchy, it did draw attention to the fact that the selection of an appropriate unit of account might need to take into account the stage of the underlying activities. In particular, the DP proposed that "...the geographical boundary of the unit of account would be defined initially on the basis of the exploration rights held. As exploration, evaluation and development activities take place, the unit of account would contract progressively until it becomes no greater than a single area, or group of contiguous areas, for which the legal rights are held and which is managed separately and would be expected to generate largely independent cash flows".⁸⁴ The DP's view was that the components approach in IAS 16 "would apply to determine the items that should be accounted for as a single asset".⁸⁵ However, the DP suggested that an entity may decide to account for its assets using a smaller unit of account.

The thinking underlying the above proposal in the DP would be relevant in the following types of situations:

- Certain transactions in the extractive industries (e.g., carried interest arrangements) result in the creation of new legal rights out of existing legal rights. Whenever this is the case, an entity needs to assess whether such transactions give rise to new units of account. If so, the accounting policies should be applied to those new units of account rather than the previous unit/s of account.
- When an entity acquires a business that owns reserves and resources, it needs to consider whether it should define the unit of account at the level of the licence or separate ore zones or reservoirs within the licence.

Determining the unit of account is an area that requires a significant amount of judgement, which may need to be disclosed under IAS 1 *Presentation of Financial Statements* together with other judgements that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements. [IAS 1.122].

As the prevalence of unconventional oil and gas projects increases, the determination of the unit of account is becoming an increasingly common topic. With unconventional programs, the objectives of individual wells or drilling campaigns may differ to those for a conventional drilling program. It may be that the drilling of each well provides important information about the extent of the oil and gas reserves present in the oil and gas field, but multiple wells need to be drilled before a decision can be made regarding success. So unlike conventional oil and gas projects, concluding whether a well cost should be capitalised may not be possible on an individual well basis immediately after each well is drilled. In these circumstances, an entity may determine that the costs of an individual well should be carried forward pending further analysis.

5 Legal rights to explore for, develop and produce mineral properties

An entity can acquire legal rights to explore for, develop and produce wasting resources on a mineral property by:⁸⁶

- (a) Purchasing of minerals (i.e., outright ownership)
- (b) Obtaining a lease or concession (see sections 5.1 and 5.2 below)
- (c) Entering into a production-sharing contract or production-sharing agreement (see section 5.3 below)
- (d) Entering into a pure-service contract (see section 5.4 below)
- (e) Entering into a service contract (also called a service agreement or risk service contract) (see section 5.5.1 below)
- (f) Entering into a joint operating agreement (see section 5.6 below)
- (g) Retaining an overriding royalty or other royalty interest subsequent to sale of an interest (see section 5.7 below)

Although many of these are more commonly encountered in the oil and gas sector, which is reflected in many of the examples and illustrations below, they are not restricted to this sector and mining entities can and do enter into similar arrangements.

The IASC Issues Paper noted that “in the mining sector, rights to explore for, develop, and produce minerals are often acquired by purchase of either the mineral rights alone (which does not include ownership of the land surface) or by purchase of both mineral rights and surface rights. In other cases, they are acquired through a right to mine contract, which grants the enterprise the rights to develop and mine the property and may call for a payment at the time the contract becomes effective and subsequent periodic payments. In the mining sector, rights to explore for, develop, and produce minerals may also be acquired by mineral leases from private owners or from the government”.⁸⁷

In the oil and gas sector, entities usually obtain the rights to explore for, develop, and produce oil and gas through mineral leases, concession agreements, production-sharing contracts, or service contracts.⁸⁸ Arrangements similar to production sharing contracts are also common in the mining sector. The type of legal arrangement used depends to a large extent on the legal framework of the country and market practice. The main features of each of these legal rights to access mineral reserves and resources, except for the outright ownership of minerals, are discussed below.

Practical example 5-1 below from the financial statements of TotalEnergies SE illustrates the different types of legal arrangements that an oil and gas company may enter into to secure access to mineral reserves and resources.

⁸⁶ IASC Issues Paper, 2.12.

⁸⁷ IASC Issues Paper, 2.13.

2.3 Upstream oil and gas activities [extract]

2.3.5 Contractual framework of Upstream oil and gas production activities

Licenses, permits and contracts governing the ownership of oil and gas interests by TotalEnergies' entities have terms that vary from country to country and are generally granted by or entered into with a government entity or a state-owned company or sometimes with private owners. These agreements usually take the form of concessions or production-sharing contracts.

In the framework of oil concession agreements, the oil company (or consortium) owns the assets and the facilities and is entitled to the entire production. In exchange, the operating risks, costs and investments are the oil company's or the consortium's responsibility and it agrees to remit to the relevant host country, usually the owner of the subsoil resources, a production-based royalty, income tax, and possibly other taxes that may apply under local tax legislation.

The production sharing contract (PSC) involves a more complex legal framework than the concession agreement. It defines the terms and conditions of production sharing and sets the rules governing the cooperation between the company (the contractor) or consortium (the contracting group) in possession of the license and the host country, which is generally represented by a state-owned company. The latter can thus be involved in operating decisions, cost accounting and production allocation. The contractor (or contractor group) undertakes the execution and financing, at its own risk, of all exploration, development or operational activities. In exchange, it is entitled to a portion of the production, known as "cost oil", the sale of which is intended to cover its incurred expenses (capital and operating costs). The balance of production, known as "profit oil", is then shared in varying proportions, between the contractor (or the contracting group), on the one hand, and the host country or state-owned company, on the other hand.

Today, concession agreements and PSCs can coexist, sometimes in the same country. Even though there are other contractual models, TotalEnergies' license portfolio is comprised mainly of concession agreements.

On most licenses, the partners and authorities of the host country, often assisted by international accounting firms, perform joint venture and PSC cost audits and ensure the observance of contractual obligations.

In some countries, TotalEnergies has also signed contracts called "risk service contracts", which are similar to production sharing contracts. However, the profit oil is replaced by a defined or determinable cash monetary remuneration, agreed by contract, which depends in particular on field performance parameters such as the amount of barrels produced.

Oil and gas exploration and production activities are subject to authorization granted by public authorities (licenses), which are granted for specific and limited periods of time and include an obligation to relinquish a large portion, or the entire portion in case of failure, of the area covered by the license at the end of the exploration period.

TotalEnergies pays taxes on income generated from its oil and gas production and sales activities under its concessions, PSCs and risk service contracts, as required by local regulations. In addition, depending on the country, TotalEnergies' production and sales activities may be subject to a number of other taxes, fees and withholdings, including special petroleum taxes and fees. The taxes imposed on oil and gas production and sales activities are generally substantially higher than those imposed on other industrial or commercial businesses.

5.1 Mineral lease

In most countries, the government owns all minerals and rights over those minerals, but in some other countries, minerals and mineral rights can also be directly owned by individuals. While these contracts are negotiated individually, and therefore each may be different, they typically share a large number of common features, which are discussed below:

- (a) The owner/lessor of the mineral rights retains a *royalty interest*, which entitles it to a specified percentage of the mineral produced. The lessor is normally only required to pay for its share of the severance taxes and the costs of getting the production into a marketable state, but not for any exploration and development costs. The *royalty* is either payable in cash or payable in kind. Although the lessor is normally not interested in receiving its royalty in kind, the option of receiving the royalty in kind is often included for tax purposes.
- (b) The lessee obtains a *working interest* under the mineral lease, which entitles it to explore for, develop, and produce minerals from the property at its cost. The working interest can be held by more than one party, in which case a *joint operating agreement* needs to be executed (see section 5.6 below).
- (c) Upon signing of the mineral lease agreement, the lessee typically pays the lessor a *lease bonus* or *signature bonus*, which is a one-off upfront payment in exchange for the lessor's signing of the mineral lease agreement.
- (d) It is in the lessor's interest for the lessee to explore the property as quickly as possible. To ensure that the lessee does not delay exploration and development unnecessarily, the following terms are typically included:
 - Most mineral leases define a *primary term* during which the lessee is required to commence drilling.
 - Normally the lessee has a *drill or exploration obligation* that must be met within a certain period. However, by paying *delay rentals* the lessee can defer commencement of drilling or exploration.
 - The mineral lease will remain in force once the obligatory drilling/exploration programme has been completed successfully and production commences, but the lease will be cancelled if activities are suspended for a prolonged period.

- (e) Most mineral leases provide that the lessee and the lessor have the right to assign their interest to another party without approval from the owner/lessor. This means that both the lessee and the lessor can create new rights out of existing rights (see section 5.7 below).
- (f) Under many oil and gas lease contracts, the lessee can be required to pay *shut-in royalties* when a successful well capable of commercial production has been completed, but production has not commenced within a specified time.
- (g) The lessor is typically not entitled to royalties on any minerals consumed in producing further minerals from a property.

5.2 Concessionary agreements (concessions)

Concessionary agreements or concessions are mineral leases “...under which the government owning mineral rights grants the concessionaire the right to explore, develop, and produce the minerals”.⁸⁹ However, unlike a production sharing contract (see section 5.3 below), under a concessionary agreement, the extractive industries company retains title to the assets constructed during the term of the concession. Furthermore, the company bears all the risks and there is no profit-sharing arrangement with the government. Rather, the government is entitled to a royalty computed in much the same way as a royalty under lease contracts.⁹⁰ In addition, depending on the country’s fiscal policies, the government will typically also collect taxes such as duties, severance or production taxes, and income taxes.

In some jurisdictions, the government may retain the option to participate in the project as a working interest owner in the property. In this case, the company initially holds 100% of the working interest. If the project is successful and reserves are found, the national oil company or entity representing the government becomes a working interest owner and will pay for its proportionate share of the investment.

5.3 Traditional production sharing contracts

A production sharing contract (PSC) or production sharing arrangement (PSA) is a contract between a national oil company (NOC) or the government of a host country and a contracting entity (contractor) to carry out oil and gas exploration and production activities in accordance with the terms of the contract, with the two parties sharing mineral output.⁹¹ While these arrangements have historically been more commonly found in the oil and gas sector, similar types of arrangements do exist in the mining sector.

In such countries, the ownership of the mineral reserves and resources in the ground does not pass to the contractor. Instead, the contractor is permitted to recover its costs and share in the profits from the exploration and production activities. Although the precise form and content of a PSC may vary, the following features are likely to be encountered in traditional oil and gas PSCs:⁹²

- (a) The government retains ownership of the reserves and resources and grants the contractor the right to explore for, develop, and produce the reserves.
- (b) The government is often directly involved in the operation of the property, either by way of an *operating committee* that comprises representatives of the contractor and the government or NOC, or by requiring the contractor to submit its annual work programme and corresponding annual budget to the government or NOC for approval. The contractor is responsible to the NOC for carrying out operations in accordance with contract terms.
- (c) Upon signing of the PSC, the contractor pays the government a *signature bonus*, which is a once-off upfront payment in exchange for the government’s signing of the PSC.
- (d) The contractor pays the government a *production bonus* upon commencement of production and when the average production over a given period first exceeds a threshold level.
- (e) The government is entitled to a *royalty payment* that is calculated as a percentage of the net production (i.e., net of petroleum lost, flared or re-injected) and which is payable in kind or in cash at the option of the government. The royalty rate applicable is not necessarily a fixed percentage, but may depend on the production volume or destination of the production (e.g., different rates may apply to crude oil and gas that is exported).

⁸⁹ IASC Issues Paper, 2.21.

⁹⁰ IASC Issues Paper, 2.21.

⁹¹ IASC Issues Paper, Glossary.

⁹² IASC Issues Paper, 2.19.

- (f) The contractor provides all financing and technology necessary to carry out operations and pays all the costs specified.
- (g) The contractor is typically required to bear all the risks related to exploration and, perhaps, development (i.e., the government does not have a working interest during the exploration and development phases).
- (h) The contractor is frequently required to provide infrastructure, such as streets, electricity, water systems, roads, hospitals, schools, and other items during various phases of activities. Additionally, the contract customarily requires the contractor to provide specified training of personnel. Infrastructure and training costs may or may not be recoverable from future production by the contractor.⁹³
- (i) The contractor may have a *domestic market obligation* that requires them to meet, as a priority, the needs of domestic oil and/or gas consumption in the host country. Alternatively, the contractor may be required to sell oil and/or gas to the NOC at the official oil or gas price.
- (j) The contractor is normally committed to completing a *minimum work programme* in each of the phases of the project, which generally needs to be completed within a specified period. If the work is not performed, the contract may require the unspent amount to be paid in cash to the government.
- (k) A PSC normally requires *relinquishment* of a certain percentage of the original contract area by the end of the initial term of the exploration period. A further reduction is typically required by the end of the exploration period. The government can negotiate a new contract with another party for the continued exploration of the surrendered acreage. Any data and information relating to the surrendered area often becomes the exclusive property of the government.
- (l) Equipment that is acquired for the development and production activities normally becomes the property of the government or NOC.
- (m) Operating costs and specified exploration and development costs are recoverable out of *cost recovery oil*, which is a specified percentage of production revenues after the royalty payment each year. The PSC specifies whether particular types of cost are recoverable or non-recoverable. Recoverable costs not recovered by the contractor in the current period can be carried forward to the following reporting period for recovery purposes.
- (n) Revenues remaining after royalty and cost recovery are called *profit oil*. Profit oil is split between the government and the contractor on a predetermined basis.
- (o) Many PSCs provide that the income tax to which the contractor is subject is deemed to have been paid to the government as part of the payment of profit oil (see section 21.2 below).
- (p) Some PSCs give the contractor the right to set up a decommissioning reserve fund which enables the contractor to recover the costs associated with future decommissioning and site restoration. In cases where the PSC terminates before the end of the life of the field, the government is typically responsible for decommissioning and site restoration.

Even in situations where the provisions of a PSC are fairly straightforward at first sight, it may be rather complicated to calculate the entitlement of each of the parties involved as is shown in the Illustration below.

Illustration 5-1: Production sharing contract

An oil and gas company (contractor) entered into a PSC that includes the following terms:

- The oil and gas company pays for all exploration costs
- The government is entitled to:
 - 15% royalty on the production
 - Severance tax of CU2.50 per barrel
 - CU5 million production bonus when average production first exceeds 25,000 barrels per day
- And
- 10% of the profit oil
- Operating expenses are recoverable before exploration costs
- Development costs are recoverable after exploration costs
- Cost recovery oil is capped at 45% of the annual production
- The national oil company (NOC) and the contractor have a 51% and 49% working interest, respectively

93 IASC Issues Paper, 12.12(b).

How should the production be allocated between parties, assuming the following for 20X1?

- Annual production in 20X1 is 10 million barrels
- Recoverable operating costs in 20X1 are CU25 million
- The average oil price in 20X1 is CU100/barrel (this amount is used to convert any amount calculated in monetary units i.e., CU, back into volumetric units i.e., barrels of oil)
- During 20X1 average production exceeded 25,000 barrels per day for the first time
- Unrecovered exploration costs at the beginning of 20X1 were CU180 million
- Unrecovered development costs at the beginning of 20X1 were CU275 million

		Barrels	Contractor (49%) bbls	NOC (51%) bbls	Government bbls
Production in 20X1	a	10,000,000			
Royalty 15% of 10,000,000 =	b	1,500,000			1,500,000
Severance tax 10,000,000 × CU2.50 ÷ CU100 =	c	250,000			250,000
Cost oil					
Operating costs CU25,000,000 ÷ CU100 =	d	250,000	122,500	127,500	
Exploration cost CU180,000,000 ÷ CU100 =	e	1,800,000	1,800,000		
Development cost CU275,000,000 ÷ CU100, but capped at 2,450,000 (i.e., g - d - e)	f	2,450,000	1,200,500	1,249,500	
Total cost oil 45% of 10,000,000 =	g	4,500,000			
Production bonus CU5,000,000 ÷ CU100 =	h	50,000			50,000
Profit oil: a - b - c - g - h =	i	3,700,000			
Government profit oil 10% of 3,700,000 =	j	370,000			370,000
Working interest in profit oil 3,700,000 - 370,000 =	k	3,330,000	1,631,700	1,698,300	
Total: (b + c + g + h + i) =		10,000,000	4,754,700	3,075,300	2,170,000
Unrecovered development costs CU275,000,000 - (2,450,000 × CU100) =		CU30,000,000	CU14,700,000	CU15,300,000	

The above example illustrates not only that calculating an entity's share in the production of the current period requires a detailed knowledge of the PSC's provisions, but also that calculating the contractor's share of the remaining reserves requires a number of assumptions.

The reserves and production that the parties are entitled to varies depending on the oil price. Had the average oil price in 20X1 been CU50/barrel the parties' entitlements would have been as follows: Contractor 5,540,400 barrels, NOC 2,019,600 barrels and Government 2,440,000 barrels. The quantity of reserves and production attributable to each of the parties often reacts to changes in oil prices in ways that, at first, might seem counterintuitive.

It is important to note that the type and nature of contracts emerging continue to evolve. New contracts have some attributes of PSCs but do differ from the traditional PSC. We discuss these in more detail in section 5.5 below.

5.4 Pure-service contracts

A pure-service contract is an agreement between a contractor and a host government that typically covers a defined technical service to be provided or completed during a specific period of time. The service company investment is typically limited to the value of equipment, tools, and personnel used to perform the service. In most cases, the service contractor's reimbursement is fixed by the terms of the contract with little exposure to either project performance or market factors. Payment for services is normally based on daily or hourly rates, a fixed turnkey rate, or some other specified amount. Payments may be made at specified intervals or at the completion of the service. Payments, in some cases, may be tied to the field performance, operating cost reductions, or other important metrics.

The risks of the service company under this type of contract are usually limited to non-recoverable cost overruns, losses owing to client breach of contract, default, or contractual dispute. Such a contract is generally considered to be a services contract that gives rise to revenue from the rendering of services and not income from the production of mineral. Therefore, the minerals produced are not included in the normal reserve disclosures of the contractor,⁹⁴ and the contractor bears no risk if reserves are not found. It is worth noting that such contracts do need to be assessed to determine whether the arrangement contains a lease in accordance with the requirements of IFRS 16. See section 17.1 below for more information. As noted above with respect to PSCs, the type and nature of contracts continue to evolve. These new contracts also have some attributes of services contracts but do differ from pure-service contracts. We discuss these in more detail in section 5.5 below.

5.5 Evolving contractual arrangements

The type and nature of contracts emerging has and continues to evolve. New contracts have some attributes of PSCs but do differ from the traditional PSC. As these contractual arrangements continue to evolve, determining the accounting implications of these contracts becomes increasingly complex. This not only has an impact on the accounting for such contracts but also on whether, and the extent to which, the contractor entity is able to recognise reserves in relation to its interests in mineral volumes arising from these contracts.

Each contractual arrangement needs to be analysed carefully to determine whether reserves recognition in relation to these contractual interests in mineral volumes is appropriate. Such an analysis would include, at a minimum:

- The extent of risk to which the contractor party is exposed, including exploration and/or development risk
- The structure of the contractor's reimbursement arrangements and whether it is subject to performance/reservoir risk or price risk
- The ability for the contractor to take product in-kind, rather than a cash reimbursement only

Other facts and circumstances may also be relevant in reaching the final assessment. Given the varying terms and conditions that exist within these contracts and the fact that they are continuing to change/evolve, each contract will need to be individually analysed and assessed in detail.

⁹⁴ IASC Issues Paper, 12.68.

5.5.1 Risk service contracts

An example of a contractual arrangement that has continued to evolve is a risk service contract (RSC). Unlike pure-service contracts, under an RSC (also called risk service agreement or at-risk service contract), a fee is not certain: an entity (contractor) agrees to explore for, develop, and produce minerals on behalf of a host government, but the contractor is at risk for the amount spent on exploration and development costs. That is, if no minerals are found in commercial quantities, no fee is paid.⁹⁵ Although an RSC does not result in the contractor's ownership of the minerals in place, the contractor may be at risk for the costs of exploration and may have economic interest in those minerals. The IASC Issues Paper noted that in the case of RSCs:⁹⁶

- The fee may be payable in cash or in minerals produced.
- The contract may call for the contractor to bear all or part of the costs of exploration that are usually recoverable, in whole or in part, from production. If there is no production, there is no recovery.
- The contract may also give the contractor the right to purchase part of the minerals produced.

As noted in Practical example 5-1 above from TotalEnergies SE' financial statements, RSCs are similar to PSCs in a number of respects. Although the precise form and content of an RSC may vary, the following features are common:

- (a) The repayment of expenses and the compensation for services are established on a monetary basis.
- (b) An RSC is for a limited period, after which the government or national oil company will take over operations.
- (c) Under an RSC, the contractor does not obtain ownership of the mineral reserves or production.
- (d) The contractor is normally required to carry out a minimum amount of work in providing the contracted services.
- (e) The fee that is payable to the contractor covers its capital expenditure, operating costs and an agreed-upon profit margin.
- (f) Ownership of the assets used under the contract passes to the government when the contractor has been reimbursed for its costs.

The SPE's *Guidelines for the Evaluation of Petroleum Reserves and Resources* notes in connection with RSCs that "under the existing regulations, it may be more difficult for the contractor to justify reserves recognition, and special care must be taken in drafting the agreement. If regulations are satisfied, reserves equivalent to the value of the cost-recovery-plus-revenue-profit split are normally reported by the contractor".⁹⁷

The nature and terms and conditions of these RSCs continue to change over time. Therefore, each contract will need to be analysed in detail to determine how it should be accounted for.

5.6 Joint operating agreements

When several entities are jointly involved in an arrangement (e.g., joint ownership of a property, production sharing contract or concession), they will need to enter into some form of joint operating agreement (JOA). A JOA is a contract between two or more parties to a joint arrangement that sets out the rights and obligations to operate the property. Typically, a JOA designates one of the working interest owners as the operator and it governs the operations and sharing of costs between parties. A JOA does not override, but instead builds upon, the contracts that are already in place (such as production sharing contracts). In fact, many production sharing contracts require the execution of a JOA between the parties.

A JOA may give rise to a joint arrangement under IFRS 11 *Joint Arrangements* if certain criteria are met. This is discussed in more detail in section 7.1 below.

5.7 Different types of royalty interests

Mining entities and oil and gas entities frequently enter into royalty arrangements with owners of mineral rights (e.g., governments or private land-owners). These royalties are often payable upon the extraction and/or sale of minerals. The royalty payments may be based on a specified rate per unit of the commodity (e.g., tonne or barrel) or the entity may be obliged to dispose of all of the relevant production and pay over a specified proportion of the aggregate proceeds of sale, often after deduction of certain extraction costs.

There are also other types of arrangements, which may be referred to as royalty payments/arrangements, but may potentially represent a different type of arrangement. Under these arrangements, the royalty holder may have retained (or obtained) a more direct interest in the underlying production and may undertake mineral extraction and sale arrangements independently. We discuss these further below.

5.7.1 Working interest and basic royalties

As discussed in section 5.1 above, under a mineral lease, the owner/lessor of the mineral rights retains a *basic royalty* interest (or non-operating interest), which entitles it to a specified percentage of the mineral produced, while the lessee obtains a *working interest* (or operating interest) under the mineral lease, which entitles it to explore for, develop, and produce minerals from the property.

If the owner of a working interest cannot fund or does not wish to bear the risk of exploration, development or production from the property, it may be able to - if this is permitted by the underlying lease - sell the working interest or to create new types of interest out of its existing working interest. By creating new types of non-operating interests, the working interest owner is able to raise financing and spread the risk of the development. The original working interest holder may either:

- Retain the non-operating interest and transfer the working interest (i.e., the rights and obligations for exploring, developing and operating the property)
- Carve out and transfer a new non-operating interest to another party, while retaining the working interest

The following non-operating interests are commonly created in practice:⁹⁸

- Overriding royalties (see section 5.7.2 below)
- Production payment royalties (see section 5.7.3 below)
- Net profits interests (see section 5.7.4 below)

5.7.2 Overriding royalties

An *overriding royalty* is very similar to a basic royalty, except that the former is created out of the operating interest and if the operating interest expires, the overriding royalty also expires.⁹⁹ An overriding royalty owner bears only its share of production taxes and sometimes the costs incurred to get the product into a saleable condition.

5.7.3 Production payment royalties

A *production payment royalty* is the right to recover a specified amount of cash or a specified quantity of minerals, out of the working interest's share of gross production. For example, the working interest holder may assign a production payment royalty to another party for CU12 million, in exchange for a repayment of CU15 million plus 12% interest out of the first 65% of the working interest holder's share of production. Production payments that are specified as a quantity of minerals are often called volumetric production payments or VPPs.

5.7.4 Net profits interests

A *net profits interest* is similar to an overriding royalty. However, the amount to be received by the royalty owner is a share of the net proceeds from production (as defined in the contract) that is paid solely from the working interest owner's share. The owner of a net profits interest is not liable for any expenses.

⁹⁸ D. R. Jennings, J. B. Feiten and H. R. Brock, *Petroleum Accounting, Principles, Procedures, & Issues*, 5th edition, Professional Development Institute, Denton (Texas), pp.165-169.

⁹⁹ IASC Issues Paper, 12.9.

5.7.5 Revenue and royalties: gross or net?

Many mineral leases, concession agreements and production sharing contracts require the payment of a royalty to the original owner of the mineral reserves or the government. The accounting treatment for government and other royalties payable has historically been diverse, as it has not been entirely clear whether revenue should be presented net of royalty payments or not. Historically, many entities have presented revenue net of those royalties that are paid in kind. This was on the basis that the entity had no legal right to the royalty product and hence, never received any inflow of economic benefits from those volumes. However, when the entity is required to sell the physical product in the market and remit the net proceeds (after deduction of certain costs incurred) to the royalty holder, the entity could be considered to have control of those volumes to such an extent that it was appropriate to present revenue on a gross basis and include the royalty payment within cost of sales or taxes (depending on how the royalty is calculated). See section 12.11.2 below for further discussion.

Practical examples 5-2 and 5-3 below, from the financial statements of Barrick Gold Corporation and BHP Group Limited respectively, illustrate typical accounting policies for royalties under IFRS.

Practical example 5-2: Barrick Gold Corporation (2022)	United Kingdom
Barrick Annual Report 2022 [extract] NOTES TO CONSOLIDATED FINANCIAL STATEMENTS [extract] 2. MATERIAL ACCOUNTING POLICY INFORMATION [extract]	
<p>k) Royalties</p> <p>Certain of our properties are subject to royalty arrangements based on mineral production at the properties. The primary type of royalty is a net smelter return ("NSR") royalty. Under this type of royalty we pay the holder an amount calculated as the royalty percentage multiplied by the value of gold production at market gold prices less third-party smelting, refining and transportation costs. Royalty expense is recorded on completion of the production or sales process in cost of sales. Other types of royalties include:</p> <ul style="list-style-type: none"> • Net profits interest ("NPI") royalty to a party other than a government, • Modified NSR royalty, • Net smelter return sliding scale ("NSRSS") royalty, • Gross proceeds sliding scale ("GPSS") royalty, • Gross smelter return ("GSR") royalty, • Net value ("NV") royalty, • Land tenement ("LT") royalty, and a • Gold revenue royalty. 	
Practical example 5-3: BHP Group Limited (2022)	Australia
Annual Report 2022 [extract] 1.6 Notes to the Financial Statements [extract] Performance [extract] 6 Income tax expense [extract] Recognition and measurement [extract]	
<div style="border: 1px solid black; padding: 5px;"> <p>Royalty-related taxation</p> <p>Royalties are treated as taxation arrangements (impacting income tax expense/(benefit)) when they are imposed under government authority and the amount payable is calculated by reference to revenue derived (net of any allowable deductions) after adjustment for temporary differences. Obligations arising from royalty arrangements that do not satisfy these criteria are recognised as current liabilities and included in expenses.</p> </div>	

Practical example 5-4 below, from the financial statements of Equinor ASA, illustrates some of the complications that may arise in determining revenue when an entity sells product on behalf of the government.

Practical example 5-4: Equinor ASA (2022)	Norway
Annual report and Form 20-F [extract] Notes to the Consolidated financial statements [extract] 7 Total revenues and other income [extract]	
Transactions with the Norwegian State Equinor markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf (NCS). The Norwegian State's participation in petroleum activities is organised through the SDFI (the Norwegian State's Direct Financial Interests). All purchases and sales of the SDFI's oil production are classified as purchases [net of inventory variation] and revenues from contracts with customers, respectively.	
Equinor sells, in its own name, but for the SDFI's account and risk, the SDFI's production of natural gas. These gas sales and related expenditures refunded by the SDFI are presented net in the Consolidated financial statements. Natural gas sales made in the name of Equinor's subsidiaries are also presented net of the SDFI's share in the Consolidated statement of income, but this activity is reflected gross in the Consolidated balance sheet.	
<u>Accounting judgement related to transactions with the Norwegian State</u> Whether to account for the transactions gross or net involves the use of significant accounting judgement. In making the judgement, Equinor has considered whether it controls the State-originated crude oil volumes prior to onwards sales to third party customers. Equinor directs the use of the volumes, and although certain benefits from the sales subsequently flow to the SDFI, Equinor purchases the crude oil volumes from the SDFI and obtains substantially all the remaining benefits. On that basis, Equinor has concluded that it acts as principal in these sales.	
Regarding gas sales, Equinor concluded that ownership of the gas had not been transferred from the SDFI to Equinor. Although Equinor has been granted the ability to direct the use of the volumes, all the benefits from the sales of these volumes flow to the SDFI. On that basis, Equinor is not considered the principal in the sale of the SDFI's natural gas volumes.	
Reference is made to note 27 Related parties for detailed financial information regarding transactions performed between Equinor and SDFI.	
...	

The SPE-PRMS (see section 2.2 above) notes that "...royalty quantities must be deducted from the lessee's entitlement to resources so that only the net revenue interest quantities are recognized". In some agreements, production taxes imposed by the host government may be referred to as royalties. These payment obligations are expressed in monetary terms and are typically linked to production rates, quantities produced cost recovery, the value of production (price sensitive), or the profits derived from it. These payments are not associated with an interest retained by the lessor/host. Thus, such payment obligations are effectively a production tax instead of a royalty. In such cases, the production and underlying resources are controlled by the lessee/contractor who may (subject to contractual terms and/or regulatory guidance) elect to report these obligations as a tax without a corresponding reduction in lessor/contractor's entitlement.¹⁰⁰

¹⁰⁰ SPE-PRMS, pp.23-24.

6 Risk-sharing arrangements

As discussed in section 1.1 above, the high costs and high risks in the extractive industries often lead entities to enter risk-sharing arrangements. The following types of risk-sharing arrangements are discussed in this chapter:

- Carried interests (see section 6.1 below)
- Farm-ins and farm-outs (see section 6.2 below)
- Asset swaps (see section 6.3 below)
- Unitisations (see section 15.4.1 below)
- Investments in subsidiaries, joint arrangements and associates (see section 7 below)
- Production sharing contracts (see section 5.3 above), which result in a degree of risk sharing with local governments
- Risk service contracts (see section 5.5.1 above)

6.1 Carried interests

Carried interests often arise when a party in an arrangement is either unable or unwilling to bear the risk of exploration or is unable or unwilling to fund its share of the cost of exploration or development. A carried interest is an agreement under which one party (the carrying party) agrees to pay for a portion or all of the pre-production costs of another party (the carried party) on a licence in which both own a portion of the working interest.¹⁰¹ In effect, commercially, the carried party is trading a share of any production to which it is entitled in the future in exchange for the carrying party funding one or more phases of the project. In other words, the parties create a new interest out of an existing working interest. If the project is unsuccessful then the carrying party will not be reimbursed for the costs that it has incurred on behalf of the carried party. If the project is successful then the carrying party will be reimbursed either in cash out of proceeds of the share of production attributable to the carried party, or by receiving a disproportionately high share of the production until the carried costs have been recovered.¹⁰²

6.1.1 Types of carried interest arrangements

Carried interest arrangements tend to fall into one of the following two categories:

- *Financing-type arrangements* - the carrying party provides funding to the carried party and receives a lender's return on the funds provided, while the right to additional production acts as a security that underpins the arrangement.
- *Purchase/sale-type arrangement* - the carried party effectively sells an interest or a partial interest in a project to the carrying party. The carrying party will be required to fund the project in exchange for an increased share of any proceeds if the project succeeds, while the carried party retains a reduced share of any proceeds.

In practice, however, it is not always easy to determine in which category a particular carried interest arrangement falls, as shown in the Illustration below.

Illustration 6-1: Carried interests

Scenario 1

The carrying party has proposed a CU10 million project, which has a very high chance of succeeding. The carried party, which is unable to fund its share of the project, agrees that the carrying party is entitled to recover its cost plus 7% interest by giving it a disproportionately high share of the production. If the production from this project is insufficient to repay the initial investment, the carried party should reimburse the carrying party out of its share of production from other fields within the same licence.

Scenario 2

The carrying party has proposed a project that may cost up to CU6 million, the outcome of which is uncertain. The carried party, which is unwilling to participate in the project, agrees that the carrying party is entitled to all production from the project until it has recovered three times its initial investment.

¹⁰¹ Former Oil Industry Association Committee Statement of Recommended Practice Accounting for Oil and Gas Exploration, Development, Production and Decommissioning Activities (July 2001) 'Former OIAC SORP' 149.

¹⁰² Former OIAC SORP 150.

Scenario 3

The carrying party has proposed a project that may cost up to CU5 million, which has a good chance of succeeding. The carrying party has a 60% interest in the licence and the carried party holds the remaining 40%. The carried party, which is unable to fund its share of the project, agrees that the carrying party is entitled to an additional 25% of the production until the carrying party has recovered its costs plus a 20% return.

When entering into a carried interest arrangement, an entity must assess whether the arrangement is a financing-type arrangement or purchase/sale-type arrangement. Some of the indicators that a carried interest arrangement should be accounted for as a financing-type arrangement are that:

- The carried party is unable to fund its share of the project.
- The risks associated with the development are not significant, i.e., financing-type arrangements will be more common in the development stage.
- The carrying party receives a return that is comparable to a lender's rate of return.

Indicators that a carried interest arrangement should be treated as a purchase/sale-type arrangement include:

- The carrying party and carried party have genuinely different opinions about the chances of success of the project, and the carried party could fund its share of the project if it wanted to.
- There are significant uncertainties about the outcome of the project. Purchase/sale-type arrangements are therefore more common in the E&E phase.
- The arrangement gives the carrying party voting rights in the project.
- There are significant uncertainties about the costs of the project, perhaps because it involves use of a new technology or approach.
- The carrying party could lose all of its investment or possibly earn a return significantly in excess of a lender's rate of return.
- The carrying party can only recover its investment from the project that is subject to the arrangement and there is no recourse to other assets or interests of the carried party.

In Illustration 6-1 above, scenario 1 has the characteristics of a financing-type arrangement, while scenario 2 has those of a purchase/sale-type arrangement. However, when an arrangement (such as scenario 3) has financing-type and purchase/sale-type characteristics (e.g., as a result of the relative bargaining strength of the parties), an entity will need to analyse the arrangement carefully and exercise judgement in developing an appropriate accounting policy.

The following types of carried interest arrangements are discussed below:

- Carried interest arrangements in the E&E phase (see section 6.1.2 below)
- Financing-type carried interest arrangements in the development phase (see section 6.1.3 below)
- Purchase/sale-type carried interest arrangements in the development phase (see section 6.1.4 below)

6.1.2 Carried interest arrangements in the E&E phase

While IFRS 6 should be applied to accounting for E&E expenditures, the standard does not address other aspects of accounting by entities engaged in the exploration for and evaluation of mineral resources. [IFRS 6.4]. That leaves unanswered the question of whether carried interest arrangements can ever fall within the scope of IFRS 6.

In the case of a purchase/sale-type carried interest arrangement the transaction, at least in economic terms, leads to the acquisition of an E&E asset by the carrying party and a disposal by the carried party.

On the other hand, a finance-type carried interest arrangement (which is generally not as common in the E&E phase) that has no significant impact on the risks and rewards that an entity derives from the underlying E&E working interest, may be more akin to a funding arrangement.

How we see it

We believe that given the nature of purchase/sale-type carried interest arrangements in the E&E phase, these would fall within the scope of IFRS 6.

For finance-type carried interest arrangements, as IFRS 6 deals only with accounting for E&E expenditures and assets, it is a matter of judgement whether or not the accounting for these is considered to be outside the scope of IFRS 6.

For purchase/sale-type carried interest arrangements in the E&E phase, we believe that an entity has two options: either to develop an accounting policy under IAS 8 as discussed in section 6.1.4 below, or, on transition to IFRS or first application under IFRS, to develop an accounting policy under IFRS 6 that is based on a previous national GAAP that contains such guidance.

In practice this usually means that:

- The carrying party accounts for its expenditures under a carried interest arrangement in the same way as directly incurred E&E expenditure (see sections 3.2 and 3.3 above).
- The carried party would not record expenditure incurred by the carrying party on its behalf subsequent to the arrangement commencing. However, the carried party may need to recognise a loss when the terms of the transaction indicate that the existing carrying value of the asset is impaired.

If a finance-type carried interest arrangement is considered to be outside the scope of IFRS 6, it might be appropriate to account for it in the same way as finance-type carried interest arrangements that relate to projects that are not in the E&E phase (see section 6.1.3 below).

6.1.3 Financing-type carried interest arrangements in the development phase

As financing-type carried interest arrangements do not result in the transfer of the economic risks and rewards of the underlying working interest between parties, such arrangements are not accounted for as a sale (purchase) by the carried party (carrying party). Instead, these arrangements are in effect secured borrowings in which the underlying asset is used as collateral that provides an identifiable stream of cash flows.

These arrangements are most appropriately accounted for as giving rise to a financial asset for the carrying party and a financial liability for the carried party.

The carried party will continue to recognise the expenditure incurred in relation to its full share of the working interest prior to the execution of the carried interest arrangement, and a corresponding financial liability for the amount that it is expected to reimburse to the carrying party as the pre-production costs being met by the carrying party are incurred, irrespective of whether it is a non-recourse arrangement or not. Under IFRS 9 *Financial Instruments*, any financial liability would likely be measured at amortised cost unless it meets the definition of a derivative or is designated at fair value through profit or loss. See Chapter 44 for more information. As a financial liability measured at amortised cost, under IFRS 9, the carried party should accrete interest on the liability and reduce the loan to the extent the carrying party recovers its costs. It should be noted, however, that the application of the effective interest rate method under IFRS 9 requires adjustment of the carrying amount when the entity revises its estimates of the payments to be made. [IFRS 9.B5.4.6].

Conversely the carrying party should recognise a financial asset for the amount that it expects to recover as a reimbursement as the pre-production costs (which are being met by the carrying party) are incurred. Under IFRS 9, an entity would need to determine the classification of the financial asset based on an assessment of the entity's business model for managing financial assets and the contractual cash flow characteristics of the financial asset. See Chapter 44 for more information. Where the entity expects to recover all of its investment (so it is considered a debt instrument and not an equity instrument), the terms are solely payments of principal and interest and its business model is to hold the investment in order to collect contractual cash flows, the financial asset will be carried at amortised cost. This could be the case in financing-type carried interest arrangements. Where there is exposure to other factors, e.g., uncertainty about recovery and the exposure is through something other than principal and interest, the financial asset could have to be carried at fair value through profit or loss.

This approach to accounting for carried interest arrangements might not be appropriate if there were more than an insignificant transfer of risk (without necessarily resulting in a purchase/sale-type carried interest arrangement). The transfer of risk would suggest that:

- The carried party should recognise a provision under IAS 37 rather than a liability under IAS 32 *Financial Instruments: Presentation* and IFRS 9. Any financial liability would likely be measured at amortised cost unless it meets the definition of a derivative or was designated at fair value through profit or loss. See Chapter 44 for more information.
- The carrying party should account for its right to receive reimbursement as a financial asset at fair value through profit or loss under IFRS 9 or a reimbursement right under IAS 37.

6.1.4 Purchase/sale-type carried interest arrangements in the development phase

The accounting suggested in this section for the carried party is the same as that set out in paragraph 155 of the former OIAC SORP. It stated that the disposal should be accounted for in accordance with the entity's normal accounting policy.

Historically, some entities have accounted for these types of transactions on a cash basis, i.e., the carried party does nothing and the carrying party accounts for its actual cash outlays. It is hard to see how this can be justified under IFRS accounting standards.

In purchase/sale-type carried interest arrangements, the carried party effectively sells part of its interest in a project to the carrying party. For example, the carried party could sell part of its interest in the mineral reserves to the carrying party which, in exchange, is obliged to fund the remaining costs of developing the field. Consequently, the arrangement has two elements, the purchase/sale of mineral reserves and the funding of developments costs, which should be accounted for in accordance with their substance.

Therefore, the carried party should:

- Derecognise the part of the asset that it has sold to the carrying party, consistent with the derecognition principles of IAS 16 or IAS 38. [IAS 16.67, IAS 38.112]. Determining the amount to be derecognised could require a considerable amount of judgement depending on how the interest sold is defined.
- Recognise the consideration received or receivable from the carrying party.
- Recognise a gain or loss on the transaction for the difference between the net disposal proceeds and the carrying amount of the asset disposed of. Recognition of a gain would be appropriate only when the value of the consideration can be determined reliably. If not, then the carried party should account for the consideration received as a reduction in the carrying amount of the underlying assets. See section 12.6.1.A below and Chapter 28 for discussion of how IFRS 15 *Revenue from Contracts with Customers* could impact such calculations.

And

- Test the retained interest for impairment if the terms of the arrangement indicate that the retained interest may be impaired.

In accounting for its purchase, the carrying party should:

- Recognise an asset that represents the underlying (partially) undeveloped interest acquired at cost in accordance with the principles of IAS 16 or IAS 38. [IAS 16.15, IAS 38.21]. Cost is defined in these standards as "the amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs". [IAS 16.6, IAS 38.8].

And

- Recognise a liability for the obligation to make defined payments on behalf of the carried party, which relate to the carried party's share of future investments.

The application of this approach is shown in Illustration 6-2 below.

Illustration 6-2: Carried interests

An oil and gas company is developing an oil field. Assume that the company did not capitalise any E&E costs in relation to the field, but that by 1 January 20X2 it had capitalised CU250 million of costs in relation to the construction of property, plant and equipment. To complete the development of the oil field and bring it to production a further investment in property, plant and equipment of CU350 million is required in the first half of 20X2.

At 1 January 20X2, the oil and gas company (the carried party) enters into a purchase/sale-type carried interest arrangement with a carrying party, which will fund the entire CU350 million required for the further development of the field. Upon entering into the carried interest arrangement, the carried party's entitlement to oil is expected to be reduced from 15,000,000 barrels of oil to 9,000,000 barrels of oil, i.e., its interest in the oil field and the related property, plant and equipment has been reduced to 60% ($9,000,000 \div 15,000,000$). In practice, calculating the portion of the interest sold may require a considerable amount of judgement (e.g., in scenario 2 in Illustration 6-1 above it would not be straightforward to calculate the portion of the interest sold).

Both parties believe that the fair value of the oil field and related property, plant and equipment will be CU1 billion once the remaining investment of CU350 million has been made. Consequently, the fair value of the oil

field and related property, plant and equipment at 1 January 20X2 is CU650 million (CU1 billion - CU350 million).

The fair value of the interest acquired (which comprises a portion of the oil field and a portion of the related property, plant and equipment) by the carrying party is CU260 million ($40\% \times \text{CU650 million}$). In exchange for its interest, the carrying party will pay CU50 million in cash and undertakes to pay the remaining investments related to the carried party's interest.

The carried party accounts for the transaction as follows:

Dr	Cash received from the carrying party	CU50	
Dr	Capital calls to be paid by the carrying party ($60\% \times \text{CU350 million}$) †	CU210	
Cr	Property, plant and equipment ($40\% \times \text{CU250 million}$)		CU100
Cr	Gain on sale ($40\% \times (\text{CU650 million} - \text{CU250 million})$)		CU160

† The carried party has obtained the commitment from the carrying party to make certain payments on its behalf.

If the carried party had recognised a loss on the interest sold, it would need to perform an impairment test on the interest retained.

The carrying party accounts for the transaction as follows:

Dr	Assets acquired ($\text{CU50 million} + \text{CU210 million}$) †	CU260	
Cr	Cash paid to the carried party		CU50
Cr	Capital calls payable on behalf of the carried party ($60\% \times \text{CU350 million}$)‡		CU210

† As discussed above, the cost of property, plant and equipment is defined as the fair value of the consideration. In an arm's length transaction, the fair value of property, plant and equipment acquired is normally equal to the fair value of the consideration paid. The fair value of the portion of the oil field and the portion of the related property, plant and equipment acquired is ($40\% \times \text{CU650 million}$) CU260 million.

‡ The carrying party has assumed a liability to make these payments on behalf of the carried party. The carrying party will also be required to pay ($40\% \times \text{CU350 million}$) CU140 million for its own share of the future investments, but that amount is only recognised as a liability upon recognition of the related property, plant and equipment.

The receivable recognised by the carried party and the corresponding liability recognised by the carrying party are reduced over the course of the construction of the assets to which they relate. The carrying party reduces the liability as it funds the carried party's share of the investment and the carried party recognises its share of the assets being constructed while reducing the balance of the receivable.

6.2 Farm-ins and farm-outs

A farm-out (from the viewpoint of the transferor) or a farm-in (from the viewpoint of the transferee) was defined in the former OIAC SORP as "the transfer of part of an oil and gas interest in consideration for an agreement by the transferee (farmee) to meet, absolutely, certain expenditure which would otherwise have to be undertaken by the owner (farmor)".¹⁰³ Farm-in transactions generally occur in the exploration or development phase and are characterised by the transferor (i.e., farmor) giving up future economic benefits, in the form of reserves, in exchange for a (generally) permanent reduction in future funding obligations.

Under a carried interest arrangement, the carried party transfers a portion of the risks and rewards of a property, in exchange for a funding commitment from the carrying party. Under a farm-in arrangement, the farmor transfers all the risks and rewards of a proportion (i.e., a straight percentage) of a property, in exchange for a commitment from the farmee to fund certain expenditures. Therefore, a farm-out represents the complete disposal of a proportion of a property and is similar to purchase/sale-type carried interest arrangements as discussed in section 6.1.4 above.

The following types of farm-in arrangements are separately discussed below:

- Farm-in arrangements in the E&E phase (see section 6.2.1 below)
- Farm-in arrangements outside the E&E phase (see section 6.2.2 below)

¹⁰³ Former OIAC SORP 16.

6.2.1 Farm-in arrangements in the E&E phase

IFRS 6 deals only with accounting for E&E expenditures and does not address other aspects of accounting by entities engaged in the exploration for and evaluation of mineral resources. [IFRS 6.4]. That leaves open the question of whether farm-in arrangements can ever fall within the scope of IFRS 6.

How we see it

A farm-in arrangement leads to the acquisition of an E&E asset by the farmee and a disposal by the farmor. We believe that a farm-in arrangement would fall within the scope of IFRS 6. Hence an entity has two options: either to develop an accounting policy under IAS 8 as discussed in section 6.2.2 below or to develop an accounting policy under IFRS 6. In practice many entities use the second option and apply an accounting policy to farm-in arrangements that is based on a previous national GAAP. If an entity applies its previous GAAP accounting policy in respect of farm-in arrangements, we would expect the entity also to make the farm-in disclosures required by its previous GAAP.

Accounting policies for farm-in arrangements in the E&E phase that are based on an entity's previous national GAAP will often require that:

- The farmee recognises its expenditure under the arrangement in respect of its own interest and that retained by the farmor, as and when the costs are incurred. The farmee accounts for its expenditures under a farm-in arrangement in the same way as directly incurred E&E expenditure.
- The farmor accounts for the farm-out arrangement as follows:
 - The farmor does not record any expenditure made by the farmee on its behalf.
 - The farmor does not recognise a gain or loss on the farm-out arrangement, but rather redesignates any costs previously capitalised in relation to the whole interest as relating to the partial interest retained.
- And
- Any cash consideration received is credited against costs previously capitalised in relation to the whole interest with any excess accounted for by the farmor as a gain on disposal.

While it may be unlikely an E&E asset would meet the definition of a business, an entity would still need to consider this for farm-ins in the E&E phase. See section 6.2.2.B below.

6.2.2 Farm-in arrangements outside the E&E phase: accounting by the farmee

A farm-in represents the complete acquisition of a proportion of a property. The accounting for such an arrangement will depend on whether the entity is farming into an asset or into an arrangement that is considered a business (and which is a joint operation), or whether the farm-in results in the arrangement becoming a joint operation. See Chapter 10 for discussion of the definition of a business.

6.2.2.A Farming into an asset

Where a farmee farms into an asset, regardless of whether it is a joint operation or results in the formation of a joint operation, it should recognise an asset that represents the underlying (partially) undeveloped interest acquired at cost in accordance with IAS 16 or IAS 38, [IAS 16.15, IAS 38.21], and recognise a liability that reflects obligations to fund the farmor's share of the future investment from which the farmee itself will not derive any future economic benefits.

Farm-in arrangements can be structured in numerous ways, some requiring payment of a fixed monetary amount while others are more flexible and state, for example, that capital expenditures over the next five years will be paid for by the farmee regardless of what those amounts may be.

How we see it

Accounting for farm-in arrangements depends on the nature of the transaction. In some cases, the liability may meet the definition of a financial liability under IAS 32 and therefore would be required to be accounted for in accordance with IFRS 9. In other scenarios, such as the latter example above, the liability may meet the definition of a provision under IAS 37 as the timing and amount of the liability are uncertain and a decision may need to be made on when a provision would need to be recognised.

The topic of variable and contingent consideration payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The IFRS IC determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively. However, at the time of writing this is not listed as an active research project on the IASB's work plan. See section 8.4.1 below for further discussion on accounting for variable and contingent consideration in an asset acquisition.

6.2.2.B Farming into a business which is a joint operation or results in the formation of a joint operation

Where a farmee farms into a project that is considered to be a business (as defined in IFRS 3) which is either a joint operation or results in the formation of a joint operation, historically there has been some diversity in how this was to be accounted for. Some have applied the business combination principles in IFRS 3 and other standards and some have applied the asset acquisition accounting principles (as discussed above in section 6.2.2.A).

This issue was resolved by the IASB issuing an amendment to IFRS 11 which was effective for annual reporting periods commencing on or after 1 January 2016. This amendment requires that where an entity acquires an interest in a joint operation which constitutes a business, the business combination accounting principles of IFRS 3 and other standards must be applied. See Chapter 10 for discussion of the definition of a business.

See Chapter 13 for further discussion on this issue. These requirements will include such interests acquired through a farm-in.

It is important to note that for the IFRS 11 amendment to mandatorily apply, the definition of a joint operation in accordance with IFRS 11 must be met, i.e., there must be joint control. Where there is joint control, the amendment applies to all entities party to the joint operation whether or not the entity is a party that has joint control. IFRS 11 specifies that: [IFRS 11.23]

Extract from IFRS 11

- 23 A party that participates in, but does not have joint control of, a joint operation shall also account for its interest in the arrangement in accordance with paragraphs 20-22 if that party has rights to the assets, and obligations for the liabilities, relating to the joint operation. If a party that participates in, but does not have joint control of, a joint operation does not have rights to the assets, and obligations for the liabilities, relating to that joint operation, it shall account for its interest in the joint operation in accordance with the IFRSs applicable to that interest.

How we see it

When it comes to accounting for the acquisition of an interest in an arrangement which does not meet the definition of a joint operation under IFRS 11, i.e., there is no joint control, there is no specific guidance as to how this is required to be accounted for. That is, it is not clear whether an entity can, or is required to, apply similar provisions to those applicable to acquiring an interest in a joint operation (discussed above). Until this is formally addressed, we do not consider IFRS 3 needs to be applied, and accounting for the transaction as an asset acquisition would be appropriate. However, whereby the underlying business meets the definition of a business and would be in scope of IFRS 3 if there was joint control, we would accept entities applying IFRS 3 as an accounting policy choice. In practice we see both approaches being applied and consider it important that there is adequate disclosure of the accounting policy adopted and judgements made.

6.2.3 Farm-in arrangements outside the E&E phase: accounting by the farmor

In accounting for a farm-in arrangement the farmor should:

- Derecognise the proportion of the asset that it has sold to the farmee, consistent with the principles of IAS 16 or IAS 38. [IAS 16.67, IAS 38.112].
- Recognise the consideration received or receivable from the farmee, which represents the farmee's obligation to fund the capital expenditure in relation to the interest retained by the farmor.
- Recognise a gain or loss on the transaction for the difference between the net disposal proceeds and the carrying amount of the asset disposed of. [IAS 16.71, IAS 38.113]. Recognition of a gain would be appropriate only when the value of the consideration can be determined reliably. If not, then the carried party should account for the consideration received as a reduction in the carrying amount of the underlying assets.

And

- Test the retained interest for impairment if the terms of the arrangement indicate that the retained interest may be impaired.

Under IAS 16, IAS 38 and IFRS 15, the amount of consideration to be included in the gain/loss arising from the derecognition of an item of property, plant and equipment or an intangible asset, and hence the receivable that is recognised, is determined in accordance with the requirements for determining the transaction price under IFRS 15. Subsequent changes to the estimated amount of the consideration included in the gain or loss calculation shall be accounted for in accordance with the requirements for changes in the transaction price in IFRS 15. [IAS 16.72, IAS 38.116]. See Chapter 28 for more information.

Any part of the consideration that is receivable in the form of cash will meet the definition of a financial asset under IAS 32, [IAS 32.11], and should be accounted for in accordance with IFRS 9, either at amortised cost or fair value depending on the nature of the receivable or how the farmor designates the receivable. See Chapter 44 for more information on classifying a financial asset under IFRS 9.

Practical example 6-1 below describes the farm-out transactions of Bowleven Plc.

Practical example 6-1: Bowleven Plc (2022)	United Kingdom
Annual Report and Accounts 2022 [extract] Financial Statements [extract] Notes forming part of the financial statements [extract] 8 Intangible exploration assets [extract]	
Etinde Farm-Out in 2015 On 16 March 2015, the Group completed a farm-out of part of its interest in the Etinde asset to LUKOIL Overseas West Project Limited (LUKOIL) and New Age (African Global Energy) Limited (New Age). The operatorship of Etinde transferred to New Age on that date with Bowleven retaining a 25% non-operated interest. \$165 million initial cash proceeds were received on 16 March 2015 along with a further \$15 million on 30 September 2016. In accordance with the Company's then policy under IFRS 6 'Exploration for and Evaluation of Mineral Assets' the Group deducted the net proceeds received from the carrying value of intangible exploration assets in the prior years.	
In addition to these cash payments, there was an amount of deferred consideration: <ul style="list-style-type: none"> • up to \$40 million (net) carry for two Etinde appraisal wells, including testing (or cash alternative in 2020); and • \$25 million cash contingent upon and to be received at Etinde development project FID. 	
The \$40 million (maximum) net carry for the two Etinde appraisal wells was fully utilised in FY2018 and the deferred consideration balance recognised at that date was fully utilised.	
The remaining \$25 million is currently disclosed as a contingent asset (Note 20) and will be credited to intangible exploration assets once sufficient certainty on FID project sanction is achieved.	

6.3 Asset swaps

Asset exchanges are transactions that have challenged standard-setters for a number of years. For example, an entity might swap certain intangible assets that it does not require or is no longer allowed to use for those of a counterparty that has other surplus assets. It is not uncommon for entities to exchange assets as part of their portfolio and risk management activities or simply to meet demands of competition authorities.

The key accounting issues that need to be addressed are:

- Whether such an exchange should give rise to a profit when the fair value of the asset received is greater than the carrying value of the asset given up
- Whether the exchange of similar assets should be recognised

In the extractive industries an exchange of assets could involve property, plant and equipment (PP&E), intangible assets, investment property or E&E assets, which are in the scope of IAS 16, IAS 38, IAS 40 and IFRS 6, respectively. Hence there are three possible types of exchanges (which will be discussed below), involving:

- (a) Only E&E assets
- (b) Only PP&E, intangible assets and/or investment property
- (c) A combination of E&E assets, PP&E, intangible assets and/or investment property

6.3.1 E&E assets

Accounting for E&E assets, and therefore also accounting for swaps involving only E&E assets, falls within the scope of IFRS 6. [IFRS 6.3]. As that standard does not directly address accounting for asset swaps, it is necessary to consider its hierarchy of guidance in the selection of an accounting policy. IFRS 6 does not require an entity to look at other standards and interpretations that deal with similar issues, or the guidance in the IASB's *Conceptual Framework*. [IFRS 6.7]. Instead, it allows entities to develop their own accounting policies, or use the guidance issued by other standard-setters, thereby effectively allowing entities to continue using accounting policies that they applied under their previous national GAAP. Therefore, many entities, especially those which consider that they can never determine the fair value of E&E assets reliably, have selected an accounting policy under which they account for E&E assets obtained in a swap transaction at the carrying amount of the asset given up. An alternative approach, which is also permitted under IFRS 6, would be to apply an accounting policy that is based on the guidance in other standards as discussed below.

6.3.2 PP&E, intangible assets and investment property

Three separate international accounting standards contain virtually identical guidance on accounting for exchanges of assets: IAS 16, IAS 38 and IAS 40. These standards require the acquisition of PP&E, intangible assets or investment property, as the case may be, in exchange for non-monetary assets (or a combination of monetary and non-monetary assets) to be measured at fair value. The cost of the acquired asset is measured at fair value unless:

- (a) The exchange transaction lacks 'commercial substance'.
- Or
- (b) The fair value of neither the asset received nor the asset given up is reliably measurable. [IAS 16.24, IAS 38.45, IAS 40.27].

For more information, see Chapter 19 (PP&E), Chapter 18 (intangible assets) and Chapter 20 (investment properties).

6.3.3 Exchanges of E&E assets for other types of assets

An entity that exchanges E&E assets for PP&E, intangible assets or investment property needs to apply an accounting treatment that meets the requirements of IFRS 6 and those of IAS 16, IAS 38 or IAS 40. There is no specific guidance in IFRS 6 relating to asset swaps therefore an entity will need to develop an accounting policy in accordance with the requirements of IAS 8 as permitted by IFRS 6. As discussed above, exchanges involving PP&E, intangible assets and investment property that have commercial substance must be accounted for at fair value. Since this treatment is also allowed under IFRS 6, an entity that exchanges E&E assets for assets within the scope of IAS 16, IAS 38 or IAS 40 could apply an accounting policy that complies with the guidance in those standards.

7 Investments in the extractive industries

Extractive industries are characterised by the high risks associated with the exploration for and development of mineral reserves and resources. To mitigate those risks, industry participants use a variety of ownership structures that are aimed at sharing risks, such as joint investments through subsidiaries, joint arrangements, associates or equity interests. IFRS accounting standards define a subsidiary, an associate and a joint arrangement as follows: [IFRS 10 Appendix A, IAS 28.3]

Extract from IFRS 10

Appendix A Defined terms

subsidiary	An entity that is controlled by another entity.
------------	---

Extract from IAS 28

3 The following terms are used in this Standard with the meanings specified:
 An *associate* is an entity over which the investor has significant influence.
 ...
 A *joint arrangement* is an arrangement of which two or more parties have joint control.
 ...

Sometimes entities in the extractive industries do not own 100% of their subsidiaries, and there can often be significant non-controlling shareholders that share in some of the risk and rewards. Accounting for non-controlling interests is discussed in detail in Chapter 8. Furthermore, the existence of put and/or call options over non-controlling interests may transfer some of the risks between the parent entity and the non-controlling shareholders. This issue is discussed in detail in Chapter 8.

- Joint arrangements are discussed further in section 7-1 below.
- Undivided interests - participations in projects which entitle the reporting entity only to a share of the production or use of an asset, and do not of themselves give the entity any form of control, joint control or significant influence (see section 7.2 below).
- Associates are discussed further in Chapter 12.
- Equity interests - entities over which the reporting entity cannot exercise any control, joint control or significant influence (see Chapters 44 and 45).

7.1 Joint arrangements

Joint arrangements have always been, and continue to be, a common structure in the extractive industries. Such arrangements are used to bring in partners to source new projects, combine adjacent mineral licences, improve utilisation of expensive infrastructure, attract investors and help manage technical or political risk or comply with local regulations. The majority of entities operating in the extractive industries are party to at least one joint arrangement. However, not all arrangements that are casually described as 'joint arrangements' or 'joint ventures' meet the definition of a joint arrangement under IFRS accounting standards.

Accounting for joint arrangements is governed by IFRS 11. Given the prevalence of joint arrangements in the extractive industries, careful analysis of IFRS 11, in conjunction with the requirements of IFRS 10 *Consolidated Financial Statements* (see Chapter 7), is required. Chapter 13 contains a full discussion on IFRS 11 and its requirements and therefore while some specific areas for extractives entities to consider are set out below, this section should be read in conjunction with that chapter.

We also discuss some issues relating to the acquisition of interests in joint operations (see section 8.3 below).

A joint arrangement in the scope of IFRS 11 is an arrangement over which two or more parties have joint control. [IFRS 11.4]. (See section 7.1.1 below for further discussion on the definition of joint control). Under IFRS 11, there are two- types of joint arrangements - 'joint operations' and 'joint ventures'. [IFRS 11 Appendix A].

Extract from IFRS 11

Appendix A

Defined terms

joint operation	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the assets, and obligations for the liabilities, relating to the arrangement
joint venture	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement

Classification between these two types of arrangements is based on the rights and obligations that arise from the contractual arrangement. An entity will need to have a detailed understanding of the specific rights and obligations of each of its arrangements to be able to determine the impact of this standard.

Subsequent to the issuance of IFRS 11, the IFRS IC discussed various implementation issues particularly when it came to classifying a joint arrangement that is structured through a separate vehicle. In March 2015, the IFRS IC issued an agenda decision dealing with a range of issues, including:

- How and why particular facts and circumstances create rights and obligations
- Implication of 'economic substance'
- Application of 'other facts and circumstances' to specific fact patterns:
 - Output sold at a market price
 - Financing from a third party
 - Nature of output (i.e., fungible or bespoke output)
 - Determining the basis for 'substantially all of the output'

This agenda decision includes a number of fact patterns which could be relevant for extractive industries, including (for example) the impact on agreements to purchase a joint arrangement's output. See Chapter 13 for further discussion.

7.1.1 Assessing joint control

Joint control is defined in IFRS 11 as: *[IFRS 11.7, IFRS 11 Appendix A]*

Extract from IFRS 11

Appendix A

Defined terms

joint control	The contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control.
---------------	---

IFRS 11 describes the key aspects of joint control as follows:

- *Contractually agreed* - contractual arrangements are usually, but not always, written, and set out the terms of the arrangements. *[IFRS 11.5(a), IFRS 11.B2].*
- *Control and relevant activities* - IFRS 10 describes how to assess whether a party has control, and how to identify the relevant activities, which are described in more detail in Chapter 7. Some of the aspects of 'relevant activities' and 'control' that are most relevant to extractives arrangements are discussed in sections 7.1.1.A and 7.1.2 below, respectively. *[IFRS 11.8, IFRS 11.B5].*
- *Unanimous consent* - means that any party (with joint control) can prevent any of the other parties, or a group of the parties, from making unilateral decisions about the relevant activities without its consent. *[IFRS 11.B9].* Joint control requires sharing of control or collective control by two or more parties. Some of the aspects of 'unanimous consent' for extractives arrangements are discussed in section 7.1.1.B below.

For more information on assessing joint control see Chapter 13.

7.1.1.A Relevant activities

Relevant activities are those activities of the arrangement which significantly affect the returns of the arrangement. Determining what these are for each arrangement may require significant judgement.

Examples of decisions about relevant activities include, but are not limited to:

- “Establishing operating and capital decisions of the investee, including budgets” [IFRS 10.B12(a)] - for an arrangement in the extractive industries, this may include approving the operating and/or capital expenditure programme for the next year
- “Appointing and remunerating an investee’s key management personnel or service providers and terminating their services or employment” [IFRS 10.B12(b)] - for example, appointing a contract miner or oil field services provider to undertake operations

For more information on identifying relevant activities, see Chapter 7 and Chapter 13.

7.1.1.B Meaning of unanimous consent

Unanimous consent means that any party with joint control can prevent any of the other parties, or a group of parties, from making unilateral decisions about relevant activities.

For further discussion on unanimous consent, see Chapter 13.

In some extractive industries operations, decision-making may vary over the life of the project, e.g., during the exploration and evaluation phase, the development phase or the production phase. For example, it may be agreed at the time of initially entering the contractual arrangement that during the exploration and evaluation phase, one party to the arrangement may be able to make all of the decisions, whereas once the project enters the development phase, decisions may then require unanimous consent.

How we see it

To determine whether the arrangement is jointly controlled, it will be necessary to decide (at the point of initially entering the contractual arrangement, and subsequently, if facts and circumstances change) which of these activities, e.g., exploration and evaluation and/or development, most significantly affect the returns of the arrangement. This is because the arrangement will only be considered to be a joint arrangement if those activities which require unanimous consent are the ones that most significantly affect the returns. This will be a highly judgemental assessment.

For further information on the impact of different decision-making arrangements over various activities, see Chapter 13.

7.1.2 Determination of whether a manager/lead operator of a joint arrangement has control

It is common in the extractive industries for one of the parties to be appointed as the operator or manager of the joint arrangement. The manager is frequently referred to as the operator, but as IFRS 11 uses the terms ‘joint operation’ and ‘joint operator’ with specific meanings, to avoid confusion we refer to such a party as the manager/lead operator. The other parties to the arrangement could delegate some of the decision-making rights to this manager/lead operator. In many instances, it is considered that the manager/lead operator does not control the joint arrangement, but simply carries out the decisions of the parties under the joint venture (or operating) agreement (JOA), i.e., the manager/lead operator acts as an agent. This view is based on the way in which these roles are generally established and referred to, or perceived, in the industries. Under IFRS 11, consideration is given to whether the manager/lead operator actually controls the arrangement. This is because when decision-making rights have been delegated, IFRS 10 describes how to assess whether the decision-maker is acting as a principal or an agent, and therefore, which party (if any) has control.

Careful consideration of the following will be required:

- Scope of the manager’s/lead operator’s decision-making authority
- Rights held by others (e.g., protective rights and removal rights)
- Exposure to variability in returns through the remuneration of the manager/lead operator
- Variable returns held through other interests (e.g., direct investments by the manager/lead operator in the joint arrangement)

Of these factors, rights held by others and variable returns held through other interests will be particularly relevant for mining entities and oil and gas entities. Each of the above is discussed in Chapter 7 in more detail.

It is important to note that assessing whether an entity is a principal or an agent will require consideration of all factors collectively. See Chapter 7 for more details regarding the principal versus agent requirements. Where it is determined that a manager is acting as a principal and therefore controls an arrangement, the impact of this will depend upon the rights and obligations conveyed by the arrangement (see sections 7.1.2.A and 7.1.2.B below for further discussion on this issue). Where it is determined that the manager/lead operator is acting as an agent, the manager/lead operator would only recognise its own interests in the joint arrangement (the accounting for which will depend upon whether it is a joint operation or joint venture) and its operator/management fee.

7.1.2.A Implications of controlling a joint operation

While the principal versus agent assessment could lead to a conclusion that a manager/lead operator has control, if the joint arrangement is a joint operation, and each party has specific rights to, and obligations for, the underlying assets and liabilities of the arrangement by virtue of the contract, then the manager/lead operator does not control anything over and above its own direct interest in those assets and liabilities. Therefore, it still only recognises its interest in those assets and liabilities conveyed to it by the contractual arrangement. This accounting applies regardless of whether the arrangement is in a separate vehicle or not, as the contractual terms are the primary determinant of the accounting. Note that IFRS 11 defines a separate vehicle as “a separately identifiable financial structure, including separate legal entities or entities recognised by statute, regardless of whether those entities have a legal personality”. [IFRS 11 Appendix A]. To explain this further, it is worth considering the two types of joint arrangements contemplated by IFRS 11 - one that is not structured through a separate vehicle (e.g., a contract alone) and one that is structured through a separate vehicle.

No separate vehicle: Even if the manager/lead operator ‘controlled’ the arrangement, there is really nothing for it to control. This is because each party would continue to account for its rights and obligations arising from the contract, e.g., it would apply IAS 16 to account for its rights to any tangible assets, IAS 38 to account for its rights to any intangible assets or IFRS 9 to account for its obligations for any financial liabilities etc. Additionally, the consolidation requirements of IFRS 10 would not apply as they only apply to entities and, in most circumstances, a contract does not create an entity.

Separate vehicle: If a manager/lead operator controls an arrangement structured through a separate vehicle, e.g., a company or trust, one may consider that an entity would automatically look to IFRS 10 and consolidate the arrangement and account for the interests of the other parties as non-controlling interests. However, in such situations, a contract may exist which gives other parties to the arrangement direct rights to, and obligations for, the underlying assets and liabilities of that arrangement. Therefore, this requires consideration of the impact of such an arrangement on the separate financial statements of the joint operation.

Given this, the rights and obligations arising from the contractual arrangement should be accounted for first. That is, each party to the arrangement would be required to recognise its respective share of the assets and liabilities (applying each IFRS accounting standard as appropriate, e.g., IAS 16, IAS 38, IFRS 9 etc.).

To the extent that the parties to the arrangement have specific rights to the assets, or obligations for the liabilities, from the perspective of the separate vehicle, this means that the rights to, and obligations for, its assets and liabilities have been contracted out to other parties (i.e., the parties to the contractual arrangement) and therefore there may be no assets or liabilities remaining in the separate vehicle to recognise.

Consequently, from the perspective of the manager/lead operator of the joint arrangement, who may be considered to control the separate vehicle, it would initially account for its and other parties’ rights and obligations arising from the contract. Then when it looks to consolidate the separate vehicle, there may be nothing left to consolidate, as the separate vehicle may effectively be empty. However, this would only apply where the separate vehicle was an entity as IFRS 10 only applies to entities.

How we see it

Where parties to an arrangement genuinely have contractual rights to, and obligations for, the underlying assets and liabilities of the arrangement, concluding that a manager/lead operator controls the arrangement does not change the accounting for either the manager/lead operator or the non-operator parties. However, the disclosure requirements would likely differ, since IFRS 12 *Disclosure of Interests in Other Entities* does not apply to joint arrangements in which a party does not have joint control, unless that party has significant influence.

The disclosure requirements of IFRS 12 are discussed in Chapter 14.

7.1.2.B Implications of controlling a joint venture

If a manager/lead operator has control of a joint venture which was structured through a separate vehicle which is considered to be an entity, the manager/lead operator would have to consolidate the separate vehicle and recognise any non-controlling interest(s). However, if the joint venture is structured through a separate vehicle that is not an entity, IFRS 10 would not apply, and the manager/lead operator would apply the relevant IFRS accounting standards.

7.1.3 Parties to a joint arrangement without joint control or control

The accounting treatment of an interest in a contractual arrangement that does not give rise to joint control or control depends on the rights and obligations of the party.

7.1.3.A Joint operations

In some cases, a mining company or oil and gas company may be involved in a joint operation, but it does not have joint control or control of that arrangement.

How we see it

If the joint arrangement is a joint operation (i.e., joint control exists between two or more parties), and the party has rights to the assets and obligations for the liabilities relating to that joint operation, it does not matter whether the party in question has control, joint control or not - the accounting is the same as that for a joint operation under IFRS 11.

This is similar to the situation discussed above in section 7.1.2.A and is discussed in more detail in Chapter 13. [IFRS 11.23]. The critical aspect of this accounting is whether there is joint control by two or more parties within the arrangement (and therefore it is a joint operation in accordance with IFRS 11). However, the disclosure requirements would likely differ, since IFRS 12 does not apply to joint arrangements in which a party does not have joint control, unless that party has significant influence. The disclosure requirements of IFRS 12 are discussed in Chapter 14.

If the party does not have rights to the assets and obligations for the liabilities relating to the joint operation, it accounts for its interest in the joint operation in accordance with other applicable IFRS accounting standards. [IFRS 11.23]. For example, if it:

- (a) Has significant influence over a separate vehicle which is an entity - apply IAS 28 *Investments in Associates and Joint Ventures*
- (b) Has significant influence over a separate vehicle which is not an entity - apply other applicable IFRS accounting standards
- (c) Does not have significant influence over a separate vehicle - account for that interest as a financial asset under IFRS 9
- (d) Has an interest in an arrangement without a separate vehicle - apply other applicable IFRS accounting standards

7.1.3.B Joint ventures

In some cases, a mining company or oil and gas company could be involved in a joint venture, but it does not have joint control or control of that arrangement. In this instance it would account for its interest as follows:

- (a) Significant influence over a separate vehicle which is an entity - still apply IAS 28, [IFRS 11.25], however, there are some minor disclosure differences for an associate versus a joint venture as defined in IFRS 11 (see Chapter 14).
- (b) Significant influence over a separate vehicle which is not an entity - apply other applicable IFRS accounting standards.
- (c) Does not have significant influence over a separate vehicle - account for that interest as a financial asset under IFRS 9 at fair value through profit or loss or other comprehensive income unless the investment was held for trading. See Chapter 44 for further information on IFRS 9. [IFRS 11.25, IFRS 11.C14].

7.1.4 Managers/lead operators of joint arrangements

It is clear that a participant in a joint operation is required to recognise its rights to the assets, and its obligations for the liabilities (or share thereof), of the joint arrangement. Therefore, it is important that an entity fully understands what these rights and obligations are and how these may differ between the parties.

See section 7.1.2 above for a discussion of the principal versus agent assessment that needs to be considered when an entity is appointed as manager/lead operator of a joint arrangement and what impact that assessment might have on the manager's/lead operator's accounting.

7.1.4.A Reimbursements of costs

A manager/lead operator often carries out activities on behalf of the joint arrangement on a no gain, no loss basis. Generally, these activities can be identified separately and are carried out by the manager/lead operator in its capacity as an agent for the joint arrangement, which is effectively the principal in those transactions. The manager/lead operator receives reimbursement of direct costs recharged to the joint arrangement. Such recharges are reimbursements of costs that the manager/lead operator incurred as an agent for the joint arrangement and therefore, have no effect on profit or loss in the statement of comprehensive income (or income statement) of the manager/lead operator.

In many cases, a manager/lead operator also incurs certain general overhead and other expenses in carrying out activities on behalf of the joint arrangement. As these costs can often not be specifically identified, many joint operating agreements allow the manager/lead operator to recover the general overhead expenses incurred by charging an overhead fee that is based on a fixed percentage of the total costs incurred by the joint arrangement for the year. Although the purpose of this recharge is very similar to the reimbursement of direct costs, the manager/lead operator is not acting as an agent in this case. Therefore, the manager/lead operator would be required to recognise the general overhead expenses and the overhead fee in profit or loss in its statement of comprehensive income (or income statement) as an expense and income, respectively.

A specific example of this is where the manager/lead operator of a joint arrangement enters into a lease with a third-party supplier, who then carries out activities on behalf of the joint arrangement with the leased asset and is entitled to reimbursement from the non-operator parties. This is discussed further in section 18 below.

7.1.4.B Direct legal liability for costs incurred and contracts entered into

The manager/lead operator of a joint arrangement may have a direct legal liability to third party creditors in respect of the entire balance arising from transactions related to the joint arrangement, e.g., suppliers, lessors etc.¹⁰⁴ IFRS accounting standards prohibits the offsetting of such liabilities against the amounts recoverable from the other joint arrangement participants. [IAS 1.32, IAS 32.42]. The manager/lead operator may therefore need to recognise and/or disclose, for example, some of the leases or supply arrangements that it has entered into on behalf of the joint arrangement, as if it had entered into these in its own name. This is discussed further in section 18.1 below.

7.1.4.C Joint and several liability

It is also possible that there could be liabilities in the arrangement where the obligation is joint and several. That is, an entity is not only responsible for its proportionate share, but it is also liable for the other party's or parties' share(s) should it/they be unable or unwilling to pay. A common example of this in the extractives industries is restoration, rehabilitation and decommissioning obligations.

In these instances, each party not only takes up its proportionate share of the decommissioning/restoration obligation, they are also required to assess the likelihood that the other party(ies) will not be able or willing to meet their obligation for their share. The facts and circumstances would need to be assessed in each case, and any additional liability would be accounted for, and disclosed, in accordance with IAS 37.

Any increase in the provision would be accounted for under IFRIC 1, if it related to a restoration or decommissioning liability that had both been included as part of an asset measured in accordance with IAS 16 and measured as a liability in accordance with IAS 37 (see Chapter 27 for more details). Such an addition to the asset would also require an entity to consider whether this is an indication of impairment of the asset as a whole, and if so, would need to test for impairment in accordance with IAS 36. Increases that do not meet the requirements of IFRIC 1 would be recognised in profit or loss.

¹⁰⁴ Former OIAC SORP 144.

7.1.5 Non-operators of joint arrangements

How we see it

For expenses and liabilities incurred by the manager/lead operator directly in its own name which it recharges to the non-operators, the non-operator entities would be required to recognise an amount payable to the operator for such amounts. Depending on the nature of these arrangements, these may need to be recognised as a financial instrument under IAS 32 and IFRS 9, as a lease under IFRS 16 (where a sublease exists between the lead operator and the joint arrangement), or potentially a provision under IAS 37, and not under the standard which relates to the type of cost being reimbursed.

For example, the non-operator's share of employee entitlements relating to the manager's employees who work on the joint project would not be recognised as an employee benefit under IAS 19 *Employee Benefits*. In addition, the related disclosure requirements of IAS 19 would not apply, instead the disclosure requirements of other standards, e.g., IFRS 7 *Financial Instruments: Disclosures* would apply.

Expenses and liabilities incurred by the manager/lead operator jointly on behalf of all of the parties to the arrangement would have to be recognised by each of the non-operator parties in proportion to their respective interests in the arrangement. Such amounts would be recognised for the costs incurred on an accruals basis for production costs, operating expenses etc. and associated 'joint venture payables' would be recognised. With respect to longer term arrangements, such as leases entered into by the lead operator on behalf of the joint arrangement, the non-operator parties would consider the broader contractual arrangements to determine whether or not there was a lease by the joint operation. This is discussed further in section 18.5.1 below.

7.2 Undivided interests

Undivided interests are usually subject to joint control (see Chapter 13) and can, therefore, be accounted for as joint operations. However, some JOAs do not establish joint control but are, instead, based on some form of supermajority voting whereby a qualified majority (e.g., 75%) of the participants can approve decisions. This situation usually arises when the group of participants is too large for joint control to be demonstrable or when the main investor wants to retain a certain level of influence.

Where joint control does not exist, such undivided interests cannot be accounted for as joint operations in the scope of IFRS 11. Instead, the appropriate accounting treatment by the investor depends on the nature of the arrangement:

- If the investor has rights to the underlying assets then the arrangement would be required to be accounted for as a tangible or intangible asset under IAS 16 or IAS 38, respectively. The investor's proportionate share of the operating costs of the asset (e.g., repairs and maintenance) would be required to be accounted for in the same way as the operating costs of wholly owned assets.
- If the investor is entitled only to a proportion of the cash flows generated by the asset, then its investment will generally meet the definition of a financial asset under IAS 32. As the investor is exposed to risks other than just credit risk, such investments are unlikely to be considered debt instruments and instead would be considered equity investments under IFRS 9. Equity instruments are normally measured at fair value through profit or loss under IFRS 9. [IFRS 9.4.1.4]. However, on initial recognition, an entity may make an irrevocable election (on an instrument-by-instrument basis) to present in other comprehensive income subsequent changes in the fair value of an investment in an equity instrument within the scope of IFRS 9. See Chapter 44 for a detailed analysis of the impact of IFRS 9 on the classification of this investment.

With respect to such undivided interests, entities also enter into arrangements in which they buy and sell parts of undivided assets, e.g., carried interests (see section 6.1 above) and farm-in arrangements outside the E&E phase (see sections 6.2.2 and 6.2.3 above).

How we see it

Although neither IAS 16 nor IAS 38 addresses part-disposals of undivided assets, it is industry practice to apply the principles in those standards when the vendor disposes of these interests in circumstances in which it can demonstrate that it neither controls nor jointly controls the whole of the original asset. In these circumstances, the principles of IAS 16 and IAS 38 are applied and the entity derecognises part of the asset, having calculated an appropriate carrying value for the part disposed of, and a gain or loss on disposal.

See Chapter 18 and Chapter 19.

8 Acquisitions

8.1 Business combinations versus asset acquisitions

When an entity acquires an asset or a group of assets, careful analysis is required to identify whether what is acquired constitutes a business or represents only an asset or group of assets. Accounting for business combinations is discussed in detail in Chapter 10.

8.1.1 Differences between asset purchase transactions and business combinations

The reason it is important to distinguish between an asset acquisition and a business combination is because the accounting consequences are significantly different. The main differences between accounting for an asset acquisition and a business combination can be summarised as follows:

- Goodwill or a bargain purchase (also sometimes referred to as negative goodwill) only arise in business combinations.
- Assets and liabilities are accounted for at fair value in a business combination, while they are assigned a carrying amount based on their relative fair values in an asset acquisition (see section 8.4 below).
- Transaction costs should be recognised as an expense under IFRS 3, but can be capitalised on an asset acquisition.
- In an asset acquisition, no deferred tax will arise in relation to acquired assets and assumed liabilities as the initial recognition exception for deferred tax under IAS 12 applies. See Chapter 29 for further details. See Chapter 10 where additional differences are discussed.

8.1.2 Definition of a business

IFRS 3 defines a business as: *[IFRS 3 Appendix A]*

Extract from IFRS 3

Appendix A Defined terms

business

An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities.

In assessing whether a transaction is the acquisition of a business or an asset acquisition, an entity can elect to first apply a concentration test. Under the concentration test, an acquired set of activities and assets is not a business if substantially all of the fair value of the gross assets acquired is concentrated in a single identifiable asset or a group of similar identifiable assets. Where the concentration test is not met, an entity will perform a qualitative analysis to determine whether it has acquired an input and a substantive process that together significantly contributes to the ability to create outputs. *[IFRS 3.B7A]*

See Chapter 10 for further discussion on the definition of a business.

Determining whether a particular set of integrated activities and assets is a business, and/or whether the optional concentration test applies, will often require a significant amount of judgement, particularly for oil and gas entities and mining entities depending on the stage of the asset in the asset life cycle.

For entities in the extractives industries, in applying the concentration test in IFRS 3, the following practical considerations are relevant:

- Single identifiable asset: this includes any asset or group of assets that would be recognised and measured as a single identifiable asset in a business combination. For example, oil and gas field and well equipment, or a mining property and mining equipment;
- Similar identifiable assets: this may include producing and approved for development properties, in the same geographical region. These may be considered similar if an entity concludes that they do not have significantly different risk characteristics.

For more information on the concentration test (including considerations relating to a identifying a single identifiable asset and/or a group of similar identifiable assets) refer to Chapter 10.

8.2 Business combinations

8.2.1 Goodwill in business combinations

Prior to the adoption of IFRS accounting standards, many mining entities and oil and gas entities assumed that the entire consideration paid for upstream assets should be allocated to the identifiable net assets acquired. That is, any excess of the consideration transferred over the fair value of the identifiable net assets (excluding mineral reserves and resources) acquired would then have been included within mineral reserves and resources acquired and goodwill would not generally be recognised. However, goodwill could arise as a result of synergies, overpayment by the acquirer, or when IFRS accounting standards requires that acquired assets and/or liabilities are measured at an amount that is not fair value (e.g., deferred taxation).

How we see it

It is unlikely to be appropriate for mining entities or oil and gas entities to simply assume that goodwill would never arise in a business combination and that any differential automatically goes to mineral reserves and resources. Mineral reserves and resources and any exploration potential (if relevant) acquired would be expected to be valued separately. Any excess of the consideration transferred over and above the supportable fair value of the identifiable net assets (which include mineral reserves, resources and acquired exploration potential), is required to be allocated to goodwill.

By virtue of the way IFRS 3 operates, if an entity were simply to take any excess of the consideration transferred over the fair value of the identifiable net assets acquired to mineral reserves and resources, they could end up having to allocate significantly larger values to minerals reserves and resources than expected. This is because, under IFRS 3, an entity is required to provide for deferred taxation on the temporary differences relating to all identifiable net assets acquired (including mineral reserves and resources), but not on temporary differences related to goodwill. Therefore, if any excess was simply allocated to mineral reserves and resources, to the extent that this created a difference between the carrying amount and the tax base of the mineral reserves and resources, IAS 12 would give rise to a deferred tax liability on the temporary difference, which would create a further excess. This would then result in an iterative calculation in which the deferred tax liability recognised would increase the amount attributed to mineral reserves and resources, which would in turn give rise to an increase in the deferred tax liability (see Chapter 29). Given the very high marginal tax rates to which extractive activities are often subject (i.e., tax rates of 60% to 80% are not uncommon) the mineral reserves and resources might end up being grossed up by a factor of 2.5 to 5 (i.e., $1 \div (1 - 60\%) = 2.5$). Such an approach would only be acceptable if the final amount allocated to mineral reserves and resources remained in the range of fair values determined for those mineral reserves and resources. If not, such an approach would lead to excessive amounts being allocated to mineral reserves and resources which could not be supported by appropriate valuations.

In March 2020, the IASB published a comprehensive Discussion Paper *Business Combinations - Disclosures, Goodwill and Impairment*.¹⁰⁵ The project arose as a result of the post-implementation review of IFRS 3. As part of this project, the IASB is exploring whether to retain the impairment only approach (as currently applied or simplified) or reintroduce the amortisation of goodwill. In December 2022, the IASB decided to add this project to its standard-setting programme. At the time of writing, the IASB expects to issue an exposure draft of the proposed changes in the first half of 2024. For more detail on the IASB's preliminary views see Chapter 10.

¹⁰⁵ Discussion Paper [DP/2020/1](#), *Business Combinations - Disclosures, Goodwill and Impairment*, IASB, March 2020. Available on the IFRS Foundation's website.

Practical example 8-1 below from Glencore plc financial statements illustrates a typical accounting policy for business combinations in which excess consideration transferred is treated as goodwill.

Practical example 8-1: Glencore plc (2022)	Jersey
Annual Report 2022 [extract] Financial Statements [extract] Notes to the financial statements [extract] 1. Accounting policies [extract] Business combinations and goodwill Acquisitions of subsidiaries and businesses are accounted for using the acquisition method of accounting. The cost of the acquisition is measured at fair value, which is calculated as the sum of the acquisition date fair values of the assets transferred, liabilities incurred to the former owners of the acquiree and the equity interests issued in exchange for control of the acquiree. The identifiable assets, liabilities and contingent liabilities ("identifiable net assets") are recognised at their fair value at the date of acquisition. Acquisition-related costs are recognised in the consolidated statement of income as incurred. Where a business combination is achieved in stages, Glencore's previously held interests in the acquired entity are remeasured to fair value at the acquisition date (i.e. the date Glencore attains control) and the resulting gain or loss, if any, is recognised in the consolidated statement of income. Goodwill is measured as the excess of the sum of the consideration transferred, the amount of any non-controlling interests in the acquiree, and the fair value of the acquirer's previously held equity interest in the acquiree (if any) over the net of the acquisition-date amounts of the identifiable assets acquired and the liabilities assumed. ...	

8.2.2 Impairment of assets and goodwill recognised on acquisition

There are a number of circumstances in which the carrying amount of assets and goodwill acquired as part of a business combination and as recorded in the consolidated accounts, may be measured at a higher amount through recognition of notional tax benefits, also known as tax amortisation benefits (i.e., the value has been grossed up on the assumption that its carrying value is deductible for tax) or deferred tax (which can increase goodwill as described above). Application of IAS 36 to goodwill which arises upon recognition of deferred tax liabilities in a business combination is discussed in Chapter 21.

8.2.3 Value beyond proven and probable reserves (VBPP)

In the mining sector specifically, the 'value beyond proven and probable reserves' (VBPP) is defined as the economic value of the estimated cash flows of a mining asset beyond that asset's proven and probable reserves.

While this term is specifically relevant to the mining sector by virtue of specific guidance in US GAAP, the concept may be equally relevant to the oil and gas sector, i.e., the economic value of an oil and gas licence/area beyond the proven and probable reserves.

For mining entities, there are various situations in which mineralisation and mineral resources might not be classified as proven or probable:

- Prior to the quantification of a resource, a mining company could identify mineralisation following exploration activities. However, it may be too early to assess if the geology and grade is sufficiently expansive to meet the definition of a resource.
- Acquired Exploration Potential (AEP) represents the legal right to explore for minerals in a particular property, occurring in the same geological area of interest.
- Carrying out the required assessments and studies to obtain classification of mineral reserves can be very costly. Consequently, these activities are often deferred until they become necessary for the planning of future operations. Significant mineral resources are often awaiting the initiation of this process.
- If an entity acquires a mining company at a time when commodity prices are particularly low, the mineral resources owned by the acquiree may not meet the definition of proven or probable reserves because extraction might not be commercially viable.

While the above types of mineralisation and mineral resources cannot be classified as proven or probable, they will often be valuable because of the future potential that they represent (i.e., reserves may be proven in the future and commodity price increases may make extraction commercially feasible).

IFRS 3 requires that an acquirer recognises the identifiable assets acquired and liabilities assumed that meet the definitions of assets and liabilities at the acquisition date. [IFRS 3.11].

While the legal or contractual rights that allow an entity to extract minerals are not themselves tangible assets, the mineral reserves concerned clearly are. The legal or contractual rights - that allow an entity to extract mineral reserves and resources - acquired in business combinations should be recognised, without exception, at fair value.

An entity that acquires mineral reserves and resources that cannot be classified as proven or probable, could consider accounting for the VBPP as part of the value allocated to mining assets, to the extent that a market participant would include VBPP in determining the fair value of the asset, rather than as goodwill.¹⁰⁶ In practice, the majority of mining entities treat mining assets, the related mineral reserves and resources and licences as tangible assets on the basis that they relate to minerals in the ground, which are themselves tangible assets. However, some entities present the value associated with E&E assets as intangible assets. AEP would often be indistinguishable from the value of the mineral licence to which it relates. Therefore, the classification of AEP could vary depending on how an entity presents its mining assets and licences. If an entity presents them as tangible assets, they may be likely to treat AEP (or its equivalent), where applicable, as forming part of mineral properties, and hence AEP would be classified as a tangible asset. For an entity that classifies some of its mineral assets as intangible assets, e.g., E&E assets, then they may classify AEP as an intangible also.

Determining the fair value of VBPP requires a considerable amount of expertise. An entity must not only take account of commodity spot prices but also consider the effects of anticipated fluctuations in the future price of minerals, in a manner that is consistent with the expectations of a market participant. An entity would consider all available information including current prices, historical averages, and forward pricing curves and maximise the use of observable inputs. Those market participant assumptions typically are consistent with the acquiring entity's operating plans for developing and producing minerals. However, entities need to undertake steps to demonstrate this is true (to ensure compliance with the requirements of IFRS 13 *Fair Value Measurement*). The potential upside associated with mineral resources that are not classified as reserves can be much larger than the downward risk. A valuation model that only takes account of a single factor, such as the spot price, historical average or a single long-term price, without considering other information that a market participant would consider, would generally not be able to reflect the upward potential that determines much of the value of VBPP. Consequently, an entity may need to apply option valuation techniques in measuring VBPP.

There are commonly considered to be three categories of VBPP, including:

- Mineral resources not yet tested for economic viability
- Early mineralisation
- Acquired exploration potential (AEP)

The CRIRSCO reporting standards consider the geological definition of mineral resources that have not yet been tested for economic viability, which is the first category of VBPP. Valuation techniques used for this category include:

- Probability weighted discounted-cash flows
- Resource reserve conversion adjustment
- Comparable transactions
- Option valuation

In relation to early mineralisation, the second category of VBPP, while it may represent a discovery, its true value will be determined by further appraisal/evaluation activities to confirm whether a resource exists. This category of VBPP is often grouped with the next (and final) category, being AEP, even though it has a higher intrinsic value, and is valued using:

- Cost based methods
- Budgeted expenditure methods
- Comparable sales
- Farm-in/out values
- Sophisticated option pricing

In relation to AEP, the basis for its valuation varies from studying historic cost to the use of sophisticated option valuation techniques.

¹⁰⁶ ASC 930-805-30-1 Extractive Activities - Mining - Business Combinations - Initial Measurement (pre-codification EITF 04-3, Mining Assets: Impairment and Business Combinations, EITF, March 2004).

As VBPP does not provide current economic benefits, there is no need to allocate its cost against current revenue and hence no need for amortisation or depreciation. However, as part of the process of completing the acquisition accounting, an entity would need to form a view about how that value will ultimately be ascribed to future discoveries and converted into proven and probable reserves and then ultimately transferred to a category of assets that are then depreciated. Such methodologies might include a per unit (e.g., tonnes/ounces) basis or possibly an area (e.g., acreage) basis. VBPP would need to be tested for impairment under IAS 36 if, depending on the classification of VBPP, there is an indicator of impairment under that standard or IFRS 6. The VBPP could ultimately be impaired because it may never be converted into proven or probable reserves, but impairment may not be confirmed until the entity is satisfied that the project will not continue.

An impairment of VBPP is required to be recognised if its book value exceeds the higher of fair value less costs of disposal and value in use. In practice, there may not be a convenient method to determine the value in use. Hence, impairment testing will often need to rely on an approach based on fair value less costs of disposal.

Practical example 8-2 below illustrates that AngloGold Ashanti Limited does not subsume the 'value beyond proven and probable reserves' in goodwill but instead recognises it as part of the value ascribed to mineral resources.

Practical example 8-2:	AngloGold Ashanti Limited (2022)	South Africa

<p>Carrying value of goodwill</p> <p>Where an investment in a subsidiary, joint venture or an associate is made, any excess of the consideration transferred over the fair value of the attributable Mineral Resource including value beyond Proved and Probable Mineral Reserve, exploration properties and net assets is recognised as goodwill.</p>		
...		

8.3 Acquisition of an interest in a joint operation that is a business

One area where there had historically been a lack of clarity was how to account for acquisitions of interests in joint operations (under IFRS 11) which constitute businesses. However, an amendment to IFRS 11 was made to clarify this, which applied prospectively to acquisitions that occurred on or after 1 January 2016. The amendment stated that where an entity is acquiring an interest in a joint operation that is a business as defined in IFRS 3, it is required to apply, to the extent of its share in accordance with IFRS 11.20, all of the principles of business combinations accounting in IFRS 3, and in other IFRS accounting standards, that do not conflict with IFRS 11. In addition, the entity must disclose the information that is required in those IFRS accounting standards in relation to business combinations. However, if an entity acquires an interest in an asset/group of assets that is (are) not a business as defined in IFRS 3, then it would apply the guidance on asset acquisitions that IFRS accounting standards already provides. [IFRS 11.BC45].

The requirements apply to the acquisition of an initial interest in a joint operation or where the acquisition leads to the formation of a joint operation that constitute a business, and also to the acquisition of additional interests in a joint operation to the extent that joint control is maintained. The amendment also makes it clear that any previously held interest in the joint operation would not be remeasured if the joint operator acquires an additional interest while retaining joint control.

In addition to the matters outlined above, there are a number of additional issues which have been raised in relation to joint operations. These include:

- *A passive investor in a joint operation becomes a joint operator:* In this situation, the issue is whether a previously held interest in the assets and liabilities of a joint operation that is a business is remeasured to fair value when the investor's acquisition of an additional interest results in the investor becoming a joint operator (i.e., assumes joint control) in that joint operation.
The IFRS IC considered this issue and tentatively decided that the previously held interest in this situation should not be remeasured. The IASB agreed with this decision and an amendment was issued as part of the 2015-2017 annual improvements cycle. This amendment clarifies that the previously held interests in a joint operation are not remeasured where a party that participates in, but does not have joint control of, a joint operation obtains joint control of the joint operation in which the activity of the joint operation constitutes a business as defined in IFRS 3. [IFRS 11.BC45A, IFRS 11.BC45H].
- *Obtaining control over a joint operation:* Where a party obtains control over a joint operation structured through a separate vehicle, over which it previously had joint control, it is required to apply the business combination achieved in stages accounting requirements in IFRS 3, if the acquiree meets the definition of a business. This includes remeasuring previously held interests in the assets and liabilities of the joint operation at fair value. In doing so, the acquirer remeasures its entire previously held interest in the joint operation (see Chapter 10).

See Chapter 13 for more information on the above matters.

8.4 Asset acquisitions

The acquisition of an asset, group of assets or an entity that does not constitute a business is not a business combination. In such cases the acquirer is required to identify and recognise the individual identifiable assets acquired and liabilities assumed. The cost of the acquisition is then allocated to the individual identifiable assets acquired and liabilities assumed on the basis of their relative fair values at the date of purchase. Such a transaction or event does not give rise to goodwill. [IFRS 3.2(b)]. Thus, existing book values or values in the acquisition agreement may not be appropriate.

As noted in section 8.1 above, there are some key differences between an asset acquisition and a business combination. These are discussed in more detail in Chapter 10.

In November 2017, the IFRS IC issued an agenda decision that clarified how an entity accounts for the acquisition of a group of assets that does not constitute a business. This is also discussed in Chapter 10.

8.4.1 Asset acquisitions and variable and contingent consideration

The terms of an arrangement to acquire an asset or a group of assets/net assets that do not constitute a business might include variable or contingent amounts. Transactions involving variable or contingent consideration elements are often very complex and payment may depend on a number of factors. Examples might include variable or contingent payments based on an index or rate, variable or contingent payments which depend upon the purchasers' future actions, variable or contingent payments related to the condition of the asset, or variable or contingent payments related to the asset's performance. For the extractive industries, such examples include royalty-based payments based on production or some formula, e.g., net smelter royalties. Some arrangements may contain more than one source of variability. Further complexity can also arise, for example, because some such arrangements may be akin to profit sharing agreements which are not addressed in any standard.

The topic of variable payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The IFRS IC's discussions considered both the accounting at the date of purchasing the asset and subsequently, and distinguished between those variable payments that depend on the purchaser's future activity and those that do not. The IFRS IC determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively. In May 2016, the IASB tentatively agreed that this issue would be included in the research pipeline between 2017 and 2021. At the time of writing this is not listed as an active research project on the IASB's work plan.

A critical step in analysing the accounting for the purchase of an item of PP&E in an arrangement involving variable or contingent consideration is to fully understand the contractual arrangements, understanding the nature of the contingent or variable payments. This includes developing a full understanding of whether those variable or contingent payments are linked to the initial value of the asset, or to its future performance, whether the contingency or variability is within or outside of the purchasers' control and whether the variable payment is a payment for some other goods or services from the seller. In some cases, the contract may establish an obligation for the contingent payment at the outset, whilst in others it might be determined that the arrangement is an executory contract, and the liability to make the contingent payments is only recognised later once either party fulfils its obligations under the contract.

The two key issues with regards to the accounting for variable or contingent consideration in an asset purchase are:

- Whether and when to recognise a liability for that variable or contingent consideration.
- Whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset.

How we see it

Consistent with the discussions in Chapter 19, in light of the discussions held by the IFRS IC and in the absence of clear guidance in the final agenda decision, with respect to whether and when the obligation to make variable or contingent payments should be recognised as a liability, entities will need to develop an accounting policy. In doing so, entities will need to apply the hierarchy in IAS 8. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

As discussed above, currently, there is no explicit guidance on the treatment of variable or contingent consideration in the acquisition of an asset and there is diversity in practice in the accounting for these types of arrangements. With respect to the first question, examples of some accounting policies an entity may want to consider regarding initial recognition of the asset include the following:

- The cost of the asset on initial recognition includes the fair value of all variable or contingent consideration at the date of acquisition. A corresponding liability is recognised for the same amount.
- The cost of the asset on initial recognition excludes any variable or contingent payments. Accordingly, no liability is recognised for those contingent or variable amounts.

The second question that needs to be addressed is how an entity must account for subsequent payments and changes to the estimate of variable or contingent consideration. Depending on the facts and circumstances of the arrangement an entity may determine that:

1. Variability arises from exchange rates, time value of money, or embedded derivatives - Changes in the carrying amount of a recognised liability that arise from exchange rates are accounted for in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* and IFRIC 22, while the time value of money and embedded derivatives are accounted for in accordance with IFRS 9;
2. Variability is directly linked to the quality or quantity of the asset(s) received - In these cases, the initial recognition of the asset and liability were based on an accounting estimate that is subsequently updated in accordance with IAS 8.37; or
3. The variability in the arrangement does not fall under (1) or (2) above and an accounting policy needs to be developed to address it.

In the latter case, an entity will need to apply the requirements of IAS 8 to develop an accounting policy that it should apply consistently to all similar transactions. The accounting policy developed will need to address whether the change in the estimate of variable or contingent consideration should be capitalised as part of the cost of the asset or expensed. This determination is usually based on the reason for the contingent payment and entities should consider the substance of the arrangement in determining the appropriate treatment.

It is only appropriate for subsequent changes to a recognised liability to be recognised as part of the cost of the asset to the extent that it relates to future economic benefits embodied in the asset initially received. For example, if the contingency or variability is viewed as being linked to the quality or quantity of the asset initially received. Variability arising due to other factors, such as its use over time, would generally be expensed.

How we see it

With respect to whether subsequent payments of variable or contingent consideration or changes to the measurement of a previously recognised liability to make variable or contingent payments are included as part of the cost of the acquired asset or expensed as incurred, until this matter is resolved by the IASB, where the accounting for the variability or contingency is not prescribed in another standard, an entity should adopt and apply a consistent accounting policy in accordance with the hierarchy in IAS 8.

As above, an entity should exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

If information about any selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

For the detailed discussions of the key accounting considerations related to the treatment of variable or contingent payments in the acquisition of an asset, including the general approaches applied in practice and the related discussions by the IFRS IC and the IASB, see Chapter 19.

8.4.2 Accounting for land acquisitions

Obtaining the legal rights to explore for, develop and produce minerals can be achieved in a number of ways, as outlined in section 5 above. One of these ways is through the outright purchase of the minerals and the land on, or under, which the minerals are located. In undertaking such a transaction, it is not uncommon for an entity to pay an amount in excess of the intrinsic value of the land itself. In such a situation, an entity needs to ensure it appropriately allocates the purchase price between the fair value of the land and the fair value of the mineral or surface mining rights acquired. The amount allocated to land will be capitalised and not depreciated, whereas the amount allocated to the minerals or surface mining rights will form part of the total cost of mining assets and will ultimately be depreciated on a units of production basis over the economically recoverable reserves to which it relates.

9 Functional currency

9.1 Determining functional currency

Determining functional currency correctly is important because it will, for example, affect the volatility of revenue and operating profit resulting from exchange rate movements, determine whether transactions can be hedged or not and influence the identification of embedded currency derivatives. The movements may give rise to temporary differences that affect profit or loss. [IAS 12.41]. While under IAS 21 an entity can select any presentation currency, it does not have a free choice in determining its functional currency. Choice of functional currency is discussed in detail in Chapter 16; below is a summary of the application of the requirements to the extractive industries.

IAS 21 requires an entity to determine separately the functional currency of each entity within a consolidated group. There is no concept of the functional currency of the group, only a presentation currency. Therefore, the functional currency of an operating subsidiary may differ from that of the group's parent and/or foreign sales company to which it sells its production. The factors taken into account in determining functional currency may differ for operating entities and for group entities that are financing or intermediate holding entities (see Chapter 16). [IAS 21.9].

Extract from IAS 21

- 9 The primary economic environment in which an entity operates is normally the one in which it primarily generates and expends cash. An entity considers the following factors in determining its functional currency:
- (a) the currency:
 - (i) that mainly influences sales prices for goods and services (this will often be the currency in which sales prices for its goods and services are denominated and settled); and
 - (ii) of the country whose competitive forces and regulations mainly determine the sales prices of its goods and services.
 - (b) the currency that mainly influences labour, material and other costs of providing goods or services (this will often be the currency in which such costs are denominated and settled).

While the currency referred to under (a)(i) above will often be the currency in which sales prices for its goods and services are denominated and settled, this is not always the case. The US dollar is used for many commodities as the contract or settlement currency in transactions (e.g., iron ore, oil), but the pricing of transactions is often driven by factors completely unrelated to the US dollar or the US economy (e.g., it may be influenced more by demand from the local economy or other economies such as China).

As the extractive industries are international, it is often difficult to determine the currency of the country whose competitive forces and regulations mainly determine the sales prices of its goods and services. Therefore, factor (a)(ii) above will often prove to be inconclusive when a particular product is produced in many different countries.

It will generally be fairly straightforward to identify the currency that mainly influences an entity's key inputs (i.e., factor (b) above). In developing countries an entity will often need to import a significant proportion of its key inputs (e.g., fuel, equipment and expatriate workers) and even local inputs in an economy with a high inflation rate will often be linked to the US dollar. In such a case, the local currency is less likely to be the main currency that influences an entity's key inputs. In most developed countries, however, the inputs tend to be denominated in the local currency, although some inputs (e.g., major items of equipment) may be denominated in another currency. As the extractive industries are capital intensive, the cost of equipment often far exceeds the operating expenses incurred. Equipment is often purchased in US dollars.

When the factors described above are mixed, as they often are in practice, and the functional currency is not obvious, management should use its judgement “to determine the functional currency that most faithfully represents the economic effects of the transactions, events and conditions”. [IAS 21.12]. If the above factors are inconclusive then an entity should also consider the following secondary factors:

- The currency in which funds from financing activities (i.e., issuing debt and equity instruments) are generated
- The currency in which receipts from operating activities are usually retained
- The functional currency of the reporting entity that has the foreign operation as its subsidiary, branch, associate or joint venture [IAS 21.10, IAS 21.11]

After considering both the primary and secondary factors the functional currency may not be obvious because, for example, revenue is denominated in US dollars while virtually all expenses are denominated in the local currency. In that situation management may conclude that revenue, while denominated in US dollars, is in fact influenced by a basket of currencies. It is therefore possible that entities operating in a similar environment can reach different conclusions about their functional currency. Even in developed countries there is a general bias towards the US dollar as the functional currency.

Although local statutory and tax requirements should be ignored in determining the functional currency, there may be a requirement to keep two sets of accounting records when an entity concludes that its local currency is not its functional currency.

Practical example 9-1 below from Rio Tinto plc illustrates a typical currency translation accounting policy of a mining company.

Practical example 9-1: Rio Tinto plc (2022)	United Kingdom
Annual Report 2022 [extract] Financial statements [extract] Notes to the Rio Tinto plc Financial Statements [extract] A Principal accounting policies [extract]	
c. Currency translation <p>Items included in the financial statements are measured using the currency of the primary economic environment in which the company operates (the functional currency). The financial statements are presented in US dollars, which is the company's functional and presentation currency. Transactions denominated in other currencies, including the issue of shares, are translated into the functional currency using the exchange rates prevailing at the date of the transaction.</p> <p>Foreign exchange gains and losses resulting from the settlement of such transactions, and from the translation at year-end exchange rates of monetary assets and liabilities denominated in foreign currencies, are recognised in the profit and loss account.</p> <p>Exchange rates used are consistent with the rates used by the Group as disclosed in the consolidated financial statements on page 151.</p>	

9.2 Changes in functional currency

IAS 21 requires management to use its judgement to determine the entity's functional currency so that it most faithfully represents the economic effects of the underlying transactions, events and conditions that are relevant to the entity. [IAS 21.12]. Note that IAS 21 requires the functional currency to be determined by reference to factors that exist during the reporting period. Therefore, an entity should ignore future developments in its business, no matter how likely those developments are. For example, even if an entity is convinced that in three years' time it will have revenues that will be denominated in US dollars, this is not a factor to be considered in determining its functional currency today. This is particularly relevant for entities in the extractive industries given the nature of their operations. For example, a company may conclude that during the development phase of the project the local currency is its functional currency but that once production and sales commence the US dollar will become its functional currency. Alternatively, exposure to a particular currency may increase during a period.

This is illustrated in Practical example 9-2 below from Anglo American Platinum Limited's 2022 financial statements.

Practical example 9-2:	Anglo American Platinum Limited (2022)	South Africa
Audited annual financial statements 2022 [extract]		
1 Compliance and assurance [extract]		
Significant accounting principles [extract]		
Basis of preparation [extract]		
<p>Functional currency</p> <p>The financial statements are presented in South African rand, which is the presentation currency of the group and the functional currency of the company and its most significant operating subsidiary, namely Rustenburg Platinum Mines Limited.</p> <p>During the first half of the year, a review of the functional currency of Anglo Platinum Marketing Limited (APML) was conducted. An increase in trading activities with third parties, additions to the marketing team to support these activities, and enhanced trading limits that allow greater autonomy and more structured third-party transactions, led management to conclude that the marketing entity is becoming less of an extension of the mining and processing operations, and its functional currency should be changed from South African rand to US dollars from 1 January 2022. Refer to notes 5, 20 and 31 where specific impacts of the change have been highlighted.</p>		

Once the functional currency is determined, the standard allows it to be changed only if there is a change in those underlying transactions, events and conditions. For example, a change in the currency that mainly influences the sales prices of goods and services may lead to a change in an entity's functional currency. [IAS 21.36].

Practical example 9-3 below, from Santos Limited's financial statements, provides an example of a change in conditions that resulted in a change in functional currency. Accounting for a change in functional currency is discussed in Chapter 16.

Practical example 9-3:	Santos Limited (2019)	Australia
Annual Report [extract]		
Notes to the Consolidated Financial Statements [extract]		
Section 8: Other [extract]		
8.4 Accounting policies [extract]		
(b) Functional currency		
<p>The Group performed a reassessment of the functional currency of the Parent entity (Santos Limited) and certain entities within the Group, resulting in it changing functional currency to US dollars, effective 1 January 2019. Prior to 1 January 2019, Santos Limited and these entities had a functional currency of Australian dollars.</p> <p>The change in functional currency was driven by a reassessment of the primary and where necessary, secondary indicators of economic environment that impacts the cash inflows and outflows of the companies. This included factors such as a change in mix of income stream and in some instances where companies were acting as extensions of the Parent. The US dollar was determined to be the currency that predominantly impacted each of the companies.</p> <p>The presentation currency of the Group remains US dollars.</p>		

10 Decommissioning and restoration/rehabilitation

The operations of entities engaged in extractive industries can have a significant impact on the environment. Decommissioning or restoration activities at the end of a mining or oil and gas operation may be required by law, the terms of mineral licences or an entity's stated policy and past practice. The associated costs of decommissioning, remediation or restoration can be significant. The accounting treatment for such costs is therefore critical. Different terms may be used, often interchangeably, to essentially refer to the same activity, e.g., restoration, remediation and rehabilitation. In this section we shall use the words decommissioning and restoration.

Accounting for decommissioning and restoration costs is governed by the requirements of IAS 37 and IFRIC 1. The discussion below should be read in conjunction with Chapter 19 (Property, Plant and Equipment), Chapter 27 (Provisions, Contingent Liabilities and Contingent Assets) and Chapter 29 (Income Taxes). Some of the specific issues to consider with respect to such provisions are listed below:

- Initial recognition - see section 10.1.1 below
 - Initial measurement - see section 10.1.2 below
 - Discount rates - see Chapter 27
 - Decommissioning or restoration costs incurred in the production phase - see section 10.1.3 below
 - Changes in decommissioning and restoration/rehabilitation costs - see Chapter 27
 - Treatment of foreign exchange differences - see section 10.2 below
 - Accounting for deferred taxes - see Chapter 29
 - Indefinite life assets - see section 10.3 below
 - Funds established or put aside to meet a decommissioning or restoration obligation - see Chapter 27
- The Board is currently developing proposals for three targeted improvements to IAS 37. This would involve aligning the definition of a liability and requirements for identifying liabilities with the *Conceptual Framework*. At the time of writing, resulting amendments are expected to replace IFRIC 21 with new application requirements for levies. The IASB has also indicated an intention to add new examples to the Guidance on implementing IAS 37 to illustrate the application of the requirements, and to update the explanations for some of the existing examples, without changing those conclusions.¹⁰⁷ In addition, the IASB is developing proposals to clarify which costs to include in the measurement of a provision, and whether the rate at which an entity discounts a provision should reflect the entity's own credit risk. At the time of writing, discussions are ongoing, with an Exposure Draft expected in the last quarter of 2024.¹⁰⁸ See Chapter 27

10.1 Recognition and measurement issues

10.1.1 Initial recognition

How we see it

Initial recognition of a decommissioning or restoration provision only on commencement of commercial production is generally not appropriate under IFRS accounting standards, because the obligation to remove facilities and to restore the environment typically arises during the development/construction of the facilities, with some further obligations arising during the production phase. Therefore, a decommissioning or restoration provision is typically recognised during the development or construction phase (see section 1.6.1 above) of the project, i.e., before any production takes place, and is required to be included as part of the cost of the assets acquired or constructed (if they are capitalised).

It may also be necessary to recognise a further decommissioning or restoration provision during the production phase (see section 10.1.3 below).

While the damage caused in the exploration phase may generally be immaterial, an entity should recognise a decommissioning or restoration provision where the damage is material and the entity will be required to carry out remediation. The accounting for such a provision will depend on how the related E&E costs have been accounted for. If the E&E costs are capitalised, the associated decommissioning costs should also be capitalised. However, if the E&E costs are expensed, any associated decommissioning or restoration costs should also be expensed.

¹⁰⁷ IASB Update, April 2024, available on the IFRS Foundation's website.

¹⁰⁸ [IFRS Foundation work plan](#), IFRS Foundation website (accessed June 2024).

Finally, even if decommissioning and restoration were not planned to take place in the foreseeable future (for example because the related assets are continually renewed and replaced), IAS 37 would still require a decommissioning or restoration provision to be recognised. However, in these cases the discounted value of the obligation may be comparatively insignificant.

Practical example 10-1 below shows Woodside Energy Group Ltd's sensitivity analysis for restoration obligations.

Practical example 10-1: Woodside Energy Group Ltd (2022)	Australia
<p>ANNUAL REPORT [extract] Financial Statements [extract] Notes to the financial statements [extract] D. Other assets and liabilities [extract] D.5 Provisions [extract] Key estimates and judgements [extract] (a) Restoration obligations [extract] Inherent uncertainties [extract]</p> <div data-bbox="416 719 1177 918"> <p>A range of pre-tax discount rates between 3.4% and 4.7% (2021: 0.4% to 2.4%) has been applied. If the discount rates were decreased by 0.5% then the provision would be \$316 million higher. If the cost estimates were increased by 10% then the provision would be \$627 million higher. The proportion of the non-current balance not expected to be settled within 10 years is 54% (2021: 65%).</p> </div>	

10.1.2 Measurement of the liability

Measurement of a decommissioning or restoration provision requires a significant amount of judgement because:

- The amount of remedial work required will depend on the scale of the operations. In the extractives industries the environmental damage may vary considerably depending on the type and development of the project.
- The amount of remedial work further depends on environmental standards imposed by local regulators, which may vary over time.
- Detailed decommissioning and remedial work plans will often not be developed until fairly shortly before closure of the operations.
- Decommissioning and restoration provisions are often subject to local governmental regulation and are therefore required to comply with prescribed closure plans and activities. In this case, it may not always be clear which costs are directly attributable to decommissioning or restoration (e.g., security costs, maintenance cost, ongoing environmental monitoring and employee termination costs). Careful attention may be needed to determine which cash flows fall within the scope of the recognition and measurement requirements under IAS 37.
- The timing of the decommissioning or restoration depends on when the fields or mines cease to produce at economically viable rates, which depends upon future commodity prices and reserves.
- The actual decommissioning or restoration work will often be carried out by specialised contractors, the cost of which will depend on future market prices for the necessary remedial work.

Many of the uncertainties above can only be finally resolved towards the end of the production phase, shortly before decommissioning and restoration are to take place. A significant increase in the decommissioning or restoration provision resulting from revised estimates would result in recognition of an additional asset. However, as IFRIC 1 specifically states that any addition to an asset as a result of an increase in a decommissioning or restoration provision is considered to be a trigger for impairment testing, a significant increase in a decommissioning or restoration provision close to the end of the production phase may lead to an immediate impairment of that additional asset. Conversely, a decrease in the decommissioning or restoration provision could exceed the carrying amount of the related asset, in which case the excess should be recognised as a gain in profit or loss.

10.1.3 Decommissioning or restoration costs incurred in the production phase

IAS 16 considers “the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located...” to be part of the cost of an item of property, plant and equipment. [IAS 16.16(c)]. However, an entity is required to apply IAS 2 “to the costs of obligations for dismantling, removing and restoring the site on which an item is located that are incurred during a particular period as a consequence of having used the item to produce inventories during that period”. [IAS 16.18]. That means that such additional decommissioning or restoration costs resulting from production activities should be included in the cost of inventories, [IAS 2.10], while decommissioning costs resulting from the construction of assets during the production phase should be accounted for as discussed above.

An entity that incurs abnormal amounts of costs (e.g., costs of remediation of soil contamination from oil spills or overflowing of a tailings pond) should not treat these as part of the cost of inventories under IAS 2, but expense them immediately. [IAS 2.16].

10.2 Treatment of foreign exchange differences

In most cases it will be appropriate for the exchange differences arising on provisions to be taken to profit or loss in the period they arise. However, it may be that an entity has recognised a decommissioning provision under IAS 37 and capitalised it as part of the initial cost of an asset under IAS 16. One practical difficulty with decommissioning provisions recognised under IAS 37 is that due to the long period over which the actual cash outflows will arise, an entity may not know the currency in which the transaction will actually be settled. Nevertheless, if it is determined that it is expected to be settled in a foreign currency it will be a monetary item. The main issue then is what should happen to any exchange differences.

As discussed in Chapter 27, IFRIC 1 applies to any decommissioning or similar liability that has been both included as part of an asset and measured as a liability in accordance with IAS 37. IFRIC 1 requires, *inter alia*, that any adjustment to such a provision resulting from changes in the estimated outflow of resources embodying economic benefits (e.g., cash flows) required to settle the obligation should not be taken to profit or loss as it occurs, but should be added to or deducted from the cost of the asset to which it relates. Therefore, the requirement of IAS 21 to take the exchange differences arising on the provision to profit or loss in the period in which they arise conflicts with this requirement in IFRIC 1.

How we see it

It is our view that IFRIC 1 is the more relevant pronouncement for decommissioning purposes, therefore we consider that exchange differences on decommissioning and restoration/rehabilitation provisions are not required to be taken to profit or loss but dealt with in accordance with IFRIC 1.

10.3 Indefinite life assets

While the economic lives of oil fields and mines are finite, certain infrastructure assets (e.g., pipelines and refineries) are continually being repaired, replaced and upgraded. While individual parts of such assets may not have an indefinite economic life, these assets may occupy a particular site for an indefinite period.

Regardless of whether the related asset has an indefinite life, the decommissioning provision will normally meet the criteria relating to the recognition of a provision as set out in IAS 37.14(a) and (b), in that an entity will have a present obligation and it will be probable that an outflow of resources will be required to settle the obligation. With respect to the final criterion in IAS 37.14(c), while it might seem that a reliable estimate of the decommissioning provision cannot be made if the underlying asset has an indefinite life, ‘indefinite’ does not mean that the asset has an infinite life but that the life is long and has not yet been determined. IAS 37 presumes that “Except in extremely rare cases, an entity will be able to determine a range of possible outcomes and can therefore make an estimate of the obligation that is sufficiently reliable to use in recognising a provision.” [IAS 37.25].

Therefore, it should be extremely rare for an entity to conclude that it cannot make a reliable estimate of the amount of the obligation. Even if an entity did conclude in an extremely rare case that no reliable estimate could be made, there would still be a contingent liability and the following disclosures would be required:

- A brief description of the nature of the contingent liability
- Where practicable:
 - An estimate of its financial effect, measured under IAS 37.36 to IAS 37.52
 - An indication of the uncertainties relating to the amount or timing of any outflow
- And
- The possibility of any reimbursement [IAS 37.26, IAS 37.86]

Finally, it should be noted that the discounted value of decommissioning costs that will only be incurred far into the future may be relatively insignificant.

11 Impairment of assets

The following issues require additional attention when a mining company or oil and gas company applies the impairment testing requirements under IFRS accounting standards:

- Impairment indicators (see section 11.1 below)
- Identifying cash-generating units (see section 11.2 below)
- Projections of cash flows (see sections 11.4.2 and 11.5.1 below)
- Cash flows from mineral reserves and resources and the appropriate discount rate (see section 11.4.2.A below)
- Commodity price assumptions (see sections 11.4.3 and 11.5.2 below)
- Future capital expenditure (see sections 11.4.4 and 11.5.3 below)
- Foreign currency cash flows (see sections 11.4.5 and 11.5.4 below)
- Consistency in cash flows and the carrying amount of CGU (see section 11.4.1 below)

The general requirements of IAS 36 are covered in Chapter 21.

11.1 Impairment indicators

Impairment indicators applicable to assets of mining entities and oil and gas entities are found in two places, IFRS 6 and IAS 36. IFRS 6 describes a number of situations in which an entity is required to test E&E assets for impairment, discussed in section 3.5.1 above, while an entity is required to apply the impairment indicators in IAS 36 to assets other than E&E assets. The lists of impairment indicators in IFRS 6 and IAS 36 are not exhaustive. Entities operating in the extractive industries could also consider carrying out an impairment test in the following situations:¹⁰⁹

- Declines in prices of products or increases in production costs
- Governmental actions, such as new environmental regulations, imposition of price controls and tax increases
- Actual production levels from the cost centre or cost pool are below forecast and/or there is a downward revision in production forecasts
- Serious operational problems and accidents
- Capitalisation of large amounts of unsuccessful pre-production costs in the cost centre
- Decreases in reserve estimates
- Increases in the anticipated period over which reserves will be produced
- Substantial cost overruns during the development and construction phases of a field or mine
- Adverse drilling results

Practical example 11-1 below shows BHP Group Limited's accounting policy for impairment testing.

Practical example 11-1: BHP Group Limited (2022)

Australia

Annual Report 2022 [extract]

Financial Statements [extract]

1.6 Notes to the Financial Statements [extract]

Resource assets [extract]

13 Impairment of non-current assets [extract]

Recognition and measurement

Impairment tests for all non-financial assets (excluding goodwill) are performed when there is an indication of impairment. Goodwill is tested for impairment at least annually. Where the asset does not generate cash flows that are independent from other assets, the Group estimates the recoverable amount of the cash generating unit (CGU) to which the asset belongs, being the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets. If the carrying amount of the asset or CGU exceeds its recoverable amount, the asset or CGU is impaired and an impairment loss is charged to the income statement so as to reduce the carrying amount in the balance sheet to its recoverable amount.

Previously impaired assets (excluding goodwill as impairment losses are not reversed in subsequent periods) are reviewed for possible reversal of previous impairment at each reporting date. Impairment reversal cannot exceed the carrying amount that would have been determined (net of depreciation) had no impairment loss been recognised for the asset or CGU. Such reversal is recognised in the income statement. There were no reversals of impairment in the current or prior year.

How recoverable amount is calculated

The recoverable amount is the higher of an asset's or CGU's fair value less cost of disposal (FVLCD) and its value in use (VIU).

Fair value less cost of disposal

FVLCD is an estimate of the amount that a market participant would pay for an asset or CGU, less the cost of disposal. FVLCD for mineral assets is generally determined using independent market assumptions to calculate the present value of the estimated future post-tax cash flows expected to arise from the continued use of the asset, including the anticipated cash flow effects of any capital expenditure to enhance production or reduce cost, and its eventual disposal where a market participant may take a consistent view. Cash flows are discounted using an appropriate post-tax market discount rate to arrive at a net present value of the asset, which is compared against the asset's carrying value. FVLCD may also take into consideration other market-based indicators of fair value. FVLCD are based primarily on Level 3 inputs as defined in note 23 'Financial risk management' unless otherwise noted.

Value in use

VIU is determined as the present value of the estimated future cash flows expected to arise from the continued use of the asset in its present form and its eventual disposal or closure. VIU is determined by applying assumptions specific to the Group's continued use and cannot take into account future development. These assumptions are different to those used in calculating FVLCD and consequently the VIU calculation is likely to give a different result (usually lower) to a FVLCD calculation.

Key judgements and estimates

Judgements: Assessment of indicators of impairment or impairment reversal and the determination of CGUs for impairment purposes require significant management judgement.

Indicators of impairment may include changes in the Group's operating and economic assumptions, including those arising from changes in reserves or mine planning, updates to the Group's commodity supply, demand and price forecasts, or the possible additional impacts from emerging risks including those related to climate change and the transition to a low carbon economy.

Climate change

Impacts related to climate change and the transition to a low carbon economy may include:

- demand for the Group's commodities decreasing, due to policy, regulatory (including carbon pricing mechanisms), legal, technological, market or societal responses to climate change, resulting in a proportion of a CGU's reserves becoming incapable of extraction in an economically viable fashion
- physical impacts related to acute risks resulting from increased frequency or severity of extreme weather events, and those related to chronic risks resulting from longer-term changes in climate patterns

The Group's assessment of the potential impacts of climate change and the transition to a low carbon economy continues to mature. As outlined in the Basis of Preparation, where sufficiently developed, the potential financial impacts on the Group of climate change and the transition to a low carbon economy have been considered in the assessment of indicators of impairment, including:

- the Group's current assumptions relating to demand for commodities and carbon pricing, including their impact on the Group's long-term price forecasts
- the Group's operational emissions reduction strategy

Estimates: The Group performs a recoverable amount determination for an asset or CGU when there is an indication of impairment or impairment reversal.

When the recoverable amount is measured by reference to FVLCD, in the absence of quoted market prices or binding sale agreement, estimates are made regarding the present value of future post-tax cash flows. These estimates are made from the perspective of a market participant and include prices, future production volumes, operating costs, capital expenditure, closure and rehabilitation costs, taxes, risk factors applied to cash flows and discount rates. The cash flow forecasts may include net cash flows expected from the extraction, processing and sale of material that does not currently qualify for inclusion in ore reserves. Reserves and resources are included in the assessment of FVLCD to the extent that it is considered probable that a market participant would attribute value to them.

When recoverable amount is measured using VIU, estimates are made regarding the present value of future cash flows based on internal budgets and forecasts and life of asset plans. Key estimates are similar to those identified for FVLCD, although some assumptions and values may differ as they reflect the perspective of management rather than a market participant.

All estimates require management judgements and assumptions and are subject to risk and uncertainty that may be beyond the control of the Group; hence, there is a possibility that changes in circumstances will materially alter projections, which may impact the recoverable amount of assets/CGUs at each reporting date. While no indicators of impairment, or impairment reversal, were identified across the Group's CGUs at 30 June 2022, with the exception of the Cerro Colorado CGU, the carrying value of the Spence CGU is the most susceptible to changes in the significant estimates outlined below in the next reporting period.

The significant estimates impacting the Group's recoverable amount determinations are:

Commodity prices

Commodity prices were based on latest internal forecasts which assume short-term market prices will revert to the Group's assessment of long-term price. These price forecasts reflect management's long-term views of global supply and demand, built upon past experience of the commodity markets and are benchmarked with external sources of information such as analyst forecasts. Prices are adjusted based upon premiums or discounts applied to global price markers to reflect the location, nature and quality of the Group's production, or to take into account contracted prices.

Future production volumes

Estimated production volumes were based on detailed data and took into account development plans established by management as part of the Group's long-term planning process. When estimating FVLCD, assumptions reflect all reserves and resources that a market participant would consider when valuing the respective CGU, which in some cases are broader in scope than the reserves that would be used in a VIU test. In determining FVLCD, risk factors may be applied to reserves and resources which do not meet the criteria to be treated as proved.

Cash outflows (including operating costs, capital expenditure, closure and rehabilitation costs and taxes)

Cash outflows are based on internal budgets and forecasts and life of asset plans. Cost assumptions reflect management experience and expectations. Tax assumptions reflect existing tax and royalty regimes and rates applicable in the jurisdiction of the CGU. In the case of FVLCD, cash flow projections include the anticipated cash flow effects of any capital expenditure to enhance production or reduce cost where a market participant may take a consistent view. VIU does not take into account future development.

Discount rates

The Group uses real post-tax discount rates applied to real post-tax cash flows. The discount rates are derived using the weighted average cost of capital methodology. Adjustments to the rates are made for any risks that are not reflected in the underlying cash flows, including country risk.

11.2 Identifying cash-generating units (CGUs)

An entity is required under IAS 36 to test individual assets for impairment. However, "if it is not possible to estimate the recoverable amount of an individual asset then an entity should determine the recoverable amount of the CGU to which the asset belongs". [IAS 36.66]. A CGU is defined by the standard as the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets. [IAS 36.6]. See Chapter 21 for further discussion about how an entity is required to determine its CGUs.

In determining appropriate CGUs, mining entities and oil and gas entities could need to consider some of the following issues:

- (a) Active markets for intermediate products (see section 11.2.1 below)
- (b) External users of the processing assets (see section 11.2.2 below)
- (c) Fields or mines that are operated as one 'complex' through the use of shared infrastructure (see section 11.2.3 below)
- (d) Stand-alone fields or mines that operate on a portfolio basis (see section 11.2.4 below)

These issues are discussed further below.

11.2.1 Markets for intermediate products

In vertically integrated operations, the successive stages of the extraction and production process are often considered to be one CGU as it is not possible to allocate net cash inflows to individual stages of the process. This is common in some mining operations. However, if there is an active market for intermediate commodities (e.g., bauxite, alumina and aluminium) then a vertically integrated mining company needs to consider whether its smelting and refining operations are part of the same CGU as its mining operations. If there is an active market for the output produced by an asset or group of assets, the assets concerned are identified as a separate CGU, even if some or all of the output is used internally. If extraction and smelting or refining are separate CGUs and the cash inflows generated by the asset or each CGU are based on internal transfer pricing, the best estimate of an external arm's length transaction price should be used in estimating the future cash flows to determine the asset's or CGU's VIU. [IAS 36.70]. See Chapter 21.

11.2.2 External users of processing assets

When an entity is able to derive cash inflows from its processing assets (e.g., smelting or refining facilities) under tolling arrangements (see section 20 below), the question arises as to whether or not those processing assets are a separate CGU. If an entity's processing assets generate significant cash inflows from arrangements with third parties then those assets are likely to be a separate CGU.

11.2.3 Shared infrastructure

When several fields or mines share infrastructure (e.g., pipelines to transport gas or oil onshore, railways, ports or refining and smelting and other processing facilities), the question arises as to whether the fields or mines and the shared infrastructure is required to be treated as a single CGU. Treating the fields or mines and the shared infrastructure as part of the same CGU is not appropriate under the following circumstances:

- (a) If the shared infrastructure is relatively insignificant
- (b) If the fields or mines are capable of selling their product without making use of the shared infrastructure
- (c) If the shared infrastructure generates substantial cash inflows from third parties as well as the entity's own fields or mines
- (d) If the shared infrastructure is classified as a corporate asset, which is defined under IAS 36 as "...assets other than goodwill that contribute to the future cash flows of both the cash-generating unit under review and other cash-generating units". [IAS 36.6]. In that case, the entity should apply the requirements in IAS 36 regarding corporate assets, which are discussed in Chapter 21.

However, if none of the conditions under (a) to (d) above apply then it could be appropriate to treat the fields or mines and the shared infrastructure as one CGU.

Any shared infrastructure that does not belong to a single CGU but relates to more than one CGU still need to be considered for impairment purposes. It is considered that there are two ways to do this and an entity should use the method most appropriate. Shared infrastructure can be allocated to individual CGUs or the CGUs can be grouped together to test the shared assets (similar to the way corporate assets are tested - see commentary above).

Under the first approach, the shared assets should be allocated to each individual CGU or group of CGUs on a reasonable and consistent basis. The cash flows associated with the shared assets, such as fees from other users and expenditure, should be allocated similarly and should form part of the cash flows of the individual CGU. Under the second approach, the group of CGUs that benefit from the shared assets are grouped together with the shared assets to test the shared assets for impairment.

11.2.4 Fields or mines operated on a portfolio basis

Mining entities and oil and gas entities sometimes operate a 'portfolio' of similar mines or fields, which are completely independent from an operational point of view. However, IAS 36 includes the following illustrative example. [IAS 36.IE Example 1C].

Illustration 11-1: Single product entity

Entity M produces a single product and owns plants A, B and C. Each plant is located in a different continent. A produces a component that is assembled in either B or C. The combined capacity of B and C is not fully utilised. M's products are sold worldwide from either B or C. For example, B's production can be sold in C's continent if the products can be delivered faster from B than from C. Utilisation levels of B and C depend on the allocation of sales between the two sites.

Although there is an active market for the products assembled by B and C, cash inflows for B and C depend on the allocation of production across the two sites. It is unlikely that the future cash inflows for B and C can be determined individually. Therefore, it is likely that B and C together are the smallest identifiable group of assets that generates cash inflows that are largely independent.

The same rationale could also be applied by a mining company that, for example, operates two coal mines on a portfolio basis, or an oil and gas company that, for example, operates two fields within the one PSC and the entitlement to revenue is dependent on production of, the revenue earned and costs incurred across the PSC, not on a field by field basis. However, judgement needs to be exercised before concluding that it is appropriate to treat separate fields or mines as one CGU, particularly when the production costs of the output of fields or mines differ considerably. This is because there may be a desire to combine them into one CGU, so that the higher cost fields or mines are protected by the headroom of the lower cost fields or mine, thereby avoiding a recognition of an impairment charge.

How we see it

To be able to combine fields or mines on a portfolio basis, an oil and gas company or a mining company would have to be able to demonstrate that the future cash inflows for the individual fields or mines cannot be determined individually and therefore, the combined group represents the smallest identifiable group of assets that generates cash inflows that are largely independent.

11.3 Basis of recoverable amount - value-in-use or fair value less costs of disposal

The standard requires the carrying amount of an asset or CGU to be compared with its recoverable amount, which is the higher of fair value less costs of disposal (FVLCD) and value-in-use (VIU). [IAS 36.18]. If either the FVLCD or the VIU is higher than the carrying amount, no further action is necessary as the asset is not impaired. [IAS 36.19]. Recoverable amount is calculated for an individual asset, unless that asset does not generate cash inflows that are largely independent of those from other assets or groups of assets. [IAS 36.22].

In sections 11.4 and 11.5 below we further consider the practical and technical aspects associated with the calculation of VIU and FVLCD respectively for mining entities and oil and gas entities.

11.4 Calculation of VIU

IAS 36 defines VIU as: [IAS 36.6]

Extract from IAS 36

6 The following terms are used in this Standard with the meanings specified:

...

Value in use is the present value of the future cash flows expected to be derived from an asset or cash-generating unit.

Estimating the VIU of an asset/CGU involves estimating the future cash inflows and outflows that will be derived from the use of the asset and from its ultimate disposal in its current condition and discounting them at an appropriate rate. [IAS 36.31]. There are complex issues involved in determining the cash flows and choosing a discount rate and often there is no agreed methodology to follow. IAS 36 contains detailed and explicit requirements concerning the data to be assembled to calculate VIU that can best be explained and set out as a series of steps. The steps in the process are:

- Step 1: Dividing the entity into CGUs (see section 11.2 above)
- Step 2: Allocating goodwill to CGUs or CGU groups (see Chapter 21)
- Step 3: Identifying the carrying amount of CGU assets (see section 11.4.1 below)
- Step 4: Estimating the future pre-tax cash flows of the CGU under review (see sections 11.4.2 to 11.4.5 below)
- Step 5: Identifying an appropriate discount rate and discounting the future cash flows (see Chapter 21 and below in section 11.4.2.A)
- Step 6: Comparing carrying value with VIU (assuming FVLCD is lower than carrying value) and recognising impairment losses (see Chapter 21)

11.4.1 Consistency in cash flows and book values attributed to the CGU

An essential requirement of impairment testing under IAS 36 is that the recoverable amount of a CGU must be determined in the same way as for an individual asset and its carrying amount must be determined on a basis that is consistent with the way in which its recoverable amount is determined. [IAS 36.74, IAS 36.75].

The carrying amount of a CGU includes only those assets that can be attributed directly or allocated on a reasonable and consistent basis. These must be the assets that will generate the future cash inflows used in determining the CGU's VIU. It does not include the carrying amount of any recognised liability, unless the recoverable amount of the cash-generating unit cannot be determined without taking it into account.

For practical reasons, the entity may determine the recoverable amount of a CGU after taking into account assets and liabilities such as receivables or other financial assets, trade payables, pensions and other provisions that are outside the scope of IAS 36 and not part of the CGU. [IAS 36.79]. If the cash flows of a CGU are determined taking into account these sorts of items, then it is essential that cash flows and assets and liabilities within CGUs are prepared on a consistent basis.

Specific issues mining entities and oil and gas entities will need to consider are:

- Environmental provisions and similar provisions and liabilities (see section 11.4.1.A below)
- The impact of cash flows associated with lease liabilities recognised in accordance with IFRS 16 (see Chapter 21)
- Working capital such as trade debtors, trade payables and inventories (see Chapter 21 for further discussion)

11.4.1.A Environmental provisions and similar provisions and liabilities

IAS 36 requires the carrying amount of a liability to be excluded from the carrying amount of a CGU unless the recoverable amount of the CGU cannot be determined without consideration of that liability. [IAS 36.76, IAS 36.78]. This typically applies when the asset/CGU cannot be separated from the associated liability. See Chapter 21 for further discussion of some of the practical challenges associated with this issue when it comes to environmental provisions and similar provisions and liabilities.

11.4.2 Projections of cash flows

IAS 36 requires that in calculating VIU an entity base its cash flow projection on the most recent financial budgets/forecasts approved by management, excluding any estimated future cash inflows or outflows expected to arise from future restructurings or from improving or enhancing the asset's performance. The assumptions used to prepare the cash flows should be reasonable and supportable, which can best be achieved by benchmarking against market data or performance against previous budgets. These projections cannot cover a period in excess of five years, unless a longer period can be justified. [IAS 36.33(b)]. Entities are permitted to use a longer period if they are confident that their projections are reliable, based on past experience. [IAS 36.35].

In practice, most production or mining/field plans will cover a period of more than five years and hence management will typically make financial forecasts for a corresponding period. The use of such longer-term forecasts could be appropriate where it is based on proved and probable reserves and expected annual production rates. Assumptions as to the level of reserves expected to be extracted are expected to be consistent with the latest estimates prepared by reserve engineers; annual production rates are expected to be consistent with those of preceding periods; and price and cost assumptions are expected to be consistent with the final period of specific assumptions.

11.4.2.A Cash flows from mineral reserves and resources and the appropriate discount rate

As discussed in sections 2.2 and 2.3 above, a significant amount of work is required before an entity can conclude that its mineral resources should be classified as mineral reserves. In practice, an entity may not have formally completed all of the detailed work that is required in order to designate mineral resources as mineral reserves. IAS 36 requires the cash flow projection used in calculating the VIU of assets to be based on "...reasonable and supportable assumptions that represent management's best estimate of the range of economic conditions that will exist over the remaining useful life of the asset". [IAS 36.33(a)]. Therefore, while ordinarily the starting point for the calculation of VIU would be based upon the mineral reserves recorded, it could sometimes be appropriate under IAS 36 to take into account mineral resources that have not formally been designated as mineral reserves. However, an entity would need to adjust the discount rate it uses in its VIU calculation for the additional risks associated with mineral resources for which the future cash flow estimates have not been adjusted. [IAS 36.55]. If the risks have been factored into the future cash flow estimates modelled, an entity is required to be aware not to also adjust for this risk via the discount rate applied.

The requirements of IAS 36 for determining an appropriate discount rate are discussed in detail in Chapter 21.

11.4.3 Commodity price assumptions

Forecasting commodity prices is never straightforward, because it is not usually possible to know whether recent changes in commodity prices are a temporary aberration or the beginning of a longer-term trend. Management usually takes a longer-term approach to estimates of commodity prices for internal management purposes, but these are not always consistent with the VIU requirements. Given the long life of most mines and oil fields, an entity must not consider price levels only for the past three or four years. Instead, it is required to consider future pricing based on future supply and demand levels in a changing environment particularly with respect to climate risk. Historical price levels for longer periods, and how these prices were influenced by changes in underlying supply and demand levels, may provide some insight into pricing but must be considered in the context of future supply and demand.

For actively traded commodities, there are typically forward price curves available and, in such situations, these provide another reference point for forecast price assumptions.

The commodity assumptions need to match the profile of the life of the mine or oil field. Spot prices and forward curve prices (where they are available as at the impairment testing date) are more relevant for shorter life mines and oil fields, or for pricing of volumes in the earlier years of a longer life mines or oil fields. Long-term price assumptions are more relevant for longer life mines and oil fields and are typically used beyond the initial 2-3-year period for which forward curve pricing may be used. Forecast prices (where available) are required to be used for the future periods covered by the VIU calculation. Where the forward price curve does not extend far enough into the future, the price at the end of the forward curve is generally held steady or reverts to a longer-term average price (in real terms), where appropriate.

The future cash flows relating to the purchase or sale of commodities might be known from forward purchase or long-term sales contracts for which prices are either fixed or vary based on an index e.g., inflation. Use of these contracted prices in the VIU calculation in place of the spot price or forward curve price for the contracted volumes will generally be acceptable. However, it is possible that some of these forward contracts might be accounted for as derivatives contracts at fair value in accordance with IFRS 9, and therefore the related assets or liabilities will be recognised in the statement of financial position. It is important to ensure consistency between the carrying values included in the CGU and the cash flows included in the VIU calculation with respect to cash flow hedges, whether they qualify for hedge accounting or not. This is discussed further in Chapter 21.

The commodity price is a key assumption in calculating the VIU of any mine or oil field. Only in the context of impairment testing of goodwill and indefinite life intangible assets does IAS 36 specifically require disclosure of:

- (i) A description of each key assumption on which management has based its cash flow projections for the period covered by the most recent budgets/forecasts. Key assumptions are those to which the unit's ('group of units') recoverable amount is most sensitive.
- (ii) A description of management's approach to determining the value(s) assigned to each key assumption, whether those value(s) reflect past experience or, if appropriate, are consistent with external sources of information, and, if not, how and why they differ from past experience or external sources of information. [IAS 36.134(d)(i), IAS 36.134(d)(ii), IAS 36.134(e)(i), IAS 36.134(e)(ii)].

How we see it

In practice, considerable differences may exist between entities in their estimates of future commodity prices. Therefore, we recommend disclosure of the actual commodity prices used in calculating the VIU of any mine or oil field that does not have any goodwill or indefinite life intangibles allocated to it, even though this is not specifically required by IAS 36 as these would generally be considered a significant judgement or estimate and hence would require disclosure under IAS 1.

A possible approach to such disclosures is illustrated in Practical example 11-2 below from the financial statements of BP p.l.c.

Practical example 11-2: BP p.l.c. (2022)

United Kingdom

bp Annual Report and Form 20-F 2022 [extract]

Investments [extract]

Significant judgements and estimates: recoverability of asset carrying values [extract]

Oil and natural gas properties

For upstream oil and natural gas properties in subsidiaries, expected future cash flows are estimated using management's best estimate of future oil and natural gas prices, and production and reserves and certain resources volumes. The estimated future level of production in all impairment tests is based on assumptions about future commodity prices, production and development costs, field decline rates, current fiscal regimes and other factors. A change in the discount rate, reserves, resources or the oil and gas price assumptions in the next financial year may result in a recoverable amount of one or more of these assets above or below the current carrying amount and therefore there is a risk of impairment reversals or charges in that period. Management consider that reasonably possible changes in the discount rate or forecast revenue, arising from a change in oil and natural gas prices and/or production could result in a material change in their carrying amounts within the next financial year.

Oil and natural gas prices

The price assumptions used for value in use impairment testing are based on those used for investment appraisal. bp's carbon emissions cost assumptions and their interrelationship with oil and gas prices are described in 'Judgements and estimates made in assessing the impact of climate change and the transition to a lower carbon economy' on page 185. The investment appraisal price assumptions are recommended by the senior vice president economic & energy insights after considering a range of external price sets and supply and demand profiles associated with various energy transition scenarios. They are reviewed and approved by management. As a result of the current uncertainty over the pace of transition to lower-carbon supply and demand and the social, political and environmental actions that will be taken to meet the goals of the Paris climate change agreement, the scenarios considered include those where those goals are met as well as those where they are not met.

During the year, bp's price assumptions applied in value-in-use impairment testing (in real 2021 terms) for Brent oil assumption from 2024 up to 2030 was increased to \$70 per barrel to reflect near term supply constraints before steadily declining to \$45 per barrel by 2050 continuing to reflect the assumption that as the energy system decarbonises, falling oil demand will cause oil prices to decline. The price assumptions for Henry Hub gas up to 2035 and up to 2050 were increased to \$4 per mmBtu and \$3.50 per mmBtu respectively to reflect the increased demand for US gas production to offset reduced Russian gas flows. These price assumptions are derived from the central case investment appraisal assumptions, adjusted where applicable to reflect short-term market conditions (see page 28). A summary of the group's revised price assumptions for Brent oil and Henry Hub gas, applied in 2022 and 2021, in real 2021 terms, is provided below. The assumptions represent management's best estimate of future prices at the balance sheet date, which sit within the range of external scenarios considered as appropriate for the purpose. They are considered by bp to be in line with a range of transition paths consistent with the temperature goal of the Paris climate change agreement, of holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels. However, they do not correspond to any specific Paris-consistent scenario. An inflation rate of 2% (2021 2%) is applied to determine the price assumptions in nominal terms.

Notes to the Consolidated Financial Statements [extract]

12. Impairment of Non-Financial Assets [extract]

(c) Key Judgements, Estimates and Assumptions [extract]

The table below summarises the key assumptions used in the carrying value assessments as at 30 June 2022, and for comparison also provides the equivalent assumptions used in 2021:

Assumptions for financial year	As at 30 June 2022					As at 30 June 2021				
	2023	2024	2025	2026	Long term (2027+)	2022	2023	2024	2025	Long term (2026+)
Gold (US\$ per ounce)	\$1,750	\$1,650	\$1,550	\$1,550	\$1,500	\$1,750	\$1,700	\$1,550	\$1,500	\$1,500
Copper (US\$ per pound)	\$3.70	\$3.60	\$3.50	\$3.50	\$3.50	\$3.75	\$3.50	\$3.30	\$3.30	\$3.30
AUD:USD exchange rate	\$0.73	\$0.75	\$0.75	\$0.75	\$0.75	\$0.78	\$0.78	\$0.77	\$0.76	\$0.75
CAD:USD exchange rate	\$0.80	\$0.80	\$0.80	\$0.80	\$0.80	\$0.80	\$0.80	\$0.80	\$0.80	\$0.80
USD:PGK exchange rate	K3.52	K3.52	K3.52	K3.52	K3.52	K3.51	K3.51	K3.51	K3.51	K3.51

Commodity prices and exchange rates estimation approach

Commodity price and foreign exchange rates are estimated with reference to external market forecasts and reviewed at least annually. The rates applied have regard to observable market data including spot and forward values, and to market analysis including equity analyst estimates.

Metal prices

Newcrest has updated its US dollar gold price estimates and its US dollar copper prices applied as at 30 June 2022. These changes were to align with observable market data, taking into account spot prices during the 2022 financial year and Newcrest's analysis of observable market forecasts for future periods. Newcrest has maintained its long-term gold price.

11.4.4 Future capital expenditure

When determining VIU, although the standard permits an entity to take account of cash outflows required to make an asset ready for use, i.e., those relating to assets under construction, [IAS 36.42], it does not allow inclusion of cash outflows relating to future restructuring to which an entity is not yet committed, or, improving or enhancing an asset's performance. [IAS 36.44]. This may have a significant impact on relatively new assets and on fields or mines that will be developed over time. Note that while enhancement capital expenditure may not be recognised, routine or replacement capital expenditure necessary to maintain the function or current performance of the asset or assets in the CGU has to be included. Entities must therefore distinguish between maintenance and enhancement expenditure. This distinction may not be easy to draw in practice but, for example, an anticipated increase in mineral reserves as a consequence of incurring future capital expenditure may be an indicator that the expenditure is enhancement expenditure.

11.4.5 Foreign currency cash flows

An entity in the extractive industries will often sell its product in a currency that is different from the one in which it incurs its production costs (e.g., silver production may be sold in US dollars while production costs may be incurred in pesos). In such situations, impairment testing and calculating VIU under IAS 36 require that the foreign currency cash flows should first be estimated in the currency in which they will be generated and then discounted using a discount rate appropriate for that currency. An entity is then required to translate the present value calculated in the foreign currency using the spot exchange rate at the date of the VIU calculation. [IAS 36.54]. This is to avoid the problems inherent in using forward exchange rates, which are based on differential interest rates. Using such forward rates would result in double-counting the time value of money, first in the discount rate and then in the forward rate. [IAS 36.BCZ49].

This requirement, however, is more complex than it may initially appear. Effectively, this method requires an entity to perform separate impairment tests for cash flows generated in different currencies, but make them consistent with one another so that the combined effect is meaningful. This can be a difficult exercise to undertake. Many different factors need to be considered, including relative inflation rates and relative interest rates, as well as appropriate discount rates for the currencies in question. Because of this, the possibility for error is significant, given this, it is important for entities to seek input from experienced valuers who will be able to assist them in dealing with these challenges.

11.5 Calculation of FVLCD

FVLCD is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date, less the costs of disposal. [IAS 36.6]. FVLCD is less restrictive in its application than VIU and can be easier to work with, which may be why some entities choose to use this approach for impairment testing purposes. While IAS 36 does not impose any restrictions on how an entity determines the FVLCD, there are specific requirements in IFRS 13 as to how to determine fair value. IFRS 13 is discussed in more detail in Chapter 15.

The concept of fair value in IFRS 13 is explicitly an exit price notion. FVLCD, like fair value, is not an entity-specific measurement, but is focused on market participants' assumptions for a particular asset or liability. Under IFRS 13, for non-financial assets, entities have to consider the highest and best use (from a market participant perspective) to which the asset could be put. However, it is generally presumed that an entity's current use of those mining or oil and gas assets or CGUs would be its highest and best use (unless market or other factors suggest that a different use by market participants would maximise the value of the asset).

IFRS 13 does not limit or prioritise the valuation technique(s) an entity might use to measure fair value. An entity could use any valuation technique, or multiple techniques, as long as it is consistent with one of three valuation approaches: market approach, income approach and cost approach and is appropriate for the type of asset/CGU being measured at fair value. However, IFRS 13 does focus on the type of inputs to be used and requires an entity to maximise the use of relevant observable inputs and minimise the use of the unobservable inputs.

Historically, many mining entities and oil and gas entities have calculated FVLCD using a discounted cash flow (DCF) valuation technique. This approach differs from VIU in a number of ways. One of the key differences is that FVLCD would require an entity to use assumptions that a market participant would be likely to take into account rather than entity-specific assumptions. For example, as mining sector and oil and gas sector market participants invest for the longer term, they would not restrict themselves to a limited project time horizon. Therefore, the cash flow forecasts included in a FVLCD calculation could cover a longer period than may be used in a VIU calculation. Moreover, market participants would also likely take into account future expansionary capital expenditure related to subsequent phases in the development of a mining property in a FVLCD calculation, whereas this is not permitted in a VIU calculation. Having said this, some of the issues discussed above for a VIU calculation also need to be considered for a FVLCD calculation which uses a DCF model (we discuss some of these further below). As illustrated in Practical example 11-1 in section 11.1 above, BHP uses this approach in determining the FVLCD for its mineral assets.

11.5.1 Projections of cash flows

As required by IFRS 13, the assumptions and other inputs used in a FVLCD DCF model are required to maximise the use of observable market inputs. These are required to be both realistic and consistent with what a typical market participant would assume.

11.5.2 Commodity price assumptions

Similar to a VIU calculation, commodity price is a key assumption in calculating the FVLCD of any mine or oil field when using a DCF model, and therefore similar issues as those discussed for a VIU calculation (see section 11.4.3 above) apply. On the same basis, while the specific disclosure requirements relating to price assumptions in IAS 36 technically only apply in the context of impairment testing of CGUs to which goodwill and indefinite life intangible assets are allocated, because there can be considerable differences between entities in their estimates of future commodity prices, we recommend additional disclosures be provided. Regardless of the specific requirements of IAS 36, an entity is also required to consider the disclosure requirements relating to significant judgements or estimates and hence the requirements of IAS 1. [IAS 1.122, IAS 1.125]. For example, an entity may wish to disclose the actual commodity prices used in calculating the FVLCD of any mine or oil field, as these would generally be considered a significant judgement or estimate and hence would require disclosure under IAS 1.

11.5.3 Future capital expenditure

There are no restrictions similar to those applicable to a VIU calculation when determining FVLCD provided that it can be demonstrated that a market participant would be willing to attribute some value to the future enhancement and that the requirements of IFRS 13 have been complied with. IFRS 13 is discussed in more detail in Chapter 15.

The treatment of future capital expenditure in an impairment test is discussed in more detail in Chapter 21.

11.5.4 Foreign currency cash flows

For FVLCD calculations, the requirements relating to foreign currency cash flows are not specified other than they must reflect what a market participant would use when valuing the asset or CGU. In practice, entities that use a DCF analysis when calculating FVLCD will incorporate a forecast for exchange rates into their calculations rather than using the spot rate. A key issue in any forecast is the assumed timeframe over which the exchange rate may return to lower levels. This assumption is generally best analysed in conjunction with commodity prices in order to ensure consistency in the parameters used, i.e., a rise in prices will usually be accompanied by a rise in currency.

11.6 Low mine or field profitability near end of life

While mining entities and oil and gas entities would like to achieve steady profitability and returns over the life of a project, it is not uncommon to see profitability declining over the life of a mine or field. From an economic perspective, a mining company or oil and gas company will generally continue to extract minerals as long as the cash inflows from the sale of minerals exceed the cash cost of production.

From a mining perspective, most mine plans aim to maximise the net present value of mineral reserves by first extracting the highest-grade ore with the lowest production costs. Consequently, in most mining operations, the grade of the ore mined steadily declines over the life of the mine which results in a declining annual production, while the production costs (including depreciation/amortisation) per volume of ore, e.g., tonne, gradually increases as it becomes more difficult to extract the ore. From an oil and gas perspective, both oil and gas may be produced from the same wells but ordinarily oil generates greater revenue per barrel of oil equivalent sold relative to gas. As the oil is often produced in greater quantities first, this means that the oil and gas operation is often more profitable in the earlier years relative to later years.

Consequently, where there is a positive net cash flow, a mining company or oil and gas company will continue to extract minerals even if it does not fully recover the depreciation of its property, plant and equipment and mineral reserves, as is likely to occur towards the end of the mine or field life. In part, this is the result of the depreciation methods applied:

- The straight-line method of depreciation allocates a relatively high depreciation charge to periods with a low annual production.
- A units of production method based on the quantity of ore extracted allocates a relatively high depreciation charge to production of lower grade ore compared to the price at which such ore is sold.
- A units of production method based upon the quantity of petroleum product produced in total terms allocates an even depreciation charge per barrel of oil equivalent, whereas the revenue earned varies.
- A units of production method based on the quantity of minerals produced allocates a relatively high depreciation charge to production of minerals that are difficult to recover.

Each of these situations is most likely to occur towards the end of the life of a mine or field. It is possible the methods of depreciation most commonly used in each of the sectors do not allocate a sufficiently high depreciation charge to the early life of a project when production is generally most profitable. An entity is required to therefore be mindful of the fact that relatively small changes in facts and circumstances can lead to an impairment of assets.

Following on from this, the impairment tests in the early years of the life of a mine or field will often reveal that the project is cash flow positive and is able to produce a recoverable amount that is sufficient to recoup the carrying value of the project, i.e., the project is not impaired. However, when the impairment tests are conducted in later years, while the mine or field may still be cash flow positive, i.e., the expected cash proceeds from the future sale of minerals still exceed the expected future cash costs of production and hence management will continue with the mining or oil and gas operations, as margins generally reduce towards the end of mine or field life, the impairment tests may not produce a recoverable amount sufficient to recoup the remaining carrying value of the mine or field. Therefore, it will need to be impaired.

It is possible, when preparing the impairment models for a mine or field, for an entity to identify when (in the future) the remaining net cash inflows may no longer be sufficient to recoup the remaining carrying value, that is, when compared to the way in which the assets are expected to be depreciated over the remaining useful life. However, provided the recoverable amount as at the date of the impairment test exceeds the carrying amount of the mine or field, there is no requirement to recognise any possible future impairment. It is only when the recoverable amount actually falls below the carrying amount that an impairment must be recognised.

12 Revenue recognition

The sub-sections below consider some of the specific revenue recognition issues faced by mining entities and oil and gas entities under the requirements as set out in IFRS 15 (see Chapter 28 for more details) or where they may earn other revenue (or other income) in the scope of other standards (see Chapter 28).

12.1 Revenue in the development phase

Given the nature of extractive industries projects, there are many instances where income may be generated prior to the commencement of commercial production and the asset moving into the production phase.

Some mining examples include:

- During the evaluation phase, i.e., when the technical feasibility and commercial viability are being determined, an entity may 'trial mine', to determine which development method would be the most profitable and efficient in the circumstances, and which metallurgical process is the most efficient. Ore mined through trial mining may be processed and sold during the evaluation phase.
- As part of the process of constructing a deep underground mine, the mining operation may extract some saleable 'product' during the construction of the mine e.g., sinking shafts to the depth where the main ore-bearing rock is located.
- At the other end of the spectrum, income may be earned from the sale of product from 'ramping up' the mine to production at commercial levels.

Some oil and gas examples include:

- Onshore wells are frequently placed on long-term production test as part of the process of appraisal and formulation of a field development plan. Test production may be sold during this time.
- Testing the start-up of an LNG plant or gas processing plant.

There may be instances during the construction/development phase, i.e., before an asset is ready for its intended use, where an entity enters into incidental operations that are not, in themselves, necessary to bring the asset itself into the location and condition necessary for it to be capable of operating in the manner intended by management. The standard gives the example of income earned by using a building site as a car park prior to starting construction. An extractives example may be income earned from leasing out the land surrounding the mine site or an onshore gas field to a local farmer to run his sheep on.

Under IAS 16, the cost of an item of property, plant and equipment includes "...any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management". [IAS 16.16(b)].

IAS 16 makes it clear that because incidental operations such as these are not necessary to bring an item to the location and condition necessary for it to be capable of operating in the manner intended by management, the income and related expenses of incidental operations are to be recognised in profit or loss and included in their respective classifications of income and expense. [IAS 16.21]. Such incidental income is not offset against the cost of the asset.

Where there has been historical divergence in practice with respect to revenue that is considered integral to development, IAS 16 provides guidance in these instances. This is discussed in sections 12.1.1 and 12.1.2 below.

12.1.1 Revenue is integral to development

IAS 16 requires that the cost of an item of PP&E includes any costs directly attributable to bringing that asset to the location and condition necessary for it to be capable of operating in the manner intended by management. Specifically, one type of cost identified in IAS 16.17(e), is the cost of testing whether the asset is functioning properly, in practice this was determined after deducting the net proceeds from selling any items produced while making the asset available for use.

Effective January 2022, IAS 16 was amended to prohibit the deduction of sales proceeds from the cost of an item of PP&E. Instead, an entity would recognise such sales proceeds, together with the costs of producing those items (production costs), in profit or loss, applying the applicable IFRS.

In applying the provisions of IAS 16, the following is noted:

- The costs of producing items of inventory before an asset is ready for its intended use must be recognised in profit or loss in accordance with applicable standards, and the entity measures the cost of those items applying the measurement requirements of IAS 2. [IAS 2.34, IAS 16.20A].
- Neither specific presentation nor disclosure requirements for the sale of items that are part of an entity's ordinary activities are required.
- For the sale of items that are not part of an entity's ordinary activities (and to which an entity does not apply IFRS 15 and IAS 2), an entity is required to:
 - Disclose separately the sales proceeds and their related production costs recognised in profit or loss. [IAS 16.74A(b)].
 - Specify the line item(s) in the statement of profit or loss and other comprehensive income that include(s) the sales proceeds and the production costs. [IAS 16.74A(b)].

It is noted that, these requirements would lead to greater visibility of an entity's different revenue classes, should this revenue be so material that separate disclosures are required by IFRS 15 or other relevant standards, it would direct more attention to the date at which an asset is ready for its intended use, i.e., the commissioning date. This is a critical date as it impacts other aspects of the accounting for such assets, such as when costs (including borrowing costs) should cease to be capitalised, when accounting for stripping costs changes (mining entities only), and when depreciation commences.

The Basis for Conclusions indicate that, while the IASB observed that an entity would have to apply judgement in identifying the costs, the amendments would require little more judgement beyond that already required to apply current IFRS accounting standards when allocating costs incurred. [IAS 16.BC16J].

The Basis for Conclusions also acknowledges that such an approach would mean that the cost of such inventories would exclude depreciation of any PP&E relating to the production of such inventory, that is not yet available for use. [IAS 16.BC16F, IAS 16.BC16G].

Various approaches have been observed in practice to determine the amount to be included in cost of goods sold. These are discussed in section 12.1.2 below. Similar issues and considerations are likely to continue to arise and will require entities to exercise judgement. It is expected that entities will use their disclosures to clarify their approach to pre-commissioning/testing revenue and the determination of cost of goods sold.

In addition, significant judgement will also continue to be required to determine when the asset is in the location and condition to be capable of operating as intended by management, i.e., when it is ready for its intended use. In the absence of specific guidance, divergence in this judgement will also continue so entities could consider providing clear disclosures.

12.1.2 Approaches to cost allocations where revenue is integral to development

IAS 16 requires an entity to separately identify the production costs associated with selling volumes before an asset is ready for its intended use. An entity is required to identify and measure production costs applying the measurement requirements in paragraphs 9-33 of IAS 2 Inventories.

The key challenge with this issue is usually not how to measure the revenue but how to distinguish those costs that were directly attributable to developing the operating capability of the mine or field from those that represented the cost of producing saleable material. It can be extremely difficult to apportion these costs. Consequently, there is a risk of misstatement of gross profits if these amounts recorded as revenue and the amount of costs included in profit or loss as cost of goods sold were too low or too high.

Other GAAPs have previously provided further guidance that had influenced some of the costing approaches adopted under IFRS accounting standards. The various approaches observed in practice to determine the amount to be included in cost of goods sold include:

- An amount equivalent to the revenues was charged to cost of sales and credited against the asset to record a zero net margin on such production (similar to the guidance in the former OIAC SORP)
- A standard or expected cost of production was ascribed to the volumes produced, e.g., weighted average cost per tonne/barrel based on actual results over a historical period, e.g., the last two or three years; or for new mines or fields, the expected cost per tonne/bbl as set out in the business, mine or field plan, producing a standard margin
- Recognising only the incremental cost of processing the product
- Recognising nothing in cost of goods sold

While diverse treatments may have previously been adopted and accepted in practice, it is unlikely the third and fourth cost of goods sold approaches would be appropriate because they would not provide a fair reflection of the cost to produce the saleable product as required by IAS 16.

12.2 Sale of product with delayed shipment

From time to time, an entity may enter into a sales arrangement where the purchaser pays a significant portion of the final estimated purchase price but then requests delayed shipment, for example, because of limited storage space. These sales can sometimes also be referred to as 'in store sales' or 'bill-and-hold' sales. These are commonly seen in the mining sector.

The application guidance in IFRS 15 specifically addresses bill-and-hold arrangements. IFRS 15 states that an entity will need to determine when it has satisfied its performance obligation to transfer a product by evaluating when a customer obtains control of that product (see Chapter 28 for more information on transfer of control). In addition to applying these general requirements, an entity must also meet the criteria to be able to demonstrate control has passed for a bill-and-hold arrangement. [IFRS 15.B79, IFRS 15.B80, IFRS 15.B81, IFRS 15.B82]. See Chapter 28 for more information.

IFRS 15 also states that even if an entity recognises revenue for the sale of a product on a bill-and-hold basis, it will also need to consider whether it has remaining performance obligations (e.g., for custodial services or security services) to which the entity will need to allocate a portion of the transaction price. [IFRS 15.B82]. See Chapter 28 for more information.

12.3 Inventory exchanges with the same counterparty

Mining entities and oil and gas entities may exchange inventory with other entities in the same line of business, which is often referred to as 'loans/borrows'. This can occur with commodities such as oil, uranium, coal or certain concentrates, for which suppliers exchange or swap inventories in various locations to supplement current production, to facilitate more efficient management of capacity and/or to help achieve lower transportation costs.

IFRS 15 scopes out certain non-monetary "exchanges between entities in the same line of business to facilitate sales to customers or potential customers." [IFRS 15.5(d)]. The legacy scope exclusion in IAS 18 *Revenue* was different. IAS 18.12 used the words 'similar in nature and value' and did not focus on the intention of the exchange. Therefore, some transactions that were treated as exchanges of dissimilar goods (and, hence, revenue-generating under IAS 18) may no longer be considered to be revenue-generating if the entities are in the same line of business and the exchange is intended to facilitate sales to customers or potential customers. Conversely, some exchanges of similar items (and, therefore, excluded from IAS 18) may not be intended to facilitate sales to customers or potential customers and would, therefore, be within the scope of IFRS 15.

Accounting for exchanges of inventories requires a degree of judgement particularly:

- Interpreting what 'same line of business' means and how broadly or narrowly this should be interpreted
- Whether the exchange is to facilitate sales to customers or potential customers
- Whether the transaction is non-monetary and the impact of settling net in cash may have on this assessment

Furthermore, while the scope section of IFRS 15 makes it clear that such inventory exchanges do not result in revenue generation, it does not provide application guidance on how these transactions between the two parties would be accounted for and no other specific requirements exist within IFRS accounting standards. Despite this, any receivable or payable balance would not entirely meet the definition of inventory in IAS 2 but instead would likely be a non-monetary receivable or payable. The product receivable or payable would normally be recorded at cost within current assets or liabilities. However, given the lack of clarity, diversity in accounting practice could continue.

12.4 Over-lift and under-lift (oil and gas)

In jointly owned oil and gas operations, it is often not practical for each participant to take in kind or to sell its exact share of production during a period. In most periods, some participants in the jointly owned operations will be in an over-lift position (i.e., they have taken more product than their proportionate entitlement) while other participants may be in an under-lift position (i.e., they have taken less product than their proportionate entitlement).

Generally, costs are invoiced to the participants in a joint operation in proportion to their equity interest, creating a mismatch between the proportion of revenue lifted and sold and the proportion of costs borne. Imbalances between volumes for which production costs are recognised and volumes sold (for which revenue is recognised in accordance with IFRS 15) may be settled between/among joint operation participants either in cash or by physical settlement. The accounting could be different depending on the specific terms of the agreement. Such lifting imbalances are usually settled in one of three ways:¹¹⁰

- In future periods the owner in an under-lift position may sell or take product in excess of their normal entitlement, while the owner in an over-lift position will sell or take less product than the normal entitlement.
 - Cash balancing may be used, whereby the over-lift party will make a cash payment to the under-lift party for the value of the imbalance volume.
- Or
- If the co-owners have joint ownership interests in other properties, they may agree to offset balances in the two properties to the extent possible.

12.4.1 Accounting for imbalances in revenue under IFRS 15

Revenue from contracts with customers that falls within the scope of IFRS 15 should be treated according to the requirements of IFRS 15. Sales of product by a participant in a joint operation to external customers are within the scope of IFRS 15 and should be recognised when the sales actually occur i.e., when the entity satisfies its performance obligation by transferring a promised good or service (i.e., an asset) to a customer. An asset is transferred when (or as) the customer obtains control of that asset. [IFRS 15.31].

Transactions with other joint operation participants are unlikely to fall within the scope of IFRS 15 and, hence, would not form part of revenue from contracts with customers. [IFRS 15.5(d), IFRS 15.6]. This is consistent with IFRS 15.BC52 to IFRS 15.BC56, the March 2015 IFRS IC agenda decision on IFRS 11 ('Recognition of revenue by a joint venture'), and IFRS 11 which states that "A joint operator shall account for the assets, liabilities, revenues and expenses relating to its interest in a joint operation in accordance with the IFRS accounting standards applicable to the particular assets, liabilities, revenues and expenses". [IFRS 11.21, IFRS 15.BC53-BC56].

This was confirmed in the IFRS IC agenda decision issued in March 2019 ('Sale of Output to an Operator'). The IFRS IC concluded that "in the fact pattern described in the request, the joint operator recognises revenue that depicts only the transfer of output to its customers in each reporting period, i.e., revenue recognised applying IFRS 15. This means, for example, the joint operator does not recognise revenue for the output to which it is entitled but which it has not received from the joint operation and sold. The IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for a joint operator to determine its revenue from the sale of its share of output arising from a joint operation as described in the request. Consequently, the IFRS IC decided not to add this matter to its standard-setting agenda."¹¹¹

Accordingly, where a participant in a joint operation has contractual arrangements with customers which do fall within the scope of IFRS 15, it should record revenue from those contracts under IFRS 15, that is, based on its actual sales to customers in that period. No adjustments are to be recorded in revenue to account for any variance between the actual share of production volumes sold to date and the share of production which the party has been entitled to sell to date.

Revenue from contracts with customers recognised in accordance with IFRS 15 is a subset of total revenue recognised by an entity, and must be presented separately as required by IFRS 15. [IFRS 15.113(a)]. However, recording adjustments through other revenue in order to align total revenue earned (i.e., revenue from contracts with customers under IFRS 15 plus other revenue) with the share of production the joint operation participant is entitled to in the period, would not be appropriate. Recording the amounts earned in one period in other revenue and, subsequently, recording them as revenue under IFRS 15 in a future period (or *vice versa*), would result in recycling of revenue earned between two line items in profit or loss and would not be appropriate.

¹¹⁰ IASC Issues Paper, 10.27.

¹¹¹ IFRIC Update, March 2019.

12.4.2 Consideration of cost of goods sold where revenue is recognised in accordance with IFRS 15

If revenue is recognised based on actual sales to customers in the period, and costs are based on invoiced costs to the participants in a joint operation in proportion to their equity interest, there will be a mismatch between the proportion of revenue lifted and sold and the proportion of costs borne.

Entities could determine that it is appropriate to adjust production costs to align volumes for which production costs are recognised with volumes sold (for which revenue has been recognised in accordance with IFRS 15). The accounting for the adjustments to cost of goods sold will depend on whether the imbalances are settled between/among joint operation participants in cash or by physical settlement, as well as whether the joint operation is in an overlift or underlift position.

In the case of physical settlement, an overlift participant would recognise a liability for future expenses by way of future production costs that are not matched by corresponding future revenues. This overlift liability meets the definition of a provision under IAS 37, as the timing and amount of the settlement are uncertain. In applying IAS 37, the amount recognised as a provision should be "...the best estimate of the expenditure required to settle the present obligation at the end of the reporting period," [IAS 37.36], which is "...the amount that an entity would rationally pay to settle the obligation at the end of the reporting period or to transfer it to a third party at that time." [IAS 37.37].

The overlift liability is recorded at the market value or cost of the production imbalance, depending on whether the overlift liability is considered to represent: i) a provision for production costs attributable to the volumes sold in excess of current entitlement (which would likely be recorded at cost); or, ii) an obligation for physical delivery of petroleum product (taken out of the entity's future entitlements) for which fair value measurement may be more appropriate.

Conversely, an underlift participant may recognise an underlift asset depending on whether the underlift participant considers they have: i) a right equivalent to a prepaid commodity purchase; or ii) a right to additional physical inventory, and therefore, applies IAS 2 by analogy. Consistent with IAS 2, an underlift asset would be measured at the lower of cost or net realisable value, [IAS 2.9], or otherwise at net realisable value, if there is a well-established industry practice. [IAS 2.3(a)].

If an overlift or underlift adjustment is recorded in cost of goods sold at fair value, this will result in the joint operator's gross margin reflecting the gross margin that would be earned based on its entitlement interest. If an adjustment were recorded through cost of goods sold at cost, the gross margin shown would reflect the gross margin attributed to the volumes actually sold to customers.

In some instances, not accounting for the effects of imbalances has been justified on the grounds that operating costs for the period should be expensed as incurred because they relate to the period's production activity and not to the revenues recognised.¹¹²

In the case of cash balancing, the underlift asset or overlift liability meets the definition of a financial asset or financial liability respectively, in accordance with IAS 32 and therefore, should be accounted for in accordance with IFRS 9. The initial recognition of that financial asset or financial liability would be at fair value. Depending on the designation of the financial asset or financial liability, subsequent measurement would be either at amortised cost or fair value.

Practical example 12-1 below sets out Equinor ASA's disclosure of its accounting for revenues relating to oil and natural gas properties in which the group has an interest with other entities.

Practical example 12-1: Equinor ASA (2022)	Norway
Annual Report and Form 20-F 2022 [extract] Consolidated financial statements of the Equinor group [extract] Notes to the Consolidated financial statements [extract] 7 Total revenues and other income [extract] Accounting policies [extract] Revenue from contracts with customers [extract]	
Revenues from the production of oil and gas in which Equinor shares an interest with other companies are recognised on the basis of volumes lifted and sold to customers during the period (the sales method). Where Equinor has lifted and sold more than the ownership interest, an accrual is recognised for the cost of the overlift. Where Equinor has lifted and sold less than the ownership interest, costs are deferred for the underlift.	

¹¹² IASC Issues Paper, 10.29.

12.4.3 Facility imbalances

Imbalances that are similar to overlifts and underlifts can also arise on facilities such as pipelines when a venturer delivers more or less product into a pipeline than it takes out in the same period. The resulting accounting issues arising are similar to those concerning overlifts and underlifts.

12.5 Production sharing contracts/arrangements (PSCs)

These arrangements are discussed more generally in section 5.3 above. It is necessary to consider whether such contracts are within the scope of IFRS 15. That is, whether the relationship between the government entity and the contracting enterprise (i.e., the mining company or oil and gas company) represents one between a customer and a supplier.

IFRS 15 defines a customer as: [IFRS 15 Appendix A]

Extract from IFRS 15

Appendix A

Defined terms

customer

A party that has contracted with an entity to obtain goods or services that are an output of the entity's ordinary activities in exchange for consideration.

See Chapter 28 for details.

There are no specific requirements within IFRS accounting standards governing the accounting for PSCs, which has resulted in accounting approaches that have evolved over time. These contracts are generally considered to be more akin to working interest relationships than pure services contracts. This is because the contracting enterprise assumes risks associated with performing the exploration, development and production activities and receives a share (and often a greater share) of future production as specified in the contract. When an entity determines it has an interest in the mineral rights themselves, revenue is recognised only when the mining company or oil and gas company receives its share of the extracted minerals under the PSC and sells those volumes to third-party customers. In other arrangements, the entity's share of production is considered a fee for services (e.g., construction, development and/or operating services) which is recognised as the services are rendered to the national government entity.

IFRS 15 notes that, in certain transactions, while there may be payments between parties in return for what appears to be goods or services of the entity, a counterparty may not always be a 'customer' of the entity. Instead, the counterparty may be a collaborator or partner that shares the results from the activity or process (such as developing an asset in a collaboration arrangement) rather than to obtain the output of the entity's ordinary activities. Generally, contracts with collaborators or partners are not within the scope of the standard, except as discussed below. [IFRS 15.6].

The IASB decided not to provide additional application guidance for determining whether certain revenue generating collaborative arrangements are in the scope of the standard. In the Basis for Conclusions to IFRS 15, it explains that it would not be possible to provide application guidance that applies to all collaborative arrangements. [IFRS 15.BC54].

In determining whether the contract between a government entity and a contracting enterprise is within the scope of the standard, an entity must look to the definition of a customer and what constitutes its 'ordinary activities' and there should also be a transfer of control of a good or service to the customer (if there is one). It may be that certain parts of the PSC relationship involve the contracting enterprise and the national government entity acting as collaborators (and, hence, that part of the arrangement would be outside the scope of IFRS 15), while for other parts of the arrangement the two parties may act as supplier and customer. The latter is in the scope of IFRS 15 and an analysis of the impact of the requirements will be necessary. See Chapter 28.

12.6 Forward-selling contracts to finance development

Mineral and oil and gas exploration and development are highly capital intensive businesses and different financing methods have arisen. At times, obtaining financing for these major projects may be difficult, particularly if equity markets are tight and loan financing is difficult to obtain. Some common structured transactions involve the owner of the mineral interests, or oil and gas interests, i.e., a mining entity or oil and gas entity (the producer), selling a specified volume of future production from a specified property/field to a third party 'investor' for cash. Such arrangements can be referred to as streaming arrangements.

A common example in the mining sector might be a precious metal streaming arrangement where a bulk commodity producer (e.g., a copper producer who has a mine that also produces precious metals as a by-product) enters into an arrangement with a streaming company (the investor). Here the producer receives an upfront cash payment and may also receive an ongoing predetermined per ounce payment for part or all of the by-product precious metal (the commodity) production - ordinarily gold and/or silver, which is traded on an active market. By entering into these contracts, the mining entity is able to access funding by monetising the non-core precious metal, while the investor receives the future production of precious metals without having to invest directly in, or operate, the mine.

We also note that similar types of arrangements are used in the oil and gas sector as a source of funding.

These arrangements can take many forms and accounting for such arrangements can be highly complex. In many situations there is no specific guidance for accounting for these types of arrangements under IFRS accounting standards.

12.6.1 Accounting by the producer

Generally, the accounting for these arrangements by the producer could be one of the following:

- *A sale of a mineral interest* (under IAS 16 or IAS 38) *and a contract to provide services such as extraction, refining, etc.*, in accordance with IFRS 15. This would occur when the arrangement effectively transfers control over a portion of the mine from the producer to the investor and there is an obligation to provide future extraction services.
- *A commodity contract*, which is outside the scope of IFRS 9 and in the scope of IFRS 15. This would only occur when the arrangement is an executory contract to deliver an expected amount of the commodity in the future to the investor from the producer's own operation (i.e., it meets the 'own-use' exemption). If the commodity contract does not meet the own-use exemption, the arrangement will be in scope of IFRS 9.
- *A financial liability* (i.e., debt) in accordance with IAS 32 and IFRS 9. A key factor in determining whether the contract is a financial liability is whether the contract establishes an unavoidable contractual obligation for the producer to make payments in cash or another financial asset, [IAS 32.11, IAS 32.16(a)], that is, whether the arrangement has more of the characteristics of debt.

Whether the arrangement constitutes, a sale of mineral interest, a contract to provide services, a forward sale of a commodity or a debt, is subject to significant judgement.

In each classification, the producer must assess and determine whether the arrangement contains separable embedded derivatives. That is, the producer would need to determine whether the arrangement contains a component or terms which had the effect that some of the cash flows of the combined instrument (being the arrangement) vary in a similar way to a stand-alone derivative (i.e., an embedded derivative).

For both the producer and the investor, each arrangement will have very specific facts and circumstances that will need to be understood and assessed, as different accounting treatments may apply in different circumstances. Understanding the economic motivations and outcomes for both the producer and the investor and the substance of the arrangement are necessary to ensure a robust and balanced accounting conclusion can be reached. In many cases, the route to determining the classification will be a non-linear and iterative process.

The potential implications of IFRS 15 need to be considered for transactions which are considered to be either a sale of a mineral interest with a contract to provide services or a commodity contract.

12.6.1.A Sale of a mineral interest with a contract to provide services

When the nature of the arrangement indicates that the investor's investment is more akin to an equity interest in the project (rather than debt), this could indicate that the producer has essentially sold an interest in a property to the investor in return for the advance. In such a situation, the arrangement would likely be considered (fully or partially) as a sale of a mineral interest. In some instances, some of the upfront payment may also relate to an extraction services contract representing the producer's obligation to extract the investor's share of the future production.

To apply this accounting, an entity would have to be able to demonstrate that the criteria in relation to the sale of an asset in IAS 16 and IAS 38 have been satisfied; that the investor bears the risks and economic benefits of ownership related to the output and control over a portion of the property (a mineral interest); and agrees to pay for a portion or all of the production costs of extracting and/or refining its new mineral interest to the producer. Some of the relevant risks include:

- Production risk (which party bears the risk the project will be unable to produce output or will have a production outage)
- Resource risk (which party bears the risk the project has insufficient reserves to repay the investor)
- Price risk (which party bears the risk the price of the output will fluctuate)

If this is possible, IFRS 15 would indicate that part of this arrangement is outside scope of IFRS 15 and will need to be accounted for in accordance with the applicable IFRS accounting standards. Consequently, the amount paid by the investor will need to be allocated between the sale of the mineral interest and the provision of future extraction services. The mere fact that a portion of consideration was received upfront and a remainder of consideration may be received over the life of the operation does not necessarily mean the upfront payment solely relates to the sale of the mineral interest, or that the subsequent payments due on production relate solely to the provision of future extraction services. For the portion allocated to the sale of the mineral interest, the issues discussed in section 12.9.3 below will need to be considered.

For the portion allocated to the future extraction services, the following provisions of IFRS 15 will need to be considered:

- The identification of performance obligations, i.e., future extraction services (see Chapter 28)
- The determination of the transaction price and whether it contains a significant financing component (see Chapter 28)
- The allocation of the transaction price to those performance obligations and how subsequent changes to the transaction price should be allocated (see Chapter 28)
- Whether the performance obligations are satisfied over time or at a point in time (see Chapter 28)

Given the period over which these extraction services are to be provided may extend for quite some time into the future and/or may change (particularly if they relate to the remaining life of the mine or field), this may lead to some complexity in the accounting. A reasonable degree of uncertainty still exists as to how these issues should be addressed and how they will impact such arrangements.

12.6.1.B Commodity contract - forward sale of future production

A producer and an investor may agree to enter such an arrangement where both parties have an expectation of the amount of the commodity to be delivered under the contract at inception (for example, based on the reserves) and that there may or may not be additional resources. On the basis that the reserves will be delivered under the contract (and the contract cannot be net settled in cash), the mining company or oil and gas company has effectively pre-sold its future production and the investor has made an upfront payment/advance which would be considered a deposit for some or all of the commodity volumes to be delivered at a future date.

In this case, the arrangement is a commodity contract that falls outside the scope of IAS 32 and IFRS 9, but only if the contract will always be settled through the physical delivery of the commodity which has been extracted by the producer as part of its own operations (i.e., it meets the 'own-use exemption' discussed in section 13.1 below). [IAS 32.8, IFRS 9.2.4].

To determine if the own-use exemption applies and continues to apply, the key tests are whether the contract will always be settled through the physical delivery of a commodity (that is, not in cash and would not be considered to be capable of net settlement in cash), and that the commodity will always be extracted by the producer as part of its own operations. This means that there is no prospect of the producer settling part, or the entire advance, by delivering a different commodity or purchasing the commodity on the open market or from a third party.

The issues to be considered under IFRS 15 will be the same as those relating to the provision of future extraction services (see section 12.6.1.A above).

Practical example 12-2 below sets out Barrick Gold Corporation's assessment of its streaming arrangements under IFRS 15.

Practical example 12-2: Barrick Gold Corporation (2022)	Canada
Annual Report 2022 [extract] Notes to consolidated financial statements [extract] 2. Material accounting policy information [extract] e) Revenue Recognition [extract]	
<p>Streaming Arrangements</p> <p>As the deferred revenue on streaming arrangements is considered variable consideration, an adjustment is made to the transaction price per unit each time there is a change in the underlying production profile of a mine (typically in the fourth quarter of each year). The change in the transaction price per unit results in a cumulative catch-up adjustment to revenue in the period in which the change is made, reflecting the new production profile expected to be delivered under the streaming agreement. A corresponding cumulative catch-up adjustment is made to accretion expense, reflecting the impact of the change in the deferred revenue balance.</p>	
3. Critical judgements, estimates, assumptions, and risks [extract]	
<p>Streaming Transactions</p> <p>The upfront cash deposit received from Royal Gold on the gold and silver streaming transaction for production linked to Barrick's 60% interest in the Pueblo Viejo mine has been accounted for as deferred revenue since we have determined that it is not a derivative as it will be satisfied through the delivery of non-financial items (i.e., gold and silver) rather than cash or financial assets. It is our intention to settle the obligations under the streaming arrangement through our own production and if we were to fail to settle the obligations with Royal Gold through our own production, this would lead to the streaming arrangement becoming a derivative. This would cause a change to the accounting treatment, resulting in the revaluation of the fair value of the agreement through profit and loss on a recurring basis. Refer to note 29 for further details.</p> <p>The deferred revenue component of our streaming agreements is considered variable and is subject to retroactive adjustment when there is a change in the timing of the delivery of ounces or in the underlying production profile of the relevant mine. The impact of such a change in the timing or quantity of ounces to be delivered under a streaming agreement will result in retroactive adjustments to both the deferred revenue recognized and the accretion recorded prior to the date of the change. Refer to note 2e. For further details on streaming transactions, including our silver sale agreement with Wheaton Precious Metals Corp. ("Wheaton"), refer to note 29.</p>	

12.6.2 Accounting by the investor

From the investor's perspective, where the accounting becomes more complex is where the investor has acquired a right to receive cash, some quantity or value of a particular commodity, or the option to choose one or the other, or some combination of both. From the investor's perspective, there are generally four common accounting outcomes that are frequently observed:

- Acquisition of a mineral interest (under the principles of IAS 16 or IAS 38) and potentially a prepayment in relation to future services such as extraction, refining, etc., - this would occur when the arrangement effectively transfers control over a portion of the mine/field from the producer to the investor and there is a right to receive future extraction services
- Commodity contract, which is outside the scope of IFRS 9 and in the scope of IAS 38 likely as a prepayment - this would only occur when the arrangement is an executory contract to receive an expected amount of the commodity in the future from the producer and it meets the 'own-use' exemption for the investor. If the commodity contract does not meet the own-use exemption, the arrangement will be in scope of IFRS 9
- A financial asset (i.e., a receivable or some sort of other financial asset) in accordance with IFRS 9 - this would occur when the arrangement establishes a contractual right to receive cash or another financial asset in the future
- A mix of all three

The accounting implications of each for the investor, from a profit or loss perspective, can be significantly different.

12.7 Trading activities

Many mining and metals and oil and gas entities engage in trading activities (e.g., crude oil cargos or coal) and they may either take delivery of the product or resell it without taking delivery. Even when an entity takes physical delivery and becomes the legal owner of a commodity, it may still only be as part of its trading activities. Such transactions do not fall within the normal purchase and sales exemption (see section 13.1 below) when “for similar contracts, the entity has a practice of taking delivery of the underlying and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer’s margin.” [IAS 32.9(c), IFRS 9.2.6(c)]. Where the entity has a practice of settling similar physical commodity-based contracts net in cash, these contracts also do not fall within the normal purchase and sales exemption. [IAS 32.9(b), IFRS 9.2.6(b)]. In that case, the purchase and sales contracts should be accounted for as derivatives within the scope of IFRS 9.

12.8 Embedded derivatives in commodity arrangements

IFRS 15 states that if a contract is partially within scope of this standard and partially in the scope of another standard, entities will first apply the separation and measurement requirements of the other standard(s). [IFRS 15.7]. Therefore, to the extent that there is an embedded derivative contained within a revenue contract, e.g., provisional pricing mechanisms (discussed in more detail in section 12.8.1 below), diesel price linkage in a crude oil contract, or oil price linkage in a gas sales contract, these will continue to be assessed and accounted for in accordance with IFRS 9.

Under IFRS 9, if a feature of a revenue contract is considered to be an embedded derivative that is not closely related to a non-financial host contract; the embedded derivative is required to be separated from the non-financial host contract. If it is closely related, it is not required to be separated. In the event that the embedded derivative is considered to be closely related to the non-financial host contract, once transfer of control of the product has occurred and the entity has an unconditional right to receive cash and the host contract becomes a financial asset (i.e., a receivable), the accounting changes.

Under IFRS 9, embedded derivatives are not separated from a host financial receivable. Instead, the receivable will fail the contractual cash flows test. As a consequence, the whole receivable will have to be subsequently measured at fair value through profit or loss from the date of recognition of that receivable. See Chapter 44 for more information on the classification of financial assets under IFRS 9.

IFRS 15 does not impact the treatment of embedded derivatives under IFRS 9. Revenue within the scope of IFRS 15 will be recognised when control passes to the customer and will be measured at the amount to which the entity expects to be entitled. Any subsequent fair value movements in the receivable would be recognised in profit or loss. However, as a result of the specific disclosure requirements of IFRS 15, these need to be presented separately from IFRS 15 revenue. This is discussed in relation to provisionally priced sales in section 12.8.1 below.

12.8.1 Provisionally priced sales contracts

Sales contracts for certain commodities (e.g., copper and oil) often provide for provisional pricing at the time of shipment. The final sales price is often based on the average quoted market prices during a subsequent period (the ‘quotational period’ or ‘QP’), the price on a fixed date after delivery or the amount subsequently realised by another party (e.g., the smelter or refiner, net of tolling charges).

As discussed in section 13.2.2 below, these QP pricing exposures may meet the definition of an embedded derivative under IFRS 9. The treatment of embedded derivatives in commodity contracts is discussed in more detail in section 12.8 above.

From a revenue recognition perspective, under IFRS 15, revenue will be recognised when control passes to the customer and will be measured at the amount to which the entity expects to be entitled, being the estimate of the price expected to be received at the end of the QP, i.e., the forward price. [IFRS 15.47]. Furthermore, any changes in volume, for example between initial and final assays (where material), will be accounted for as variable consideration under IFRS 15 on the basis that volume adjustments are directly related to the satisfaction of an entity’s performance obligation.

If shipping is considered to be a separate performance obligation, some of the revenue may need to be allocated between the sale of the commodity and provision of shipping services. See section 12.12 below for further discussion.

With respect to the presentation of any fair value movements in the receivable from the date of sale, entities have often presented the QP movements as part of revenue. IFRS 15 does not address the presentation of fair value movements in receivables. Likewise, IFRS 9 does not specify where such movements should be presented in profit or loss.

IFRS 15 only addresses a subset of total revenue (i.e., revenue from contracts with customers). That is, transactions outside the scope of IFRS 15 might result in the recognition of revenue. However, while IFRS 15 does not specifically prohibit fair value movements of a receivable from being described as revenue, it does specifically require an entity to disclose revenue from contracts with customers separately from its other sources of revenue, either in the statement of comprehensive income or in the notes. [IFRS 15.113]. Therefore, entities will need to track these separately.

The Practical examples below set out the accounting policy for provisionally priced sales for Rio Tinto plc and Anglo American Platinum Limited under IFRS 15.

Practical example 12-3: Rio Tinto plc (2022)	United Kingdom
<p>Annual Report 2022 [extract] Financial statements [extract] Notes to the 2022 financial statements [extract] Our financial performance [extract] 6 Revenue by destination and product [extract] Recognition and measurement [extract]</p> <p>Certain of the Group's products may be provisionally priced at the date revenue is recognised and a provisional invoice issued; however, substantially all iron ore and aluminium sales are reflected at final prices in the results for the period. Provisionally priced receivables are subsequently measured at fair value through the income statement under IFRS 9 "Financial Instruments" as described in note 24. The final selling price for all provisionally priced products is based on the price for the quotational period stipulated in the contract. Final prices for copper concentrate are normally determined between 30 and 120 days after delivery to the customer. The change in value of the provisionally priced receivable is based on relevant forward market prices and is included in sales revenue; refer to "Other revenue" within the sales by product disclosure below.</p> <p style="text-align: center;">...</p> <p>(a) Consolidated sales revenue includes both revenue from contracts with customers, accounted for under IFRS 15, and subsequent movements in provisionally priced receivables, accounted for under IFRS 9, and included in "other revenue" above.</p> <p style="text-align: center;">...</p>	

Practical example 12-4: Anglo American Platinum Limited (2022)

United Kingdom

Integrated Annual Report 2022 [extract]

Financial statements and other financial information [extract]

Notes to the financial statements [extract]

Other items [extract]

39. Accounting policies [extract]

C. Financial performance [extract]

Revenue recognition [extract]

Revenue is derived principally from commodity sales. A sale is recognised when control has been transferred. This is usually when title and insurance risk have passed to the customer and the goods have been delivered to a contractually agreed location. Revenue from contracts with customers is measured at the fair value of consideration received or receivable as at the date control is transferred, after deducting discounts, volume rebates, value added tax and other sales taxes. Sales of metal concentrate are stated at their invoiced amount which is net of treatment and refining charges.

Sales of certain commodities are provisionally priced such that the price is not settled until a predetermined future date and is based on the market price at that time or a specified period to that date. These sales are marked to market at each reporting date using the forward price for the period equivalent to that outlined in the contract. Revenue on provisionally priced sales is recognised with reference to the forward market price when control passes to the customer and is classified as revenue from contracts with customers. Subsequent mark-to-market adjustments are recognised in revenue from other sources.

...

12.9 Royalty income

Entities in the extractive industries sometimes enter into arrangements whereby they may receive some form of royalty income. This may arise when they sell some or all their interest in a mining project or oil and gas project and in return agree to accept a future royalty amount which may be based on production and/or payable in cash or in kind. Alternatively, the acquiring entity may pay a net profit interest, that is, a percentage of the net profit (calculated using an agreed formula) generated by the interest sold. There may be other types of arrangements where the mining company or oil and gas company grants another entity a right in return for other types of payments - for example streaming arrangements (see section 12.6 above for more detail).

Accounting for mineral rights and mineral reserves is scoped out of a number of standards including IAS 16, IAS 38 and IFRS 16. Consequently, diverse practice has emerged in the accounting for such transactions.

With respect to these royalty arrangements, these can take a number of different forms and different accounting approaches have emerged. These may include:

- *Future receipt is solely dependent on production:* For some arrangements, the future royalty stream is solely dependent on future production, such that, if there is no future production, no royalty income will be received.

In some instances, the inflows (i.e., the royalty income) and the associated royalty receivable, are only recognised once the related mineral is extracted and the royalty is due, rather than when the interest in the project is originally sold. When such royalty receipts occur, they are often disclosed as either revenue or other income.

An alternate approach observed is that the sale of the mineral interest is considered to create a contractual right to receive these royalty amounts (i.e., a contractual right to receive cash). Therefore, such royalty amounts (and, hence, the related receivable) would be recognised at the date of disposal and included in the calculation of the gain or loss on sale. Further divergence exists as to how subsequent movements in the receivable are recognised in profit or loss (i.e., as revenue or as other gains/losses).

There is more specific guidance when the royalty receivable represents contingent consideration in the sale of a business (see Chapter 41).

- *Minimum additional amount due, but timing linked to production:* In other arrangements, the entity may be entitled to receive a certain additional (minimum) amount of cash regardless of the level of production, but the timing of receipt is linked to future production. This type of arrangement is considered to establish a contractual right to receive cash at the point when the disposal transaction occurs. Therefore, an entity recognises a receivable and the associated income when the arrangement is entered into and this will form part of the gain or loss on sale of the mineral interest.

The impact of IFRS 15 will depend on whether the royalty arrangement is considered to arise from a collaborative arrangement, in the context of a supplier-customer relationship, or from the sale of a non-financial asset.

12.9.1 Royalty arrangements with collaborative partners

As discussed in section 12.5 above, IFRS 15 only addresses contracts with customers for goods or services provided in the ordinary course of an entity's business, it does not apply to arrangements between collaborative partners. [IFRS 15.6]. Where royalties are received by an entity as part of such an arrangement, they will generally not be in the scope of IFRS 15, unless the collaborator or partner meets the definition of a customer for some, or all, aspects of the arrangement. See section 12.9.2 below.

12.9.2 Royalty arrangements with customers

IFRS 15 does not scope out revenue from the extraction of minerals. Therefore, regardless of the type of product being sold, if the counterparty to the contract is determined to be a customer, then the contract will be in scope of IFRS 15.

If a royalty arrangement is considered to be a supplier-customer relationship (and, hence, is in scope), mining entities and oil and gas entities may face a number of challenges in applying IFRS 15 to these arrangements. These may include identifying the performance obligations, determining the transaction price (e.g., if consideration is variable and dependent upon actions by the customer, which would be the case for the future extraction of minerals), applying the constraint on variable consideration, and reallocating the transaction price when and if there is a change in the transaction price. See Chapter 28 for more details on these requirements.

When considering the accounting for such royalties, IFRS 15 contains specific requirements that apply to licences of intellectual property, which may appear similar to some types of royalty arrangements in extractives industries. However, it is important to note that the IFRS 15 requirements only apply to licences of intellectual property and not all sales-based or usage-based royalties. So, the general requirements applicable to variable consideration, including those relating to the constraint, will need to be considered (see Chapter 28 for further discussion).

12.9.3 Royalty arrangements and the sale of non-financial items

If the royalty arrangement is not considered to relate to a contract with a customer nor to a collaborative arrangement, but instead, relates to the sale of a non-financial asset (e.g., an interest in a mining project or oil and gas project), IFRS 15 may still impact these arrangements. This is because the requirements for the recognition and measurement of a gain or loss on the transfer of some non-financial assets that are not the output of an entity's ordinary operations (e.g., property, plant and equipment in the scope of IAS 16), refer to the requirements of IFRS 15 (see Chapter 28 for more detail).

Specifically, an entity needs to:

- Determine the date of disposal and, therefore, the date of derecognition (i.e., the date control transfers to the acquirer) (see Chapter 28 for more detail)
- Measure the consideration to be included in the calculation of the gain or loss arising from disposal including any variable consideration requirements (see Chapter 28 for more detail)
- Recognise any subsequent changes to the estimated amount of consideration (see Chapter 28 for more detail)

Mineral rights and mineral reserves (and, hence, the associated capitalised costs) are outside the scope of both IAS 16 and IAS 38. However, in selecting an accounting policy for the disposal of these assets, in practice, most entities look to the principles of these two standards. Therefore, these requirements are likely to be applied by analogy to arrangements in which an entity sells all (or part) of its mining properties or oil and gas properties and some of the consideration comprises a royalty-based component.

There is also a lack of clarity as to how to apply the requirements of IFRS 15 to such arrangements where, by virtue of the royalty rights, the vendor is considered to have retained an interest in the mineral property. This may impact what is recognised or derecognised from the balance sheet in terms of mineral assets and/or financial assets, and also the gain/loss that is recognised in profit or loss.

There is more specific guidance on when the royalty receivable represents contingent consideration in the sale of a business (see Chapter 10 and Chapter 43).

12.10 Modifications to commodity-based contracts

Mining entities and oil and gas entities frequently enter into long-term arrangements for the sale, transportation or processing of commodities. Over time, these contractual arrangements may be amended to effect changes in tenure, volume, price, or delivery point, for example. This may take the form of amendments, new tranches under existing agreements, or new contractual arrangements. IFRS 15 contains requirements on how to account for changes to a contract depending on whether the change is considered to be a contract modification, a new contract, or a combination of both. Further guidance on contract modifications is set out in Chapter 28.

12.11 Principal versus agent considerations in commodity-based contracts

When identifying performance obligations, there may be some arrangements for which an entity needs to determine whether it is acting as principal or agent. This will be important as it affects the amount of revenue the entity recognises. That is, when the entity is the principal in the arrangement, the revenue recognised is the gross amount to which the entity expects to be entitled. When the entity is the agent, the revenue recognised is the net amount the entity is entitled to retain in return for its services as the agent. The entity's fee or commission may be the net amount of consideration that the entity retains after paying the other party the consideration received in exchange for the goods or services to be provided by that party. The critical factor to consider here is whether the entity has control of the good or service before transferring on to its customer. See Chapter 28 for more information on the principal versus agent indicators.

12.11.1 Relationships with joint arrangement partners

It is not uncommon for valid vendor-customer relationships to exist alongside joint arrangement/collaborator contracts such as joint operating agreements or production sharing contracts. The manager/lead operator of a joint arrangement may have a vendor-customer contract to purchase volumes produced by the non-operating parties. The manager/lead operator would then on sell the product to third parties, and depending on the specific contract terms, could be acting as the principal in the onward sale, or as agent that is selling on behalf of the other joint arrangement partners.

Similarly, an entity with a gathering station or processing plant could purchase commodities from other parties with tenements or fields in the same region at the point of entry into the plant. Both the seller and purchaser would have to consider whether the purchaser is a principal or an agent in the onward sale to the third-party customer and account for the revenue accordingly.

Practical example 12-5: Equinor ASA (2022)

Norway

Annual Report on Form 20-F 2022 [extract]

Consolidated financial statements of the Equinor group [extract]

Notes to the Consolidated financial statements [extract]

7 Total revenues and other income [extract]

Accounting policies [extract]

Transactions with the Norwegian State

Equinor markets and sells the Norwegian State's share of oil and gas production from the Norwegian continental shelf (NCS). The Norwegian State's participation in petroleum activities is organised through the SDFI (the Norwegian State's Direct Financial Interests). All purchases and sales of the SDFI's oil production are classified as purchases [net of inventory variation] and revenues from contracts with customers, respectively.

Equinor sells, in its own name, but for the SDFI's account and risk, the SDFI's production of natural gas. These gas sales and related expenditures refunded by the SDFI are presented net in the Consolidated financial statements. Natural gas sales made in the name of Equinor's subsidiaries are also presented net of the SDFI's share in the Consolidated statement of income, but this activity is reflected gross in the Consolidated balance sheet.

Accounting judgement related to transactions with the Norwegian State

Whether to account for the transactions gross or net involves the use of significant accounting judgement. In making the judgement, Equinor has considered whether it controls the State-originated crude oil volumes prior to onwards sales to third party customers. Equinor directs the use of the volumes, and although certain benefits from the sales subsequently flow to the SDFI, Equinor purchases the crude oil volumes from the SDFI and obtains substantially all the remaining benefits. On that basis, Equinor has concluded that it acts as principal in these sales.

Regarding gas sales, Equinor concluded that ownership of the gas had not been transferred from the SDFI to Equinor. Although Equinor has been granted the ability to direct the use of the volumes, all the benefits from the sales of these volumes flow to the SDFI. On that basis, Equinor is not considered the principal in the sale of the SDFI's natural gas volumes.

...

12.11.2 Royalty payments

As discussed in section 5.7.5 above, mining entities and oil and gas entities frequently enter into a range of different royalty arrangements with owners of mineral rights (e.g., governments or private land-owners) and at times, the treatment is diverse. It is unclear whether, and how, such arrangements should be accounted for under IFRS 15.

In situations where the royalty holder retains or obtains a direct interest in the underlying production, it may be that the relationship between the mining company or oil and gas company and the royalty holder is more like a collaborative arrangement (and, hence, is not within the scope of IFRS 15). See section 12.5 above for further discussion.

If these royalty payments are in scope, the requirements relating to principal versus agent in IFRS 15 will be helpful in assessing how these royalty payments should be presented. Specifically, an entity will need to determine whether it obtains control of all the underlying minerals once extracted, sells the product to its customers and then remits the proceeds to the royalty holder. If so, the mining company or oil and gas company will be considered to be acting as the principal and, hence, would recognise the full amount as revenue with any payments to the royalty holder being recognised as part of cost of goods sold (or possibly as an income tax, depending on the nature of the royalty payment - see section 21 below for further discussion on determining when an arrangement is an income tax). Where the entity does not obtain control over those volumes, it may be acting as the royalty holder's agent and extracting the minerals on its behalf.

The principal versus agent assessment under IFRS 15 is discussed in more detail in Chapter 28 and the issue of how sales (and other similar) taxes should be accounted for are discussed in Chapter 28.

12.12 Shipping

Given the location of the commodities produced in the mining sector and oil and gas sector, they generally have to be shipped to the customer. Such transportation may occur by road, rail or sea. The terms associated with shipping can vary depending on the method of shipping and the contract.

When applying IFRS 15, there are a number of factors to consider in relation to shipping terms linked to customer contracts which are set out below in sections 12.12.1 to 12.12.2.

12.12.1 Identification of performance obligations

Subsequent to the issuance of IFRS 15, there was some debate as to whether shipping represented a separate performance obligation. The issue was raised with the joint Transition Resources Group (TRG) and was also considered by the IASB and US FASB. The US FASB amended their standard to allow US GAAP entities to elect to account for shipping and handling activities performed after the control of a good has been transferred to the customer as a fulfilment cost (i.e., an expense). Without such an accounting policy choice, a US GAAP entity that has shipping arrangements after the customer has obtained control may determine that the act of shipping is a performance obligation under the standard. The IASB did not permit a similar policy choice under IFRS 15.

Given this, when assessing customer contracts, mining entities and oil and gas entities need to consider the requirements of IFRS 15 to determine whether shipping is a separate performance obligation. It is likely that any shipping services provided to a customer after the customer obtains control over a good will represent a separate performance obligation. If this is the case the transaction price for that contract will need to be allocated to the various performance obligations including shipping. Revenue will then be recognised when the goods are delivered and when the shipping services have been provided, either at a point in time or over time.

Practical example 12-6 below illustrates how Rio Tinto plc has identified shipping services in certain types of arrangements to be separate performance obligations.

Practical example 12-6: Rio Tinto plc (2022)**United Kingdom****Annual Report 2022 [extract]****2022 Financial statements [extract]****Notes to the 2022 financial statements [extract]****Our financial performance [extract]****6 Revenue by destination and product [extract]****Recognition and measurement [extract]**

Revenue is principally derived from sale of commodities. We sell the majority of our products on CFR or CIF Incoterms. This means that the Group is responsible (acts as principal) for providing shipping services and, in some instances, insurance after the date at which control of goods passes to the customer at the loading port. The Group, therefore, has separate performance obligations for freight and insurance services that are provided solely to facilitate sale of the products it produces. Other Incoterms commonly used by the Group are Free on Board (FOB), where the Group has no responsibility for freight or insurance once control of the goods has passed at the loading port, and Delivered at Place (DAP), where control of the goods passes when the product is delivered to the agreed destination. For these Incoterms there is only one performance obligation, being the provision of product at the point where control passes.

...

12.12.2 Satisfaction of performance obligations - control assessment

Under IFRS 15, an entity recognises revenue only when it satisfies a performance obligation by transferring control of a promised good or service to the customer and control may be transferred over time or at a point in time. See Chapter 28 for more information.

When assessing contracts with customers, mining entities and oil and gas entities need to carefully examine the terms of their contracts, including shipping terms, in light of the indicators of control, to assess how shipping is required to be accounted for. See Chapter 28 for more information on presentation considerations relating to shipping costs.

It is also worth noting that there may be some shipping arrangements where title to the goods must pass to the carrier during transportation, but the related contract includes a clause that requires the carrier to sell the goods back to the mining company or oil and gas company at the same or another specified price. The impact of repurchase clauses is discussed in section 12.14 below.

Practical example 12-7 below illustrates how Anglo American Platinum Limited recognises revenue from shipping services over time.

Practical example 12-7: Anglo American Platinum Limited (2022)**United Kingdom****Integrated Annual Report 2022 [extract]****Financial statements and other financial information [extract]****Notes to the financial statements [extract]****Other items [extract]****39. Accounting policies [extract]****C. Financial performance [extract]****Revenue recognition [extract]**

Revenue from services is recognised over time in line with the policy above. For contracts which contain separate performance obligations for the sale of commodities and the provision of freight services, the portion of the revenue representing the obligation to perform the freight service is deferred and recognised over time as the obligation is fulfilled. In situations where the Group is acting as an agent, amounts billed to customers are offset against the relevant costs.

...

12.13 Gold bullion sales (mining only)

Under IFRS 15, revenue is recognised only when the identified performance obligation is satisfied by transferring the promised good or service to the customer. A good or service is transferred when the customer obtains control of that good or service.

When mining entities sell gold bullion, there is generally a period of time (usually a matter of days) between when the bullion leaves the mine site with the security shipper and when the gold (fine metal) is credited to the metal account of the customer. In the intervening period, the gold bullion is sent to the refinery where it is refined, 'out turned', and finally, the fine metal is transferred or credited to the customer's metal account.

At the time when the gold bullion leaves the mine site, given the way these transactions are commonly structured, the customer may not control the bullion and the IFRS 15 indicators that determine whether control has transferred, may not be present. That is, the customer may not have the ability to direct the use of, or receive the benefit from, the gold bullion. Instead, these indicators may only be present when the gold bullion is actually credited to the customer's metal account.

Whereas the above applies to contracts for the sale of bullion, most precious metals producers do not have in-house refining capabilities to refine to commercial bullion standards. Instead, they may produce semi-refined bars that are shipped to third party refiners (who specialize in refining to bullion standard), and are then converted into bullion. As a manner of optimizing working capital and aligning cash flows with production, it is common for gold producers to arrange the sale of the "material metal content", meaning the gold contained in the semi-refined bars at a point prior to it being refined into bullion. Under these arrangements, key terms (price and quantity) have been agreed to, the producer may be entitled to payment, and the customer has the ability to direct the metals at a point prior to the completion of refining into bullion. Terms may be indicative of multiple performance obligations (the transfer of control over the material metal content, and the separate arrangement for provision of refining services), and control over the material metal content may pass to the customer at a point prior to it having been converted into refined bullion. Careful consideration of contractual terms will be required.

12.14 Repurchase agreements

Some agreements in the extractive industries include repurchase provisions, either as part of a sales contract or as a separate contract, that relate to the goods in the original agreement or similar goods (e.g., tolling, processing or shipping agreements). The application guidance to IFRS 15 clarifies the types of arrangements that qualify as repurchase agreements. The repurchased asset may be the asset that was originally sold to the customer, an asset that is substantially the same as that asset or another asset of which the asset that was originally sold is a component. [IFRS 15.B64].

IFRS 15 specifically notes that repurchase agreements generally come in three forms:

- An entity's obligation to repurchase the asset (a forward)
 - An entity's right to repurchase the asset (a call option)
- And
- An entity's obligation to repurchase the asset at the customer's request (a put option) [IFRS 15.B65]

Where a repurchase agreement exists, this may change whether and when revenue is recognised. See Chapter 28 for more details on repurchase agreements. See section 20 below for discussion on tolling arrangements.

12.15 Multi-period commodity-based sales contracts

In the extractive industries, entities commonly enter into long-term (multi-period) commodity-based sales contracts. There are a range of different issues to be considered when applying IFRS 15 in accounting for such arrangements.

12.15.1 Identify the contract

Judgement will need to be applied when identifying the contract for these long-term arrangements. A contract is an agreement between two or more parties that creates enforceable rights and obligations. [IFRS 15 Appendix A]. Entities will need to determine what the enforceable part of the contract is. For example, whether there is a specified minimum the customer must buy (e.g., in take-or-pay contracts - see section 12.16 below), whether it is the overall agreement, sometimes referred to as the master services agreement, or whether it is each purchase order. See Chapter 28 for more details.

12.15.2 Identify the performance obligations

The next step is to identify all the promised goods or services within the contract to determine which will be treated as separate performance obligations. Chapter 28 explores in detail the requirements for determining whether a good or service is distinct, whether the transfer of a good or service represents a separate performance obligation and/or whether (and when) they need to be bundled.

During the development of IFRS 15, some respondents thought it was unclear whether a three-year service or supply contract would be accounted for as a single performance obligation or a number of performance obligations covering smaller time periods (e.g., yearly, quarterly, monthly, daily) or individual units such as ounces, tonnes or barrels.

IFRS 15 clarifies that even if a good or service is determined to be distinct, if that good or service is part of a series of goods and services that are substantially the same and have the same pattern of transfer, that series of goods or services is treated as a single performance obligation. However, before such a treatment can be applied, specific criteria must be met. See Chapter 28 for further discussion and guidance.

Given the nature of these multi-period commodity-based sales arrangements, each unit (e.g., each metric tonne (mt) of coal or each barrel of oil), would likely be a distinct good and therefore, each unit would represent a separate performance obligation that is satisfied at a point in time. Because such goods are satisfied at a point in time, they would not meet the criteria to be considered a series of distinct goods that would have to be treated as a single performance obligation.

In addition, any option for additional goods or services will need to be evaluated to determine if those goods or services should be considered a separate performance obligation. See Chapter 28 for further discussion.

Practical example 12-8 below illustrates Rio Tinto plc's policy for identifying performance obligations in commodity sales contracts.

Practical example 12-8: Rio Tinto plc (2022)	United Kingdom
Annual Report 2022 [extract] 2022 Financial statements [extract] Notes to the 2022 financial statements [extract] Our financial performance [extract] 6 Revenue by destination and product [extract] Recognition and measurement [extract]	
<p>Within each sales contract, each unit of product shipped is a separate performance obligation. Revenue is generally recognised at the contracted price as this reflects the stand-alone selling price. Sales revenue excludes any applicable sales taxes. Sales of copper concentrate are stated net of the treatment and refining charges which will be required to convert it to an end product.</p> <p>...</p>	

Practical example 12-9 below illustrates Equinor ASA's policy for identifying performance obligations, and, whether they are recognised at a point in time or over time.

Practical example 12-9: Equinor ASA (2022)	Norway
Annual Report on Form 20-F 2022 [extract] Consolidated financial statements of the Equinor group [extract] Notes to the Consolidated financial statements [extract] 7 Total revenues and other income [extract] Accounting policies [extract]	
<p>Revenue from contracts with customers</p> <p>Revenue from the sale of crude oil, natural gas, petroleum products and other merchandise is recognised when a customer obtains control of those products, which normally is when title passes at point of delivery, based on the contractual terms of the agreements. Each such sale normally represents a single performance obligation. In the case of natural gas, which is delivered on a continuous basis through pipelines, sales are completed over time in line with the delivery of the actual physical quantities.</p> <p>...</p>	

12.15.3 Determine the transaction price

The transaction price is the amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties (e.g., some sales taxes). When determining the transaction price, an entity should consider the effects of all the following:

- Variable consideration (including any related constraint)
- A significant financing component (i.e., the time value of money)
- Non-cash consideration
- Consideration payable to a customer

In many cases, the transaction price is readily determinable because the entity will receive payment at or near the same time as it transfers the promised good or service and the price is fixed for the minimum committed purchases. However, determining the transaction price may be more challenging when it is variable in amount, when payment is received at a time that is different from when the entity provides the goods or services and the effect of the time value of money is significant to the contract, or when payment is in a form other than cash. See Chapter 28 for more information.

For a fixed price contract, this step will be relatively straightforward. For variable price contracts, determining the transaction price may appear to be significantly more complex than for a fixed price contract. Many commodity sales contracts contain market-based or index-based pricing terms that create variable consideration. After separating out any parts of the transaction price that are within the scope of another standard (e.g., IFRS 9, see section 12.8 above), an entity will need to determine whether it should partially or fully constrain the portion of the variable transaction price. Chapter 28 discusses variable consideration and, in particular, the requirements relating to the constraint.

12.15.4 Allocate the transaction price

The next step is to allocate the transaction price to the performance obligations, generally in proportion to their stand-alone selling prices (i.e., on a relative stand-alone selling price basis), with two exceptions relating to the allocation of variable consideration and discounts. See Chapter 28 for detail. With commodity-based sales contracts, there are a number of things to consider depending on whether the transaction price is variable (or contains a variable component), fixed and/or whether there is a discount. Some factors to consider with variable and fixed consideration are discussed below, while the allocation of a discount is discussed in Chapter 28.

12.15.4.A Variable consideration

If certain criteria are met, an entity will need to allocate variable consideration (e.g., the market- or index-based price) to one or more, but not all, performance obligations (i.e., the distinct commodities transferred in that period) or distinct goods or services in a series (where relevant), instead of using the relative stand-alone selling price allocation approach to allocate variable consideration proportionately to all performance obligations. See Chapter 28 for detail on these criteria.

12.15.4.B Fixed consideration

Entities that have fixed-price commodity-based sales contracts that call for deliveries over multiple periods need to determine the stand-alone selling price of the performance obligations to allocate the transaction price if they do not qualify to be combined into a single performance obligation as a series of distinct goods (discussed further in section 12.15.2 above). IFRS 15 states that the stand-alone selling price is the price at which an entity would sell a promised good or service separately to a customer. *[IFRS 15 Appendix A]*. This is best evidenced by the observable price of a good or service when the entity sells it separately in similar circumstances and to similar customers. In other cases, it must be estimated. Estimating the stand-alone selling price may require judgement in long-term fixed-price commodity-based sales contracts, particularly when forward prices are available for the commodity being sold in a location with an active market.

If stand-alone selling prices are not directly observable, entities are required to consider all information (including market conditions, entity-specific factors and information about the customer or class of customer) that is reasonably available to determine the stand-alone selling price for each performance obligation. An entity could consider a number of factors in making this estimate, such as the forward curve, spot prices, expectations of market supply and demand shifts that are not represented in the forward curve or spot prices and expected transportation and storage capacity constraints that lead to premiums or discounts. Entities are required to maximise the use of observable inputs and apply similar estimation

methods consistently in similar circumstances. The standard sets out a number of different approaches for doing this. See Chapter 28 for further discussion.

12.15.5 Recognise revenue

Finally, an entity will recognise revenue once each performance obligation is satisfied which will occur when control of the good transfers to the customer. As discussed earlier, for long-term commodity-based sales arrangements, the performance obligations are likely to be satisfied at a point in time. See Chapter 28 for more information on how to determine when a performance obligation is satisfied. The precise timing of when control transfers to a customer may be impacted by the shipping terms associated with each contract. See section 12.12 above and Chapter 28 for further discussion on shipping.

Practical example 12-10 below illustrates Rio Tinto plc's policy for determining when control of its commodity sales passes.

Practical example 12-10: Rio Tinto plc (2022)	United Kingdom
<p>Annual Report 2022 [extract] 2022 Financial statements [extract] Notes to the 2022 financial statements [extract] Our financial performance [extract] 6 Revenue by destination and product [extract] Recognition and measurement [extract]</p> <p>Sales revenue is recognised on individual sales when control transfers to the customer. In most instances, control passes and sales revenue is recognised when the product is delivered to the vessel or vehicle on which it will be transported once loaded, the destination port or the customer's premises. There may be circumstances when judgment is required based on the five indicators of control below:</p> <ul style="list-style-type: none"> – The customer has the significant risks and rewards of ownership and has the ability to direct the use of, and obtain substantially all of the remaining benefits from, the good or service. – The customer has a present obligation to pay in accordance with the terms of the sales contract. For shipments under the Incoterms Cost, Insurance and Freight (CIF)/Carriage Paid to (CPT)/Cost and Freight (CFR) this is generally when the ship is loaded, at which time the obligation for payment is for both product and freight. – The customer has accepted the asset. Sales revenue may be subject to adjustment if the product specification does not conform to the terms specified in the sales contract but this does not impact the passing of control. Assay and specification adjustments have been immaterial historically. – The customer has legal title to the asset. The Group usually retains legal title until payment is received for credit risk purposes only. – The customer has physical possession of the asset. This indicator may be less important as the customer may obtain control of an asset prior to obtaining physical possession, which may be the case for goods in transit. <p style="text-align: center;">...</p>	

12.16 Take-or-pay contracts

A take-or-pay contract is a specific type of long-term commodity-based sales agreement between a customer and a supplier in which the pricing terms are set for a specified minimum quantity of a particular good or service. The customer must pay the minimum amount as per the contract, even if it does not take the volumes. There may also be options for additional volumes in excess of the minimum.

We discuss some of the broader accounting considerations associated with these contracts further in section 19.2 below. When applying IFRS 15, in addition to the issues outlined in section 12.15 above, the matters outlined below may also need to be considered.

12.16.1 Volumes paid for, but not taken

A feature unique to take-or-pay contracts is the terms relating to payments made for volumes not taken, as explained further in section 19.2.1 below. The requirements of IFRS 15 may result in different accounting considerations and possibly different conclusions depending on the specific facts and circumstances of each arrangement.

12.16.1.A Payments cannot be applied to future volumes

If payments received for unused volumes cannot be applied to future volumes, the seller has no obligation to deliver the unused volumes in the future. Such amounts can generally only be recognised as revenue once the seller's obligations no longer exist (i.e., once the customer's right to volumes has expired unused).

For most take-or-pay contracts, such an assessment may only be possible at the end of a pre-defined period (e.g., the end of each contract year). This is because the customer's rights have technically not expired and the entity is still obliged to deliver volumes if the customer requests them, until the end of the stated period. This treatment is consistent with current practice.

The standard does, however, consider whether it may be possible to recognise revenue in relation to a customer's unexercised rights earlier through the requirements relating to breakage. This is discussed in more detail in section 12.16.2 below.

12.16.1.B Payments can be applied to future volumes

If payments received for unused volumes can be applied to future volumes, the seller has received consideration in advance for some future unsatisfied performance obligations (i.e., the delivery of the unused volumes at some point in the future). This amount represents a contract liability.

In this situation, an entity will need to determine how such future volumes can be taken. That is, whether the timing of the future transfer of those volumes is at the discretion of the customer or is determined by the entity itself. This determination will be important as it may require an assessment of the time value of money (i.e., the existence of a significant financing component). See Chapter 28 for further discussion.

It will also be necessary for an entity to understand whether the customer is likely to take its unused volumes as this may require an assessment of the requirements relating to unexercised customer rights or breakage (see section 12.16.2 below for further information). This could impact the amount and timing of revenue recognised.

Such determinations will need to be made in light of the contract terms and an assessment of the expected customer behaviours. For example, such an assessment may involve considering whether the make-up volumes:

- Will be the first volumes taken at the start of the following period
- Can only be taken after the minimum volumes have been satisfied in the following periods
- Can only be taken after a certain amount of time or at the end of the contract period

12.16.2 Breakage (customers' unexercised rights)

The standard requires that when an entity receives consideration that is attributable to a customer's unexercised rights, the entity is to recognise a contract liability equal to the amount prepaid by the customer (because the entity has not yet satisfied the performance obligations to which the payment relates). However, IFRS 15 discusses the situation where, in certain industries, customers may pay for goods or services in advance, but may not ultimately exercise all of their rights to these goods or services - either because they choose not to or are unable to. IFRS 15 refers to these unexercised rights as 'breakage'. [IFRS 15.B44, IFRS 15.B45, IFRS 15.B46, IFRS 15.B47].

IFRS 15 states that when an entity expects to be entitled to a breakage amount, the expected breakage will be recognised as revenue in proportion to the pattern of rights exercised by the customer. Otherwise, breakage amounts will only be recognised when the likelihood of the customer exercising its right becomes remote. See Chapter 28 for more information.

This may apply to take-or-pay contracts, for which payments are received in relation to make-up volumes and the customer's rights remain unexercised. Such breakage provisions may be applicable if:

- A customer is unable to use the make-up volumes in other areas of its own operations.
- A customer is unable to store the make-up volumes and use them after the take-or-pay contract has expired.
- A customer is unable to take delivery of the make-up volumes and sell them into the market.
- There are limitations (physical or contractual) that prevent the customer from taking all of the make-up volumes.

For take-or-pay contracts, this may mean that an entity may be able to recognise revenue in relation to breakage amounts in an earlier period, provided it can demonstrate it is not required to constrain its estimate of breakage. This could potentially occur in the following ways:

- At contract inception, the mining entity or oil and gas entity may be able to reliably estimate the amount of breakage and would include that amount in the transaction price and allocate that to expected actual usage.
- If the entity cannot estimate an amount of breakage, it will recognise the revenue associated with those unexercised rights when it becomes remote that they will be exercised. This could occur during a make-up period after the initial term of the contract or when the deficiency make-up period expires outright (which would be consistent with current accounting).

It is also possible that, given the nature of these arrangements and the inherent uncertainty in being able to predict a customer's behaviour, it may be difficult to satisfy the requirements relating to constraint because the entity's experience may not be predictive of the outcome at this level of certainty (i.e., highly probable).

13 Financial instruments

13.1 Normal purchase and sales exemption

Contracts to buy or sell non-financial items generally do not meet the definition of a financial instrument because the contractual right of one party to receive a non-financial asset or service and the corresponding obligation of the other party do not establish a present right or obligation of either party to receive, deliver or exchange a financial asset. For example, contracts that provide for settlement only by the receipt or delivery of non-financial items (e.g., forward purchase of oil or a forward purchase of copper) are not financial instruments. However, some of these contracts are traded in a standardised form on organised markets in the same way as derivative financial instruments. The parties buying and selling the contract are, in effect, trading the underlying commodity. The ability to buy or sell a commodity contract for cash does not alter the characteristics of the contract and make it into a financial instrument. Nevertheless, some contracts to buy or sell non-financial items that can be settled net or by exchanging financial instruments, or in which the non-financial item is readily convertible to cash, are within the scope of the IAS 32 and IFRS 9 as if they were financial instruments. [IAS 32.8, IAS 32.AG20].

IAS 32 and IFRS 9 are required to be applied to those contracts to buy or sell a non-financial item that can be settled net as if the contracts were financial instruments, whether this be in cash, another financial instrument, or by exchanging financial instruments, unless the contracts were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. [IAS 32.8, IFRS 9.2.4].

There are various ways in which a contract to buy or sell a non-financial item can be settled net, including:

- (a) The terms of the contract permit either party to settle it net
- (b) The ability to settle the contract net is not explicit in its terms, but the entity has a practice of settling similar contracts net (whether with the counterparty, by entering into offsetting contracts or by selling the contract before its exercise or lapse)
- (c) For similar contracts, the entity has a practice of taking delivery of the underlying and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin
- (d) The non-financial item that is the subject of the contract is readily convertible to cash, e.g., precious metals or base metals quoted on the London Metal Exchange are considered to be readily convertible to cash [IAS 32.9, IFRS 9.2.6]

There is no further guidance in IFRS 9 explaining what is meant by 'readily convertible to cash'. Typically, a non-financial item would be considered readily convertible to cash if it consists of largely fungible units and quoted spot prices are available in an active market that can absorb the quantity held by the entity without significantly affecting the price. Further discussion on the net settlement criteria can be found in Chapter 41.

Commodity-based contracts that are excluded from IAS 32 and IFRS 9 are contracts that were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. Contracts that fall within this exemption, which is known as the 'normal purchase or sale exemption', 'executory contract exemption' or 'own-use exemption', are accounted for as executory contracts. An entity recognises such contracts in its statement of financial position only when one of the parties meets its obligation under the contract to deliver either cash or a non-financial asset. [CF 4.46].

The IASB views the practice of settling net or taking delivery of the underlying and selling it within a short period after delivery as an indication that the contracts are not normal purchases or sales. Therefore, contracts to which (b) or (c) apply cannot be subject to the normal purchase or sale exemption. Other contracts that can be settled net are evaluated to determine whether this exemption can actually apply. [IAS 32.9, IFRS 9.2.6, IFRS 9.BC22.18].

A written option to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, in accordance with (a) or (d) must be accounted for under IFRS 9 and does not qualify for use of the normal purchase or sale exemption. [IFRS 9.2.7, IFRS 9.BC22.18].

The conditions associated with the use of the normal purchase or sale exemption often pose problems for mining entities and oil and gas entities because, historically, they have settled many purchase and sales contracts on a net basis.

A further problem may arise when a mining company or oil and gas company holds a written option for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements - because IFRS 9 would require such contracts to be accounted for as derivative financial instruments.

How we see it

From time-to-time mining entities and oil and gas entities may need to settle contracts for the sale of commodities on a net basis because of operational problems. Such a situation may mean that the company would usually need to treat those contracts as derivative financial instruments under IFRS 9 as they may now have a practice of settling net under (b) or (c) above. Where this situation is caused by a unique event beyond management's control, a level of judgement will be required to determine whether that would prevent the company from applying the own use exemption to similar contracts. This is required to be assessed on a case-by-case basis.

Judgement will also be required as to what constitutes 'similar contracts'. The definition of similar contracts in IFRS 9, [IFRS 9.2.6], considers the intended use for such contracts. This means that contracts identical in form may be dissimilar due to their intended use, e.g., own purchase requirements versus proprietary trading. If the intended use is for normal purchase or sale, such an intention must be documented at inception of the contract. A history of regular revisions of expected purchase or sale requirements could impair the ability of a company to distinguish identical contracts as being dissimilar.

IFRS 9 provides a fair value option for own use contracts. At the inception of a contract, an entity may make an irrevocable designation to measure an own use contract at fair value through profit or loss (the 'fair value option') even if it was entered into for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirement. However, such designation is only allowed if it eliminates or significantly reduces an accounting mismatch that would otherwise arise from not recognising that contract because it is excluded from the scope of IFRS 9.

[IFRS 9.2.5].

See Chapter 41 for more information on the normal purchase and sales exemption.

Practical example 13-1 below from Alkane Resources Limited's 2022 financial statements illustrate how this could affect an entity's reported financial position.

Practical example 13-1: Alkane Resources Limited (2022)

Australia

Annual Report 2022 [extract]

Financial report [extract]

Financial Statements [extract]

Notes to the consolidated financial statements [extract]

Note 27. Commitments [extract]

(b) Physical gold delivery commitments

As part of its risk management policy, the group enters into derivatives including gold forward contracts and gold put options to manage the gold price of a proportion of anticipated gold sales.

Alkane purchased gold forward sales and put options as part of a risk mitigation strategy on any potential downward price pressure while Tomingley was processing the low grade stockpiles during the year.

The gold forward sales contracts disclosed below did not meet the criteria of financial instruments for accounting purposes on the basis that they met the normal purchase/sale exemption because physical gold would be delivered into the contract. Accordingly, the contracts were accounted for as sale contracts with revenue recognised in the period in which the gold commitment was met. The balances in the table below relate to the value of the contracts to be delivered into by transfer of physical gold.

	Gold for physical delivery Ounces	Contracted gold sale price per ounce (\$)	Value of committed sales \$'000
30 June 2022			
Fixed forward contracts			
Within one year	36,800	2,716	99,949
30 June 2021			
Fixed forward contracts			
Within one year	24,000	2,307	55,368

13.2 Embedded derivatives

A contract that qualifies for the normal purchase and sale exemption still needs to be assessed for the existence of embedded derivatives. An embedded derivative is a component of a hybrid or combined instrument that also includes a non-derivative host contract; it has the effect that some of the cash flows of the combined instrument vary in a similar way to a stand-alone derivative. In other words, it causes some or all of the cash flows that otherwise would be required by the contract to be modified according to a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other underlying variable (provided in the case of a non-financial variable that the variable is not specific to a party to the contract). [IFRS 9.4.3.1].

The detailed requirements regarding the separation of embedded derivatives and the interpretation and application of those requirements under IFRS 9 are discussed in Chapter 42. A number of issues related to embedded derivatives that are of particular importance to the extractive industries are discussed in sections 13.2.1 to 13.2.4 below.

13.2.1 Foreign currency embedded derivatives

The most common embedded derivatives in the extractive industries are probably foreign currency embedded derivatives which arise when a producer of minerals sells these in a currency that is not the functional currency of any substantial party to the contract, the currency in which the price of the related commodity is routinely denominated in commercial transactions around the world or a currency that is commonly used in contracts to purchase or sell non-financial items in the economic environment in which the transaction takes place. [IFRS 9.B4.3.8(d)]. A more detailed analysis of these requirements can be found in Chapter 42.

13.2.2 Provisionally priced sales contracts

As discussed above in section 12.8.1, sales contracts for certain commodities (e.g., copper and oil) often provide for provisional pricing at the time of shipment, with final pricing based on the average market price for a particular future period, i.e., the 'quotational period'.

If the contract is cancellable without penalty before delivery, the price adjustment feature does not meet the definition of a derivative because there is no contractual obligation until delivery takes place.

If the contract is non-cancellable, the price adjustment feature is considered to be an embedded derivative. The non-financial contract for the sale or purchase of the product, e.g., copper or oil, at a future date would be treated as the host contract.

For non-cancellable contracts, there will be a contractual obligation, but until control passes to the customer, the embedded derivative would be considered to be closely related to the non-financial host commodity contract and does not need to be recorded separately.

As discussed in section 12.8.1 above, revenue is recognised when control passes to the customer. At this point, the non-financial host commodity contract is considered to be satisfied and a corresponding receivable is recognised. However, the receivable is still exposed to the price adjustment feature. As discussed in section 12.8 above, under IFRS 9, embedded derivatives are not separated from financial assets, i.e., from the receivable. Instead, the receivable will need to be measured at fair value through profit or loss in its entirety. See Chapter 44 for more information on the classification of financial assets.

13.2.3 Long-term supply contracts

Long-term supply contracts sometimes contain embedded derivatives because of a desire to shift certain risks between contracting parties or as a consequence of existing market practices. The fair value of embedded derivatives in long-term supply contracts can be highly material to the entities involved. For example, in the mining sector electricity purchase contracts sometimes contain price conditions based on the commodity that is being sold, which provides an economic hedge for the mining company. While the electricity price component (if fixed) would meet the definition of an embedded derivative, it would be considered closely related to the host contract and hence would not have to be separated. However, the linkage to the commodity price would be unlikely to be considered closely related and would likely have to be separately accounted for as an embedded derivative. In the oil and gas sector the sales price of gas is at times based on the price of electricity, which provides an economic hedge for the utility company that purchases the gas, and would also likely represent an embedded derivative that has to be separately accounted for. See Chapter 42 for further discussion.

13.2.4 Development of gas markets

Where there is no active local market in gas, market participants may enter into long-term contracts that are priced on the basis of a basket of underlying factors, such as oil prices, electricity prices and inflation indices. In the absence of an active market in gas, such price clauses are not considered to give rise to embedded derivatives because there is no accepted benchmark price for gas that could have been used instead.

An entity that applies IFRS 9 is required to assess whether an embedded derivative is required to be separated from the host contract (provided that host contract is not a financial asset (see section 12.8 above for more information)) and accounted for as a derivative when the entity first becomes a party to the contract. [IFRS 9.B4.3.11]. Subsequent reassessment of embedded derivatives under IFRS 9 is generally prohibited. [IFRS 9.B4.3.11]. See Chapter 42 for more information. Therefore, in the case of gas, when an active market subsequently develops, an entity is not permitted to separate embedded derivatives from existing gas contracts, unless there is a change in the terms of the contract that significantly modifies the cash flows that otherwise would be required under the contract. However, if the entity enters into a new gas contract with exactly the same terms and conditions, it would be required to separate embedded derivatives from the new gas contract.

How we see it

Judgement is required in determining whether there is an active market in a particular geographic region and the relevant geographic market for any type of commodity. Where no active market exists, consideration will need to be given to the industry practice for pricing such commodity-based contracts. A pricing methodology that is consistent with industry practice would generally not be considered to contain embedded derivatives.

Practical example 13-2 below from BP International Limited's financial statements shows the company's previous approach to embedded derivatives before and after the development of an active gas trading market in the UK, and demonstrates that the fair value of embedded derivatives in long-term gas contracts can be quite significant.

Practical example 13-2: BP International Limited (2021)

United Kingdom

ANNUAL REPORT AND FINANCIAL STATEMENTS 2021 [extract]

Notes to the financial statements [extract]

20. Derivatives and other financial instruments [extract]

Embedded derivatives

Prior to the development of an active gas trading market, UK gas contracts were priced using a basket of available price indices, primarily relating to oil products, power and inflation. After the development of an active UK gas market, certain contracts were entered into or renegotiated using pricing formulae not directly related to gas prices, for example, oil product and power prices. In these circumstances, pricing formulae have been determined to be derivatives, embedded within the overall contractual arrangements that are not clearly and closely related to the underlying commodity. The resulting fair value relating to these contracts is recognized on the balance sheet with gains or losses recognized in the profit and loss account. All embedded derivatives are valued using inputs that include price curves for each of the different products that are built up from active market pricing data. Where necessary, these are extrapolated to the expiry of the contracts (the last of which is in 2018) using all available external pricing information. Additionally, where limited data exists for certain products, prices are interpolated using historic and long-term pricing relationships.

...

13.3 Volume flexibility in supply contracts

It is not uncommon for other sales contracts, such as those with large industrial customers, to contain volume flexibility features. For example, a supplier might enter into a contract requiring it to deliver, say, 100,000 units at a given price as well as giving the counterparty the option to purchase a further 20,000 units at the same price. Often such a supply contract will be readily convertible to cash as parties to the contract can settle the contract on a net basis, as discussed in section 13.1 above. For example, precious metals or base metals quoted on the London Metal Exchange or oil contracts are considered to be readily convertible to cash, whereas bulk materials without spot prices (e.g., coal and iron ore) are generally not considered to be readily convertible to cash. However, with increasing levels of liquidity in certain commodities, this view may need to be reconfirmed/re-challenged before concluding that this remains the case.

If the customer has access to markets for the non-financial item and, following the guidance of the IFRS IC the supplier might consider such a contract to be within the scope of IFRS 9 as it contains a written option (see Chapter 41). However, some would say that the supplier could split the contract into two separate components for accounting purposes: a forward contract to supply 100,000 units (which may qualify as a normal sale and so meet the recognition exemption) and a written option to supply 20,000 units (which would not). Arguments put forward include:

- The parties could easily have entered into two separate contracts, a forward contract and a written option.
- It is appropriate to analogise to the requirements for embedded derivatives and separate a written option from the normal forward sale or purchase contract because it is not closely related.

Some contracts, however, contain operational volume tolerances such as, in the case of certain oil purchase and sale contracts, a volume that is plus or minus a certain (often quite small) percentage of the stated quantity. These tolerances relate to physical changes in the volume during transportation caused by, for example, evaporation. The optionality within the contract typically cannot be monetised by either party but, instead is a practical requirement of the contract. In such cases, the optionality would not be considered a separate derivative within the scope of IFRS 9. In other cases, however, the volume tolerance may be greater than that which is required for practical reasons. This optionality could give one party the ability to benefit from changing underlying prices and could be considered a separate derivative. Judgement is required in assessing the nature of these volume tolerances.

This issue is discussed in more detail in Chapter 41.

13.4 Hedging sales of metal concentrate (mining)

In the mining sector certain commodities are often sold in the form of a concentrate that comprises two or more metals and impurities. These concentrates are the output of mines and are sold and shipped to smelters for treatment and refining in order to extract the metals in their pure form from the concentrate (or, alternatively, the concentrate may be sold to traders who will subsequently sell and ship to smelters). The metal content of concentrate varies depending on the mine and grade of ore being mined. The sales proceeds of concentrate are typically determined as the total of the payments for the actual content of each of the metals contained in a given concentrate shipment and they reflect the condition in which the metal is sold (i.e., unrefined, still being dissolved in concentrate). Typical pricing formulas are based on the price for dissolved metal off the quoted price for refined metal (e.g., the London Metal Exchange (LME)), with deductions for amounts that reflect the fact that the metal sold is not treated and/or refined. Actual deductions may vary by contract but typically comprise treatment and refining charges, price participation clauses, transportation, impurity penalties, etc.

Under IFRS 9, an entity is permitted to designate a risk component of a non-financial item as the hedged item in a hedging relationship, provided the risk component is separately identifiable and reliably measurable. See Chapter 49 for IFRS 9 hedge accounting requirements and Chapter 49 for further information on hedging of risk components. These considerations also apply from the perspective of an entity that purchases metals in the form of a concentrate.

14 Inventories

Inventories are required to be measured at the lower of cost and net realisable value under IAS 2. However, IAS 2 does not apply to the measurement of "... minerals and mineral products, to the extent that they are measured at net realisable value in accordance with well-established practices in those industries".

[IAS 2.3(a)]. There is also an exception for "commodity broker-traders who measure their inventories at fair value less costs to sell. When such inventories are measured at fair value less costs to sell, changes in fair value less costs to sell are recognised in profit or loss in the period of the change". [IAS 2.3(b)]. This is discussed further in section 14.4 below.

Where inventory is measured at cost, various cost methods are acceptable under IFRS accounting standards and include specific identification, weighted average costs, or first-in first-out (FIFO). Last-in first-out (LIFO) is not permitted under IFRS accounting standards. [IAS 2.BC9].

The IFRS IC received a request for clarification on how to determine which costs should be included as part of the "costs necessary to make the sale" when determining the net realisable value in accordance with IAS 2. The IFRS IC confirmed via their agenda decision that entities are not permitted to limit the cost to only those that are incremental. Judgement will be needed to determine which costs are necessary to sell inventories and an entity will be required to consider specific facts and circumstances, including the nature of the inventory. See Chapter 23 for further information.

Issues that mining entities and oil and gas entities commonly face in relation to inventory include:

- Point of recognition (see section 14.1 below)
- Cost absorption in the measurement of inventory
- Method of allocating costs to inventory, e.g., FIFO or weighted average
- Determination of joint and by-products and measurement consequences (see section 14.2 below)
- Accounting for core inventories (see section 14.3 below)
- Measuring inventory at fair value (see section 14.4 below)

Additional issues relating to inventory for mining entities include:

- Accounting for stockpiles of long-term, low grade ore (see section 14.5 below)
- Heap leaching (see section 14.6 below)

14.1 Recognition of work in progress

Determining when to start recognising inventory is more of an issue for mining entities than oil and gas entities. Inventory is recognised when it is probable that future economic benefits will flow to the entity and the asset has a cost or value that can be reliably measured.

Oil and gas entities often do not separately report work-in-progress inventories of either oil or gas. As is noted in the IASC Issues Paper "the main reason is that, at the point of their removal from the earth, oil and gas frequently do not require processing and they may be sold or may be transferred to the enterprise's downstream operations in the form existing at the time of removal, that is, they are immediately recognised as finished goods. Even if the oil and gas removed from the earth require additional processing to make them saleable or transportable, the time required for processing is typically minimal and the amount of raw products involved in the processing at any one time is likely to be immaterial".¹¹³ However, if more than an insignificant quantity of product is undergoing processing at any given point in time then an entity may need to disclose work-in-progress under IAS 2. [IAS 2.8, IAS 2.37].

For mining entities, it has become accepted practice to recognise work-in-progress at the point at which ore is broken and the entity can make a reasonable assessment of quantity, recovery and cost.¹¹⁴

¹¹³ IASC Issues Paper, 11.17.

¹¹⁴ IASC Issues Paper, 11.9-11.16.

Practical example 14-1 from the financial statements of Harmony Gold Mining Company Limited illustrates the need for judgement in determining when work-in-progress can be recognised.

Practical example 14-1: Harmony Gold Mining Company Limited (2022)

South Africa

Financial Report 2022 [extract]

Notes to the group financial statements [extract]

23 Inventories [extract]

Accounting policy

Inventories, which include bullion on hand, gold-in-process, gold in lock-up, ore stockpiles and consumables, are measured at the lower of cost and net realisable value. Net realisable value is assessed at each reporting date and is determined with reference to relevant market prices.

The cost of bullion, gold-in-process and gold in lock-up is determined by reference to production cost, including amortisation and depreciation at the relevant stage of production. Ore stockpiles are valued at average production cost. Stockpiles and gold in lock-up are classified as non-current assets where the stockpile's volume exceeds current processing capacity and where a portion of static gold in lock-up is expected to be recovered more than 12 months after balance sheet date.

Gold-in-process inventories represent materials that are currently in the process of being converted to a saleable product. In-process material is measured based on assays of the material fed to process and the projected recoveries at the respective plants. In-process inventories are valued at the average cost of the material fed to process attributable to the source material coming from the mine or stockpile plus the in-process conversion costs, including the applicable depreciation relating to the process facility, incurred to that point in the process. Gold-in-process includes gold in lock-up, which is generally measured from the plants onwards. Gold in lock-up is expected to be extracted when plants are demolished at the end of their useful lives, which is largely dependent on the estimated useful life of the operations feeding the plants.

At the group's open pit operations, gold-in-process represents production in broken ore form.

Consumables are valued at weighted average cost value after appropriate allowances for slow-moving and redundant items.

Measurement issues can arise in relation to work-in-progress for concentrators, smelters and refineries, where significant volumes of product can be located in pipes or vessels, with no uniformity of grade. Work-in-progress inventories may also be in stockpiles, for example underground, where it is more difficult to measure quantities.

Processing varies in extent, duration and complexity depending on the type of mineral and different production and processing techniques that are used. Therefore, measuring work-in-progress, as it moves through the various stages of processing, is difficult and determining the quantities of work-in-progress may require a significant degree of estimation. Practice varies in this area, which is a reflection of the genuine differences mining entities face in their ability to assess mineral content and predict production and processing costs.

Practical example 14-2 below from the financial statements of Anglo American Platinum Limited illustrates the complexity involved in making such estimates.

Practical example 14-2: Anglo American Platinum Limited (2022)	South Africa
<p>Audited Annual Financial Statements 2022 [extract]</p> <p>Compliance and assurance [extract]</p> <p>Significant accounting principles [extract]</p> <p>Critical accounting estimates and judgements [extract]</p> <p>Critical accounting estimates [extract]</p> <p>Metal inventory</p> <p>Work-in-progress metal inventory is valued at the lower of net realisable value (NRV) and the average cost of production or purchase less the NRV of by-products produced during the period.</p> <p>For own-mined production, joint products inventory is measured by allocating total production costs to each joint product. Production cost is allocated to the joint products using a 3E (platinum, palladium and rhodium) and nickel revenue split. The allocation to each 3E metal is then based on production volumes.</p> <p>The allocated production costs per metal is then divided by the output per metal to arrive at a unit cost per metal. Production costs are determined on a 12-month rolling average basis and own-mined production costs and processing costs are adjusted for periods of prolonged abnormal production.</p> <p>For purchase of concentrate (POC), costs are allocated to each joint product based on the actual POC cost per joint product. The allocated POC costs per metal are then divided by the output per metal to arrive at a unit cost per metal. POC costs are determined on a six-month rolling average basis.</p>	

POC agreements are provisionally priced contracts to acquire inventory. The final price of the inventory is only determined three months into the future when quantities and prices are confirmed. Changes in prices include impacts of changes in US dollar metal price as well as foreign exchange rates, as the final price is determined in South African rand. Changes in pricing between the delivery date and the date that prices are confirmed is capitalised to inventory as it forms part of the cost directly related to bringing the inventory to its present location and condition.

The quantity of ounces of joint products in work-in-progress is calculated based on the following factors:

- The theoretical inventory at that point in time, which is calculated by adding the inputs to the previous physical inventory and then deducting the outputs for the inventory period
- The inputs and outputs include estimates due to the delay in finalising analytical values
- The estimates are subsequently trued up to the final metal accounting quantities when available
- The theoretical inventory is then converted to a refined equivalent inventory by applying appropriate recoveries depending on where the material is within the production pipeline. The recoveries are based on actual results as determined by the inventory count and are in line with industry standards
- Unrealised profits and losses are excluded from the inventory valuation before determining the lower of NRV and cost calculation.

Other than at the precious metal refinery, an annual physical count of work-in-progress is done, usually around February of each year. The precious metal refinery is subject to a physical count, usually every three years, but this could occur more frequently, by exception. A physical count of work-in-progress, including at the precious metal refinery, was performed in February 2022. Refer to note 40 for the impact of the results of the count.

Ore in circuit for a mining company at the end of a reporting period can be very difficult to measure as it is generally not easily accessible. The value of materials being processed therefore needs to be estimated based on inputs, throughput time and ore grade. The significance of the value of ore in circuit will depend on the type of commodity being processed. For example, precious metals producers could have a material value in process at reporting period end.

14.2 Sale of by-products and joint products

In the extractive industries it is common for more than one product to be extracted from the same reserves, e.g., copper is often found together with gold and silver and oil, gas and gas liquids are commonly found together. Products produced at the same time are classified as joint products or by-products and are usually driven by the importance of the different products to the viability of the mine or field. The same commodity could be treated differently based on differing grades and quantities of products. In most cases where more than one product is produced there is a clear distinction between the main product and the by-products. In other cases, the distinction may not be as clear.

The decision as to whether these are joint products or whether one is a by-product, is important, as it impacts the way in which costs are allocated. This decision could also affect the classification of sales of the various products.

14.2.1 By-products

A by-product is a secondary product obtained during the course of production or processing, having relatively small importance when compared with the principal product or products. [IAS 2.14].

Extract from IAS 2

- 14 A production process may result in more than one product being produced simultaneously. This is the case, for example, when joint products are produced or when there is a main product and a by-product. When the costs of conversion of each product are not separately identifiable, they are allocated between the products on a rational and consistent basis. The allocation may be based, for example, on the relative sales value of each product either at the stage in the production process when the products become separately identifiable, or at the completion of production. Most by-products, by their nature, are immaterial. When this is the case, they are often measured at net realisable value and this value is deducted from the cost of the main product. As a result, the carrying amount of the main product is not materially different from its cost.

By-products that are significant in value are required to be accounted for as joint products as discussed in section 14.2.2 below. However, there are some entities that treat such by-product sales as a negative cost, i.e., by crediting these against cost of goods sold of the main product. See Chapter 28.

How we see it

We do not believe that it would be appropriate for an entity to recognise the sale of by-products or scrap materials as a reduction of cost of goods sold. This is because recognising the sale of by-products or scrap materials as a reduction of cost of goods sold might inappropriately reflect the cost of raw materials used in manufacturing the main product. However, this interpretation would not apply if other accounting standards allow for recognition as a reduction of costs. The treatment of by-product revenue as a negative cost is not in accordance with IFRS accounting standards and would likely only be acceptable on the basis of materiality.

In our view, the language used in IAS 2 only relates to the allocation of the costs of conversion between the main product and by-product. It does not allow the proceeds from a sale of by-products to be presented as a reduction of cost of goods sold.

If an entity determines the sale of by-products or scrap materials is in the course of its ordinary activities (even if they are not significant), the entity would recognise those sales as revenue from contracts with customers under IFRS 15. If an entity determines that such sales are not in its ordinary course of business, the entity would recognise those sales as either other income or other revenues (i.e., separate from revenue from contracts with customers) because they represent sales to non-customers.

Practical examples 14-3 and 14-4 below illustrate how Rio Tinto plc and Anglo American Platinum Limited respectively account for their by-product revenue under IFRS 15.

Practical example 14-3: Rio Tinto plc (2022)

United Kingdom

Annual Report 2022 [extract]

2022 Financial statements [extract]

Notes to the 2022 financial statements [extract]

Our financial performance [extract]

6 Revenue by destination and product [extract]

Recognition and measurement [extract]

Revenues from the sale of significant by-products, such as gold, are included in sales revenue. Third-party commodity swap arrangements principally for delivery and receipt of smelter-grade alumina are offset within operating costs. Sundry revenue incidental to the main revenue-generating activities of the operations is treated as a credit to operating costs.

...

Practical example 14-4: Anglo American Platinum Limited (2022)**United Kingdom****Integrated Annual Report 2022 [extract]****Financial statements and other financial information [extract]****Notes to the financial statements [extract]****Other items [extract]****39. Accounting policies [extract]****C. Financial performance [extract]****Revenue recognition [extract]**

Revenues from the sale of material by-products are recognised within revenue from contracts with customers at the point control passes. Where a by-product is not regarded as significant, revenue may be credited against operating costs.

...

Although IAS 2 does not require extensive disclosures in respect of by-products, if amounts are material, disclosure of the following information, which many extractive entities provide on a voluntary basis, will greatly assist users:

- Accounting policies applied to by-products
- Line items in the primary financial statements in which revenues and capitalised amounts have been disclosed
- Quantities of by-products sold
- Average prices of by-products sold

14.2.2 Joint products

Joint products are two or more products produced simultaneously from a common raw material source, with each product having a significant relative sales value. One joint product cannot be produced without the other and the products cannot be identified separately until a certain production stage, often called the 'split-off point', is reached. Joint products are very common in both the oil and gas sector (e.g., crude oil when run through a refinery produces a variety of products) and the mining sector.

Joint products, by definition, are all significant in value and require that an entity allocate on a rational and consistent basis the costs of conversion that are not separately identifiable for each product. The IASC Issues Paper outlined two approaches that have found acceptance in practice:¹¹⁵

(1) Allocation on the basis of physical characteristics

In the oil and gas sector, entities often combine quantities of oil and gas based on their relative energy content (i.e., 6,000 cubic feet of gas is roughly equal in energy to one barrel of oil). This method, however, does not take account of the fact that, for example, gas is cheaper per unit of energy than oil because the latter is more difficult to transport.

(2) Allocation on the basis of relative values

This approach is more common in the mining sector where often it is not possible to identify a relevant physical characteristic that can be used to combine quantities of different products. The drawback of this method is that it results in very similar profit margins for each of the joint products, which may not be reflective of the underlying economic reality (i.e., one of the joint products, if mined in isolation, might have a completely different profit margin).

How we see it

While neither allocation method described above is perfect, both approaches are currently permitted under IFRS accounting standards.

It is true also that whichever method is selected, it is unlikely to have a material effect on reported profit overall. Practical example 14-5 below illustrates the application of approach (b) by Anglo American Platinum Limited.

¹¹⁵ IASC Issues Paper, 7.61-7.68.

Practical example 14-5: Anglo American Platinum Limited (2022)

Integrated Annual Report 2022 [extract]**Financial statements and other financial information [extract]****Notes to the financial statements [extract]****Other items [extract]****39. Accounting policies [extract]****E. Working capital [extract]****Inventories**

Inventory and work in progress are measured at the lower of cost and net realisable value, except for inventory held by commodity broker-traders which is measured at fair value less costs to sell and are disclosed separately to the extent that they are material. The production cost of inventory includes an appropriate proportion of depreciation and production overheads. Cost is determined on the following basis:

- Raw materials and consumables are measured at cost on a first in, first out (FIFO) basis or a weighted average cost basis
- Work in progress and finished products are measured at raw material cost, labour cost and a proportion of production overhead expenses
- Metal and coal stocks are included within finished products and are measured at average cost.

At precious metals operations that produce 'joint products', cost is allocated among precious metal products according to production volumes.

Inventory is recognised as a current asset where it is expected to be consumed in the next 12 months. Stockpiles are classified as non-current where stockpiles are not expected to be processed in the next 12 months and there is no market to sell the product in its current state.

14.3 Core inventories

In certain industries, for example the petrochemical sector, certain processes or storage arrangements require a core of inventory to be presented in the system at all times in order for it to function properly. For example, in order for a crude oil refining process to take place, the plant must contain a certain minimum quantity of oil. This oil can only be taken out once the plant is abandoned and could then only be sold as sludge. Similarly, underground gas storage caves are filled with gas, but a substantial part (in some instances 25%) of that gas can never be sold as its function is to pressurise the cave, thereby allowing the remaining 75% to be extracted. Even though the gas will be turned around on a continuous basis, at any one time, 25% of it will never be available to sell and cannot be recouped from the cave. Finally, long distance pipelines contain a significant volume of gas that keeps them operational.

Similar examples of core inventories exist in the mining sector where certain processes or processing facilities require a core or minimum amount of inventory to be present in the system at all times. These may include:

- Potlines in the aluminium industry
- Blast furnaces in the steel industry
- Electrowinning plants
- Carbon in leach processing in the gold industry

The key issue with such minimum amounts of inventory is whether they are required to be accounted for as inventory in accordance with IAS 2 or as PP&E in accordance with IAS 16.

How we see it

If an item of inventory is not held for sale or consumed in a production process but is necessary to the operation of a facility during more than one operating cycle, and its cost cannot be recouped through sale (or is significantly impaired), this item of inventory is required to be accounted for as an item of PP&E under IAS 16 rather than as inventory under IAS 2. This applies even if the part of inventory that is deemed to be an item of PP&E cannot be separated physically from the rest of inventory.

These matters will always involve the exercise of judgement, however, in the above instances, we consider that:

- The deemed PP&E items do not meet the definition of inventories
- Although it is not possible to physically separate the chemicals involved into inventory and PP&E categories, there is no accounting reason why one cannot distinguish between identical assets with different uses and therefore, account for them differently. Indeed, IAS 2 does envisage such a possibility when discussing different cost formulas. [IAS 2.25].
- The deemed PP&E items are necessary to bring another item of PP&E to the condition necessary for it to be capable of operating in the manner intended by management. This meets the definition of the costs of PP&E in IAS 16 upon initial recognition. [IAS 16.16(b)].
- Recognising these items as inventories would lead to an immediate loss because these items cannot be sold or consumed in a production process, or during the process of rendering services. This does not properly reflect the fact that the items are necessary to operate another asset over more than one operating cycle.

By contrast, core inventory that is not necessary to operate the asset and that is recoverable (e.g., gas in a pipeline) is considered to be held for sale or to be consumed in the production process or process of rendering services. Therefore, such gas is accounted for as inventory.

The issue of core inventories or ‘minimum fill’ was considered by the IFRS IC in March and July 2014. The staff paper considered by the IFRS IC proposed that base or cushion gas in storage facilities (required to maintain adequate cavern pressure) and pipeline fill (i.e., the minimum volume of oil or gas to be kept in a pipeline to ensure its operability) would be required to be accounted for as PP&E under IAS 16 where the carrying amount was not considered recoverable through sale or consumption in the production process (which is consistent with our views above). After consideration of this issue, the IFRS IC noted that, although there was diversity in practice between industries, there was no, or only limited, diversity in practice within the industries for which the issue is significant (including extractive industries). Given there was not sufficient diversity within industry, they decided not to continue with the development of an interpretation, and to remove this item from its agenda.

Practical example 14-6 below from the financial statements of ENGIE SA shows how cushion gas is accounted for as a tangible asset that is depreciated over its economic life.

Practical example 14-6: ENGIE SA (2022)	France
2022 Management Report and Annual Consolidated Financial Statements [extract] Notes to the consolidated financial statements [extract] Note 13 fixed assets [extract] 13.3 Property, plant and equipment [extract] Accounting standards [extract]	
Cushion gas “Cushion” gas injected into underground storage facilities is essential for ensuring that reservoirs can be operated effectively, and is therefore inseparable from these reservoirs. Unlike “working” gas which is included in inventories (see Note 22.2 “Inventories”), cushion gas is reported in other property, plant and equipment.	
Note 22 working capital requirements, inventories, other assets and other liabilities [extract] Accounting standards [extract]	
Gas inventories Gas injected into underground storage facilities includes working gas, which can be extracted without adversely affecting the subsequent operation of the reservoirs, and cushion gas, which is inseparable from the reservoirs and essential for their operation (see Note 13.3 “Property, plant and equipment”). Working gas is classified in inventories and measured at weighted average purchase cost upon entering the transportation network regardless of its source, including any regasification costs. Group inventory outflows are valued using the weighted average unit cost method.	
...	

14.4 Inventory carried at fair value

As noted earlier, inventories are required to be measured at the lower of cost and net realisable value under IAS 2. However, IAS 2 does not apply to the measurement of “... minerals and mineral products, to the extent that they are measured at net realisable value in accordance with well-established practices in those industries”. [IAS 2.3(a)]. There is also an exception for “...commodity broker-traders who measure their inventories at fair value less costs to sell. When such inventories are measured at fair value less costs to sell, changes in fair value are recognised in profit or loss in the period of the change”. [IAS 2.3(b)].

An extractives company that wishes to use the exemption relating to minerals and mineral products outlined above would need to demonstrate that valuation at net realisable value was a well-established practice in its industry, which may be difficult to do for base metals inventory.

The commodity broker-trader exemption above is commonly used by entities that engage in commodity trading. Practical example 14-7 below from the financial statements of BP p.l.c. illustrates a typical accounting policy for an oil and gas company that makes use of this exemption.

Practical example 14-7: BP p.l.c. (2022)

United Kingdom

bp Annual Report and Form 20-F 2022 [extract]

Financial statements [extract]

Notes on financial statements [extract]

1. Significant accounting policies, judgements, estimates and assumptions [extract]

Inventories

Inventories, other than inventories held for short-term trading purposes, are stated at the lower of cost and net realizable value. Cost is typically determined by the first-in first-out method and comprises direct purchase costs, cost of production, transportation and manufacturing expenses. Net realizable value is determined by reference to prices existing at the balance sheet date, adjusted where the sale of inventories after the reporting period gives evidence about their net realizable value at the end of the period.

Inventories held for short-term trading purposes are stated at fair value less costs to sell and any changes in fair value are recognized in the income statement.

Supplies are valued at the lower of cost on a weighted-average basis and net realizable value.

14.5 Stockpiles of low-grade ore (mining)

Mining entities often stockpile low grade ore that cannot be economically processed at current market prices or to give priority to the processing of higher-grade ore. Low-grade ore stockpiles may not be processed for many years until market prices or technology have improved or until no higher-grade ore remains available. Practical example 14-8 below from AngloGold Ashanti illustrates that stockpiles of low-grade ore may be held for many years.

Mineralised waste that is stockpiled in the hope, but without the expectation, that it may become economical to process in the future is required to be accounted for in the same way as overburden and other waste materials (see section 15.5 below). Low-grade ore that is stockpiled with the expectation that it will be processed in the future is required to be accounted for in the same way as high-grade ore. However, if the cost of the low-grade ore exceeds its net realisable value, an entity is required to recognise an impairment charge that it might need to reverse at some point in the future if (and when) commodity prices were to increase.

Where the processing of low-grade ore may be deferred until it becomes economically viable and management intends to process the stockpile in the future, the ore is often presented as non-current inventory under IAS 2. Such stockpiles are required to be measured at the lower of cost and net realisable value. [IAS 2.9].

How we see it

IAS 2 provides limited guidance in how to determine net realisable value. In allocating production costs to the low-grade ore stockpiles, and in subsequently assessing net realisable value, significant judgement will be involved and key estimates and assumptions made are required to be disclosed where material.

Given this limited guidance, in allocating production costs to the low-grade, ore stockpile and in subsequently assessing net realisable value, an entity could consider the following:

- Timing of sale: what is a reasonable and supportable assumption about the time it takes to sell.
- Commodity prices: whether to use those at the reporting date or future commodity prices. The commodity price at the reporting date may not be representative of the price that can realistically be expected to prevail when the ore is expected to be processed. The assumptions as to the long-term commodity prices used in the estimate of the sales proceeds and the expected timing of realisation, would generally be required to be consistent with those used in the Life of Mine Plan and other models that would be used for valuation and impairment purposes.
- Costs of processing: these may change in the future because of inflation, technological changes and new environmental regulations.
- Storage costs: specifically, how these should be factored in.
- Time value of money: depending on how net realisable value is determined and what inputs are used, the time value of money could impact the calculation of net realisable value. IAS 2 is silent as to how to address the time value of money and does not consider the degree to which the use of future commodity prices may already reflect the time value of money.

Practical example 14-8 below shows how AngloGold Ashanti Limited accounts for ore stockpiles.

Practical example 14-8: AngloGold Ashanti Limited (2022)	South Africa
<p>Annual Financial Statements 2022 [extract] Financial statements [extract] Group - Notes to the financial statements [extract] 1. Statement of compliance [extract] 1.2 Significant accounting judgements and estimates [extract] Use of estimates [extract]</p> <p>Stockpiles and metals in process</p> <p>Costs that are incurred in or benefit the production process are accumulated in stockpiles and metals in process values. Practical example 14-9: IAMGOLD Corporation (2022)		Canada
Annual Report 2022 [extract]		
Consolidated financial statements [extract]		
Notes to consolidated financial statements [extract]		
10. Inventories		
	December 31, 2022	December 31, 2021
Finished goods	\$ 42.6	\$ 95.2
Ore stockpiles	30.4	33.6
Mine supplies	126.9	173.3
	199.9	302.1
Non-current ore stockpiles	92.4	124.1
	\$ 292.3	\$ 426.2
For the year ended December 31, 2022, the Company recognized a net realizable value write-down in finished goods amounting to \$6.7 million (December 31, 2021 - \$7.8 million).		
For the year ended December 31, 2022, the Company recognized a net realizable value write-down in current ore stockpiles amounting to \$2.1 million (December 31, 2021 - \$6.9 million) and a net reversal of previously recorded net realizable value write-downs in non-current ore stockpiles amounting to \$17.0 million (December 31, 2021 - net realizable write-down of \$73.8 million).		
For the year ended December 31, 2022, the Company recognized a write-down in mine supplies inventories amounting to \$2.4 million (December 31, 2021 - \$4.8 million).		

14.6 Heap leaching (mining)

Heap leaching is a process which may be used for the recovery of metals from low grade ore. The crushed ore is laid on a slightly sloping, impermeable pad and leached by uniformly trickling a chemical solution through the heaps to be collected in ponds. The metals are subsequently extracted from the pregnant solution. Although heap leaching is one of the lowest cost methods of processing, recovery rates are relatively low.

Despite the estimation and measurement challenges associated with heap leaching, ore loaded on heap leach pads is usually recognised as inventory. An entity that develops an accounting policy for heap leaching needs to consider the following:

- The metal recovery factor is relatively low and will vary depending on the metallurgical characteristics of the material on the heap leach pad. The final (actual) recovery is therefore unknown until leaching is complete. Therefore, an entity will need to estimate the quantity of recoverable metal on each of its heap leach pads, based on laboratory test work or historical ore performance.
- The assayed head grade of ore added to the heap.
- The ore stockpiles on heap leach pads are accounted for as inventories that are measured at cost under IAS 2. As the valuable metal content is leached from these ore stockpiles, the cost basis is depleted based upon expected grades and recovery rates. The depletion charge would be accounted for as part of the cost of production of work in progress or finished goods.
- The level at which the heap leach pads are measured - that is, whether they are measured separately, in groups or in total. The preferred approach is to consider each pad separately (where possible) because this reduces the expected volatility in ore type to more manageable levels.
- Ore stockpiles on heap leach pads from which metals are expected to be recovered in a period longer than 12 months are generally classified as non-current assets.

Practical examples 14-10 and 14-11 below from the financial statements of AngloGold Ashanti Limited and Kinross Gold Corporation illustrate the issues that an entity will need to consider in developing an accounting policy for heap leaching.

Practical example 14-10: AngloGold Ashanti Limited (2022)	South Africa
<p>Annual Financial Statements 2022 [extract] Financial statements [extract] Annexure A [extract] Summary of material accounting policies [extract] Inventories [extract]</p> <p>Inventories are valued at the lower of cost and net realisable value after appropriate allowances for redundant and obsolete items. Cost is determined on the following bases:</p> <ul style="list-style-type: none"> • Metals in process are valued at the average total production cost at the relevant stage of production; • gold distribution is valued on an average total production cost method; • ore stockpiles are valued at the average mining cost of mining and stockpiling the ore. Stockpiles are classified as a non-current asset where the stockpile exceeds current processing capacity; • by-products, which include silver and sulphuric acid, are valued using an average total production cost method; • mine operating supplies are valued at average cost; and • heap leach pad materials are measured on an average total production cost basis. <p>...</p>	
Practical example 14-11: Kinross Gold Corporation (2022)	Canada
<p>2022 Annual Report [extract] Notes to the consolidated financial statements [extract] 3. Summary of significant accounting policies [extract]</p> <p>vi. Inventories</p> <p>Inventories consisting of metal in circuit ore, metal in-process and finished metal are valued at the lower of cost or net realizable value ("NRV"). NRV is calculated as the difference between the prevailing or long-term metal price estimates, and estimated costs to complete production into a saleable form and estimated costs to sell.</p> <p>Metal in circuit is comprised of ore in stockpiles and ore on heap leach pads. Ore in stockpiles is coarse ore that has been extracted from the mine and is available for further processing. Costs are added to stockpiles based on the current mining cost per tonne and removed at the average cost per tonne. Costs are added to ore on the heap leach pads based on current mining costs and removed from the heap leach pads as ounces are recovered, based on the average cost per recoverable ounce of gold on the leach pad. Ore in stockpiles not expected to be processed in the next twelve months is classified as long-term.</p> <p>The quantities of recoverable gold placed on the leach pads are reconciled by comparing the grades of ore placed on the leach pads to the quantities of gold actually recovered (metallurgical balancing); however, the nature of the leaching process inherently limits the ability to precisely monitor inventory levels. As a result, the metallurgical balancing process is constantly monitored and the engineering estimates are refined based on actual results over time. Variances between actual and estimated quantities resulting from changes in assumptions and estimates that do not result in write downs to NRV are accounted for on a prospective basis. The ultimate actual recovery of gold from a leach pad will not be known until the leaching process has concluded. In the event that the Company determines, based on engineering estimates, that a quantity of gold contained in ore on leach pads is to be recovered over a period exceeding twelve months, that portion is classified as long-term.</p> <p>In-process inventories represent materials that are in the process of being converted to a saleable product.</p> <p>Materials and supplies are valued at the lower of average cost and NRV.</p> <p>Write-downs of inventory are recognized in the consolidated statement of operations in the current period. The Company reverses inventory write downs in the event that there is a subsequent increase in NRV.</p>	

15 Property, plant and equipment

15.1 Major maintenance and turnarounds/renewals and reconditioning costs

Some assets (e.g., refineries, smelters and gas processing plants) require major maintenance at regular intervals, which is often described as an overhaul or turnaround in the oil and gas sector and renewal or reconditioning in the mining sector. When an entity incurs further costs in relation to an item of PP&E, IAS 16 requires it to determine the nature of the costs. Where such costs provide access to future economic benefits they are required to be capitalised. Costs of day-to-day servicing (e.g., costs of labour and consumables, and possibly the cost of small parts) are required to be expensed as incurred. [IAS 16.12]. If the costs relate to the replacement of a part of the entire asset, then the entity derecognises the carrying amount of the part that is replaced and recognises the cost of the replacement part. [IAS 16.13]. However, the part need not represent a physical part of the asset.

When a major inspection, renewal or reconditioning project is performed, its cost should be recognised in the carrying amount of the item of property, plant and equipment as a replacement if the recognition criteria of IAS 16 are satisfied. Any remaining carrying amount of the cost of the previous inspection/renewal (which will be distinct from physical parts) is derecognised. This is not affected by whether the entity identified the cost of the previous inspection when the item was initially acquired or constructed. [IAS 16.14]. See Chapter 19.

Subsequent costs that meet the recognition criteria must therefore be capitalised even if the costs incurred merely restore the assets to their original standard of performance, and the remaining carrying amount of any cost previously capitalised must be expensed. However, under IAS 37 an entity cannot provide for the costs of planned future maintenance (e.g., turnarounds, renewals/reconditions) as is shown in Illustration 15-1, based on Example 11A in IAS 37. [IAS 37.IE Example 11A].

Illustration 15-1: Refurbishment costs - no legislative requirement

A furnace has a lining that needs to be replaced every five years for technical reasons. At the end of the reporting period, the lining has been in use for three years.

Under IAS 37 no provision should be recognised as there is no present obligation. The cost of replacing the lining is not recognised because, at the end of the reporting period, no obligation to replace the lining exists independently of the company's future actions - even the intention to incur the expenditure depends on the company deciding to continue operating the furnace or to replace the lining. Instead of a provision being recognised, the depreciation of the lining takes account of its consumption, i.e., it is depreciated over five years. The re-lining costs then incurred are capitalised with the consumption of each new lining shown by depreciation over the subsequent five years.

Even a legal requirement to refurbish does not make the costs of a turnaround/renewal a liability under IAS 37, because no obligation exists independently of the entity's future actions - the entity could avoid the future overhaul expenditure by its future actions, for example, by selling the refinery or the asset that is being renewed/reconditioned. [IAS 37.IE Example 11B].

Practical example 15-1 below from BP p.l.c. illustrates a typical accounting policy for repairs, maintenance and inspection costs under IFRS accounting standards.

Practical example 15-1: BP p.l.c. (2022)

United Kingdom

bp Annual Report and Form 20-F 2022 [extract]

Financial statements [extract]

Notes on financial statements [extract]

1. Significant accounting policies, judgements, estimates and assumptions [extract]

Property, plant and equipment [extract]

Expenditure on major maintenance refits or repairs comprises the cost of replacement assets or parts of assets, inspection costs and overhaul costs. Where an asset or part of an asset that was separately depreciated is replaced and it is probable that future economic benefits associated with the item will flow to the group, the expenditure is capitalized and the carrying amount of the replaced asset is derecognized. Inspection costs associated with major maintenance programmes are capitalized and amortized over the period to the next inspection. Overhaul costs for major maintenance programmes, and all other maintenance costs are expensed as incurred.

...

Turnarounds/renewals can have a considerable impact on financial performance because of additional costs incurred and lower revenues. Therefore, fairly detailed information is generally disclosed about turnaround costs incurred in the past and turnarounds planned in the future.

15.2 Well workovers and recompletions (oil and gas)

Well workovers or recompletions are often required when the producing oil sands become clogged and production declines or other physical or mechanical problems arise.¹¹⁶ Workover costs that relate to the day-to-day servicing of the wells (i.e., primarily the costs of labour and consumables, and possibly the cost of small parts) must be expensed as incurred. However, as discussed in section 15.1 above, costs incurred to restore a well to its former level of production is required to be capitalised under IFRS accounting standards, but an entity would be required to derecognise any relevant previously capitalised well completion costs. However, to the extent that an entity can forecast future well workovers, it will need to depreciate the original well completion costs over a shorter economic life. Conversely, if an entity unexpectedly incurs well workover costs, it may need to consider whether those additional costs result in the need to perform an impairment test.

15.3 Care and maintenance

At certain times, a mining operation, gas plant or other substantial component of operations may be suspended because of a change in circumstances which may include a weakening of global demand for the commodity, lower prices, higher costs, changes in demand for processing, changes in exchange rates, changes in government policy or other events of nature such as seismic events or cyclones. Such changes mean that continuing with production or further development becomes uneconomical. Instead of permanently shutting down and abandoning the mine or plant, the operations and development are curtailed and the mine, plant or operation is placed on 'care and maintenance'. This can happen either in the development phase or the production phase.

A decision to put an asset such as a mine or gas plant on care and maintenance would be an indicator of impairment (see section 11.1 above). An impairment test would need to be conducted and if the recoverable amount of the CGU is less than the carrying amount, an impairment loss would need to be recognised.

While the asset remains in care and maintenance, expenditures are still incurred but usually at a lower rate than when the mine or gas plant is operating. A lower rate of depreciation for tangible non-current assets is also usually appropriate due to reduced wear and tear. Movable plant and machinery would generally be depreciated over its useful life. Management should consider depreciation to allow for deterioration. Where depreciation for movable plant and machinery had previously been determined on a units of production basis, this may no longer be appropriate.

Management should also ensure that any assets for which there are no longer any future economic benefits, i.e., which have become redundant, are written off.

The length of the closure and the associated care and maintenance expenditure may be estimated for depreciation and impairment purposes. However, it is not appropriate to recognise a provision for the entire estimated expenditure relating to the care and maintenance period. All care and maintenance costs are to be expensed as incurred.

Development costs amortised or depreciated using the units of production method would no longer be depreciated. Holding costs associated with such assets should be expensed in profit or loss in the period they are incurred. These may include costs such as security costs and site property maintenance costs.

The costs associated with restarting a mine or gas plant which had previously been on care and maintenance should only be capitalised if they improve the asset beyond its original operating capabilities. Entities will need to exercise significant judgement when performing this assessment.

¹¹⁶ IASC Issues Paper, 6.64.

15.4 Unitisations and redeterminations

15.4.1 Unitisations

A unitisation arrangement is “...an agreement between two parties each of which owns an interest in one or more mineral properties in an area to cross-assign to one another a share of the interest in the mineral properties that each owns in the area; from that point forward they share, as agreed, in further costs and revenues related to the properties”.¹¹⁷ The parties pool their individual interests in return for an interest in the overall unit, which is then operated jointly to increase efficiency.¹¹⁸ Once an area is subject to a unitisation arrangement, the parties share costs and production in accordance with their percentages established under the unitisation agreement. The unitisation agreement does not affect costs and production associated with non-unitised areas within the original licences, which continue to fall to the original licensees.¹¹⁹

IFRS accounting standards do not specifically address accounting for a unitisation arrangement. Therefore, the accounting for such an arrangement depends on the type of asset that is subject to the arrangement. If the assets subject to the arrangement were E&E assets, then the transaction would fall within the scope of IFRS 6, which provides a temporary exemption from IAS 8 (see section 3.2.1 above). An entity would be permitted to develop an accounting policy for unitisation arrangements involving E&E assets that is not based on IFRS accounting standards. However, unitisations are unlikely to occur in the E&E phase when technical feasibility and commercial viability of extracting a mineral resource are not yet demonstrable.

For unitisations that occur outside the E&E phase, as there is no specific guidance in IFRS accounting standards, an entity will need to develop an accounting policy in accordance with the IAS 8 hierarchy. The first step in developing an accounting policy for unitisations is setting criteria for determining which assets are included within the transaction. Particularly important is the assessment as to whether the unitisation includes the mineral reserves themselves or not. The main reason for not including the mineral reserves derives from the fact that they are subject to redetermination (see section 15.4.2 below).

The Illustration below, which is taken from the IASC Issues Paper, shows how a unitisation transaction might work in practice.

Illustration 15-2: Unitisation¹²⁰

Entities E and F have carried out exploration programs on separate properties owned by each in a remote area near the Antarctic Circle. Both entities have discovered petroleum reserves on their properties and have begun development of the properties. Because of the high operating costs and the need to construct support facilities, such as pipelines, dock facilities, transportation systems, and warehouses, the entities decide to unitise the properties, which mean that they have agreed to combine their properties into a single property. A joint operating agreement is signed and Entity F is chosen as operator of the combined properties. Relevant data about each entity's properties and costs are given as follows:

Party E

Prospecting costs incurred prior to property acquisition	CU8,000,000
Mineral acquisition costs	CU42,000,000
Geological and geophysical exploration costs (G&G)	CU12,000,000
Exploratory drilling costs:	
▪ Successful	CU16,000,000
▪ Unsuccessful	CU7,000,000
Development costs incurred	CU23,000,000
Estimated reserves, agreed between parties (in barrels)	30,000,000

Party F

Prospecting costs incurred prior to property acquisition	CU3,000,000
Mineral acquisition costs	CU31,000,000

120 IASC Issues Paper, 12.14.

Geological and geophysical exploration costs (G&G)	CU17,000,000
Exploratory drilling costs:	
▪ Successful	CU24,000,000
▪ Unsuccessful	CU4,000,000
Development costs incurred	CU36,000,000
Estimated reserves, agreed between parties (in barrels)	70,000,000

Ownership ratio in the venture is to be based on the relative quantity of agreed-upon reserves contributed by each party (30% to E and 70% to F). The parties agree that there should be an equalisation between them for the value of pre-unitisation exploration and development costs that directly benefit the unit, but not for other exploration and development costs. That is, there will be a cash settlement between the parties for the value of assets (other than mineral rights) or services that each party contributes to the unitisation. This is done so that the net value contributed by each party for the specified expenditures will equal that venturer's share of the total value of such expenditures at the time unitisation is consummated. Thus, the party contributing a value less than that party's share of ownership in the total value of those costs contributed by all the parties will make a cash payment to the other party so that each party's net contribution will equal that party's share of total value. The agreed amounts of costs to be equalised that are contributed by E and F are:

Expenditures made by:	E	F	Total
	CU	CU	CU
Successful exploratory drilling	12,000,000	12,000,000	24,000,000
Development costs	18,000,000	30,000,000	48,000,000
Geological and geophysical exploration	4,000,000	14,000,000	18,000,000
Total expenditure	34,000,000	56,000,000	90,000,000

As a result of this agreement, F is obliged to pay E the net amount of CU7,000,000 to equalise exploration and development costs. This is made up of the following components:

- CU4,800,000 excess of value of exploratory drilling received by F ($\text{CU16,800,000} = 70\% \times \text{CU24,000,000}$) in excess of value for successful exploratory drilling contributed (CU12,000,000)
Plus
- CU3,600,000 excess of value of development costs received by F in the unit ($\text{CU33,600,000} = 70\% \times \text{CU48,000,000}$) in excess of the value of development costs contributed by F (CU30,000,000)
Less
- CU1,400,000 excess of value of G&G costs contributed by F (CU14,000,000) over the value of the share of G & G costs owned by F after unitisation ($\text{CU12,600,000} = 70\% \times \text{CU18,000,000}$)

Although the reserves are unitised in the physical sense (i.e., each party will end up selling oil or gas that physically came out of the reserves of the other party), in volume terms the parties remain entitled to a quantity of reserves that is equal to that which they contributed. However, the timing of production and the costs to produce the reserves may be impacted by the unitisation agreement. The Illustration below explains this in more detail.

Illustration 15-3: Reserves contributed in a unitisation

Entities A and B enter into a unitisation agreement and contribute Licences A and B, respectively. The table below shows the initial determination, redetermination and final determination of the reserves in each of the fields.

	Initial determination		Redetermination		Final determination	
	mboe		mboe		mboe	
Licence A	20	40.0%	19	37.3%	21	38.9%
Licence B	30	60.0%	32	62.7%	33	61.1%
	50	100.0%	51	100.0%	54	100.0%

Although Licences A and B were unitised, ultimately Entity A will be entitled to 21 mboe and Entity B will be entitled to 33 mboe, which is exactly the same quantity that they would have been entitled to had there been no unitisation.

How we see it

To the extent that the unitisation of the mineral reserves themselves lacks commercial substance (see section 6.3.2 above), it could be appropriate to exclude the mineral reserves in accounting for a unitisation. Where the unitisation significantly affects the risk and timing of the cash flows or the type of product (e.g., a unitisation could lead to an exchange of, say, gas reserves for oil reserves), there is likely to be substance to the unitisation of the reserves.

If the assets subject to the unitisation arrangement are not E&E assets, or not only E&E assets, then it is necessary to develop an accounting policy in accordance with the requirements of IAS 8. Unitisation arrangements generally give rise to joint control over the underlying assets or entities:

- (a) If the unitisation arrangement results in joint control over a joint venture, then the parties must apply IFRS 11 (see Chapter 13) and IAS 28 (see Chapter 12) and provide the relevant disclosures in accordance with the requirements contained in IFRS 12 (see Chapter 14).
- (b) If the unitisation arrangement gives rise to a joint operation or results in a swap of assets that are not jointly controlled, then each of the parties must account for the arrangement as an asset swap (see section 6.3 above).

Under both (a) and (b) above, a party to a unitisation agreement would report a gain (or loss) depending on whether the fair value of the interest received is higher (or lower) than the carrying amount of the interest given up.

15.4.2 Redeterminations

The percentage interests in a unitisation arrangement are based on estimates of the relative quantities of reserves contributed by each of the parties. As field life progresses and production experience is gained, many unitisation agreements require the reserves to be redetermined, which often leads the parties to conclude that the recoverable reserves in one or perhaps both of the original properties are not as previously estimated. Unitisation agreements typically require one or more 'redeterminations' of percentage interests once better reservoir information becomes available. In most cases, the revised percentage interests are deemed to be effective from the date of the original unitisation agreement, which means that adjustments are required between the parties in respect of their relative entitlements to cumulative production and their shares of cumulative costs.¹²¹

Unitisation agreements normally set out when redeterminations need to take place and the way in which adjustments to the percentage interests should be effected. The former OIAC SORP described the process as follows:

- (a) "Adjustments in respect of cumulative 'capital' costs are usually made immediately following the redetermination by means of a lump sum reimbursement, sometimes including an 'interest' or uplift element to reflect related financing costs."¹²²
- (b) "Adjustments to shares of cumulative production are generally effected prospectively. Participants with an increased share are entitled to additional 'make-up' production until the cumulative liftings are rebalanced. During this period adjusted percentage interests are applied to both production entitlement and operating costs. Once equity is achieved the effective percentage interests revert to those established by the redetermination."¹²³

How we see it

An adjustment to an entity's percentage interest due to a redetermination is not a prior period error under IFRS accounting standards. Instead, the redetermination results from new information or new developments and therefore, must be treated as a change in an accounting estimate. Accordingly, a redetermination does not result in a retrospective adjustment but instead would be accounted for prospectively.

Redeterminations give rise to some further accounting issues which are discussed below.

¹²¹ Former OIAC SORP 177-178.

¹²² Former OIAC SORP 179-180.

¹²³ Former OIAC SORP 179-180.

15.4.2.A Redeterminations as capital reimbursements

How we see it

Under many national GAAPs, redeterminations are accounted for as reimbursement of capital expenditure rather than as sales/purchases of a partial interest. Given that this second approach could result in the recognition of a gain upon redetermination, followed by a higher depreciation charge per barrel, it has become accepted industry practice that redeterminations would typically be accounted for as reimbursements of capital expenditure under IFRS accounting standards.

Both approaches are shown in Illustration 15-4 below.

In addition, a redetermination gives rise to a number of questions, for example, how the entities account for:

- The adjustment of their share in the remaining reserves
- The 'make-up' oil obligation
- Their revised shares in the decommissioning liabilities

The 'make-up' oil obligation and the revised shares in the decommissioning liabilities are discussed further following the Illustration below.

Illustration 15-4: Redetermination (1)

Entities A and B have a 10% and 90% interest in a unitised property, respectively. On 1 January 20X1, after three years of operations, their interests in the property are redetermined. The relevant data about each entity's interest in the property are as follows:

	A	B	Total
Percentage interest after initial determination	10%	90%	100%
Percentage interest after redetermination	8%	92%	100%
Initial reserves at 1/1/2021 (million barrels of oil equivalent)	100 mboe	900 mboe	1000 mboe
Total production from 2018 to 2020	30 mboe	270 mboe	300 mboe
Remaining reserves at 31/12/2020 before redetermination	70 mboe	630 mboe	700 mboe
Reserves after redetermination at 1/1/2021	56 mboe	644 mboe	700 mboe
'Make-up' oil: $300 \text{ mboe} \times (10\% - 8\%) =$	-6 mboe	6 mboe	-
Total entitlement at 1/1/2021	50 mboe	650 mboe	700 mboe
	CU	CU	CU
Exploration and development asset at 1/1/2018	400	3,600	4,000
Units of production depreciation:			
$CU400 \div 100 \text{ mboe} \times 30 \text{ mboe} =$	120		120
$CU3,600 \div 900 \text{ mboe} \times 270 \text{ mboe} =$		1,080	1,080
Exploration and development asset at 31/12/2020 before redetermination	280	2,520	2,800
	A	B	Total
Total investment based on 'initial determination':			
A: 10% of CU4,000 = CU400 and B: 90% of CU4,000 = CU3,600	400	3,600	4,000
Total investment based on redetermination:			
A: 8% of CU4,000 = CU320 and B: 92% of CU4,000 = CU3,680	320	3,680	4,000
Reimbursement of exploration and development costs	80	-80	-
Decommissioning asset at 1/1/2018	100	900	1,000

Units of production depreciation:

CU100 ÷ 100 mboe × 30 mboe =	30		30
CU900 ÷ 900 mboe × 270 mboe =		270	270
Decommissioning asset at 31/12/2020 before redetermination	70	630	700
Decommissioning provision at 1/1/2018	100	900	1,000
Accreted interest from 1/1/2018 to 31/12/2020	20	180	200
Decommissioning provision at 31/12/2020 before redetermination	120	1,080	1,200
Reduction in decommissioning provision	-24	24	-
Decommissioning provision at 1/1/2021: A: 8% of CU1,200 = CU96 and B: 92% of CU1,200 = CU1,104	96	1,104	1,200

There are different ways in which an entity might interpret the effect of a redetermination on the exploration and development asset:

- (a) Reimbursement of capital expenditure
- (b) Sale/purchase of a partial interest

Reimbursement of capital expenditure

Under this approach, the redetermination is treated as a reimbursement of capital expenditure and the 'make-up' oil is accounted for prospectively. This would lead Entity A to make the following journal entries:

Dr	Cash	CU80	
	Cr	Exploration and development asset	CU80

The reimbursement of exploration and development costs is accounted for as a reduction in the exploration and development asset.

The overall impact on the statement of financial position of both Entities A and B is summarised in the table below:

	A	B	Total
	CU	CU	CU
Exploration and development asset at 31/12/2020 before redetermination	280	2,520	2,800
Reimbursement of exploration and development costs	-80	80	-
Exploration and development asset at 1/1/2021 after redetermination	200	2,600	2,800

Before the redetermination both A and B would record depreciation of the exploration and development asset of CU4/barrel (i.e., A: CU400 ÷ 100 mboe = CU4/barrel and B: CU3,600 ÷ 900 mboe = CU4/barrel). After the redetermination the depreciation of the exploration and development asset is still CU4/barrel for both A and B (i.e., A: CU200 ÷ 50 mboe = CU4/barrel and B: CU2,600 ÷ 650 mboe = CU4/barrel).

Sale/purchase of a partial interest

The second approach, which is sometimes advocated, is to treat the redetermination as the equivalent of a sale or purchase of part of an interest.

Dr	Cash	CU80	
	Cr	Exploration and development asset: (8% - 10%) ÷ 10% × CU280 =	CU56
	Cr	Gain on disposal of exploration and development asset	CU24

The reimbursement of exploration and development costs is accounted for as a partial disposal of the exploration and development asset.

However, Entity B will treat its entire payment of CU80 to Entity A as the cost of the additional 2% interest that it 'acquired' in the redetermination. The overall impact on the statement of financial position of both Entities A and B is summarised in the table below:

	A	B	Total
	CU	CU	CU
Exploration and development asset at 31/12/2020 before redetermination	280	2,520	2,800
Reimbursement of exploration and development costs	-56	80	-
Exploration and development asset at 1/1/2021 after redetermination	224	2,600	2,824

After the redetermination the depreciation of exploration and development asset for Entity A is (CU224 ÷ 50 mboe =) CU4.48/barrel and for Entity B is (CU2,600 ÷ 650 mboe =) CU4/barrel.

15.4.2.B 'Make-up' oil

As indicated in Illustration 15-4 above, Entity B would be entitled to 6 mboe of 'make-up' oil out of Entity A's share of the production. This raises the question whether Entity A is required to recognise a liability for the 'make-up' oil and whether Entity B is required to recognise an asset for the 'make-up' oil that it is entitled to.

'Make-up' oil is in many ways comparable to an overlift or underlift of oil, because after the redetermination it appears that Entity A is effectively in an overlift position (i.e., it has sold more product than its proportionate share of production) while Entity B is in an underlift position (i.e., it has sold less product than its proportionate share of production).

IFRS accounting standards do not directly address accounting for underlifts and overlifts (as discussed in section 12.4 above) or accounting for 'make-up' oil following a redetermination. Consequently, an entity that is entitled to receive or is obliged to pay 'make-up' oil will need to apply the hierarchy in IAS 8 to develop an accounting policy that is compliant with current IFRS accounting standards. In doing so, the entity could look to the accounting standards of another standard-setter with a similar conceptual framework, such as US GAAP or UK GAAP, in which case the entity would not recognise an asset or liability and account for the 'make-up' oil prospectively.

Under many unitisation agreements, entities are required to give up oil only to the extent that there is production from the underlying field. Under these circumstances, Entity A would have no obligation to deliver oil or make another form of payment to the other parties under the unitisation agreement. In those cases, the 'make-up' oil obligation would not meet the definition of financial liability under IAS 32 or that of a provision under IAS 37. It may also be considered that Entity B cannot recognise an asset, because its right to 'make-up' oil only arises because of a future event (i.e., the future production of oil).

15.4.2.C Decommissioning provisions

Another effect of a redetermination is that it may increase or decrease an entity's share of the decommissioning liability in relation to the project, as shown in the Illustration below.

Illustration 15-5: Redetermination (2)

Assuming the same facts as in Illustration 15-4 above, how should Entities A and B account for the change in the decommissioning provision?

Under IFRIC 1 the change in a decommissioning provision should be added to, or deducted from, the cost of the related asset in the current period. However, if a decrease in the liability exceeds the carrying amount of the asset, the excess should be recognised immediately in profit or loss. [IFRIC 1.5].

This would lead Entities A and B to make the following journal entries:

Entity A

Dr	Decommissioning provision	CU24	
	Cr	Decommissioning asset	CU24

Entity B

Dr	Decommissioning asset	CU24	
	Cr	Decommissioning provision	CU24

The decommissioning asset is adjusted in accordance with IFRIC 1 for the change in the decommissioning provision.

If Entity A had recognised a gain of CU24 upon the reduction of the decommissioning liability, this would have resulted in an increase in the depreciation of the decommissioning asset from $(\text{CU}100 \div 100 \text{ mboe} =) \text{CU}1/\text{barrel}$ to $(\text{CU}70 \div 50 \text{ mboe} =) \text{CU}1.40/\text{barrel}$. The IFRIC 1 approach avoids this although it increases the depreciation of the decommissioning asset slightly to $(\text{CU}56 \div 50 \text{ mboe} =) \text{CU}1.12/\text{barrel}$, as the decommissioning provision is also affected by the accretion of interest. Nevertheless, the approach required by IFRIC 1 is largely consistent with the treatment of a redetermination as a reimbursement of capital expenditure as in Illustration 15-4 above.

15.5 Stripping costs in the production phase of a surface mine (mining)

In surface mining operations it is necessary to remove overburden and other waste materials to gain access to ore from which minerals can be extracted - this is also referred to as stripping. IFRIC 20 *Stripping Costs in the Production Phase of a Surface Mine* specifies how stripping costs incurred during the production phase of a surface mine are to be accounted for. IFRIC 20 considers the different types of stripping costs encountered in a surface mining operation. These costs are separated into those incurred in the development phase of the mine (i.e., pre-production) and those that are incurred in the production phase. [IFRIC 20.2, IFRIC 20.3]. For these purposes, the mine is considered to be an asset that is separate from the mineral rights and mineral reserves, which are outside the scope of IAS 16. [IAS 16.3(d)].

15.5.1 Scope of IFRIC 20

Generally, those costs incurred in the development phase of a mine would be capitalised as part of the depreciable cost of building, developing and constructing the mine, under the principles of IAS 16. Ultimately, these capitalised costs are depreciated or amortised on a systematic basis, usually by using the units of production method, once production commences. The stripping costs incurred in the development phase of a mine are not within the scope of IFRIC 20.

Instead, the interpretation applies to all waste removal (stripping) costs incurred during the production phase of a surface mine (production stripping costs). [IFRIC 20.2]. It does not apply to oil and natural gas extraction and underground mining activities. Also, it does not address the question of whether oil sands extraction is considered to be a surface mining activity and therefore whether it is in scope or not. [IFRIC 20.BC4].

Despite the importance of the term 'production phase', this is not defined in the Interpretation, or elsewhere in IFRS accounting standards. See section 15.5.2 below for further discussion of production phase.

Stripping activity undertaken during the production phase may create two benefits (1) the extraction of ore (inventory) in the current period and (2) improved access to the ore body to be mined in a future period. Where the benefits are realised in the form of inventory produced, the production stripping costs are to be accounted for in accordance with IAS 2. Where the benefits are improved access to ore to be mined in the future, these costs are to be recognised as a non-current asset, if the required criteria are met (see section 15.5.2 below). The Interpretation refers to this non-current asset as the 'stripping activity asset'. [IFRIC 20.8].

15.5.2 Determining when production phase commences

As noted above, there is no specific guidance or definition in IFRS accounting standards relating to the concept of production phase. The production phase is considered to commence once the asset is in the location and condition necessary for it to be capable of operating in the manner intended by management. Given the nature of mining and metals projects, the key area of judgement is determining exactly when an asset is in the location and condition necessary for it to be capable of operating as intended by management.

The determination of the commencement of the production phase, which is also often referred to as the commissioning date, not only affects stripping costs, but also affects many other accounting issues in the extractive industries, described in more detail below. These include the cessation of the capitalisation of other costs, including borrowing costs, the commencement of depreciation or amortisation (see section 16 below), and the treatment of certain pre-production revenues (see section 12.1 above).

For some larger mining and metals entities, determining the production date may not be as critical as it may be for a smaller entity, particularly when that smaller entity only has one major mining project. In some instances, a difference of a week could have a material impact.

No specific guidance exists within IFRS accounting standards, particularly as to what it means for an asset to be 'in the location and condition necessary for it to be capable of operating as intended by management'. Consequently, various approaches have evolved. It is common for many entities to simply refer to the achievement of 'commercial production' as the point at which the assets are commissioned, i.e., ready for their intended use, without providing any detail as to exactly what commercial production means. Having said this, some entities identify 'production start date' as a significant judgement and provide more detailed disclosures.

How we see it

In our experience, many entities distinguish start-up/commissioning from post-commissioning costs, which can also be referred to as ramp-up or operating costs. Start-up/commissioning costs are often capitalised when the asset is available for use, but is incapable of operating at normal levels without the necessary start-up/commissioning period. Generally, this allows costs associated with the physical capabilities of a mining and metals project to be capitalised, but not the costs incurred as a result of the need to build up demand. Deliberate or avoidable delays in achieving physical completion or obtaining necessary approvals to operate the mine are likely to be deemed abnormal and expensed as incurred.

While disclosures may sometimes be limited, as part of the process of assessing when a mining and metals project is ready for its intended use, a variety of factors are often considered with varying degrees of emphasis placed on each. The specific factors used are generally determined by the unique nature of each mine and are impacted by the complexity of the project and its location.

While not specifically contained in any IFRS accounting standards guidance, some common examples of the range of factors that are often considered include:

- The level of capital expenditure compared to the estimated construction cost
- A majority of the assets making up the mining project are substantially complete and ready for use
- Completion of a reasonable period of testing of the mine plant and equipment
- The project has been turned over to operations from the development team
- A specified percentage of design capacity for the mine and/or mill, e.g., 50% to 70%, has been achieved over a continuous period, e.g., three months
- The percentage grade (metal content) of ore being mined is sufficiently economic and consistent with the overall mine plan
- The ability to produce the commodity in a saleable form (within specifications and the *de minimis* rule)
- The ability to sustain ongoing production over a certain period, e.g., one to three months

Generally, no single factor is considered more important than another. Entities must be cautious in how they apply these factors as they can sometimes be open to abuse. Each factor must be considered in context with the facts and circumstances of the specific project.

15.5.3 Recognition criteria - stripping activity asset

IFRIC 20 states that: [IFRIC 20.9]

Extract from IFRIC 20

- 9 An entity shall recognise a stripping activity asset if, and only if, all of the following are met:
- (a) it is probable that the future economic benefit (improved access to the ore body) associated with the stripping activity will flow to the entity;
 - (b) the entity can identify the component of the ore body for which access has been improved; and
 - (c) the costs relating to the stripping activity associated with that component can be measured reliably.

Instead of being a separate asset, the stripping activity asset is to be accounted for as an addition to, or as an enhancement of, an existing asset. This means that the stripping activity asset will be accounted for as part of an existing asset. [IFRIC 20.10]. IFRIC 20 does not specify whether the stripping activity asset is a tangible or intangible asset. Instead, it simply states that it is required to be classified as tangible or intangible according to the nature of the existing asset of which it is part - so it will depend upon whether an entity classifies its mine assets as tangible or intangible.

The Interpretation considers that the stripping activity asset might add to or improve a variety of existing assets, such as, the mine property (land), the mineral deposit itself, an intangible right to extract the ore or an asset that originated in the mine development phase. [IFRIC 20.BC10]. In most instances, entities classify their producing mine assets as tangible assets; therefore, it is likely that the stripping activity assets will also be classified as tangible assets.

15.5.4 Initial recognition

The stripping activity asset is to be initially measured at cost. This will be the accumulation of costs directly incurred to perform the stripping activity that benefits the identified component of ore, plus an allocation of directly attributable overhead costs. [IFRIC 20.12]. Examples of the types of costs expected to be included as directly attributable overhead costs are items such as salary costs of the mine supervisor overseeing that component of the mine, and an allocation of rental costs of any equipment hired specifically to perform the stripping activity. [IFRIC 20.BC12].

Some incidental operations may take place at the same time as the production stripping activity that are not necessary for the production stripping activity to continue as planned. The costs associated with these incidental operations are not to be included in the cost of the stripping activity asset. [IFRIC 20.12]. An example provided in the Interpretation is the building of an access ramp in the area in which the production stripping activity is taking place. These ancillary costs must be recognised as assets or expensed in accordance with other IFRS accounting standards.

15.5.4.A Allocating costs between inventory and the stripping activity asset

If the costs of waste removal can be directly allocated between inventory and the stripping activity asset, then the entity should allocate those costs accordingly. However, it may be difficult in practice to identify these costs separately, particularly if inventory is produced at the same time as access to the ore body is improved. This is likely to be very common in practice. Where this is the case, the Interpretation permits an entity to use an allocation approach that is based on a relevant production measure as this is considered to be a good indicator of the nature of benefits that are generated for the activity taking place in the mine. [IFRIC 20.13].

The Interpretation provides a (non-exhaustive) list of some of the possible metrics that could be used to determine the appropriate allocation basis: [IFRIC 20.13]

Extract from IFRIC 20

- | | |
|-----|--|
| 13 | ... Examples of such measures include: |
| (a) | cost of inventory produced compared with expected cost; |
| (b) | volume of waste extracted compared with expected volume, for a given volume of ore production; and |
| (c) | mineral content of the ore extracted compared with expected mineral content to be extracted, for a given quantity of ore produced. |

An allocation basis which uses sales value or relative sales value is not acceptable. [IFRIC 20.BC15].

The production measure is calculated for each identified component of the ore body. Application of this allocation methodology effectively involves a comparison of the expected level of activity for that component with the actual level of activity for the same component, to identify when additional activity may have occurred and may be creating a future benefit. See section 15.5.4.B below for further discussion about how to determine a component.

Where the actual level of activity exceeds the expected level of activity, the waste removal activity incurred at the expected level and its associated costs would then form part of the cost of inventory produced in that period. Any excess of actual activity over the expected level (and the associated costs of such excess activity) needs to be considered to determine whether it represents a stripping activity asset.

It is important to note that where actual stripping levels exceed those expected for the identified component, this will not automatically result in the recognition of a stripping activity asset. An entity will need to assess whether the removal of such additional waste has actually resulted in a future economic benefit, i.e., improved access to future ore. If not, such costs should not be capitalised as an asset, but instead should be recognised in profit or loss in the period incurred. For example, the mining of an unexpected fault or dyke should not be capitalised but instead expensed as incurred.

Where actual waste removal activity is less than the expected level of activity, only the actual waste removed and its associated costs, not the expected costs, will form part of the cost of inventory produced in that period. This is because continuing to recognise waste costs at the expected level would require an entity to recognise a deferred stripping liability. This is not permitted under IFRIC 20 or generally under IFRS accounting standards because, in the absence of a legal or constructive obligation to continue to mine the deposit, such costs would not satisfy the criteria to be recognised as a liability.

It is worth noting that while some of the allocation approaches set out in the Interpretation are similar to the life-of-mine average strip ratio approach used by many entities prior to the introduction of IFRIC 20, there are differences.

The key difference is that the level at which the expected level of activity is to be determined when calculating the relevant production measure is likely to be lower than that which was previously used for the life-of-mine average strip ratio approach. The life-of-mine average strip ratio approach used the entire ore body, whereas IFRIC 20 requires this to be determined for each component of the ore body, which is expected to be a subset of the ore body. See section 15.5.4.B below for further discussion about how to determine a component.

The other difference relates to the way in which any stripping activity asset is recognised in profit or loss. Under the life-of-mine average stripping ratio approach, a portion of the deferred stripping asset was recognised in profit or loss when the actual stripping ratio fell below the expected average life-of-mine strip ratio. Under IFRIC 20 however, the stripping activity asset is to be depreciated or amortised over the useful life of the identified component of the ore body that becomes more accessible. The units of production (UOP) method is to be used unless another method is more appropriate. [IFRIC 20.15].

It is important to note that the calculation of the expected production measure for each component will need to be reviewed and updated if there are material changes to the mine plan for that component (for example due to differences in actual versus budgeted performance or changes in future mining plans resulting from other factors, e.g., changes in commodity prices or increases in costs). If these changes impact the expected production measure for the remaining life of the component, then the IFRIC 20 calculations will need to be updated and applied on a prospective basis. The calculation of the expected production measures will also be required if and when new components commence production.

Illustration 15-6: Allocating costs between inventory and the stripping activity asset

Scenario A - actual performance measure exceeds the expected performance measure

The following example illustrates how an entity would allocate costs between inventory and the stripping activity asset where the actual performance measure exceeds the expected performance measure for a component in a particular period.

Assume Entity A has a mine which comprises two separate pits which are accessing one ore body. For the purposes of IFRIC 20, each pit is identified as a component. Pit 1 has a total life of three years and at reporting period end, has been in production for one year. Pit 2 has a total life of five years but production has not yet commenced.

At the commencement of production from pit 1, the company has forecast the following mining and stripping activity:

Expected ore to be extracted over the 3 years	1,000 tonnes
Expected volume of waste to be extracted over the 3 years	3,000 tonnes

During the current period, the following had occurred in relation to the production from pit 1:

Cost incurred for mining activity	CU13,000,000 (a)
Actual tonnes of ore removed	100 tonnes (b)
Actual tonnes of waste removed	1,200 tonnes (c)
Average cost per tonne in year 1 = (a) ÷ [(b) + (c)]	CU10,000

The company determined that it is not practically possible to identify separately what portion of the waste removal costs leads to the extraction of inventory and what portion to improved access to future ore. This is because these two activities were occurring simultaneously as there were multiple shovels in operation in multiple parts of the component and a single haulage fleet was used.

Given this, the company has decided that it will allocate costs by comparing the actual volume of waste and ore extracted (the actual strip ratio) in the period with the expected volume of waste and ore (expected strip ratio) for the life of the component i.e., for pit 1.

The allocation of the actual waste removal costs incurred will involve the following steps:

Step 1: Calculate the expected strip ratio for pit 1

Expected volume of waste to be extracted ÷ expected volume of ore to be extracted
 = 3,000 tonnes ÷ 1,000 tonnes
 = 3.00 (expected strip ratio)

This means that for every 1 tonne of ore extracted over the life of pit 1, the company expects (on average) to remove 3 tonnes of waste.

Step 2: Calculate the additional waste extracted compared to the expected waste extracted for the actual volume of ore extracted

Actual volume of ore extracted × expected strip ratio
 = 100 tonnes × 3 tonnes
 = 300 tonnes

Actual volume of waste extracted in year 1 = 1,200 tonnes

Additional waste extracted in year 1 = actual waste extracted less expected waste to be extracted
 = 1,200 tonnes - 300 tonnes
 = 900 tonnes of additional waste was extracted

Step 3: Allocate mining costs between inventory and the stripping activity asset

Stripping activity asset

Additional waste tonnes removed × cost per tonne
 = 900 tonnes × CU10,000
 = CU9,000,000

Inventory

Total mining costs incurred less costs allocated to the stripping activity asset
 = CU13,000,000 - CU9,000,000
 = CU4,000,000

This comprises:

(1) The cost of extracting the inventory tonnes
 = 100 × CU10,000
 = CU1,000,000

Plus:

(2) The cost of waste removal allocated directly to inventory (which was allocated at the expected level of 3:1)
 = 300 tonnes × CU10,000
 = CU3,000,000

Scenario B - actual strip ratio is less than the expected strip ratio

Assume the same basic fact pattern as per Scenario A above, but with different actual mining results for pit 1 in the current period:

Cost incurred for mining activity	CU13,000,000 (a)
Actual tonnes of ore removed	1,200 tonnes (b)
Actual tonnes of waste removed	100 tonnes (c)
Average cost per tonne in year 1 = (a) ÷ [(b) + (c)]	CU10,000

The allocation of the actual waste removal costs incurred will involve the following steps:

Step 1: Calculate the expected strip ratio for pit 1

Expected volume of waste to be extracted ÷ expected volume of ore to be extracted
 = 3,000 tonnes ÷ 1,000 tonnes
 = 3.00 (expected strip ratio)

This means that for every 1 tonne of ore extracted over the life of pit 1, the company expects (on average) to remove 3 tonnes of waste.

Step 2: Calculate the additional waste extracted compared to the expected waste extracted for the actual volume of ore extracted

Actual volume of ore extracted × expected strip ratio
 = 1,200 tonnes × 3 tonnes
 = 3,600 tonnes

Actual volume of waste extracted in year 1 = 100 tonnes

During the current period the actual strip ratio was only 0.0833. As this is less than the expected strip ratio, as explained above, there is no additional waste removed during the period.

Step 3: Allocate mining costs between inventory and the stripping activity asset

Stripping activity asset

As the actual strip ratio was below the expected strip ratio, no additional waste was removed during the period; therefore, there is no amount to be added to the stripping activity asset.

Inventory

As the actual amount of waste removed during the current period is less than the expected level of waste for the life of the component, and there is no amount to be allocated to the stripping activity asset, then the total mining costs for the period will be allocated to inventory.

= CU13,000,000

This comprises:

(1) The cost of extracting the inventory tonnes

= 1,200 × CU10,000

= CU12,000,000

Plus:

(2) The cost of waste removal allocated directly to inventory (which is allocated based on the actual waste tonnes removed during the period)

= 100 tonnes × CU10,000

= CU1,000,000

15.5.4.B Identifying the component of the ore body

Identifying the various components of the ore body is one of the critical steps in applying IFRIC 20. This is necessary for several reasons:

- (a) Production stripping costs can only be capitalised as an asset if the component of the ore body for which access has been improved, can be identified.
- (b) To allocate stripping activity costs between inventory and the stripping activity asset, an entity needs to determine the expected level of activity for each component of the mine.
- (c) The stripping activity asset is required to be depreciated or amortised on a systematic basis, over the expected useful life of the identified component of the ore body that becomes more accessible as a result of the stripping activity.

The Interpretation provides limited guidance on how to identify components, although it does appear a component is expected to be a subset of the whole ore body. This view is supported in several parts of IFRIC 20.

- A 'component' refers to the specific volume of the ore body that is made more accessible by the stripping activity; the identified component of the ore body would typically be a subset of the total ore body of the mine; and a mine may have several components, which are identified during the mine planning stage. [IFRIC 20.BC8].
- The depreciation or amortisation requirements state that the expected useful life of the identified component of the ore body that is used to depreciate or amortise the stripping activity asset will differ from the expected useful life that is used to depreciate or amortise the mine itself and the related life-of-mine assets, unless the stripping activity provides improved access to the whole of the ore body. [IFRIC 20.BC17].

In practice, the identification of components of an ore body is a complex process which requires a significant amount of management judgement. While it is considered that an entity's mine plan will provide the information required allowing these judgements to be made with reasonable consistency, this may not be a straightforward exercise, and it will be particularly challenging for the more complex mines. This is because ore bodies vary significantly in shape and size and are more haphazard than often illustrated in simple examples. Management may identify components in a number of different ways. These could include identifying discrete components in the mine plan, such as phases, sections, push backs, cutbacks, lay backs, blocks, etc.; examining annual production plans; or examining push back campaigns. Whatever approach is adopted, it is essential that the components are recognisable to those who are responsible for mine planning as they will be the ones who will need to track progress as ore is removed and will need to update the assessment of components should the mine plan change. Given this, practice has revealed that when identifying the components of an ore body, it is essential that input is obtained from those who best understand the mine plan, i.e., the mining engineers and operational personnel.

The identification of components will need to be reassessed and updated (if necessary) whenever there are material changes to the mine plan. Given this, an entity will need to establish systems, processes, procedures and controls to ensure it is able to identify when material changes to the mine plan have occurred that would require the IFRIC 20 calculations to be updated. Identification of components will also be required when an entity commences production on a new component of the ore body or in relation to a new ore body.

15.5.5 Subsequent measurement

After initial recognition, the stripping activity asset must be carried at its cost or revalued amount less depreciation or amortisation and less impairment losses, in the same way as the existing asset of which it is a part. [IFRIC 20.14]. The stripping activity asset is to be depreciated or amortised on a systematic basis, over the expected useful life of the identified component of the ore body that becomes more accessible as a result of the stripping activity. [IFRIC 20.15].

The units of production method is effectively required to be applied unless another method is more appropriate. [IFRIC 20.15]. The expected useful life of the identified component that is used to depreciate or amortise the stripping activity asset will generally differ from the expected useful life that is used to depreciate or amortise the mine itself and the related life-of-mine assets, unless the stripping activity provides improved access to the whole of the ore body (this is expected to be rare). [IFRIC 20.16].

Consistent with the units of production method used for other mining assets, the calculation of the units of production rate will be completed when a stripping activity asset is first recognised. It will then need to be reviewed (and if necessary, updated) at the end of each reporting period, or when the mine plan changes. The new units of production rate will be applied prospectively.

Given the depreciation or amortisation of the stripping activity asset represents the consumption of the benefits associated with the stripping activity asset, and those benefits are realised by the extraction of the ore to which the stripping activity asset relates (i.e., the ore for which access was improved by the removal of this waste in prior periods), this depreciation or amortisation effectively represents part of the cost of extracting that ore in future periods. In accordance with IAS 2, such costs must be included in the cost of that subsequent ore. This effectively means that the depreciation or amortisation of the stripping activity asset is required to be recapitalised as part of the cost of the inventory produced in those subsequent periods. Once the inventory is sold, those costs will be recognised in profit or loss as part of cost of goods sold.

15.5.6 Disclosures

IFRIC 20 has no specific disclosure requirements. However, the general disclosure requirements of IAS 1 are relevant, e.g., the requirements to disclose significant accounting policies, [IAS 1.117], and significant judgements, estimates and assumptions. [IAS 1.125]. For many entities, it is likely that the accounting policy for stripping costs would be considered a significant accounting policy which would therefore warrant disclosure, as would the judgements, estimates and assumptions they make when applying this policy.

Practical example 15-2 below from Rio Tinto plc illustrates an IFRIC 20 accounting policy disclosure.

Deferred stripping

In open pit mining operations, overburden and other waste materials must be removed to access ore from which minerals can be extracted economically. The process of removing overburden and waste materials is referred to as stripping. During the development of a mine (or, in some instances, pit; see below), before production commences, stripping costs related to a component of an orebody are capitalised as part of the cost of construction of the mine (or pit). These are then amortised over the life of the mine (or pit) on a units of production basis.

Where a mine operates several open pits that are regarded as separate operations for the purpose of mine planning, initial stripping costs are accounted for separately by reference to the ore from each separate pit. If, however, the pits are highly integrated for the purpose of mine planning, the second and subsequent pits are regarded as extensions of the first pit in accounting for stripping costs. In such cases, the initial stripping (such as overburden and other waste removal) of the second and subsequent pits is considered to be production phase stripping (see below).

Key judgment – Deferral of stripping costs

We apply judgment as to whether multiple pits at a mine are considered separate or integrated operations. This determines whether the stripping activities of a pit are classified as pre-production or production phase stripping and, therefore, the amortisation base for those costs. The analysis depends on each mine's specific circumstances and requires judgment: another mining company could make a different judgment even when the fact pattern appears to be similar.

The following factors would point towards the initial stripping costs for the individual pits being accounted for separately:

- If mining of the second and subsequent pits is conducted consecutively following that of the first pit, rather than concurrently;
- If separate investment decisions are made to develop each pit, rather than a single investment decision being made at the outset;
- If the pits are operated as separate units in terms of mine planning and the sequencing of overburden removal and ore mining, rather than as an integrated unit;
- If expenditures for additional infrastructure to support the second and subsequent pits are relatively large; and
- If the pits extract ore from separate and distinct orebodies, rather than from a single orebody.

If the designs of the second and subsequent pits are significantly influenced by opportunities to optimise output from several pits combined, including the co-treatment or blending of the output from the pits, then this would point to treatment as an integrated operation for the purposes of accounting for initial stripping costs. The relative importance of each of the above factors is considered in each case.

In order for production phase stripping costs to qualify for capitalisation as a stripping activity asset, three criteria must be met:

- It must be probable that there will be an economic benefit in a future accounting period because the stripping activity has improved access to the orebody;
- It must be possible to identify the "component" of the orebody for which access has been improved; and
- It must be possible to reliably measure the costs that relate to the stripping activity.

A "component" is a specific section of the orebody that is made more accessible by the stripping activity. It will typically be a subset of the larger orebody that is distinguished by a separate useful economic life (for example, a pushback).

Recognition and measurement

Phase	Development Phase	Production Phase	
Stripping activity	Overburden and other waste removal during the development of a mine before production commences.	Production phase stripping can give access to two benefits: the extraction of ore in the current period and improved access to ore which will be extracted in future periods.	
Period of benefit	After commissioning of the mine.	Future periods after first phase is complete.	Current and future benefit are indistinguishable.
Capitalised to mining properties and leases in property, plant and equipment	During the development of a mine, stripping costs relating to a component of an orebody are capitalised as part of the cost of construction of the mine.	It may be the case that subsequent phases of stripping will access additional ore and that these subsequent phases are only possible after the first phase has taken place. Where applicable, the Group considers this on a mine-by-mine basis. Generally, the only ore attributed to the stripping activity asset for the purposes of calculating the life-of-component ratio is the ore to be extracted from the originally identified component.	Stripping costs for the component are deferred to the extent that the current period ratio exceeds the life-of-component ratio.
Allocation to inventory	Not applicable	Not applicable	The stripping cost is allocated to inventory based on a relevant production measure using a life-of-component strip ratio. The ratio divides the tonnage of waste mined for the component for the period either by the quantity of ore mined for the component or by the quantity of minerals contained in the ore mined for the component. In some operations, the quantity of ore is a more appropriate basis for allocating costs, particularly when there are significant by-products.
Component	A "component" is a specific section of the orebody that is made more accessible by the stripping activity. It will typically be a subset of the larger orebody that is distinguished by a separate useful economic life (for example, a pushback).		
Life-of-component ratio	The life-of-component ratios are based on the ore reserves of the mine (and for some mines, other mineral resources) and the annual mine plan; they are a function of the mine design and, therefore, changes to that design will generally result in changes to the ratios. Changes in other technical or economic parameters that impact the ore reserves (and for some mines, other mineral resources) may also have an impact on the life-of-component ratios even if they do not affect the mine design. Changes to the ratios are accounted for prospectively.		
Depreciation basis	Depreciated on a "units of production" basis based on expected production of either ore or minerals contained in the ore over the life of the component unless another method is more appropriate.

16 Depreciation, depletion and amortisation (DD&A)

16.1 Requirements under IAS 16 and IAS 38

The main types of depreciable assets of mining entities and oil and gas entities are property, plant and equipment, intangible assets and mineral reserves, although the exact titles given to these types of assets may vary.

While “...mineral rights and expenditure on the exploration for, or development and extraction of, minerals, oil, natural gas and similar non-regenerative resources” are outside the scope of IAS 16 and IAS 38, any items of property, plant and equipment (PP&E) and other intangible assets that are used in the extraction of mineral reserves should be accounted for under IAS 16 and IAS 38. [IAS 16.2, IAS 16.3, IAS 38.2].

For items of PP&E, various descriptions are used for such assets which can include producing mines, mine assets, oil and gas assets and producing properties. Whatever the description given, IAS 16 requires depreciation of an item of PP&E over its useful life. Depreciation is required to be calculated separately for each part (often referred to as a ‘component’), of an item of PP&E with a cost that is significant in relation to the total cost of the item, unless the item can be grouped with other items of PP&E that have the same useful life and depreciation method. [IAS 16.43, IAS 16.45].

How we see it

The guidance in IAS 16 relating to parts of an asset does not apply directly to intangible assets as IAS 38 does not apply a ‘parts’ approach, nor does it apply to mineral rights. Given this, entities are encouraged to use the general principles for determining an appropriate unit of account that are outlined in section 4 above.

IAS 16’s general requirements are described in Chapter 19 and IAS 38 is addressed in Chapter 18.

16.1.1 Mineral reserves

In the absence of a standard or an interpretation specifically applicable to mineral reserves and their related expenditures, which are technically outside the scope of IAS 16 and IAS 38, management needs to develop an accounting policy for the depreciation or amortisation of mineral reserves. These need to be developed in accordance with the hierarchy in IAS 8, taking into account the requirements and guidance in Standards and Interpretations dealing with similar and related issues and the definitions, recognition criteria and measurement concepts for assets, liabilities, income and expenses in the *Conceptual Framework*. [IAS 8.11]. In practice, an entity will generally develop an accounting policy that is based on the depreciation and amortisation principles in IAS 16 and IAS 38, which deal with similar and related issues.

16.1.2 Assets depreciated using the straight-line method

The straight-line method of depreciation is generally preferred in accounting for the depreciation of property, plant and equipment. The main practical advantages of the straight-line method are considered to be its simplicity and the fact that its results are often not materially different from the units of production method if annual production is relatively constant.¹²⁴ In general, the straight-line method is considered to be preferable for:

- Assets whose loss in value is more closely linked to the passage of time than to the quantities of minerals produced (e.g., front-end loaders that are used in stripping overburden and production of minerals)
- Assets that are unrelated to production and that are separable from the field or mine (e.g., office buildings)
- Assets with a useful life that is either much longer (e.g., offshore platforms) or much shorter (e.g., drill jumbos) than that of the field or mine in which they are used
- Assets used in fields or mines whose annual production is relatively constant. However, if assets are used in fields or mines that are expected to suffer extended outages, due to weather conditions or periodic repairs and maintenance, then the straight-line method may be less appropriate
- Assets that are used in more than one field or mine (e.g., service trucks)

¹²⁴ IASC Issues Paper, 7.13.

If the production of a field or mine drops significantly towards the end of its productive life, then the straight-line method may result in a relatively high depreciation charge per unit of production in these latter years. In those cases, an entity may need to perform an impairment test on the assets involved.

Practical example 16-1 below indicates the assets to which BHP Group Limited applies the straight-line method.

Practical example 16-1: BHP Group Limited (2022)

Australia

Resource assets [extract]

11 Property, plant and equipment [extract]

Recognition and measurement [extract]

Depreciation

Depreciation of assets, other than land, assets under construction and capitalised exploration and evaluation that are not depreciated, is calculated using either the straight-line (SL) method or units of production (UoP) method, net of residual values, over the estimated useful lives of specific assets. The depreciation method and rates applied to specific assets reflect the pattern in which the asset's benefits are expected to be used by the Group. The Group's proved reserves for petroleum assets and proved and probable reserves for minerals assets are used to determine UoP depreciation unless doing so results in depreciation charges that do not reflect the asset's useful life. Where this occurs, alternative approaches to determining reserves are applied, such as using management's expectations of future oil and gas prices rather than yearly average prices, to provide a phasing of periodic depreciation charges that better reflects the asset's expected useful life.

Where assets are dedicated to a mine or petroleum lease, the useful lives below are subject to the lesser of the asset category's useful life and the life of the mine or petroleum lease, unless those assets are readily transferable to another productive mine or lease.

Assets classified as held for sale are measured at the lower of their carrying amount and fair value less cost to sell and therefore not depreciated. BMC and Petroleum were classified as held for sale since November 2021 and December 2021 respectively.

Key estimates

The determination of useful lives, residual values and depreciation methods involves estimates and assumptions and is reviewed annually. Any changes to useful lives or any other estimates or assumptions, including the expected impact of climate change and the transition to a lower carbon economy, may affect prospective depreciation rates and asset carrying values. The table below summarises the principal depreciation methods and rates applied to major asset categories by the Group.

Category	Buildings	Plant and equipment	Mineral rights and petroleum interests	Capitalised exploration, evaluation and development expenditure
Typical depreciation methodology	SL	SL	UoP	UoP
Depreciation rate	25-50 years	3-30 years	Based on the rate of depletion of reserves	Based on the rate of depletion of reserves

16.1.3 Assets depreciated using the units of production method

When it comes to assets relating to mineral reserves, the units of production method is the most common method applied. "The underlying principle of the units of production method is that capitalised costs associated with a cost centre are incurred to find and develop the commercially producible reserves in that cost centre, so that each unit produced from the centre is assigned an equal amount of cost."¹²⁵ The units of production method thereby effectively allocates an equal amount of depreciation to each unit produced, rather than an equal amount to each year as under the straight-line method.

When the level of production varies considerably over the life of a project (e.g., the production of oil fields is much higher in the periods just after the start of production than in the final periods of production), depreciation based on a units of production method will produce a more equal cost per unit from year to year than straight-line methods. Under the straight-line method, the depreciation charge per unit in the early years of production could be much less than the depreciation per unit in later years. "That factor, coupled with the fact that typically production costs per unit increase in later years, means that the profitability of operations would be distorted if the straight-line method is used, showing larger profits in early years and lower profits in later years of the mineral resource's life. The higher cost per unit in later years is, in part, due to fewer units being produced while many production costs remain fixed and, in part, a result of many variable costs per unit increasing over time because reserves may be harder to extract, there may be greater equipment repairs, and similar other factors."¹²⁶ Nevertheless, even under the units of production method, profitability often drops significantly towards the end of the productive life of a field or mine. When this happens, an entity will need to carry out an impairment test and may need to recognise an impairment charge (see section 11 above).

¹²⁵ IASC Issues Paper, 7.19.

¹²⁶ IASC Issues Paper, 7.20.

In general, the units of production method is considered to be preferable for:

- Assets used in fields or mines whose annual production may vary considerably over their useful economic life
- Assets whose loss in value is more closely linked to the quantities of minerals produced than to the passage of time (e.g., draglines used in the extraction of mineral ore)
- Assets that are used in production or that are inseparable from the field or mine (e.g., wells and well heads)
- Assets with a useful life that is the same as that of the field or mine in which they are used
- Assets that are used in only one field or mine (e.g., overland conveyor belts)

Practical example 16-1 above indicates the classes of asset to which BHP apply the units of production method.

The practical application of the units of production method gives rise to the following issues that require entities to exercise a considerable degree of judgement in determining the:

- (a) Units of production formula (see section 16.1.3.A below)
- (b) Reserves base (see section 16.1.3.B below)
- (c) Unit of measure (see section 16.1.3.C below)
- (d) Joint and by-products (see section 16.1.3.D below)

As discussed in section 16.1.3.B below, the asset base that is subject to depreciation is required to be consistent with the reserves base that is used, which may require an entity to exclude certain costs from (or include future investments in) the depreciation pool.

16.1.3.A Units of production formula

There are a number of different ways in which an entity could calculate a depreciation charge under the units of production method. The most obvious of these is probably the following formula:

$$\begin{array}{rcccl} \text{Depreciation} & & & \text{Cost of the asset} & \text{Cumulative depreciation and} \\ \text{charge for} & = & \text{Current} & \text{at the beginning} & \text{impairment at the beginning} \\ \text{the period} & & \text{period's} & \text{of the period} & \text{of the period} \\ & & \text{production} & & \\ & \times & & \text{Opening reserves estimated at the beginning of the period} & \end{array}$$

The reserves estimate used in the above formula is the best estimate of the reserves at the beginning of the period, but by the end of the period a revised and more accurate estimate is often available. Therefore, it could be considered that in order to take into account the most recent information, the opening reserves could be calculated by adding the 'closing reserves estimated at the end of the period' to the 'current period's production'. However, reserves estimates might change for a number of reasons:

- (a) More detailed knowledge about existing reserves (e.g., detailed engineering studies or drilling of additional wells which occurred after the commencement of the period)
- (b) New events that affect the physical quantity of reserves (e.g., major fire in a mine)
- (c) Changes in economic assumptions (e.g., higher commodity prices)

It is generally not appropriate to take account of these events retrospectively. For example, changes in reserves estimates that result from events that took place after the end of the reporting period (such as those under (b) and (c)) are non-adjusting events that should be accounted for prospectively in accordance with IFRS accounting standards. [IAS 8.36, IAS 10.3]. Changes in reserves estimates that result from new information or new developments which do not offer greater clarity concerning the conditions that existed at the end of the reporting period (such as those under (a)) are not considered to be corrections of errors; instead, they are changes in accounting estimates that should be accounted for prospectively under IFRS accounting standards. [IAS 8.5, IAS 8.36].

Determining whether actual changes in reserves estimates is required to be treated as adjusting or non-adjusting events will depend upon the specific facts and circumstances and may require significant judgement.

Usually, an entity will continue to invest during the year in assets in the depreciation pool (see section 16.1.3.B below for a discussion of 'depreciation pools') that are used to extract minerals. This raises the question as to whether or not assets that were used for only part of the production during the period should be depreciated on a different basis. Under the straight-line method, an entity will generally calculate the depreciation of asset additions during the period based on the assumption that they were added (1) at the beginning of the period, (2) in the middle of the period or (3) at the end of the period.

While method (2) is often the best approximation, methods (1) and (3) are generally not materially different when the accounting period is rather short (e.g., monthly or quarterly reporting) or when the level of asset additions is relatively low compared to the asset base.

The above considerations explain why the units of production formula that is commonly used in the extractive industries is slightly more complicated than the formula given above:

$$\begin{array}{rcccl} \text{Depreciation} & & & \text{Cost of the asset} & \text{Cumulative depreciation and} \\ \text{charge for} & = & \text{Current} & \text{at the end of the} & \text{impairment at the beginning} \\ \text{the period} & & \text{period's} & \text{period} & \text{of the period} \\ & & \text{production} & & \\ & \times & & \text{Reserves estimated at the} & \text{Current period's} \\ & & & \text{end of the period} & \text{production} \end{array}$$

This units of production formula is widely used in the oil and gas sector by entities that apply US GAAP or did apply the former OIAC SORP. In the mining sector, however, both the first and the second units of production formulae are used in practice. To reiterate, when using the second formula, consideration is required as to whether actual changes in reserves estimates are required to be treated as adjusting or non-adjusting events.

16.1.3.B Reserves base

An important decision in applying the units of production method is selecting the reserves base that will be used. The following reserves bases could in theory be used:

- (a) Proved developed reserves (see (a) below)
- (b) Proved developed and undeveloped reserves (see (b) below)
- (c) Proved and probable reserves (see (c) below)
- (d) Proved and probable reserves and a portion of resources expected to be converted into reserves (see (d) below)
- (e) Proved, probable and possible reserves

The term 'possible reserves', which is used in the oil and gas sector, is associated with a probability of only 10% (see section 2.2.1 above). Therefore, it is generally not considered acceptable to include possible reserves within the reserves base in applying the units of production method.

It is important that whatever reserves base is chosen the costs applicable to that category of reserves are included in the depreciable amount to achieve a proper matching of costs and production.¹²⁷ For example, "if the cost centre is not fully developed ... there may be costs that do not apply, in total or in part, to proved developed reserves, which may create difficulties in matching costs and reserves. In addition, some reserve categories will require future costs to bring them to the point where production may begin".¹²⁸

IFRS accounting standards does not provide any guidance on the selection of an appropriate reserves base or cost centre (i.e., unit of account) for the application of the units of production method. The relative merits for the use of each of the reserves bases listed under (a) to (c) above are discussed in detail below.

(a) Proved developed reserves

Under some national GAAPs that have accounting standards for the extractive industries, an entity is required to use proved developed reserves as its reserves base for the depreciation of certain types of assets. An entity would therefore calculate its depreciation charge on the basis of actual costs that have been incurred to date. However, the cost centre frequently includes capitalised costs that relate to undeveloped reserves. To calculate the depreciation charge correctly, it will be necessary to exclude a portion of the capitalised costs from the depreciation calculation. Illustration 16-1 below, which is taken from the IASC Issues Paper, illustrates how this might work.

¹²⁷ IASC Issues Paper, 7.36.

¹²⁸ IASC Issues Paper, 7.39.

Illustration 16-1: Exclusion of capitalised costs relating to undeveloped reserves¹²⁹

In an offshore oil and gas field, a platform may be constructed from which 20 development wells will be drilled. The platform's cost has been capitalised as a part of the total cost of the cost centre. If only 5 of the 20 wells have been drilled, it would be inappropriate to depreciate that portion of platform costs, as well as that portion of all other capitalised costs, that are deemed to be applicable to the 15 wells not yet drilled. Only 5/20ths of the platform costs would be subject to depreciation in the current year, while 15/20ths of the platform costs (those applicable to the 15 undrilled wells) would be withheld from the depreciable amount. The costs withheld would be transferred to the depreciable amount as the additional wells are drilled. In lieu of basing the exclusion from depreciation on the number of wells, the exclusion (and subsequent transfer to depreciable amount) could be based on the quantity of reserves developed by individual wells compared with the estimated total quantity of reserves to be developed.

Similarly, an appropriate portion of prospecting costs, mineral acquisition costs, exploration costs, appraisal costs, and future dismantlement, removal, and restoration costs that have been capitalised is required to be withheld from the depreciation calculation if proved developed reserves are used as the reserves base and if there are undeveloped reserves in the cost pool.¹³⁰

By withholding some of the costs from the depreciation pool, an entity is able to achieve a better matching of the costs incurred with the benefits of production. This is particularly important in respect of pre-development costs, which provide future economic benefits in relation to reserves that are not yet classified as 'proved developed'.

However, excluding costs from the depreciation pool may not be appropriate if it is not possible to determine reliably the portion of costs to be excluded or if the reserves that are not 'proved developed' are highly uncertain. It may not be necessary to exclude any costs at all from the depreciation pool if those costs are immaterial, which is sometimes the case in mining operations.

As illustrated in Practical example 16-2, Shell plc, in reporting under IFRS accounting standards, applies the units of production method based on proved developed reserves.

Practical example 16-2: Shell plc (2022)**United Kingdom****Annual Report and Accounts 2022 [extract]****Consolidated Financial Statements [extract]****Notes to the Consolidated Financial Statements [extract]****2. Significant accounting policies, judgements and estimates [extract]****Property, plant and equipment and intangible assets other than goodwill [extract]****Depreciation, depletion and amortisation**

Property, plant and equipment related to hydrocarbon production activities are in principle depreciated on a unit-of-production basis over the proved developed reserves of the field concerned, other than assets whose useful lives differ from the lifetime of the field which are depreciated applying the straight-line method. However, for certain Integrated Gas and Upstream assets, the use for this purpose of proved developed reserves, which are determined using the Securities and Exchange Commission (SEC) mandated yearly average oil and gas prices, would result in depreciation charges for these assets which do not reflect the pattern in which their future economic benefits are expected to be consumed as, for example, it may result in assets with long-term expected lives having accelerated or being fully depreciated within one year. Therefore, in these instances, other approaches are applied to determine a reserves base for the purpose of calculating depreciation, such as using management's expectations of future oil and gas prices rather than yearly average prices and using total proved reserves to provide a phasing of periodic depreciation charges that more appropriately reflects the expected utilisation of the assets concerned. (See Note 12)

Rights and concessions in respect of proved properties are depleted on the unit-of-production basis over the total proved reserves of the relevant area. Where individually insignificant, unproved properties may be grouped and depreciated based on factors such as the average concession term and past experience of recognising proved reserves.

...

(b) Proved developed and undeveloped reserves

Another approach that is common under IFRS accounting standards is to use 'proved developed and undeveloped reserves' as the reserves base for the application of the units of production method. This approach reflects the fact that it is often difficult to allocate costs that have already been incurred between developed and undeveloped reserves and has the advantage that it effectively straight-lines the depreciation charge per unit of production across the different phases of a project. For example, if the depreciation cost in phase 1 of the development is CU24/barrel and the depreciation cost in phase 2 of the development could be CU18/barrel, an entity that uses proved developed and undeveloped reserves as its reserves base might recognise depreciation of, say, CU22/barrel during phase 1 and phase 2.

¹²⁹ IASC Issues Paper, 7.41.

¹³⁰ IASC Issues Paper, 7.42.

Application of this approach is complicated by the fact that phase 1 of the project will start production before phase 2 is completed. To apply the units of production method on the basis of proved developed and undeveloped reserves, the entity would need to forecast the remaining investment related to phase 2. The approach does not appear unreasonable at first sight, given that the proved reserves are reasonably certain to exist and “...the costs of developing the proved undeveloped reserves will be incurred in the near future in most situations, the total depreciable costs can also be estimated with a high degree of reliability”.¹³¹ Nevertheless, the entity would therefore define its cost pool (i.e., unit of account) as including both assets that it currently owns and certain future investments.

How we see it

Although there is no specific precedent within IFRS accounting standards for using such a widely defined unit of account, the approach above is not prohibited, and in practice it has gained a broad measure of acceptance within the extractive industries.

(c) Proved and probable reserves

The arguments in favour of using ‘proved and probable reserves’ as the reserves base in applying the units of production method are similar to those discussed at (b) above. The IASC Issues Paper summarised the arguments in favour of this approach as follows:

“Proponents of [using “proved and probable reserves” as the reserve base] use the same arguments given for including proved undeveloped reserves and related future costs in calculating depreciation. They point out that in a cost centre in which development has only begun a large part of capitalised prospecting, mineral acquisition, exploration, and appraisal costs may apply to probable reserves. Often in this situation there are large quantities of probable reserves, lacking only relatively minor additional exploration and/or appraisal work to be reclassified as proved reserves. They argue that, in calculating depreciation, it would be possible to defer all costs relating to the probable reserves if either proved developed reserves only, or all proved reserves, were to be used as the quantity on which depreciation is based. They contend that using probable and proved reserves in the reserve base and including in the depreciable costs any additional costs anticipated to explore and develop those reserves provides more relevant and reliable information.”¹³²

The main drawbacks of this approach are that estimates of probable reserves are almost certainly different from actual reserves that will ultimately be developed and estimates of the costs to complete the development are likely to be incorrect because of the potentially long time scales involved.¹³³ Nevertheless, this approach has also found a considerable degree of acceptance under IFRS accounting standards among mining entities and oil and gas entities that were permitted to apply the approach under their national GAAP before (e.g., UK GAAP). Both Tullow Oil plc and Anglo American Platinum Limited apply this approach, as illustrated in Practical examples 16-3 and 16-4 respectively below.

Practical example 16-3: Tullow Oil plc (2022)

United Kingdom

(l) Commercial reserves

Commercial reserves are proven and probable oil and gas reserves, which are defined as the estimated quantities of crude oil, natural gas and natural gas liquids which geological, geophysical and engineering data demonstrate with a specified degree of certainty to be recoverable in future years from known reservoirs and which are considered commercially producible. There should be a 50% statistical probability that the actual quantity of recoverable reserves will be more than the amount estimated as proven and probable reserves and a 50% statistical probability that it will be less.

(m) Depletion and amortisation

All expenditure carried within each field is amortised from the commencement of production on a unit of production basis, which is the ratio of oil and gas production in the period to the estimated quantities of commercial reserves at the end of the period plus the production in the period, generally on a field-by-field basis or by a group of fields which are reliant on common infrastructure. Costs used in the unit of production calculation comprise the net book value of capitalised costs plus the estimated future field development costs required to recover the commercial reserves remaining. Changes in the estimates of commercial reserves or future field development costs are dealt with prospectively.

Depreciation of property, plant and equipment

Mining properties are depreciated to their residual values using the unit of production method based on Proved and Probable Ore Reserves and, in certain limited circumstances, other Mineral Resources included in the Life of Asset Plan. These other Mineral Resources are included in depreciation calculations where, taking into account historical rates of conversion to Ore Reserves, there is a high degree of confidence that they will be extracted in an economic manner. This is the case principally for diamond operations, where depreciation calculations are based on Diamond Reserves and Diamond Resources included in the Life of Asset Plan. This reflects the unique nature of diamond deposits where, due to the difficulty in estimating grade, Life of Asset Plans frequently include significant amounts of Inferred Resources.

...

(d) Proved and probable reserves and a portion of resources expected to be converted into reserves (mining entities only)

We observe in practice that some mining entities adopt a slightly different approach when depreciating some of their mining assets. They use proven and probable reserves and a portion of resources expected to be converted into reserves. Such an approach tends to be limited to mining entities where the type of mineral and the characteristics of the ore body indicate that there is a high degree of confidence that those resources will be converted into reserves. For example, this is very common for underground operations that only perform infill drilling just prior to production commencing. This is done so that capital is not spent too early before it is really needed.

Such resources can comprise measured, indicated and inferred resources, and even exploration potential. Determining which of those have a high degree of confidence of being extracted in an economic manner will require judgement. Such an assessment will take into account the specific mineralisation and the 'reserves to resource' conversion that has previously been achieved for a mine.

Such an approach is generally justified on the basis that it helps to ensure the depreciation charges reflect management's best estimate of the useful life of the assets and provides greater accuracy in the calculation of the consumption of future economic benefits.

Anglo American applies this approach, as illustrated in Practical example 16-4 above, as does Rio Tinto plc, as illustrated in Practical example 16-5 below.

Units of production basis

For mining properties and leases and certain mining equipment, consumption of the economic benefits of the asset is linked to production. Except as noted below, these assets are depreciated on the units of production basis.

In applying the units of production method, depreciation is normally calculated based on production in the period as a percentage of total expected production in current and future periods based on ore reserves and, for some mines, other mineral resources. Other mineral resources may be included in the calculations of total expected production in limited circumstances where there are very large areas of contiguous mineralisation, for which the economic viability is not sensitive to likely variations in grade, as may be the case for certain iron ore, bauxite and industrial mineral deposits, and where there is a high degree of confidence that the other mineral resources can be extracted economically. This would be the case when the other mineral resources do not yet have the status of ore reserves merely because the necessary detailed evaluation work has not yet been performed and the responsible technical personnel agree that inclusion of a proportion of measured and indicated resources in the calculation of total expected production is appropriate based on historical reserve conversion rates.

The required level of confidence is unlikely to exist for minerals that are typically found in low-grade ore (as compared with the above), such as copper or gold. In these cases, specific areas of mineralisation have to be evaluated in detail before their economic status can be predicted with confidence.

Sometimes the calculation of depreciation for infrastructure assets, primarily rail and port, considers measured and indicated resources. This is because the asset can benefit current and future mines. The measured and indicated resource may relate to mines which are currently in production or to mines where there is a high degree of confidence that they will be brought into production in the future. The quantum of mineral resources is determined taking into account future capital costs as required by the JORC code. The depreciation calculation, however, applies to current mines only and does not take into account future development costs for mines which are not yet in production. Measured and indicated resources are currently incorporated into depreciation calculations in the Group's Australian iron ore business.

An entity preparing its financial statements under IFRS accounting standards will need to choose between using 'proved developed reserves', 'proved developed and undeveloped reserves', 'proved and probable reserves' and, for mining entities in relation to certain mines, 'proved and probable reserves and a portion of resources expected to be converted into reserves' as its reserves base. Each of these approaches is currently acceptable under IFRS accounting standards. Preparers of financial statements should, however, be aware of the difficulties that exist in ensuring that the reserves base and the costs that are being depreciated correspond. Users of financial statements need to understand that comparability between entities reporting under IFRS accounting standards may sometimes be limited and need to be aware of the impact that each of the approaches has on the depreciation charge that is reported. Given this, detailed disclosures are essential.

16.1.3.C Unit of measure

Under the units of production method, an entity assigns an equal amount of cost to each unit produced. Determining the appropriate unit by which to measure production requires a significant amount of judgement. An entity could measure the units of production by reference to physical units or, when different minerals are produced in a common process, cost could be allocated between the different minerals on the basis of their relative sales prices.

(a) Physical units of production method

If an entity uses the physical units of production method, each physical unit of reserves (such as barrels, tonnes, ounces, gallons, and cubic metres) produced is assigned a *pro rata* portion of undepreciated costs less residual value.

Illustration 16-2: Physical units of production method¹³⁴

If an entity produces 100 units during the current period and the estimated remaining commercial reserves at the end of the period are 1,900 units, the units available would be 2,000. The fractional part of the depreciable basis to be charged to depreciation expense would be 100/2,000. Therefore, if the depreciable basis was 5,000 monetary units, the depreciation for the period would be 250 monetary units.

¹³⁴ IASC Issues Paper, 7.23.

In applying the physical units of production method, a mining company needs to decide whether to use either 1) the quantity of ore produced; or 2) the quantity of mineral contained in the ore as the unit of measure.¹³⁵ Similarly, an oil and gas company needs to decide whether to use either 1) the volume of hydrocarbons; or 2) the volume of hydrocarbons plus gas, water and other materials. When mining different grades of ore, a mining company's gross margin on the subsequent sale of minerals will fluctuate far less when it uses the quantity of minerals as its unit of measure. While a large part of the wear and tear of equipment used in mining is closely related to the quantity of ore produced, the economic benefits are more closely related to the quantity of mineral contained in the ore.

How we see it

Both of the approaches, mentioned above, are currently acceptable under IFRS accounting standards.

(b) Revenue-based units of production method

Another possible approach in applying the units of production method that may have been used by some entities previously is to measure the units produced based on the gross selling price of mineral.¹³⁶

However, this approach is no longer permitted. This is because as part of the 2011-2013 cycle of annual improvements the IASB approved an amendment to IAS 16 and IAS 38 to clarify that a revenue-based depreciation or amortisation method would not be appropriate.

16.1.3.D Joint and by-products

In the extractive industries, it is common for more than one product to be extracted from the same reserves (e.g., copper mines often produce gold and silver; lead and zinc are often found together; and many oil fields produce both oil and gas). When the ratio between the joint products or between the main product and the by-products is stable, this does not pose any complications. Also, if the value of the by-products is immaterial then it will often be acceptable to base the depreciation charge on the main product. In other cases, however, it will be necessary to define a unit of measure that takes into account all minerals produced. The IASC Issues Paper listed the following approaches in defining conversion factors used in computing depreciation when joint products are extracted:¹³⁷

“(a) physical characteristics:

- (i) based on volume: such as barrels, litres, gallons, thousand cubic feet or cubic metres;
- (ii) based on weight: such as tonnes, pounds, and kilograms; or
- (iii) based on energy content (British thermal units) of oil and gas;

(b) gross revenues for the period in relation to estimated total gross revenues of the current period and future periods (more commonly seen in the mining sector); and

(c) net revenues for the period in relation to total net revenues of the current and future periods.”

Calculation of a conversion factor based on volume or weight has the benefit of being easy to apply and can lead to satisfactory results if the relative value of the products is fairly stable. For example, some mining entities that produce both gold and silver from the same mines express their production in millions of ounces of silver equivalent. This is calculated as the sum of the ounces of silver produced plus their ounces of gold produced multiplied by some ratio of the gold price divided by the silver price. For example, if the gold price was CU900 and the silver price was CU12, this would provide a ratio of 1/75 - so the quantity of gold would be multiplied by 75 to determine the equivalent ounces of silver. However, these ratios can change depending on the relationship between gold and silver.

Calculation of a conversion factor based on other physical characteristics is quite common in the oil and gas sector. Typically, production and reserves in oil fields are expressed in millions of barrels of oil equivalent (mmboe), which is calculated by dividing the quantity of gas expressed in thousands of cubic feet by 6 and adding that to the quantity of oil expressed in barrels. This conversion is based on the fact that one barrel of oil contains as much energy as 6,000 cubic feet of gas. While this approach is commonly used, it is important to recognise two limiting factors: the actual energy conversion factor will not always be 1:6 but may vary between 1:5½ to 1:6½ and the market price of gas per unit of energy (typically BTU) is often lower than that of oil because of government price controls and the need for expensive infrastructure to deliver gas to end users.

¹³⁵ IASC Issues Paper, 7.24.

¹³⁶ IASC Issues Paper, 7.25.

¹³⁷ IASC Issues Paper, 7.61.

An approach that is commonly used (more so in the mining sector than the oil and gas sector) in calculating a conversion factor when joint products are extracted, is to base it on gross revenues. As discussed in section 16.1.3.C above, the main drawback of this method is that it requires an entity to forecast future commodity prices. Despite this drawback, there will be situations where no other viable alternative exists for calculating an appropriate conversion factor.

Finally, it is possible to calculate a conversion factor based on net revenue after deducting certain direct processing costs. An argument in favour of this method is that gross revenues do not necessarily measure the economic benefits from an asset. However, taken to an extreme this argument would lead down a path where no depreciation is charged in unprofitable years, which is clearly not an acceptable practice.

Accounting for the sale of joint products and by-products is addressed in section 14.2 above.

16.2 Block caving - depreciation, depletion and amortisation (mining)

Given the nature of mining operations, determining the appropriate unit of account has always been a matter requiring considerable judgement for mining entities. See section 4 above for further discussion.

Block cave mining is a mass mining method that allows for the bulk mining of large, relatively lower grade, ore bodies for which the grade is consistently distributed throughout. The word 'block' refers to the layout of the mine - which effectively divides the ore body into large sections, with areas that can be several thousand square metres in size. This approach adopts a mine design and process which involves the creation of an undercut by fracturing the rock section underneath the block through the use of blasting. This blasting destroys the rock's ability to support the block above. Caving of the rock mass then occurs under the natural forces of gravity (which can be in the order of millions of tonnes) when a sufficient amount of rock has been removed underneath the block. The broken ore is then removed from the base of the block. This mine activity occurs without the need for drilling and blasting, as the ore above continues to fall while the broken ore beneath is removed. Broken ore is removed from the area at the extraction level through the use of a grid of draw points. These effectively funnel the broken ore down to a particular point so that it can be collected and removed for further processing.

Block caving has been applied to large scale extraction of various metals and minerals, sometimes in thick beds of ore but more usually in steep to vertical masses. Examples of block caving operations include Northparkes (Australia), Palabora (South Africa), Codelco (Chile) and Freeport (Indonesia).¹³⁸

Block cave mining does require substantial upfront development costs, as initial underground access followed by large excavations (undercutting), must be completed to gain access and initially 'undermine' the block that is to cave. In addition, large underground and above ground haulage and milling infrastructure must be constructed to extract and then process the ore that a successful cave will generate.

One of the key issues to be addressed is how these substantial upfront development costs, in addition to the ongoing development costs associated with each block (i.e., to extend the undercutting beneath each new block and construct the draw points for each block) should be treated for depreciation or amortisation.

Generally, these costs are depreciated or amortised on a units of production basis - therefore, in determining useful life, it is necessary to determine what the appropriate reserves base should be for each of these different types of costs. For example, in relation to the costs associated with initially going underground and constructing the main haulage tunnel which will be used to access and extract the reserves from the entire ore body, the useful life associated with such assets may be the reserves of the entire ore body.

In relation to the costs associated in constructing the milling infrastructure, it is possible that such assets may be used to process ore from multiple ore bodies. Therefore, the useful life of such assets may be the reserves of multiple ore bodies. However, this will depend upon the specific facts and circumstances of the particular development.

For those costs associated with each individual block, e.g., the undercutting costs directly attributable to each block and the costs associated in constructing the draw points for that block, the appropriate reserves base may potentially only be those to be extracted from that particular block, which may only be a component of the entire ore body.

The approach adopted by each entity will be determined by the specific facts and circumstances of each mine development, such as the nature of the block cave mining technique employed and how the associated assets will be used. Such an assessment will require entities to exercise considerable judgement.

Appropriate disclosures are recommended where significant judgements and estimates are considered material.

¹³⁸ [Underground Block Caving: A Guide for Investors | INN \(investingnews.com\)](#) (accessed 09/06/2015).

17 IFRS 16 Leases

IFRS 16 governs the accounting for leases. IFRS 16 requires lessees to recognise most leases on their balance sheet as lease liabilities together with corresponding right-of-use assets. However, lessees can make accounting policy elections to apply accounting similar to operating lease accounting under IAS 17 *Leases* to short-term leases and leases of low-value assets.

Lessees will apply a single model for most leases. The profit or loss impact will largely comprise interest (on the lease liability) and depreciation (of the right-of-use asset). There may also be other lease expenses which continue to be recognised as an operating expense, e.g., variable payments not based on an index or rate, short-term lease payments and lease payments relating to low-value assets.

Lessor accounting is substantially unchanged from the previous IAS 17 accounting. Lessors are required to classify their leases into two types: finance leases and operating leases. Lease classification determines how and when a lessor recognises lease revenue and what assets a lessor records.

While the requirements of the IFRS 16 model are discussed in detail in Chapter 24, some of the key aspects of IFRS 16 that are particularly relevant to mining entities and oil and gas entities include:

- Scope and exclusions (see section 17.1 below and Chapter 24)
- Definition of a lease (see section 17.2 below and Chapter 24)
- Leases of subsurface rights (see section 17.1.3 below and Chapter 24)
- Substitution rights (see section 17.3 below and Chapter 24)
- Identifying and separating lease and non-lease components and allocating contract consideration (see section 17.4 below and Chapter 24)
- Identifying lease payments (see section 17.5 below and Chapter 24)
- Allocating contract consideration (see section 17.6 below and Chapter 24)
- Interaction of leases and asset retirement obligations (see section 17.7 below)
- Arrangements entered into by joint arrangements (see section 18 below)

17.1 Scope and scope exclusions

17.1.1 Mineral rights

Leases to explore for or use minerals, oil, natural gas and similar non-regenerative resources are excluded from the scope of IFRS 16, [IFRS 16.3], (amongst other types of arrangements - see Chapter 24 for the full list of scope exclusions).

IFRS 16 does not specify whether the scope exclusion for leases to explore for or use minerals, oil, natural gas and similar non-regenerative resources applies broadly to other leases that relate to, or are part of, the process of exploring for, or using, those resources. For example, in some jurisdictions, the minerals are owned by the government, but the land within which the minerals are located is privately owned. In these jurisdictions, a mining and metals entity needs to enter into a mineral lease with the government as well as a surface lease (i.e., the right to use the land) with the private landowner. IFRS 16's Basis for Conclusions states that IFRS 6 specifies the accounting for rights to explore for, and evaluate, mineral resources.

[IFRS 16.BC68(a)].

The US GAAP leases standard (ASC 842 *Leases*), includes more specific guidance on how this scope exclusion should be applied. It states that leases of minerals, oil, natural gas and similar non-regenerative resources, including the intangible rights to explore for those resources and the rights to use the land in which those natural resources are contained (unless those rights of use include more than the right to explore for natural resources) are outside the scope of ASC 842. For example, in the event that there is also a corporate head office building on part of the land, an apportionment would be applied, and the scope exclusion would not apply to the portion of the land upon which the head office is built. However, equipment used to explore for the natural resources is within the scope of ASC 842.2.

IFRS 16 is not specific as to whether the scope exclusion only applies to mineral rights in the E&E phase or whether it also applies to other rights (e.g., exploitation and/or extraction rights that arise in connection with development and production phases). The wording of the exclusion specifies that it applies to 'leases to explore for or use minerals' (emphasis added), which suggests that it applies more broadly (i.e., to the E&E, development and production phases). However, the reference to IFRS 6 in the Basis for Conclusions of IFRS 16 [IFRS 16.BC68(a)] may infer that the exclusion is limited to rights in the E&E phase.

How we see it

Entities will need to apply judgement to determine how broadly to interpret and apply this scope exclusion relating to mineral rights under IFRS 16. Most mining entities and oil and gas entities generally apply the above scope exclusion to the mineral rights in the E&E, development and production phases. We would expect that given the wording in the main body of the standard, the scope exclusion would apply to mineral rights in all phases. We would also expect that consistent with ASC 842, in the event that rights extend to more than the right to explore for or use natural resources, the scope exclusion would not apply. We would not expect the scope exclusion to extend to equipment used to explore, develop or produce mineral rights.

17.1.2 Land easements or rights of way

Land easements or rights of way are rights to use, access or cross another entity's land for a specified purpose. For example, a land easement might be obtained for the right to construct and operate a pipeline or other assets (e.g., a railway line) over, under or through an existing area of land or body of water while allowing the landowner continued use of the land for other purposes (e.g., farming), as long as the landowner does not interfere with the rights conveyed in the land easement.

When determining whether a contract for a land easement or right of way is a lease, mining entities and oil and gas entities will need to assess whether there is an identified asset and whether the customer obtains substantially all of the economic benefits of the identified asset and has the right to direct the use of that asset(s) throughout the period of use.

This will require careful consideration of the rights and obligations in each arrangement and conclusions may vary given that the nature of these contracts can also vary by jurisdictions. The issue of accounting for land easements is discussed in Chapter 24.

17.1.3 Subsurface rights

In June 2019, the IFRS IC discussed a contract for subsurface rights.¹³⁹ In the contract described, a pipeline operator obtains the right to place an oil pipeline in underground space for 20 years in exchange for consideration. The contract specifies the exact location and dimensions (path, width and depth) of the underground space within which the pipeline will be placed. The landowner retains the right to use the surface of the land above the pipeline, but it has no right to access or otherwise change the use of the specified underground space throughout the 20-year period of use. The customer has the right to perform inspection, repairs and maintenance work (including replacing damaged sections of the pipeline when necessary).

During the discussion, the IFRS IC noted the following:

- Paragraph 3 of IFRS 16 requires an entity to apply IFRS 16 to all leases, with limited exceptions. In the contract described in the request, none of the exceptions in IFRS 16.3 and IFRS 16.4 apply. In particular, the IFRS IC noted that the underground space is tangible. Accordingly, if the contract contains a lease, IFRS 16 applies to that lease. If the contract does not contain a lease, the entity would then consider which other IFRS accounting standard applies.
- Applying IFRS 16.B9, to meet the definition of a lease the customer must have both:
 - The right to obtain substantially all the economic benefits from use of an identified asset throughout the period of use.
 - The right to direct the use of the identified asset throughout the period of use.
- The specified underground space is physically distinct from the remainder of the land. The contract's specifications include the path, width and depth of the pipeline, thereby defining a physically distinct underground space. The space being underground does not in itself affect whether it is an identified asset - the specified underground space is physically distinct in the same way that a specified area of space on the land's surface would be physically distinct. As the landowner does not have the right to substitute the underground space throughout the period of use, the IFRS IC concluded that the specified underground space is an identified asset as described in IFRS 16.B13-B20.
- The customer has the right to obtain substantially all the economic benefits from use of the specified underground space throughout the 20-year period of use. The customer has exclusive use of the specified underground space throughout that period of use.

¹³⁹ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

- The customer has the right to direct the use of the specified underground space throughout the 20-year period of use because the customer has the right to operate the asset throughout the period of use without the supplier having the right to change those operating instructions. How and for what purpose the specified underground space will be used (i.e., to locate the pipeline with specified dimensions through which oil will be transported) is predetermined in the contract. The customer has the right to operate the specified underground space by having the right to perform inspection, repairs and maintenance work. The customer makes all the decisions about the use of the specified underground space that can be made during the 20-year period of use.

Consequently, the IFRS IC concluded that the contract described in the request contains a lease as defined in IFRS 16. The customer would therefore apply IFRS 16 in accounting for that lease.

17.2 Definition of a lease

A lease is defined in IFRS 16 as: *[IFRS 16 Appendix A]*

Extract from IFRS 16

Appendix A

Defined terms

lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.
--------------	--

To be a lease, a contract must convey the right to control the use of an identified asset.

As discussed above, a wide variety of arrangements exist in the mining sector and oil and gas sector that may provide a right to control the use of an identified asset(s). Some examples include:

- Mining or oil field services contracts (e.g., equipment used to deliver a service, including drilling contracts)
- Shipping, freight and other transportation arrangements, including railway infrastructure and harbour loading services contracts
- Refining, processing and tolling arrangements
- Storage arrangements (including certain capacity portions of such arrangements)

Also, while not specific to the mining sector or oil and gas sector, there are many other arrangements commonly entered into by mining entities and oil and gas entities that will also need to be considered. Such arrangements include outsourcing arrangements, such as IT, and utility supply arrangements; such as those for the purchase of gas, electricity, water or telecommunications.

All of these arrangements will need to be assessed to determine whether they represent, or contain, a lease.

17.3 Substitution rights

IFRS 16 states that even if an asset is specified in an arrangement, a customer does not have the right to use an identified asset if, at inception of the contract, a supplier has the substantive right to substitute the asset throughout the period of use. *[IFRS 16.B14]*. A substitution right is substantive if the supplier has both the practical ability to substitute alternative assets throughout the period of use and the supplier would benefit economically from exercising its right to substitute the asset. *[IFRS 16.B14]*. If the customer cannot readily determine whether the supplier has a substantive substitution right, the customer presumes that any substitution right is not substantive. *[IFRS 16.B19]*.

Entities will need to carefully evaluate whether a supplier's substitution right is substantive based on facts and circumstances at inception of the contract. In many cases, it will be clear that the supplier will not benefit from the exercise of a substitution right because of the costs associated with substituting an asset. *[IFRS 16.BC113]*. For example, an asset is highly customised and/or significant costs have been incurred to ensure the asset meets the specifications required by the contract such that the supplier would not benefit economically from exercising its substitution right. In addition, the supplier's substitution rights may not be substantive if alternative assets are not readily available to the supplier or they could not be sourced by the supplier within a reasonable period of time and hence there is no practical ability to substitute them.

See Chapter 24 for further discussion.

17.4 Identifying and separating lease and non-lease components

Many contracts may contain a lease(s) coupled with an agreement to purchase or sell other goods or services (non-lease components). Examples of contracts in the mining sector and oil and gas sector that could contain a lease and significant non-lease components for services provided by the supplier include but are not limited to:

- Transportation and storage contracts, which generally require the supplier to operate the facilities, and/or provide staff/crew
- Outsourced mining services contracts or oilfield services arrangements including closure arrangements
- Exploration drilling contracts, which typically include operation services

For these contracts, IFRS 16 requires an entity to account for each lease component within the contract as a lease separately from non-lease components of the contract, unless the entity applies the practical expedient to combine lease and associated non-lease components. [IFRS 16.12]. The non-lease components are identified and accounted for separately from the lease component(s), in accordance with other standards. For example, the non-lease components may be accounted for as executory arrangements by lessees (customers) or as contracts subject to IFRS 15 by lessors (suppliers).

See Chapter 24 for further information.

17.5 Identifying lease payments included in the measurement of the lease liability

Some lease agreements include payments that are described as variable or may appear to contain variability but are in-substance fixed payments because the contract terms require the payment of a fixed amount that is unavoidable. Such payments are lease payments included in the measurement of the lease liability and right-of-use assets at the commencement date.

For example, consideration paid for the use of equipment, such as drilling rigs, is typically expressed as a rate paid for each operating day, hour or fraction of an hour. The types of rates a lessee may be charged include:

- Full operating rate - a rate charged when the rig is operating at full capacity with a full crew (in which case there could be a non-lease component of crew services)
- Standby rate or cold-stack rate - a rate charged when the lessee unilaterally puts the rig on standby
- Major maintenance rate - a minimal rate, or in some cases a 'zero rate' charged when the lessor determines that maintenance needs to be performed and the rig is not available for use by the lessee
- Inclement weather rate - a minimal rate, or in some cases a 'zero rate' charged when weather makes it dangerous to operate the rig and, therefore, it is not available for use by the lessee

How we see it

There will likely be variability in the pricing of a drilling contract, however, typically there will be a minimum rate in these types of contracts. This amount would likely be the lowest rate that the lessee would pay while the asset is available for use by the lessee. Depending on the contract, this rate may be referred to using terms such as a standby or cold-stack rate. When identifying lease payments in an arrangement, mining entities and oil and gas entities would only consider rates that apply when the asset is available for use.

Illustration 17-1: Identifying lease payments - inclement weather

Upstream Entity A enters into a 3-year contract with Rig Owner for the right to use Drilling Rig 1 over a three-year period. The contract is considered to contain a lease. The contract specifies the rates a lessee may be charged and these include:

- Full operating rate of CU100,000 per day - charged when the rig is operating at full capacity with a full crew.
 - Standby rate of CU40,000 per day - charged when the lessee unilaterally puts the rig on standby.
- And
- Inclement weather rate of zero CU per day - charged when weather makes it dangerous to operate the rig and, therefore, it is not available for use by the lessee.

Analysis

In calculating the lease liability, the standby rate of CU40,000 per day for 3 years would be used. The inclement weather rate is not applicable in calculating the minimum lease payments as the rate only applies when the asset is not available for use.

Illustration 17-2: Identifying lease payments - major maintenance

Mining entity Z enters into an arrangement with Equipment Supplier T for the lease of a piece of processing equipment to be utilised at the mine site. The contract requires payment of CU10,000 per day for the equipment, but stipulates Supplier T perform 10 days per annum of major maintenance that is required on the equipment. The day rate for those 10 major maintenance days is zero CU per day.

Analysis

In calculating the lease liability, the rate of CU10,000 per day would be used. However, the rate would only be applied for 355 days each year on the basis that the contractual arrangement clearly sets out that there are 10 days per annum where the equipment will not be available for use to allow for major maintenance to be undertaken and that a zero day rate will apply on those days. Accordingly, contractually, the minimum lease payments are in fact lower, as the equipment will only be available for 355 days per annum.

This differs from the zero day rate that applies for inclement weather in Illustration 17-1 above because the period of time when the inclement weather rate will apply, is outside of the control of both parties.

See Chapter 24 for further discussion.

17.6 Allocating contract consideration

Lessees allocate the consideration in the contract to the lease and non-lease components on a relative stand-alone price basis. However, IFRS 16 provides a practical expedient that permits lessees to make an accounting policy election, by class of underlying asset, to account for each separate lease component of a contract and any associated non-lease components as a single lease component. Lessors are required to apply IFRS 15 to allocate the consideration in a contract between the lease and non-lease components, generally, on a relative stand-alone selling price basis. See Chapter 24 for further information.

17.7 Interaction of leases with asset retirement obligations

When undertaking remediation and rehabilitation activities, it may be possible that a mining company or oil and gas company enters into an arrangement with a supplier that is, or contains, a lease. The costs associated with these activities form a significant component of the costs which make up the asset retirement obligation (ARO) that was recognised by the mining company or oil and gas company at commencement of the mine or field.

Assuming this lease is not a short-term lease and does not relate to the lease of a low-value asset, a right-of-use asset and lease liability will need to be recognised. One of the issues to consider is whether the mining company or oil and gas company's recognition of the lease liability results in the derecognition of the ARO liability recognised on the balance sheet. Given that prior to the commencement of any ARO-related activities, the mining company or oil and gas company still has an obligation to rehabilitate under IAS 37, it cannot derecognise the ARO liability. Instead, it now has a separate lease liability for the financing of the lease of the asset. Accordingly, acquiring the right-of-use asset does not result in the derecognition of the ARO liability, rather, it would be the activity undertaken or output of the asset which would ultimately settle the ARO liability. This approach would be consistent with a scenario where an asset, e.g., the leased asset, had been purchased, using bank finance, and the finance liability relating to the bank debt used to purchase the asset, is separately recognised on the balance sheet.

As such, at the point prior to any ARO activity (assuming this occurs at end of mine/field life), the mining company or oil and gas company has:

- No ARO asset (fully amortised)
- An ARO liability for the full ARO estimate
- A right-of-use asset
- A lease liability

See Chapter 24 for discussion on measurement of the right-of-use asset and lease liability.

The impacts of this will include:

- Amortisation of the right-of-use asset across the period of use
- Interest expense on the lease liability
- Interest expense arising from the unwinding on the discount on the ARO liability, assuming interest continues to unwind over the remediation and rehabilitation activity period
- The use (reduction) of the ARO liability (as the leased asset is used to settle the obligation)

Consideration should be given to the requirements of IAS 37, [IAS 37.61, IAS 37.62], which sets out that a provision shall be used only for expenditures for which the provision was originally recognised, i.e., that expenditures that relate to the original provision are set against it. See Chapter 27.

18 Interaction of IFRS 16 and IFRS 11

In the mining and metals sector and oil and gas sector, it is common for a group of entities to collaboratively perform exploration, development and/or production activities using a joint operation ('JO').¹⁴⁰ In such circumstances, a single party will often be appointed to be responsible for undertaking the operations on behalf of parties to the JO (i.e., the lead operator). The arrangement is often governed by a joint operating agreement ('JOA'). There may also be other contractual arrangements that govern the relationship and activities between the non-operator parties and the lead operator, some arrangements may involve specific agreements such as rig sharing agreements, and these may be verbal or written.

These agreements generally provide the lead operator with a right to recover the costs it incurs on behalf of the non-operator parties, including costs related to leasing assets to be used in the JO. Some stakeholders may have previously considered that the right to recover costs pursuant to a separately negotiated JOA meant that the lead operator was only required to recognise a lease liability incurred as part of a contract with a third party supplier (lessor) in proportion to its interest in the JO.

One issue highlighted during the implementation of IFRS 16, was how a lead operator is required to recognise lease-related assets and liabilities when it is the sole signatory to a contract that is or contains a lease. This issue was taken to the IFRS IC in 2019 and they discussed a question relating to lease arrangements in a JO under IFRS 16. The question asked was how a lead operator recognises a lease liability. The question specifically focused on situations where the JO is not structured through a separate vehicle and the lead operator, as the sole signatory, enters into a lease contract with a third party supplier (lessor) for an item of property, plant and equipment that will be operated jointly as part of the JO's activities. The lead operator has the right to recover a share of the lease costs from the other joint operators in accordance with the contractual and other arrangements governing the JO.

The IFRS IC concluded that in accordance with IFRS 11, a joint operator identifies and recognises both:

- (a) Liabilities it incurs in relation to its interest in the JO
- (b) Its share of any liabilities incurred jointly with other parties to the joint arrangement.

It observed that identifying the liabilities a joint operator incurs and those incurred jointly requires an assessment of the terms and conditions of all contractual agreements that relate to the JO, including consideration of the laws pertaining to those agreements.¹⁴¹ It also acknowledged contractual agreements relating to each JO are likely to differ.

The IFRS IC further observed, in accordance with IFRS 11, the liabilities a joint operator recognises include those for which it has primary responsibility.¹⁴² Also, in the fact pattern as it was presented, the conclusion was that the JOA and related contractual arrangements did not extinguish or transfer the lead operator's primary responsibility for the lease liability.¹⁴³ Therefore, as sole signatory and where a lead operator has primary responsibility for a lease, the lead operator recognises 100% of the lease liability.

The IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for the lead operator to identify and recognise its liabilities in relation to its interest in a JO and, consequently, the IFRS IC decided not to add this matter to its standard-setting agenda.¹⁴⁴

Consequently, if the lead operator is the primary obligor in a lease arrangement, even when the underlying asset will be used to satisfy the activities of the JO, the lead operator must account for the lease by recognising the full lease liability measured in accordance with IFRS 16. In this circumstance, even though the lead operator has a right to recover costs from the non-operator parties, including their share of the lease obligation, it is not appropriate for the lead operator to only recognise its proportionate share of the lease liability by relying on the terms and conditions of the JOA or other arrangements with the non-operator parties to which the third party supplier is not a party. This is because the JOA and other arrangements are separately negotiated with the non-operators and do not extinguish the lead operator's obligation for the lease with the third party supplier.

¹⁴⁰ Appendix A of IFRS 11 defines a joint operation as a joint arrangement whereby the parties that have joint control of the arrangement have rights to the assets and obligations for the liabilities, relating to the arrangement.

¹⁴¹ [IASB Staff Paper 9](#): Project: *Liabilities in relation to a joint operator's interest in a joint operation (IFRS 11)*, Paper topic: *Agenda decision to finalise*, IFRS IC Meeting, March 2019, para. 30(a). Available on the IFRS Foundation's website.

¹⁴² [IASB Staff Paper 9](#): Project: *Liabilities in relation to a joint operator's interest in a joint operation (IFRS 11)*, Paper topic: *Agenda decision to finalise*, IFRS IC Meeting, March 2019, para. 30(b). Available on the IFRS Foundation's website.

¹⁴³ [IASB Staff Paper 9](#): Project: *Liabilities in relation to a joint operator's interest in a joint operation (IFRS 11)*, Paper topic: *Agenda decision to finalise*, IFRS IC Meeting, March 2019, para. 28. Available on the IFRS Foundation's website.

¹⁴⁴ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

As a direct consequence of this decision, the immediate issue is then to determine who has primary responsibility for the arrangement with the third party supplier. Determining whether a lead operator, each joint operator party, or the JO itself, has primary responsibility for obligations such as a lease liability, could require a detailed evaluation of all relevant terms and conditions and facts and circumstances, including the legal environment in which the arrangement(s) operate (see section 18.1 below).

While the agenda decision addressed the accounting for lease liabilities in relation to a joint operator's interest in a JO, it did not address some of the related issues that often arise in these situations.

This section explores and discusses some of these related issues and the potential considerations for arrangements between lead operators and the other joint operators (referred to as non-operator parties) of a JO, particularly in relation to their respective rights and obligations. It explores a range of factors that may need to be considered when assessing how to account for these contractual arrangements, and acknowledges different conclusions could be reached for different joint arrangements and in different jurisdictions.

This section primarily considers situations where the lead operator has a lease with a third party supplier for which it has primary responsibility, and then specifically focuses on determining how the contractual arrangement(s) between the lead operator and the non-operator parties should be assessed and accounted for under IFRS accounting standards.¹⁴⁵ However, similar issues may arise where the lead operator owns the asset used on a JO.

There may also be some similar concerns, i.e., identification of a lease and other consequential impacts, where the lead operator and the non-operator parties (together, the parties to the JO) enter into an arrangement directly with a third party supplier. However, this is not the primary focus of this section.

Some of the potential follow-on issues to consider include, but may not be limited to:

- Who is the customer (see section 18.2 below)
- Whether the arrangement between the lead operator and the JO is, or contains, a sublease (see section 18.3 below)
- Depending on the conclusion reached in determining whether the arrangement between the lead operator and the JO contains a sublease (see section 18.3 below), determining the appropriate accounting by the lead operator (see section 18.4 below) and the non-operator parties (see section 18.5 below)

See Chapter 24 for a general discussion of the requirements of IFRS 16.

18.1 Determining who has primary responsibility

Determining whether a lead operator, each party to the JO or the JO itself, has primary responsibility for obligations, such as a lease liability, may require a careful evaluation of all relevant terms and conditions as well as facts and circumstances and the legal environment in which the arrangement(s) operate.

When assessing the fact pattern presented to the IFRS IC, the analysis in the March 2019 Agenda paper¹⁴⁶ specifically focused on the derecognition requirements of IFRS 9. The Agenda paper noted that an entity could only derecognise a liability when it was extinguished, i.e., when the entity discharges the liability or is legally released from primary responsibility for the liability either by process of laws or by the creditor.

It also referred to the considerations the IASB undertook when developing IFRS 16 and whether an intermediate lessor should be permitted to offset payments received under the sublease against the liability recognised on the head lease. The IASB decided not to permit this on the basis that each contract was negotiated separately, with the counterparty to the sublease being different to the counterparty to the head lease. As such, the obligations arising from the head lease were generally not extinguished by the terms and conditions of the sublease. This analysis indicated that the legal form of the arrangements is essential in determining who has primary responsibility. As noted above, the outcome may vary depending on the legal jurisdiction in which the arrangements operate.

¹⁴⁵ When considering the implications of these issues from a US GAAP perspective, while the IFRS and US GAAP lease standards are aligned with respect to the definition of a lease, there is no equivalent US standard to IFRS 11 when accounting for joint arrangements. Also, as noted above, contractual arrangements can and will differ between JO's and legal jurisdictions. Given this, it cannot be assumed the issues identified in this chapter and the analysis that would be required to determine the accounting under IFRS would be the same under US GAAP.

¹⁴⁶ [IASB Staff Paper 9](#): Project: *Liabilities in relation to a joint operator's interest in a joint operation (IFRS 11)*, Paper topic: *Agenda decision to finalise, IFRS IC Meeting, March 2019*, paras. 35-39. Available on the IFRS Foundation's website.

Where it is established the lead operator has primary responsibility, the IFRS IC decision made it clear that the lead operator will initially recognise the entire lease liability and related right-of-use asset in accordance with IFRS 16.

Before undertaking the lease assessment, set out in section 18.2 below, it is critical to first determine who the customer is. This is because a lease arises when a customer has a right to control the use of an identified asset for a period of time in exchange for consideration.

18.2 Identifying the customer when there is a JO

Once it has been established the lead operator has primary responsibility for the lease arrangement with the third party supplier, it is then necessary to assess the arrangement(s) between the lead operator and the JO. In undertaking this assessment, it is important to remember that where there is a joint arrangement, IFRS 16 makes it clear that for the purposes of identifying a lease, it is the JO that is the customer in the arrangement with the lead operator rather than each of the parties to the JO individually.¹⁴⁷

However, the IFRS IC staff paper also noted IFRS 16.B11 was developed to apply only when assessing whether a contract contains a lease and in determining who is the 'customer' as per the requirements of IFRS 16. It has no further effect on the required accounting for the lease or the joint arrangement, or when assessing who is the customer for the purposes of other standards.¹⁴⁸ See section 18.4.2 below for further discussion of where the term customer is used in other standards.

18.3 Determining whether the contractual arrangement between the lead operator and the JO contains a sublease

When assessing the nature of the relationship between the lead operator and the JO and the potential consequential accounting outcomes, including whether there is a sublease, all relevant enforceable contracts, facts and circumstances and the relevant legal environment, need to be considered.

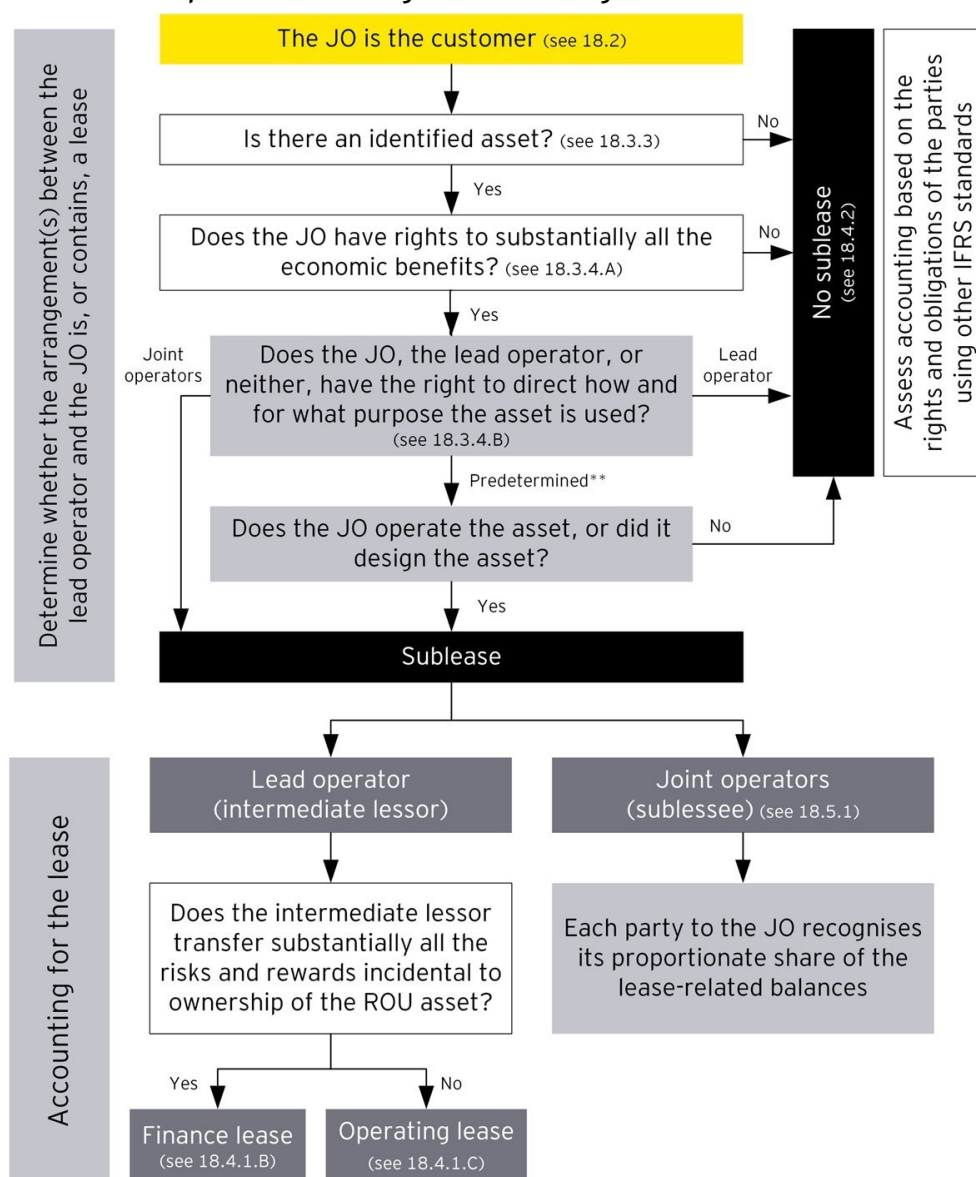

Some examples of potential contracts that may need to be considered when identifying relevant facts and circumstances and enforceable rights and obligations are set out in section 18.3.1 below. Some of the factors that need to be assessed to determine whether there is a sublease arrangement in place are discussed in section 18.3.2 below.

This overall assessment process is summarised in the following flow chart:

¹⁴⁷ IFRS 16.B11 specifically states that when a contract to receive goods or services is entered into by a joint arrangement [as defined in IFRS 11], or, on behalf of a joint arrangement, for the purpose of a lease assessment, the joint operators to the joint arrangement, collectively, are considered to be the customer in the contract.

¹⁴⁸ [IASB Staff Paper 9](#): Project: *Liabilities in relation to a joint operator's interest in a joint operation (IFRS 11)*, Paper topic: *Agenda decision to finalise, IFRS IC Meeting, March 2019*, para. 17; and [IASB Staff Paper 3](#): Project: *IFRS 11 Joint Arrangements - Joint Operations*, Paper topic: *Initial Consideration, IFRS IC Meeting, September 2018*, paras. 40-44. Available on the IFRS Foundation's website.

Figure 18-1: Determining whether the contractual arrangements between the lead operator (as the supplier) and the JO (as the customer) is, or contains, a sublease; and the subsequent accounting for the arrangement

****** In accordance with IFRS 16.B24, a customer has the right to direct the use of an identified asset throughout the period of use if the relevant decisions about how and for what purpose the asset is used are predetermined and: (i) the customer has the right to operate the asset (or to direct others to operate the asset in a manner that it determines) throughout the period of use, without the supplier having the right to change those operating instructions; or (ii) the customer designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use.

18.3.1 Assessing the contractual arrangements between the lead operator and the non-operator parties to the JO

18.3.1.A Joint operating agreement

It is common in the extractives industries for a JOA to exist between the parties to the JO. Depending on the terms of the JOA, the underlying activities may be determined and governed by the field/mine development plan and/or the annual operating plans and these may require the unanimous consent or a majority vote of the parties to the JO. In some instances, the JOA may not be explicit as to how all aspects of the JO will operate, particularly when it comes to determining which party (i.e., the lead operator or the JO) has the right to control the use of the assets used to perform the activities of the JO. In other instances, the JOA may give the lead operator primary authority over the development and operations plan for the field/mine and/or the right to determine the relevant decisions over certain assets (e.g., the right to determine when and whether specific assets will be used in the development and operations plan).

As JOAs can vary between JOs and across jurisdictions as they relate to control and responsibility for the activities pursuant to the development and operations plan, each arrangement needs to be carefully considered based on individual facts and circumstances to identify the enforceable rights and obligations.

18.3.1.B Other enforceable contractual arrangements (written and verbal)

Other enforceable contractual arrangements, written and/or verbal, may also affect the rights and obligations of the lead operator and the non-operator parties and thus need to be taken into consideration. For example, for significant assets such as a deep-water drilling rig that is integral to the activities of the JO, a separate contractual arrangement between the lead operator and non-operator parties may exist. This may have been required to evidence the non-operator parties' agreement to use of the specific drilling rig and specific contractual terms including the payment terms, prior to the lead operator entering into the lease arrangement with the third-party lessor. This may take the form of a written agreement, or, for example, could be via enforceable verbal agreements reached through the operating committee meetings of the JO which are then minuted.

The extent and nature of contractual arrangements can vary between JOs and relevant legal environments in different jurisdictions. Given this, the specific facts and circumstances and enforceability of each contractual arrangement need to be considered to determine the rights and obligations of the lead operator and the JO.

18.3.2 Determining if there is a sublease

Once it has been established there is a customer-supplier relationship between the lead operator and the JO, the next step is to determine whether there is a lease.

IFRS 16 states that a contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration. [IFRS 16.9]. In assessing whether a contract conveys the right to control the use of an identified asset for a period of time, an entity assesses whether, throughout the period of use, the customer has both:

- The right to obtain substantially all of the economic benefits from use of the identified asset
- The right to direct the use of the identified asset

The key factor to determine whether there is a sublease is whether it is the lead operator (as the supplier) or the JO (as the customer) that has the right to control the use of the identified asset.

18.3.3 Determining if there is an identified asset

18.3.3.A Specified asset - explicit or implicit

The first step in a lease assessment is to determine if there is an identified asset. As noted in the introduction in section 18 above, this assessment will be the same irrespective of whether the asset in question is owned or leased by the lead operator. However, the focus of this subsection is on situations where the asset in question is leased by the lead operator from a third-party supplier.

An asset is typically identified by being explicitly specified in a contract. However, an asset can also be identified by being implicitly specified at the time that it is made available for use by the customer. A capacity or other portion of an asset, that is not physically distinct, may be an identified asset if the customer's rights to use that asset represent substantially all of the capacity of the asset and thereby provide the customer with the right to obtain substantially all of the economic benefits from use of the asset. For example, a capacity portion of a pipeline or processing plant being used by the JO, could be an identified asset if the portion represents substantially all of the capacity, even if it is not physically distinct.

When analysing the contractual arrangement between the lead operator and the third-party supplier, if a capacity or other portion of an asset has been appropriately evaluated, the right to use the asset still needs to be assessed to determine whether it is an identified asset for the purpose of evaluating the existence of a sublease between the lead operator and the JO. This assessment will be based not only on the enforceable terms and conditions of the contractual arrangement between the lead operator and the non-operator parties, but also other relevant facts and circumstances, [IFRS 16.2], inclusive of supplier substitution rights (see section 18.3.3.B below for a discussion on substantive substitution rights).

Illustration 18-1: Identified asset - explicitly identified

A lead operator enters into a lease with a third-party supplier for the use of an identified drilling rig for a period of three years. This drilling rig is to be used on JO1 for the full three-year period and this has been discussed and agreed between all parties to the JO at its Operating Committee (OpComm) and has been documented in the OpComm meeting minutes, which are enforceable under this JOA and for this jurisdiction. The lead operator has no substantive substitution rights with respect to this drilling rig throughout the three-year term of the arrangement with JO1.

Analysis: The drilling rig is an identified asset. The drilling rig is explicitly specified in OpComm meeting minutes, and there are no substantive substitution rights.

Illustration 18-2: Identified asset - capacity portion of an asset

A lead operator enters into a lease with a third-party supplier for the right to use an explicitly specified iron ore processing plant for three years. The lead operator then uses this processing plant to process iron ore received from multiple JO's, including JO1. The JOA between the lead operator and JO1 requires the lead operator to undertake all iron ore processing activities using the processing plant which the lead operator has leased. Given the quantity of JO1's iron ore which needs to be processed and the capacity of the processing plant, this arrangement provides JO1 with the right to substantially all of the processing plant's capacity. The lead operator has no substantive substitution rights with respect to this processing plant.

Analysis: The processing plant is an identified asset. While the capacity portion of the processing plant is not physically distinct, as JO1 has the right to substantially all of the processing plant's capacity, JO1 has the right to obtain substantially all of the economic benefits from use of the processing plant. Also, there are no substantive substitution rights.

18.3.3.B Substantive substitution rights

IFRS 16 states that even if an asset is specified, a customer does not have the right to use an identified asset if the supplier has the substantive right to substitute the asset throughout the period of use.

[IFRS 16.B14]. In determining whether the lead operator has the substantive right to substitute the asset throughout the period of use, it will be necessary to consider whether the lead operator has the practical ability to substitute (e.g., due to having a portfolio of similar underlying assets which it owns or leases and can easily substitute), and, whether it would benefit economically from doing so.

Demonstrating there is an economic benefit from substitution is a high hurdle, as the customer (i.e., the JO) has to be able to demonstrate the supplier has the practical ability to substitute the underlying asset and the supplier's economic benefits associated with substituting the asset, throughout the period of use, would exceed its costs. If the customer cannot readily determine whether the supplier has a substantive substitution right, the customer presumes the right is not substantive. [IFRS 16.B19].

Illustration 18-3: Identified asset - explicitly identified but multiple assets available

A lead operator enters into a lease with a third-party supplier for the use of helicopter XYZ for a period of three years. The lead operator plans to use helicopter XYZ for flights to and from JO1 (a remote mining operation) for the full three-year period. The use of helicopter XYZ has been agreed between the lead operator and the non-operator parties to JO1.

However, while all the parties to JO1 have agreed to use helicopter XYZ, the lead operator also leases two other helicopters of the same specifications, and all three helicopters are retained at the same nearby air base. The minutes from the same OpComm meeting also confirm that to maximise efficiency of operations, the lead operator is permitted to utilise helicopter XYZ on the lead operator's other unrelated nearby JOs and the similar helicopters can be used on JO1 provided each continues to meet specified safety requirements.

The lead operator's lease arrangements with its third-party suppliers allow each of the three helicopters leased by the lead operator to be used for flights to and from each of its mining operations.

Analysis: The arrangement does not contain an identified asset. The lead operator has substantive substitution rights as it has access to two other helicopters that can fly to and from the JO1 mine site. Also, as the helicopters are of the same specification and are held at the same nearby air base, practically substitution can occur. The lead operator would substitute where it provides for efficiency of operations, and accordingly, an economic benefit would arise from substitution. Therefore, notwithstanding helicopter XYZ is explicitly specified in the minutes to the OpComm meeting for JO1, there is no identified asset as the lead operator has a substantive right of substitution.

The existence of a substantive substitution right must be considered on a lease-by-lease basis taking into consideration the specific facts and circumstances existing at lease inception. Given the nature of some assets used within these types of contractual arrangements and the location of the underlying assets, it will often be difficult to demonstrate that the lead operator has a substantive right to substitute the asset under these circumstances. This is because it is likely the lead operator may not have the practical ability to substitute the assets and, even so, costs of substitution would be high. Therefore, it may be difficult to demonstrate, throughout the period of use, that the benefits of substitution are greater than the costs.

18.3.4 Determining if the customer has the right to control the use of an identified asset

As discussed in section 18.2 above, when applying the requirements of IFRS 16 (as outlined below) and specifically when considering the concept of the customer, it is the JO that is the customer. The JO (as the customer) has the right to control the use of an identified asset if it has both the right to obtain substantially all of the economic benefits from use and the right to direct the use of the asset. It would be inappropriate to conclude that a contract does not contain a lease on the grounds that each of the parties to the JO either obtains only a portion of the economic benefits from use of the underlying asset or does not unilaterally direct the use of the underlying asset. [IFRS 16.BC126].

18.3.4.A Right to obtain substantially all of the economic benefits from the use of the identified asset

To control the use of an identified asset, a customer is required to have the right to obtain substantially all of the economic benefits from use of the identified asset throughout the period of use (e.g., by having exclusive use of the asset throughout that period).

There may be some situations where there is a difference between an asset's nominal/expected capacity and the capacity expected to be used by the customer. This may impact the assessment of whether a customer has the right to substantially all of the economic benefits from the use of the identified asset.

Illustration 18-4: Assessing 'substantially all' when the customer's use of the asset is not 100% of the nominal operating capacity

A lead operator enters into a 30-year lease with Supplier A to transport gas through a pipeline. The lead operator has the right to use 100% of the pipeline. The lead operator will then use the pipeline to transport gas for JO1. At the commencement of the arrangement with JO1, JO1 has the right to use 70% of the pipeline's nominal capacity. The pipeline is located in a remote area where the probability of another customer using the excess capacity of the pipeline is remote.

Analysis: Where the likelihood of another customer using the excess capacity is not substantive, JO1 will be considered to have the right to obtain substantially all of the economic benefits from using the pipeline throughout the period of use.

Determining whether JO1 has the right to obtain substantially all of the economic benefits from using the pipeline throughout the period of use requires consideration of all facts and circumstances. This includes considering the reason for the unused excess capacity.

In this situation, the assessment should be performed based on JO1's right to use 70% of the capacity, combined with an assessment of the likelihood of another customer using the excess capacity.

There is a range of factors to take into consideration when determining whether the JO has the right to substantially all of the economic benefits from the use of an asset. These include (but are not limited to):

- The importance of these types of assets used in the activities of JOs in the mining sector/oil and gas sector and the location of the assets, e.g., in locations which are difficult to get to and/or are remote
- Whether they are located on the mining entity's/oil and gas entity's property
- The likelihood of another customer being able to access any excess capacity

18.3.4.B The right to direct the use of the asset

IFRS 16 states that a customer can obtain the right to direct the use of an identified asset throughout the period of use if the customer has the right to direct how and for what purpose the asset is used throughout the period of use.

When assessing the range of service arrangements used in the mining sector/oil and gas sector, to determine if they are, or contain, leases, it is essential to understand what and who dictates how and for what purpose an identified asset is used. In undertaking this assessment, the decision-making rights most relevant to changing how and for what purpose an identified asset is used throughout the period of use are considered. Decision-making rights are relevant when they affect the economic benefits to be derived from use.

When assessing arrangements between a lead operator and a JO, it is critical to assess whether it is the lead operator or the JO as a whole, that has the right to direct the use of the asset. This involves obtaining an understanding of the JOA and other relevant enforceable arrangements to determine who has the right to make (and change) the key decisions with respect to the use of the asset throughout the period of use.

Under IFRS 11, a joint arrangement exists where:

- The contractual arrangement gives all the parties, or a group of the parties, control over the arrangement collectively.
- The decisions about the relevant activities require the unanimous consent of the parties sharing control. [IFRS 11.5, IFRS 11.7].

For arrangements in the extractives industries, under the terms of a JOA, approval of the mine plan or field plan and/or annual operating budget may be considered a relevant activity, and, for this to require unanimous consent of all parties to the JO for approval. Identification of relevant activities and determining which require unanimous consent, is a critical part of the rationale to support joint control such that the arrangement is a joint arrangement in scope of IFRS 11.

When assessing who has the right to direct the use of an asset in accordance with IFRS 16, in some arrangements, the lead operator may retain this right and therefore there will be no sublease between the lead operator and JO.

However, if the enforceable terms of the JOA and other arrangements in place and relevant facts and circumstances support this, it is possible the JO may have the right to direct the use of an identified asset(s) used as part of the activities of the JO.

For example, where it has been concluded that the mine plan or field plan is specific enough that it provides the JO the right to determine how and for what purpose an identified asset is used throughout the period of use and subsequent changes to that mine plan or field plan require unanimous consent, then the JO may direct the use of the identified asset. If the JO also has the right to substantially all of the economic benefits from use of the asset, the JO (as the customer) has the right to control the use of the asset.

Illustration 18-5: Right to direct the use - dedicated asset

Company A, in its role as lead operator, enters into a 10-year lease (head lease) for a Floating Production Storage Offloading (FPSO) vessel with a third-party supplier, as sole signatory and has primary responsibility for the lease payments. It recognises the entire lease liability and related right-of-use asset in respect of the head lease. The FPSO is highly specialised to allow for production from a single specified field, owned by JO1, on which it is to be deployed. The FPSO will be used by JO1 for 10 years.

The enforceable terms of the JOA for JO1 specify that the lead operator is responsible for sourcing an appropriate FPSO to be used on JO1 for 10 years. Once identified, the lead operator will not have a substantive right to substitute the underlying FPSO during the 10-year period.

In addition, in this example, the field development and operations plans, which determine how and for what purpose the FPSO is used throughout the period of use, require the unanimous consent of the parties to JO1. Due to changing oil prices, costs, field performance, etc. the parties to JO1 also have the right to change these plans. Therefore, such decisions are the relevant decisions impacting the economic benefits derived from use of the FPSO.

The lead operator recovers its costs related to the lease of the FPSO payable to the third-party supplier by billing all parties to JO1, pro-rated based on their equity interests in JO1 throughout the 10-year right of use term.

Analysis: There is a sublease between the lead operator and the JO. In this instance, given the enforceable terms of the JOA and other relevant facts and circumstances, the FPSO is implicitly identified and JO1 has the right to substantially all of the economic benefits and has the right to direct the use of the identified FPSO throughout the period of use.

Illustration 18-6: Right to direct the use - asset can be used on multiple locations for multiple JOs

Company B is the lead operator for a range of different JOs, each of which have exploration licences in close proximity to each other. Exploration and appraisal drilling is expected to occur over a two-year period. Company B's equity interest in each JO varies. Given expected upcoming drilling activity, Company B enters into a lease with a third-party supplier for a drilling rig for a period of two years.

Under the terms of the JOAs governing each of the JOs, Company B is required to execute drilling activity over the coming two years over a number of the licences, but has flexibility in determining the exact timing of drilling to be performed on each respective licence.

Company B has the substantive right to determine when and where to drill for each licence and can change such decisions, throughout the period of use. The JOs have no right to make or change relevant decisions about the use of the asset, even when the drilling rig is currently in use on their respective licences.

Throughout the period in which the rig is drilling on a licence, Company B has the right to recover costs incurred from the respective JOs relative to the equity interests of each of the non-operator parties. When the drilling rig is idle, Company B has no right to recover costs from any JO.

Analysis: The arrangements between the lead operator and the JOs do not contain a sublease. In this situation, the lead operator has the right to make the relevant decisions about the use of the drilling rig. Those decisions include determining when and where to use the drilling rig throughout the period of use. No single JO has the right to control the use of the drilling rig over the full two-year lease term; rather, Company B has the right to control the use of the drilling rig.

Illustration 18-7: Right to direct the use - asset only used on one JO

Company C is the lead operator for JO2, an onshore field in the development phase. Development drilling is planned for the next 15 months and the field development plan sets out that 30-60 wells will be drilled within a pre-approved budget. Company C has entered into a 15 month lease with a third party supplier to secure a drilling rig for the activity.

Under the terms of the JOA governing JO2, Company C is required to utilise its knowledge of the field to execute the drilling programme that maximises the economics of JO2's development plan. In this example, Company C has the right to determine whether, when and where each well will be drilled within the licence area and has the right to change such decisions, throughout the period of use. JO2 has no right to make or change relevant decisions about the use of the asset.

Throughout the period in which the rig is drilling on the licence, Company C has the right to recover costs incurred from the JO2 non-operator parties relative to their equity interests in the licence.

Analysis: The arrangement between the lead operator and the JO does not contain a sublease. In this situation, the lead operator has the right to make the relevant decisions about the use of the drilling rig. In this example, those decisions include determining whether, when and where to use the drilling rig throughout the period of use. In this example, Company C has the right to control the use of the drilling rig throughout the period of use.

18.3.4.C Right to direct the use is predetermined

IFRS 16 also considers circumstances whereby the right to direct the use of the asset is 'predetermined'. That is, a customer has the right to direct the use of an identified asset throughout the period of use if the relevant decisions about how and for what purpose the asset is used are predetermined and: (i) the customer has the right to operate the asset (or to direct others to operate the asset in a manner that it determines) throughout the period of use, without the supplier having the right to change those operating instructions; or (ii) the customer designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use. [IFRS 16.B24]. The concept of predetermined has not been considered in detail in this subsection.

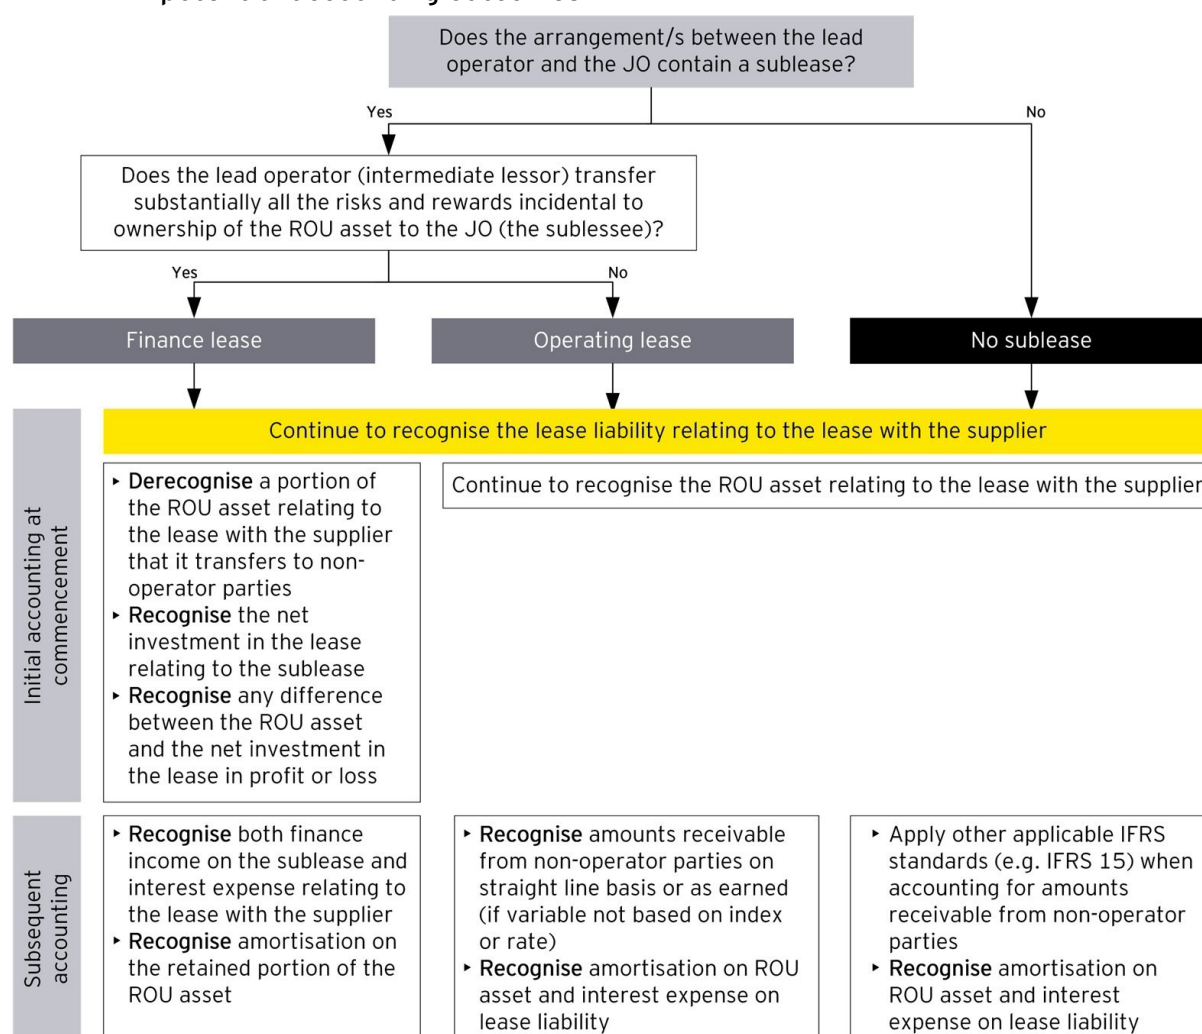

There are a range of factors entities will need to consider to determine whether a sublease exists between a lead operator and a JO. Entities need to ensure the evidence used to support conclusions about joint control for the purposes of applying IFRS 11 (in particular, the factors used to conclude that there is a joint arrangement and the lead operator is not controlling the arrangement itself, but instead is just carrying out the decisions of the parties to the joint arrangement), is taken into consideration when determining who has the right to control the use of an identified asset used as part of the JO activities in accordance with IFRS 16, i.e., the lead operator or the JO.

18.4 Accounting by the lead operator

Where the lead operator is the sole signatory to, and has primary responsibility for, the contract that is or contains a lease with the third-party supplier, the lead operator is required to initially recognise 100% of the right-of-use asset and the related lease liability in accordance with IFRS 16. Regardless of whether the JOA and related arrangements are considered to contain a sublease, for as long as the lead operator remains a party to the lease arrangement with the third-party supplier, the lead operator will continue to recognise 100% of the lease liability. This is on the basis that the JOA and related arrangements do not extinguish or transfer the lead operator's enforceable rights and obligations under the contract with the third-party supplier and instead, the lead operator retains the primary responsibility for the lease liability. However, the subsequent accounting for the right-of-use asset and the accounting for the amounts received or receivable from the non-operator parties will depend on whether a sublease exists, and if there is a sublease, whether it is a finance lease or operating lease.

A summary of the potential outcomes is as follows:

Figure 18-2: Lead operator's accounting for the contractual arrangement with the JO - potential accounting outcomes

18.4.1 JOA and/or related contractual arrangements are, or contain, a sublease

18.4.1.A Classifying the sublease

Lessor accounting remains largely unchanged from that prescribed by the previous accounting standard, IAS 17. Therefore, the lessor needs to determine whether the arrangement transfers substantially all the risks and rewards incidental to ownership of the underlying asset and if so, it is a finance lease. When assessing the lease classification, this is undertaken by reference to the right-of-use asset arising from the head lease, not by reference to the underlying asset. If the head lease is a short-term lease that the lead operator, as a lessee, has accounted for applying the practical expedient, [IFRS 16.6], the sublease is classified as an operating lease.

For more information on classifying leases by a lessor see Chapter 24.

Illustration 18-8: Classifying the sublease - finance lease

Company A, as lead operator of JO1, enters into a 10-year contract with a third-party supplier that contains a lease (head lease) for a FPSO vessel as a sole signatory and has primary responsibility for the lease payments. Therefore, the lead operator recognises 100% of the lease liability and the related right-of-use asset.

The FPSO is used on JO1 and for the purposes of this Illustration, it has been concluded that the arrangement contains a 10-year sublease.

The FPSO is highly specialised to allow for production from a single specified licence, owned by JO1, on which it is to be deployed, and hence can only be used by JO1 (as the sublessee), without major modifications. The FPSO has an estimated useful life of 25 years.

Analysis: The sublease is classified as a finance lease. The sublease is classified by reference to the right-of-use asset in the head lease and not the underlying FPSO. The lease term for the sublease represents all (and hence a major part) of the life of the right-of-use asset, as the sublease is for 10 years and the tenure of the right-of-use asset is also 10 years. Furthermore, the asset is specialised in nature.

Illustration 18-9: Classifying the sublease - operating lease

Company A, as lead operator of JO1, enters into a contract with a third-party supplier that contains a lease of an excavator for five years (head lease). The excavator is not specialised.

For the purposes of this Illustration, it has been concluded the arrangement contains a 2-year sublease of the excavator.

Analysis: The sublease is classified as an operating lease. The sublease is classified with reference to the right-of-use asset in the head lease and not the underlying excavator. The lease period does not represent a major part of the life of the right-of-use asset, because the sublease is only for two years and the right-of-use asset is for five years. Also, there are no other factors in this example which would indicate there is a finance lease.

18.4.1.B Accounting for the sublease - finance lease

At commencement of the sublease: the lead operator, as intermediate lessor:

- Derecognises a portion of the right-of-use asset which had been recognised in relation to the lease with the third-party supplier - the portion derecognised represents the portion of the right-of-use asset transferred to the non-operator parties
- The portion of the right-of-use asset retained represents the lead operator's share of the sublease as a participant in the JO recognised in accordance with IFRS 11
- Recognises a net investment in the lease - the net investment in the lease is measured as the sum of the discounted lease payments receivable from the non-operator parties in respect of the sublease and any unguaranteed residual value in the right-of-use asset accruing to the lead operator as intermediate lessor
- Recognises any difference between the portion of the right-of-use asset derecognised and the net investment in the lease recognised in profit or loss
- Continues to recognise the existing lease liability relating to the lease with the third-party supplier in its statement of financial position, which represents the lease payments it owes to the third-party supplier as the head lessor

During the term of the sublease: the lead operator, as the intermediate lessor, recognises finance income on the sublease (net investment in the lease), amortisation of its share of the right-of-use asset which is retained in its books and interest expense on the lease liability relating to the head lease. For more information on accounting for finance leases by a lessor see Chapter 24. Any variable lease payments that do not depend on an index or rate (e.g., performance- or usage-based payments) are recognised in profit or loss (unless they are included in the carrying amount of another asset in accordance with other IFRS accounting standards) in the period in which the event that triggers the payment occurs.

Illustration 18-10: Accounting for the sublease - finance lease

Assume the lead operator recognises a right-of-use asset and lease liability of CU100 on a head lease (assume there were no other adjustments required against either of these balances), and the arrangement between the lead operator and the JO contains a sublease classified as a finance lease.

The lease term for the head lease and sublease are both 10 years, have the same commencement dates, and the timing and amounts of the lease payments are identical.

The lead operator remains primarily obligated for the lease, including the lease payments under the head lease.

The lead operator (as a participant in the JO) has a 40% interest in the JO. The entries recognised by the lead operator will be, as follows:

Commencement of the head lease

Dr	Right-of-use asset	CU100	
	Cr	Lease liability (head lease)	CU100

Journal entry to recognise the head lease determined using the sum of the discounted lease payments.

Commencement of the sublease

Dr	Net investment in the lease	CU60	
	Cr	Right-of-use asset	CU60

Journal entry to derecognise a portion of the right-of-use asset relating to the head lease equal to the non-operators' interests in the lease between the lead operator and the JO and recognise the discounted value of the sum of the related amounts receivable from the non-operator parties.

Net impact for lead operator

Dr	Right-of-use asset [#]	CU40	
Dr	Net investment in the lease	CU60	
	Cr	Lease liability (head lease)	CU100

[#] *The right-of-use asset retained by the lead operator represents the lead operator's 40% share of the lease between itself and the JO which it recognises because it is also a participant in the JO.*

18.4.1.C Accounting for the sublease - operating lease

At lease commencement: the lead operator, as intermediate lessor:

- Continues to recognise the right-of-use asset relating to the lease with the third-party supplier
- Continues to recognise the lease liability relating to the lease with the third-party supplier in its statement of financial position, which represents the lease payments it owes to the third-party supplier as the head lessor

During the term of the sublease: the lead operator, as the intermediate lessor, recognises amortisation of the right-of-use asset and interest expense on the lease liability relating to the lease with the third-party supplier. It also recognises payments received from the non-operator parties as income, on either a straight-line basis or another systematic basis if that better represents the pattern in which benefit is expected to be derived from the use of the asset. Any variable lease payments that do not depend on an index or rate (e.g., performance- or usage-based payments) are recognised in profit or loss (unless they are included in the carrying amount of another asset in accordance with other IFRS accounting standards) in the period in which the event that triggers the payment occurs.

18.4.2 JOA and/or related contractual arrangements are not, do not contain, a sublease

When the contractual arrangements between the lead operator and the JO do not contain a sublease, the lead operator continues to recognise the right-of-use asset and related lease liability in relation to the lease with the third-party supplier at lease commencement and will recognise amortisation of the right-of-use asset and interest on the lease liability across the term of the lease.

The arrangement with the JO will then likely represent an executory contract and the accounting by the lead operator for amounts receivable from the non-operator parties will depend on the nature of this arrangement. Some of the potential accounting considerations may include the matters listed below. When undertaking these assessments, as discussed in section 18.2 above, it is important to note that the determination of the customer for the purposes of applying IFRS 16 does not necessarily impact the determination of a customer for the purposes of other standards. For example, a customer, for the purposes of IFRS 15, is determined by applying the specific requirements and guidance of IFRS 15.

- Provision of JO management services whereby the JO is considered to be a customer: the arrangement will be in the scope, and the lead operator will apply the provisions, of IFRS 15. Revenue will be recognised at the amount the lead operator expects to be entitled to in exchange for providing the JO management services to the JO as the relevant performance obligations are satisfied. See Chapter 28 for more information on factors to consider when applying IFRS 15.
- JO does not represent a customer: where the lead operator does not consider it is providing JO management services to the non-operator parties within the scope of IFRS 15, the lead operator will need to apply other relevant IFRS accounting standards, or when no specific IFRS accounting standards are applicable, use judgement to determine the appropriate accounting treatment for the arrangement. The lead operator will need to apply IAS 8¹⁴⁹ to determine the nature of the relationship and whether and when it should recognise amounts receivable from the non-operator parties. Specifically, the lead operator will need to assess whether the provisions of IFRS 9 relating to financial assets apply or whether the reimbursement requirements of IAS 37 apply. The lead operator will also need to assess whether these amounts represent a form of income or a direct reimbursement of expenditure.

18.4.3 Other issues to consider

In addition to the above, there are a number of other potential issues that a lead operator may need to consider when evaluating the overall accounting implications, which include but are not limited to:

- Capitalisation of costs: where the activities of the JO are being undertaken in relation to a project that is in the exploration and evaluation (E&E) phase or the development phase, depending on the lead operator's accounting policies, it may need to consider whether some of the costs incurred, e.g., a portion of the amortisation of the right-of-use asset and/or interest expense on the lease liability, are required to be capitalised. The lead operator will need to assess whether such costs meet the requirements for capitalisation under the relevant standards (including IAS 23 which explicitly scopes in interest in respect of leases under IFRS 16), and if so, determine the amount that is required to be capitalised versus the amount that are required to be expensed.
- Mismatch between the lead operator's costs and the amounts receivable from the non-operator parties: in each period, the lead operator's accounting for the expenses relating to the lease with a third party which are to effectively be reimbursed by the non-operator parties, will not necessarily be equivalent to the amounts receivable from the non-operator parties. This is because the IFRS 16 accounting for the lease with the third-party supplier will generally be more front ended and will comprise amortisation of the right-of-use asset and interest on the lease liability. This will differ from the income a lead operator will recognise under sublease operating accounting or executory contract accounting. This will lead to timing mismatches for the lead operator in its profit or loss.
- Presentation of amounts receivable from the non-operator parties (where the arrangement is not a 'sublease which is a finance lease', i.e., it is either an operating lease or not a sublease): in this situation, a question that may be asked is whether any amounts receivable from the non-operator parties can be offset against the amounts recognised by the lead operator. This question is generally raised because from an economic perspective, the non-operator parties are effectively paying their respective share of the cash costs incurred by the lead operator on the lease with the third-party supplier. Hence, some lead operators may prefer to present the effects of this on a net basis, if/where possible.

¹⁴⁹ The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

When assessing this offsetting issue, the following needs to be considered:

- Ability to offset: IAS 1, [IAS 1.32], and the Conceptual Framework, [CF 7.10], provide the requirements and guidance with respect to offsetting of assets and liabilities and income and expenses. IAS 1 states offsetting is not allowed unless required/permitted by another standard and the Conceptual Framework notes it is generally not permitted as offsetting classifies dissimilar items together. Given this, it is expected the ability to achieve offsetting will be rare.
- Lead operator capitalises its costs as part of an E&E or development asset: in such a situation, the lead operator would only be able to capitalise the portion of the costs incurred on the head lease relating to its ownership in the JO assets. This is on the basis that it would not receive the future economic benefits associated with the costs attributable to the non-operator parties. These costs would therefore need to be recognised in profit or loss (P&L). See below for further discussion on the issues this would present.
- Lead operator recognises its costs in P&L: in this situation, the question is whether the lead operator can offset the amounts receivable from non-operator parties directly against the line items within P&L in which it has recognised the costs relating to the lease with the third-party supplier. The challenges here may include:
 - Mismatches in amounts (as discussed above)
 - Whether such amounts received can be offset and if so, upon what basis
 - If a valid argument could be mounted to support offsetting, which is considered difficult to achieve, given the lead operator will be recognising amortisation and interest, it is unclear how the amounts received would be allocated between the two line items

18.5 Accounting by the non-operator parties

As discussed in section 18.4 above, where the lead operator is the sole signatory to, and has primary responsibility for, the contract that is or contains a lease with the third-party supplier, the lead operator is required to initially recognise 100% of the lease-related balances. The accounting by the non-operator parties will then depend on whether the JOA and/or related contractual arrangements contain a sublease or not.

18.5.1 JOA and/or related contractual arrangements contain a sublease

When the JO is the sublessee, under IFRS 16, there is no longer any differentiation between operating or finance leases. As a result, there will be a right-of-use asset and lease liability in relation to the lease with the lead operator, for which each participant in the JO will, in accordance with IFRS 11, need to:

- Recognise its proportionate share of the right-of-use asset and lease liability based on its respective interest in the JO
- During the term of the sublease:
 - Recognise amortisation of its share of the right-of-use asset
 - Recognise interest expense in relation to its share of the lease liability

18.5.2 JOA and/or related contractual arrangements do not contain a sublease

Where the JOA and/or related contractual arrangements do not contain a sublease, IFRS 16 does not apply to the JO. Therefore, the non-operator parties will likely continue to recognise amounts payable to the lead operator consistently based on their existing accounting policies.

18.5.3 Other factors to consider when evaluating the overall accounting

In addition to the above, there are a number of other potential factors which non-operator parties will need to consider when evaluating the overall accounting, which include but are not limited to:

- Capitalisation of costs: where the activities of the JO are being undertaken in relation to a project that is in the E&E phase or the development phase, depending on the non-operator's accounting policies, it may need to consider whether the costs incurred, e.g., amortisation of the right-of-use asset and/or interest expense on the lease liability, are required to be capitalised. Each non-operator party will need to assess whether such costs meet the eligibility requirements for capitalisation in accordance with the relevant standard (including IAS 23), their own policies and appropriate industry practice. If so, the amount that will need to be capitalised versus the amount that will be expensed will need to be identified.
- Cash flow impact: the profile over which right-of-use amortisation and interest expense will be recognised will vary depending on the nature of the particular asset and could vary significantly from the pattern in which cash costs are incurred. This is because it is expected that most lead operators will seek to align cost recovery with the pattern in which their cash costs are incurred. This is likely to lead to timing and potentially overall measurement differences between amounts incurred and cash outflows recognised.

18.6 Other practical considerations

In addition to the issues discussed above, there are other factors requiring consideration which are relevant to both the lead operator and non-operator parties.

18.6.1 Access to information

If the contractual arrangement between the lead operator and the JO are concluded to contain a sublease, or the JO itself is considered to have entered into a lease directly with a third-party supplier, the parties to the JO will need to recognise their respective share of the lease liability, right-of-use asset, amortisation expense, interest expense and variable lease payments, if any. To do this, the lead operator will need to provide non-operator parties with the required information. Therefore, parties to the JO will need to discuss and agree what information is required, who will prepare and provide such information and when such information will be made available.

Where lead operators agree to prepare, or are required to prepare, such information on behalf of the non-operator parties, the non-operator parties will need to consider whether there are any material differences in accounting policies which need to be adjusted for before recognising such amounts in their own financial statements.

18.6.2 Impact on systems and processes

Where leases are concluded to exist, this may require significant alterations to systems and processes. Lead operators will be required to consider the ability of existing systems and processes to execute joint interest billing going forward in light of these changes. Non-operator parties will need to consider whether their systems and processes are capable of accounting for leases.

Entities are encouraged to liaise closely with parties to each of their JOs, sharing sufficient information so that each member of the JO is able to determine their appropriate accounting.

19 Long-term contracts and leases

Given the nature of the extractive industries, mining entities and oil and gas entities regularly enter into a wide range of long-term contracts. These may relate to the provision of services or the sale of goods. There are a number of potential issues to be addressed when considering the accounting for these arrangements, these are discussed below. This section is required to be read in conjunction with the general discussion set out in Chapter 24.

19.1 Embedded leases

IFRS 16 requires an entity to determine whether a contract is, or contains, a lease at the inception of the contract. [IFRS 16.9]. The assessment of whether a contract is or contains a lease will be straightforward in most arrangements. However, judgement may be required in applying the definition of a lease to certain arrangements. For example, in contracts that include significant services, determining whether the contract conveys the right to direct the use of an identified asset may be challenging.

There are a range of arrangements commonly found in the extractive industries which may convey the right to control the use of an identified asset to the customer, as well as provide the customer with related services or outputs. This may include:

- Outsourcing arrangements
- Take-or-pay and similar contracts (see section 19.2 below)
- Service arrangements - such as contract mining services arrangements or oilfield services arrangements
- Throughput arrangements (which may take the form of a take-or-pay arrangement)
- Tolling contracts (see section 20 below)
- Contractor facilities located on the mining company's or oil and gas company's property
- Storage facility arrangements
- Energy-related or utility contracts, e.g., gas, electricity, telecommunications, water
- Transportation/freight/shipping/handling services contracts

IFRS 16 makes it clear that these types of arrangements (or part thereof) could be within the scope of IFRS 16 if it meets the definition of a lease, e.g., if it conveys to the lessee the right to use an asset (the underlying asset) for a period of time in exchange for consideration. [IFRS 16 Appendix A]. This is regardless of the fact that the arrangement is not described as a lease and is likely to grant rights that are significantly different from those in a formal lease agreement. IFRS 16 is to be applied to each lease component within the contract as a lease separately from non-lease components of the contract unless the entity applies the practical expedient to combine the lease and associated non-lease components. [IFRS 16.12]. The detailed requirements of IFRS 16 and the definition of a lease are discussed in Chapter 24.

See sections 17 and 18 above for a discussion of the impact of IFRS 16 on mining entities and oil and gas entities and Chapter 24 for a general discussion on IFRS 16.

Barrick Gold Corporation's acknowledgement that non-lease contracts need to be assessed for the existence of embedded leases under IFRS 16 is provided in Practical example 19-1 below.

Practical example 19-1: Barrick Gold Corporation (2018)

Canada

Annual Report 2018 [extract]

Notes to Consolidated Financial Statements [extract]

2. Significant Accounting Policies [extract]**z) New Accounting Standards Issued But Not Yet Effective [extract]****IFRS 16 Leases [extract]**

these lease payments will be recorded as financing outflows in our cash flow statement. We have developed a full implementation plan to determine the impact on our financial statements and internal controls. In the fourth quarter of 2017, we formed an IFRS 16 working group and began the process of compiling all of our existing operating leases and service contracts. In the first quarter of 2018, we began reviewing the relevant agreements to identify which of the operating leases and service contracts are in scope for IFRS 16. In the second quarter of 2018, we had largely completed our review of existing service contracts for embedded leases and had identified all operating leases. In the third quarter of 2018, we continued our review of existing service contracts for embedded leases, began developing a valuation approach to discount our population of leases, and evaluated various leasing software tools to assist with the increased accounting and disclosure requirements arising from the new leasing standard. In the fourth quarter of 2018, we performed a completeness test to validate the population of service

19.2 Take-or-pay contracts

A 'take-or-pay' contract is a specific type of long-term commodity-based sales agreement between a customer and a supplier in which the pricing terms are set for a specified minimum quantity of a particular good or service. The customer must pay the minimum amount as per the contract, even if it does not take the volumes. There may also be options for additional volumes in excess of the minimum. Take-or-pay contracts for the supply of gas are particularly common, because entities developing gas fields need to make very significant investments in infrastructure such as pipelines, liquefaction plants and shipping terminals, to make transport of gas to the end-consumer economically viable. In order to raise the funds to finance such investments, it is crucial to know that there is a profitable market for the gas, as it cannot easily be diverted and sold in an alternative market or to an alternative customer.

While take-or-pay contracts perhaps most commonly involve the supply of gas, they can also include other arrangements such as contracts for pipeline capacity or LNG regasification facilities. Take-or-pay contracts are also used in the mining sector, e.g., with some coal contracts, though less frequently than in the oil and gas sector. Often take-or-pay contracts permit the purchaser to recover payments for quantities not taken, by allowing the purchaser to take more than the minimum in later years and to apply the previously paid-for undertake amount towards the cost of product taken in the later years.¹⁵⁰

¹⁵⁰ IASC Issues Paper, 10.26.

The following issues need to be considered in accounting for take-or-pay contracts:

- *Structured entities* - If a take-or-pay contract transfers the majority of the risks and rewards from the development of a mine or gas field to the customer, it is necessary to consider whether the entity developing the gas field has, in effect, become a structured entity of that customer and therefore, the customer needs to consider the level of influence it has over that mining entity or oil and gas entity (see Chapter 7).
- *Embedded leases* - Take-or-pay contracts are often for a very significant portion of the output of the gas field that it relates to. Therefore, as illustrated in Practical example 19-1 above, the operator and customer need to consider whether the take-or-pay contract contains a lease of the related assets (see section 19.1 above for further discussion).
- *Embedded derivatives* - As illustrated in Practical example 19-2 below, the price of gas sold under take-or-pay contracts is often based on a 'basket' of fuel prices and/or inflation price indices. If there is an active market for gas then this often means that an embedded derivative needs to be separated from the underlying host take-or-pay contract (see section 13.2 above).
- *Guarantees* - Lenders are often willing to provide funding for the development of a gas field only if the operator can present a solid business case, which includes a 'guaranteed' stream of revenue from a reputable customer. In such cases, the take-or-pay contract acts as a form of credit enhancement or possibly as a guarantee. The operator and customer may need to consider whether the take-or-pay arrangement includes a guarantee that is required to be accounted for under IFRS 9 (see Chapter 41).
- *Make-up product and undertake* - A customer that fails to take the specified volume during the period specified must nevertheless pay for the agreed-volume. However, a take-or-pay contract sometimes permits the customer to take an equivalent amount of production (makeup product) at a later date after the payment for the guaranteed amount has been made (see section 12.16 above and section 19.2.1 below).

Practical example 19-2 below from the financial statements of ENGIE SA gives an overview of some of these important terms and conditions that exist in take-or-pay contracts.

Practical example 19-2: ENGIE SA (2017)	France
<p>2017 Registration Document [extract]</p> <p>2 Risk factors [extract]</p> <p>2.3 Operational risks [extract]</p> <p>2.3.1.1 Purchase and sale of natural gas</p> <p>The Group has established a procurement portfolio composed in part of long-term contracts, including some with a take-or-pay clause which, under certain conditions, stipulates that minimum quantities will be taken during a period.</p> <p>In case of major gas supply interruption (for example, due to an interruption of Russian deliveries or an interruption of transit in Ukraine) or an interruption of LNG supply (for example, from Yemen or Egypt), or difficulty in renewing certain contracts under favorable economic conditions, the replacement cost for gas, including transportation, could be higher and affect the Group's margins. To mitigate this risk, the Group has a number of tools for flexibility and modulation (flexibility in long-term contracts, storage and regasification capacity, and purchasing in the marketplaces) as well as a diversified portfolio.</p> <p>Prices of long-term purchase contracts (partially indexed to the price indices of oil products) may be decorrelated from selling prices or prices in the gas markets. This spread might have a significant impact on the Group's results. Long-term contracts include price adjustment clauses, so that the economic balance between producer and buyer can be altered. The Group's buy/sell margin may therefore change according to price adjustments in LNG or gaseous gas contracts and the state of the gas market in general.</p> <p>Negotiations in recent years have led to the integration of market indices in long-term contracts and/or to the reduction of the difference between the contract price and market price. They have also led to increased frequency of price revisions.</p>	

19.2.1 Make-up product and undertake

Under some take-or-pay arrangements, a customer who is required to pay for the product not taken will often have no right of future recovery. The customer is required to recognise an expense equal to the payment made, while the operator recognises the same amount as revenue. However, if the substance of the relationship between the operator and customer is such that a renegotiation of the arrangement is probable then it may be more appropriate for the operator to recognise the penalty payment as a contract liability, i.e., deferred revenue. The customer, however, is still required to recognise an expense in this case as it does not have a legal right to receive reimbursement or makeup product.¹⁵¹

The accounting is different when a customer that is required to pay for product not taken has a right to take makeup product in the future.

In this case, the operator would recognise a contract liability, i.e., unearned revenue, in relation to the 'undertake' measured in accordance with IFRS 15, as it represents an obligation for the operator to have to provide the product in the future. The operator only recognises revenue in accordance with IFRS 15 once the make-up product has been taken by the customer, i.e., the performance obligation is satisfied. Only once the make-up period has expired or it is clear that the purchaser has become unable to take the product, would the liability be eliminated and revenue recognised.¹⁵² For a discussion of the IFRS 15 considerations for these types of arrangements, see section 12.16 above.

From the customer's perspective, it would normally recognise a prepaid amount representing the make-up product that it is entitled to receive in the future. However, if the customer is entitled to more make-up product than it can sell, it may need to recognise an impairment charge.

¹⁵¹ IASC Issues Paper, 10.23.

¹⁵² IASC Issues Paper, 10.24.

20 Tolling arrangements

In the mining sector it is common for entities to provide raw material to a smelter or refiner for further processing. If the raw material is sold to the smelter or refiner and the relevant criteria are satisfied, the mining company recognises revenue in accordance with IFRS 15. However, under a 'tolling' arrangement a mining company generally supplies, without transferring ownership, raw material to a smelter or refiner which processes it for a fee and then returns the finished product to the customer. Alternatively, the mining company may sell the raw material to the smelter or refiner, but is required to repurchase the finished product. In the latter of the two situations, no revenue is required to be recognised under IFRS 15 when the raw material is shipped to the smelter or refiner as the customer, i.e., the smelter or refiner, has not obtained control of the raw materials. An entity must carefully assess the terms and conditions of its tolling arrangements to determine:

- When and if it is appropriate to recognise revenue
- Whether those arrangements contain embedded leases that require separation under IFRS 16 (see section 19.1 above)
- Whether the tolling arrangement is part of a series of transactions with a joint arrangement
- Whether the toll processing entity is a structured entity that requires consolidation under IFRS 10 (see Chapter 7 for more information)

Practical example 20-1 below describes a tolling arrangement between Alberta Petroleum Marketing Commission and Canadian Natural Resources Partnership.

Practical example 20-1: Alberta Petroleum Marketing Commission (2022)	Canada
Annual Report [extract] Management discussion and analysis [extract] STURGEON REFINERY - TOLLPAYER <p>NWRP was formed on February 16, 2011 and constructed, and now operates the Sturgeon Refinery. On February 16, 2011, essentially identical processing agreements were entered into by the APMC and Canadian Natural Resources Partnership ("CNR") (collectively, the "Processing Agreements"). The Processing Agreements were 30-year tolling arrangements which contract the APMC and CNR as Tollpayers ("Tollpayers") for 75 percent and 25 percent of the Refinery capacity, respectively, and were in effect commencing June 1, 2018. The Refinery commenced commercial operation on June 1, 2020. In accordance with the Processing Agreements, NWRP will process 37,500 bbls/d of bitumen feedstock for the APMC. As required by the terms of the Processing Agreements, a trust account (the Initial Proceeds Trust Account or "IPTA") has been established to facilitate the payments to and from the Tollpayers and NWRP. As part of the Optimization Transaction, the Processing Agreements were amended on June 30, 2021, effective wherein the term of the Processing Agreements were extended by 10 years to 2058. The APMC has exercised judgment in determining that the tollpayer arrangement is a joint operation in which it has a 75 percent interest in the assets, liabilities, revenue, and expenses, and records its 75 percent interest in the APMC financial statements. The Commission is unconditionally obligated to pay its 75 percent pro rata share of the debt component of the monthly fee-for-service toll over the 40-year tolling period. Sales of diesel and refined products and associated refining tolls are recognized in the Sturgeon Refinery segment.</p> <p style="text-align: center;">...</p>	

For a discussion on the impacts of IFRS 15 on repurchase agreements, see section 12.14 above.

21 Taxation

As mentioned in section 1.1 above, one of the characteristics of the extractive industries is the intense government involvement in their activities, which ranges from “outright governmental ownership of some (especially petroleum) or all minerals to unusual tax benefits or penalties, price controls, restrictions on imports and exports, restrictions on production and distribution, environmental and health and safety regulations, and others”.¹⁵³

Mining entities and oil and gas entities typically need to make payments to governments in their capacity as:

- Owner of the mineral resources
- Co-owner or joint arrangement partner in the projects
- Regulator of, among other things, environmental matters and health and safety matters
- Tax authority

The total payment to a government is often described as the ‘government take’. This includes fixed payments or variable payments that are based on production, revenue, or a net profit figure; and which may take the form of fees, bonuses, royalties or taxes. Determining whether a payment to government meets the definition of income tax is not straightforward.

IAS 12 is required to be applied in accounting for income taxes, defined as including:

- (a) All domestic and foreign taxes which are based on taxable profits
- (b) Taxes, such as withholding taxes, which are payable by a subsidiary, associate or joint arrangements on distributions to the reporting entity [IAS 12.1, IAS 12.2]

As discussed in Chapter 29, it is not altogether clear what an income tax actually is. In the extractive industries the main problem with the definition in IAS 12 occurs when:

- (a) A government raises ‘taxes’ on sub-components of net profit (e.g., net profit before financing costs or revenue minus allowed costs)
- (b) There is a mandatory government participation in certain projects that entitle the government to a share of profits as defined in a joint operating agreement

A considerable amount of judgement is required to determine whether a particular arrangement falls within the definition of ‘income tax’ under IAS 12 or whether it is another form of government take. From a commercial perspective the overall share of the economic benefits that the government takes is much more important than the distinction between its different forms. In practice, most governments receive benefits from extractive activities in several different ways, as discussed below. Governments can choose any of these methods to increase or decrease their share of the benefits.

However, the distinction is crucial given the considerable differences in the accounting treatments and disclosures that apply to income taxes, other taxes, fees and government participations. For example, it will affect where these amounts are presented in the profit or loss, e.g., in operating costs or income tax expense; and it will determine whether deferred tax balances are required to be recognised and the related disclosures provided.

21.1 Excise duties, production taxes and severance taxes

Excise duties, production taxes and severance taxes result in payments that are due on production (or severance) of minerals from the earth. Depending on the jurisdiction and the type of mineral involved, they are calculated:

- (a) As a fixed amount per unit produced
- (b) As a percentage of the value of the minerals produced
- (c) Based on revenue minus certain allowable costs

¹⁵³ IASC Issues Paper, 1.27.

21.1.1 Production-based taxation

If the tax is based on a fixed amount per unit produced or as a percentage of the value of the minerals produced, then it will not meet the definition of an income tax under IAS 12. In these cases, the normal principles of liability recognition under IAS 37 apply in recognising the tax charge.

Another issue that arises is whether these taxes are, in effect, collected by the entity from customers on behalf of the taxing authority, as an agent. In other cases, the taxpayer's role is more in the nature of principal than agent. The regulations differ significantly from one country to another. The practical accounting issue that arises concerns the interpretation of the requirements of IFRS 15 which states that the "...transaction price is the amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties (for example, some sales taxes)". [IFRS 15.47]. Specifically, should excise duties, production taxes and severance taxes be deducted from revenue (net presentation) or included in the production costs and, therefore, revenue (gross presentation)? See section 12.11.2 above for further discussion on the impact of IFRS 15 on the presentation of royalty payments.

The appropriate accounting treatment will depend on the particular circumstances. In determining whether gross or net presentation is appropriate, the entity needs to consider whether it is acting in a manner similar to that of an agent or principal. For further discussion of principal versus agent under IFRS 15, see section 12.11 above and Chapter 28 and presentation of royalties in section 5.7.5 above.

Given that excise duties, production taxes and severance taxes are aimed at taxing the production of minerals rather than the sale of minerals, they are considered to be a tax on extractive activities rather than a tax collected by a mining company or oil and gas company on behalf of the government. Based on this, the tax would be presented as a production cost.

However, it may be considered that when the excise duty, production tax or severance tax is payable in kind, that the mining company or oil and gas company never receives any of the benefits associated with the production of the associated minerals. Hence, it would be more appropriate to present revenue net of the production or severance tax as it is in substance the same as a royalty payment.

21.1.2 Petroleum revenue tax (or resource rent tax)

Determining whether a petroleum revenue tax (PRT) (or resource rent tax (RRT)) is a production- or profit-based tax is often not straightforward.

In some parts of the world the specific PRT or RRT that applies may be considered similar to an income tax in that the tax is a percentage of revenue minus certain costs. However, there are also a number of other features of a PRT or RRT that are not commonly found in income taxes or in some other resource rent taxes:

- There may be allowances, such as oil allowances, where there is a physical quantity of oil that is PRT exempt in each field, subject to a cumulative maximum over the life of the field.
- The tax may be levied on individual oil fields rather than the entity owning the oil field as a whole.

There are many different types of PRTs or RRTs around the world, some of which are clearly not income taxes, while others have some of the characteristics of an income tax. In determining whether a particular production tax meets the definition of an income tax under IAS 12, an entity will need to assess whether or not the tax is based on (or closely enough linked to) net profit for the period. If it does not meet the definition of an income tax, an entity must develop an accounting policy under the hierarchy in IAS 8.

Practice is mixed, which means that while some entities may treat a particular PRT or RRT as an income tax under IAS 12 and hence provide for current and deferred taxes (see Practical example 21-1 below), others may consider the same tax to be outside the scope of IAS 12.

Entities also need to consider whether there is any country specific legislation or accounting standard requirements that mandates whether a PRT or RRT is treated as an income tax. One example of this is in Australia where Petroleum Resource Rent Tax (PRRT) is required to be treated as an income tax.

Practical example 21-1: Woodside Energy Group Ltd (2022)**Australia****Annual Report 2022 [extract]**

Notes to the financial statements [extract]

A. Earnings for the year [extract]

A.5 Taxes [extract]

Key estimates and judgements [extract]

(a) Income tax classification

Judgement is required when determining whether a particular tax is an income tax or another type of tax. PRRT is considered, for accounting purposes, to be an income tax. Accounting for deferred tax is applied to income taxes as described above, but is not applied to other types of taxes, e.g. North West Shelf royalties, excise and levies which are recognised in cost of sales in the income statement.

As illustrated in Practical example 21-2 below, BHP Group Limited assesses resource rent taxes and royalties individually to determine whether they meet the definition of an income tax or not.

Practical example 21-2: BHP Group Limited (2022)**Australia****Annual Report 2022 [extract]**

Financial Statements [extract]

1.6 Notes to the Financial Statements [extract]

Performance [extract]

6 Income tax expense [extract]

Recognition and measurement [extract]

Royalty-related taxation

Royalties are treated as taxation arrangements (impacting income tax expense/(benefit)) when they are imposed under government authority and the amount payable is calculated by reference to revenue derived (net of any allowable deductions) after adjustment for temporary differences. Obligations arising from royalty arrangements that do not satisfy these criteria are recognised as current liabilities and included in expenses.

21.2 Grossing up of notional quantities withheld

Many production sharing contracts provide that the income tax to which the contractor is subject is deemed to have been paid to the government as part of the payment of profit oil to the government or its representative (e.g., the designated national oil company) (see section 5.3 above). This raises the question as to whether an entity must be presenting current and deferred taxation arising from such 'notional' income tax, which is only deemed to have been paid, on a net or a gross basis.

Illustration 21-1: Grossing up of notional quantities withheld

Entity A is the operator of an oil field that produces 10 million barrels of oil per year. Under the production sharing contract between entity A and the national government, entity A and the government are entitled to 4,000,000 and 6,000,000 barrels of oil, respectively. The production sharing contract includes the following clause:

'The share of the profit petroleum to which the government is entitled in any calendar year in accordance with the production sharing contract shall be deemed to include a portion representing the corporate income tax imposed upon and due by entity A, and which will be paid directly by the government on behalf of entity A to the appropriate tax authorities.'

Assuming the following facts, how should entity A account for the income tax that it is deemed to have paid in 20X1:

- The normal corporate income tax rate in the country in which entity A operates is 40%
 - Entity A made a net profit of CU30 million in 20X1
- And
- The average oil price during the year was CU50/barrel

Gross presentation

Entity A's profit after 40% corporate income tax was CU30 million. Therefore, its profit before tax would have been CU50 million (i.e., $\text{CU30 million} \div (100\% - 40\%)$). In other words, the government is deemed to have paid corporate income tax of CU20 million on behalf of entity A. Therefore, the government is deemed to have taken 400,000 barrels (i.e., $\text{CU20 million} \div \text{CU50/barrel}$) out of entity A's share of the production. Hence, entity A's share of production before corporate income tax was 4,400,000 barrels (i.e., 4,000,000 barrels + 400,000 barrels).

Net presentation

Under the net presentation approach, entity A ignores the corporate income tax that was deemed to have been paid by the government because it is not a transaction that entity A was party to or because the deemed transaction did not actually take place.

The disadvantage of presenting such tax on a gross basis is that the combined production attributed to the entity and that attributable to the government exceeds the total quantity of oil that is actually produced (i.e., in the above example the government and entity A would report a combined production of 10.4 million barrels whereas actual production was only 10 million barrels). Similarly, if the reserves were to be expressed on the same basis as revenues, the reserves reported by the entity would include oil reserves that it would not actually be entitled to.

On the other hand, if the host country has a well-established income tax regime that falls under the authority of the ministry of finance and the production sharing contract requires an income tax return to be filed, then the entity would have a legal liability to pay the tax until the date on which the national oil company or the ministry responsible for extractive activities (e.g., the ministry of mines, industry and energy) pays the tax on its behalf. In such cases, it may be appropriate to present revenue and income tax on a gross basis.

21.3 Deferred tax accounting for decommissioning obligations

In May 2021, the Board issued *Deferred Tax related to Assets and Liabilities arising from a Single Transaction - Amendments to IAS 12*. The Board amended IAS 12 to reduce diversity in the way that entities account for deferred tax on transactions and events, such as leases and decommissioning obligations, that lead to the initial recognition of both an asset and a liability. The amendments narrow the scope of the initial recognition exception under IAS 12, so that it no longer applies to transactions that give rise to equal taxable and deductible temporary differences.

How we see it

Entities in the extractive industries will need to consider the recoverability of any deferred tax asset recognised in relation to decommissioning obligations considering the long-dated nature of their projects.

The amendments also clarify that where payments that settle a liability are deductible for tax purposes, it is a matter of judgement (having considered the applicable tax law) whether such deductions are attributable for tax purposes to the liability recognised in the financial statements (and interest expense) or to the related asset component (and interest expense). This judgement is important in determining whether any temporary differences exist on initial recognition of the asset and liability.

For further discussion see Chapter 29.

22 Events after the reporting period

22.1 Reserves proven after the reporting period

IAS 10 *Events after the Reporting Period* distinguishes between two types of events:

- Adjusting events after the reporting period being those that provide evidence of conditions that existed at the end of the reporting period.
- Non-adjusting events after the reporting period being those that are indicative of conditions that arose after the reporting period. [IAS 10.3].

This raises the question as to how an entity should deal with information regarding mineral reserves that it obtains after the end of its reporting period, but before its financial statements are authorised for issue i.e., finalised. For example, suppose that an entity concludes after the year-end that its remaining mineral reserves at that date were not 10 million barrels (or tonnes) but only 8 million barrels (or tonnes). As discussed in section 16.1.3.A above, a company needs to assess whether such a change in mineral reserves is required to be treated as an adjusting event in accordance with IAS 10 (i.e., the new estimate provides evidence of conditions that existed previously) or as a change in estimate in accordance with IAS 8 (i.e., the new estimate resulted from new information or new developments).

22.2 Business combinations - application of the acquisition method

If the initial accounting for a business combination can be determined only provisionally by the end of the period in which the combination is effected - because either the fair values to be assigned to the acquiree's identifiable assets, liabilities or contingent liabilities or the fair value of the combination can be determined only provisionally - the acquirer would account for the combination using those provisional values. Where, as a result of completing the initial accounting within 12 months from the acquisition date, adjustments to the provisional values have been found to be necessary, IFRS 3 requires them to be recognised from the acquisition date. [IFRS 3.45]. Specifically, IFRS 3 states that the provisional values are to be retrospectively adjusted to reflect new information obtained about facts and circumstances that existed as at the acquisition date and, if known, would have affected the measurement of the amounts recognised as at that date. This raises the question of how an entity should account for new information that it receives regarding an acquiree's reserves before it has finalised its acquisition accounting.

Illustration 22-1: Acquisition of an entity that owns mineral reserves

Entity A acquires Entity B for CU27 million at 31 October 20X0. At the time it assigned the following fair values to the acquired net assets:

	CU million
Mineral reserves (assuming reserves of 10 million barrels)	10
Other net assets acquired	5
Goodwill	12
Consideration transferred	27

At 30 June 20X1, after conducting a drilling programme which commenced in March 20X1, Entity A obtains information about the reserves (as at 30 June 20X1), which when added to the production for the period (i.e., from 31 October 20X0 to 30 June 20X1) reveals that the mineral reserves at the date of acquisition were not 10 million barrels, as previously thought, but were only 8 million barrels.

Can Entity A revise its initial acquisition accounting to reflect the fact that the mineral reserves are only 8 million barrels, rather than 10 million?

The answer to this question is not straightforward and it is a matter of significant judgement which needs to be made based on the facts and circumstances of each individual situation.

IFRS 3 requires assets acquired and liabilities assumed to be measured at fair value as at the acquisition date. It then defines fair value as the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. The challenge with the new information obtained about the mineral reserves in Illustration 22-1 above is determining whether it provided new information about facts and circumstances that existed as at the acquisition date or whether it resulted from events that occurred after the acquisition date. As discussed in section 16.1.3.A above, it is difficult to determine exactly what causes a reserve estimate to change, i.e., whether the facts and circumstances existed at acquisition date or whether it was due to new events.

In Illustration 22-1 above, the new reserves information arose as a result of a drilling programme that commenced five months after the acquisition date and it is not entirely clear why the reserves estimate changed. One may therefore conclude that as entity A should be valuing the mineral reserves acquired on the basis of information that a knowledgeable, willing party would and could reasonably have been expected to use in an arm's length transaction at 31 October 20X0, that this new information should not have an impact on the provisional accounting. This is on the basis that this new information was not available at acquisition date and could not reasonably have been expected to be considered as part of the acquisition.

Similarly, if entity A had concluded at 30 June 20X1 that its internal long-term oil price assumption was CU60/barrel instead of CU70/barrel that would not have any effect on the acquisition accounting. Entity A should be valuing the mineral reserves on the basis of information that a knowledgeable, willing party would have used in an arm's length transaction at 31 October 20X0; this may, of course, have been neither CU60/barrel nor CU70/barrel.

The conclusion may differ however, if the drilling programme had been completed and the information was available at acquisition date, but due to the pressures of completing the transaction, entity A had not been able to assess fully or take into account all of this information e.g., it had not had time to properly analyse all of the information available in the data room. In this instance, it would be appropriate to adjust the provisional accounting.

22.3 Completion of E&E activity after the reporting period

As discussed in section 3.5.1 above, IFRS 6 requires E&E assets to be tested for impairment when "exploration for and evaluation of mineral resources in the specific area have not led to the discovery of commercially viable quantities of mineral resources and the entity has decided to discontinue its activities in the specific area". [IFRS 6.20]. An entity that concludes, after its reporting period, that an exploration and evaluation project is unsuccessful, is required to account for this conclusion as:

- A *non-adjusting event* if the conclusion is indicative of conditions that arose after the reporting period, for example new information or new developments that did not offer greater clarity concerning the conditions that existed at the end of the reporting period (one possible example may be drilling that only commenced after reporting date). The new information or new developments are considered to be changes in accounting estimates under IAS 8. Also, based on the information that existed at the reporting period, the fair value less costs of disposal of the underlying E&E asset might well have been in excess of its carrying amount. [IAS 8.5].
- An *adjusting event* if the decision not to sanction the project for development was based on information that existed at the reporting date. Failure to use, or misuse of, reliable information that was available when financial statements for those periods were authorised for issue and could reasonably be expected to have been obtained and taken into account in the preparation and presentation of those financial statements, would constitute an error under IAS 8. [IAS 8.5].

Evaluating whether information obtained subsequent to the reporting period but before the financial statements are authorised for issue is an adjusting or non-adjusting event may require significant judgement. The conditions are required to be carefully evaluated based on the facts and circumstances of each individual situation.

Appendix A - Index of Illustrations

Illustration 3-1:	Impairment losses on E&E assets	3304
Illustration 4-1:	Unit of account - dry well	3307
Illustration 5-1:	Production sharing contract	3312
Illustration 6-1:	Carried interests	3319
Illustration 6-2:	Carried interests	3322
Illustration 11-1:	Single product entity	3353
Illustration 15-1:	Refurbishment costs - no legislative requirement	3399
Illustration 15-2:	Unitisation	3401
Illustration 15-3:	Reserves contributed in a unitisation	3402
Illustration 15-4:	Redetermination (1)	3404
Illustration 15-5:	Redetermination (2)	3406
Illustration 15-6:	Allocating costs between inventory and the stripping activity asset	3410
Illustration 16-1:	Exclusion of capitalised costs relating to undeveloped reserves	3420
Illustration 16-2:	Physical units of production method	3423
Illustration 17-1:	Identifying lease payments - inclement weather	3430
Illustration 17-2:	Identifying lease payments - major maintenance	3430
Illustration 18-1:	Identified asset - explicitly identified	3437
Illustration 18-2:	Identified asset - capacity portion of an asset	3437
Illustration 18-3:	Identified asset - explicitly identified but multiple assets available	3437
Illustration 18-4:	Assessing 'substantially all' when the customer's use of the asset is not 100% of the nominal operating capacity	3438
Illustration 18-5:	Right to direct the use - dedicated asset	3439
Illustration 18-6:	Right to direct the use - asset can be used on multiple locations for multiple JOs	3440
Illustration 18-7:	Right to direct the use - asset only used on one JO	3440
Illustration 18-8:	Classifying the sublease - finance lease	3442
Illustration 18-9:	Classifying the sublease - operating lease	3442
Illustration 18-10:	Accounting for the sublease - finance lease	3443
Illustration 21-1:	Grossing up of notional quantities withheld	3455
Illustration 22-1:	Acquisition of an entity that owns mineral reserves	3456

Appendix B - Defined terms common in the Extractive Industries

The glossary below defines some of the terms and abbreviations commonly used in the extractive industries.¹⁵⁴

Term / Abbreviation	Definition / Explanation
Abandon	To discontinue attempts to produce oil or gas from a well or lease, plug the reservoir in accordance with regulatory requirements and recover equipment.
Area-of-interest method	An accounting concept by which costs incurred for individual geological or geographical areas that have characteristics conducive to containing a mineral reserve are deferred as assets pending determination of whether commercial reserves are found. If the area of interest is found to contain commercial reserves, the accumulated costs are capitalised. If the area is found to contain no commercial reserves, the accumulated costs are charged to expense.
Barrels of oil equivalent (BOE)	Using prices or heating content, units of sulphur, condensate, natural gas and by products are converted to and expressed in equivalent barrels of oil for standard measurement purposes.
British Thermal Unit (BTU)	A measure of the amount of heat required to raise the temperature of one pound of water one degree Fahrenheit at the temperature at which water has its greatest density (39 degrees Fahrenheit).
Bullion	Metal in bars, ingots or other uncoined form.
Business	An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities. <i>[IFRS 3 Appendix A]</i> .
Carried interest	An agreement by which an entity that contracts to operate a mineral property and, therefore, agrees to incur exploration or development costs (the carrying party) is entitled to recover the costs incurred (and usually an amount in addition to actual costs incurred) before the entity that originally owned the mineral interest (the carried party) is entitled to share in revenues from production.
Carried party	The party for whom funds are advances in a carried interest arrangement.
Carrying party	The party advancing funds in a carried interest agreement.
Cash-generating unit	A cash-generating unit is the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or group of assets. <i>[IAS 36.6]</i> .
Concession	A contract, similar to a mineral lease, under which the government owning mineral rights grants the concessionaire the right to explore, develop, and produce the minerals.
Corporate assets	Corporate assets are assets other than goodwill that contribute to the future cash flows of both the cash-generating unit under review and other cash-generating units. <i>[IAS 36.6]</i> .

¹⁵⁴ IASC Issues Paper, Glossary of Terms.

Term / Abbreviation	Definition / Explanation
Cost	Cost is the amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRS accounting standards, e.g., IFRS 2 <i>Share-based Payment</i> . [IAS 16.6].
Cost recovery oil	Oil revenue paid to an operating entity to enable that entity to recover its operating costs and specified exploration and development costs from a specified percentage of oil revenues remaining after the royalty payment to the property owner.
Customer	A party that has contracted with an entity to obtain goods or services that are an output of the entity's ordinary activities in exchange for consideration. [IFRS 15 Appendix A].
Customer smelter	A smelter which processes concentrates from independent mines. Concentrates may be purchased or the smelter may be contracted to do the processing for the independent company.
Delay rental	Annual payments by the lessee of a mineral property to the lessor until drilling has begun.
Delineation well	A well to define, or delineate, the boundaries of a reservoir.
Development well	A well drilled to gain access to oil or gas classified as proved reserves.
Downstream activities	The refining, processing, marketing, and distributing of petroleum, natural gas, or mined mineral (other than refining or processing that is necessary to make the minerals that have been mined or extracted capable of being sold).
Dry gas	Natural gas composed of vapours without liquids and which tends not to liquefy.
Dry hole	An exploratory or development well that does not contain oil or gas in commercial quantities.
Entitlements method	A method of revenue recognition by which a joint venturer records revenue based on the share of production for the period to which that venturer is entitled.
Exploration and evaluation assets	Exploration and evaluation expenditures recognised as assets in accordance with the entity's accounting policy. [IFRS 6 Appendix A].
Exploration and evaluation expenditures	Expenditures incurred by an entity in connection with the exploration for and evaluation of mineral resources before the technical feasibility and commercial viability of extracting a mineral resource are demonstrable. [IFRS 6 Appendix A].
Exploration for and evaluation of mineral resources	The search for mineral resources, including minerals, oil, natural gas and similar non-regenerative resources after the entity has obtained legal rights to explore in a specific area, as well as the determination of the technical feasibility and commercial viability of extracting the mineral resource. [IFRS 6 Appendix A].
Exploratory well	A well drilled to find and produce oil or gas in an unproved area, to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir, or to extend a known reservoir.
Farm out and farm in	An agreement by which the owner of operating rights in a mineral property (the farmor) transfers a part of that interest to a second party (the farmee) in return for the latter's paying all of the costs, or only specified costs, to explore the property and perhaps to carry out part or all of the development of the property if reserves are found.

Term / Abbreviation	Definition / Explanation
Full cost method	An accounting concept by which all costs incurred in searching for, acquiring, and developing mineral reserves in a cost centre are capitalised, even though a specific cost clearly resulted from an effort that was a failure.
Geological and geophysical costs (G&G)	Costs of topographical, geological, geochemical, and geophysical studies.
Infill drilling	Technical and commercial analyses may support drilling additional producing wells to reduce the spacing beyond that utilised within the initial development plan. Infill drilling may have the combined effect of increasing recovery efficiency and accelerating production.
Joint control	The contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control. <i>[IFRS 11 Appendix A].</i>
Joint operating agreement (JOA)	A contract between two parties to a sharing arrangement that sets out the rights and obligations to operate the property if operating interests are owned by both parties after a sharing arrangement.
Joint operation	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the assets, and obligations for the liabilities, relating to the arrangement. <i>[IFRS 11 Appendix A].</i>
Joint venture	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement. <i>[IFRS 11 Appendix A].</i>
Lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration. <i>[IFRS 16 Appendix A].</i>
Over-lift or under-lift	Over-lift is the excess of the amount of production that a participant in a joint venture has taken as compared to that participant's proportionate share of ownership in total production. Under-lift is the shortfall in the amount of production that a participant in a joint venture has taken as compared to that participant's proportionate share of ownership in total production.
Production sharing contract (PSC)	A contract between a national oil company or the government of a host country and a contracting entity (contractor) to carry out oil and gas exploration and production activities in accordance with the terms of the contract, with the two parties sharing mineral output.
Profit oil	Revenue in excess of cost recovery oil and royalties.
Recompletion	The process of re-entering a previously completed well to install new equipment or to perform such services necessary to restore production.
Redetermination	A retroactive adjustment to the relative percentage interests of the participants in a field that is subject to a unitisation agreement.
Risk service contract	A contract by which an entity agrees to explore for, develop, and produce minerals on behalf of a host government in return for a fee paid by the host government.
Royalty	A portion of the proceeds from production, usually before deducting operating expenses, payable to a party having an interest in a lease.
Sales method	A method of revenue recognition by which a joint venturer records revenue based on the actual amount of product it has sold (or transferred downstream) during the period. No receivable or other

Term / Abbreviation	Definition / Explanation
	asset is recorded for undertaken production (underlift) and no liability is recorded for overtaken production (overlift).
Separate vehicle	A separately identifiable financial structure, including separate legal entities or entities recognised by statute, regardless of whether those entities have a legal personality. <i>[IFRS 11 Appendix A].</i>
Stripping ratio	The ratio of tonnes removed as waste relative to the number of tonnes of ore removed from an open pit mine.
Subsidiary	An entity that is controlled by another entity. <i>[IFRS 10 Appendix A].</i>
Successful efforts method	An accounting concept that capitalises only those upstream costs that lead directly to finding, acquiring and developing mineral reserves, while those costs that do not lead directly to finding, acquiring and developing mineral reserves are charged to expense.
Take-or-pay contracts	An agreement between a buyer and seller in which the buyer will still pay some amount even if the product or service is not provided. If the purchaser does not take the minimum quantity, payment is required for that minimum quantity at the contract price. Normally, deficiency amounts can be made up in future years if purchases are in excess of minimum amounts.
Unitisation	An agreement between two parties, each of which owns an interest in one or more mineral properties in an area, to cross-assign to one another a share of the interest in the mineral properties that each owns in the area; from that point forward they share, as agreed, in further costs and revenues related to the properties.
Upstream activities	Exploring for, finding, acquiring, and developing mineral reserves up to the point that the reserves are first capable of being sold or used, even if the entity intends to process them further.
Value in use	Value in use is the present value of the future cash flows expected to be derived from an asset or cash-generating unit. <i>[IAS 36.6].</i>
Workovers	Major repairs, generally of oil and gas wells.

Chapter 40

Financial instruments: Introduction

Contents

Overview	3464
1 Standards applying to financial instruments	3465
2 IAS 32	3466
3 IAS 39	3467
4 IFRS 7	3468
5 IFRS 9	3469
6 Structure and objectives of the standards	3471

Overview

This chapter explains which standards contain the IASB's requirements for the recognition, measurement, presentation and disclosure of financial instruments and summarises information about their development and structure. The actual requirements of these standards are addressed in the subsequent ten chapters.

What you need to know

- For most entities' financial instruments, the relevant accounting standards are IAS 32 *Financial Instruments: Presentation*, IFRS 7 *Financial Instruments: Disclosures* and IFRS 9 *Financial Instruments*.
- Some entities, most commonly banks, continue to apply some, or all, of the hedge accounting requirements of IAS 39 *Financial Instruments: Recognition and Measurement* rather than those of IFRS 9.
- The most significant recent amendments to these standards address issues arising from the post-implementation review of IFRS 9's classification and measurement requirements and contracts referencing nature-dependent electricity.
- The IASB has a number of standard-setting projects on its agenda that could over the next several years change the accounting standards applying to financial instruments, for example those addressing financial instruments with the characteristics of equity, dynamic risk management (DRM) and amortised cost measurement.

1 Standards applying to financial instruments

The subject matter of this chapter and the next ten chapters is the recognition, measurement, presentation and disclosure of financial instruments, the IASB's accounting requirements for which are regarded by many as some of the more difficult to understand. There are many likely reasons for this, including the fact that it is such a broad topic encompassing some of the more complex contracts entities enter into. In addition, the requirements have been subject to a process of almost continual change over the last 20 years or so and are dealt with in several different standards and other pronouncements.

The following are the standards which deal primarily with the accounting for financial instruments:

- IAS 32
- IAS 39
- IFRS 7
- IFRS 9

In addition, a number of interpretations address the requirements of these standards, including:

- IFRIC 2 *Members' Shares in Co-operative Entities and Similar Instruments*
- IFRIC 16 *Hedges of a Net Investment in a Foreign Operation*
- IFRIC 19 *Extinguishing Financial Liabilities with Equity Instruments*

Information about the development of the standards is set out in sections 2 to 5 below.

2 IAS 32

The original version of IAS 32 was issued in June 1995. The presentation requirements of the standard were subject to significant review during 2002 and 2003, and a revised standard was published in December 2003. IFRS 7, which was published in August 2005, superseded the disclosure requirements in IAS 32 and the title of the latter standard was changed to reflect this. In February 2008, the IASB amended IAS 32 to change the classification of certain puttable financial instruments and instruments of limited life entities from liabilities to equity. Further amendments to IAS 32, designed to clarify its requirements for offsetting (or netting) of financial instruments (covered in Chapter 50), were issued in December 2011 and numerous other amendments have been made throughout the life of the standard.

The IASB has for some time recognised that the classification of financial instruments as liabilities or equity in accordance with IAS 32 (covered in Chapter 43) presents many challenges and, in November 2023, published an exposure draft of proposed amendments to the standard. These aimed to address some of the more common issues encountered in practice in this area, but it was intended that changes to classification outcomes would be limited, particularly to those shown to provide more useful information to users of financial statements. The exposure draft also developed certain presentation and disclosure proposals that were included in *Financial Instruments with Characteristics of Equity*, a discussion paper published in June 2018. At the time of writing, the IASB is reviewing the feedback received and reconsidering its proposals, with a view to finalising amendments to IAS 32 in 2026.

3 IAS 39

IAS 39 was originally published in March 1999. Its origins could be found in US GAAP and at a high level there were only limited differences between the two systems. Both adopted a similar 'mixed attribute' model whereby some financial instruments were measured by reference to their historical cost and some by reference to their fair value.

By dealing with most aspects of virtually all financial instruments, it was the longest, and by far the most complex, standard issued by the IASC which also established a process to develop and publish guidance in the form of Questions and Answers (Q&As). IAS 39, like IAS 32, was subject to significant review during 2002 and 2003 and a revised standard, incorporating most of the Q&As as implementation guidance, was published in December 2003.

Many other changes have been made to IAS 39 since its original publication, including amendments in March 2004 allowing the use of hedge accounting for certain portfolio (or macro) fair value hedges of interest rate risk. However, subject to limited exceptions, most of the requirements of IAS 39 are now superseded by or carried forward into IFRS 9. Those exceptions are:

- Any entity may continue applying the hedge accounting requirements of IAS 39 instead of those in IFRS 9 even after applying the rest of IFRS 9.

And

- Any entity may apply the macro fair value hedge accounting requirements of IAS 39 for hedges of interest rate risk in addition to the hedge accounting requirements of IFRS 9.

In addition, entities using the IFRS for SMEs can for the time being, instead of applying the requirements set out in that standard, choose to apply the recognition and measurement provisions of IAS 39.

This publication reflects the reduced applicability of IAS 39 by covering its requirements only at a high level, although there are explanations in Chapter 49 of the more important differences between hedge accounting under IAS 39 and IFRS 9. Entities' continued ability to apply the remaining parts of IAS 39 will depend on the outcome of the IASB's project addressing DRM activities (see section 5 below).

4 IFRS 7

A project principally focused on revising the then IAS 30 *Disclosures in the Financial Statements of Banks and Similar Financial Institutions* evolved into a comprehensive review of all disclosure requirements related to financial instruments. This resulted in the publication of IFRS 7 in August 2005, superseding IAS 30 and the disclosure requirements in IAS 32.

IFRS 7 has been subject to a number of amendments since its publication. The requirements relating to liquidity risk were improved in the light of experience gained in the financial crisis; disclosures about transfers of financial assets were enhanced following an aborted attempt to revise the requirements addressing derecognition of financial assets; and disclosure requirements about offsetting and netting agreements were added. To complement the requirements in IFRS 9 addressing the classification and measurement of financial instruments, a significant number of amendments and additions were made to IFRS 7 setting out extensive disclosure requirements for impairments and hedge accounting.

More recently, disclosure requirements were added to IFRS 7 relating to the amendments to IFRS 9 published in May 2024 following the post-implementation review of its classification and measurement requirements, and changes to IFRS 9 addressing contracts referencing nature-dependent electricity (see section 5 below). IFRS 7 is addressed in Chapter 50.

5 IFRS 9

In April 2009, during the financial crisis, the IASB committed itself to a comprehensive review of IAS 39. The IASB's plan split this project into the following three phases, each of which would result in the publication of requirements replacing the corresponding parts of IAS 39:

- Classification of financial assets and financial liabilities
- Impairment and the effective interest method
- And
- Hedge accounting

IFRS 9, like IAS 39 before, contains a mixed attribute accounting model. Consequently, some instruments are measured at amortised cost and others at fair value. Similarly, certain gains and losses on remeasurement to fair value are recognised in profit or loss and some in other comprehensive income. The impairment requirements of IFRS 9 reflect an 'expected loss' approach which results in the earlier recognition of impairment losses compared to the 'incurred loss' model of IAS 39.

The hedge accounting phase of the project was designed to simplify hedge accounting, expand the relationships for which hedge accounting could be applied and align the accounting requirements more closely with entities' risk management practices. IFRS 9 does not itself address portfolio hedge accounting and viewed in isolation, is less accommodating than IAS 39 in this respect. However, IFRS 9 does allow for the continued application of the portfolio fair value hedge accounting requirements of IAS 39 alongside its more general hedge accounting requirements. In addition, entities wishing to use the portfolio cash flow hedge accounting guidance in IAS 39 can continue applying the entirety of IAS 39's hedge accounting requirements, although none of the benefits of applying the hedge accounting requirements of IFRS 9 are then available.

The IASB has for many years been working on a project which aims to eliminate any need for this continued application of IAS 39 (and also the so-called EU 'carve-out' - see Chapter 1) and a discussion paper, *Accounting for Dynamic Risk Management: a Portfolio Revaluation Approach to Macro Hedging*, was published in April 2014. However, given the diversity in views and comments received, the IASB did not develop the proposals further into an exposure draft. Since then, the IASB has developed an accounting model designed to enable investors to understand the effect of a company's DRM of repricing risk due to changes in interest rate (which is predominately used in the banking industry), and to evaluate the effectiveness of that risk management. At the time of writing, the IASB is expected to issue an Exposure Draft on the DRM model in the fourth quarter of 2025. The DRM developments and hedge accounting requirements of IFRS 9 are covered in Chapter 49 which also highlights important differences between those requirements and those of IAS 39.

The first version of IFRS 9 was published in November 2009 with significant amendments following in October 2010 and November 2013 before it was substantially completed in July 2014. In October 2017, the IASB published limited amendments to the standard designed to address concerns about the classification of financial assets containing certain prepayment features.

Most entities were required to adopt IFRS 9 for periods commencing on or after 1 January 2018, with certain insurers being allowed to defer application until adoption of IFRS 17 *Insurance Contracts*, which was mandatory for periods commencing on or after 1 January 2023.

During the development of IFRS 9, the IASB worked closely with its counterparts at the FASB with the aim of aligning, as far as possible, the financial reporting requirements for financial instruments in accordance with IFRS and US GAAP. The measurement of fair values under the two bodies of GAAP is to a large extent the same and in June 2016, the FASB published a new standard requiring impairment of financial assets to be based on expected losses, although it is somewhat different to the approach in IFRS 9 (see Chapter 47). The FASB has made various other amendments to US GAAP in recent years, but important differences remain in the areas of classifying and measuring financial instruments and hedge accounting and there are significant differences in other areas including the approach to offsetting financial assets and financial liabilities.

Many jurisdictions have now replaced or substantially finalised the replacement of interbank offered rates (IBORs) with alternative rates, the long-term viability of the former having been brought into question following the financial crisis. The IASB responded to these reforms in two phases. The first was designed to mitigate the effects of these reforms on hedge accounting in the period before financial instruments were issued or modified to reference these alternative rates. The second addressed changes made to contractual cash flows, including modifications of financial assets and financial liabilities, and to hedging relationships when an interest rate benchmark was replaced. As a result, IFRS 9 (and IAS 39) were amended in September 2019 and August 2020 and these amendments are addressed in *Supplement: IBOR Reform*.

The IASB conducts post-implementation reviews to assess the effects of new standards or major amendments to standards on investors, entities and auditors after the requirements have been widely applied for some time. The review of IFRS 9 has been divided into three phases, reflecting the way the standard was developed. In May 2024, following completion of the first phase (classification and measurement), the IASB issued amendments to IFRS 9, primarily designed to clarify how financial assets with contingent features including environmental, social and governance (ESG)-linked instruments, non-recourse loans, and contractually linked instruments are classified (which is covered in Chapter 44).

The IASB completed the second phase (impairment) of the post-implementation review of IFRS 9 in July 2024 and is expected to consider when to start its review of the hedge accounting requirements of IFRS 9 as it gets closer to finalising the DRM proposals. The review concluded that the impairment requirements in IFRS 9 are generally working as intended, although the IASB has added a standard-setting project to review matters relating to amortised cost measurement including modifications of financial assets and liabilities, derecognition and write-off of financial assets, the application of the effective interest method to floating rate financial instruments and the interaction of these areas. In addition, the IASB will investigate targeted improvements to the credit risk disclosure requirements in IFRS 7.

The IASB will sometimes consider amendments to standards to reflect emerging or other issues brought to its attention, often after referral from the IFRS IC. For example, the May 2024 amendments mentioned above also clarify how the derecognition requirements of IFRS 9 are applied to financial assets and financial liabilities and create an exception to its general principles for certain electronic payment systems. Further information about electronic payments and derecognition of financial assets and financial liabilities is included in Chapter 48. In December 2024, the IASB published amendments to IFRS 9 that clarify the application of the 'own-use' requirements for certain contracts referencing nature-dependent electricity, permit hedge accounting if these contracts are used as hedging instruments, and add new disclosure requirements to enable investors to understand the effect of these contracts on a company's financial performance and cash flows. Assessing whether contracts to buy or sell non-financial items including nature-dependent electricity are within the scope of IFRS 9 is covered in Chapter 41 and, as noted earlier, hedge accounting is covered in Chapter 49.

6 Structure and objectives of the standards

The main text of the standards is supplemented by application guidance (which is an integral part of each standard).¹ IAS 32 and IFRS 9 are each supplemented by illustrative examples and IFRS 7 and IFRS 9 by implementation guidance. These examples and implementation guidance accompany, but are not part of, the standards.²

The objective of IAS 32 is set out as: [IAS 32.2]

Extract from IAS 32

- 2 The objective of this Standard is to establish principles for presenting financial instruments as liabilities or equity and for offsetting financial assets and financial liabilities. It applies to the classification of financial instruments, from the perspective of the issuer, into financial assets, financial liabilities and equity instruments; the classification of related interest, dividends, losses and gains; and the circumstances in which financial assets and financial liabilities should be offset.

For IFRS 9 it is set out as: [IFRS 9.1.1]

Extract from IFRS 9

Chapter 1 Objective

- 1.1 The objective of this Standard is to establish principles for the financial reporting of *financial assets* and *financial liabilities* that will present relevant and useful information to users of financial statements for their assessment of the amounts, timing and uncertainty of an entity's future cash flows.

Finally, the objective of IFRS 7 is set out as: [IFRS 7.1]

Extract from IFRS 7

- 1 The objective of this IFRS is to require entities to provide disclosures in their financial statements that enable users to evaluate:
- (a) the significance of financial instruments for the entity's financial position and performance; and
 - (b) the nature and extent of risks arising from financial instruments to which the entity is exposed during the period and at the end of the reporting period, and how the entity manages those risks.

1 IAS 32, Application Guidance, para. before para. AG1, IFRS 7, Appendix B, Application guidance, para. after main heading, IFRS 9, Appendix B, Application guidance, para. after main heading.

2 IAS 32, Illustrative Examples, para. after main heading, IFRS 7, Guidance on implementing, para. after main heading and IFRS 9, Illustrative Examples, para. after main heading and Guidance on Implementing, para. before main heading Section A.

Chapter 41

Financial instruments: Definitions and scope

Contents

Overview	3474
1 What is a financial instrument?	3475
1.1 Definitions	3475
1.2 Applying the definitions	3476
1.2.1 The need for a contract	3476
1.2.2 Simple financial instruments	3476
1.2.3 Contingent rights and obligations	3477
1.2.4 Leases	3478
1.2.5 Non-financial assets and liabilities and contracts thereon	3478
1.2.6 Payments for goods and services	3479
1.2.7 Equity instruments	3480
1.2.8 Derivative financial instruments	3480
1.2.9 Dividends payable	3481
1.2.10 Crypto-assets	3481
2 Scope	3482
2.1 Subsidiaries, associates, joint ventures and similar investments	3482
2.2 Leases	3483
2.3 Insurance and similar contracts	3483
2.3.1 Weather derivatives	3484
2.3.2 Contracts with discretionary participation features	3484
2.3.3 Separating financial instrument components including embedded derivatives from insurance contracts	3485
2.3.4 Credit card contracts and similar arrangements which give rise to insurance risk	3485
2.3.5 Loan contracts that transfer significant insurance risk only on settlement of the policyholder's obligation created by the contract	3485
2.3.6 Amounts receivable from an intermediary	3485
2.4 Financial guarantee contracts	3486
2.4.1 Definition of a financial guarantee contract	3486
2.4.1.A Reimbursement for loss incurred	3486
2.4.1.B Debt instrument	3487
2.4.1.C Form and existence of contract	3488
2.4.2 Issuers of financial guarantee contracts	3489
2.4.3 Holders of financial guarantee contracts	3489
2.4.4 Financial guarantee contracts between entities under common control	3490

2.5	Loan commitments	3490
2.5.1	Performance guarantees	3493
2.6	Equity instruments	3494
2.6.1	Equity instruments issued	3494
2.6.2	Equity instruments held	3494
2.7	Business combinations	3494
2.7.1	Contingent consideration in a business combination	3494
2.7.1.A	Payable by an acquirer	3494
2.7.1.B	Receivable by a vendor	3494
2.7.2	Contracts between an acquirer and a vendor in a business combination	3495
2.8	Contingent pricing of property, plant and equipment and intangible assets	3496
2.9	Employee benefit plans and share-based payment	3498
2.10	Reimbursement rights in respect of provisions	3498
2.11	Disposal groups classified as held for sale and discontinued operations	3498
2.12	Indemnification assets	3498
2.13	Rights and obligations within the scope of IFRS 15	3499

Overview

The standards which address financial instruments are IAS 32 *Financial Instruments: Presentation*, IFRS 7 *Financial Instruments: Disclosures* and IFRS 9 *Financial Instruments*, which for most entities became effective for periods beginning on or after 1 January 2018 and replaced substantially all of the requirements relating to the recognition and measurement of financial instruments in IAS 39 *Financial Instruments: Recognition and Measurement*. Insurers that met specified criteria were permitted to continue with the application of IAS 39 for accounting periods that commenced before 1 January 2023. All insurers are required to apply IFRS 9 for periods that commenced on or after 1 January 2023. As set out in Chapter 49, entities are permitted to elect an accounting policy choice to continue applying the hedge accounting requirements of IAS 39 instead of those in IFRS 9.

In many cases, it will be clear whether an asset, liability, equity instrument, or other similar instrument must be accounted for in accordance with one or more of these standards. However, at the margins, determining whether these standards must be applied is not so easy.

Firstly, one needs to determine whether the definition of a financial instrument is met; secondly, not all financial instruments are within the scope of each of these standards - some are within the scope of other standards and some are not within the scope of any standard; and finally, certain contracts that do not meet the definition of a financial instrument are within the scope of some of these standards.

In general, this chapter does not attempt to discuss differences between the IFRS and US GAAP guidance on this topic as the standards are not converged. Therefore, differences between IFRS and US GAAP could exist that are not discussed in this chapter.

What you need to know

This chapter addresses the definition and scope of financial instruments in three main sections covering the following broad areas:

- Application of the definitions used in IFRS, i.e., determining what a financial instrument actually is (see section 1 below).
 - Determining which financial instruments are within the scope of which standards (see section 2 below).
- And
- Assessing whether a non-financial contract is to be accounted for as if it were a financial instrument (see section 3 below).

1 What is a financial instrument?

1.1 Definitions

The main terms used in the standards that apply to financial instruments are defined in IAS 32 as follows:
[IAS 32.11]

Extract from IAS 32

11 The following terms are used in this Standard with the meanings specified:

A *financial instrument* is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity.

A *financial asset* is any asset that is:

- (a) cash;
- (b) an equity instrument of another entity;
- (c) a contractual right:
 - (i) to receive cash or another financial asset from another entity; or
 - (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or
- (d) a contract that will or may be settled in the entity's own equity instruments and is:
 - (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or
 - (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments.

A *financial liability* is any liability that is:

- (a) a contractual obligation:
 - (i) to deliver cash or another financial asset to another entity; or
 - (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or
- (b) a contract that will or may be settled in the entity's own equity instruments and is:
 - (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or
 - (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments.

As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D.

An *equity instrument* is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities.

...

For the purpose of these definitions, 'entity' includes individuals, partnerships, incorporated bodies, trusts and government agencies. [IAS 32.14].

1.2 Applying the definitions

1.2.1 The need for a contract

The terms 'contract' and 'contractual' are important to the definitions and refer to "an agreement between two or more parties that has clear economic consequences that the parties have little, if any, discretion to avoid, usually because the agreement is enforceable by law". Such contracts may take a variety of forms and need not be in writing. [IAS 32.13].

Frequently asked questions

Question 1-1: What constitutes a contract in the context of gaming transactions?

The IFRS IC examined the question of what constitutes a contract in the context of gaming transactions. This is because, in some jurisdictions, a wager does not give rise to a contract that is enforceable under local contract law. The IFRS IC staff noted that a gaming transaction constitutes an agreement between two or more parties that has clear economic consequences for both. Furthermore, in most countries, gambling is heavily regulated and only parties acting within a regulated framework are licensed to operate gaming institutions, so that such entities cannot realistically fail to pay out on a good wager and therefore, the gaming institution will have little or no discretion as to whether it pays out on the bet. Consequently, the IFRS IC agreed that a wager should be treated as a contract.¹

A contractual right or contractual obligation to receive, deliver or exchange financial instruments is itself a financial instrument. Additionally, a chain of contractual rights or contractual obligations meets the definition of a financial instrument if it will ultimately lead to the receipt or payment of cash or to the acquisition or issue of an equity instrument. [IAS 32.AG7].

Assets and liabilities relating to non-contractual arrangements that arise as a result of statutory requirements imposed by governments, such as income taxes or levies are not financial liabilities or financial assets because they are not contractual. [IAS 32.AG12]. Accounting for income taxes is dealt with in more detail in another standard, IAS 12 *Income Taxes* (see Chapter 29), while levies are covered by IFRIC 21 *Levies* (see Chapter 27).

Similarly, constructive obligations as defined in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 27) do not arise from contracts and are therefore not financial liabilities. [IAS 32.AG12].

1.2.2 Simple financial instruments

The most common and simplest form of financial instrument is cash. [IAS 32.AG3].

Extract from IAS 32

AG3 Currency (cash) is a financial asset because it represents the medium of exchange and is therefore the basis on which all transactions are measured and recognised in financial statements. A deposit of cash with a bank or similar financial institution is a financial asset because it represents the contractual right of the depositor to obtain cash from the institution or to draw a cheque or similar instrument against the balance in favour of a creditor in payment of a financial liability.

¹ [INFORMATION FOR OBSERVERS](#), IFRIC Meeting: May 2007, London, Project: *Gaming Transactions (Agenda Paper 11(i))*, IASB, paras. 25 -27; and [IFRIC Update](#), July 2007. Available on the IFRS Foundation's website. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

In addition to cash, the following common financial instruments give rise to financial assets representing a contractual right to receive cash in the future, and corresponding financial liabilities representing a contractual obligation to deliver cash in the future:

- (a) Trade accounts receivable and payable
- (b) Notes receivable and payable
- (c) Loans receivable and payable

And

- (d) Bonds receivable and payable

In each case, one party's contractual right to receive (or obligation to pay) cash is matched by the other party's corresponding obligation to pay (or right to receive). [IAS 32.AG4].

Another type of financial instrument is one for which the economic benefit to be received or given up is a financial asset other than cash. For example, a note payable in government bonds gives the holder the contractual right to receive, and the issuer the contractual obligation to deliver, government bonds, not cash. The bonds are financial assets because they represent obligations of the issuing government to pay cash. Therefore, the note is a financial asset of the note holder and a financial liability of the note issuer. [IAS 32.AG5].

Perpetual debt instruments (such as perpetual bonds, debentures and capital notes) normally provide the holder with the contractual right to receive payments on account of interest at fixed dates extending indefinitely, either with no right to receive a return of principal or a right to a return of principal under terms that make it very unlikely or very far in the future. For example, an entity may issue a financial instrument requiring it to make annual payments in perpetuity equal to a stated interest rate of 8% applied to a stated par or principal amount of CU1,000. Assuming 8% is the market rate of interest for the instrument when issued, the issuer assumes a contractual obligation to make a stream of future interest payments having a net present value (or fair value) of CU1,000 on initial recognition. The holder and issuer of the instrument have a financial asset and a financial liability, respectively. [IAS 32.AG6].

1.2.3 Contingent rights and obligations

The ability to exercise a contractual right or the requirement to satisfy a contractual obligation may be absolute (as in the examples in section 1.2.2 above), or it may be contingent on the occurrence of a future event. A contingent right or obligation, e.g., to receive or deliver cash, meets the definition of a financial asset or a financial liability. [IAS 32.AG8].

For example, a financial guarantee is a contractual right of the lender to receive cash from the guarantor, and a corresponding contractual obligation of the guarantor to pay the lender, if the borrower defaults. The contractual right and obligation exist because of a past transaction or event (the assumption of the guarantee), even though the lender's ability to exercise its right and the requirement for the guarantor to perform under its obligation are both contingent on a future act of default by the borrower. [IAS 32.AG8].

Illustration 1-1: Does contingent consideration arising from the sale of a business meet the definition of a financial instrument?

An entity sells its entire shareholding in a subsidiary to a third party. The terms of the arrangement require the buyer to transfer an additional amount of cash if a specified event occurs in the future. The question is whether the seller accounts for this contingent consideration as a financial instrument. The following three scenarios are considered.

Scenario 1

The additional consideration is contingent on the market price of the shares issued to affect the business combination. This share price-based contingency meets the definition of a financial asset and a derivative because the seller has a contractual right to receive an amount whose value changes in response to changes in the market price of the shares.

Scenario 2

The additional consideration is contingent on the acquiree maintaining or achieving specified earnings levels in future periods, such as revenue or EBITDA. This earnings-based contingency meets the definition of a financial asset as it represents a contractual right to receive cash or other financial assets. Whether it meets the definition of a derivative depends on whether the seller's accounting policy is to view revenue / EBITDA as a financial or non-financial variable (see Chapter 42). If the seller's policy is to view the underlying earnings-based variable as a financial variable, then the contract meets the definition of a derivative. If the seller's policy is not to view the underlying earnings-based variable as a financial variable, then the contract does not currently meet the definition of a derivative, because the variable is specific to a party to the contract. In this case, it will still be accounted for at fair value through profit or loss as it will fail the 'contractual cash flow characteristics' test due to the linkage of the cash flows to the acquiree's earnings.

Scenario 3

The additional consideration is contingent on a favourable court ruling on a case initiated by the business prior to its sale, and all the proceeds will be passed to the seller. This legal contingency does not meet the definition of a derivative or a financial asset. Although a contract exists between the buyer and the seller, in this circumstance, the buyer is not exposed to any risks or rewards arising from the contract. Generally, the buyer acts as an agent for the seller and transfers any proceeds received from a favourable outcome in court to the seller. In the consolidated financial statements of the seller, the contract is not a derivative but a right to receive future contingent proceeds, which meets the definition of a contingent asset. Therefore, it must be accounted for in accordance with the requirements of IAS 37. Therefore, if the acquiree recognised such a contingent asset prior to the sale, and the buyer acts as an agent in a manner noted above, the seller would not derecognise the contingent asset in its consolidated financial statements at the time of the sale.

Even though contingent rights and obligations can meet the definition of a financial instrument, they are not always recognised in the financial statements as such. For example, contingent rights and obligations may be insurance contracts within the scope of IFRS 17 *Insurance Contracts* (see Chapter 51) or may otherwise be excluded from the scope of IFRS 9 (see section 2 below). [IAS 32.AG8].

1.2.4 Leases

A lease typically creates an entitlement of the lessor to receive, and an obligation of the lessee to make, a stream of payments that are substantially the same as blended payments of principal and interest under a loan agreement. The lessor accounts for its investment in the amount receivable under a finance lease rather than the underlying asset itself. Accordingly, a lessor regards a finance lease as a financial instrument. In contrast, a lessor does not recognise its entitlement to receive lease payments under an operating lease. The lessor continues to account for the underlying asset itself rather than any amount receivable in the future under the contract. Accordingly, a lessor does not regard an operating lease as a financial instrument, except as regards individual payments currently due and payable by the lessee.

[IAS 32.AG9].

IFRS 16 *Leases* requires a lessee to recognise a lease liability (with a corresponding right-of-use asset) at the commencement date of the lease, at the present value of the lease payments that are not paid at that date. [IFRS 16.22, IFRS 16.26]. Accordingly, under IFRS 16, a lessee regards a lease as giving rise to a financial liability.

Nevertheless, as discussed in more detail in section 2.2 below, whilst leases can give rise to financial instruments for lessors and for lessees respectively, those financial instruments are not always accounted for under IFRS 9.

1.2.5 Non-financial assets and liabilities and contracts thereon

Physical assets (e.g., inventories, property, plant and equipment), right-of-use assets and intangible assets (e.g., patents and trademarks) are not financial assets. Control of such assets creates an opportunity to generate an inflow of cash or another financial asset, but it does not give rise to a present right to receive cash or another financial asset. [IAS 32.AG10]. For example, whilst gold bullion is highly liquid (and perhaps more liquid than many financial instruments), it gives no contractual right to receive cash or another financial asset, and so is therefore a commodity, not a financial asset. [IFRS 9.IG B.1].

Assets like prepaid expenses, for which the future economic benefit is the receipt of goods or services rather than the right to receive cash or another financial asset, are not financial assets. Similarly, items like deferred revenue and most warranty obligations are not financial liabilities, because the outflow of economic benefits associated with them is the delivery of goods and services rather than a contractual obligation to pay cash or another financial asset. [IAS 32.AG11].

Contracts to buy or sell non-financial items do not meet the definition of a financial instrument because the contractual right of one party to receive a non-financial asset or service and the corresponding obligation of the other party, do not establish a present right or obligation of either party to receive, deliver or exchange a financial asset. For example, contracts that provide for settlement only by the receipt or delivery of a non-financial item (e.g., an option, future or forward contract on silver and many similar commodity contracts) are not financial instruments. However, as set out in section 3 below, certain contracts to buy or sell non-financial items that can be settled net or by exchanging financial instruments, or in which the non-financial item is readily convertible into cash are included within the scope of IAS 32 and IFRS 9 respectively, essentially because they exhibit similar characteristics to financial instruments. [IAS 32.AG20].

Frequently asked questions

Question 1-2: Cash deposits in respect of returnable containers

In some industries, e.g., brewing and heating gas, entities distribute their products in returnable containers. Often, these entities will collect a cash deposit for each container delivered, which they have an obligation to refund on return of the container. The IFRS IC addressed the classification of these obligations in November 2007, in particular whether they meet the definition of a financial instrument.² It is easy to jump to the conclusion (as the IFRS IC did initially)³ that such an arrangement represents a contract to exchange a non-financial item (the container) for cash and is therefore outside the scope of IFRS 9. However, the IFRS IC recognised that this analysis holds true only if, in accounting terms, the container ceases to be an asset of the seller when the sale is made, i.e., it is derecognised. If the container is not derecognised, the customer cannot be regarded as receiving the non-financial asset because the accounting treatment regards the seller as retaining the asset. Instead, the deposit represents an obligation for the seller to transfer cash and therefore, the seller classifies it as a financial liability.⁴

Some contracts are commodity-linked, but do not involve settlement through the physical receipt or delivery of a commodity. Instead, they specify settlement through cash payments that are determined according to a formula in the contract. For example, the principal amount of a bond may be calculated by applying the market price of oil prevailing at the maturity of the bond to a fixed quantity of oil, but is settled only in cash. Such a contract constitutes a financial instrument. [IAS 32.AG22].

Financial instruments also include contracts that give rise to a non-financial asset or non-financial liability in addition to a financial asset or financial liability. Such arrangements often give one party an option to exchange a financial asset for a non-financial asset. For example, an oil-linked bond may give the holder the right to receive a stream of fixed periodic interest payments and a fixed amount of cash on maturity, with the option to exchange the principal amount for a fixed quantity of oil. The desirability of exercising this option will vary over time depending on the fair value of oil relative to the exchange ratio of cash for oil (the exchange price) inherent in the bond, but the intentions of the bondholder do not affect the substance of the component assets. The financial asset of the holder and the financial liability of the issuer make the bond a financial instrument, regardless of the other types of assets and liabilities also created. [IAS 32.AG23].

1.2.6 Payments for goods and services

Where payment on a contract involving the receipt or delivery of physical assets is deferred past the date of transfer of the asset, a financial instrument arises at the date of transfer. In other words, the sale or purchase of goods on trade credit gives rise to a financial asset (a trade receivable) and a financial liability (a trade payable) when the goods are transferred. This is the case even if an invoice is not issued at the date of transfer. However, where required by IFRS 15 *Revenue from Contracts with Customers*, a financial instrument would arise at an earlier date. [IAS 32.AG21].

IAS 32 does not explain whether the same logic should apply to the delivery of other, less tangible, non-financial items, e.g., construction or other services. IFRIC 12 *Service Concession Arrangements* provides guidance on how operators of service concessions over public infrastructure assets must account for these arrangements. Where an operator obtains an unconditional contractual right to receive cash from the grantor in exchange for construction or other services, the accrued revenue represents a financial asset. This is the case even if payment is not due immediately and even if it is contingent on the operator ensuring that the underlying infrastructure meets specified quality or efficiency requirements (see Chapter 26). [IFRIC 12.16].

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

3 [IFRIC Update](#), November 2007, available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

4 [IFRIC Update](#), May 2008, available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

1.2.7 Equity instruments

Equity instruments include non-puttable ordinary shares, some puttable and similar instruments, some types of preference shares and warrants or written call options that allow the holder to subscribe for or purchase a fixed number of non-puttable ordinary shares in the issuing entity, in exchange for a fixed amount of cash or another financial asset. [IAS 32.AG13]. The definition of equity instruments is considered in more detail in Chapter 43.

1.2.8 Derivative financial instruments

In addition to primary instruments such as receivables, payables and equity instruments, financial instruments also include derivatives such as financial options, futures and forwards, interest rate swaps and currency swaps. Derivatives normally transfer one or more of the financial risks inherent in an underlying primary instrument between the contracting parties without any need to transfer the underlying instruments themselves (either at inception of the contract or even, where cash settled, on termination).

[IAS 32.AG15, IAS 32.AG16].

There are important accounting consequences for financial instruments that are considered to be derivatives, and the defining characteristics of derivatives are covered in more detail in Chapter 42.

As noted in section 1.2.5 above, certain derivative contracts on non-financial items are included within the scope of IAS 32 and IFRS 9, even though they are not, strictly, financial instruments as defined. These contracts are covered in more detail in section 3 below.

On inception, the terms of a derivative financial instrument generally give one party a contractual right (or obligation) to exchange financial assets or financial liabilities with another party under conditions that are potentially favourable (or unfavourable). Some instruments embody both a right and an obligation to make an exchange and, as prices in financial markets change, those terms may become either favourable or unfavourable. [IAS 32.AG16].

A put or call option to exchange financial assets or financial liabilities gives the holder a right to obtain potential future economic benefits associated with changes in the fair value of the underlying instrument. Conversely, the writer of an option assumes an obligation to forgo such potential future economic benefits or bear potential losses associated with the underlying instrument. The contractual right (or obligation) of the holder (or writer) meets the definition of a financial asset (or liability). The financial instrument underlying an option contract could be any financial asset, including shares in other entities and interest-bearing instruments. An option may require the writer to issue a debt instrument, rather than transfer a financial asset, but the instrument underlying the option would constitute a financial asset of the holder if the option were exercised. The option-holder's right (or writer's obligation) to exchange the financial asset under potentially favourable (or unfavourable) conditions is distinct from the underlying financial asset to be exchanged upon exercise of the option. The nature of the holder's right and of the writer's obligation (which characterises such contracts as a financial instrument) are not affected by the likelihood that the option will be exercised. [IAS 32.AG17].

Another common type of derivative is a forward contract. For example, consider a contract in which two parties (the seller and the purchaser) promise in six months' time to exchange CU1,000 cash (the purchaser will pay cash) for CU1,000 face amount of fixed rate government bonds (the seller will deliver the bonds). During those six months, both parties have a contractual right and a contractual obligation to exchange financial instruments (cash in exchange for bonds). If the market price of the government bonds rises above CU1,000, the conditions will be favourable to the purchaser and unfavourable to the seller, and *vice versa* if the market price falls below CU1,000. The purchaser has a contractual right (a financial asset) similar to the right under a call option held and a contractual obligation (a financial liability) similar to the obligation under a put option written. The seller has a contractual right (a financial asset) similar to the right under a put option held and a contractual obligation (a financial liability) similar to the obligation under a call option written. As with options, these contractual rights and obligations constitute financial assets and financial liabilities separate and distinct from the underlying financial instruments (the bonds and cash to be exchanged). Both parties to a forward contract have an obligation to perform at the agreed time, whereas performance under an option contract occurs only if and when the holder of the option chooses to exercise it. [IAS 32.AG18].

Other types of derivative also embody a right or obligation to make a future exchange, including interest rate and currency swaps, interest rate caps, collars and floors, loan commitments, note issuance facilities and letters of credit. An interest rate swap contract can be seen as a variation of a forward contract in which the parties agree to make a series of future exchanges of cash amounts, one amount calculated with reference to a floating interest rate and the other with reference to a fixed interest rate. Futures contracts are another variation of forward contracts, with the primary difference being that futures contracts are standardised and traded on an exchange. [IAS 32.AG19].

1.2.9 Dividends payable

As part of its project to provide authoritative accounting guidance for non-cash distributions (see Chapter 9), the IFRS IC, in January 2008, found itself debating the seemingly simple question of how to account for a declared but unpaid cash dividend (or, more accurately, which standard applies to such a liability). Although there are clear indicators within IFRS accounting standards that an obligation to pay a cash dividend is a financial liability, [IAS 32.AG13], the IFRS IC originally decided that it was appropriate to apply the principles in IAS 37 to all dividends payable, [IFRIC 17.BC25], a decision that appeared to have been made more on the grounds of expediency rather than using any robust technical analysis. By the time IFRIC 17 *Distributions of Non-cash Assets to Owners* was published in November 2008, the IFRS IC had modified its position slightly. Aside from standards dealing with the measurement of liabilities that are clearly not relevant (e.g., IAS 12), they considered that others, except IAS 37 or IFRS 9,⁵ were not applicable because they addressed liabilities arising only from exchange transactions. [IFRIC 17.BC22]. IFRIC 17 specifies the accounting treatment to be applied to distributions without linking to any individual standard. [IFRIC 17.BC27]. The IFRS IC concluded that it was not appropriate to conclude that all dividends payable are to be regarded as financial liabilities.⁶ Therefore, entities will have to exercise judgement to determine whether IAS 37 or IFRS 9 must be applied to declared but unpaid cash dividends.

1.2.10 Crypto-assets

Crypto-assets have diverse terms and conditions, and the purpose for holding them differs. As a result, the holders and issuers of crypto-assets will need to evaluate their own facts and circumstances in determining which IFRS accounting standards classification and measurement requirements need to be applied (see Chapter 18). Generally, crypto-assets are not considered to be financial instruments, as in many cases, they do not give rise to a financial asset of one entity and a financial liability or equity instrument of another entity.

It has been observed that certain crypto-assets may provide different rights to the holder, depending on facts and circumstances. For example, a holder of a crypto-asset may have a right to convert the crypto-asset into cash only if the holder has a bank account with a particular party. In such case, the same crypto asset may meet the definition of a financial asset for holders with a bank account but not for others.

The accounting for crypto-assets that meet the definition of intangible assets is discussed in Chapter 18. For crypto-assets that are classified as inventories refer to Chapter 23. The distinction between cryptocurrencies and Central Bank Digital Currencies, as well as considerations on whether these are considered to meet the definition of cash and cash equivalents is discussed in Chapter 36.

⁵ Paragraph BC 22 of IFRIC 17 refers to IAS 39. For the purpose of this paragraph the reference to IAS 39 has been superseded by IFRS 9.

⁶ [IFRIC Update](#), July 2008, available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

2 Scope

IAS 32, IFRS 7 and IFRS 9 apply to the financial statements of all entities that are prepared in accordance with International Financial Reporting Standards. [IAS 32.4, IFRS 7.3, IFRS 9.2.1]. In other words, there are no exclusions from the presentation, recognition, measurement, or even the disclosure requirements of these standards based on the nature of the reporting entity, even for entities that do not have publicly traded securities or those that are subsidiaries of other entities.

The standards do not, however, apply to all of an entity's financial instruments, some of which are excluded from their scope, for example, insurance contracts (see Chapter 51). These exceptions are considered in more detail in sections 2.1 to 2.14 below. Conversely, certain contracts over non-financial items that behave in a similar way to financial instruments but do not actually fall within the definition - essentially some commodity contracts - are included within the scope of the standards and these are considered in section 3 below.

2.1 Subsidiaries, associates, joint ventures and similar investments

Most interests in subsidiaries, associates, and joint ventures that are consolidated or equity accounted in consolidated financial statements are outside the scope of IAS 32, IFRS 7 and IFRS 9. However, such instruments must be accounted for in accordance with IFRS 9 and disclosed in accordance with IFRS 7 in the following situations: [IAS 32.4(a), IFRS 7.3(a), IFRS 9.2.1(a)]

- In separate financial statements of the parent or investor if the entity chooses not to account for those investments at cost or using the equity method as described in IAS 28 *Investments in Associates and Joint Ventures* (see Chapter 9). [IAS 27.10, IAS 27.11, IAS 28.44].
- When investments in an associate or a joint venture held by a venture capital organisation, mutual fund, unit trust or similar entity are classified as financial instruments at fair value through profit or loss on initial recognition (see Chapter 12). [IAS 28.18]. When an entity has an investment in an associate, a portion of which is held indirectly through a venture capital organisation, mutual fund, unit trust or similar entity including an investment-linked insurance fund, the entity may elect to measure that portion of the investment in the associate at fair value through profit or loss regardless of whether the venture capital organisation, mutual fund, unit trust or similar entity has significant influence over that portion of the investment. If the election is made, the equity method must be applied to any remaining portion of the investment. [IAS 28.19].

And

- An investment in a subsidiary by an investment entity that is measured at fair value through profit or loss using the investment entity exception (see Chapter 7). [IFRS 10.31].

In January 2013, the IFRS IC concluded that impairments of investments in subsidiaries, associates and joint ventures accounted for at cost in the separate financial statements of the investor are dealt with by IAS 36 *Impairment of Assets* - not IFRS 9.⁷

Frequently asked questions

Question 2-1: Which standard applies to impairment of long-term interests in an associate or joint venture that, in substance, form part of the net investment in the associate or joint venture?

Whilst the scope of IFRS 9 excludes interests in associates and joint ventures accounted for using the equity method, [IFRS 9.2.1(a)], it was initially unclear whether the scope also excludes long-term interests in an associate or joint venture that, in substance, form part of the net investment in the associate or joint venture (see Chapter 12). However, in October 2017, the IASB issued an amendment to IAS 28 clarifying that IFRS 9, including its impairment requirements, applies to the measurement of long-term interests in an associate or a joint venture that form part of the net investment in the associate or joint venture, but to which the equity method is not applied. [IAS 28.14A].

IAS 32, IFRS 7 and IFRS 9 apply to most derivatives on interests in subsidiaries, associates and joint ventures, irrespective of how the investment is otherwise accounted for. However, IFRS 9 does not apply to instruments containing potential voting rights that, in substance, give access to the economic benefits arising from an ownership interest which is consolidated or equity accounted (see Chapter 8, Chapter 12 and Chapter 13). [IFRS 10.B91].

⁷ [IFRIC Update](#), January 2013, available on the IFRS Foundation's website.

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

From the perspective of an entity issuing derivatives, the requirements of IFRS 9 and IFRS 7 do not apply if such derivatives meet the definition of an equity instrument of the entity. [IFRS 7.3(a), IFRS 9.2.1(a)]. For example, a written call option allowing the holder to acquire a subsidiary's shares that can be settled only by delivering a fixed number of those shares in exchange for a fixed amount of cash might meet the definition of equity in the group's consolidated financial statements (see section 2.6 below and Chapter 43).

Sometimes an entity will make a strategic investment in the equity of another party. These are often made with the intention of establishing or maintaining a long-term operating relationship with the investee. Unless they are equity accounted as associates or joint ventures, these investments are within the scope of IFRS 9. [IFRS 9.B2.3].

2.2 Leases

Whilst all financial assets and liabilities arising from leases are within the scope of IAS 32 and IFRS 7, they are only within the scope of IFRS 9 to the following extent:

- Lease receivables and lease liabilities are subject to the derecognition provisions (see Chapter 48).
 - Lease receivables are subject to the 'expected credit loss' requirements (see Chapter 47).
- And
- The relevant provisions that apply to derivatives embedded within leases (see Chapter 42).

Otherwise the applicable standard is IFRS 16 (see Chapter 24), not IFRS 9. [IFRS 9.2.1(b)].

In March 2022, the IFRS IC considered a rent concession in which a lessor legally released the lessee from its obligation to make specifically identified lease payments, some of which are amounts contractually due but not paid (which the lessor had recognised as an operating lease receivable). The IFRS IC concluded that, in the period before the rent concession is granted, the lessor measures expected credit losses on the operating lease receivable as required by IFRS 9, and must consider its expectations of forgiving lease payments recognised as part of that receivable. [IFRS 9.5.5.17]. Furthermore, the IFRS IC concluded that the derecognition requirements in IFRS 9 apply to forgiven lease payments that the lessor had included in an operating lease receivable on the date the rent concession is granted; and the lease modification requirements in IFRS 16 apply to forgiven lease payments that the lessor had not included in an operating lease receivable. This issue is discussed in more detail in Chapter 24.

In July 2024, the IASB issued amendments to IFRS 9 related to derecognition of lease liabilities. Paragraph 2.1(b)(ii) of IFRS 9 has been amended by adding a cross-reference to paragraph 3.3.3 of IFRS 9 to resolve potential confusion for a lessee applying the derecognition requirements in IFRS 9. [IFRS 9.2.1(b)]. This is to clarify that, when a lease liability (or part of a lease liability) is extinguished or transferred to another party, the difference between the carrying amount and the consideration paid, including any non-cash assets transferred or liabilities assumed, is recognised in profit or loss. A lessee is required to apply this amendment for annual reporting periods beginning on or after 1 January 2026. Earlier application is permitted. This amendment does not address how a lessee distinguishes between a lease modification as defined in IFRS 16 and an extinguishment of a lease liability in accordance with IFRS 9. This is discussed further in chapter 24.

2.3 Insurance and similar contracts

Although insurance contracts as defined in IFRS 17 often satisfy the definition of a financial instrument, they are generally excluded from the scope of IAS 32, IFRS 7 and IFRS 9. However, those standards apply to certain embedded derivatives (see section 2.3.3 below), investment components (see section 2.3.3 below), financial guarantee contracts (see section 2.4 below), rights and obligations that are financial instruments arising under credit card contracts (see section 2.3.4 below) and loan contracts that transfer significant insurance risk only on settlement the policyholder's obligation created by the contract (see section 2.3.5 below). [IAS 32.4(d), IFRS 7.3(d), IFRS 9.2.1(e)]. IFRS 17 is discussed in Chapter 51.

Extracts from IFRS 17

Appendix A

Defined terms

financial risk	The risk of a possible future change in one or more of a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract.
insurance contract	A contract under which one party (the insurer or issuer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder .
insurance risk	Risk, other than financial risk , transferred from the holder of a contract to the issuer

[IFRS 17 Appendix A].

In many cases, it will be quite clear whether a contract is an insurance contract or not, although this will not always be the case and IFRS 17 contains guidance on this definition (see Chapter 51). [IFRS 17.B2-B30].

The application guidance makes it clear that insurers' financial instruments that are not within the scope of IFRS 17 must be accounted for under IFRS 9. [IFRS 9.B2.4].

2.3.1 Weather derivatives

Contracts which require a payment based on climatic variables (often referred to as 'weather derivatives') or on geological or other physical variables are within the scope of IFRS 9 unless they fall within the scope of IFRS 17. [IFRS 9.B2.1]. Generic or standardised contracts will rarely meet the definition of insurance contracts because the variable is unlikely to be specific to either party to the contract. [IFRS 17.B26(k), IFRS 17.B27(g)]. This is shown in the following Illustration.

Illustration 2-1: Rainfall contract - derivative financial instrument or insurance contract?

Company E has contracted to lease a stall at an open-air event from which it plans to sell goods to people attending the event. The event will be held at a village approximately 100 km from Capital City.

Because E is concerned that poor weather may deter people from attending the event, it enters into a contract with Financial Institution K, the terms of which are that, in return for a premium paid by E on inception of the contract, K will pay a fixed amount of money to E if, during the day of the event, it rains for more than three hours at the meteorological station in the centre of Capital City.

The non-financial variable in the contract, i.e., rainfall at the meteorological station, is not specific to E. E will only suffer loss as a result of rainfall at the village, not at Capital City. Also, because the potential payment to be received is for a fixed amount, it might not be possible to demonstrate that E has suffered a loss for which it has been compensated. Therefore, E must account for the contract as a financial instrument under IFRS 9.

2.3.2 Contracts with discretionary participation features

IFRS 17 is clear that investment contracts that have the legal form of an insurance contract but do not expose the insurer to significant insurance risk (see Chapters 51) are financial instruments and not insurance contracts. [IFRS 17.B27(a)]. Investment contracts (normally taking the form of life insurance policies) which contain what are called discretionary participation features, essentially rights of the holder to receive additional benefits whose amount or timing is, contractually, at the discretion of the issuer are accounted for under IFRS 17 if (and only if) the entity also issues insurance contracts, as the IASB believes that applying IFRS 17 to these contracts in these circumstances would provide more relevant information about the contracts than would be provided by applying other standards. [IFRS 17.3(c), IFRS 17.BC65(a)]. In rare cases, where an entity issues contracts with discretionary participation features but does not issue any insurance contracts, those contracts would fall within the scope of IAS 32 and IFRS 9.

If investment contracts with discretionary participation features are accounted for under IFRS 17, they would be outside the scope of IAS 32, IFRS 9 and IFRS 7. [IAS 32.4(d), IFRS 9.2.1(e), IFRS 7.3(d)].

2.3.3 Separating financial instrument components including embedded derivatives from insurance contracts

IFRS 17 requires entities to apply IFRS 9 to determine whether a contract contains an embedded derivative to be separated and to apply IFRS 9 to those components that are separated. [IFRS 9.2.1(e), IFRS 17.11(a)]. IFRS 7 applies to all embedded derivatives that are separately accounted for. [IFRS 7.3(d)].

IFRS 17 requires an entity to separate an investment component (amounts an insurance contract requires the entity to repay to the policyholder in all circumstances, regardless of whether an insured event occurs [IFRS 17 Appendix A]) from a host insurance contract if the component is 'distinct' (see Chapter 51). The separated component is accounted for and disclosed in accordance with IFRS 9 and IFRS 7 unless it is an investment contract with discretionary participation features within the scope of IFRS 17. [IFRS 7.3(d), IFRS 9.2.1(e), IFRS 17.11(b)].

2.3.4 Credit card contracts and similar arrangements which give rise to insurance risk

Credit card contracts or similar arrangements can in some circumstances meet the definition of an insurance contract. For example, some credit cards, charge cards, consumer financing and bank account contracts involve the lender providing guarantees to its customer in respect of products purchased using the arrangement. IFRS 17 excludes such contracts from its scope if, and only if, the entity does not reflect an assessment of the insurance risk associated with an individual customer in setting the price of the contract with that customer. If excluded from IFRS 17, these contracts would be within the scope of IFRS 9. However, if, and only if, the insurance coverage is a contractual term of such a financial instrument, the entity shall separate that component and apply IFRS 17 to it (see Chapter 51). [IFRS 17.7(h), IFRS 9.2.1(e)(iv)]. Other IFRS accounting standards, such as IFRS 15 or IAS 37, might apply to other components of the contract, such as other service components or insurance components required by law or regulation. [IFRS 17.BC94C].

2.3.5 Loan contracts that transfer significant insurance risk only on settlement of the policyholder's obligation created by the contract

Some contracts meet the definition of an insurance contract but limit the compensation for insured events to the amount otherwise required to settle the policyholder's obligation created by the contract. These might include loans with death waivers such as lifetime or equity release mortgages in which the borrower's obligation on death or incapacitation is limited to the value of the property on which the loan is secured. If such contracts are not otherwise excluded from the scope of IFRS 17, an entity can elect to apply either IFRS 17 or IFRS 9 to such contracts that it issues. The choice must be made for each portfolio of insurance contracts and the choice for such a portfolio is irrevocable (see Chapter 51). [IFRS 17.8A].

2.3.6 Amounts receivable from an intermediary

Most insurers use intermediaries as a link between them and a policyholder to arrange an insurance contract. In many of these arrangements, the policyholder pays the cash premiums to the intermediary but the contractual arrangement between the insurer and the intermediary allows the intermediary to pay the premiums to the insurer at a later date. In some situations, when the policyholder has paid the premiums to the intermediary, the policyholder has not discharged its obligation to the insurer. In other situations, when the policyholder has paid the premiums to the intermediary, the policyholder has discharged its obligation under the insurance contract and the insurer is obliged to provide insurance contract services to the policyholder. Normally, if the policyholder has discharged its obligation under the insurance contract and the intermediary fails to pay the premiums to the insurer, the insurer does not have the right to recover the premiums from the policyholder, or to cancel the insurance contract.

In situations when the policyholder has paid the premiums to the intermediary and has discharged its obligation under the insurance contract, the issue is whether the premiums receivable from the intermediary are future cash flows within the boundary of an insurance contract and included in the measurement of the group of insurance contracts applying IFRS 17 or are a separate financial asset applying IFRS 9. IFRS 17 is silent on whether future cash flows within the boundary of an insurance contract are removed from the measurement of a group of insurance contracts only when these cash flows are recovered or settled in cash. This matter was discussed by the IFRS IC in September 2023 which concluded that an insurer could determine that cash flows are removed from the measurement of a group of insurance contracts and accounted for under IFRS 9 either when the cash flows are recovered or settled in cash (View 1) or when the policyholder's obligation under the insurance contract is discharged (View 2). See Chapter 51 for a detailed discussion.

2.4 Financial guarantee contracts

Where a contract meets the definition of a financial guarantee contract (see section 2.4.1 below), the issuer is normally required to apply specific accounting requirements within IFRS 9, which are different from those that apply to other financial liabilities. Usually, the contract is measured at fair value on initial recognition and subsequently at the higher of the amount of the loss allowance determined in accordance with the impairment requirements of IFRS 9 (see Chapter 47) and the amount initially recognised less, when appropriate, the cumulative amount of income recognised in accordance with the principles of IFRS 15 (see Chapter 46). [IFRS 9.4.2.1]. There are exceptions to this general requirement and these are dealt with in section 2.4.2 below.

2.4.1 Definition of a financial guarantee contract

Extract from IFRS 9

Appendix A Defined terms

financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument.
-------------------------------------	---

[IFRS 9 Appendix A].

2.4.1.A Reimbursement for loss incurred

Some credit-related guarantees (or letters of credit, credit derivative default contracts or credit insurance contracts) do not, as a precondition for payment, require that the holder is exposed to, and has incurred a loss on, the failure of the debtor to make payments on the guaranteed asset when due. An example of such a guarantee is one that requires payments in response to changes in a specified credit rating or credit index. Such guarantees are not financial guarantee contracts, as defined in IFRS 9, nor are they insurance contracts within the scope of IFRS 17. Rather, they are derivatives and accordingly fall within the scope of IFRS 9. [IFRS 9.B2.5(b), IFRS 17.B27(f), IFRS 17.B30].

When a debtor defaults on a guaranteed loan a significant time period may elapse prior to full and final legal settlement of the loss. Because of this, certain credit protection contracts provide for the guarantor to make a payment at a fixed point after the default event using the best estimate of loss at the time. Such payments typically terminate the credit protection contract with no party having any further claim under it whilst ownership of the loan remains with the guaranteed party. In situations like this, if the final loss on the debtor exceeds the amount estimated on payment of the guarantee, the guaranteed party will suffer an overall financial loss; conversely, the guaranteed party may receive a payment under the guarantee but eventually suffer a smaller loss on the loan. Therefore, such a contract will often not meet the essence of the definition of a financial guarantee. However, if the payment is designed to be a reasonable estimate of the loss actually incurred, such a feature (which is common in many conventional insurance contracts) will sometimes allow the contract to be classified as a financial guarantee contract. This will particularly be the case if such payments are agreed by both parties in order to settle the financial guarantee, as opposed to being specified as part of the original contract.

Also, such a contract is likely to meet the definition of a guarantee if it was structured in either of the following ways:

- The contract requires the guarantor to purchase the defaulted loan for its nominal amount.
- Or
- On settlement of the final loss, the contract provides for a further payment between the guarantor and guaranteed party for any difference between that amount and the initial loss estimate that was paid.

However, if there are circumstances in which the holder of the guarantee could be reimbursed for a loss that it has not incurred, for example where the guarantee is traded separately from the underlying debt and the holder could have acquired it without owning the underlying debt instrument, the guarantee does not meet the definition of a financial guarantee contract.

2.4.1.B Debt instrument

Although the term ‘debt instrument’ is used extensively as a fundamental part of the definition of a ‘financial guarantee contract’, it is not defined within the financial instruments or insurance accounting standards.

The term ‘debt instrument’ will typically be considered to include trade debts, overdrafts and other borrowings, including mortgage loans and certain debt securities. Entities often provide guarantees of payments due with respect to other items and determining whether they are consistent with the definition of a ‘financial guarantee contract’ may not be straightforward. For example, there may be instances where a guarantee is issued over an exposure which will only crystallise at a future date. An example is a guarantee issued over an executory contract that is outside the scope of IFRS 9. Another example is a guarantee over a debt instrument that may arise from a currently undrawn loan commitment, if the loan is drawn at a future date. The issue is whether these guarantees are issued over debt instruments.

The IFRS IC received a request in 2024 about how an entity accounts for guarantees that it issues. The request described three fact patterns in the context of an entity’s separate financial statements. In the fact patterns, an entity issues several types of contractual guarantees on obligations of a joint venture. As part of the analysis, the IFRS IC noted that the IASB, at its April 2024 meeting, discussed diversity in practice in the interpretation of the term ‘debt instrument’ in the definition of a financial guarantee contract. The IASB decided to consider during its next agenda consultation the broader application questions related to financial guarantee contracts, including about the meaning of the term ‘debt instrument’ in the definition of a financial guarantee contract. In March 2025, the IFRS IC concluded that an entity applies judgement in interpreting the meaning of the term ‘debt instrument’ when determining whether a guarantee is accounted for as a financial guarantee contract.⁸

How we see it

IFRS 9 does not explicitly require the debt instrument to exist when the guarantee is issued. If the guarantee covers losses incurred due to failure to make specified payments by a specified debtor for amounts that are due and payable at the point of the guarantee being called, we believe the guarantee is over a debt instrument. As such, these types of guarantees would be financial guarantees if all other criteria for financial guarantees are met.

Illustration 2-2: Guarantee issued over a lessor’s receipts under a lease contract

Entity A leases an asset to Entity B. Entity A is concerned about the credit risk that may arise for lease payments that become payable over the lease term. Entity C, an unrelated third party to Entity A and Entity B, issues a guarantee to reimburse Entity A for losses that Entity A may incur for non-payment of amounts due and payable under the lease agreement. For this guarantee to be considered a financial guarantee, the guarantee must relate to losses arising from a debt instrument.

If the lease is classified as a finance lease, the guarantee issued by Entity C is considered a financial guarantee since a finance lease, in substance, gives rise to a loan agreement (see section 1.2.4 above).

If the lease is classified as an operating lease, lease payments are only recognised by Entity A as financial instruments, hence a debt instrument, when they are due. The issue is whether a guarantee over future debt instruments would be considered a financial guarantee when it is issued. As discussed in section 2.4.1.B above, IFRS 9 does not explicitly require the debt instrument to exist when the guarantee is issued. If the guarantee covers losses incurred due to non-payment by a specified debtor for amounts that are due and payable at the point of the guarantee being called, we believe that the guarantee is over a debt instrument. Therefore, the guarantee issued by Entity C would be considered a financial guarantee, since it only covers losses for amounts that are due at the time of the guarantee being called.

⁸ [IFRIC Update](#), March 2025, available on the IFRS Foundation’s website.

An additional complexity arises in respect of guarantees issued over derivative contracts. In such contracts, the issuer agrees to compensate the holder for losses incurred by the holder due to a default event on a derivative contract that the holder is a party to. For such guarantees, it is important to consider whether the guaranteed amount can be considered a debt instrument and whether the guarantee gives rise to 'specified payments'. There are two broad views. Those who hold the view that the guaranteed amount is a debt instrument argue that if such a guarantee covers losses due to non-payment of amounts under a derivative contract that crystallise upon default, it is a guarantee over a debt instrument and it does give rise to 'specified payments'. They argue that the payments are specified when it matters, i.e., when the guarantee is triggered. Those who argue that the guaranteed amount is not a debt instrument argue that a guarantee over a derivative cannot be a financial guarantee contract because the nature of the derivative exposure is transferring broader market risks which are inconsistent with the definition of a 'debt instrument'. In September 2023, the IFRS IC considered this question. However, its findings indicated that the issue does not have widespread effects and it does not have (and nor is it expected to have) a material effect on those affected. Consequently, the IFRS IC decided not to add a standard-setting project to the work plan and it did not conclude on the matter in an agenda decision.

How we see it

In the absence of specific guidance in IFRS accounting standards, we believe that an entity has an accounting policy choice to account for a guarantee over a derivative as either a financial guarantee contract or not. This policy must be applied consistently.

As part of its request analysis on how entities account for issued guarantees, the IFRS IC noted that there is no single IFRS Accounting Standard that applies to all guarantees. Entities must therefore apply judgment based on the nature of the guarantee and the type of risk transferred (i.e., financial risk, insurance risk, or other risk).

According to the IFRS IC, an entity first considers whether a guarantee it issues is a financial guarantee contract under IFRS 9. If not, the entity assesses whether the guarantee is an insurance contract within the scope of IFRS 17 (see Chapter 51). If the guarantee is neither a financial guarantee contract nor an insurance contract, other IFRS standards may apply:

- IFRS 9: If the guarantee is a loan commitment (see Section 2.5 below), a derivative (see Chapter 42), or otherwise meets the definition of a financial liability (see Chapter 43).
- IFRS 15g: If the counterparty is a customer and the guarantee forms part of a revenue arrangement (see Chapter 28).
- IAS 37: If the guarantee gives rise to a provision, contingent liability, or contingent asset only when not covered by another standard (see Chapter 27).

2.4.1.C Form and existence of contract

The application guidance to IFRS 9 emphasises that, whilst financial guarantee contracts may have various legal forms (such as guarantees, some types of letters of credit, credit default contracts or insurance contracts), their accounting treatment does not depend on their legal form. [IFRS 9.B2.5].

In some cases, guarantees arise, directly or indirectly, as a result of the operation of statute or regulation. In such situations, it is necessary to examine whether the arrangement gives rise to a contract as that term is used in IAS 32. For example, in some jurisdictions, a subsidiary may avoid filing its financial statements or having them audited if its parent and fellow subsidiaries guarantee its liabilities by entering into a deed of cross guarantee. In other jurisdictions, similar relief is granted if group companies elect to make a statutory declaration of guarantee. In the first situation, it would seem appropriate for the issuer to regard the deed as a contract and hence, any guarantee made under it would be within the scope of IFRS 9. The statutory nature of the declaration in the second situation makes the analysis more difficult. Although the substance of the arrangement is little different from the first situation, statutory obligations are not financial liabilities and are therefore outside the scope of IFRS 9.

2.4.2 Issuers of financial guarantee contracts

In general, issuers of financial guarantees contracts must apply IAS 32, IFRS 9 and IFRS 7 to those contracts even though they meet the definition of an insurance contract in IFRS 17 if the risk transferred is significant. [IFRS 9.B2.5(a)]. However, if an entity has previously asserted explicitly that it regards such contracts as insurance contracts and has used accounting applicable to insurance contracts, the issuer may elect to apply either IFRS 9 or IFRS 17 (see Chapter 51). That election may be made contract by contract, but the election for each contract is irrevocable. [IAS 32.4(d), IFRS 7.3(d), IFRS 9.2.1(e), IFRS 17.7(e)]. This concession does not extend to contracts that are similar to financial guarantee contracts but are actually derivative financial instruments (see section 2.4.1.A above).

The IASB was concerned that entities other than credit insurers could elect to apply IFRS 4 *Insurance Contracts* (the preceding insurance standard to IFRS 17) to financial guarantee contracts and consequently (if their accounting policies permitted) recognise no liability on inception. Therefore, it imposed the restrictions outlined in the previous paragraph. [IFRS 9.BC22.12]. The application guidance to IFRS 9 states that assertions that an issuer regards contracts as insurance contracts are typically found throughout the issuer's communications with customers and regulators, contracts, business documentation as well as in their financial statements. Furthermore, insurance contracts are often subject to accounting requirements that are distinct from the requirements for other types of transactions, such as contracts issued by banks or commercial companies. In such cases, an issuer's financial statements would typically include a statement that the issuer had used those accounting requirements, i.e., ones normally applied to insurance contracts. [IFRS 9.B2.6]. This option had been intended as a temporary solution, pending the publication of IFRS 17. However, the Board decided to carry forward to IFRS 17 the option to account for a financial guarantee contract as if it were an insurance contract, without any substantive changes, because the option has worked in practice and results in consistent accounting for economically similar contracts issued by the same entity. [IFRS 17.BC93].

Accounting for the revenue associated with financial guarantee contracts issued in connection with the sale of goods is dealt with under IFRS 15 (see Chapter 28). [IFRS 9.B2.5(c)].

2.4.3 Holders of financial guarantee contracts

Financial guarantee contracts held are not within the scope of IFRS 9 because they are insurance contracts (see section 2.3 above). [IFRS 9.2.1(e)]. However, IFRS 17 does not apply to insurance contracts that an entity holds (other than reinsurance contracts held) either. [IFRS 17.7(g)]. Therefore, financial guarantee contracts held by an entity are not required to be recognised separately by IFRS 9 or IFRS 17.

For the purposes of measuring ECL, IFRS 9 requires the estimate of expected cash shortfalls to reflect the cash flows expected from collateral and other credit enhancements that are part of the contractual terms and are not recognised separately by the entity. [IFRS 9.B5.5.55]. This means that a financial guarantee contract held which is considered to be an integral component of the guaranteed debt instrument will be accounted for as part of the ECL on that debt instrument (see Chapter 47).

However, the holder of a financial guarantee contract which is not considered to be integral to the underlying debt instrument will need to develop an accounting policy in accordance with the 'hierarchy' in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*. The IAS 8 hierarchy specifies criteria to use if no IFRS accounting standard applies specifically (see Chapter 3). [IFRS 17.BC66].

How we see it

In developing a policy for a financial guarantee contract which is not considered integral to the underlying debt instrument, entities could look to the requirements of IAS 37 dealing with contingent assets (see Chapter 27) or reimbursement assets (see Chapter 47), at least as far as recoveries under the contract are concerned.

In certain situations, it could also be appropriate for the holder of a financial guarantee contract to account for it as an asset at fair value through profit or loss. This might be the case if the guaranteed asset has itself been classified as at fair value through profit or loss.

2.4.4 Financial guarantee contracts between entities under common control

There is no exemption from the measurement requirements of IFRS 9 for guarantees issued between parents and their subsidiaries, between entities under common control nor by a parent or subsidiary on behalf of a subsidiary or a parent (unlike an exemption under US GAAP). [IFRS 9.BCZ2.14].

Therefore, for example, where a parent guarantees the borrowings of a subsidiary, the guarantee must be accounted for as a standalone instrument in the parent's separate financial statements. However, for the purposes of the parent's consolidated financial statements, such guarantees are normally considered an integral part of the terms of the borrowing (see Chapter 43) and therefore must not be recognised independently of the borrowing.

2.5 Loan commitments

Loan commitments are firm commitments to provide credit under pre-specified terms and conditions. [IFRS 9.BCZ2.2]. The term can include arrangements such as offers to individuals in respect of residential mortgage loans as well as committed borrowing facilities granted to a corporate entity. The definition of a loan commitment requires that the terms and conditions are pre-specified. As such, all the terms and conditions do not need to be fixed but rather they need to be specified at the time when the commitment is entered into. For example, a commitment to provide a loan with a variable interest rate could meet the definition of a loan commitment.

A loan commitment meets the definition of a derivative financial instrument since it represents a written option for the potential borrower to obtain a loan at a specified rate (see section 1.2.8 above and Chapter 42). [IFRS 9.BCZ2.2]. However, a pragmatic decision has been taken by the IASB to simplify the accounting for holders and issuers of many loan commitments. [IFRS 9.BCZ2.3]. Accordingly, loan commitments that cannot be settled net - in practice, most loan commitments - may be excluded from the scope of IFRS 9, with the exception of the impairment requirements and derecognition provisions (see Chapters 47 and 48), but are included within the scope of IFRS 7. [IFRS 9.2.1(g), IFRS 7.4].

How we see it

Although a loan commitment represents a written option to provide credit to the holder of the commitment, we believe it is appropriate to apply the exclusion from IFRS 9 to non-optional loan commitments provided the necessary conditions above are met. An example of a non-optional loan commitment is where the holder is contractually obligated to take out credit at a future date.

However, the exclusion is available only for firm commitments to provide credit and therefore, it will be applicable only where there is a commitment to lend funds. [IFRS 9.BCZ2.2]. Consider, for example, a contract between entities A and B that gives B the right to sell a transferable (but unquoted) debt security to A issued by entity C that B currently owns. Even if, on subsequent acquisition, A will measure the debt security at amortised cost or fair value through other comprehensive income, the contract would not be considered a loan commitment as it does not involve A providing credit to B.

Some loan commitments, however, are within the scope of IFRS 9, namely: [IFRS 9.2.1(g)]

- Those that are designated as financial liabilities at fair value through profit or loss (this could be appropriate if the associated risk exposures are managed on a fair value basis or because designation eliminates an accounting mismatch). [IFRS 9.2.3(a), IFRS 9.4.2.2].
 - Commitments that can be settled net in cash or by delivering or issuing another financial instrument. [IFRS 9.2.3(b)].
 - All those within the same class where the entity has a past practice of selling the assets resulting from its loan commitments shortly after origination. The IASB sees this as achieving net settlement. [IFRS 9.2.3(a)].
- And
- Commitments to provide a loan at a below-market interest rate (see Chapter 45). [IFRS 9.2.3(c)].

For loan commitments at a below-market interest rate, IFRS 9 contains specific measurement requirements which are different from those applying to other financial liabilities. IFRS 9 requires the commitments to be measured at fair value on initial recognition and subsequently amortised to profit or loss using the principles of IFRS 15 (see Chapter 28) but requires the expected credit loss allowance to be used, if higher. [IFRS 9.4.2.1(d)]. The reason for this accounting treatment is that the IASB was concerned that liabilities resulting from such commitments might not be recognised in the statement of financial position because, often, no cash consideration is received. [IFRS 9.BC22.7].

IFRS 9 contains only limited guidance on what 'net settlement' means in respect of commitments that can be settled net in cash. Clearly a fixed interest rate loan commitment that gives the lender and/or the borrower an explicit right to settle the value of the contract (taking into account changes in interest rates etc.) in cash or by delivery or issuing another financial instrument would be considered a form of net settlement and therefore a derivative. However, paying out a loan in instalments (for example, a mortgage construction loan where instalments are paid out in line with the progress of construction) is not regarded as net settlement. [IFRS 9.2.3(b)]. Most loan commitments could be settled net by renegotiating the terms of the contract. However, of more relevance is the question of whether one party has the practical ability to settle net, e.g., because the terms of the contract allow net settlement or by the use of some market mechanism.

Illustration 2-3: Is a loan commitment to a special purpose entity (SPE) scoped out of IFRS 9 if the substance of the arrangement is different from a normal loan commitment?

Paragraphs 2.1(g) and 2.3 of IFRS 9 scope out some loan commitments from IFRS 9, although they indicate that such loan commitments are still covered by the impairment and derecognition requirements of the standard. The guidance provided in IFRS 9.2.3 seems to focus on straight forward loan commitments to entities with a genuine business activity, which are normally provided on the basis that the borrower meets certain conditions precedent prior to drawing. This raises the question of whether a loan commitment to an SPE, even if it meets the scope exception criteria, should indeed be scoped out of IFRS 9 if the substance of the arrangement is different from a normal loan commitment.

In practice, the following three scenarios can be found when a loan commitment has been provided to an SPE that is not consolidated by the entity providing the loan commitment. The question is if these loan commitments must be accounted for under IFRS 9 and measured at fair value through profit or loss, or if they are subject only to the impairment and derecognition requirements of IFRS 9.

Scenario 1

An SPE has been established to act as the counterparty to a single derivative trade. The SPE will operate on autopilot and the loan commitment will be drawn upon in the event there is a payment due under the terms of the derivative (with the premium on the derivative being passed to the facility provider as the commitment fee).

Scenario 2

An SPE has been established to invest in a diversified portfolio of highly liquid instruments. Funding will be provided to the SPE through subordinated loan notes, other loan financing and repurchase agreements. The SPE will also enter into a revolving or static loan commitment with a bank; the primary purpose being to fund its liquidity needs. When the SPE is unable to finance its operations through its current financing arrangements it will draw on the loan commitment. This will be at the discretion of the SPE.

Scenario 3

Similar to the situation outlined in scenario 2, but the liquidity facility also supports the 'first loss' of the SPE so that when there is a credit event or credit downgrade within the SPE, the loan commitment will be drawn upon to fund the losses.

Conclusion

Consideration will need to be given to the nature and exact terms of the loan commitment. It is important to emphasise that loan commitments on standard market terms will normally be provided on the basis that the borrower meets certain conditions precedent prior to drawing. In particular, lenders will often withdraw the loan commitments in the event there is a significant decline in the borrower's credit rating.

In scenarios 1 and 3 above, the loan commitment provided to the SPE is akin to an equity instrument as it will absorb the first loss of the vehicle. Whilst it is not explicitly stated in IFRS 9 or the Basis for Conclusions, we do not believe that the Board would have considered a standard market loan commitment to include these and similar facilities. Therefore, a loan facility provided to an SPE must be excluded from the scope of IFRS 9 if, under normal operating conditions, it would be highly probable that the loan would be repaid if drawn. In other words, loan commitments that are structured to give rise to an exposure that in substance is another financial instrument, such as equity, need to be scoped into IFRS 9. This assessment must be made when an entity becomes a party to the loan commitment. It does not need to be reassessed subsequently. Applying this to each of the three scenarios:

Scenario 1

The commitment meets the definition of a loan commitment and does not meet the criteria of IFRS 9.2.3 to be scoped within IFRS 9. However, as the SPE only holds one asset - the derivative - and it is prohibited from owning any other assets, in substance, the transaction is the same as if the counterparty had entered into a normal market credit derivative. We do not consider that this was the type of transaction the Board envisioned when drafting the scope exemption and therefore it must be accounted for under IFRS 9 as a derivative.

Scenario 2

So long as the facility will be drawn to meet the financing requirements of the SPE and at the inception of the commitment there was an expectation that there was a high probability that the funds will be re-paid by the SPE, it would be excluded from the scope of IFRS 9. However, to carry out the assessment, it will be important to perform a detailed review of the origination documents to understand the exact terms and conditions of the facility.

Scenario 3

The facility will only be drawn when there is a credit event or downgrade, with the probability being that the funds will not be returned to the finance provider. Therefore, we consider this must be included in the scope of IFRS 9 and accounted for as a derivative, even though it might not meet the criteria of IFRS 9.2.3 to be scoped into IFRS 9. [IFRS 9.2.1(g), IFRS 9.2.3].

Where the entity has a past practice of selling the assets shortly after origination, no guidance is given on what is meant by a class (although the Basis for Conclusions makes it clear that an entity can have more than one). [IFRS 9.BC22.6]. Therefore, an assessment will need to be made based on individual circumstances.

Illustration 2-4: Identifying classes of loan commitment

A banking group has two main operating subsidiaries, one in country A and the other in country B. Although they share common functions (e.g., information systems) the two subsidiaries' operations are clearly distinct. Both subsidiaries originate similar loans under loan commitments. In country A there is an active and liquid market for the assets resulting from loan commitments issued in that country. The subsidiary operating in that country has a past practice of disposing of such assets in this market shortly after origination. There is no such market in country B.

The fact that one subsidiary has a past practice of settling its loan commitments net (as the term is used in the standard) would not normally mean that the loan commitments issued in country B are required to be classified as at fair value through profit or loss.

The above example is relatively straightforward - in some circumstances it may be more difficult to define the class. However, there is no reason why an individual entity (say a subsidiary of a group) cannot have two or more classes of loan commitment, e.g., where they result in the origination of different types of assets that are clearly managed separately. Any associated entitlement to fees must be accounted for in accordance with IFRS 15 or IFRS 9 (see Chapter 28 and Chapter 46, respectively). No accounting requirements are specified for holders of loan commitments, but they will normally be accounted for as executory contracts - essentially, this means that fees payable will be recognised as an expense in a manner that is appropriate to the terms of the commitment. Any resulting borrowing will obviously be accounted for as a financial liability under IFRS 9.

IFRS 9 contains no guidance on how to account for loan commitments that are originated with different business models in mind. For example, an entity may enter into a loan commitment where it has the intention to sell or sub-participate a portion of the loan immediately after origination and to hold the remaining balance of the loan to collect contractual cash flows. As the entity has a past practice of selling some of the resulting assets that arise from these commitments shortly after origination, it cannot consider the entire loan commitment (if it is considered to be a single unit of account) to be outside the scope of IFRS 9. However, it is unclear whether the single loan commitment can be split into separate units of account and accounted for accordingly.

A similar challenge occurs when determining the classification of a loan that is originated with the intention of sub-participating a portion and retaining the rest (see Chapter 44).

How we see it

An entity could consider the activities of originating loan commitments with an intention to (i) hold the resulting drawn asset to collect its contractual cash flows and (ii) to sell or sub-participate it as two separate business models and portfolios. A split approach to account for the loan commitment is likely to be acceptable if the entity can forecast with reasonable confidence that a portion of the loan arising from the commitment will be sold and a portion will not. The portion of the loan commitment where the intention is to sell the resulting loan would be in scope of IFRS 9.2.3(a) and accounted for at fair value through profit or loss. The portion of the loan commitment where the intention is to hold the resulting loan will be out of the scope of IFRS 9.2.3(a).

2.5.1 Performance guarantees

Performance guarantees, sometimes referred to as surety bonds, fidelity bonds, performance bonds and bid bonds, are contracts that provide compensation if another party fails to perform a contractual obligation, for example an obligation to construct a building. IFRS 17 considers these to be examples of contracts that are insurance contracts if the resulting transfer of insurance risk is significant (see Chapter 51). [IFRS 17.B26(f)]. These contracts differ from financial guarantee contracts in that financial guarantee contracts are based on underlying financial obligations, rather than non-financial ones.

In some cases, performance guarantees include, or are issued in conjunction with, indemnity agreements that give the issuer of the performance guarantee the right to claim back any amounts paid out from the party whose non-performance led to the guarantee being called. Judgement is required to determine whether such arrangements are insurance contracts in the scope of IFRS 17 or financial instruments accounted for under IFRS 9. It is particularly important to assess if the performance guarantee and the indemnity clause constitute a single unit of account and, if they do, whether the resulting unit of account gives rise to a transfer of significant insurance risk. A difficulty that arises in making the assessment is that this kind of contract is a tripartite agreement and, therefore, it is not always clear from whose perspective the transfer of insurance risk needs to be evaluated. Different conclusions could be reached depending on the angle from which this is assessed. Therefore, a reporting entity has an accounting policy choice when evaluating from whose perspective there is a transfer of insurance risk in a tripartite agreement. This policy must be applied consistently. As such, for identical facts and circumstances, the same conclusion must be reached for all transactions within a reporting entity and for all transactions included in a consolidated group.

Illustration 2-5: Performance guarantees with an indemnity clause

Entity B, a builder, enters into a contract with Entity D, a developer, to construct a bridge. In order to reduce the risk of the Entity B not performing on its obligation to build the bridge, Entity D requires Entity B to source a performance guarantee from Entity F, a financial institution.

Entity B pays for, and Entity F duly issues, a performance guarantee under which Entity F agrees to compensate Entity D for losses suffered due to Entity B's failure to perform its non-financial obligations in terms of the construction contract.

The performance guarantee also includes an indemnity clause whereby Entity F has the right to claim back from Entity B any amounts paid out to Entity D as a result of Entity B's non-performance.

In such cases, Entity F must exercise judgement based on the specific arrangement to assess if the performance guarantee and the indemnity clause constitute a single unit of account and if the resulting unit(s) of account give rise to a transfer of significant insurance risk. If Entity F determines that the performance guarantee and the indemnity agreement are a single unit of account that does not give rise to a transfer of significant insurance risk, this unit of account will be a financial instrument, accounted for under IFRS 9. If Entity F determines that the unit(s) of account give rise to a transfer of significant insurance risk, they will be accounted for in terms of IFRS 17.

See Chapter 2, Chapter 42, Chapter 51 for further guidance on determining the unit of account and Chapter 51 for guidance on assessing the transfer of significant insurance risk.

2.6 Equity instruments

2.6.1 Equity instruments issued

Financial instruments (including options and warrants) that are issued by the reporting entity and meet the definition of equity instruments in IAS 32 (see section 1.1 above and Chapter 43) are outside the scope of IFRS 9, unless the election in IAS 32.33A is applied. [IAS 32.33A, IFRS 9.2.1(d)]. Under IAS 32.33A, where an entity reacquires its own equity to hold in an investment fund that provides investors with benefits determined by units in the fund or as an underlying item for groups of insurance contracts with direct participation features, it may elect on an instrument-by-instrument basis to continue to account for the treasury share as issued equity. In such case, the reacquired instrument is accounted as if it were a financial asset and measured at fair value through profit or loss in accordance with IFRS 9. For the purposes of this election, insurance contracts include investment contracts with discretionary participation features. For further details, see Chapter 43. [IAS 32.33A].

In principle, IFRS 7 applies to issued equity instruments except for those that are derivatives based on interests in subsidiaries, associates or joint ventures (see section 2.1 above). [IFRS 7.3(a)]. However, this is of largely academic interest because IFRS 7 specifies no disclosure requirements for issued equity instruments.

In fact, the scope of IFRS 7 for these types of instruments is even more curious. Firstly, it is explained that derivatives over subsidiaries, associates and joint ventures that are equity instruments from the point of view of the issuer are excluded from the scope of IFRS 7 because equity instruments are not remeasured and hence do not expose the issuer to statement of financial position and income statement risk. Also, the disclosures about the significance of financial instruments for financial position and performance are not considered relevant for equity instruments. [IFRS 7.BC8]. Given the reasons quoted, it is not entirely clear why the IASB did not exclude all instruments meeting the definition of equity in IAS 32 from the scope of IFRS 7, e.g., non-puttable ordinary shares issued by the reporting entity. Secondly, it is very difficult to see how a derivative over a reporting entity's associate or joint venture could ever meet the definition of equity from the perspective of the reporting entity.

2.6.2 Equity instruments held

From the point of view of the holder, equity instruments are within the scope of IFRS 7 and IFRS 9 (unless they meet the exception in section 2.1 above). [IFRS 7.3, IFRS 9.2.1(d)].

2.7 Business combinations

2.7.1 Contingent consideration in a business combination

2.7.1.A Payable by an acquirer

For business combinations accounted for under IFRS 3 *Business Combinations*, contingent consideration that meets the definition of a financial asset or liability will be measured at fair value, with any resulting gain or loss recognised in profit or loss in accordance with IFRS 9 (see Chapter 10). [IFRS 3.58(b)(i)].

Further, contingent consideration arising from an acquiree's prior business combination that an acquirer assumes in its subsequent acquisition of the acquiree does not meet the definition of contingent consideration in the acquirer's business combination. Rather, it is one of the identifiable liabilities assumed in the subsequent acquisition. Therefore, to the extent that such arrangements are financial instruments, they are within the scope of IAS 32, IFRS 9 and IFRS 7.⁹

2.7.1.B Receivable by a vendor

IFRS 9 does not go on to explain whether the vendor should be accounting for the contingent consideration in accordance with its provisions.

In most cases, the vendor will have a contractual right to receive cash or another financial asset from the purchaser and, therefore, it is hard to avoid the conclusion that the contingent consideration meets the definition of a financial asset and hence is within the scope of IFRS 9, not IAS 37. IFRS 10 *Consolidated Financial Statements* requires consideration received on the loss of control of an entity or business to be measured at fair value, which is consistent with the treatment required by IFRS 9 for financial assets. [IFRS 10.B98, IFRS 9.5.1.1].

⁹ [IASB Update](#), June 2009, available on the IFRS Foundation's website.

2.7.2 Contracts between an acquirer and a vendor in a business combination

IFRS 9 does not apply to forward contracts between an acquirer and a selling shareholder to buy or sell an acquiree that will result in a business combination (as defined in IFRS 3 Appendix A) at a future acquisition date. In order to qualify for this scope exclusion, the term of the forward contract must not exceed a reasonable period normally necessary to obtain any required approvals and to complete the transaction, for example to accommodate the completion of necessary regulatory and legal processes. [IFRS 9.2.1(f), IFRS 9.BCZ2.39].

How we see it

The scope exemption with regards to forward contracts to buy or sell an acquiree that will result in a business combination applies to all types of business combinations. This is irrespective of whether the business combination is structured to be achieved through a transfer of an equity interest, a transfer of net assets or any other type of arrangement.

The scope exclusion under IFRS 9 applies only when completion of the business combination is not dependent on further actions of either party. Option contracts allow one party to control the occurrence or non-occurrence of future events depending on whether the option is exercised. Consequently, option contracts that on exercise will result in the reporting entity obtaining control of another entity are within the scope of IFRS 9, whether they are currently exercisable or not. [IFRS 9.BCZ2.40, IFRS 9.BCZ2.41].

It was suggested that 'in-substance' or 'synthetic' forward contracts, e.g., the combination of a written put and purchased call where the strike prices, exercise dates and notional amounts are equal, or a deeply in- or out-of-the-money option, should be excluded from the scope of IFRS 9. However, the IASB staff did not agree with the notion that synthetic forward contracts (which do provide optionality to one or both parties) are substantially identical to forward contracts (which commit both parties). The IASB staff accepted that in normal financial instrument transactions, the economics of a synthetic forward will be favourable to one party to the contract and would therefore result in its exercise, but a similar assumption does not necessarily hold true in business combination transactions because one party may choose not to exercise the option due to other factors. Therefore, it is not possible to assert that the contracts will always result in a business combination.¹⁰

The acquisition of an interest in an associate represents the acquisition of a financial instrument, not an acquisition of a business. Therefore, the scope exclusion does not apply by analogy to contracts to acquire investments in associates and similar transactions. [IFRS 9.BCZ2.42].

Another related issue is the treatment at a consolidated level of forward contracts to purchase an entity that owns a single asset, such as a ship or building, which does not constitute a business. This type of contract could be within the scope of IFRS 9, since the contract would not qualify for the scope exclusion discussed above. [IFRS 9.2.1(f)]. The reason a contract for a business combination is normally considered to be a financial instrument seems to be because there is often a substantive reason (for example related to tax) to sell an asset within a 'corporate wrapper' and therefore it may be argued that the 'corporate wrapper' changes the substance of the transaction, so that it represents a contract to purchase equity instruments rather than the underlying asset. Consequently, it could be argued, even at a consolidated level, that a contract to purchase a controlling interest in a single asset company meets the definition of a financial instrument.

On the other hand, it could be argued that the substance of the contract is the purchase of the underlying asset because, at a consolidated level, the entity will never recognise the shares but will recognise the underlying asset. The implication of this argument is that the contract might qualify for the own-use exemption (see section 3 below) and therefore be scoped out of IFRS 9.

10 [INFORMATION FOR OBSERVERS](#), Board Meeting: March 2009, London, Project: *Annual Improvements Project - Comment Letter Analysis* Subject: *IAS 39 Financial Instruments: Recognition and Measurement - Scope exemption for business combination contracts (IAS 39.2(g))* (Agenda Paper 10C), IASB, paras. 13 and 15. Available on the IFRS Foundation's website. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

How we see it

Given the lack of clear guidance, entities have an accounting policy choice as to whether, at a consolidated level, a forward contract to purchase all the shares in a single asset entity that does not constitute a business is in substance an acquisition of equity instruments or the acquisition of the underlying asset of the entity.

Although forward contracts between an acquirer and a vendor in a business combination are scoped out of IFRS 9 and hence are not accounted for as derivatives, they are still within the scope of IFRS 7.

2.8 Contingent pricing of property, plant and equipment and intangible assets

IAS 32 is clear that the purchase of goods on credit gives rise to a financial liability when the goods are delivered (see section 1.2.6 above) and that a contingent obligation to deliver cash meets the definition of a financial liability (see section 1.2.3 above). [IAS 32.AG8, IAS 32.AG21]. Consequently, it would seem that a financial liability arises on the outright purchase of an item of property, plant and equipment or an intangible asset, where the purchase contract involves variable or contingent consideration, for example amounts based on the performance of the asset. Further, because there is no exemption from applying IFRS 9 to such contracts, one might expect that such a liability would be accounted for in accordance with IFRS 9, i.e., any measurement changes to that liability would flow through the statement of profit or loss. This would be consistent with the accounting treatment for contingent consideration arising from a business combination under IFRS 3 (see section 2.7.1.A above). [IFRS 3.58(b)(i)].

However, in practice, contracts can be more complex than suggested in the previous paragraph. The variable or contingent payment for these types of transactions may be dependent on a number of factors. Examples might include variable payments based on an index or rate, variable payments which are dependent upon the purchaser's future actions, variable or contingent payments related to the condition of the asset itself or variable or contingent payments related to the asset's performance. Some arrangements may contain more than one source of variability. Further complexity can also arise when arrangements are akin to profit sharing or collaboration agreements which are not addressed in any standard.

The topic of variable payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The IFRS IC's discussions considered both the accounting at the date of purchasing the asset and subsequently, and distinguished between those variable payments that depend on the purchaser's future activity and those that do not. The IFRS IC determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively.¹¹ In May 2016, the IASB tentatively agreed that this issue would be included in the research pipeline between 2017 and 2021. At the time of writing this is not listed as an active research project on the IASB's work plan.

A critical step in analysing the accounting for the purchase of an item of PP&E or an intangible asset in an arrangement involving variable or contingent consideration is to fully understand the contractual arrangements, including the nature of the contingent or variable payments. This includes developing a full understanding of whether those contingent payments are linked to the initial value of the asset, or to its future performance, whether the contingency or variability is within or outside of the purchasers' control and whether the variable payment is a payment for some other goods or services from the seller. In some cases, the contract may establish an obligation for the contingent payment at the outset, whilst in others it might be determined that the arrangement is an executory contract, and the liability to make the contingent payments is only recognised later once either party fulfils its obligations under the contract.

The two key issues with regards to the accounting for variable consideration in an asset purchase are 1) whether and when to recognise a liability for that variable consideration, and 2) whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset.

¹¹ [IFRIC Update](#), March 2016, available on the IFRS Foundation's website.

Looking at the first question of when a liability to make variable or contingent payments would be recognised, if the arrangement is not considered to be an executory contract, one consideration is whether those payments are dependent on the entity's future activity, or not. IAS 32.25 stipulates that where the contingency is outside the control of both the issuer and the holder, a contingent obligation to deliver cash meets the definition of a financial liability (see Chapter 43). Therefore, if the obligation to make the variable payment does not depend on the acquiring entity's future activity, it would seem appropriate to recognise a financial liability in respect of the contingent amounts. [IAS 32.25]. However, it is acknowledged that whilst this view was tentatively agreed during the course of the IFRS IC discussions on the topic, ultimately, this was not clarified or confirmed as part of the final agenda decision. Furthermore, the final agenda decision notes that there are questions about the accounting for variable payments subsequent to the purchase of the asset, and in making that statement the IFRS IC did not distinguish between the different types of variable payments.

How we see it

In light of the discussions held by the IFRS IC and the absence of clear guidance in the final agenda decision, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions. If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

Examples of some accounting policies an entity may want to consider regarding initial recognition of the asset include the following:

- The cost of the asset on initial recognition includes the fair value of all variable or contingent consideration at the date of acquisition. A corresponding liability is recognised for the same amount.
- The cost of the asset on initial recognition excludes any variable or contingent payments. Accordingly, no liability is recognised for those contingent or variable amounts.

If the accounting policy selected gives rise to a liability in scope of IFRS 9, depending on the classification (see Chapter 44), the liability should be subsequently measured at either amortised cost or fair value through profit or loss (see Chapter 46). For the second question on whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset, see Chapter 18.

Where contingent consideration arises on the sale of an asset that is within the scope of IAS 16 *Property, Plant and Equipment* - or IAS 38 *Intangible Assets* - then the requirements of IFRS 15 apply in determining the amount of consideration to be included in the gain or loss on derecognition of the asset (see Chapter 28). [IAS 16.72, IAS 38.116]. IFRS 15 requires that variable consideration (which includes contingent consideration) be estimated, using one of two methods, but requires that the amount of the estimate included within the transaction price be constrained to avoid significant reversals in future periods (see Chapter 28). [IFRS 15.50]. During 2019 and 2020, the IFRS IC and the IASB discussed whether IFRS 10 or IFRS 15 applies when an entity loses control of a single asset entity containing real estate as part of its ordinary activities. In June 2022, the Board assessed this matter as a low priority and concluded this topic could be explored if identified as a priority in the next agenda consultation.¹² As noted in section 2.7.1.B above, IFRS 10 requires consideration received on the loss of control of a subsidiary to be measured at fair value. [IFRS 10.B98(b)(i)]. Therefore, depending on which standard is applied to the disposal, the accounting outcome could be very different when contingent consideration is involved. This issue is discussed in more detail in Chapter 8 and Chapter 28.

¹² [Project Report and Feedback Statement: Post-implementation Review: IFRS 10 Consolidated Financial Statements, IFRS 11 Joint Arrangements, IFRS 12 Disclosure of Interests in Other Entities](#), IASB, June 2022.

2.9 Employee benefit plans and share-based payment

Employers' rights and obligations under employee benefit plans, which are dealt with under IAS 19 *Employee Benefits* are excluded from the scope of IAS 32, IFRS 7 and IFRS 9. [IAS 32.4(b), IFRS 7.3(b), IFRS 9.2.1(c)]. The IFRS IC noted in November 2005 that IAS 19 indicates that employee benefit plans include a wide range of formal and informal arrangements and concluded it was clear that the exclusion of employee benefit plans from IAS 32 (and by implication IFRS 7 and IFRS 9) includes all employee benefits covered by IAS 19, for example a liability for long service leave.¹³

Similarly, most financial instruments, contracts and obligations arising from share-based payment transactions, which are dealt with under IFRS 2 *Share-based Payment* are also excluded. However, IAS 32, IFRS 7 and IFRS 9 do apply to contracts to buy or sell non-financial items in share-based transactions that can be settled net (as that term is used in this context) unless they are considered to be 'normal' sales and purchases (see section 3 below). [IAS 32.4(f)(i), IFRS 7.3(e), IFRS 9.2.1(h)]. For example, a contract to purchase a fixed quantity of oil in exchange for issuing a fixed number of shares that could be settled net would be excluded from the scope of IAS 32, IFRS 7 and IFRS 9 only if it qualified as a 'normal' purchase (which would be unlikely).

In addition, IAS 32 applies to treasury shares (see Chapter 43) that are purchased, sold, issued or cancelled in connection with employee share option plans, employee share purchase plans, and all other share-based payment arrangements. [IAS 32.4(f)(ii)].

2.10 Reimbursement rights in respect of provisions

Most reimbursement rights in respect of provisions arise from insurance contracts and are therefore outside the scope of IFRS 9 as set out in section 2.3 above. The scope of IFRS 9 is also restricted so as not to apply to other financial instruments that are rights to payments to reimburse the entity for expenditure it is required to make to settle a liability that it has recognised as a provision in accordance with IAS 37 in the current or an earlier period. [IFRS 9.2.1(i)].

However, a residual interest in a decommissioning or similar fund that extends beyond a right to reimbursement, such as a contractual right to distributions once all the decommissioning has been completed or on winding up the fund, could be an equity instrument within the scope of IFRS 7 and IFRS 9. [IFRS 7.3, IFRIC 5.5].

2.11 Disposal groups classified as held for sale and discontinued operations

The disclosure requirements in IFRS 7 do not apply to financial instruments within a disposal group classified as held for sale or within a discontinued operation, except for disclosures about the measurement of those assets and liabilities (see Chapter 50) if such disclosures are not already provided in other notes to the financial statements. [IFRS 5.5B]. However, additional disclosures about such assets (or disposal groups) may be necessary to comply with the general requirements of IAS 1 *Presentation of Financial Statements* - particularly for financial statements to achieve a fair presentation and to disclose information about assumptions made and the sources of estimation uncertainty (see Chapter 3). [IAS 1.15, IAS 1.125, IFRS 5.5B].

2.12 Indemnification assets

IFRS 3 specifies the accounting treatment for 'indemnification assets', a term that is not defined but is described as follows: [IFRS 3.27]

Extract from IFRS 3

- 27 The seller in a business combination may contractually indemnify the acquirer for the outcome of a contingency or uncertainty related to all or part of a specific asset or liability. For example, the seller may indemnify the acquirer against losses above a specified amount on a liability arising from a particular contingency; in other words, the seller will guarantee that the acquirer's liability will not exceed a specified amount. As a result, the acquirer obtains an indemnification asset. ...

13 [IFRIC Update](#), November 2005, available on the IFRS Foundation's website.

How we see it

From the perspective of the acquirer, an indemnification asset will normally meet the definition of a financial asset within IAS 32. In some situations, the asset might be seen as similar to a reimbursement right (see section 2.10 above). However, there will be cases where these assets are, strictly, within the scope of IFRS 9, creating something of a tension with IFRS 3. This appears to be nothing more than an oversight and, in our view, entities need to apply the more specific requirements of IFRS 3 when accounting for these assets which are covered in more detail in Chapter 10.

2.13 Rights and obligations within the scope of IFRS 15

An unconditional right to consideration (i.e., only the passage of time is required before the payment of that consideration is due) in exchange for goods and services transferred to the customer (a receivable) is accounted for in accordance with IFRS 9. [IFRS 9.2.1(j), IFRS 15.108]. A conditional right to consideration in exchange for goods or services transferred to a customer (a contract asset) is accounted for in accordance with IFRS 15, which requires an entity to assess contract assets for impairment in accordance with IFRS 9. [IFRS 15.107]. Other rights and obligations within the scope of IFRS 15 are generally not accounted for as financial instruments.

The credit risk disclosure requirements within IFRS 7.35A-35N apply to those rights that IFRS 15 specifies are accounted for in accordance with IFRS 9 for the purposes of measurement of impairment gains and losses (i.e., contract assets). [IFRS 7.5A].

2.14 Commodity loans

Commodity loan transactions could be structured in many ways. The accounting for these transactions is complex and small differences in fact patterns can affect the accounting outcome. As such, an entity must apply judgement in accounting for commodity loans by considering the specific facts and circumstances in the transaction.

Frequently asked questions

Question 2-2: How to account for a commodity loan transaction?

In March 2017, the IFRS IC considered a request on how to account for a commodity loan transaction.¹⁴ Specifically, the transaction they considered was one in which a bank (reporting entity) borrows gold from a third party (contract 1) and then lends that gold to a different third party for the same term and for a higher fee (contract 2). The bank enters into the two contracts in contemplation of each other, but the contracts are not linked (i.e., the bank negotiates the contracts independently of each other). In each contract, the borrower obtains legal title to the gold at inception and has an obligation to return, at the end of the contract, gold of the same quality and quantity as that received. In exchange for the loan of gold, each borrower pays a fee to the respective lender over the term of the contract but there are no cash flows at inception of the contract.

The IFRS IC was asked whether, for the term of the two contracts, the bank that borrows and then lends the gold recognises:

(a) An asset representing the gold (or the right to receive gold)

And

(b) A liability representing the obligation to deliver gold

The IFRS IC observed that the particular transaction in the submission might not be clearly captured within the scope of any IFRS accounting standard. In the absence of a IFRS accounting standard that specifically applies to a transaction, an entity applies paragraphs 10 and 11 of IAS 8 in developing and applying an accounting policy to the transaction.¹⁵

The related Staff paper¹⁶ noted that in order to make the judgement described in IAS 8, the reporting entity would first assess whether any of the requirements in IFRS accounting standards deal with 'similar and related issues'. The entity's conclusion on which, if any, requirements deal with similar and related issues could result in different accounting outcomes. For example:

'Similar and related' issue in existing IFRS accounting standard	Accounting by Reporting Entity	Reporting Entity recognises an asset and a liability as a result of the transaction?
Securities lending (IFRS 9)	Account for the transaction as if the gold is not transferred from the Lender to the Reporting Entity.	No
Revenue transaction/transfer of inventory (IFRS 15/IAS 2 <i>Inventories</i>)	Account for the purchase of gold and receipt of inventory from the Lender, and a sale of gold and transfer of inventory to the Borrower.	Yes
Lease (IFRS 16)	Reporting Entity is the intermediate lessor in a sublease. As such, the Reporting Entity recognises a lease liability owing to the Lender and a lease receivable from the Borrower.	Yes
None	If the transaction is analysed by applying the principles in the Conceptual Framework, the Reporting Entity would conclude that it has a liability (the obligation to deliver gold to Lender in 12 months' time) and an asset (the right to receive gold from Borrower in 12 months' time) as a result of the transaction.	Yes

¹⁴ The IFRS IC analysis was primarily in the context of standards that were effective at the time of the discussion.

3 Contracts to buy or sell commodities and other non-financial items

Contracts to buy or sell non-financial items do not generally meet the definition of a financial instrument (see section 1.2.5 above). However, many such contracts are standardised in form and traded on organised markets in much the same way as some derivative financial instruments. The application guidance explains that a commodity futures contract, for example, may be bought and sold readily for cash because it is listed for trading on an exchange and may change hands many times. [IAS 32.AG20]. In fact, this is not strictly true because such contracts are bilateral agreements that cannot be transferred in this way. Rather, the contract would normally be 'closed out' (rather than sold) by entering into an offsetting agreement with the original counterparty or with the exchange on which it is traded.

The ability to buy or sell such a contract for cash, the ease with which it may be bought or sold (or, more correctly, closed out), and the possibility of negotiating a cash settlement of the obligation to receive or deliver the commodity, do not alter the fundamental character of the contract in a way that creates a financial instrument. The buying and selling parties are, in effect, trading the underlying commodity or other asset. However, the IASB is of the view that there are many circumstances where they need to be accounted for as if they were financial instruments. [IAS 32.AG20].

Accordingly, the provisions of IAS 32, IFRS 7 and IFRS 9 are normally applied to those contracts to buy or sell non-financial items that can be settled net in cash or another financial instrument or by exchanging financial instruments or in which the non-financial instrument is readily convertible to cash, effectively as if the contracts were financial instruments (see section 3.2 below). However, there is one exception for what are commonly termed 'normal' purchases and sales or 'own use' contracts (these are considered in more detail in section 3.3 below). [IAS 32.8, IFRS 7.5, IFRS 9.2.4].

Typically, the non-financial item will be a commodity, but this is not necessarily the case. For example, an emission right, which is an intangible asset (see Chapter 18), is a non-financial item. Therefore, these requirements would apply equally to contracts for the purchase or sale of emission rights if they could be settled net. These requirements will also be appropriate for determining whether certain commodity leases are within the scope of IFRS 9. Commodity leases generally do not fall within the scope of IFRS 16 as they do not relate to a specific or identified asset (see section 2.14 above for commodity leases accounting considerations).

A contract that qualifies for the own use exemption still needs to be assessed for the existence of embedded derivatives, which would not disqualify the underlying contract from falling within the own use exemption. An embedded derivative within a normal purchase or sale contract must be accounted for in accordance with section 4.3 of IFRS 9 and bifurcated from the underlying purchase or sales contract if required (see Chapter 42).

A contract to buy or sell non-financial items that qualifies for the own-use exemption is accounted for as an executory contract. IAS 37 defines an executory contract as a contract under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent. [IAS 37.3]. The costs associated with executory contracts are normally expensed as incurred using accrual accounting, rather than requiring recognition of any liabilities or assets. Importantly, executory contracts still need to be monitored on an ongoing basis because provisions would need to be recognised if the contracts becomes onerous (see Chapter 27).

In 2022, the IASB was asked to consider questions about contracts to buy and sell non-financial items as part of the post-implementation review of the classification and measurement requirements in IFRS 9. No further actions were noted by the IASB because it considered the concerns not to be widespread or expected to have a material effect.¹⁷ In 2023, specific questions relating to contracts referencing nature-dependent electricity were raised to the IFRS IC and escalated to the IASB.¹⁸ On 18 December 2024, the IASB published Amendments to IFRS 9 and IFRS 7 - Contracts Referencing Nature-dependent Electricity. See section 3.4 below for more details regarding the amendments.

3.1 Decision process for contracts to buy or sell non-financial items

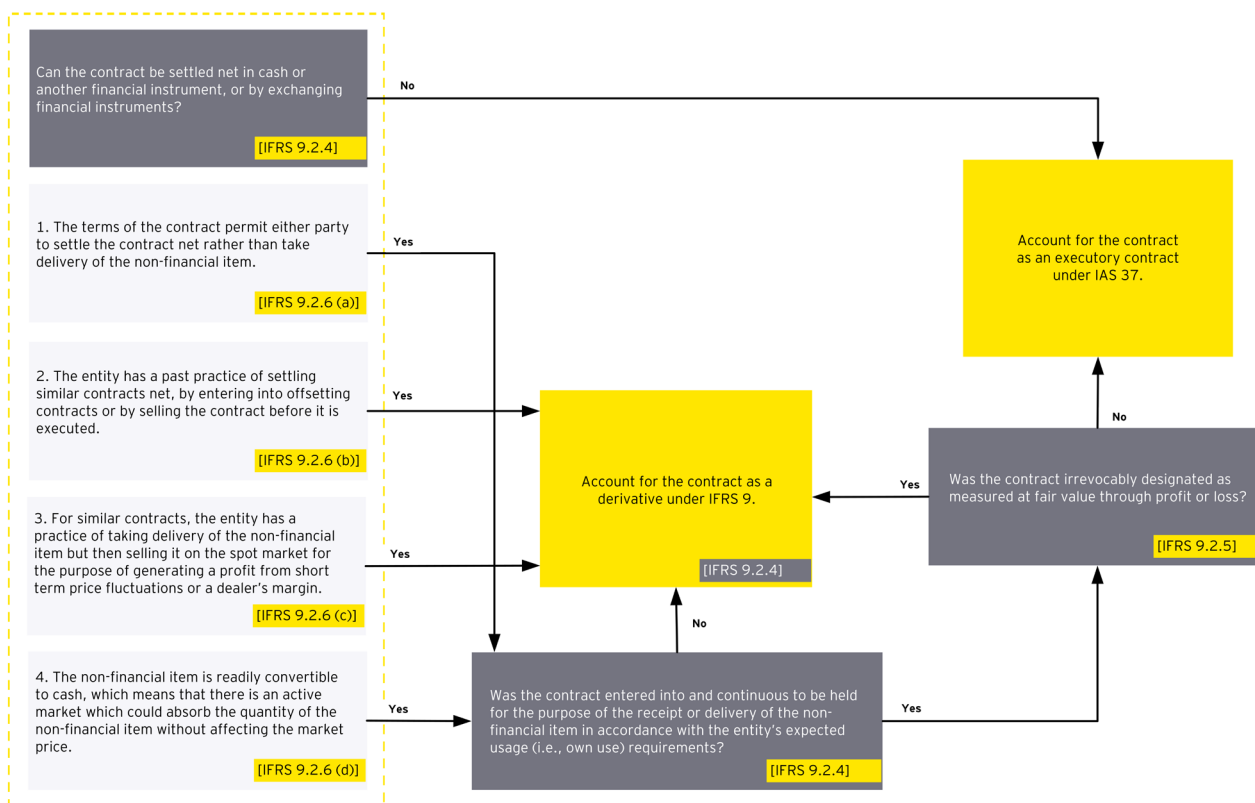

Extract from IFRS 9

- 2.4 This Standard shall be applied to those contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments, with the exception of contracts that were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. However, this Standard shall be applied to those contracts that an entity designates as measured at fair value through profit or loss in accordance with paragraph 2.5.
- 2.5 A contract to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contract was a financial instrument, may be irrevocably designated as measured at fair value through profit or loss even if it was entered into for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. This designation is available only at inception of the contract and only if it eliminates or significantly reduces a recognition inconsistency (sometimes referred to as an 'accounting mismatch') that would otherwise arise from not recognising that contract because it is excluded from the scope of this Standard (see paragraph 2.4).
- 2.6 There are various ways in which a contract to buy or sell a non-financial item can be settled net in cash or another financial instrument or by exchanging financial instruments. These include:
- (a) when the terms of the contract permit either party to settle it net in cash or another financial instrument or by exchanging financial instruments;
 - (b) when the ability to settle net in cash or another financial instrument, or by exchanging financial instruments, is not explicit in the terms of the contract, but the entity has a practice of settling similar contracts net in cash or another financial instrument or by exchanging financial instruments (whether with the counterparty, by entering into offsetting contracts or by selling the contract before its exercise or lapse);
 - (c) when, for similar contracts, the entity has a practice of taking delivery of the underlying and selling it within a short period after delivery for the purpose of generating a profit from short term fluctuations in price or dealer's margin; and
 - (d) when the non-financial item that is the subject of the contract is readily convertible to cash.
- A contract to which (b) or (c) applies is not entered into for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements and, accordingly, is within the scope of this Standard. Other contracts (which include contracts as described in paragraph 2.3A) to which paragraph 2.4 applies are evaluated to determine whether they were entered into and continue to be held for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements and, accordingly, whether they are within the scope of this Standard.
- 2.8 An entity shall also apply paragraphs B2.7-B2.8 to assess whether contracts referencing nature-dependent electricity (as described in paragraph 2.3A) are entered into and continue to be held for the purpose of the receipt of electricity in accordance with the entity's expected usage requirements.

[IFRS 9.2.4, IFRS 9.2.5, IFRS 9.2.6, IFRS 9.2.8]

The figure below provides a summary of factors to consider in determining whether contracts to buy or sell non-financial items are within the scope of IAS 32, IFRS 7 and IFRS 9. Section 3.2 and section 3.3 below consider these factors in more detail.

Figure 3-1: Contracts to buy or sell non-financial items scope decision chart

IFRS 9 must be applied to contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments with the exception of contracts that were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. Therefore, the first decision point in assessing the scoping of these contracts is to understand whether the contract is capable of being net settled. IFRS 9.2.6 provides four examples of factors that must be considered in determining whether the contract can be net settled (see section 3.2 below). If the contract cannot be net settled, the contract is accounted for as an executory contract.

If the contract can be net settled, the next decision point involves understanding the reason why it can be net settled. According to IFRS 9.2.6, a contract to which IFRS 9.2.6(b) or IFRS 9.2.6(c) applies is not entered into for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements. [IFRS 9.2.4, IFRS 9.2.6]. Such contracts must be accounted for as if they were derivatives under IFRS 9.

If the contract can be net settled as a result of IFRS 9.2.6(a) or (d), further assessment is required to determine whether the contract is held for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements. This is commonly referred to as the own use exception (see section 3.3 below). [IFRS 9.2.4, IFRS 9.2.6].

If it is held for own use, it is treated as an executory contract, provided the entity does not designate it as measured at fair value through profit or loss (see section 3.3.6 below). [IFRS 9.2.5]. If it is not held for own use purposes, the contract is accounted for as if it were a derivative.

3.2 Contracts that may be settled net

IFRS 9 explains that there are various ways in which a contract to buy or sell a non-financial item can be settled net, including when: *[IAS 32.9, IFRS 9.2.6, IFRS 9.BC22.18]*

- (a) The terms of the contract permit either party to settle it net.
- (b) The ability to settle the contract net is not explicit in its terms, but the entity has a practice of settling similar contracts (see section 3.3.1 below) net (whether with the counterparty, by entering into offsetting contracts or by selling the contract before its exercise or lapse).
- (c) For similar contracts (see section 3.3.2 below), the entity has a practice of taking delivery of the underlying and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin.

And

- (d) The non-financial item that is the subject of the contract is readily convertible to cash.

There is no further guidance in IFRS 9 explaining what is meant by 'readily convertible to cash'.

How we see it

Typically, a non-financial item would be considered readily convertible to cash if it consists of largely fungible units and quoted spot prices are available in an active market that can absorb the quantity held by the entity without significantly affecting the price. Entities must exercise significant judgement when assessing whether a non-financial item is readily convertible to cash.

Whether there exists an active market for a non-financial item, particularly a physical one such as a commodity, will depend on its quality, location or other characteristics such as size or weight. For example, if a commodity is actively traded in London, this may have the effect that the same commodity located in, say, Rotterdam is considered readily convertible to cash as well as if it was located in London. However, if it were located in Siberia it might not be considered readily convertible to cash if more than a little effort were required (often because of transportation needs) for it to be readily sold. Refer to Chapter 15 for factors to consider in determining whether an active market exists.

Like loan commitments, most contracts could as a matter of fact be settled net if both parties agreed to renegotiate terms.

How we see it

Again, we do not believe the IASB intended the possibility of such renegotiations to be considered in determining whether such contracts may be settled net. Of more relevance is the question of whether one party has the practical ability to settle net, e.g., in accordance with the terms of the contract or using some market mechanism.

3.3 Own use contracts

As indicated in section 3 above, the provisions of IAS 32, IFRS 9 and IFRS 7 are not normally applied to those contracts to buy or sell non-financial items that can be settled net if they were entered into and continue to be held for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements ('own use'). *[IAS 32.8, IFRS 7.5, IFRS 9.2.4]*.

However, an entity may in certain circumstances be able to designate such a contract at fair value through profit or loss (see section 3.3.6 below).

For contracts referencing nature-dependent electricity, the guidance in IFRS 9.B2.7 and IFRS 9.B2.8 is considered in determining whether the contracts are considered 'own use'. *[IFRS 9.2.8]*. See section 3.4 below for more information about contracts referencing nature-dependent electricity contracts.

It should be noted that 'own use' is a two-part test, i.e., in order to qualify as a normal purchase or sale, the contract needs to both (a) have been entered into, and (b) continue to be held, for that purpose. Consequently, a reclassification of an instrument can be only one way. [IAS 32.8, IFRS 9.2.4]. For example, if a contract that was originally entered into for the purpose of delivery ceases to be held for that purpose at a later date, it must subsequently be accounted for as a financial instrument under IFRS 9. Conversely, where an entity holds a contract that was not originally held for the purpose of delivery and was accounted for under IFRS 9, but subsequently its intentions change such that it is expected to be settled by delivery, the contract remains within the scope of IFRS 9. The IASB views the practice of settling net or taking delivery of the underlying and selling it within a short period after delivery as an indication that the contracts are not normal purchases or sales. Therefore, contracts to which (b) or (c) in section 3.2 above apply cannot be subject to the normal purchase or sale exception. Other contracts that can be settled net are evaluated to determine whether this exception can apply. [IAS 32.9, IFRS 9.2.6, IFRS 9.BC22.18].

The implications of this requirement are considered further in sections 3.3.1 and 3.3.2 below.

The implementation guidance illustrates the application of the exception as follows: [IFRS 9.IG A.1]

Illustration 3-1: Determining whether a copper forward is within the scope of IFRS 9

Company XYZ enters into a fixed-price forward contract to purchase 1,000 kg of copper in accordance with its expected usage requirements. The contract permits XYZ to take physical delivery of the copper at the end of twelve months, or to pay or receive a net settlement in cash, based on the change in fair value of copper.

The contract is a derivative instrument because there is no initial net investment, the contract is based on the price of copper, and it is to be settled at a future date. However, if XYZ intends to settle the contract by taking delivery and has no history of settling similar contracts net in cash, or of taking delivery of the copper and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin, the contract is accounted for as an executory contract rather than as a derivative.

The Illustration below considers whether a prepayment for a commodity that is readily convertible to cash is within the scope of IFRS 9.

Illustration 3-2: Prepayment of a commodity that is readily convertible to cash

Company Z makes a prepayment of CU1 million to Company Y for a commodity. The prepayment will be settled by Company Y physically delivering 1000kg of the commodity to Company Z at a future date. The commodity is readily convertible to cash.

The accounting for this contract by Company Z depends on facts and circumstances. Despite the commodity being readily convertible to cash, if Company Z entered into the prepaid contract in accordance with its expected purchase, sale or usage requirements for that commodity, as per IFRS 9.2.4 and IFRS 9.2.6 the prepaid contract is held for own use purposes. As such, the prepayment will not be in scope of IFRS 9, unless Entity Z designates the contract at fair value through profit or loss in accordance with IFRS 9.2.5 (see section 3.3.6 below). If the contract is not accounted for within the scope of IFRS 9, the prepayment will be accounted for as a non-financial asset to reflect Company Z's right to receive the commodity. Furthermore, Entity Z must consider whether the prepayment includes a significant financing component that must be accounted for separately (see Chapter 28).

In accordance with IFRS 9.2.4 and IFRS 9.2.6, if the prepaid contract is not held for own use purposes by Company Z, the prepaid contract can be settled net in cash since it is readily convertible to cash. As such, the prepayment will be within the scope of IFRS 9 and accounted for as if it were a derivative at fair value through profit or loss.

Sometimes a market design or process imposes a structure or intermediary that prevents the producer of a non-financial item from physically delivering it to the customer. For example, a gold miner may produce gold bars (doré) that are physically delivered to a mint for refining and, whilst remaining at the mint, the gold could be credited to either the producer's or a counterparty's 'gold account'. Where the producer enters into a contract for the sale of gold which is settled by allocating gold to the counterparty's gold account, this may constitute 'delivery' as that term is used in the standard. Accordingly, a contract that is expected to be settled in this way could potentially be considered a normal sale (although of course it would need to meet all the other requirements). However, if the gold is credited to the producer's account and the sale contract was settled net in cash, this would not constitute delivery. In these circumstances, treating the contract as a normal sale would, in effect, link a non-deliverable contract entered into with a customer with a transaction to buy or sell through an intermediary as a single synthetic arrangement, contrary to the general requirements on linking contracts discussed in Chapter 42.¹⁹

¹⁹ [IFRIC Update](#), August 2005, available on the IFRS Foundation's website.

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

3.3.1 Net settlement of similar contracts

If the terms of a contract to buy or sell a non-financial item do not explicitly provide for net settlement but an entity has a practice of settling similar contracts net (see section 3.3.1.A below), that contract must be considered as capable of being settled net (see section 3.2 above). Net settlement could be achieved either by entering into offsetting contracts (see section 3.3.1.B below) with the original counterparty or by selling the contract before its maturity. In these circumstances the contract cannot be considered a normal sale or purchase and is accounted for in accordance with IFRS 9 (see section 3.2 above). [IAS 32.9, IFRS 9.2.6, IFRS 9.BC22.18].

3.3.1.A The meaning of 'similar contracts'

'Similar contracts' is not a defined term in IFRS accounting standards. However, in plain English, it refers to contracts which are almost, but not exactly, the same. At face value, this could be assessed by comparing the nature of the rights and obligations that the counterparties are exposed to as a result of the contracts' terms. However, such an interpretation of 'similar contracts' could be particularly troublesome. For example, it is common for entities in, say, the energy sector to have a trading arm that is managed completely separately from their other operations. These trading operations commonly trade in contracts on non-financial assets, the terms of which are similar, if not identical, to those used by the entity's other operations for the purpose of physical supply. Accordingly, the standard might suggest that the own use exemption is unavailable to any entity that has a trading operation that trades in similar contracts.

However, generally, under IFRS 9, contracts could be dissimilar, even if they are identical in form, when management enters into the contracts with different intentions. An example is the classification of a financial asset between the different categories. An entity might own two identical bonds issued by the same entity and classify one bond as fair value through profit or loss and the other bond as amortised cost. In such a situation, classification is not solely based on the legal form of the contract but also on management's intention for the contract.

We believe that this distinction must also be made in interpreting 'similar contract' for the purposes of applying IFRS 9.2.6(b). Therefore, both the nature of the rights and obligations arising from the contractual terms and the business within which the contract will be used (e.g., trading or physical supply) must be considered.

How we see it

For the purposes of IFRS 9.2.6(b), contracts are 'similar' if the nature of the rights and obligations arising from their contractual terms is similar and the entity intends to use them within the same business (e.g., for trading or physical supply).

3.3.1.B The meaning of 'offsetting'

The reference in IFRS 9.2.6(b) to 'offsetting' raises the question of whether the offsetting contract must offset all risks including credit risk in order for the practice of entering into offsetting contracts to be considered 'net settlement'. IFRS 9 does not contain guidance on the meaning of the term 'offsetting' in the context of the application of IFRS 9.2.6.

How we see it

Offsetting can be interpreted as matching positions with equal and opposite movements in risk, for the purpose of limiting or eliminating risk. When an entity purchases a non-financial item and sells the item within a short period after delivery, the entity will normally have credit risk on the gross amount. Paragraph 2.6(b) of IFRS 9 indicates that offsetting can occur with the counterparty, by entering into offsetting contracts or by selling the contract before its maturity. The word 'or' implies that it is not necessary to offset the credit risk component of the contract as in the latter situation, the counterparty may not be the same counterparty as in the original contract. It would, accordingly, be inconsistent to require that all risks, including credit risk, must be offset for a contract to be considered offsetting under IFRS 9.2.6(b).

Consequently, in our view, for a contract to be considered net settled by entering into offsetting contracts in accordance with IFRS 9.2.6(b), the new contract must offset all risks other than credit risk.

3.3.1.C Changes in the purpose for which contracts are being held

It is possible that a contract is entered into entirely for own use requirements and during the life of the contract these expectations change. The standard is clear that, in order to qualify for the own use exemption, the contract needs to both (a) have been entered into, and (b) continue to be held, for own use requirements. [IAS 32.8, IFRS 9.2.4]. Consequently, a reclassification of a contract can only be one way. If some or all of a contract that was originally entered into for own use at a later date ceases to be held for own use purposes, the entire contract will no longer qualify for the own use exemption and must subsequently be accounted for as a financial instrument under IFRS 9. Once scoped into IFRS 9 these contracts will, in most cases, meet the definition of a derivative and will therefore be measured at fair value through profit or loss. This will result in immediate recognition of the cumulative fair value gain or loss on the entire contract in profit or loss, including the portion which relates to any part that is still held for own use. Conversely, where an entity holds a contract that was not originally held for own use and was therefore accounted for under IFRS 9, but subsequently the contract begins to be held for own use, the contract remains within the scope of IFRS 9.

The standard contains no further guidance on what degree of net settlement would be necessary to create a practice of net settlement that would prevent an entity from treating similar contracts as own use.

How we see it

We do not believe that any net settlement automatically taints an entity's ability to apply the own use exemption to similar contracts, as long as it is isolated and infrequent. For example, if an entity is required to net settle a number of contracts as a result of an exceptional disruption arising from external events at a production facility, this isolated net settlement would not constitute a practice of net settlement, and would therefore not taint the entity's ability to use the exemption for other similar contracts. However, judgement will need to be applied based on the facts and circumstances of each individual case.

It stands to reason that regular revisions of own use requirements that result in the inability to continue applying the own use exemption for the respective contracts, could jeopardise the exemption for similar contracts in future, because the entity does not appear to be able to forecast its own use requirements reliably. This is similar to the situation under hedge accounting when 'highly probable' forecast transactions frequently fail to take place as forecast. For this reason, if an entity operates an own use and a trading business, it is important that the two businesses are clearly distinguished.

3.3.1.D Non-performance penalty clauses

It is common for commodity contracts to have penalty clauses relating to non-delivery or incomplete delivery (by the seller) and non-acceptance of all, or part of, the delivery (by the buyer) of the minimum contracted quantities.

Commodity contracts could be within the scope of IFRS 9 if they can be settled net in cash. [IFRS 9.2.4, IFRS 9.2.6]. A non-performance penalty clause in a fixed-price commodity supply contract could provide the entity with the ability to settle that contract net in cash. The following scenarios arise:

Scenario 1 - Fixed Penalty

The buyer (seller) will pay a fixed penalty to the seller (buyer) if it accepts (delivers) less than the minimum contracted quantity. An alternative to Scenario 1 would be where either of the parties must pay for the quantities not delivered or not accepted at the fixed contracted price.

Scenario 2 - Asymmetrical default clause

The buyer will pay a penalty for the minimum quantities it fails to take delivery of, being the difference between the fixed contract price and the market price, if the market price is lower than the contract price. The seller will pay a penalty for the minimum quantities it fails to deliver, being the difference between the fixed contract price and the market price, if the market price is higher than the contract price.

Scenario 3 - Symmetrical default clause

The buyer will pay a penalty for the minimum quantities it fails to take delivery of, being the difference between the fixed contract price and the market price, if the market price is lower than the contract price. However, if the market price is higher than the fixed contract price the seller must pay the difference to the buyer.

How we see it

Neither a fixed penalty nor an asymmetrical variable penalty meets the criteria to be treated as net settled in cash per IFRS 9.2.6(a), and therefore will not cause the contract to be within the scope of IFRS 9.

A symmetrical variable penalty does meet the criteria of net settled in cash per IFRS 9.2.6(a). However, the contract could still be outside the scope of IFRS 9 because of the 'own use' exemption. This exemption will not apply if the entity has a practice of net cash settlement in accordance with IFRS 9.2.6(b) (i.e., the symmetrical default clause is exercised on non-delivery).

A fixed price penalty (Scenario 1) does not reflect changes in market value and is not always economically beneficial to the defaulting party. Accordingly, a fixed price penalty does not meet the net cash settlement criteria in IFRS 9.2.6(a). [IFRS 9.2.6].

For the asymmetrical variable penalty clause (Scenario 2), the defaulting party has an obligation to compensate the counterparty for the loss the counterparty incurs due to unfavourable market prices at the time of the default. It does not give the defaulting party the right to demand any potential gain the counterparty realises because of the default. Such clauses are designed to compensate the non-defaulting counterparty for losses incurred. Generally, the amount of the penalty represents the loss incurred. Accordingly, asymmetrical variable non-performance penalties do not represent net cash settlement provisions for the purpose of applying IFRS 9.2.6(a). [IFRS 9.2.6].

For the symmetrical variable penalty clause (Scenario 3), the defaulting party has both an obligation to compensate the counterparty for the loss the counterparty suffers as a consequence of the default and a right to receive any gain the counterparty realises as a consequence of the default. Such clauses are considered net-settlement clauses. In this case, the seller may be acting as the buyer's broker. For example, if the buyer takes less than the minimum quantity per the contract, the seller is effectively selling it on the market on the buyer's behalf. If the buyer took the minimum quantity and sold the unwanted quantity on the market, this would constitute net-settlement. Symmetrical variable penalty clauses are often exercised by counterparties that enter into the commodity contract for speculative purposes.

While a symmetrical variable penalty meets the criteria of net settled in cash per IFRS 9.2.6(a), the contract is outside the scope of IFRS 9 if the 'own use' exemption in IFRS 9.2.4 above applies. If the entity has a practice of settling these contracts net in cash, as contemplated in IFRS 9.2.6(b), the 'own use' exemption will not apply and the contract will, therefore, be in the scope of IFRS 9. [IFRS 9.2.4, IFRS 9.2.6].

3.3.2 Commodity broker-traders and similar entities

To be exempted from the scope of IFRS 9, a contract for the purchase or sale of a non-financial item that can be settled net in cash or another financial instrument or by exchanging financial instruments, must be transacted in accordance with the entity's expected purchase, sale or usage requirements. [IFRS 9.2.4, IFRS 9.2.6].

An entity's 'expected purchase, sale or usage requirements' is not defined within IFRS accounting standards, therefore its intentions and actual behaviour must be considered when making an assessment.

How we see it

IFRS 9 contains no further guidance on what degree of net settlement (or trading) is necessary to make the normal sale or purchase exemption inapplicable, but in many cases, it will be reasonably clear. For example, in our view, the presumption must be that contracts entered into by a commodity broker-trader that measures its inventories at fair value less costs to sell in accordance with IAS 2 (see Chapter 23) fall within the scope of IFRS 9. However, there will be situations that are much less clear-cut, and the application of judgement will be necessary.

The following factors may be considered when making an assessment to determine whether the entity enters into contracts with the intention of making a profit from trading activities and/or whether it enters into non-trading contracts in accordance with its expected purchase, sale or usage requirements:

Factor	Indicator of trading activities	Indicator of transactions in accordance with expected purchase, sale or usage requirements
How the entity intends to profit from the contract	The entity seeks to profit from short term price fluctuations or by making a margin between the bid and ask prices. This may involve taking price exposure and actively monitoring movements in price and closing out positions to capture more profit from such movements.	Generation of a profit margin by creating a market between normal buyers and sellers of a commodity, by entering into back-to-back sales and purchase contracts with a stable customer base, at a relatively consistent spread such that the current spot or future price is less relevant.
Customer base/contract counterparty	Counterparties vary based on market conditions as, typically, the entity or the customer initiates the trade due to market opportunity.	Trades are usually with a stable customer base who are normally producers or users within the value chain (refer to the value chain indicator below).
How an entity manages its business	Business is managed based on a 'mark to market' profit reflecting the fair value changes of contracts.	Business is managed based on a planned production or sale process and customer supply and demand and is measured based on gross margin.
How staff are remunerated	Remuneration includes a significant bonus component, based on mark to market profits of the forward contracts.	Remuneration is unlikely to include significant bonuses based on mark to market profits of the forward contracts.
Whether value is added by linking parties in the value chain.	Sales and purchases contracts made with counterparties that also trade and/or are not end users of the commodity themselves may indicate that the entity intends to profit from trading rather than from creating links between various counterparties in the commodity value chain.	The entity enters into purchase and sales contracts with producers and users of the commodity creating links within the value chain for the commodity. This may include repackaging but it is not necessary to repackage the commodity to be eligible for the expected purchase, sale or usage expectation.
Settlement of the contracts	Contracts are regularly settled net, for example, by entering into offsetting contracts with the same counterparty and physically delivering the net difference between the contracts (note that this would automatically bring such contracts into the scope of IFRS 9).	Contracts are always settled by physical delivery.

This is not an exhaustive list and the weight applied to each factor requires the application of judgement as, in many situations, mixed factors may be present. Consideration of an entity's control environment may be warranted where seemingly similar contracts are entered into for different purposes. This analysis can be made at a consolidated level or separately by business activity/unit (i.e., it is possible for management to deem one business activity as trading while another may be within expected purchase, sale or usage requirements, depending on the specific facts and circumstances of each business activity).

Entities could irrevocably designate a purchase or sale of a non-financial item at fair value through profit or loss, even if the purchase or sale of a non-financial item would otherwise be outside the scope of IFRS 9 (see section 3.3.6 below). [IFRS 9.2.5].

Again, the reference in the standard to 'similar contracts' in this context may be troublesome for certain entities. However, as noted in section 3.3.1.A above, we believe contracts must be 'similar' as to their purpose within the business (e.g., for trading or for physical supply) not just as to their contractual terms.

3.3.3 Written options that can be settled net

The IASB do not believe that a written option to buy or sell a non-financial item that can be settled net can be regarded as being for the purpose of receipt or delivery in accordance with the entity's expected sale or usage requirements. Essentially, this is because the entity cannot control whether or not the purchase or sale will take place. Accordingly, IAS 32, IFRS 7 and IFRS 9 apply to written options that can be settled net according to the terms of the contract or where the underlying non-financial item is readily convertible to cash (see (a) and (d) in section 3.2 above). [IAS 32.10, IFRS 9.2.7, IFRS 9.BC22.18].

Illustration 3-3: Determining whether a put option on an office building is within the scope of IFRS 9

Company XYZ owns an office building. It enters into a put option with an investor, which expires in five years and permits it to put the building to the investor for CU150 million. The current value of the building is CU175 million. The option, if exercised, may be settled through physical delivery or net cash, at XYZ's option.

XYZ's accounting depends on its intention and past practice for settlement. Although the contract meets the definition of a derivative, XYZ does not account for it as a derivative if it intends to settle the contract by delivering the building in the event of exercise and there is no past practice of settling net.

The investor, however, cannot conclude that the option was entered into to meet its expected purchase, sale, or usage requirements because it does not have the ability to require delivery. The contract could be settled net and is a written option. Regardless of past practices, its intention does not affect whether settlement is by delivery or in cash. Accordingly, the investor accounts for the contract as a derivative. As noted in Chapter 46, this will involve remeasuring the derivative to its fair value each reporting period with any associated gains and losses recognised in profit or loss.

However, if the contract were a forward contract rather than an option, required physical delivery and the investor had no past practice of settling net (either in cash or by way of taking delivery and subsequently selling within a short period), the contract would not be accounted for as a derivative. [IFRS 9.IG A.2].

3.3.4 Electricity and similar 'end-user' contracts

There have been problems in determining whether IAS 32, IFRS 7 and IFRS 9 apply to contracts to sell non-financial items (for example electricity or natural gas) to 'end-users' such as retail customers. The non-financial items will often be considered readily convertible to cash (see section 3.2 above), at least by the supplier. Accordingly, contracts to supply such items might be considered contracts that can be settled net.

Furthermore, end-user contracts often enable the customer to purchase as much of the non-financial item as needed at a given price to satisfy its usage requirements, i.e., the supplier does not have the contractual right to control whether or not the sale will take place. This might suggest that, from the perspective of the supplier, the contract is a written option with the consequence that it could not regard it as meeting the normal sale and purchase exemption (see section 3.3.3 above).

However, many argued that this was not necessarily the case, particularly in the following circumstances:

- The non-financial item is an essential item for the customer.
- The customer does not have access to a market where the non-financial item can be resold.
- The non-financial item is not easily stored in any significant amounts by the customer.

And

- The supplier is the sole provider of the non-financial item for a certain period of time.

In circumstances such as these, the apparent optionality within the contract is not exercisable by the retail customer in any economic sense. The customer will purchase volumes required whether the terms in the contract are advantageous or not and would not have the practical ability to sell any excess amounts purchased. Such a contract can have both a positive value and a negative value for the supplier when compared with market conditions and therefore fails to exhibit one of the key characteristics of an option, i.e., that it has only a positive value for the holder (the customer) and only a negative value for the writer (the supplier). In many respects, the positive value stems from an intangible, rather than financial, aspect of the contract, being the likelihood that the customer will exercise the option. Accordingly, it was often argued that such contracts must not be considered written options (and therefore not within the scope of IFRS 9).

Even if contracts such as these are considered to be within the scope of IFRS 9, it is common for the supplier to have the ability to increase the price charged at relatively short notice. Also, the customer may be able to cancel the contract without penalty and switch to another supplier. Features such as these are likely to reduce any fair value that the contract can have.

Only a small number of energy suppliers appeared to regard these contracts as falling within the scope of IFRS 9. The IFRS IC noted that the guidance already explains what constitutes a written option, essentially confirming that in this context a written option arises where a supplier does not have the contractual right to control whether or not a sale will take place.²⁰

The IFRS IC also noted that “in many situations these contracts are not capable of net cash settlement”, and therefore would not be within the scope of IFRS 9. No detailed explanation was provided of why the ability of the supplier to readily realise the non-financial item for cash does not enable it to settle the contract net (as that term is used in IFRS 9).²¹ However, we understand the reason underlying the comment to be the inability of the counterparty to realise the non-financial item (and hence the contract) for cash. This establishes a useful principle that may be applied in similar situations, i.e., a contract is not capable of net settlement if the contract is an option and the option holder cannot readily realise the non-financial item for cash.

How we see it

End user commodity contracts are not within the scope of IFRS 9.2.7 when:

- The non-financial item is a ‘necessity’ and the purchaser (e.g., a retail customer such as a consumer or small enterprise) does not have access to a market where the non-financial item can be resold.
- The non-financial item is not easily stored in any significant amounts by the purchaser, and the supplier is the sole provider of the non-financial item for a certain period (i.e., there is an exclusivity agreement between seller and the purchaser).
- The contract cannot be cash settled and the purchaser can be expected to purchase the volume it requires whether the terms in the contract are advantageous or not.

Such contracts can have either a positive or a negative value for the supplier when compared with its costs to produce. Accordingly, these contracts do not meet the definition of an option or a written option in accordance with IFRS 9, because such options can only have a positive value for the holder and only a negative value for the supplier. Therefore, they are not within the scope of IFRS 9.2.7.

End user-commodity contracts could meet the definition of options and written options, in whole or part, and be within the scope of IFRS 9.2.7 when the purchaser has access to the market or to other distributors through supply contracts that the purchaser only exercises if the contract terms are advantageous for the purchaser. Such contracts will only have a negative value for the supplier and are within the scope of IFRS 9 when the non-financial item is readily convertible to cash or the contract can otherwise be settled net in cash in accordance with IFRS 9.2.6. [IFRS 9.2.6, IFRS 9.2.7].

3.3.5 Other contracts containing volume flexibility

It is not uncommon for other sales contracts, such as those with large industrial customers, to contain volume flexibility features. For example, a supplier might enter into a contract requiring it to deliver 100,000 units at a given price, as well as giving the counterparty the option to purchase a further 20,000 units at the same price. The customer has access to markets to readily convert the non-financial item to cash and, following the guidance of the IFRS IC (see section 3.3.4 above), the supplier might consider such a contract to be within the scope of IFRS 9 as it contains a written option.

20 [IFRIC Update](#), March 2007; and [INFORMATION FOR OBSERVERS](#), IFRIC meeting: January 2007, London, Project: IAS 39 Financial Instruments: Recognition and Measurement - *Written options in retail energy contracts (Agenda Paper 14(iv))*, IASB, paras. 9-11. Available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

21 [IFRIC Update](#), March 2007; and [INFORMATION FOR OBSERVERS](#), IFRIC meeting: January 2007, London, Project: IAS 39 Financial Instruments: Recognition and Measurement - *Written options in retail energy contracts (Agenda Paper 14(iv))*, IASB, para. 15. Available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

However, the supplier could split the contract into two separate components for accounting purposes: a forward contract to supply 100,000 units (which may qualify as a normal sale) and a written option to supply 20,000 units (which would not). Arguments put forward include:

- The parties could easily have entered into two separate contracts, a forward contract and a written option. And
- It is appropriate to analogise to the requirements for embedded derivatives and separate a written option from the normal forward sale or purchase contract because it is not closely related (see Chapter 42).

The IFRS IC was asked to consider the appropriate treatment of such contracts but in spite of noting significant diversity in practice the issue has not been addressed.²²

How we see it

Entities could apply either of these interpretations as an accounting policy choice. The contract can be considered a written option in its entirety or the option contained in the contract can be considered separate from the fixed quantity sale contract.

If the option is considered separate from the fixed quantity sale contract, the components of the contract are accounted for separately as an executory contract for the fixed quantity of sales and a written option (within the scope of IFRS 9) for the additional quantity that may be delivered. Each component is evaluated individually based on the terms of the contract to determine whether the non-financial item scope exemption set out in IFRS 9.2.4 to 2.8 is met.

However, the entity must adopt a consistent accounting policy for similar contracts.

3.3.6 Fair value option

Own use contracts are accounted for as executory contracts, with the idea that any fair value change of the contract is not relevant given that the contract is used for the entity's own use. However, participants in several industries often enter into similar contracts both for own use and for trading purposes and manage all the contracts together with derivatives on a fair value basis (so as to manage the fair value risk to close to nil). In such a situation, own use accounting leads to an accounting mismatch, as the fair value change of the derivatives and the trading positions cannot be offset against fair value changes of the own use contracts.

To eliminate the accounting mismatch, an entity could apply hedge accounting by designating own use contracts as hedged items in a fair value hedge relationship. However, hedge accounting in these circumstances is administratively burdensome and often produces less meaningful results than fair value accounting. Furthermore, entities enter into large volumes of commodity contracts and, within the large volume of contracts, some positions may naturally offset each other. An entity would therefore typically hedge on a net basis. [IFRS 9.BC22.24].

Alternatively, IFRS 9 provides a 'fair value option' for own use contracts. At inception of a contract, an entity may make an irrevocable designation to measure an own use contract at fair value through profit or loss in spite of it being entered into for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirement. However, such designation is only allowed if it eliminates or significantly reduces an accounting mismatch that would otherwise arise from not recognising that contract because it is excluded from the scope of IFRS 9. [IFRS 9.2.5].

3.4 Contracts referencing nature-dependent electricity

3.4.1 Introduction

As entities aim to lower their carbon emissions, they frequently seek to utilise 'green' or 'sustainable' electricity, which is produced from renewable, nature-based sources. Because of the unique nature of the electricity market, and the lack of economic storage options, sometimes it is difficult to determine whether the own-use exception in IFRS 9.2.4 can be applied to nature-dependent electricity contracts.

²² [IASB Staff paper 16](#), Project: *Tentative agenda decisions*, Topic: *IAS 39 - Forward contracts with volumetric optionality on non-financial items that are readily convertible to cash*, IFRS IC Meeting, January 2010. Available on the IFRS Foundation's website. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

On 18 December 2024, the IASB published Amendments to IFRS 9 and IFRS 7 - Contracts Referencing Nature-dependent Electricity. These amendments are effective for reporting periods beginning on or after 1 January 2026, with early adoption permitted (see section 3.4.4 below). Prior to application of these amendments, the existing guidance discussed earlier in section 3 applies. For nature-dependent electricity contracts, the amendments:

- Clarify the application of the own-use requirements
 - Amend the designation requirements for a hedged item in a cash flow hedging relationship (see Chapter 49)
- And
- Add new disclosure requirements (see Chapter 50)

These amendments arose from a request submitted to the IFRS IC asking how an entity would apply the own-use exception to contracts to buy and take delivery of electricity generated from nature-dependent sources.²³

See Chapter 49 for details regarding the amendments for hedge accounting. See Chapter 50 for details regarding the disclosure amendments.

3.4.2 Nature-dependent electricity contracts

The amendments introduce specific requirements into IFRS 9 and IFRS 7 for contracts referencing nature-dependent electricity. [IFRS 9.2.3A, IFRS 7.42]. Nature-dependent electricity contracts expose an entity to variability in an underlying amount of electricity because the source of electricity generation depends on uncontrollable natural conditions, typically associated with renewable electricity sources such as sun and wind. [IFRS 9.2.3A, IFRS 9.BC2.17D]. For example, solar electricity generation varies with uncontrollable natural conditions like daylight availability and weather conditions like cloud cover. [IFRS 9.BC2.17D].

Illustration 3-4: Determining whether biofuel and wind contracts are nature-dependent

Electricity generated from biofuels is classified as non-nature-dependent because it relies on stored organic materials that can be managed and utilised on demand. Biofuels are renewable energy sources derived from organic materials, such as plant biomass, agricultural residues, animal waste, and even recycled materials. These resources can be converted into liquid fuels or gases, which can then be used to generate electricity. Unlike wind power, which is subject to unpredictable natural conditions, biofuel power plants can produce electricity consistently and predictably. The ability to collect and store biofuels allows for electricity generation whenever needed, independent of environmental factors. Additionally, biofuel plants operate similarly to fossil fuel plants, providing a reliable electricity supply that can respond to grid demands. In contrast, wind power's output is variable and dependent on wind conditions, making it nature-dependent. [IFRS 9.BC2.17G].

Illustration 3-5: Determining whether hydroelectricity contracts are nature-dependent

To determine whether hydroelectricity contracts are within the scope of the nature-dependent exemptions, entities should evaluate the extent to which electricity production is influenced by uncontrollable natural conditions versus conditions that are within the control of the entity. This assessment can be illustrated through two distinct types of hydroelectric facilities: pumped-storage and flow-dependent.

A pumped-storage hydroelectric facility operates by utilising two or more reservoirs located at different elevations. During periods of low electricity demand, excess electricity is used to pump water from lower reservoirs to upper reservoirs. When demand increases, the facility releases the stored water from an upper reservoir, generating electricity. In this scenario, the facility maintains control over both the volume of water released and the timing of electricity generation. Even in the face of fluctuations in rainfall or river flow, the entity may be able to effectively manage its water resources. If so, the electricity produced by a pumped-storage facility would not be considered nature-dependent, as it can generate electricity on demand, independent of uncontrollable natural conditions.

In contrast, flow-dependent hydroelectric facilities generate electricity by harnessing the natural flow of water from various sources, such as rivers, lakes, or even tidal movements. These facilities typically lack significant storage capacity and rely heavily on the water level, which is directly affected by environmental factors like rainfall, seasonal variations, and tidal patterns. In this case, the amount of electricity generated can vary significantly based on the water source's flow, which is beyond the control of the facility. During dry seasons or periods of low water levels, electricity generation may decrease, while heavy rainfall or high tides can lead to increased output. Therefore, the electricity produced by flow-dependent facilities is likely to be classified as nature-dependent, as it is predominantly influenced by uncontrollable natural conditions.

23 [IFRIC Update](#), June 2023, available on the IFRS Foundation website.

Contracts referencing nature-dependent electricity include contracts to buy or sell nature-dependent electricity, as well as financial instruments that reference such electricity. [IFRS 9.2.3A]. As such, the application guidance for nature-dependent electricity contracts includes both physical purchase power arrangements (PPAs) and virtual PPAs.

Physical PPAs are contracts that require the physical delivery of electricity generated from a specified energy production facility to the buyer. The fee for this electricity is typically fixed, providing price stability for the buyer. Physical delivery of electricity is usually facilitated through the grid, where the energy produced is transmitted directly to the buyer's location or to a designated point of interconnection. These agreements are usually associated with renewable energy sources, such as solar and wind, and involve a delivery of electricity from the supplier to the buyer. For a graphical representation, see below Figure 3-2: Off-site physical purchase power arrangement.

Virtual PPAs do not involve the physical delivery of electricity. Instead, they require net settlement of the difference between the prevailing market price for electricity and the contractually agreed price for the volume of electricity produced from a referenced production facility. These agreements are often used to support renewable energy projects while allowing buyers to maintain flexibility in their energy procurement strategies. For a graphical representation, see below Figure 3-3: Virtual purchase power arrangement.

Figure 3-2: Off-site physical purchase power arrangement

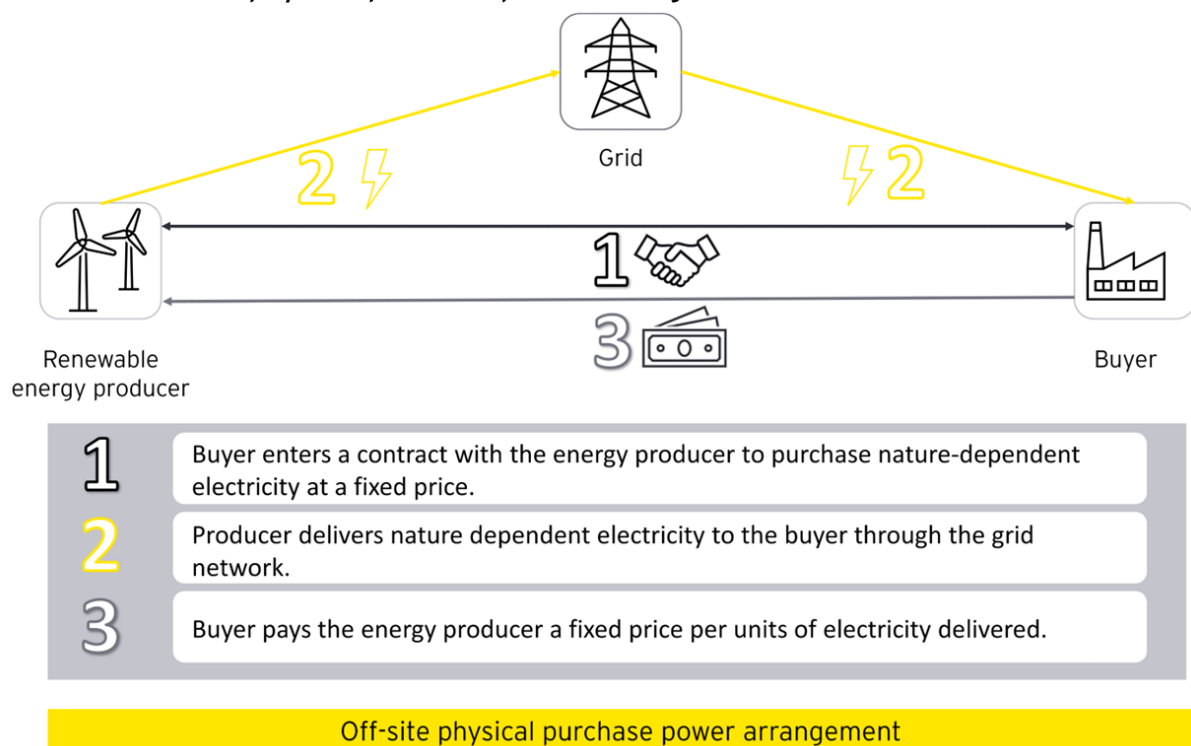

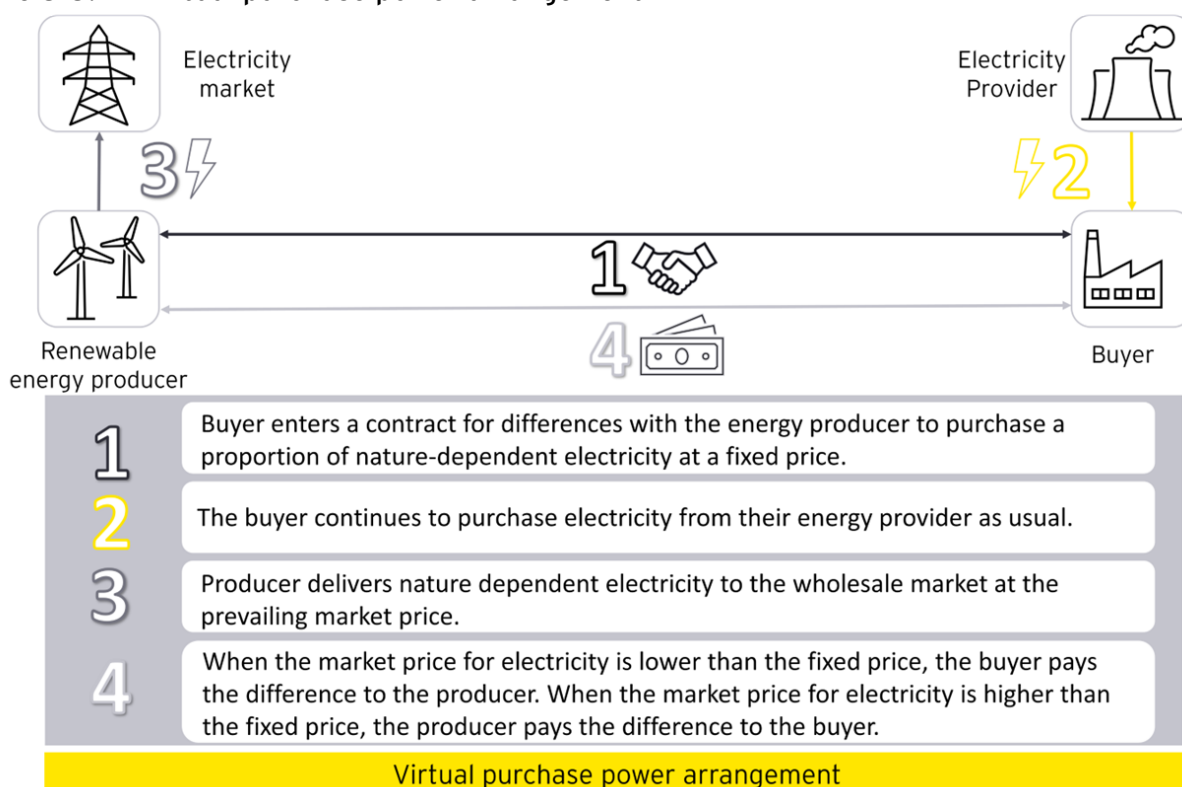

Figure 3-3: Virtual purchase power arrangement

The specific guidance in IFRS 9 for nature-dependent electricity contracts cannot be applied by analogy to other contracts, items or transactions. [IFRS 9.2.3B]. For example, renewable energy certificates (RECs), while often associated with nature-dependent electricity contracts, do not qualify as nature-dependent contracts themselves. RECs are tradable commodities that certify the environmental benefits of renewable energy generation but operate independently of the actual electricity produced. See Chapter 18 for more information on accounting for RECs.

3.4.3 Scoping contracts referencing nature-dependent electricity

Contracts that involve nature-dependent electricity may be covered by different IFRS standards besides IFRS 9. For example, if a contract gives control, joint control, or significant influence over the electricity supplier, it should be looked at under IFRS 10, IFRS 11 *Joint Arrangements*, or IAS 28. If the contract includes a lease, then IFRS 16 would apply. In these cases, it's important to follow the specific rules of those standards first. If the nature-dependent electricity contract is not within the scope of those other standards, then it is assessed against the scoping requirements in IAS 32, IFRS 7, and IFRS 9. As discussed in section 3 above, the provisions of IAS 32, IFRS 7 and IFRS 9 are normally applied to contracts to buy or sell non-financial items that can be settled net in cash or another financial instrument or by exchanging financial instruments unless the contract meets the own use exception. [IAS 32.8, IFRS 7.5, IFRS 9.2.4]. Contracts that are scoped out of IFRS 9 due to meeting the own-use exemption can still become onerous contracts in which case the guidance in IAS 37 would apply.

3.4.4 Own use for contracts referencing nature-dependent electricity

Nature-dependent electricity contracts can lead to variability in the amount of electricity produced because they rely on natural conditions that cannot be controlled. As a result, when an entity is required to purchase a specific amount of electricity as it is generated, there may be instances where the electricity delivered does not align with the entity's actual demand. In these cases, the entity may end up with excess electricity that it needs to sell. [IFRS 9.BC2.18A]. Sales of excess electricity can potentially preclude the contract from meeting the own use criteria, resulting in it being accounted for as a derivative.

Even though sales may be anticipated and may occur frequently, the entity's primary intention when entering these contracts is typically to receive electricity according to its expected usage. IFRS 9.2.4 does not provide clear guidance on how to handle the sales of any unused electricity from these contracts. To address this gap, IFRS 9.B2.7 and IFRS 9.B2.8 provide guidance on the factors to consider when determining whether nature-dependent electricity contract is held for the entity's own use. [IFRS 9.2.8].

To determine whether a nature-dependent contract to buy electricity is held for own use in accordance with IFRS 9.2.4, despite the occurrence of sales of excess electricity, all of the following factors must be satisfied: [IFRS 9.B2.7]

- the contract requires the entity to buy and take delivery of electricity as it is generated, which may not align with the entity's actual needs (see 3.4.4.A below).
- the design and operation of the market in which the electricity is delivered results in the entity having no practical ability to avoid selling any unused electricity (see 3.4.4.B below).

And

- the entity has been, and expects to be, a net purchaser of electricity for the contract period (see 3.4.4.C below).
- When an entity applies the requirements in paragraph 2.4, such sales are not necessarily inconsistent with the contract being held in accordance with the entity's expected usage requirements.

As discussed in section 3.3 above, the own use exception is a two-part test, i.e., in order to qualify as a normal purchase or sale, the contract needs to both (a) have been entered into, and (b) continue to be held, for that purpose. As such, factors used to determine whether a nature dependent electricity contract meets the own use exception should be performed on an ongoing basis (i.e., at each reporting date). [IFRS 9.2.4, IFRS 9.B2.7].

If a contract referencing nature-dependent electricity would be outside the scope of IFRS 9 because it meets the own use exception, an entity is nevertheless permitted to irrevocably designate this contract at inception as measured at fair value through profit or loss if doing so eliminates or significantly reduces an accounting mismatch. [IFRS 9.2.5].

3.4.4.A Risk of excess supply of electricity

One of the conditions for the exception to the own-use requirements for contracts referencing nature-dependent electricity is that the contract terms may require an entity to buy electricity during a delivery interval when it cannot use it. [IFRS 9.B2.7]. This condition emphasises that entities must have to accept electricity regardless of their immediate demand, which can potentially lead to excess supply. [IFRS 9.BC2.18C].

A delivery interval refers to specific time periods during which electricity is generated, delivered, and consumed. Contracts with caps and floors do not necessarily eliminate the risk of receiving excess electricity during a delivery interval. While these mechanisms may set limits on the overall amount of electricity delivered during a day or month, they may not remove the fact that the entity is exposed to the risk that during more granular delivery intervals. [IFRS 9.BC2.18D].

Illustration 3-6: Determining whether a volumetric cap exposes an entity to a risk of excess supply of electricity

Entity A has entered into a contract with a solar farm to purchase electricity. The contract stipulates that Entity A will take delivery of electricity generated by the solar farm, capped at 15 units of electricity per day. Entity A's expected electricity usage is relatively constant at 3 units per hour, which totals 36 units per day. The delivery intervals in the electricity market are set at 1 hour.

The solar farm generates electricity based on sunlight availability, which can be variable. It may produce all 15 units within a few delivery intervals, potentially leading to a situation where Entity A receives electricity it cannot use.

3.4.4.B No practical ability to avoid sales

The IASB decided that to have no practical ability to avoid selling any unused electricity, an entity needs to be 'at the mercy' of the market with regard to when sales of unused electricity occur. Entity-specific actions (for example, storing the electricity) that provide an entity with the practical ability to avoid a sale or determine the timing of such a sale mean the sales are not required due to the market design. The IASB therefore concluded that the timing of the sale is the important factor in assessing the market design. The IASB noted that this decision also enables the requirements to allow for different types of market designs or operations while preserving the main principle. [IFRS 9.BC2.18F].

Actions that allow an entity to avoid or manage the timing of sales, such as investing in storage technology, are important in assessing practical ability. If an entity possesses the capability to store electricity or control the timing of sales, it suggests that the market design does not fully govern the sales process. [IFRS 9.BC2.18F]. In this case, the sales are not mandated by market conditions, as the entity can manage its excess electricity independently.

While investing in storage for excess electricity is a possibility, an entity is only considered to have 'no practical ability' to avoid the sale of excess electricity if it is not economically feasible. Economic feasibility refers to the cost-effectiveness of such investments; if the costs associated with storage-like installation, maintenance, and operational expenses exceed the benefits, pursuing storage becomes impractical.

Illustration 3-7: Determining whether an entity has no practical ability to avoid sales

Entity A enters a contract to buy electricity from renewable sources, which depends on natural conditions. This contract requires Entity A to buy and accept electricity as it is produced, even if it doesn't match the company's immediate needs. The electricity market rules state that any excess electricity that cannot be stored must be sold within a certain time. To handle excess electricity, Entity A thinks about investing in a battery storage system.

Scenario 1: Cannot afford the storage

The cost of the battery storage system, including installation and maintenance, is not economically feasible. Because of these financial limits, Entity A cannot invest in storage. As a result, it has to sell all unused electricity. This shows that Entity A has no practical ability to avoid selling surplus electricity.

Scenario 2: Can afford the storage

Entity A evaluates the costs of the storage system and finds that the investment is economically and operationally feasible. Since the investment in storage is feasible, Entity A has the practical ability to avoid selling excess electricity.

Scenario 3: Storage capacity is not enough

Entity A invests in a battery storage system that lets it store excess electricity. However, renewable energy generation can be unpredictable, such as during high wind conditions, which can lead to times when the storage is full. Even with the currently feasible storage investment, there are times when Entity A must sell excess electricity because it cannot store all of it. This shows that while Entity A can manage much of its excess electricity, it still has no practical ability to avoid selling the surplus that it cannot store.

Scenario 4: Decision to sell excess electricity

Entity A has a battery storage system that allows it to store excess electricity generated from renewable sources. On a particular day, Entity A experiences a surplus due to high generation and low demand. Although it has the capacity to store all the excess electricity, Entity A decides to sell a portion of it. This scenario demonstrates that Entity A has the practical ability to avoid sales but chooses to sell excess electricity.

3.4.4.C Net Purchaser

An entity is considered a net purchaser if its purchases of electricity are sufficient to offset any sales of unused electricity in the same market where it sold that electricity. [IFRS 9.B2.7]. To qualify as a net purchaser, the entity must anticipate having enough headroom in its overall demand to ensure that expected purchases can adequately offset any sales of unused electricity delivered under the contract. [IFRS 9.BC2.18G].

The net purchaser assessment requires the entity to evaluate its purchasing activities over a reasonable timeframe, which cannot exceed 12 months. [IFRS 9.B2.8]. In determining a reasonable amount of time, an entity must take into account the natural variability in electricity generation due to seasonal cycles and fluctuations in the entity's operational demand. [IFRS 9.B2.8].

Importantly, the net purchaser assessment is conducted at the entity level. [IFRS 9.BC2.18I]. This means that the evaluation considers the overall purchasing activities of the entire reporting entity rather than individual contracts or transactions. However, the assessment must also be aligned with the specific market in which the entity takes delivery and sells excess electricity. [IFRS 9.B2.8]. An entity needs to apply its judgement to determine in which market the entity takes delivery of electricity under the contract, with the understanding that 'delivery' does not have to be 'physical' delivery (see section 3.3 above).

Illustration 3-8: Determining at what level the net purchaser assessment is performed

Entity B has operations in the United Kingdom, France, and Italy, with a focus on leveraging renewable energy sources. It enters a contract to buy and take delivery of nature-dependent electricity from a wind farm facility located in the United Kingdom. Due to the inherent variability in the amount of electricity generated from nature-dependent sources, Entity B negotiates a contract that allows it to purchase 110% of its required capacity from the wind farm facility. The electricity market rules state that any excess electricity that cannot be stored must be sold within a certain timeframe. Since it is not economically feasible for Entity B to store excess electricity, any surplus received is sold into the United Kingdom market.

According to the requirements outlined in paragraph B2.8 of IFRS 9, Entity B is not required to conduct the net purchaser assessment solely at the level of the wind farm facility. Instead, the assessment must be made at the market level where Entity B takes delivery of the nature-dependent electricity under the contract. Importantly, the purchases and sales of electricity in France and Italy are not considered in determining the net purchaser status for this specific contract. This means that Entity B evaluates its overall purchasing activities only within the United Kingdom market, considering all electricity purchases and sales made within that market.

Entities must also exercise caution to avoid double counting purchases of electricity when making the net purchaser assessment. Double counting occurs when an entity considers the same purchases towards multiple contracts. For instance, if an entity has existing electricity contracts that have already qualified for the own use exemption (such as those for conventional electricity) at the time when it enters into a nature-dependent electricity contract, the net purchaser assessment for the nature-dependent contract must exclude any electricity purchases already accounted for under existing contracts.

Illustration 3-9: Considerations of double counting in the net purchaser assessment

Entity C has a monthly electricity consumption forecast of 1,200 units. To fulfil its energy needs, Entity C has entered into two contracts:

1. A 15-year agreement for 800 units of conventional electricity per month, which is classified as an own-use contract (entered into two years ago).
2. A 5-year contract for 500 units of nature-dependent electricity, aimed at supporting sustainability initiatives (entered into in the current period).

When Entity C performs its net purchaser assessment for the nature-dependent electricity contract, it must consider the effect of its existing commitments. After entering into the new contract, Entity C's expected purchases of 1,300 units exceeds its expected usage of 1,200 units. If Entity C compares its purchases of 500 units under the new contract against its total expected usage of 1,200 units, it will double count the 800 units that have already been incorporated into the own use assessment of the existing contract. The correct assessment should focus on the remaining capacity after accounting for the existing contract. As a result, Entity C fails the net purchaser assessment for the nature-dependent contract, as the contract gives rise to 100 units of excess electricity purchases that are not expected to be used in the entity's operations.

Many contracts for the purchase and delivery of nature-dependent electricity are long-term. Therefore, the net purchaser assessment must be based on reasonable and supportable information that is readily available without incurring undue costs or efforts. [IFRS 9.B2.8]. Entities should leverage historical data, current market conditions, and reasonable forecasts of future transactions to inform their evaluations.

3.4.5 Effective date and transition

The amendments relating to contracts referencing nature-dependent electricity are effective for annual reporting periods beginning on or after 1 January 2026. Early adoption is permitted, but this will need to be disclosed. Furthermore, the date of initial application must be the beginning of a reporting period, but might be a reporting period other than an annual reporting period. [IFRS 9.7.1.15].

The amendments relating to the own-use exception must be applied retrospectively. An entity is not required to restate prior periods, and it is only permitted to do so if this can be done without using hindsight. If prior periods are not restated, then any difference between the previous carrying amount and the carrying amount at the date of initial application of these amendments, is recognised in the opening retained earnings at the beginning of that reporting period. [IFRS 9.7.2.51].

If a contract referencing nature-dependent electricity would be outside the scope of IFRS 9 because of being held for own use purposes, an entity is permitted, at the date of initial application, to irrevocably designate this contract as measured at fair value through profit or loss in accordance with IFRS 9 paragraph 2.5. [IFRS 9.7.2.52].

Appendix C - Defined terms

Extract from IFRS standards - Definitions

contract assets	Those rights that IFRS 15 <i>Revenue from Contracts with Customers</i> specifies are accounted for in accordance with this Standard for the purposes of recognising and measuring impairment gains or losses. [IFRS 9 Appendix A].
credit risk	The risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation. [IFRS 7 Appendix A].
derivative	<p>A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.</p> <ul style="list-style-type: none"> (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying'). (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. (c) it is settled at a future date. [IFRS 9 Appendix A].
dividends	Distributions of profits to holders of equity instruments in proportion to their holdings of a particular class of capital. [IFRS 9 Appendix A].
equity instrument	An <i>equity instrument</i> is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. [IAS 32.11].
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. [IFRS 13 Appendix A].
financial asset	<p>A <i>financial asset</i> is any asset that is:</p> <ul style="list-style-type: none"> (a) cash; (b) an equity instrument of another entity; (c) a contractual right: <ul style="list-style-type: none"> (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. [IAS 32.11].

financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument. <i>[IFRS 9 Appendix A].</i>
financial instrument	A <i>financial instrument</i> is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity. <i>[IAS 32.11].</i>
financial liability	<p>A <i>financial liability</i> is any liability that is:</p> <ul style="list-style-type: none"> (a) a contractual obligation: <ul style="list-style-type: none"> (i) to deliver cash or another financial asset to another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or (b) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <p>As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D. <i>[IAS 32.11].</i></p>
financial liability at fair value through profit or loss	<p>A financial liability that meets one of the following conditions:</p> <ul style="list-style-type: none"> (a) it meets the definition of held for trading. (b) upon initial recognition it is designated by the entity as at fair value through profit or loss in accordance with paragraph 4.2.2 or 4.3.5. (c) it is designated either upon initial recognition or subsequently as at fair value through profit or loss in accordance with paragraph 6.7.1. <i>[IFRS 9 Appendix A].</i>
finance lease	A lease that transfers substantially all the risks and rewards incidental to ownership of an underlying asset . <i>[IFRS 16 Appendix A].</i>
firm commitment	A binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates. <i>[IFRS 9 Appendix A].</i>
forecast transaction	An uncommitted but anticipated future transaction. <i>[IFRS 9 Appendix A].</i>

lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration. <i>[IFRS 16 Appendix A].</i>
lessee	An entity that obtains the right to use an underlying asset for a period of time in exchange for consideration. <i>[IFRS 16 Appendix A].</i>
lessor	An entity that provides the right to use an underlying asset for a period of time in exchange for consideration. <i>[IFRS 16 Appendix A].</i>
loans payable	Loans payable are financial liabilities, other than short-term trade payables on normal credit terms. <i>[IFRS 7 Appendix A].</i>
operating lease	A lease that does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset . <i>[IFRS 16 Appendix A].</i>
puttable instrument	A puttable instrument is a financial instrument that gives the holder the right to put the instrument back to the issuer for cash or another financial asset or is automatically put back to the issuer on the occurrence of an uncertain future event or the death or retirement of the instrument holder. <i>[IAS 32.11].</i>

Overview

Under IFRS 9 *Financial Instruments*, the question of whether an instrument is a derivative or not, is an important one for accounting purposes. Derivatives are normally recorded in the statement of financial position at fair value with any changes in value reported in profit or loss (see Chapter 46), although there are some exceptions, e.g., derivatives over own equity (see Chapter 43) and those that are designated in certain effective hedge relationships (see Chapter 49).

IFRS 9 also contains the concept of an embedded derivative which is described as a component of a hybrid or combined instrument that also includes a non-derivative host contract. In certain circumstances embedded derivatives are required to be accounted for separately as if they were freestanding derivatives, which is considered in more detail in sections 3 to 6 below. Under IFRS 9, the requirement to separate embedded derivatives only applies to financial liabilities not measured at fair value through profit or loss and non-financial items. Embedded derivatives are not separated from financial assets within the scope of IFRS 9, thus the requirements of IFRS 9 are applied to the hybrid contract as a whole.

In section 7 below we consider situations when two or more financial instruments should be accounted for as if they were a single instrument, together with the connected question of linkage (for financial reporting purposes) of transactions more generally.

This chapter does not deal with valuation of derivative financial instruments. Chapter 15 outlines the requirements of IFRS 13 *Fair Value Measurement*, a standard that defines fair value and provides principles-based guidance on how to measure fair value under IFRS. The impact of IBOR Reform on accounting for derivatives and embedded derivatives is included in *Supplement: IBOR Reform*, in particular at section 3.2.

This chapter refers to a number of discussions by the IASB and the IFRS IC on topics relevant to derivatives and embedded derivatives. A number of these discussions were held in the context of IAS 39 *Financial Instruments: Recognition and Measurement*, prior to the effective date of IFRS 9 on 1 January 2018. Those discussions which remain relevant to IFRS 9 have been retained in this chapter. Any differences that exist between the IFRS and US GAAP guidance on derivatives and embedded derivatives are not addressed in this chapter as the standards are not converged.

What you need to know

- The embedded derivative guidance applies to financial liability instruments in scope of IFRS 9 and also contracts such as leases, insurance contracts and executory contracts.
- The assessment whether an embedded derivative should be separated from the host contract is performed when the entity becomes a party to the contract. IFRS 9 prohibits subsequent reassessment.
- For an embedded derivative to be closely related, the related economic characteristics and risks of this embedded feature need to be similar to the host contract.
- Sustainability-linked features in financial liabilities are usually a non-financial variable specific to a party in the contract and therefore do not meet the definition of a derivative. Therefore, they will often not have to be separated from the host contract and separately accounted for.
- For financial assets, it is prohibited under IFRS 9 to separate embedded derivatives. See Chapter 44 for the relevant guidance.

1 Definition of a derivative

IFRS 9 defines derivatives as follows:

Extract from IFRS 9

Appendix A Defined terms

derivative

A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.

- (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying').
- (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors.
- (c) it is settled at a future date.

These three defining characteristics are considered further below. [IFRS 9 Appendix A].

1.1 Changes in value in response to changes in underlying

1.1.1 Notional amounts

A derivative usually has a notional amount, such as an amount of currency, number of shares or units of weight or volume, but does not require the holder or writer to invest or receive the notional amount at inception.

Illustration 1-1: Notional amount of a derivative

Company XYZ, whose functional currency is the US dollar, has placed an order with a company in France for delivery in six months' time. The price to be paid in six months' time is €2,000,000. To hedge the exposure to currency risk, Company XYZ enters into a contract with an investment bank to convert US dollars to euros at a fixed exchange rate. The contract requires the investment bank to remit €2,000,000 in exchange for US dollars at a fixed exchange rate of 1.65 (US\$3,300,000). The notional amount of the contract in euro term is €2,000,000.

While a derivative usually has a notional amount, this is not always the case. A derivative could require a fixed payment or payment of an amount that can change (but not proportionally with a change in the underlying) as a result of some future event that is unrelated to a notional amount. For example, a contract that requires a fixed payment of €1,000 if six-month SOFR increases by 100 basis points is a derivative, even though a notional amount is not specified (at least not in the conventional sense). [IFRS 9.BA.1]. A further Illustration is shown below.

Illustration 1-2: Derivative containing no notional amount

Company XYZ enters into a contract that requires payment of CU1,000 if Company ABC's share price increases by CU5 or more during a six-month period; Company XYZ will receive CU1,000 if the share price decreases by CU5 or more during the same six-month period; no payment will be made if the price swing is less than CU5 up or down.

The settlement amount changes with an underlying, Company ABC's share price, although there is no notional amount to determine the settlement amount. Instead, there is a payment provision that is based on changes in the underlying. Provided all the other characteristics of a derivative are present, which they are in this case, such an instrument is a derivative.¹

¹ IGC Q&A 10-6. Whilst the Implementation Guidance Committee (IGC) discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

1.1.2 Underlying variables

It follows from the definition (see section 1 above) that a derivative will always have at least one underlying variable. The following underlying variables are referred to in the standard, but this is not an exhaustive list (we have provided an example for each of the underlyings):

- Specified interest rate (e.g., EONIA)
- Financial instrument price (e.g., the share price of an entity)
- Commodity price (e.g., the price of a barrel of oil)
- Foreign exchange rate (e.g., the £/\$ spot rate)
- Index of prices or rates (e.g., Consumer Price Index)
- Credit rating (e.g., Fitch)
- Credit index (e.g., AAA rated corporate bond index)

And

- Non-financial variable (e.g., index of earthquake losses or of temperatures)

A contract to receive a royalty, often in exchange for the use of certain property that is not exchange-traded, where the payment is based on the volume of related sales or service revenues is accounted for under IFRS 15 *Revenue from Contracts with Customers* (see Chapter 28) and not as a derivative.

Derivatives that are based on sales volume or another non-financial variable specific to one party to the contract are not necessarily excluded from the scope of IFRS 9, especially where there is another (financial) underlying in the contract, as set out in the next Illustrations.

Illustration 1-3: Derivative containing two underlyings - foreign currency forward

Company XYZ, whose functional currency is the US dollar, sells products in France denominated in euros. Company XYZ enters into a contract with an investment bank to convert euros to US dollars at a fixed exchange rate. The contract requires Company XYZ to remit euros based on its sales volume in France in exchange for US dollars at a fixed exchange rate of 1.00.

The contract has two underlying variables, the foreign exchange rate and the volume of sales, no initial net investment, and a payment provision. Therefore, as the implementation guidance explains, it is a derivative. IFRS 9 does not exclude from its scope derivatives that are based on sales volume. [IFRS 9.IG B.8].

Illustration 1-4: Derivative containing two underlyings - equity kicker

A venture capital investor, Company V, provides a subordinated loan to Company A and agrees that in addition to interest and repayment of principal, if Company A lists its shares on a stock exchange, Company V will be entitled to receive shares in Company A free of charge or at a very low price (an 'equity kicker'). As a result of this feature, interest on the loan is lower than it would otherwise be.

As the implementation guidance explains, the equity kicker meets the definition of a derivative because its value changes in response to changes in the share price of the borrower, it requires no initial net investment and is settled at a future date. The implementation guidance further explains that the equity kicker meets the definition of a derivative even though the right to receive shares is contingent upon the future listing of the borrower. [IFRS 9.IG C.4].

However, contracts that are linked to variables that might be considered non-financial, such as an entity's revenue, can sometimes cause particular interpretative problems as discussed below.

1.1.3 Non-financial variables specific to one party to the contract

The definition of a derivative (see section 1 above) refers to underlyings that are non-financial variables not specific to one party to the contract. This reference was introduced by IFRS 4 *Insurance Contracts* to help determine whether a financial instrument is an insurance contract (see Chapter 41). An insurance contract is likely to contain such an underlying, for example the occurrence or non-occurrence of a fire that damages or destroys an asset of a party to the contract. Non-financial variables that are not specific to one party to the contract might include an index of earthquake losses in a particular region or an index of temperatures in a particular city. [IFRS 9.BA.5]. Those based on climatic variables are sometimes referred to as 'weather derivatives'. [IFRS 9.B2.1]. For periods beginning on or after 1 January 2023, IFRS 4 will be replaced by IFRS 17 *Insurance Contracts*.

A change in the fair value of a non-financial asset is specific to the owner if the fair value reflects not only changes in market prices for such assets (a financial variable) but also the condition of the specific non-financial asset held (a non-financial variable). For example, if a guarantee of the residual value of a specific car exposes the guarantor to the risk of changes in the car's physical condition, the change in that residual value is specific to the owner of the car, and so would not be a derivative. [IFRS 9.BA.5].

Contracts with non-financial variables also arise in the gaming industry where a gaming institution takes a position against a customer. For example, a customer will pay a stake to a bookmaker such that the bookmaker is contractually obliged to pay the customer a specified amount if the bet is a winning one, e.g., if the specified horse wins a given race. The underlying variable (the outcome of the race) is clearly non-financial in nature, but it is unlikely to be specific to either party to the contract. Accordingly, such contracts will typically be derivative financial instruments.² In contrast, when a gaming company provides services to manage the organisation of games between two or more parties, this is unlikely to be a derivative and would normally be assessed under the principles of IFRS 15.

How we see it

It is not clear whether the reference to non-financial variables specific to one party to the contract means that all instruments with such an underlying would fail to meet the definition of a derivative or only those contracts that are insurance contracts, for which the reference was originally introduced. Until the standard is clarified, in our view, a legitimate case can be made for either view.

The IFRS IC considered this issue in the context of contracts indexed to an entity's revenue or EBITDA and initially came to a tentative conclusion that the exclusion was not restricted to insurance contracts.³ However, that conclusion was later withdrawn and the IFRS IC referred the issue to the IASB, recommending that the standard be amended to limit the exclusion to insurance contracts.⁴

The IASB confirmed that it had intended the exclusion to apply only to contracts that are within the scope of IFRS 4⁵ however, the IASB eventually decided not to proceed on this issue and the existing definition of a derivative (see section 1 above) was incorporated into IFRS 9 without alteration, leaving the issue unaddressed.

A further issue that arises is that it is not always clear whether a variable is non-financial. This is shown in Illustration 1-5 below where the underlying is associated with an embedded feature which might, or might not, meet the definition of a derivative.

Illustration 1-5: Borrowing with coupons linked to revenue

Company F, a manufacturing entity, issues a debt instrument for its par value of CU10m. It is repayable in ten years' time at par and an annual coupon is payable that comprises two elements: a fixed amount of 2.5% of the par value and a variable amount equating to 0.01% of Company F's annual revenues. Company F does not designate the instrument at fair value through profit or loss.

It is assumed that if Company F had instead issued a more conventional fixed rate borrowing for the same amount with the same maturity it would have been required to pay an annual coupon of 4% of the par value. Therefore, on the face of it, the debt contains an embedded feature that represents a swap with an initial fair value of zero whereby Company F receives a fixed amount annually (1.5% of CU10m) and pays a variable amount annually (0.01% of its annual revenues). The question is now whether this feature represents an embedded derivative that should be separated from the host contract by Company F and accounted for separately - see embedded derivative guidance in section 3 and section 4 below.

It is very hard to argue that the economic characteristics and risks of this embedded feature are closely related to the debt instrument and the variable (Company F's annual revenue) is clearly specific to Company F. The key issue is whether Company F's annual revenue is a financial or non-financial variable and therefore whether the embedded feature meets the definition of a derivative.

⁴ [IFRIC Update](#), January 2007, available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

⁵ [IASB Update](#), February 2007, available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

It is not only contracts with payments based on revenue that can cause such problems. Some contracts may require payments based on other measures taken or derived from an entity's financial statements such as EBITDA. The IFRS IC considered this matter in July 2006⁶ and in January 2007 referred the matter to the IASB.⁷ However, the IASB eventually decided not to deal with this issue.

Whilst it is tempting to regard an entity's revenue and EBITDA as financial variables, they are driven by a number of different factors many of which are clearly non-financial in nature, for example the general business risks faced by the entity. In addition, many of the drivers of EBITDA and revenue will be specific to that business, for example the location of the business, the nature of its goods or services and managements actions.

It is worth noting that if a company concludes that such coupons are not derivatives, they will have to exercise judgement on how to incorporate these variable coupons into their EIR calculations, in line with IFRS 9 B5.4.6. Further guidance on this topic can be found in Chapter 46.

One company that has faced this issue in practice is Renault S.A. This company has issued liabilities on which coupons are linked to revenue and net profit. As can be seen in the following Practical example, Renault S.A states that its revenue-linked and net profit-linked features are not considered embedded derivatives and the liabilities are therefore carried at amortised cost. The Practical example below is from Renault S.A's 2021 accounts.

Practical example 1-1: Renault S.A (2021)	France
CONSOLIDATED FINANCIAL STATEMENTS 2021 [extract] 6 Notes to the consolidated financial statement [extract] 6.2 Accounting policies and scope of consolidation [extract] Note 2 - Accounting policies [extract] 2-W. Financial liabilities of the Automotive segments and Sales Financing debts [extract]	
<p>Redeemable shares of the Automotive segments are listed subordinated debt instruments that earn a variable return indexed on consolidated revenues. They are carried at amortized cost, determined by discounting forecast coupons using the effective interest rate on borrowings. The estimated effective interest rate takes account of indexation, and the amortized cost recorded in financial result is re-estimated when there is a significant change in future sales prospects, particularly when medium-term business plans are released.</p>

7 [IFRIC Update](#), January 2007, available on the IFRS Foundation's website.
Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

In 2009, the IFRS IC was asked to consider the accounting treatment for an instrument that contains participation rights by which the instrument holder shares in the net income and losses of the issuer. However, the IFRS IC considered the issue without reconsidering the assumptions described in the request, including one that the financial liability did not contain any embedded derivatives.⁸ In other words, the IFRS IC implicitly accepted that such a feature need not be separated, but did not indicate that separation was necessarily prohibited.

How we see it

In practice, we believe that an entity may make an accounting policy choice as to whether the entity's revenue, EBITDA or other measures taken or derived from the entity's financial statements, are financial or non-financial variables. Once an entity elects a particular policy, it must consistently apply that approach to all similar transactions.

More recently, entities have started to enter into debt instruments where a component of the interest margin is linked to various sustainability-linked targets. Changes in the interest margin may be dependent on achieving certain targets, such as an annual CO₂ reduction or a pre-defined sociological target. It should be considered whether this variability feature would meet the definition of a derivative, as defined in Appendix A of IFRS 9.

How we see it

In our view, this feature would usually not meet the definition of a derivative, as the sustainability-linked feature is a non-financial variable specific to a party in the contract, being the borrower. As such, no embedded derivative would exist. However, if the sustainability-linked feature is not specific to a party in the contract, then it could meet the definition of a derivative, provided the other characteristics in the definition of a derivative are met.

In the event that the sustainability-linked feature does meet the definition of a derivative, it should be assessed whether it is closely related to the non-derivative host contract. [IFRS 9.4.3.3]. This is addressed further in section 4 of this chapter.

1.2 Initial net investment

The second key characteristic of a derivative is that it has no initial net investment, or one that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors (see section 1 above). [IFRS 9 Appendix A].

Currency swaps sometimes require an exchange of different currencies of equal value at inception. This does not mean that they would not meet the definition of a derivative, i.e., no initial net investment or an initial investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors, as the following Illustration demonstrates.

Illustration 1-6: Currency swap - initial exchange of principal

Company A and Company B enter into a five-year fixed-for-fixed currency swap on euros and US dollars. The current spot exchange rate is €1 = US\$1. The five-year interest rate in the US is 8%, while the five-year interest rate in Europe is 6%. On initiation of the swap, Company A pays €2,000 to Company B, which in return pays US\$2,000 to Company A. During the swap's life, Company A and Company B make periodic interest payments to each other without netting. Company B pays 6% per year on the €2,000 it has received (€120 per year), while Company A pays 8% per year on the US\$2,000 it has received (US\$160 per year). On termination of the swap, the two parties again exchange the original principal amounts.

The currency swap is a derivative financial instrument since the contract involves a zero initial net investment (an exchange of one currency for another of equal fair value), it has an underlying, and it will be settled at a future date. [IFRS 9 Appendix A].

⁸ [IFRIC Update](#), May 2009, available on the IFRS Foundation's website.

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

The following Illustrations illustrate how to assess the initial net investment characteristic in various prepaid derivatives - these can provide guidance when assessing whether what appears to be a non-derivative instrument is actually a derivative.

Illustration 1-7: Prepaid interest rate swap (prepaid fixed leg)

Company S enters into a CU1,000 notional amount five year pay-fixed, receive-variable interest rate swap. The interest rate of the variable part of the swap resets on a quarterly basis to three-month SOFR. The interest rate of the fixed part of the swap is 10% per annum. At inception of the swap, Company S prepays its fixed obligation of CU500 ($\text{CU1,000} \times 10\% \times 5 \text{ years}$), discounted using market interest rates, while retaining the right to receive the SOFR-based interest payments on the CU1,000 over the life of the swap.

The initial net investment in the swap is significantly less than the notional amount on which the variable payments under the variable leg will be calculated and therefore requires an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market conditions, such as a variable rate bond. It therefore fulfils the 'no initial net investment or an initial investment that is smaller than would be required for other types of contracts that would be expected to have similar response to change in market factors' criterion. Even though Company S has no future performance obligation, the ultimate settlement of the contract is at a future date and its value changes in response to changes in SOFR. Accordingly, it is a derivative. [IFRS 9.IG B.4].

Illustration 1-8: Prepaid interest rate swap (prepaid floating leg)

Instead of the transactions in Illustration 1-7 above, Company S enters into a CU1,000 notional amount five year pay-variable, receive-fixed interest rate swap. The variable leg of the swap resets on a quarterly basis to three-month SOFR. The fixed interest payments under the swap are calculated as 10% of the notional amount, i.e., CU100 per year. By agreement with the counterparty, Company S prepays and discharges its obligation under the variable leg of the swap at inception by paying a fixed amount determined according to current market rates, while retaining the right to receive the fixed interest payments of CU100 per year.

The cash inflows under the contract are equivalent to those of a financial instrument with a fixed annuity stream since Company S knows it will receive CU100 per year over the life of the swap. Therefore, all else being equal, the initial investment in the contract should equal that of other financial instruments consisting of fixed annuities. Thus, the initial net investment in the pay-variable, receive-fixed interest rate swap is equal to the investment required in a non-derivative contract that has a similar response to changes in market conditions. For this reason, the instrument does not exhibit characteristic 'no initial net investment or an initial investment that is smaller than would be required for other types of contracts that would be expected to have similar response to changes in market factors' requirement and is therefore not a derivative. [IFRS 9.IG B.5].

The conclusions in Illustration 1-7 and Illustration 1-8 above are fundamentally different for what, on the face of it, appear to be very similar transactions. The key difference is that in Illustration 1-8 all possible cash flow variances are eliminated and, consequently, the resulting cash flows exhibit the characteristics of a simple non-derivative instrument, i.e., an amortising loan.

An option contract meets the definition because the premium is less than the investment that would be required to obtain the underlying financial instrument to which the option is linked. [IFRS 9.BA.3].

The implementation guidance to IFRS 9 suggests that the purchase of a deeply in the money call option would fail to satisfy the original 'little net investment' test if the premium paid was equal or close to the amount required to invest in the underlying instrument. However, the implementation guidance on which Illustration 1-9 below is based explains that a contract is not a derivative if the initial net investment approximates the amount that an entity otherwise would be required to invest. [IFRS 9.IG B.9].

Illustration 1-9: Prepaid forward purchase of shares

Company S also enters into a forward contract to purchase 100 shares in Company T in one year. The current share price is CU50 per share and the one year forward price CU55. Company S is required to prepay the forward contract at inception with a CU5,000 payment.

The initial investment in the forward contract of CU5,000 is less than the notional amount applied to the underlying, 100 shares at the forward price of CU55 per share, i.e., CU5,500. However, the initial net investment approximates the investment that would be required for other types of contracts that would be expected to have a similar response to changes in market factors because Company T's shares could be purchased at inception for the same price of CU50. Accordingly, the prepaid forward does not exhibit characteristic 'no initial net investment or an initial investment that is smaller than would be required for other types of contracts that would be expected to have similar response to changes in market factors' criterion and is therefore not a derivative. [IFRS 9.IG B.9].

Many derivative instruments, such as futures contracts and exchange traded written options, require margin payments. The implementation guidance explains that a margin payment is not part of the initial net investment in a derivative but is a form of collateral for the counterparty or clearing house and may take the form of cash, securities, or other specified assets, typically liquid assets. Consequently, they are separate assets that are accounted for separately. [IFRS 9.IG B.10].

However, while accounted for separately, the margin call and the derivative would be presented net in the statement of financial position if the offsetting requirements of IAS 32 *Financial Instruments: Presentation* are met (see Chapter 50). In some jurisdictions, depending on the precise terms of the related contracts, margin payments may represent a partial settlement of a derivative.

1.3 Future settlement

The third characteristic is that settlement takes place at a future date. Sometimes, a contract will require gross cash settlement. However, as illustrated in the next Illustration, it makes no difference whether the future settlements are gross or net.

Illustration 1-10: Interest rate swap - gross or net settlement

Company ABC is considering entering into an interest rate swap with a counterparty, Company XYZ. The proposed terms are that Company ABC pays a fixed rate of 8% and receives a variable amount based on three-month SOFR, reset on a quarterly basis; the fixed and variable amounts are determined based on a CU1,000 notional amount; Company ABC and Company XYZ do not exchange the notional amount and Company ABC pays or receives a net cash amount each quarter based on the difference between 8% and three month SOFR. Alternatively, settlement may be on a gross basis.

The contract meets the definition of a derivative regardless of whether there is net or gross settlement because its value changes in response to changes in an underlying variable (SOFR), there is no initial net investment, and settlements occur at future dates - it makes no difference whether Company ABC and Company XYZ actually make the interest payments to each other (gross settlement) or settle on a net basis. [IFRS 9.IG B.3].

The definition of a derivative also includes contracts that are settled gross by delivery of the underlying item, e.g., a forward contract to purchase a fixed rate debt instrument.

Expiry of an option at its maturity is a form of settlement even though there is no additional exchange of consideration. Therefore, even if an option is not expected to be exercised, e.g., because it is significantly 'out of the money', it can still be a derivative. [IFRS 9.IG B.7]. Such an option will have some value, albeit small, because it still offers the opportunity for gain if it becomes 'in the money' before expiry even if such a possibility is remote - the more remote the possibility, the lower its value.

2 Examples of derivatives

2.1 Common derivatives

The following table provides examples of contracts that normally qualify as derivatives. The list is not exhaustive - any contract that has an underlying may be a derivative. Moreover, as set out in Chapter 41, even if an instrument meets the definition of a derivative, it may not fall within the scope of IFRS 9.

Type of contract	Main underlying variable
Interest rate swap	Interest rates
Currency swap (foreign exchange swap)	Currency rates
Commodity swap	Commodity prices
Equity swap	Equity prices (equity of another entity)
Credit swap	Credit rating, credit index, or credit price
Total return swap	Total fair value of the reference asset and interest rates
Purchased or written bond option (call or put)	Interest rates
Purchased or written currency option (call or put)	Currency rates
Purchased or written commodity option (call or put)	Commodity prices
Purchased or written stock option (call or put)	Equity prices (equity of another entity)
Interest rate futures linked to government debt (treasury futures)	Interest rates
Currency futures	Currency rates
Commodity futures	Commodity prices
Interest rate forward linked to government debt (treasury forward)	Interest rates
Currency forward	Currency rates
Commodity forward	Commodity prices
Equity forward	Equity prices (equity of another entity)

[IFRS 9.IG B.2].

Commodity futures are an example of a contract to buy or sell a non-financial item that will meet the definition of a derivative only when they can be settled net in cash or another financial instrument, or by exchanging financial instruments. The rules governing these types of transactions are detailed in Chapter 41. This section also explains the exemption from the derivative rules for 'own use' contracts and the circumstances where this exemption is available. These considerations could also be relevant for Carbon Credits and Renewable Energy Certificates. For example, if an entity enters a forward contract to purchase carbon credits, this could meet the definition of a derivative. This will need to be assessed as the market for these products continues to evolve.

2.2 In-substance derivatives

The implementation guidance explains that the accounting should follow the substance of arrangements. In particular, non-derivative transactions should be aggregated and treated as a derivative when, in substance, the transactions result in a derivative. Indicators of this would include:

- They are entered into at the same time and in contemplation of one another
 - They have the same counterparty
 - They relate to the same risk
- And
- There is no apparent economic need or substantive business purpose for structuring the transactions separately that could not also have been accomplished in a single transaction [IFRS 9.IG B.6]

The application of this guidance is illustrated in the following Illustration.

Illustration 2-1: In-substance derivative - offsetting loans

Company A makes a five-year fixed rate loan to Company B, while at the same time Company B makes a five-year variable rate loan for the same amount to Company A. There are no transfers of principal at inception of the two loans, since Company A and Company B have a netting agreement.

The combined contractual effect of the loans is the equivalent of an interest rate swap arrangement, i.e., there is an underlying variable, no initial net investment, and future settlement. This meets the definition of a derivative.

This would be the case even if there was no netting agreement, because the definition of a derivative instrument does not require net settlement (see Illustration 1-10 in section 1.3 above). [IFRS 9.IG B.6].

The analysis above would be equally applicable if the loans were in different currencies - such an arrangement could synthesise a cross-currency interest rate swap and should be accounted for as a derivative if that is its substance.

2.3 Regular way contracts

Extract from IFRS 9

Appendix A

Defined terms

regular way purchase or sale

A purchase or sale of a financial asset under a contract whose terms require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned.

Such contracts give rise to a fixed price commitment between trade date and settlement date that meets the definition of a derivative. [IFRS 9 Appendix A]. However, because of the short duration of the commitments, they are not accounted for as derivatives but in accordance with special accounting rules. These requirements are discussed in Chapter 45. [IFRS 9.BA.4].

3 Embedded derivatives

An embedded derivative is a component of a hybrid or combined instrument that also includes a non-derivative host contract; it has the effect that some of the cash flows of the combined instrument vary in a similar way to a stand-alone derivative. In other words, it causes some or all of the cash flows, that otherwise would be required by the contract, to be modified according to a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other underlying variable (provided in the case of a non-financial variable that the variable is not specific to a party to the contract). [IFRS 9.4.3.1].

Common examples of contracts that can contain embedded derivatives include non-derivative financial instruments (especially debt instruments), leases, insurance contracts and contracts for the supply of goods or services.

Under IFRS 9, the embedded derivative rules apply only to financial liabilities that are not measured at fair value through profit or loss and non-financial items. Embedded derivatives are not separated from financial assets within the scope of IFRS 9 because the requirements of IFRS 9 are applied to the hybrid contract as a whole. [IFRS 9.4.3.2].

Normal sale or purchase contracts (see Chapter 41) can also contain embedded derivatives.

In the Basis for Conclusions to IFRS 9, the IASB asserts that, in principle, all embedded derivatives that are not measured at fair value with gains and losses recognised in profit or loss ought to be accounted for separately, but explains that, as a practical expedient, they should not be where they are regarded as 'closely related' to their host contracts. In those cases, it is believed less likely that the derivative was embedded to achieve a desired accounting result. [IFRS 9.BCZ4.92].

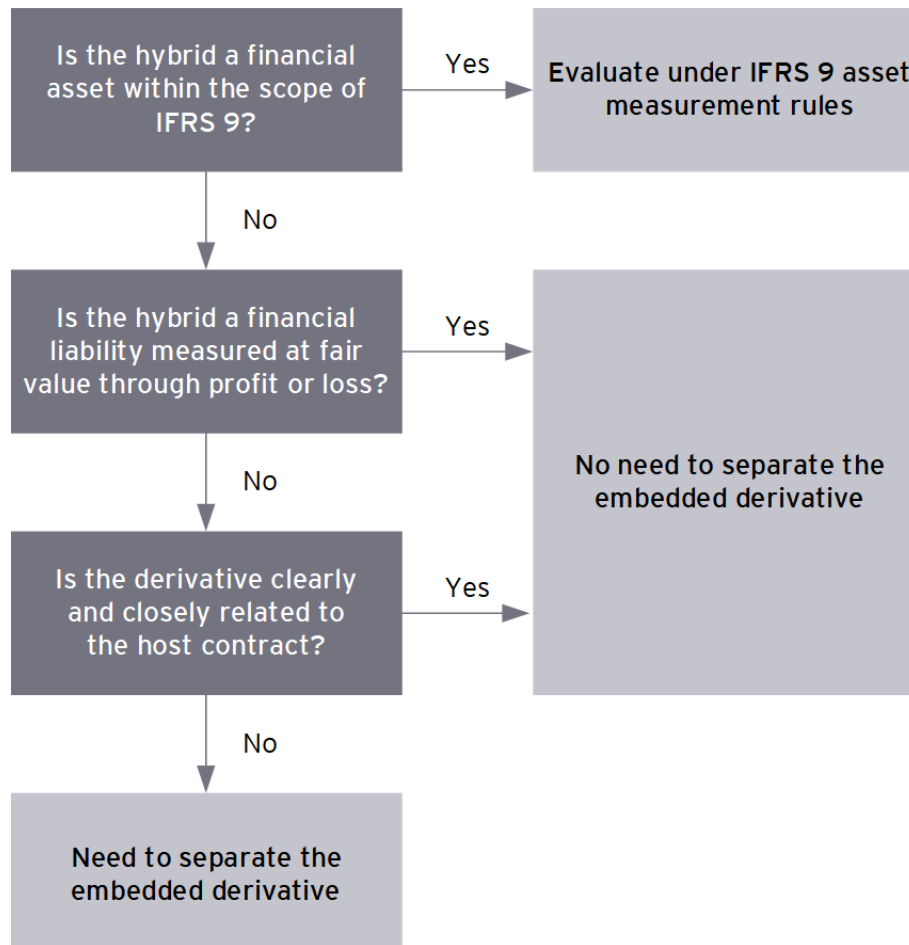

IFRS 9 defines when an embedded derivative in a host contract should be separated: [IFRS 9.4.3.3]

Extract from IFRS 9

- 4.3.3** If a hybrid contract contains a host that is not an asset within the scope of this Standard, an embedded derivative shall be separated from the host and accounted for as a derivative under this Standard if, and only if:
- (a) the economic characteristics and risks of the embedded derivative are not closely related to the economic characteristics and risks of the host (see paragraphs B4.3.5 and B4.3.8);
 - (b) a separate instrument with the same terms as the embedded derivative would meet the definition of a derivative; and
 - (c) the hybrid contract is not measured at fair value with changes in fair value recognised in profit or loss (ie a derivative that is embedded in a financial liability at fair value through profit or loss is not separated).

If any of these conditions are not met, the embedded derivative should not be accounted for separately, [IFRS 9.4.3.3, IFRS 9.B4.3.8], i.e., an entity is prohibited from separating an embedded derivative that is closely related to its host contract. The process is similar, although not identical, to that applied when separating the equity element of a compound instrument by the issuer under IAS 32 (see Chapter 43). The assessment of the closely related criterion should be made when the entity first becomes a party to a contract or in other words, on initial recognition of the contract (see section 6 below). [IFRS 9.B4.3.11].

The decision-tree diagram below illustrates how to apply the above rules to an embedded derivative that meets the IFRS 9 definition of a stand-alone derivative:

The accounting treatment for a separated embedded derivative is the same as for a standalone derivative. Such an instrument (in this case, a component of an instrument) will normally be recorded in the statement of financial position at fair value with all changes in value being recognised in profit and loss (see section overview above, Chapter 46), although there are some exceptions, e.g., embedded derivatives may be designated as a hedging instrument in an effective hedge relationship in the same way as standalone derivatives (see Chapter 49).

A derivative that is attached to a financial instrument but is contractually transferable independently of that instrument, or has a different counterparty from that instrument, is not an embedded derivative, but a separate financial instrument. [IFRS 9.4.3.1].

Where the embedded derivative's fair value cannot be determined reliably on the basis of its terms and conditions, it may be determined indirectly as the difference between the hybrid (combined) instrument and the host instrument, if their fair values can be determined. [IFRS 9.4.3.7]. If an entity is unable to measure an embedded derivative that is required to be separated from its host, either on acquisition or subsequently, the entire contract is designated at fair value through profit or loss. [IFRS 9.4.3.6].

4 Embedded derivatives: The meaning of 'closely related'

The standard does not define what is meant by 'closely related'. Instead, it illustrates what was intended by providing a series of situations where the embedded derivative is, or is not, regarded as closely related to the host. Making this determination can prove very challenging, not least because the illustrations do not always seem to be consistent with each other. This guidance is considered in the remainder of this subsection.

4.1 Financial instrument hosts

IFRS 9 includes the following guidance regarding financial instruments hosts: [IFRS 9.B4.3.2]

Extract from IFRS 9

B4.3.2 If a host contract has no stated or predetermined maturity and represents a residual interest in the net assets of an entity, then its economic characteristics and risks are those of an equity instrument, and an embedded derivative would need to possess equity characteristics related to the same entity to be regarded as closely related. If the host contract is not an equity instrument and meets the definition of a financial instrument, then its economic characteristics and risks are those of a debt instrument.

From the issuer's perspective, a hybrid instrument that meets the conditions for classification as equity under IAS 32 (see Chapter 43) is excluded from the scope of IFRS 9. The application of these principles are considered in sections 4.1.1 to 4.1.9 below.

The application of these principles is not relevant to the holder of debt or equity instruments as embedded derivatives are not separated from financial assets within the scope of IFRS 9 as the requirements of IFRS 9 are applied to the hybrid contract as a whole. [IFRS 9.4.3.2].

4.1.1 Foreign currency monetary items

A monetary item denominated in a currency other than an entity's functional currency is accounted for under IAS 21 *The Effects of Changes in Foreign Exchange Rates* with foreign currency gains and losses recognised in profit or loss. The embedded foreign currency derivative is considered closely related to the debt host and is not separated. In other words, it would not be considered a functional currency monetary item and a foreign currency forward contract. This also applies where the embedded derivative in a host debt instrument provides a stream of either principal or interest payments denominated in a foreign currency (e.g., a dual currency bond). [IFRS 9.B4.3.8(c)].

4.1.2 Interest rate indices

Many debt instruments contain embedded interest rate indices that can change the amount of interest that would otherwise be paid or received. One of the simplest examples would be a floating rate loan whereby interest is paid quarterly based on three-month SOFR. More complex examples might include the following:

- Inverse floater - coupons are paid at a fixed rate minus SOFR
 - Levered inverse floater - as above but a multiplier greater than 1.0 is applied to the resulting coupon
 - De-levered floater - coupons lag overall movements in a specified rate, e.g., coupons equal a proportion of the ten-year constant maturity treasuries rate plus a fixed premium
- Or
- Range floater - interest is paid at a fixed rate but only for each day in a given period that SOFR is within a stated range

In such cases the embedded derivative is closely related to the host debt instrument unless:

- (a) The hybrid instrument can be settled in such a way that the holder would not recover substantially all of its recognised investment.
- Or
- (b) The embedded derivative could at least double the holder's initial rate of return on the host contract and could result in a rate of return that is at least twice what the market return would be for a contract with the same terms as the host contract (often referred to as the 'double-double test'). [IFRS 9.B4.3.8(a)].

If a holder is permitted, but not required, to settle the combined instrument in a manner such that it does not recover substantially all of its recognised investment, e.g., puttable debt, condition (a) is not satisfied, and the embedded derivative is not separated. [IFRS 9.IG C.10]. The standard does not define 'substantially all' and therefore judgement will need to be applied, considering all relevant facts and circumstances.

To meet condition (b), the embedded derivative must be able to double the initial return on the host contract and result in a rate of return that is at least twice what would be expected for a similar host contract at the time it takes effect. If it meets only one part of this condition, but not the other, the derivative is regarded as closely related to the host. Due to the requirement in IFRS 9.B4.3.8(a), which states: "could result in a rate of return that is at least twice what the market return would be for a contract with the same terms as the host contract", the derivative embedded in a simple variable rate loan would be considered closely related to the host because the variable rate at any specific time would be a market rate.

As with all embedded derivatives, the assessment of condition (a) and (b) above is made when the entity becomes party to the contract (see section 3 above) on the basis of market conditions existing at that time. It is important to note that the assessment is based on the possibility of the holder not recovering its recognised investment or doubling its initial return and obtaining twice the then-market return. The likelihood of this happening is ignored in making the assessment. Therefore, even if the likelihood of this happening is low, the embedded derivative has to be separated from the host contract. The valuation of the embedded derivative would, however, consider the low probability of this happening, possibly resulting in a relatively low fair value at inception.

An example where the holder would not recover substantially all of its recognised investment would be a bond which becomes immediately repayable if SOFR increases above a certain threshold, at an amount significantly lower than its issue price. An Illustration is set out below.

Illustration 4-1: Leveraged inverse floater - not recovering substantially all of the initial investment

Company A issues a leveraged inverse floater loan note for its par value of CU20m. Interest is payable annually and is calculated as 10% minus 2 times three-month SOFR. At the time Company A issues the loan note, three-month SOFR is 3%, giving an initial return of 4%. There is no floor imposed on the interest rate and the rate could therefore be negative if SOFR increases above 5%. In such a case, the investor would need to pay interest on its investment, which would leave it unable to recover substantially all of its recognised investment. The embedded derivative is therefore not closely related to the host contract and will be accounted for separately by Company A.

An Illustration of condition (b) above, the 'double-double test', is set out below.

Illustration 4-2: Leveraged inverse floater - 'double-double test'

Assume the same fact pattern as in Illustration 4-1 above, except that there is a floor imposed on the coupon rate so that rate could not be negative. In such a case, the investor would recover substantially all of its recognised investment, meaning that no embedded derivative needs to be separated based on condition (a) above. However, before Company A could conclude on whether or not an embedded derivative needs to be recognised separately, it would need to evaluate condition (b) above. The first step is to assess whether there is a possible scenario in which the initial return of the investor would at least double. If SOFR falls to 0.5%, then the interest rate on the loan note would be 9%, which is more than double the investor's initial rate of return of 4%. The first part of the condition under (b) above is therefore fulfilled.

The question is now whether 9% is twice the market return for a contract with the same terms as the host contract. With SOFR being 0.5% this will most likely be the case, leaving both parts of condition (b) above fulfilled. The embedded derivative is therefore not closely related to the host contract and must be accounted for separately. If, however, it is concluded that 9% is not twice the market return for a contract with the same terms as the host contract, then only one part of the condition under (b) above would be fulfilled and the embedded feature would be considered closely related to the host with no requirement to record it separately.

Another Illustration is when the host contract contains an option to convert fixed-rate debt into floating-rate debt, this is set out below.

Illustration 4-3: Option to convert from fixed to floating

Company A issues a plain vanilla loan note for its par value of CU20m. Interest is payable annually and is set at 4% of the outstanding nominal. The contract contains an option to convert the loan note into a floating rate loan note paying 6-month SOFR plus 1% credit margin.

The holder has the right to exercise the conversion option, on specified dates, with no option to convert back into a fixed rate instrument. This floating rate loan note would mature on the same day as the initial fixed rate debt.

Such an option to convert fixed-rate debt into floating-rate debt is closely related to the fixed rate host debt and does not require separation. This is because, the contract is not leveraged and therefore will likely not lead to meeting condition (a). Further, the conversion option could not result in a rate of return more than double the market yield on a contract with similar terms to the host contract, unless the predetermined credit margin on conversion could mathematically result in a rate of return that is at least twice what the market rate of return would be for a contract with the same terms as the host contract. Therefore, condition (b) is also not met and the option would be closely related.

A recent example where it may be necessary to assess whether an embedded derivative exists is in the context of interest rate benchmark reform and the treatment of fallback provisions. See *Supplement: IBOR Reform* at section 3.2 for further detail.

4.1.3 Term extension and similar call, put and prepayment options in debt instruments

The application guidance explains that a call, put or prepayment option embedded in a host debt instrument is closely related to the host instrument if, on each exercise date, either i) the option's exercise price is approximately equal to the debt instrument's amortised cost or ii) the exercise price reimburses the lender for an amount up to the approximate present value of lost interest for the remaining term of the host contract; otherwise it is not regarded as closely related. [IFRS 9.B4.3.5(e)]. For embedded derivatives with more than one exercise date, there is no requirement to exclusively apply only assessment i) or ii) above to all dates, i.e., provided that either of the assessments is met for each exercise date, the embedded option will be considered to be closely related.

There is no elaboration on what is meant by the term 'approximately equal' and so judgement will need to be applied. In assessing whether the exercise price is approximately equal to the amortised cost at each exercise date, should one consider the amortised cost of the hybrid that would reflect the entity's original expectations regarding the future exercise of the prepayment option, or potential revised estimates applying the catch-up method to the amortised cost? This question is demonstrated in the following simple Illustration (which also provides further examples of the application of the effective interest method to instruments containing prepayment options).

Illustration 4-4: Embedded prepayment option

Company P borrows CU1,000 on terms that require it to pay annual fixed-rate coupons of CU80 and principal of CU1,000 at the end of ten years. The terms of the instrument also allow Company P to redeem the debt after seven years by paying the principal of CU1,000 and a penalty of CU100.

The debt instrument can be considered to comprise the following two components:

- A host debt instrument requiring ten annual payments of CU80 followed by a CU1,000 payment of principal
And
- An embedded prepayment option, exercisable only at the end of seven years with an exercise price of CU1,100

If, at inception, the prepayment option was expected *not* to be exercised, the effective interest rate of the hybrid instrument would be 8%. This is the rate that would discount the expected cash flows of CU80 per year for ten years plus CU1,000 at the end of ten years to the initial carrying amount of CU1,000. The table below provides information about the amortised cost, interest income and cash flows using this assumption.

	(a)	(b = a × 8%)	(c)	(d = a + b - c)
	Amortised cost at the start of the year	Interest and similar income	Cash flows	Amortised cost at the end of the year
Year	(CU)	(CU)	(CU)	(CU)
1	1,000	80	80	1,000
2	1,000	80	80	1,000
3	1,000	80	80	1,000
4	1,000	80	80	1,000
5	1,000	80	80	1,000
6	1,000	80	80	1,000
7	1,000	80	80	1,000
8	1,000	80	80	1,000
9	1,000	80	80	1,000
10	1,000	80	80 + 1,000	-

However, if at the outset the option was expected to be exercised, the effective interest rate of the hybrid would be 9.08% as this is the rate that discounts the expected cash flows of CU80 per year for seven years, plus CU1,100 at the end of seven years, to the initial carrying amount of CU1,000. The table below provides information about the amortised cost, interest income and cash flows using this alternative assumption.

	(a)	(b = a × 9.08%)	(c)	(d = a + b - c)
	Amortised cost at the start of the year	Interest and similar income	Cash flows	Amortised cost at the end of the year
Year	(CU)	(CU)	(CU)	(CU)
1	1,000	91	80	1,011
2	1,011	92	80	1,023
3	1,023	93	80	1,036
4	1,036	94	80	1,050
5	1,050	95	80	1,065
6	1,065	97	80	1,082
7	1,082	98	80 + 1,100	-

On the face of it, therefore, comparing the amortised cost of the hybrid instrument with the exercise price of the option at the date it could be exercised suggests the prepayment option might be considered closely related if it was likely to be exercised (since the amortised cost will be approximately equal to the exercise price of CU1,100) but not if exercise was unlikely (since the amortised cost of CU1,000 is not approximately equal to the exercise price of CU1,100).

Unfortunately, the standard is silent on this issue and preparers of accounts will be required to exercise judgement as to the most appropriate method to use in their individual circumstances.

The standard also says that an option or automatic provision to extend the remaining term to maturity of a debt instrument is not closely related to the host unless, at the time of the extension, there is a concurrent adjustment to the approximate current market rate of interest. [IFRS 9.B4.3.5(b)]. The current market rate of interest would take into consideration the credit risk of the issuer. Also, if an entity issues a debt instrument and the holder writes a call option on the debt instrument to a third party, the issuer regards the call option as extending the term to maturity of the debt instrument, provided the issuer can be required to participate in or facilitate the remarketing of the debt instrument as a result of the call option being exercised. [IFRS 9.B4.3.5(b)]. Such a component is presumably considered to represent part of a hybrid financial instrument contract rather than a separate instrument (see section 3 above).

Taken in isolation, the preceding paragraph and the first paragraph in this section on call, put or prepayment options appear reasonably straightforward to apply. However, in some situations, they are contradictory as set out in the following Illustration.

Illustration 4-5: Extension and prepayment options

Company Z borrows CU1,000 from Bank A on which it is required to pay CU50 per annum interest. Under the terms of the borrowing agreement, Company Z is required to repay CU1,000 in three years' time unless, at repayment date, it exercises an option to extend the term of the borrowing for a further two years. If this option is exercised CU50 interest per annum is payable for the additional term.

Company Z also borrows CU1,000 from Bank B on which it is required to pay CU50 per annum interest. Under the terms of this borrowing agreement, Company Z is required to repay CU1,000 in five years' time unless, at the end of three years, it exercises an option to redeem the borrowing for CU1,000.

In all practical respects these two instruments are identical - the only difference is the way in which the terms of the embedded options are expressed. In the first case, the guidance indicates that the term extension option is not closely related to the debt, as there is no concurrent adjustment to market interest rates. However, in the second case the prepayment option is considered closely related provided the amortised cost of the liability would be approximately CU1,000, the exercise price of the settlement option, at the end of year three, which it should be.

As set out in section 5.2 below, an embedded option-based derivative should be separated from its host contract on the basis of the stated terms of the option feature. However, in situations similar to the one described in Illustration 4-5 above, there is significant diversity in practice and we are aware of at least two ways in which entities have dealt with this contradiction in practice. Some entities have looked to the wording in the contract so that what is described as an extension option (or a prepayment option) is evaluated in accordance with the guidance for extension options (or prepayment options). Other entities have determined the most likely outcome of the hybrid instrument based on conditions at initial recognition and the alternative outcome is regarded as the 'option'. Under this latter approach, if Company Z in the Illustration above considered it was likely to repay its loans from Bank A and Bank B after three years, both loans would be regarded as having a two-year extension option. The first approach is based on the contractual terms, while the second approach is substance-based.

Another complication is that, viewed as a separate instrument, a term extension option is effectively a loan commitment. As loan commitments are generally outside the scope of IFRS 9, except for derecognition and impairment provisions (see Chapter 41), some would argue they do not meet the definition of a derivative (see section 1 above). Accordingly, when embedded in a host debt instrument, a loan commitment would not be separated as an embedded derivative or, alternatively, would be separated and accounted for as a loan commitment.⁹

The IFRS IC discussed both above contradictions in March 2012, noting significant diversity in practice and recommended that the IASB consider this issue when it redeliberated the classification and measurement requirements of financial liabilities under IFRS 9. The IFRS IC decided that if the Board did not address this issue as part of its redeliberation, then the IFRS IC would revisit this issue and consider whether guidance should be provided to clarify the accounting for the issuer of a fixed-rate-debt instrument that includes a term-extending option.¹⁰ This issue remains unaddressed in IFRS 9 with no indication from the IFRS IC about bringing it back onto its agenda. Preparers of financial statements are therefore left to apply their own judgement considering all the facts and circumstances.

For put, call and prepayment options, there is a further complication that the determination as to whether the option is closely related depends on the amortised cost of the instrument. It is not clear whether this reference is to the amortised cost of the host instrument, on the assumption that the option is separated, or to the amortised cost of the entire instrument on the assumption that the option is not separated. As can be seen in Chapter 46, the existence of such options can affect the amortised cost, especially for a portfolio of instruments. Although one trade body has published guidance explaining that where early repayment fees are included in the calculation of effective interest, the prepayment option is likely to be closely related to the loan,¹¹ entities are largely left to apply their own judgement to assess which appears the most appropriate in the specific circumstances.

9 Staff paper, *Term-extending options in fixed rate debt instruments*, IFRS IC, March 2012. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

10 [IFRIC Update](#), March 2012, available on the IFRS Foundation's website. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

11 *Implementation of International Accounting Standards*, British Bankers' Association, July 2004, para. 10. Whilst the guidance was provided in the context of IAS 39, it holds true under IFRS 9.

Prepayment options are also considered closely related to the host debt instrument if the exercise price reimburses the lender for an amount up to the approximate present value of lost interest for the remaining term of the host contract. For these purposes, lost interest is the product of the principal amount prepaid multiplied by the interest rate differential, i.e., the excess of the effective interest rate of the host contract over the effective interest rate that the entity would receive at the prepayment date if it reinvested the principal amount prepaid in a similar contract for the remaining term of the host contract. [IFRS 9.B4.3.5(e)(ii)]. In other words, in order for the prepayment option to be considered closely related to the host, the exercise price of the prepayment option would need to compensate the lender for loss of interest by reducing the economic loss from that which would be incurred on reinvestment. [IFRS 9.BCZ4.97]. In making this assessment, the question may arise what interest rate should be used to discount the interest payments that would be lost if the prepayment option was exercised. If the discount rate used reflects an equivalent credit risk of the issuer, this would seem reasonable. However, the guidance does not prescribe the discount rate to be used and since the assessment is whether the lender would be reimbursed for an amount that is 'approximately equal' to the present value of lost interest, there is scope to exercise judgement in determining the appropriate discount rate.

Another question that may arise is whether the lost interest test requires the lender to be reimbursed for lost interest over the full remaining contractual term at the date of exercise. The assessment states that the interest may be 'an amount up to' the present value of the remaining interest. This suggests that the amount may be less than the remaining present value of the contractual interest over the full remaining contractual term. Where this is the case, the prepayment option would be deemed to be closely related.

From the perspective of the issuer of a convertible debt instrument with an embedded call or put option, the assessment of whether the option is closely related to the host debt instrument is made before separating the equity element in accordance with IAS 32. [IFRS 9.B4.3.5(e)]. This provides a specific relaxation from the general guidance on prepayment options above because, for accounting purposes, separate accounting for the equity component results in a discount on recognition of the liability component (see Chapter 42), which means that the amortised cost and exercise price are unlikely to approximate to each other for much of the term of the instrument.

An embedded prepayment option in an interest-only or principal-only strip is regarded as closely related to the host contract provided the host contract (i) initially resulted from separating the right to receive contractual cash flows of a financial instrument that, in and of itself, did not contain an embedded derivative, and (ii) does not contain any terms not present in the original host debt contract.

[IFRS 9.B4.3.8(e)]. Again, this is a specific relaxation from the general guidance on prepayment options above.

There are also many capital instruments which have prepayment options that are contingent on a future event, for example a change of tax law or accounting rules. The standard is silent about how to perform the assessment of whether a contingent prepayment option is closely related to the host contract (the 'closely related' assessment).

How we see it

In our view, whether a prepayment option is closely related to the host contract depends on the exercise price only and the contingency should not affect the assessment.

4.1.4 Interest rate floors and caps

IFRS 9 provides the following guidance related to interest rate floors and caps: [IFRS 9.B4.3.8(b)]

Extract from IFRS 9

- B4.3.8** The economic characteristics and risks of an embedded derivative are closely related to the economic characteristics and risks of the host contract in the following examples. In these examples, an entity does not account for the embedded derivative separately from the host contract.
- (a) ...
 - (b) An embedded floor or cap on the interest rate on a debt contract or insurance contract is closely related to the host contract, provided the cap is at or above the market rate of interest and the floor is at or below the market rate of interest when the contract is issued, and the cap or floor is not leveraged in relation to the host contract ...
 - (c) ...

The standard does not clarify what is meant by ‘market rate of interest’, or whether the cap and floor should be considered as a single derivative, or a series of caplets and floorlets to be evaluated separately. Where the derivative rate is at a constant amount throughout the term of the debt, historically entities have often compared that rate with the current spot floating rate at inception of the contract to determine whether the embedded derivative is closely related.

How we see it

We do not believe it is necessary for both a cap and a floor to be present to be considered closely related. For example, a floor on the coupon paid on a debt instrument without a corresponding cap could be regarded as closely related to the host, provided it was below the market rate of interest on origination.

When interest rates are extremely low, or negative, floors are more commonly set at higher rates than current spot rates. As a result, entities would need to evaluate whether more sophisticated approaches to evaluate these features are more appropriate, e.g., by comparing the average forward rate over the life of the bond with the floor rate or by comparing the forward rate at each interest reset date with each floorlet rate.

The IFRS IC was asked, in January 2016, to clarify the application of the embedded derivatives requirements in a negative interest rate environment. The IFRS IC observed that:

- Paragraph B4.3.8(b) of IFRS 9 does not distinguish between positive and negative interest rate environments. As such an interest rate floor in a negative interest rate environment should be treated in the same way as in a positive interest rate environment.
 - When applying IFRS 9.B4.3.8(b) in a positive or negative interest rate environment, an entity should compare the overall interest rate floor (i.e., benchmark interest rate referenced in the contract plus contractual spreads and if applicable any premiums, discounts or other elements that would be relevant to the calculation of the effective interest rate) for the hybrid contract to the market rate of interest for a similar contract without the interest rate floor (i.e., the host contract).
- And
- The appropriate market rate of interest for the host contract should be determined by considering the specific forms of the host contract and the relevant spreads (including credit spreads) appropriate for the transaction. They also noted that the term ‘market rate of interest’ is linked to the concept of fair value as defined in IFRS 13 and is described in IFRS 9 as the rate of interest “for a similar instrument (similar as to currency, term, type of interest and other factors) with a similar credit rating”. [IFRS 9.B5.1.1].

The IFRS IC determined that neither an Interpretation nor an amendment to a Standard was necessary and did not add this issue to its agenda.¹²

In practice, entities perform the assessment of whether a cap or floor satisfies the requirements of IFRS 9.B4.3.8 (b) by either considering the cap or floor as a single instrument and applying the corresponding average forward swap rate (e.g., comparing a 5-year swap rate against a 5-year cap/floor strike), or by considering the component caplets and floorlets making up the overall cap or floor using the forward rate for the payment date of each particular caplet or floorlet. It is also acceptable to compare each of the individual cap/floor strike rates with the corresponding forward interest rate and assess whether, on average, the total cap/floor is closely related.

Where the assessment is performed as a single instrument and an entity determines that the cap or floor is not closely related, then the whole embedded derivative is accounted for as a single, non-closely related, embedded derivative at fair value through profit or loss.

4.1.5 Inflation-linked debt instruments

It is quite common for some entities and governments to issue inflation-linked debt instruments, i.e., where interest and/or principal payments are linked to, say, a consumer price index. The only embedded derivative guidance in IFRS 9 relating to embedded inflation-linked features is provided in the context of leases (see section 4.3.2 below). If that guidance is accepted as applying to finance leases, it should also apply to debt instruments because finance leases result in assets and liabilities that are, in substance, no different to debt instruments (see Chapter 41). Further, in much finance theory, either real (applied to current prices) or nominal (applied to inflation adjusted prices) interest rates are used, suggesting a strong link between inflation and interest rates. Finally, a government or central bank will generally raise short-term interest rates as inflation rises and reduce rates as inflation recedes, which also suggests a close relationship between the two.

¹² [IFRIC Update](#), January 2016, available on the IFRS Foundation’s website.

How we see it

We believe it would often be appropriate to treat the embedded derivative in inflation-linked debt as similar to an interest rate index and refer to the guidance in section 4.1.2 above to determine whether the index is regarded as closely related to the debt.

Typically, the index will be closely related to the debt where it is based on inflation in an economic environment in which the bond is issued/denominated, it is not significantly leveraged in relation to the debt and there is a sufficiently low risk of the investor not recovering its initial investment. An investor may lose their initial investment on an inflation-linked instrument if cumulative inflation over the life of the bond is negative and the rate is not floored at zero. Although this risk is often small, an argument could be constructed to separate the embedded derivative on the grounds that the initial investment could not be fully recovered.

The staff of the IFRS IC has expressed a view that it would be appropriate to treat the embedded derivative in inflation-linked debt as closely related in economic environments where interest rates are mainly set so as to meet inflation targets, as evidenced by strong long-run correlation between nominal interest rates and inflation. In such jurisdictions, they considered the characteristics and risks of the inflation embedded derivative to be closely related to the host debt contract.¹³ Further, in debating the application of the effective interest method to such instruments (see Chapter 46) they have implicitly acknowledged that these instruments do not necessarily contain embedded derivatives requiring separation.

4.1.6 Commodity- and equity-linked interest and principal payments

Equity-indexed or commodity-indexed interest or principal payments embedded in a host debt instrument, i.e., where the amount of interest or principal is indexed to the value of an equity instrument or commodity (e.g., gold), are not closely related to the host debt instrument because the risks inherent in the embedded derivative are dissimilar to those of the host. [IFRS 9.B4.3.5(c), IFRS 9.B4.3.5(d)]. This is shown in Illustration 4-6 below.

Illustration 4-6: Bond linked to a commodity price

A mining company issues a ten-year debt instrument for its par value of CU15m. Interest is payable annually and consists of guaranteed interest of 5% per annum and contingent interest of 0.5% if the price of commodity A increases above CU300 in the relevant year, 1% if the price of commodity A increases above CU400 in the relevant year or 1.5% if the price of commodity A increases above CU500 in the relevant year. The mining company could have issued the bond without the contingent interest rate feature at a rate of 6%.

The commodity price feature is a swap contract to receive 1% fixed interest and pay a variable amount of interest depending on the price of commodity A. This feature is not closely related to the debt host contract.

A common type of transaction that does not involve a debt instrument is where refiners of commodities enter into purchase contracts for mineral ores, whose price is adjusted subsequent to delivery, based on the quoted market price of the refined commodity extracted from the ore. These arrangements, often called provisionally priced contracts, can provide the refiner with a hedge of the fair value of its inventories and/or related sales proceeds which vary depending on subsequent changes in quoted commodity prices.

Like the debt instruments noted above, any payable (or receivable) recognised at the time of delivery will contain an embedded commodity derivative. In these circumstances, any payable will either need to be fair valued through profit or loss or the embedded derivative will need to be separated. Since the receivable is an asset within the scope of IFRS 9, the embedded derivative cannot be separated.

However, it would not normally be regarded as necessary to account separately for such an embedded derivative prior to delivery of the non-financial item. This is because, until delivery occurs, the contract is considered executory and the pricing feature would be considered closely related to the commodity being delivered (see section 4.2.2 below).

13 Information for Observers of March 2006 IFRS IC meeting, *Hedging Inflation Risk* (Agenda Paper 12), IASB, March 2006, para. 32. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

4.1.7 Credit-linked notes

Credit derivatives are sometimes embedded in a host debt instrument whereby one party (the 'beneficiary') transfers the credit risk of a particular reference asset, which it may not own, to another party (the 'guarantor'). Such credit derivatives allow the guarantor to assume the credit risk associated with the reference asset without directly owning it. [IFRS 9.B4.3.5(f)].

Whilst the economic characteristics of a debt instrument will include credit risk, should the embedded derivative be a credit derivative linked to the credit standing of an entity other than the issuer, it would not normally be regarded as closely related to the host debt instrument if the issuer were not required, through the terms of the financial instrument, to own the reference asset.

For example, a structured entity may issue various tranches of debt instruments that are referenced to a group of assets, such as a portfolio of bonds, mortgages or trade receivables, and the credit exposure from those assets is allocated to the debt instruments using a so called 'waterfall' feature. The waterfall feature itself does not normally result in the separation of an embedded credit derivative; it is the location or ownership of the reference assets that is most important to the assessment.¹⁴ If the structured entity is required to hold the reference assets, the credit risk embedded in the debt instruments is considered closely related. However, if the issuer of the debt instruments held a credit derivative over the reference assets rather than the assets themselves, the embedded credit derivative would not be regarded as closely related.

4.1.8 Instruments with an equity kicker

In some instances, venture capital entities provide subordinated loans on terms that entitle them to receive shares if and when the borrowing entity lists its shares on a stock exchange, as illustrated in the following Illustration, which is based on the same fact pattern as Illustration 1-4 in section 1.1.2 above.

Illustration 4-7: Equity kicker

A venture capital investor, Company V, provides a subordinated loan to Company A and agrees that in addition to interest and repayment of principal, if Company A lists its shares on a stock exchange, Company V will be entitled to receive shares in Company A free of charge or at a very low price (an 'equity kicker'). As a result of this feature, interest on the loan is lower than it would otherwise be. The loan is not measured by Company A at fair value with changes in fair value recognised in profit or loss.

The economic characteristics and risks of an equity return are not closely related to those of the host debt instrument. The equity kicker meets the definition of a derivative because it has a value that changes in response to the change in the price of Company A's shares, requires only a relatively small initial net investment, and is settled at a future date. It does not matter that the right to receive shares is contingent upon the borrower's future listing (although the probability of this event occurring will influence the fair value of the embedded derivative). [IFRS 9.IG C.4].

Similarly, the derivative embedded in a bond that is convertible (or exchangeable) into equity shares of a third party will not be closely related to the host debt instrument.

4.1.9 Puttable instruments

Another example of a hybrid contract is a financial instrument that gives the holder a right to put it back to the issuer (a 'puttable instrument') in exchange for an amount that varies with the change in an equity or commodity price or index. Where the host is a debt instrument, the embedded derivative that creates the indexed principal payment cannot be regarded as closely related to that debt instrument. As the principal payment can increase and decrease, the embedded derivative is a non-option derivative whose value is indexed to the underlying variable (see section 5.1 below). [IFRS 9.B4.3.5(a), IFRS 9.B4.3.6].

¹⁴ Information for Observers (December 2008 IASB meeting), *Clarification of accounting for investments in collateralised debt obligations* (Agenda Paper 6E), IASB, December 2008 and Q&As on accounting for some collateralised debts obligations (CDOs) - prepared by staff of the IASB, IASB, February 2009. Whilst the IASB discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

From the perspective of the issuer of a puttable instrument that can be put back at any time for cash equal to a proportionate share of the net asset value of an entity (such as units of an open-ended mutual fund or some unit-linked investment products), the effect of the issuer separating an embedded derivative and accounting for each component is to measure the combined instrument at the redemption amount that would be payable at the end of the reporting period if the holder were to exercise its right to put the instrument back to the issuer. [IFRS 9.B4.3.7].

For the holder of such an instrument, the requirements of the standard are applied to the instrument as a whole, resulting in such investments in puttable instruments being recognised at fair value through profit or loss in their entirety. [IFRS 9.4.3.2].

This treatment was clarified by the IFRS IC in May 2017 when the IFRS IC confirmed that the election to present subsequent changes in fair value in other comprehensive income was not available to these instruments, as they did not meet the definition of an equity instrument.¹⁵

Whilst it was not explicitly stated, the ineligibility of such instruments to make this election means they must be recognised at fair value through profit or loss.

4.2 Contracts for the sale of goods or services

4.2.1 Foreign currency derivatives

An embedded foreign currency derivative in a contract that is an insurance contract, or not a financial instrument, is closely related to the host contract provided it is not leveraged, does not contain an option feature and requires payments denominated in one of the following currencies:

- (i) The functional currency of any substantial party to the contract - see section 4.2.1.A below
- (ii) The currency in which the price of the related good or service that is acquired or delivered is routinely denominated in commercial transactions around the world (such as the US dollar for crude oil transactions) - see section 4.2.1.B below

Or

- (iii) A currency that is commonly used in contracts to purchase or sell non-financial items in the economic environment in which the transaction takes place (e.g., a relatively stable and liquid currency that is commonly used in local business transactions or external trade) - see section 4.2.1.C below

Therefore, in all of the above cases the embedded foreign currency derivative is not accounted for separately from the host contract. [IFRS 9.B4.3.8(d)]. These criteria are examined in more detail below.

4.2.1.A Functional currency of counterparty

In principle, the assessment of criterion (i) in section 4.2.1 above is straightforward. In practice, however, the functional currency of the counterparty to a contract will not always be known with certainty and, in some cases, can be a somewhat subjective assessment even for the counterparty's management (assuming the counterparty is a corporate entity) - see Chapter 16. Consequently, entities will need to demonstrate they have taken appropriate steps to make a reasonable judgement as to their counterparties' functional currencies. Where available, a counterparty's financial statements will provide evidence of its functional currency. Otherwise, it would often be appropriate to assume that an entity operating in a single country has that country's currency as its functional currency, although if there are indicators to the contrary these would have to be considered.

Another practical problem that arises in applying this criterion is identifying which parties to a contract are 'substantial'. IFRS 9 does not provide any further guidance, but it is generally considered that such a party should be one that is acting as principal to the contract. Therefore if, as part of a contract, a parent provides a performance guarantee in respect of services to be provided by its operating subsidiary, the parent may be seen to be the substantial party to the contract and not the subsidiary, where the subsidiary is acting as an agent. However, if the guarantee is not expected to be called upon, the parent would not normally be considered a substantial party to the contract. Particular care is necessary when assessing a contract under which one party subcontracts an element of the work to another entity under common control, say a fellow subsidiary with a different functional currency, although in most cases it will only be the primary contractor that is considered a substantial party.

¹⁵ [IFRIC Update](#), May 2017, available on the IFRS Foundation's website.

4.2.1.B Routinely denominated in commercial transactions

For the purposes of criterion (ii) in section 4.2.1 above, the currency must be used for similar transactions all around the world, not just in one local area. For example, if cross-border transactions in natural gas in North America are routinely denominated in US dollars and such transactions are routinely denominated in euros in Europe, neither the US dollar nor the euro is a currency in which the good or service is routinely denominated in international commerce. [IFRS 9.IG C.9]. Accordingly, the number of items to which this will apply will be limited - in practice it will be mainly commodities that are traded in, say, US dollars throughout much of the world. Examples include crude oil, jet fuel, certain base metals (including aluminium, copper and nickel) and some precious metals (including gold, silver and platinum). One other notable item might be wide-bodied aircraft where it appears that Boeing and Airbus, the two major manufacturers, routinely denominate sales in US dollars.

In September 2014, the IFRS IC received a request relating to the routinely denominated criterion. They were asked to consider whether a licensing agreement denominated in a currency, in which commercial transactions of that type were routinely denominated around the world, held an embedded foreign currency derivative that was closely related to the economic characteristics of the host contract.¹⁶

The IFRS IC noted that the issue related to a contract for a specific type of item and observed that an assessment of routinely denominated criterion is based on evidence of whether or not such commercial transactions are denominated in that currency all around the world and not merely in one local area. They further observed that the assessment of the routinely denominated criterion is a question of fact and is based on an assessment of available evidence.

4.2.1.C Commonly used currencies

The IASB noted that the requirement to separate embedded foreign currency derivatives may be burdensome for entities that operate in economies in which business contracts denominated in a foreign currency are common. For example, entities domiciled in small countries may find it convenient to denominate business contracts with entities from other small countries in an internationally liquid currency (such as the US dollar, euro or yen) rather than the local currency of any party to the transaction. Also, an entity operating in a hyperinflationary economy may use a price list in a hard currency to protect against inflation, for example an entity that has a foreign operation in a hyperinflationary economy that denominates local contracts in the functional currency of the parent. [IFRS 9.BCZ4.94].

Unfortunately, however, the assessment of whether or not a particular currency meets this requirement in a particular situation has not been straightforward in practice and this question reached the attention of the IFRS IC in May 2007.

The IFRS IC debated this matter in four consecutive meetings before referring the matter to the IASB. During its debates, the IFRS IC noted that entities should:¹⁷

- Identify where the transaction takes place.
This is not as straightforward as it might seem. For example, consider a Polish company that manufactures components in Poland and exports them to a third party in the Czech Republic. Should the sale of components be regarded as a transaction occurring in Poland or in the Czech Republic?¹⁸ It is likely that the Polish company would regard it as occurring in Poland and the Czech entity in the Czech Republic, but this is not entirely beyond debate.
- Identify currencies that are commonly used in the economic environment in which the transaction takes place.
Entities need to address what the population of transactions in the economic environment is. Some might suggest that transactions to which (i) or (ii) in section 4.2.1 above apply should be excluded, although this is not a view shared by the staff of the IFRS IC which considered that all transactions should be included.¹⁹

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

17 [IFRIC Update](#), May 2007, available on the IFRS Foundation's website.

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

18 Information for Observers (May 2007 IFRS IC meeting), IAS 39: *Financial Instruments: Recognition and Measurement* AG33(d)(iii) of IAS 39 (Agenda Paper 11(v)), IASB, May 2007, paras. 12-14. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

19 Information for Observers, paras. 18-19. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

Entities should also consider what an economic environment is. The guidance in IFRS 9.IG C.7, on which Illustration 4-8 in section 4.2.1.D below is based, implies that a country could be an economic environment. The references to local business transactions and to external trade in section 4.2.1 (iii) above suggest that other examples of economic environment are the external trade or internal trade environment of the country in which the transaction takes place. The question remains as to whether there could be other economic environments, for example the luxury goods market in a country. Depending on the view taken, a different treatment could arise.²⁰ In considering the issue subsequently, the IASB staff noted their understanding that all of these views (and possibly more, such as the internal or external trade of a specific company) were being applied in practice.²¹

The IFRS IC had also been asked to provide guidance on how to interpret the term 'common', but understandably was reluctant to do so.²² The IASB staff noted that there is no guidance as to the quantum of transactions or value that would need to be denominated in a foreign currency to conclude that the currency was commonly used and that a related matter is whether 'common' should be considered in the context of a particular entity, of an industry, or of a country.²³

The IASB staff noted other related interpretive questions raised by constituents including the following:²⁴

- What evidence does an entity require to support the notion that the use of a currency is common?
- Does the reporting entity need to investigate published statistics?
- If the reporting entity has to look for statistics, what percentage of business needs to be conducted in that currency to assert that use of the currency is common?
- Whether the consideration that a currency is commonly used should exclude from the population set those transactions falling under (i) or (ii) in section 4.2.1 above?

They concluded that there are a variety of views on the appropriate interpretation of this guidance and, consequently, that there is significant diversity in practice.²⁵

Ultimately, however, no additional guidance has been included within IFRS 9 and, therefore, determining what constitutes 'common' remains a matter where judgement is required.

4.2.1.D Examples and other practical issues

The application of the guidance above is illustrated below.

Illustration 4-8: Oil contract denominated in Swiss francs

A Norwegian company agrees to sell oil to a company in France. The oil contract is denominated in Swiss francs, although oil contracts are routinely denominated in US dollars in international commerce and Norwegian krone are commonly used in contracts to purchase or sell non-financial items in Norway. Neither company carries out any significant activities in Swiss francs.

The Norwegian company should regard the supply contract as a host contract with an embedded foreign currency forward to purchase Swiss francs. The French company should regard it as a host contract with an embedded foreign currency forward to sell Swiss francs. [IFRS 9.IG C.7].

Whilst the IASB discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

22 Information for Observers (May 2007 IFRS IC meeting), *IAS 39: Financial Instruments: Recognition and Measurement AG33(d)(iii) of IAS 39* (Agenda Paper 11(v)), IASB, May 2007, para. 44. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

23 Information for Observers (December 2007 IASB meeting), *Application of paragraph AG33(d)(iii) - Bifurcation of embedded foreign currency derivative* (Agenda Paper 3C), IASB, December 2007, paras. 12-13. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

24 Information for Observers, para. 14. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

25 Information for Observers, para. 15. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

The implementation guidance on which this Illustration is based does not state in which currency the host contract should be denominated (this will also be the currency of the second leg of the embedded forward contract). The currency should be chosen so that the host does not contain an embedded derivative requiring separation. In theory, therefore, it could be Norwegian krone or euro (the functional currencies of the parties to the contract) or US dollars (the currency in which oil contracts are routinely denominated in international commerce). Typically, however, an entity will use its own functional currency to define the terms of the host contract and embedded derivative.

A second issue arises where the terms of the contract require delivery and payment on different dates. For example, assume the contract was entered into on 1 January, with delivery scheduled for 30 June and payment required by 30 September. Should the embedded derivative be considered a six-month forward contract maturing on 30 June, or a nine-month forward contract maturing on 30 September? Conceptually at least, the latter approach seems more satisfactory, because it does not introduce into the notional terms cash flows at a point in time (i.e., on delivery) when none exist in the combined contract. In practice, however, the former approach is used far more often and is not without technical merit. It avoids the recognition of an embedded foreign currency derivative between the delivery and payment dates on what would be a foreign currency denominated monetary item, something that is prohibited by IFRS 9 (see section 4.1.1 above).

Illustration 4-9: Oil contract, denominated in US dollars and containing a leveraged foreign exchange payment

Company A, whose functional currency is the euro, enters into a contract with Company B, whose functional currency is the Norwegian Krone, to purchase oil in six months for US\$1,000. The host oil contract will be settled by making and taking delivery in the normal course of business and is not accounted for as a financial instrument because it qualifies as a normal sale or purchase contract (see Chapter 41). The oil contract includes a leveraged foreign exchange provision whereby the parties, in addition to the provision of, and payment for oil, will exchange an amount equal to the fluctuation in the exchange rate of the US dollar and Norwegian Krone applied to a notional amount of US\$100,000.

The payment of US\$1,000 under the host oil contract can be viewed as a foreign currency derivative because the dollar is neither Company A nor Company B's functional currency. However, it would not be separated as the US dollar is the currency in which crude oil transactions are routinely denominated in international commerce.

The leveraged foreign exchange provision is in addition to the required payment for the oil transaction. It is unrelated to the host oil contract and is therefore separated and accounted for as an embedded derivative.

[IFRS 9.IG C.8].

In practice, all but the simplest contracts will contain other terms and features that can often make it much more difficult to isolate the precise terms of the embedded foreign currency derivative (and the host). For example, a clause may allow a purchaser to terminate the contract in return for making a specified compensation payment to the supplier. The standard offers little guidance whether such a feature should be included within the terms of the host, of the embedded foreign currency derivative or, possibly, of both. Other problematic terms can include options to defer the specified delivery date and options to order additional goods or services.

Another practical issue arises when part of the contract price is in a currency that is neither party's functional currency, nor meets the other exemptions in IFRS 9.B4.3.8(d). The question arises whether that component of the contract should be treated as an embedded derivative and accounted for separately.

How we see it

In our view, when part of the contract price is in a currency that is neither party's functional currency, nor meets the other exemptions in IFRS 9.B4.3.8(d), the entity treats that component of the contract as an embedded derivative and accounts for it separately.

4.2.2 Inputs, ingredients, substitutes and other proxy pricing mechanisms

It is common for the pricing of contracts for the supply of goods, services or other non-financial items to be determined by reference to the price of inputs to, ingredients used to generate, or substitutes for the non-financial item, especially where the non-financial item is not itself quoted in an active market. For example, a provider of call centre services may determine that a large proportion of the costs of providing the service will be employee costs in a particular country. Accordingly, it may seek to link the price in a long-term contract to supply its services to the relevant wage index, effectively to provide an economic hedge of its exposure to changes in employee costs. Similarly, the producer of goods may index the price of its product to the market value of commodities that are used in the production process.

The standard contains little or no detailed guidance for determining whether or not such pricing features should be considered closely related to the host contract. However, the general requirement of the standard to assess the economic characteristics and risks would suggest that where a good link to the inputs can be established, such features will normally be considered closely related to the host, unless they were significantly leveraged.

Other proxy pricing mechanisms may arise in long-term supply agreements for commodities where there is no active market in the commodity. For example, in the 1980s, when natural gas first started to be extracted from the North Sea in significant volumes, there was no active market for that gas and thus no market price on which to base the price of long-term contracts. Because of this, suppliers and customers were willing to enter into such contracts where the price was indexed to the market price of other commodities such as crude oil that could potentially be used as a substitute for gas. For contracts entered into before the development of an active gas market, such features would normally be considered closely related, especially if similar pricing mechanisms were commonly used by other participants in the market.

Where there is an active market price for the non-financial items being supplied under the contract, different considerations apply.

How we see it

In our view, if the non-financial item for which an active market exists is priced by indexing it to a proxy, this mechanism is a strong indication that the entity has entered into a speculative position and we would not normally consider such features to be closely related to the host.

The separation of these types of embedded derivatives can be seen in the following Practical example from BP p.l.c.'s financial statements. Although this was disclosed under IAS 39, there is no reason to believe that the outcome would be different under IFRS 9.

Practical example 4-1: BP p.l.c. (2014)		United Kingdom
Annual Report and Form 20-F 2014 [extract]		
Notes on financial statements [extract]		
28. Derivative financial instruments [extract]		
Embedded derivatives		
The group is a party to certain natural gas contracts containing embedded derivatives. Prior to the development of an active gas trading market, UK gas contracts were priced using a basket of available price indices, primarily relating to oil products, power and inflation. After the development of an active UK gas market, certain contracts were entered into or renegotiated using pricing formulae not directly related to gas prices, for example, oil product and power prices. In these circumstances, pricing formulae have been determined to be derivatives, embedded within the overall contractual arrangements that are not clearly and closely related to the underlying commodity. The resulting fair value relating to these contracts is recognized on the balance sheet with gains or losses recognized in the income statement.		
Key information on the natural gas contracts is given below.		
At 31 December	2014	2013
Remaining contract terms	5 months to 3 years and 9 months	1 year and 5 months to 4 years and 9 months
Contractual/notional amount	70 million therms	153 million therms
...		

4.2.3 Inflation-linked features

Apart from those related to leases (see section 4.3.2 below), there is no reference in the guidance to contracts containing payments that are linked to inflation. Many types of contracts contain inflation-linked payments and it would appear sensible to apply the guidance in respect of leases to these contracts. Consider, for example, a long-term agreement to supply services under which payments increase by reference to a general price index and are not leveraged in any way. In cases such as this, the embedded inflation-linked derivative would normally be considered closely related to the host, provided the index related to a measure of inflation in an appropriate economic environment, such as the one in which the services were being supplied.

4.2.4 Floors and caps

Similar to debt instruments (see section 4.1.4 above), provisions within a contract to purchase or sell an asset (e.g., a commodity) that establishes a cap and a floor on the price to be paid or received for the asset are closely related to the host contract if both the cap and floor were out-of-the-money at inception and are not leveraged. [IFRS 9.B4.3.8(b)].

4.2.5 Fund performance fees

In the investment management industry, it is common for a fund manager to receive a fee based on the performance of the assets managed in addition to a base fee. For example, if a fund's net asset value increases over its accounting year, the manager may be entitled to a percentage of that increase. The contract for providing investment management services to the fund clearly contains an embedded derivative (the underlying is the value of the fund's assets).

How we see it

In our view, it would normally be appropriate to regard such fund performance fee type features as closely related to the host contract.

Performance-based fees are examples of variable consideration, which is discussed in more detail in Chapter 28.

4.3 Leases

IFRS 9 provides the following guidance for embedded derivatives within lease contracts: [IFRS 9.B4.3.8(f)]

Extract from IFRS 9

- B4.3.8 The economic characteristics and risks of an embedded derivative are closely related to the economic characteristics and risks of the host contract in the following examples. In these examples, an entity does not account for the embedded derivative separately from the host contract.
- (a) ...
 - (f) An embedded derivative in a host lease contract is closely related to the host contract if the embedded derivative is (i) an inflation-related index such as an index of lease payments to a consumer price index (provided that the lease is not leveraged and the index relates to inflation in the entity's own economic environment), (ii) variable lease payments based on related sales or (iii) variable lease payments based on variable interest rates.
 - (g) ...

These examples are dealt with in sections 4.3.1 to 4.3.4 below.

4.3.1 Foreign currency derivatives

A lessor's finance lease receivable or a lessee's lease payable, which is recognised in accordance with IFRS 16 *Leases*, is accounted for as a financial instrument, albeit one that is not subject to all of the measurement requirements of IFRS 9 (see Chapter 41). Therefore, a lease denominated in a foreign currency will not generally be considered to contain an embedded foreign currency derivative requiring separation, because the payable or receivable is a monetary item within the scope of IAS21.

However, under IFRS 16, an operating lease for a lessor and a short-term lease for a lessee, is accounted for as an executory contract. Accordingly, where the lease payments are denominated in a foreign currency, the analysis in section 4.2.1 above is applicable and it may be necessary to separate an embedded derivative. See Illustration 5-1 in section 5.1 below for an example of a foreign exchange currency derivative requiring separation from a (hybrid) lease contract.

4.3.2 Inflation-linked features

An embedded derivative in a lease is considered closely related to the host if it is an inflation-related index such as an index of lease payments to a consumer price index, provided that the lease is not leveraged and the index relates to inflation in the entity's own economic environment. [IFRS 9.B4.3.8(f)(i)].

4.3.3 Contingent rentals based on related sales

Where a lease requires contingent rentals based on related sales, that embedded derivative is considered to be closely related to the host lease. [IFRS 9.B4.3.8(f)(ii)].

4.3.4 Contingent rentals based on variable interest rates

If a derivative embedded within a lease arises from contingent rentals based on variable interest rates, it is considered closely related. [IFRS 9.B4.3.8(f)(iii)].

4.4 Insurance contracts

The guidance in sections 4.1.2 to 4.1.4, 4.1.6 and 4.2.1 above also applies to insurance contracts. IFRS 4 added two further illustrations to IFRS 9 that deal primarily with insurance contracts.

A unit-linking feature embedded in a host financial instrument, or host insurance contract, is closely related to the host if the unit-denominated payments are measured at current unit values that reflect the fair values of the assets of the fund. A unit-linking feature is a contractual term that requires payments denominated in units of an internal or external investment fund. [IFRS 9.B4.3.8(g)].

A derivative embedded in an insurance contract is closely related to the host if the embedded derivative and host are so interdependent that the embedded derivative cannot be measured separately, i.e., without considering the host contract. [IFRS 9.B4.3.8(h)].

Derivatives embedded within insurance contracts are covered in more detail in Chapter 51.

5 Identifying the terms of embedded derivatives and host contracts

The IASB has provided only limited guidance on determining the terms of a separated embedded derivative and host contract. Accordingly, entities may find this aspect of the embedded derivative requirements particularly difficult to implement. In addition to the guidance set out below, Illustration 4-8 and Illustration 4-9 in section 4.2.1.D above also identify the terms of an embedded derivative requiring separation. For guidance on assessing whether day one profits can arise on the separation of an embedded derivative, please refer to Chapter 45.

5.1 Embedded non-option derivatives

IFRS 9 does not define the term ‘non-option derivative’ but suggests that it includes forwards, swaps and similar contracts. An embedded derivative of this type should be separated from its host contract on the basis of its stated or implied substantive terms, so as to result in it having a fair value of zero at initial recognition. [IFRS 9.B4.3.3].

The IASB has provided implementation guidance on separating non-option derivatives in the situation where the host is a debt instrument. It is explained that, in the absence of implied or stated terms, judgement will be necessary to identify the terms of the host (e.g., whether it should be a fixed rate, variable rate or zero-coupon instrument) and the embedded derivative. However, an embedded derivative that is not already clearly present in the hybrid should not be separated, i.e., a cash flow that does not exist cannot be created. [IFRS 9.IG C.1].

For example, if a five-year debt instrument has fixed annual interest payments of CU40 and a principal payment at maturity of CU1,000 multiplied by the change in an equity price index, it would be inappropriate to identify a floating rate host and an embedded equity swap that has an offsetting floating rate leg. The host should be a fixed rate debt instrument that pays CU40 annually because there are no floating interest rate cash flows in the hybrid instrument. [IFRS 9.IG C.1].

Further, as noted above, the terms of the embedded derivative should be determined so that it has a fair value of zero on inception of the hybrid instrument. It is explained that if an embedded non-option derivative could be separated on other terms, a single hybrid instrument could be decomposed into an infinite variety of combinations of host debt instruments and embedded derivatives. This might be achieved, for example, by separating embedded derivatives with terms that create leverage, asymmetry or some other risk exposure not already present in the hybrid instrument. [IFRS 9.IG C.1].

Finally, it is explained that the terms of the embedded derivative should be identified based on the conditions existing when the financial instrument was issued, [IFRS 9.IG C.1], or when a contract is required to be reassessed (see section 6 below).

The following Illustration illustrates how a foreign currency derivative embedded in a (hybrid) lease contract, that is not closely related, could be separated.

Illustration 5-1: Separation of embedded derivative from a lease

Company X has Indian Rupees (INR) as its functional currency. On 1 January 20X1 Company X entered into a nine-month lease over an item of PP&E which required payments of US\$100,000 on 31 March 20X1, 30 June 20X1 and 30 September 20X1. The functional currency of the lessor is not US dollars; the price of such leases is not routinely denominated in US dollars and US dollars is not a currency that is commonly used in the economic environment in which the lease took place (see section 4.3.1 above). Accordingly, the embedded foreign currency derivative is not closely related to the lease.

On 1 January 20X1 the spot exchange rate was 40 and the forward exchange rates for settlement on 31 March 20X1, 30 June 20X1 and 30 September 20X1 were 41, 42 and 43 respectively. The terms of the embedded derivative could be determined as follows:

31 March 20X1	Pay US\$100,000	Receive INR4,100,000
30 June 20X1	Pay US\$100,000	Receive INR4,200,000
30 September 20X1	Pay US\$100,000	Receive INR4,300,000

Given the terms of the embedded derivative above, the host contract will be a nine-month lease over the same PP&E as the hybrid lease contract, commencing 1 January 20X1 and with scheduled payments of INR 4,100,000, INR 4,200,000 and INR 4,300,000 on 31 March 20X1, 30 June 20X1 and 30 September 20X1. It can be seen that this host, after separation of the foreign currency derivative, an INR denominated lease, does not contain an embedded derivative requiring separation and the combined terms of the two components sum to the terms of the hybrid contract.

5.2 Embedded option-based derivative

As for non-option derivatives, IFRS 9 does not define the term ‘option-based derivative’ but suggests that it includes puts, calls, caps, floors and swaptions. An embedded derivative of this type should be separated from its host contract on the basis of the stated terms of the option feature. [IFRS 9.B4.3.3].

The implementation guidance explains that the economic nature of an option-based derivative is fundamentally different from a non-option derivative and depends critically on the strike price (or strike rate) specified for the option feature in the hybrid instrument. Therefore, the separation of such a derivative should be based on the stated terms of the option feature documented in the hybrid instrument. Consequently, in contrast to the position for non-option derivatives (see section 5.1 above), an embedded option-based derivative would not normally have a fair value of zero. [IFRS 9.IG C.2].

In fact, if the terms of an embedded option-based derivative were identified so as to result in it having a fair value of zero, the implied strike price would generally result in the option being infinitely out-of-the-money, i.e., it would have a zero probability of the option feature being exercised. However, since the probability of exercising the option feature is generally not zero, this would be inconsistent with the likely economic behaviour of the hybrid. [IFRS 9.IG C.2].

Similarly, if the terms were identified to achieve an intrinsic value of zero, the strike price would equal the price of the underlying at initial recognition. In this case, the fair value of the option would consist only of time value. However, this may also be inconsistent with the likely economic behaviour of the hybrid, including the probability of the option feature being exercised, unless the agreed strike price was indeed equal to the price of the underlying at initial recognition. [IFRS 9.IG C.2].

5.3 Multiple embedded derivatives

The Standard includes the following guidance related to the issue of multiple embedded derivatives: [IFRS 9.B4.3.4]

Extract from IFRS 9

B4.3.4 Generally, multiple embedded derivatives in a single hybrid contract are treated as a single compound embedded derivative. However, embedded derivatives that are classified as equity (see IAS 32 *Financial Instruments: Presentation*) are accounted for separately from those classified as assets or liabilities. In addition, if a hybrid contract has more than one embedded derivative and those derivatives relate to different risk exposures and are readily separable and independent of each other, they are accounted for separately from each other.

For example, if a debt instrument has a principal amount related to an equity index and that amount doubles if the equity index exceeds a certain level, it is not appropriate to separate both a forward and an option on the equity index because those derivative features relate to the same risk exposure. Instead, the forward and option elements are treated as a single compound embedded derivative. Similarly, for an embedded call, put or prepayment option, if the risk associated with the option varies distinctly in different periods over the debt instrument’s life, it would still be considered as a single embedded derivative. For the same reason, an embedded floor or cap on interest rates should not be separated into a series of ‘floorlets’ or ‘caplets’ (i.e., single interest rate options).²⁶

On the other hand, if a hybrid debt instrument contains, for example, two options that give the holder a right to choose both the interest rate index on which interest payments are determined and the currency in which the principal is repaid, those two options may qualify for separation as two separate embedded derivatives since they relate to different risk exposures and are readily separable and independent of each other.²⁷

²⁶ IGC Q&A 23-8. Whilst the IGC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

²⁷ IGC Q&A 23-8. Whilst the IGC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

6 Reassessment of embedded derivatives

On initial recognition, a contract should be reviewed to assess whether it contains one or more embedded derivatives requiring separation. However, the issue arises whether an entity is required to continue to carry out this assessment after it first becomes a party to a contract, and if so, with what frequency. [IFRS 9.BCZ4.99].

The question is relevant, for example, when the terms of the embedded derivative do not change but market conditions change and the market was the principal factor in determining whether the host contract and embedded derivative are closely related. Instances when this might arise are embedded foreign currency derivatives in host contracts that are insurance contracts or contracts for the purchase or sale of a non-financial item denominated in a foreign currency. [IFRS 9.BCZ4.100, IFRS 9.B4.3.8(d)].

Consider, for example, an entity that enters into a purchase contract denominated in US dollars. If, at the time the contract is entered into, US dollars are commonly used in the economic environment in which the transaction takes place, the contract will not contain an embedded foreign currency derivative requiring separation. Subsequently however, the economic environment may change such that transactions are now commonly denominated in euros, rather than US dollars. Countries joining the European Union may encounter just such a scenario.

Clearly, in this situation, an embedded foreign currency derivative would be separated from any new US dollar denominated purchase contracts, assuming they would not otherwise be considered closely related. However, should the entity separately account for derivatives embedded within its existing US dollar denominated contracts that were outstanding prior to the change in the market?

Conversely, the entity may have identified, and separately accounted for, embedded foreign currency derivatives in contracts denominated in euros that were entered into before the economic environment changed. Does the change in economic circumstances mean that the embedded derivative should now be considered closely related and not separately accounted for as a derivative? [IFRS 9.BCZ4.100, IFRS 9.BCZ4.101]

IFRS 9 confirms that entities should assess whether an embedded derivative is required to be separated from the host contract and accounted for as a derivative when the entity first becomes a party to the contract. Subsequent reassessment is prohibited unless there is a change in the terms of a contract that significantly modifies the cash flows that otherwise would be required under the contract, in which case an assessment is required. An entity determines whether a modification to cash flows is significant by considering the extent to which the expected future cash flows associated with the embedded derivative, the host contract or both have changed and whether the change is significant relative to the previously expected cash flows on the contract. [IFRS 9.B4.3.11].

For a financial liability, a change to the terms of the contract which significantly modifies the cash flows may also require derecognition of the original instrument and recognition of a new instrument. This is discussed in more detail in Chapter 48.

6.1 Acquisition of contracts

IFRS 9 requires an entity to assess whether an embedded derivative needs to be separated from the host contract and accounted for as a derivative when it first becomes a party to that contract. Therefore, if an entity purchases a contract that contains an embedded derivative, it assesses whether the embedded derivative needs to be separated and accounted for as a derivative on the basis of conditions at the date it acquires it, not the date the original contract was established. [IFRS 9.BCZ4.106].

6.2 Business combinations

From the point of view of a consolidated entity, the acquisition of a contract within a business combination accounted for using the acquisition method under IFRS 3 *Business Combinations*, in principle, is not different from the acquisition of a contract in general. Consequently, an assessment of the acquiree's contracts should be made on the date of acquisition as if the contracts themselves had been acquired. [IFRS 3.15, IFRS 3.16(c)].

Under IFRS 3, on the acquisition date, the entire contract is to be recorded at fair value. For classification and subsequent measurement, IFRS 3.16 requires an acquirer to assess whether an embedded derivative should be separated from the host contract in accordance with IFRS 9. If, on the acquisition date, the acquirer assesses there is an embedded derivative that needs to be separated and accounted for as a derivative, another question that arises is how the acquirer should separate the embedded derivative from the host contract. IFRS 9 requires a non-option embedded derivative to be separated from its host contract on the basis of its stated or implied substantive terms, so as to result in it having a fair value of zero at initial recognition. [IFRS 9.B4.3.3]. In applying IFRS 9.B4.3.3, it should be noted that IFRS 9.IG C.1 requires the terms of an embedded derivative to be determined so that it has a fair value of zero on inception of the hybrid instrument and that the terms of the embedded derivative should be identified based on the conditions existing when the financial instrument was issued (contract inception). [IFRS 9.IG C.1].

In the context of a business acquisition, the initial recognition of an acquired contract is at the acquisition date, which could be sometime after the date the contract was originally signed. This leads to the question of how the acquirer should apply the guidance in IFRS 9.B4.3.3 in the context of a business acquisition, specifically, whether the acquirer should separate an embedded derivative so as it has zero fair value at contract inception or zero fair value at the acquisition date, which is the initial recognition date of the acquirer.

How we see it

We believe that IFRS 9.B4.3.3 doesn't contemplate a contract that is acquired upon a business acquisition subsequent to its inception, and therefore, the guidance in IFRS 9.IG C.1 could be referred to in applying IFRS 9 B4.3.3 for this situation. IFRS 9.B4.3.3 also refers to "stated or implied substantive terms" and in the absence of explicit contractual terms, implied terms could be determined based the market conditions at the time the contract was issued. We therefore believe that one appropriate approach is to determine the terms of the embedded derivative so as it had a fair value of zero on contract inception, i.e., when the hybrid contract was initially signed.

The following Illustration illustrate how an acquirer could separate an embedded derivative at the acquisition date.

Illustration 6-1: Separation of embedded derivative from a VPPA acquired as part of business combination

A business operating a windfarm enters into a virtual power purchase agreement (VPPA) contract on 1/1/20X0 for 15 years to sell to a third party (the purchaser) its output, which is made up of electricity and renewable energy credits (RECs) for a bundled fixed price of \$50.

Due to the operation of the market, electricity must always be transferred via the energy market operator, which means the windfarm business supplies electricity to the energy market operator (at spot price), which in turn supplies electricity to the purchaser (at spot price). Consequently, the VPPA contract incorporates two elements:

- a sale of electricity designed as a contract for difference (CfD), that is net cash-settled, over the notional volume of electricity supplied (by the windfarm business to the market operator), based on the difference between the fixed price (received by the windfarm business from the purchaser) and spot price (paid by the windfarm business to the purchaser); and
- a sale of RECs from the windfarm business to the purchaser. The RECs obtained by the windfarm business, from electricity it produces, are transferred directly to the purchaser.

The electricity component of the VPPA is an embedded derivative that is to be separated from the residual host, being the sale of RECs, unless the entire VPPA is accounted for at fair value through profit or loss. At inception of the VPPA contract, when separating the embedded derivative, the \$50 bundled price is split in a manner that the forward electricity derivative has a fair value of zero and the residual amount determines the forward sale price of the RECs. Based on the conditions at inception (e.g., electricity price curve), this results in the implied fixed price of the forward electricity derivative of \$30 and the remaining \$20 price is allocated to the forward sale price of RECs. Subsequently, the electricity derivative is carried at fair value through profit or loss, and fair value is measured with reference to market price of electricity (among other factors) and the \$30 fixed price allocated in the unbundling exercise.

At 1/1/20X3, an acquirer purchases the windfarm business in a business combination that is to be accounted for under IFRS 3. At the acquisition date, the entire contract is fair valued based on the current market conditions. For classification and subsequent measurement, the existence of any embedded derivatives is also to be assessed by the acquirer. In this case, the embedded electricity component is assessed for separation by the acquirer and determined that it is a separable embedded derivative, which the acquirer will choose to separately account for at fair value. In order to separate, the acquirer will need to split the \$50 bundled fixed price for the electricity component and RECs component.

The basis for splitting the \$50 bundled fixed price by the acquiree at contract inception may be used by the acquirer for splitting the price. In accordance with IFRS 9.IG C.1, which requires the terms of an embedded derivative to be determined so that it has a fair value of zero on inception of the hybrid instrument, this approach is considered an appropriate one.

Determining the terms of the embedded derivative so it has fair value of zero at the acquisition date could result in an uneconomical outcome, since after contract inception, the electricity market could have moved such that the fixed price allocated to each component (in order for the electricity embedded derivative to have zero fair value at the acquisition date) no longer reflects the substance of the contract as negotiated initially, which is a bundle contract with a bundle price made of two priced components. This could happen in the situation when, in order for the electricity component to have fair value of zero at the acquisition date, and based on the conditions at the acquisition date, the implied fixed price of the electricity component is determined to be \$50, thus the price allocated to the REC component is zero.

Neither IFRS 9 nor IFRS 3 applies to a combination of entities or businesses under common control or the formation of a joint venture. [IFRS 3.2, IFRS 9.B4.3.12].

How we see it

However, in our view, if the acquisition method is applied to a combination of entities or businesses under common control or the formation of a joint venture, the requirements set out in IFRS 3 should be followed.

6.3 Remeasurement issues arising from reassessment

IFRS 9 does not address remeasurement issues arising from a reassessment of embedded derivatives. One of the reasons for prohibiting reassessment in general was the difficulty in determining the accounting treatment following a reassessment, which is explained in the following terms.

Assume that an entity, when it first became party to a contract, separately recognised a host asset not within the scope of IFRS 9, and an embedded derivative liability. If the entity were required to reassess whether the embedded derivative was to be accounted for separately and if the entity concluded sometime after becoming a party to the contract that the derivative was no longer required to be separated, then questions of recognition and measurement would arise. In the above circumstances, the entity could:

[IFRS 9.BCZ4.105]

- (a) Remove the derivative from its statement of financial position and recognise in profit or loss a corresponding gain or loss. This would lead to recognition of a gain or loss even though there had been no transaction and no change in the value of the total contract or its components.
- (b) Leave the derivative as a separate item in the statement of financial position. The issue would then arise as to when the item is to be removed from the statement of financial position. Should it be amortised (and, if so, how would the amortisation affect the effective interest rate of the asset), or should it be derecognised only when the asset is derecognised?
- (c) Combine the derivative (which is recognised at fair value) with the asset (which may not be recognised at fair value). This would alter the carrying amount of the asset even though there had been no change in the economics of the whole contract.

IFRS 9 states that subsequent reassessment is appropriate only when there has been a change in the terms of the contract that 'significantly' modifies the cash flows, accordingly the above issues are not expected to arise. [IFRS 9.BCZ4.105].

7 Linked and separate transactions and 'synthetic' instruments

A derivative that is attached to a financial instrument, but is contractually transferable independently of that instrument, or has a different counterparty from that instrument, is not an embedded derivative, but a separate financial instrument. [IFRS 9.4.3.1].

This is also the case where a synthetic instrument is created by using derivatives to 'alter' the nature of a non-derivative instrument, as illustrated in the following Illustration:

Illustration 7-1: Investment in a synthetic fixed-rate debt

Company A issues a five-year floating rate debt instrument. At the same time, it enters into a five year pay-fixed, receive-variable interest rate swap with Entity B. Company A considers the combination of the two instruments to be a synthetic fixed rate instrument.

Embedded derivatives are terms and conditions that are included in non-derivative host contracts and it is generally inappropriate to treat two or more separate financial instruments as a single combined, or synthetic, instrument. Each of the financial instruments has its own terms and conditions and may be transferred or settled separately. Therefore, the debt instrument and the swap must be classified separately. [IFRS 9.IG C.6].

It is asserted that these transactions differ from those discussed in section 2.2 above because those had no substance apart from the resulting interest rate swap. [IFRS 9.IG C.6].

Although some might argue that the substance of the two transactions above is the resulting synthetic fixed rate debt instrument, this interpretation is clearly not allowed under the standard.

Interestingly, the guidance does not address a much more common situation whereby a company both borrows from, and transacts a related derivative with, the same counterparty - typically the borrowing will be floating rate and the derivative a perfectly matched pay-fixed, receive-floating interest rate swap.

In fact, the subject of linking transactions for accounting purposes is a difficult one, especially in the context of financial instruments. The IASB's *Conceptual Framework* specifies that transactions should be reported in accordance with their substance and economic reality and not merely their legal form, [CF 2.12], and linking transactions can be seen as dealing with the question of how to interpret this principle.

IAS 32 and IFRS 9 deal with the subject in a piecemeal way. For example, in addition to the synthetic instrument in the Illustration above:

- Two or more non-derivative contracts that are, 'in substance', no more than a single derivative are treated as a single derivative (see section 2.2 above).
- Derivatives that are 'attached' to a non-derivative financial instrument may sometimes be regarded as part of a single combined instrument (see section 3 above).
- In classifying an instrument in consolidated financial statements as equity or a financial liability, all terms and conditions agreed between members of the group and holders of the instrument are considered (see Chapter 43).
- If a loan is guaranteed by a third party, the expected credit loss determined in accordance with IFRS 9 should be calculated based on the combined credit risk of the guarantor and the guaranteed party if the guarantee is 'integral' to the contractual terms of the loan (see Chapter 47).

And

- Determining the appropriate accounting treatment for a transaction that involves the transfer of some or all rights associated with financial assets, without the sale of the assets themselves, inevitably involves linking separate contracts to assess whether the transaction results in derecognition of the assets. For example, there might be one contract defining the continued ownership of the asset and another obliging the owner to transfer the rights associated with the asset to a third party (see Chapter 45, Chapter 46 and Chapter 48).

The IFRS IC first considered the subject of linkage in 2002 and has, in the past, made certain recommendations to the IASB. In fact, the requirement to take account of linked terms when classifying instruments as debt or equity in consolidated financial statements was introduced into IAS 32 in December 2003 following the IFRS IC's deliberations. Despite agreeing proposed indicators for when transactions should be linked, and proposed guidance on accounting for linked transactions, these have never been published as an interpretation or standard.²⁸

In August 2013, the IFRS IC received a request to clarify whether three different transactions should be accounted for separately or be aggregated and treated as a single derivative. The IFRS IC decided not to add this issue to its agenda but noted that in order to determine whether to aggregate and account for the three transactions as a single derivative, reference should be made to B.6 (see section 2.2 above) and C.6 (see Illustration 7-1 above) of the Implementation Guidance to IFRS 9 and IAS 32.AG39. The IFRS IC noted that the application of the guidance in IFRS 9.B.6 requires judgement and that the indicators in that paragraph may help an entity to determine the substance of the transaction, but that the presence or absence of any single specific indicator alone may not be conclusive.²⁹

Consequently, in considering the borrowing and swap situation above, we are left principally with the guidance in IFRS 9. It is likely that the swap and the loan have their own terms and conditions and may be transferred or settled independently of each other. Therefore, the principles in Illustration 7-1 above would suggest separate accounting for the two instruments. Applying the guidance in section 2.2 above (aggregating non-derivative transactions and treating them as a derivative) would also suggest separate accounting in most cases. Even though the instruments are transacted with the same counterparty, there will normally be a substantive business purpose for transacting the instruments separately.

It seems clear that in situations involving two separate legal contracts, in most cases, the two instruments will be regarded as separate for accounting purposes. However, in certain situations the linkage between those contracts (normally itself contractual) may be such that for accounting purposes those contracts cannot be regarded as existing independently of each other.

28 [IFRIC Update](#), April 2002, [IFRIC Update](#), July 2002 and [IFRIC Update](#), February 2003 and [IASB Update](#), October 2002, available on the IFRS Foundation's website.

Whilst the IFRS IC discussions were held in the context of IAS 39, the discussions also hold true under IFRS 9.

29 [IFRIC Update](#), March 2014, available on the IFRS Foundation's website.

Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9.

Appendix B - Defined terms

Extract from IFRS 9

Appendix A Defined terms

derivative

A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.

- (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying').
- (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors.
- (c) it is settled at a future date.

regular way purchase or sale

A purchase or sale of a financial asset under a contract whose terms require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned.

Chapter 43

Financial instruments: Financial liabilities and equity

Contents

Overview	3568
1 Introduction	3569
1.1 Background	3569
1.2 Development of IFRS accounting standards on classification of liabilities and equity	3569
2 Objective and scope	3571
2.1 Objective	3571
2.2 Scope	3571
3 Definitions	3572
4 Classification of instruments	3574
4.1 Definition of equity instrument	3574
4.2 Contractual obligation to deliver cash or other financial assets	3575
4.2.1 Relationship between an entity and its members	3576
4.2.2 Implied contractual obligation to deliver cash or other financial assets	3577
4.3 Contingent settlement provisions	3578
4.3.1 Variable or contingent payments for an asset purchase	3579
4.3.2 Contingencies that are 'not genuine'	3581
4.3.3 Liabilities that arise only on liquidation	3582
4.3.4 Liabilities that arise only on a change of control	3582
4.3.5 Some typical contingent settlement provisions	3582
4.4 Examples of equity instruments	3584
4.4.1 Issued instruments	3584
4.4.2 Contracts to issue equity instruments	3584
4.5 Preference shares and similar instruments	3584
4.5.1 Instruments redeemable mandatorily or at the holder's option	3585
4.5.2 Instruments redeemable only at the issuer's option or not redeemable	3585
4.5.3 Instruments with a 'dividend blocker' or a 'dividend pusher' clause	3586
4.5.3.A Instruments with a 'dividend blocker'	3586
4.5.3.B Instruments with a 'dividend pusher'	3587

4.5.4	Perpetual instruments with a 'step-up' clause	3588
4.5.5	Relative subordination	3588
4.5.6	Economic compulsion	3589
4.5.7	'Linked' instruments	3589
4.5.8	'Change of control', 'taxation change' and 'regulatory change' clauses	3590
4.6	Puttable instruments and instruments repayable only on liquidation	3590
4.6.1	The issue	3590
4.6.2	Puttable instruments	3592
4.6.3	Instruments entitling the holder to a pro rata share of net assets only on liquidation	3593
4.6.4	Clarification of the exemptions in sections 4.6.2 and 4.6.3 above	3594
4.6.4.A	Instruments issued by a subsidiary	3594
4.6.4.B	Relative subordination of the instrument	3594
4.6.4.C	Meaning of 'identical features'	3595
4.6.4.D	No obligation to deliver cash or another financial asset	3595
4.6.4.E	Instruments that substantially fix or restrict the residual return to the holder of an instrument	3596
4.6.4.F	Transactions entered into by an instrument holder other than as owner of the entity	3596
4.6.5	Reclassification of puttable instruments and instruments imposing an obligation only on liquidation	3597
4.6.6	IFRIC 2	3597
4.7	Perpetual debt	3598
4.8	Differences of classification between consolidated and single entity financial statements	3598
4.8.1	Consolidated financial statements	3598
4.8.2	Single entity financial statements	3599
4.9	Reclassification of instruments	3600
4.9.1	Change of terms	3600
4.9.1.A	Equity instrument to financial liability	3600
4.9.1.B	Financial liability to equity instrument	3600
4.9.2	Change of circumstances - passage of time	3601
4.9.3	Change of circumstances - other than passage of time	3601
4.9.3.A	Arguments against reclassification	3602
4.9.3.B	Arguments for reclassification	3602
4.10	Special purpose acquisition companies (SPACs)	3603
4.10.1	Financial instruments issued by the SPAC	3603
4.10.2	Shares and warrants	3603
4.10.3	Founder shares	3603
4.10.4	Public shares	3604
4.10.5	Warrants	3604
4.10.6	Classification of ordinary shares and warrants by a SPAC upon acquisition	3605

5	Contracts settled by delivery of the entity's own equity instruments	3606
5.1	Contracts accounted for as equity instruments	3607
5.1.1	Comparison with IFRS 2 Share-based Payment	3607
5.1.2	Number of equity instruments issued adjusted for capital restructuring or another event	3608
5.1.3	Stepped up exercise price	3609
5.1.4	Exchange of fixed amounts of equity (equity for equity)	3610
5.2	Contracts accounted for as financial assets or financial liabilities	3610
5.2.1	Variable number of equity instruments	3610
5.2.2	Fixed number of equity instruments for variable consideration	3611
5.2.3	Fixed amount of cash (or other financial assets) denominated in a currency other than the entity's functional currency	3611
5.2.3.A	Rights issues with a price fixed in a currency other than the entity's functional currency	3612
5.2.4	Instrument with equity settlement alternative of significantly higher value than cash settlement alternative	3613
5.2.5	Fixed number of equity instruments with variable value	3613
5.2.6	Fixed amount of cash determined by reference to share price	3613
5.2.7	Net-settled contracts over own equity	3613
5.2.8	Derivative financial instruments with settlement options	3613
5.3	Liabilities arising from gross-settled contracts for the purchase of the entity's own equity instruments	3614
5.3.1	Contracts to purchase own equity during 'closed' or 'prohibited' periods	3615
5.3.2	Contracts to acquire non-controlling interests	3616
5.3.2.A	Put options over non-controlling interests - IFRS IC and IASB developments	3616
5.4	Gross-settled contracts for the sale or issue of the entity's own equity instruments	3616
6	Compound financial instruments	3618
6.1	Background	3618
6.1.1	Treatment by holder and issuer contrasted	3618
6.2	Initial recognition - 'split accounting'	3619
6.2.1	Accounting for the equity component	3621
6.2.2	Temporary differences arising from split accounting	3621
6.3	Conversion, early repurchase and modification	3621
6.3.1	Conversion at maturity	3621
6.3.2	Conversion before maturity	3622
6.3.2.A	'Fixed stated principal' of a bond	3622
6.3.2.B	Accounting treatment	3622
6.3.2.C	Treatment of embedded derivatives on conversion	3622
6.3.3	Early redemption or repurchase	3623
6.3.3.A	Early repurchase through negotiation with bondholders	3623
6.3.3.B	Early repurchase through exercising an embedded call option	3625
6.3.4	Modification	3625

6.4	The components of a compound instrument	3625
6.4.1	Determining the components of a compound instrument	3625
6.4.2	Compound instruments with embedded derivatives	3626
6.4.2.A	Issuer call option - 'closely related' embedded derivatives	3627
6.4.2.B	Issuer call option - 'not closely related' embedded derivatives	3627
6.5	Other issues	3628
6.6	Common forms of convertible bonds	3628
6.6.1	Functional currency bond convertible into a fixed number of shares	3628
6.6.2	Contingent convertible bond	3628
6.6.3	Bond convertible at the option of the issuer	3629
6.6.4	Mandatorily convertible bond	3629
6.6.4.A	Bond which is mandatorily convertible into a variable number of shares with an option for the issuer to settle early for a maximum number of shares	3630
6.6.4.B	Bond which is mandatorily convertible into a variable number of shares upon a contingent 'non-viability' event	3631
6.6.5	Foreign currency convertible bond	3633
6.6.5.A	Instrument issued by a foreign subsidiary convertible into equity the of parent	3633
6.6.6	Convertibles with cash settlement at the option of the issuer	3635
6.6.7	Bond convertible into fixed percentage of equity	3635
6.6.8	Convertible bonds with down round or ratchet features	3635
7	Settlement of financial liability with equity instrument	3637
7.1	Scope and effective date of IFRIC 19	3637
7.2	Requirements of IFRIC 19	3637
7.3	Debt for equity swaps with shareholders	3638
8	Interest, dividends, gains and losses	3639
8.1	Transaction costs of equity transactions	3640
8.2	Tax effects of equity transactions	3641
9	Treasury shares	3642
9.1	Transactions in own shares not at fair value	3642
9.2	IFRS 17 treasury share election	3643

Overview

The distinction between an equity instrument and a financial liability, from the perspective of the issuer can be complex. Some instruments, while being legally equity, can have characteristics that are, in substance, those of a financial liability, while other instruments can have a number of different features with the characteristics of both debt and equity.

To provide consistent classification of such instruments, the IASB established principles for presenting financial instruments as liabilities or equity from the perspective of the issuer in IAS 32 *Financial Instruments: Presentation*. Such principles are based on the contractual terms of the instrument. In general, an instrument will be a liability of the issuer, if the issuer has an obligation to deliver cash or another financial asset. However, exceptions can apply, such as when a transaction will be settled in the issuer's own shares, where the classification will generally depend on whether the number of shares to be delivered is fixed or variable. In other cases, an instrument may have some features which meet the definition of equity and others which meet the definition of a financial liability. IAS 32 sets out principles for the classification and measurement of such 'compound' instruments.

Where financial liabilities are settled with equity instruments IFRIC 19, *Extinguishing Financial Instruments with Equity Instruments* provides accounting guidance. In addition, IAS 32 establishes principles for offsetting financial assets and financial liabilities as well as for the classification of the related interest, dividends, gains and losses. The accounting for treasury shares is also dealt with in IAS 32.

Over the years complex forms of financing have been developed, incorporating equity and financial liability elements. The classification and accounting for such instruments under IAS 32 can be complex and require a considerable amount of analysis and judgement to allocate the different elements of the instrument.

This chapter summarises the requirements of IAS 32 with regards to the classification of financial instruments as financial assets, financial liabilities or equity, the accounting for compound instruments and treasury shares, the settlement of financial liabilities with equity, including debt for equity swaps, as well as the presentation of interest, dividends and gains or losses on equity and financial liabilities.

What you need to know

- IAS 32 establishes the principles for classifying financial instruments as liabilities or equity from the perspective of the issuer.
- Classification principles are based on the contractual terms of the instrument.
- The standard and related guidance considers both financial instruments with debt or equity features and instruments which are settled with the issuing entity's own equity, including the IFRIC 19 guidance on debt for equity swaps.
- Some complex financial instruments can exhibit the characteristics of both financial liabilities and equity and therefore determining the classification of these instruments can require considerable analysis and judgement.
- Where financial instruments contain both equity and liability components, the standard sets out the principles for splitting the instrument between liability and equity and measuring the component parts.
- The guidance in IAS 32 provides the requirements for:
 - The accounting treatment for treasury shares
 - The offsetting of financial assets and financial liabilities (covered in Chapter 50)

1 Introduction

1.1 Background

The accounting treatment of liabilities (such as loans or bonds) and equity instruments (such as shares, stock or warrants) by their issuer was not historically regarded as presenting significant problems. Essentially the accounting was dictated by the legal form of the instrument, since the traditional distinction between equity and liabilities is clear. The issue of equity creates an ownership interest in a company, remunerated by dividends, which are accounted for as a distribution of retained profit, not a charge made in arriving at the result for a particular period. Liabilities, such as loan finance, on the other hand, are remunerated by interest, which is charged to profit or loss as an expense. In general, lenders rank before shareholders in priority of claims over the assets of the company, although in practice there may also be differential rights between different categories of lenders and classes of shareholders. The two forms of finance often have different tax implications, both for the investor and the investee.

In economic terms, however, the distinction between share and loan capital can be far less clear-cut than the legal categorisation would suggest. For example, a redeemable preference share could be considered to be, in substance, much more like a liability than equity. Conversely, many would argue that a bond which can never be repaid but which will be mandatorily converted into ordinary shares deserves to be thought of as being more in the nature of equity than of debt, even before conversion has occurred.

The ambiguous economic nature of such instruments has encouraged the development of a number of complex forms of finance which exhibit characteristics of both equity and debt. The 'holy grail' is generally to devise an instrument regarded as a liability by the tax authorities (such that the costs of servicing it are tax-deductible) but treated as equity for accounting and/or regulatory purposes (so that the instrument is not considered as a component of net borrowings).

The accounting classification of an instrument as a liability or equity is much more than a matter of allocation - i.e., where particular amounts are shown in the financial statements. The requirement of IFRS accounting standards for certain liabilities, in particular derivatives, to be carried at fair value means that the classification of an item as a liability can introduce significant volatility into reported results, that would not arise if the item were classified as an equity instrument. This is because changes in the fair value of an equity instrument are not recognised in the financial statements of the issuer. [IAS 32.36].

Moreover, the extent to which an entity funds its operations through debt or equity is regarded as highly significant not only by investors, but also by other users of financial statements such as regulators and tax authorities. This means that the question of whether a particular instrument is a liability or equity raises issues of much greater and wider sensitivity than the mere matter of financial statement classification.

1.2 Development of IFRS accounting standards on classification of liabilities and equity

Under IFRS accounting standards, the classification of items as liabilities or equity is dealt with mainly in IAS 32, with some cross-reference to IFRS 9 *Financial Instruments*.

IAS 32 was originally issued in March 1995 and subsequently amended in 1998 and 2000. However, in December 2003, the previous version of IAS 32 was withdrawn and superseded by a new version, which has itself been amended by subsequent new pronouncements, most notably IFRS 7 *Financial Instruments: Disclosures* (see Chapter 50) and the amendment to IAS 32 *Puttable Financial Instruments and Obligations Arising on Liquidation* (superseded version of IAS 32).

The main text of IAS 32 is supplemented by application guidance (which is an integral part of the standard),¹ and by illustrative examples (which accompany, but are not part of, the standard).²

The IFRS IC has issued two interpretations of IAS 32 discussed in this chapter:

- IFRIC 2 *Members' Shares in Co-operative Entities and Similar Instruments* (see section 4.6.6 below)
- And
- IFRIC 19 (see section 7 below)

¹ IAS 32, Application Guidance, para. after main heading.

² IAS 32, Illustrative Examples, para. after main heading.

A joint attempt of the IASB and the FASB to develop a new model, in which classification of an instrument was based on whether the instrument would be settled with assets or with equity instruments of the issuer, was suspended in October 2010 due to significant challenges raised by a small group of external reviewers of a draft exposure draft.

In October 2014, the IASB resumed the *Financial Instruments with Characteristics of Equity Research Project* (FICE project) to explore further how to distinguish liabilities from equity claims. Following the issue of a Discussion Paper (the FICE DP) in June 2018, the IASB reached tentative decisions to address certain known practice issues by clarifying some of the underlying principles in IAS 32 and expanding the disclosures required (see section 12 below). The IASB published an Exposure Draft (ED) of proposed amendments to IAS 32, IFRS 7 and IAS 1 *Presentation of Financial Statements* in November 2023. In addition to clarifying the classification requirements in IAS 32, the ED proposed enhanced presentation and disclosures for financial liabilities and equity instruments. In response to feedback to the ED, the IASB commenced further discussions on each of the FICE topics in Q4 2024 and expects to complete its discussions and publish the final amendments to IAS 32, IFRS 7 and IFRS 18 (which has replaced IAS 1 since the FICE project commenced) during 2026.

2 Objective and scope

2.1 Objective

The objective of IAS 32 is “to establish principles for presenting financial instruments as liabilities or equity and for offsetting financial assets and financial liabilities”. [IAS 32.2]. The standard, and its associated IFRIC interpretations, address:

- The classification of financial instruments, by their issuer, into financial assets, financial liabilities and equity instruments (see sections 3 to 6 below).
- Settling a financial liability with an equity instrument (see section 7 below).
- The classification of interest, dividends, losses and gains (see section 8 below).
- Treasury shares - i.e., an entity’s own equity instruments held by the entity (see section 9 below).
- Forward contracts or options for the receipt or delivery of the entity’s own equity instruments (see section 11 below).

And

- The circumstances in which financial assets and financial liabilities must be offset (see Chapter 50).

The principles in IAS 32 complement the principles for recognising and measuring financial assets and financial liabilities in IFRS 9, and for disclosing information about them in IFRS 7. [IAS 32.3]. Additional relevant guidance is provided by IFRIC 2 *Members’ Shares in Co-operative Entities and Similar Instruments* and IFRIC 19 *Extinguishing Financial Liabilities with Equity Instruments*.

2.2 Scope

The scope of IAS 32 is discussed in detail in Chapter 41.

3 Definitions

The following definitions in IAS 32 are relevant to the issues discussed in this chapter. Further general discussion on the meaning and implications of the definitions may be found in Chapter 41. [IAS 32.11, IFRS 9 Appendix A].

Extract from IAS 32

Definitions

11 The following terms are used in this Standard with the meanings specified:

A financial instrument is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity.

A financial asset is any asset that is:

- (a) cash;
- (b) an equity instrument of another entity;
- (c) a contractual right:
 - (i) to receive cash or another financial asset from another entity; or
 - (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or
- (d) a contract that will or may be settled in the entity's own equity instruments and is:
 - (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or
 - (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments.

A financial liability is any liability that is:

- (a) a contractual obligation:
 - (i) to deliver cash or another financial asset to another entity; or
 - (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or
- (b) a contract that will or may be settled in the entity's own equity instruments and is:
 - (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or
 - (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments.

As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D.

An *equity instrument* is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities.

Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)

A *puttable instrument* is a financial instrument that gives the holder the right to put the instrument back to the issuer for cash or another financial asset or is automatically put back to the issuer on the occurrence of an uncertain future event or the death or retirement of the instrument holder.

Extract from IFRS 9

Appendix A Defined terms

derivative

A financial instrument or other contract within the scope of this Standard with all three of the following characteristics:

- (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying').
- (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors.
- (c) it is settled at a future date.

As an exception to the general definition of a financial liability, an instrument that meets the definition of a financial liability is nevertheless classified as an equity instrument, if it has all the features and meets the conditions in IAS 32.16A and 16B (see section 4.6.2 below) or IAS 32.16C and 16D (see section 4.6.3 below). [IAS 32.11].

The definition of fair value is the same definition as used in IFRS 13 *Fair Value Measurement* (see Chapter 15).

In these definitions (and throughout IAS 32 and the discussion in this chapter):

- *Contract* and *contractual* refer to an agreement between two or more parties that has clear economic consequences that the parties have little, if any, discretion to avoid, usually because the agreement is enforceable by law. Contracts, and thus financial instruments, may take a variety of forms and need not be in writing. [IAS 32.13].
- *Entity* includes individuals, partnerships, incorporated bodies, trusts and government agencies. [IAS 32.14].

4 Classification of instruments

Extract from IAS 32

- 15** The issuer of a financial instrument shall classify the instrument, or its component parts, on initial recognition as a financial liability, a financial asset or an equity instrument in accordance with the substance of the contractual arrangement and the definitions of a financial liability, a financial asset and an equity instrument.

The most important issue dealt with by IAS 32 is the classification of financial instruments (or their components) by their issuer as financial liabilities, financial assets or equity instruments, including non-controlling interests. The rule in IAS 32 for classification of items as financial liabilities or equity is essentially simple. An issuer of a financial instrument must classify the instrument (or its component parts) on initial recognition as a financial liability, a financial asset or an equity instrument in accordance with the substance of the contractual arrangement and the definitions of a financial liability, a financial asset and an equity instrument (see section 3 above). [IAS 32.15]. The application of this principle in practice, however, is often far from straightforward.

IAS 32 considers the question of whether a transaction is a financial liability or an equity instrument at two levels. First, it examines whether an individual instrument (or class of instruments) issued by the entity is a financial liability or equity. This is principally discussed in this section, although some of the provisions discussed in sections 5 and 6 below may also be relevant.

Second, where an entity settles a transaction using instruments issued by it that, when considered in isolation, would be classified as equity, IAS 32 requires the entity to consider whether the transaction considered as a whole is in fact a financial liability. This will typically be the case where a transaction is settled by issuing a variable number of equity instruments equal to an agreed value. This is principally discussed in sections 5 and 6 below, although some of the provisions discussed here in section 4 may also be relevant.

The appropriate classification is made on initial recognition of the instrument and, in general, not changed subsequently (see section 4.9 below on reclassification of instruments).

4.1 Definition of equity instrument

The application of the basic definitions in IAS 32 means that an instrument is an equity instrument only if both the following conditions are met:

- The instrument includes no contractual obligation either:
 - To deliver cash or another financial asset to another entity.
 Or
 - To exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the issuer.
- If the instrument will, or may, be settled in the issuer's own equity instruments, it is either:
 - A non-derivative that includes no contractual obligation for the issuer to deliver a variable number of its own equity instruments.
 Or
 - A derivative that will be settled only by the issuer exchanging a fixed amount of cash or another financial asset for a fixed number of its own equity instruments. For this purpose, the issuer's own equity instruments do not include instruments that have all the features and meet the conditions described in IAS 32.16A and 16B (see section 4.6.2 below) or IAS 32.16C and 16D (see section 4.6.3 below) or instruments that are contracts for the future receipt or delivery of the issuer's own equity instruments. [IAS 32.16].

As a pragmatic exception to these basic criteria, an instrument that would otherwise meet the definition of a financial liability is nevertheless classified as an equity instrument if it is either:

- A puttable instrument with all the features, and meeting the conditions described, in IAS 32.16A and 16B (see section 4.6.2 below).
- Or
- An instrument entitling the holder to a *pro rata* share of assets on a liquidation with all the features, and meeting all the conditions, described in IAS 32.16C and 16D. [IAS 32.16]. This is discussed further in section 4.6.3 below.

Broadly speaking, apart from this exemption, an instrument can only be classified as equity under IAS 32:

- If the issuer has an unconditional right to avoid delivering cash or another financial instrument (see section 4.2 below).
- Or
- If it is settled through the entity's own equity instruments, it is for an exchange of a fixed amount of cash for a fixed number of the entity's own equity instruments.

In all other cases it would be classified as a financial liability.

4.2 Contractual obligation to deliver cash or other financial assets

It is apparent from section 4.1 above that a critical feature in differentiating a financial liability from an equity instrument is the existence of a contractual obligation of one party to the financial instrument (the issuer) either:

- To deliver cash or another financial asset to the other party (the holder)
- Or
- To exchange financial assets or financial liabilities with the holder under conditions that are potentially unfavourable to the issuer [IAS 32.17]

IAS 32 focuses on the contractual rights and obligations arising from the terms of an instrument, rather than on the probability of those rights and obligations leading to an outflow of cash or other resources from the entity, as would be the case for a provision accounted for under IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 27). Thus, IAS 32 may well:

- Classify as equity an instrument that is virtually certain to result in regular cash payments by the entity
- But
- Treat as a liability an instrument which:
 - Gives its holder a right to receive cash rather than equity which no rational holder would exercise
 - Or
 - Exposes the issuer to a liability to repay the instrument contingent on an external event so remote that no liability would be recognised if IAS 37 rather than IAS 32 were the applicable standard.

The holder of an equity instrument (e.g., a non-puttable share) may be entitled to receive a *pro rata* share of any dividends or other distributions of equity that are made. However, since the issuer does not have a contractual obligation to make such distributions (because it cannot be required to deliver cash or another financial asset to another party), the instrument is not a financial liability of the issuer. [IAS 32.17]. The price or value of such an instrument may well reflect a general expectation by market participants that distributions will be made on a regular basis, but, under IAS 32, the absence of a contractual obligation requires the instrument to be classified as equity.

IAS 32 requires the issuer of a financial instrument to classify a financial instrument by reference to its substance rather than its legal form, although it is conceded that substance and form are 'commonly', but not always, the same. Typical examples of instruments that are equity in legal form but liabilities in substance are certain types of preference share (see section 4.5 below) and certain units in open-ended funds, unit trusts and similar entities (see section 4.6 below). [IAS 32.18]. Conversely, a number of entities have issued instruments which behave in most practical respects as perpetual (or even redeemable) debt, but which IAS 32 requires to be classified as equity (see section 4.5 below). IAS 32 further clarifies that a financial instrument is an equity instrument, and not a financial liability, not merely if the issuer has no legal obligation to deliver cash or other financial assets to the holder at the reporting date, but only if it has an unconditional right to avoid doing so in all future circumstances other than an unforeseen liquidation. Thus, a financial instrument (other than one classified as equity under the exceptions discussed in section 4.6 below) is classified as a financial liability even if:

- The issuer's ability to discharge its obligations under the instrument is restricted (e.g., by a lack of funds, the need to obtain regulatory approval to make payments on the instrument, or a shortfall of distributable profits, or other statutory restriction). [IAS 32.19, IAS 32.AG25].
- Or
- The holder has to perform some action (e.g., formally exercise a redemption right) in order for the issuer to become obliged to transfer cash or other financial assets. [IAS 32.19].

In September 2015, the IFRS IC considered the classification of a prepaid card and how the unspent balance on such a card would be accounted for. The IFRS IC specifically considered a prepaid card with the following features:

- No expiry date
 - Cannot be refunded, redeemed or exchanged for cash
 - Redeemable only for goods and services
 - Redeemable only at selected merchants which could include the entity
 - Upon redemption by the cardholder at a merchant, the entity has a contractual obligation to pay cash to the merchant
 - No back-end fees, e.g., the balance on the prepaid card does not reduce unless spent by the cardholder
- And
- Is not issued as part of a customer loyalty programme

The IFRS IC observed that the liability of the entity for the prepaid card meets the definition of a financial liability, because the entity has a contractual obligation to deliver cash to the merchants on behalf of the cardholder, conditional upon the cardholder using the prepaid card to buy goods or services and the entity does not have an unconditional right to avoid delivering cash to settle this contractual obligation.³

Following the receipt of responses to the draft agenda decision, the IFRS IC, in March 2016, limited the fact pattern to where the card could only be redeemed at specified third-party merchants and not at the entity itself but otherwise did not change its conclusion.

The IFRS IC determined that neither an interpretation nor an amendment to a standard was necessary.⁴

One of the key consequences of this decision is that if the card gives rise to a financial liability, then the unspent balance on the card cannot be derecognised. Any unredeemed portion of the card will continue to be recognised as a liability in perpetuity as financial liabilities can only be derecognised when extinguished. [IFRS 9.3.3.1]. It is also of note that the balances on such cards are regarded as financial liabilities even though they do not meet the strict IAS 32 definition of a financial instrument, as the balance on the prepaid card will not constitute a financial asset in the hands of the cardholder.

4.2.1 Relationship between an entity and its members

The unconditional right of the entity to avoid delivering cash or another financial asset in settlement of an obligation is crucial in differentiating a financial liability from an equity instrument.

In some entities, the right to declare dividends and/or redeem capital is reserved for the members of the entity in general meeting, as a matter either of the entity's own constitution or of general legislation in the jurisdiction concerned. The effect of such a right may be that the members can require payment of a dividend irrespective of the wishes of management. Even where management has the right to prevent a payment declared by the members, the members will generally have the right to appoint the management and can therefore appoint management that will not oppose an equity distribution declared by the members. This raises the question whether an entity whose members have such rights must classify all its distributable retained earnings as a liability, on the grounds that the members could require earnings to be distributed as dividend, or capital to be repaid, at any time.

How we see it

The role of the entity's shareholders is critical in determining the classification of financial instruments when the shareholders can decide whether the entity delivers cash or another financial asset.

In our view, an action reserved for the entity's shareholders in general meeting, is effectively an action of the entity itself. It is therefore at the discretion of the entity itself (as represented by the members in general meeting) that retained earnings are paid out as a dividend.

If on the other hand, decisions by the shareholders are not made as part of the entity's corporate governance decision making process but made in their capacity as holders of particular instruments, we would consider that the shareholders are separate from the entity.

³ [IFRIC Update](#), September 2015, available on the IFRS Foundation's website.

⁴ [IFRIC Update](#), March 2016, available on the IFRS Foundation's website.

It is therefore important to understand the relationship between the entity and its members. Shareholders can make decisions as part of the corporate governance decision making process of the entity (generally exercised in a general meeting) or separate from the entity's corporate governance decision making process, in their capacity as holders of particular instruments.

Accordingly, in the case where an action is reserved for the entity's shareholders in a general meeting referred to above, such earnings are classified as equity, and not as a financial liability, until they become a legal liability of the entity.

In the case where the decision is not made as part of the entity's corporate governance decision making process the entity would not have an unconditional right to avoid delivering cash or another financial asset and would have to classify the financial instrument as a financial liability.

This issue was brought to the IFRS IC in January 2010. The IFRS IC identified that diversity may exist in practice in assessing whether an entity has an unconditional right to avoid delivering cash, if the contractual obligation is at the ultimate discretion of the issuer's shareholders, and consequently whether a financial instrument must be classified as a financial liability or equity. However, the IFRS IC concluded that the Board's then current project on financial instruments with characteristics of equity was expected to address the distinction between equity and non-equity instruments on a timely basis, and that the IFRS IC would therefore not add this to its agenda.⁵ In October 2010, the project was suspended but was restarted in October 2014. The Board is currently considering several IAS 32 practice issues, including those concerning contingent settlement provisions (see section 12 below).

4.2.2 Implied contractual obligation to deliver cash or other financial assets

A financial instrument that does not explicitly establish a contractual obligation to deliver cash or another financial asset may nevertheless establish an obligation indirectly through its terms and conditions.

[IAS 32.20].

IAS 32.20 provides two examples:

Extract from IAS 32

- 20 A financial instrument that does not explicitly establish a contractual obligation to deliver cash or another financial asset may establish an obligation indirectly through its terms and conditions. For example:
- (a) a financial instrument may contain a non-financial obligation that must be settled if, and only if, the entity fails to make distributions or to redeem the instrument. If the entity can avoid a transfer of cash or another financial asset only by settling the non-financial obligation, the financial instrument is a financial liability.
 - (b) a financial instrument is a financial liability if it provides that on settlement the entity will deliver either:
 - (i) cash or another financial asset; or
 - (ii) its own shares whose value is determined to exceed substantially the value of the cash or other financial asset.

Although the entity does not have an explicit contractual obligation to deliver cash or another financial asset, the value of the share settlement alternative is such that the entity will settle in cash. In any event, the holder has in substance been guaranteed receipt of an amount that is at least equal to the cash settlement option (see paragraph 21).

The basic requirement of IAS 32.20 is for an entity to recognise a financial liability when it can only avoid using cash to settle an obligation by transferring a financial asset or a non-financial asset, in other words settlement of the obligation cannot be avoided in any other way. Then, given that the entity's own shares are not an asset, subparagraph (b)(ii) avoids a potential loophole: if the value of the shares would exceed the amount of cash that would be required to settle the liability, the entity will be economically compelled to settle the cash amount and hence, has a financial liability (see section 5.2.4. below).

⁵ [IFRIC Update](#), January 2010, available on the IFRS Foundation's website.

This accounting treatment was illustrated by a question put to the IFRS IC in 2015.⁶ They considered an arrangement whereby an entity received cash from a government to fund a research and development project. The cash was repayable to the government only if the entity decided to exploit and commercialise the results of the project. If the project was not commercially exploited, the entity was obliged to transfer the rights to the research to the government.

The IFRS IC observed in May 2016⁷ that, in this case, the cash receipt gave rise to a financial liability. In reaching their conclusion, the IFRS IC took the view that the entity could avoid transferring cash only by settling the obligation with a non-financial instrument (the rights to the research). The IFRS IC further noted that the cash received from the government does not meet the definition of a forgivable loan in IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance*, as the government does not undertake to waive repayment of the loan but requires settlement in cash or by transfer of the rights to research. However, they also noted that the entity would be required at initial recognition to assess whether the cash received from the government is something other than a financial instrument, for example the difference between the cash received and the fair value of the financial liability may represent a government grant that must be accounted for in accordance with IAS 20.

This last sentence implies that where the fair value of the alternative settlement option is less than fair value of the cash settlement option, IAS 32.20 only requires a financial liability to be recorded to the extent of the fair value of the alternative settlement option. But, in this example, the IFRS IC did not discuss what the fair value of the research and development might be. The IFRS IC discussion demonstrates that where entities receive loans, with alternative repayment conditions involving settlement with a non-financial asset, judgement will be necessary in assessing the substance of the settlement requirements and determining the value at inception of the non-financial asset.

4.3 Contingent settlement provisions

Some financial instruments may require the entity to deliver cash or another financial asset, or otherwise to settle it in such a way that it would be classified as a financial liability, in the event of the occurrence or non-occurrence of uncertain future events (or on the outcome of uncertain circumstances), that are beyond the control of both the issuer and the holder of the instrument. These might include:

- A change in a stock market index or a consumer price index
- Changes in interest rates
- Changes in tax law
- The issuer's future revenues, net income or debt-to-equity ratio [IAS 32.25]

Or

- Variable or contingent payments for an asset purchase (see section 4.3.1 below)

Some financial instruments may contain more than one source of variability. Further complexity can also arise when variability and contingent arrangements are akin to profit sharing agreements, which are not addressed in any standard.

IAS 32 provides that, since the issuer of such an instrument does not have the unconditional right to avoid delivering cash or another financial asset (or otherwise to settle it in such a way that it would be a financial liability), the instrument is a financial liability of the issuer unless:

- The part of the contingent settlement provision that could require settlement in cash or another financial asset (or otherwise in such a way that it would be a financial liability) is not genuine (see section 4.3.2 below).
- The issuer can be required to settle the obligation in cash or another financial asset (or otherwise to settle it in such a way that it would be a financial liability) only in the event of liquidation of the issuer (see section 4.3.3 below).

Or

- The instrument is classified as equity under the exceptions discussed in section 4.6 below. [IAS 32.25].

Whether or not the contingency is within the control of the issuer is therefore an important consideration when classifying financial instruments with contingent settlement provisions as either financial liabilities or equity (see section 4.3.5 below).

⁶ [IFRIC Update](#), November 2015, available on the IFRS Foundation's website.

⁷ [IFRIC Update](#), May 2016, available on the IFRS Foundation's website.

It is interesting that ‘future revenues, net income or debt-to-equity ratio’ are given as examples of contingencies beyond the control of both the issuer and the holder of the instrument, since, in some cases, these matters are within the control of the entity. For example, if a payment under a financial instrument is contingent upon revenue rising above a certain level, the entity could avoid the payment by ceasing to trade before revenue reaches that level. Indeed, IAS 37 argues that certain expenses (such as legally required maintenance costs) that an entity is certain to incur if it continues to trade are not liabilities until they become legally due, because the entity could avoid them by ceasing to trade by that date. As in section 4.2.2 above, the analysis in IAS 32 appears to be relying on the concept of ‘economic compulsion’ (i.e., the entity would not rationally cease its activities merely in order to avoid making a contingent payment), even though this does not feature in the definition of ‘contingent liability’ in IAS 37, nor indeed in the classification of many instruments under IAS 32.

In the context of the IASB’s FICE project, the IASB is assessing the accounting for contingent settlement provisions and proposed amendments to the requirements in the FICE Exposure Draft published in November 2023 (see section 12.4 below).

4.3.1 Variable or contingent payments for an asset purchase

The topic of variable payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The IFRS IC’s discussions considered both the accounting at the date of purchasing the asset and subsequently, distinguishing between those variable payments that depend on the purchaser’s future activity and those that do not. The IFRS IC determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively. In May 2016, the IASB tentatively agreed that this issue would be included in the research pipeline between 2017 and 2021. At the time of writing this is not listed as an active research project on the IASB’s work plan.

A critical step in analysing the accounting for the purchase of an item of PP&E in an arrangement involving variable or contingent consideration is to fully understand the contractual arrangements, understanding the nature of the contingent or variable payments. This includes developing a full understanding of whether those contingent payments are linked to the initial value of the asset, or to its future performance, whether the contingency or variability is within or outside of the purchasers’ control and whether the variable payment is a payment for some other goods or services from the seller. In some cases, the contract may establish an obligation for the contingent payment at the outset, whilst in others it might be determined that the arrangement is an executory contract, and the liability to make the contingent payments is only recognised later once either party fulfils its obligations under the contract.

The two key issues with regards to the accounting for variable consideration in an asset purchase are 1) whether and when to recognise a liability for that variable consideration, and 2) whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset.

Looking at the first question of when a liability to make variable or contingent payments would be recognised, if the arrangement is not considered to be an executory contract, one consideration is whether those payments are dependent on the entity’s future activity, or not. IAS 32.25 stipulates that where the contingency is outside the control of both the issuer and the holder, a contingent obligation to deliver cash meets the definition of a financial liability (see section 4.3 above). Therefore, if the obligation to make the variable payment does not depend on the acquiring entity’s future activity, it would seem appropriate to recognise a financial liability in respect of the contingent amounts. [IAS 32.25]. However, it is acknowledged that whilst this view was tentatively agreed during the course of the IFRS IC discussions on the topic, ultimately, this was not clarified or confirmed as part of the final agenda decision. Furthermore, the final agenda decision notes that there are questions about the accounting for variable payments subsequent to the purchase of the asset, and in making that statement the IFRS IC did not distinguish between the different types of variable payments.

How we see it

In light of the discussions held by the IFRS IC and the absence of clear guidance in the final agenda decision, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. In doing so, entities will need to apply the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Error*. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

As described above, there is no explicit guidance on the treatment of variable or contingent consideration in the acquisition of an asset and there is diversity in practice for these types of arrangements. Therefore, examples of some accounting policies an entity may want to consider regarding initial recognition of the asset include the following:

- The cost of the asset on initial recognition includes the fair value of all variable or contingent consideration at the date of acquisition. A corresponding liability is recognised for the same amount.
- The cost of the asset on initial recognition excludes any variable or contingent payments. Accordingly, no liability is recognised for those contingent or variable amounts.

The second question that needs to be addressed is how the entity must account for subsequent payments and changes to the estimate of variable or contingent consideration. Depending on the facts and circumstances of the arrangement an entity may determine that:

- 1) Variability arises from exchange rates, time value of money, or embedded derivatives - Changes in the carrying amount of a recognised liability that arise from exchange rates are accounted for in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* and IFRIC 22 *Foreign Currency Transactions and Advance Consideration*, while the time value of money and embedded derivatives are accounted for in accordance with IFRS 9;
- 2) Variability is directly linked to the quality or quantity of the asset(s) received - In these cases, the initial recognition of the asset and liability were based on an accounting estimate that is subsequently updated in accordance with IAS 8.37; or
- 3) The variability in the arrangement does not fall under (1) or (2) above and an accounting policy needs to be developed to address it.

In the latter case, an entity will need to apply the requirements of IAS 8 to develop an accounting policy that it should apply consistently to all similar transactions. The accounting policy developed will need to address whether the change in the estimate of variable or contingent consideration should be capitalised as part of the cost of the asset or expensed. This determination is usually based on the reason for the contingent payment and entities should consider the substance of the arrangement in determining the appropriate treatment.

It is only appropriate for subsequent changes to a recognised liability to be recognised as part of the cost of the asset to the extent that it relates to future economic benefits embodied in the asset initially received. For example, if the contingency or variability is viewed as being linked to the quality or quantity of the asset initially received. Variability arising due to other factors, such as its use over time, would generally be expensed.

How we see it

Until this matter is resolved by the IASB, where the accounting for the variability or contingency is not prescribed in another standard, an entity should adopt and apply a consistent accounting policy in relation to whether subsequent payments or changes to the measurement of a recognised liability to make contingent or variable payments are included as part of the cost of an acquired asset or expensed as incurred, in accordance with the hierarchy in IAS 8.

An entity should exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

4.3.2 Contingencies that are ‘not genuine’

A requirement to settle an instrument in cash or another financial asset (or otherwise in such a way that it would be a financial liability) is not genuine (see section 4.3 above) if the requirement would arise ‘only on the occurrence of an event that is extremely rare, highly abnormal and very unlikely to occur’. [IAS 32.AG28].

Similarly, if the terms of an instrument provide for its settlement in a fixed number of the entity’s equity instruments, but there are circumstances, beyond the entity’s control, in which such settlement may be contractually precluded, and settlement in cash or other assets required instead, those circumstances can be ignored if there is ‘no genuine possibility’ that they will occur. In other words, the instrument continues to be regarded as an equity instrument and not as a financial liability. [IAS 32.AG28].

Guidance in IAS 32 on the meaning of ‘not genuine’ in this context is unfortunately restricted to the thesaurus of synonyms (‘extremely rare, highly abnormal and very unlikely to occur’) above. It is, however, helpful to consider the changes made when, in 2003, SIC-5 *Classification of Financial Instruments - Contingent Settlement Provisions*⁸ was withdrawn, and its substance incorporated in these provisions of IAS 32. SIC-5 had previously required redemption terms to be ignored if they were ‘remote’. Examples given by SIC-5 were where the issue of shares is contingent merely on formal approval by the authorities, or where cash settlement is triggered by an index reaching an ‘extreme’ level relative to its level at the time of initial recognition of the instrument.⁹

IAS 32 deliberately did not reproduce the reference to, or the examples of, ‘remote’ events in SIC-5. In the Basis for Conclusions to IAS 32, the IASB states that it does not believe it is appropriate to disregard events that are merely ‘remote’. [IAS 32.BC17]. Thus, under the revised version of IAS 32, it is not appropriate to disregard a redemption term, that is triggered only when an index reaches an extreme level. This suggests that it is not open to an entity to argue (for example) that a bond that is redeemed in cash only, if the entity’s share price falls below, or fails to reach, a certain level, can be treated as an equity instrument on the grounds that there is no genuine possibility that the share price will perform in that way.

In general, terms are included in a contract for an economic purpose and therefore are genuine. The current reference in IAS 32 to terms that are ‘not genuine’ is presumably intended to deal with clauses inserted into the terms of financial instruments for some legal or tax reason (e.g., to make conversion technically ‘conditional’ rather than mandatory) but having no real economic purpose or consequence.

An example of a clause that has caused some debate on this point is a ‘regulatory change’ clause, generally found in the terms of capital instruments issued by financial institutions such as banks and insurance companies. Such entities are generally required by local regulators to maintain certain minimum levels of equity or highly subordinated debt (generally referred to as regulatory capital) in order to be allowed to do business.

A ‘regulatory change’ clause will typically require an instrument which, at the date of issue, is classified as regulatory capital to be repaid if it ceases to be so classified. The practice so far of the regulators in many markets has been to make changes to a regulatory classification with prospective effect only, such that any instruments already in issue continue to be regarded as regulatory capital even though they would not be under the new rules.

This has led some to question whether a ‘regulatory change’ clause can be regarded as a contingent settlement provision which is ‘not genuine’.¹⁰ This is ultimately a matter for the judgement of entities and their auditors in the context of the relevant regulatory environment(s). This judgement has not been made easier by the greater unpredictability of the markets (and therefore of regulators’ responses to it) since the last financial crisis.

4.3.3 Liabilities that arise only on liquidation

As noted in section 4.3 above, IAS 32 provides that a contingent settlement provision that comes into play only on liquidation of the issuer may be ignored in determining whether or not a financial instrument is a financial liability. IAS 32 refers specifically to 'liquidation'. In other words, if an instrument provides for redemption on the occurrence of events that are a possible precursor of liquidation (e.g., extreme insolvency, the financial statements not being prepared on a going concern basis, or the entity being placed under the protection of Chapter 11 of the United States Bankruptcy Code) but falling short of formal liquidation, the instrument must be treated as a financial liability. The same applies to an instrument over own equity, which is subject to a master netting agreement, such as the ISDA Master Agreement, where default or other early termination events may lead to net cash settlement. In such cases, the contingency for net settlement on default cannot be ignored and the instrument must be classified as a financial asset or liability (see sections 5.2.7 and 6.6.6 below). Also, where liquidation is in the control of the holder, the instrument will be a liability as this exception only applies to contingencies beyond the control of both the issuer and the holder.

4.3.4 Liabilities that arise only on a change of control

A number of entities have issued instruments on terms, that require the issuing entity to transfer cash or other financial assets only in the event of a change in control of the issuing entity. This raises the question of whether such an event is outside the control of the issuing entity, with the effect that any instrument containing such a provision would be classified as a liability, to the extent of any obligations arising on a change of control.

Whether a change of control is outside the control of the entity can be far from straightforward. As noted in section 4.2.1 above, it is our view that, where the power to make a decision is reserved for the members of an entity in general meeting, for the purposes of such a decision, the members and the entity are one and the same. [IAS 32.AG28].

How we see it

We consider that a change of control requiring the approval of the members in general meeting would normally need to be regarded as within the control of the entity. Conversely, we regard a change of control as not within the control of the entity where it can be effected by one or more individual shareholders without reference to the members in general meeting, for example where a shareholder holding 40% of the ordinary equity sells its shares to another party already owning 30%.

4.3.5 Some typical contingent settlement provisions

The matrix below gives a number of contingent settlement provisions that we have encountered in practice, some common, some rather esoteric, together with our view as to whether they must be regarded as outside the control of the reporting entity. If a contingent settlement provision is regarded as outside the control of the issuing entity, the instrument will be classified as a liability by the issuer. If a contingent settlement provision is regarded as within the control of the reporting entity, the instrument will be classified as equity, provided that it has no other features requiring its classification as a liability and that the contingent settlement event is also outside the control of the holder.

Contingent settlement event	Within the issuer's control?
Issuer makes a distribution on ordinary shares.	Yes. Dividends on ordinary shares are discretionary (see also section 4.2 above).
Upon the successful takeover of the issuer (i.e., a 'control event').	It depends. See section 4.3.4 above.
Event of default under any of the issuer's debt facilities.	No
Appointment of a receiver, administrator, entering a scheme of arrangement, or compromise agreement with creditors.	No. Whether this leads to the instrument being classified as equity or liability will depend on the respective requirements in each jurisdiction. In cases when these events do not necessarily result in liquidation of the issuer, this leads to classification as a liability (see section 4.3.3 above).
Upon commencement of proceedings for the winding up of the issuer.	No, but this does not lead to classification as a liability due to the requirement to ignore settlement provisions arising only on liquidation (see section 4.3.3 above).
Incurring a fine exceeding a given amount, or commencement of an investigation of the issuer by, a government agency or a financial regulator.	No
A change in accounting, taxation, or regulatory regime which is expected to adversely affect the financial position of the issuer.	No
Suspension of listing of the issuer's shares from trading on the stock exchange for more than a certain number of days.	Probably not, but it will depend on the jurisdiction and whether the reasons for suspension are always within the control of the entity.
Commencement of war or armed conflict.	No
Issue of a subordinated security that ranks equally or in priority to the securities.	Yes
Issue of an IPO prospectus prior to the conversion date.	Yes
Execution of an effective IPO.	No. The execution of a successful IPO is not within the control of the issuer. However, a contractual obligation to pay cash in the event of an IPO taking place is within the control of the issuer as the issuer can determine whether an IPO occurs or not and thus can avoid the obligation to pay cash.
Disposal of all or substantially all of the issuer's business undertaking or assets.	Yes
Change in credit rating of the issuer.	No
A payment is made by an entity under the terms of a financial instrument that was issued for the purchase of an asset, where the amount paid depends on the performance of the asset after purchase.	It depends. See section 4.3.1 above.

4.4 Examples of equity instruments

4.4.1 Issued instruments

Under the criteria above, equity instruments under IAS 32 will include non-puttable common (ordinary) shares and some types of preference share (see section 4.5 below). [IAS 32.AG13].

Whilst non-puttable shares are typically equity, an issuer of non-puttable ordinary shares nevertheless assumes a liability when it formally acts to make a distribution and becomes legally obliged to the shareholders to do so. This may be the case following the declaration of a dividend, or when, on a winding up, any assets remaining after discharging the entity's liabilities become distributable to shareholders. [IAS 32.AG13]. For example, if an entity has issued CU100 million of equity instruments on which it declares a dividend of CU2 million, it recognises a liability of only CU2 million. Whether or not a liability arises on declaration of a dividend will depend on local legislation or the terms of the instruments or both.

IAS 32 also treats some puttable instruments (see section 4.6.2 below) and some instruments, that impose an obligation on the issuer to deliver a *pro rata* share of net assets only on liquidation (see section 4.6.3 below) that would otherwise be classified as financial liabilities, as equity instruments. However, a contract that is required to be settled by the entity receiving or delivering either of these types of 'deemed' equity instrument is a financial asset or financial liability, even when it involves the exchange of a fixed amount of cash or other financial assets for a fixed number of such instruments. [IAS 32.22A, IAS 32.AG13].

4.4.2 Contracts to issue equity instruments

A contract settled using equity instruments is not necessarily itself regarded as an equity instrument. The classification of contracts settled using issued equity instruments is discussed further in section 5 below.

Warrants or written call options that allow the holder to subscribe for or purchase a fixed number of non-puttable common (ordinary) shares in the issuing entity in exchange for a fixed amount of cash or another financial asset, or the fixed stated principal of a bond, are classified as equity instruments. [IAS 32.22, IAS 32.AG13]. The meaning of a 'fixed' amount of cash is not as self-evident as it might appear and is discussed further in section 5.2.3 below. The meaning of the 'fixed stated principal' of a bond is discussed further in section 6.3.2.A below.

Conversely, an instrument is a financial liability (or financial asset) of the issuer if it gives the holder the right to obtain:

- A variable number of non-puttable common (ordinary) shares in the issuing entity in exchange for a fixed amount of cash or another financial asset. [IAS 32.21].
- Or
- A fixed number of non-puttable common (ordinary) shares in the issuing entity in exchange for a variable amount of cash or another financial asset. [IAS 32.24].

An obligation for the entity to issue or purchase a fixed number of its own equity instruments in exchange for a fixed amount of cash or another financial asset is classified as an equity instrument of the entity. However, if such a contract contains an obligation, or even a potential obligation, for the entity to pay cash or another financial asset, it gives rise to a liability for the present value of the redemption amount (which results in a reduction of equity, not an expense, see section 5.3 below). [IAS 32.23, IAS 32.AG13].

A purchased call option or other similar contract, acquired by an entity that gives it the right to reacquire a fixed number of its own equity instruments in exchange for delivering a fixed amount of cash or another financial asset, is not a financial asset of the entity. Rather, it is classified as an equity instrument, and any consideration paid for such a contract is therefore deducted from equity (see section 11.2.1 below). [IAS 32.22, IAS 32.AG14]. This requirement refers only to contracts which require the entity to settle gross (i.e., the entity pays cash in exchange for its own shares). Contracts which can be net settled (i.e., the party for whom the contract is loss-making delivers cash or shares equal to the fair value of the contract to the other party) are generally treated as financial assets or financial liabilities. This is discussed in more detail in section 11 below.

4.5 Preference shares and similar instruments

Whilst some of the discussion below (and the guidance in IAS 32) is, for convenience, framed in terms of 'preference shares', it must be applied equally to any financial instrument, however described, with similar characteristics. In practice, many such instruments are not described as shares (possibly to avoid weakening any argument that, for fiscal purposes, they are tax-deductible debt rather than non-deductible equity).

Preference shares may be issued with various rights. In determining whether a preference share is a financial liability or an equity instrument, IAS 32 requires an issuer to assess the particular rights attaching to the share to determine whether it exhibits the fundamental characteristic of a financial liability.

[IAS 32.AG25].

IAS 32 does this in part by drawing a distinction between:

- Instruments mandatorily redeemable or redeemable at the holder's option (see section 4.5.1 below)
- And
- Other instruments i.e., those redeemable only at the issuer's option or not redeemable (see sections 4.5.2 to 4.5.4 below)

4.5.1 Instruments redeemable mandatorily or at the holder's option

A preference share (or other instrument) that:

- Provides for mandatory redemption by the issuer for a fixed or determinable amount at a fixed or determinable future date
- Or
- Gives the holder the right to require the issuer to redeem the instrument at or after a particular date for a fixed or determinable amount

Contains a financial liability, since the issuer has an obligation, or potential obligation, to transfer cash or other financial assets to the holder. This obligation is not negated by the potential inability of an issuer to redeem a preference share when contractually required to do so, whether because of a lack of funds, a statutory restriction or insufficient profits or reserves. [IAS 32.18(a), IAS 32.AG25].

It is more correct to say (in the words of the application guidance) that an instrument 'contains' a financial liability than to say (as the main body of the standard does) that it 'is' a financial liability. For example, if a preference share is issued on terms that it is redeemable at the holder's option, but dividends are paid entirely at the issuer's discretion, it is only the amount payable on redemption that is a liability. This would lead to a 'split accounting' treatment (see section 6 below), whereby, at issue, the net present value of the amount payable on redemption would be classified as a liability and the balance of the issue proceeds as equity. [IAS 32.AG37].

Non-discretionary dividends, on the other hand, establish an additional liability component. In such a case there is a contractual obligation to pay cash in respect of both the redemption of the principal and the required dividend payments up to the redemption of the instrument. The liability would be recognised at an amount equal to the present value of both the redemption amount and the non-discretionary dividends. Assuming that the dividends were set at market rate, which is generally the case, this would typically result in an overall liability classification of the whole instrument. While dividend payments might be set at a fixed percentage of the nominal value, this does not need to be the case. Any non-discretionary obligation to pay dividends creates a liability that needs to be recorded on initial recognition of the instrument. If an entity has an obligation that is non-discretionary, for example to pay out a percentage of its profits, then that gives rise to a financial liability (see Chapter 42 for discussions around embedded derivatives and non-financial variables specific to one party to the contract).

4.5.2 Instruments redeemable only at the issuer's option or not redeemable

A preference share (or other instrument) redeemable in cash only at the option of the issuer does not satisfy the definition of a financial liability in IAS 32, because the issuer does not have a present or future obligation to transfer financial assets to the shareholders. In this case, redemption of the shares is solely at the discretion of the issuer. An obligation may arise, however, when the issuer of the shares exercises its option, usually by formally notifying the shareholders of an intention to redeem the shares. [IAS 32.AG25].

Likewise, where preference shares are non-redeemable, there is clearly no financial liability in respect of the 'principal' amount of the shares. In reality there may be little distinction between shares redeemable at the issuer's option and non-redeemable shares, given that in many jurisdictions an entity can 'repurchase' its 'irredeemable' shares subject to no greater restrictions than would apply to a 'redemption' of 'redeemable' shares.

Ultimately, the classification of preference shares redeemable only at the issuer's option or not redeemable according to their terms must be determined by the other rights that attach to them. IAS 32 requires the classification to be based on an assessment of the substance of the contractual arrangements and the definitions of a financial liability and an equity instrument. [IAS 32.AG26].

If the share does establish a contractual right to a dividend, subject only to restrictions on payment of dividends in the relevant jurisdiction, it contains a financial liability in respect of the dividends. This would lead to a 'split accounting' treatment (see section 6 below), whereby the net present value of the right to receive dividends would be shown as a liability and the balance of the issue proceeds as equity. Where the dividends are set at a market rate at the date of issue, it is likely that the issue proceeds would be equivalent to the fair value (at the date of issue) of dividends payable in perpetuity, so that the entire proceeds would be classified as a financial liability.

However, when redemption of the preference shares and distributions to holders of the preference shares, whether cumulative or non-cumulative, are at the discretion of the issuer, the shares are equity instruments. The classification of preference share distributions as an equity component or a financial liability component is not affected by, for example:

- A history of making distributions
 - An intention to make distributions in the future
 - A possible negative impact on the price of ordinary shares of the issuer if distributions are not made (because of restrictions on paying dividends on the ordinary shares if dividends are not paid on the preference shares - see section 4.5.3 below)
 - The amount of the issuer's reserves
 - An issuer's expectation of a profit or loss for a period
- Or
- An ability or inability of the issuer to influence the amount of its profit or loss for the period
- [IAS 32.AG26]

The treatment of non-redeemable preference shares or other instruments with preferred rights under IAS 32 is a particularly difficult issue, since such shares often inhabit the border territory between financial liabilities and equity instruments. However, the starting point is that a non-redeemable preference share whose dividend rights are simply that a dividend (whether of a fixed, capped or discretionary amount) will be paid at the issuing entity's sole discretion, is equivalent to an ordinary equity share and therefore appropriately characterised as equity.

4.5.3 Instruments with a 'dividend blocker' or a 'dividend pusher' clause

4.5.3.A Instruments with a 'dividend blocker'

A number of entities have issued non-redeemable instruments (or instruments redeemable only at the issuer's option) with the following broad terms:

- A discretionary annual coupon or dividend will be paid up to a capped maximum amount
- And
- Unless a full discretionary coupon or dividend is paid to holders of the instrument, no dividend can be paid to ordinary shareholders

This restriction on dividend payments to ordinary shareholders is colloquially referred to as a 'dividend blocker' clause. Because payments of annual coupons or dividends are at the discretion of the issuer and the instrument is non-redeemable, the issuer has an unconditional right to avoid delivering cash or another financial asset. This is not negated by the fact that the issuer cannot pay dividends to ordinary shareholders if no coupon or dividend is paid to the holder of the instruments. The instrument is therefore classified as equity in its entirety.

The economic reality is that many entities that issue such instruments are able to do so at a cost not significantly higher than that of callable perpetual debt. This indicates that the financial markets regard 'dividend blocker' clauses as providing investors with reasonable security of receiving their 'discretionary' coupon or dividend, given the adverse economic consequences for the entity of not paying it (if sufficiently solvent to do so), namely:

- The disaffection of ordinary shareholders who could not receive any dividends.
- And
- The fact that the entity would find it very difficult to raise any similar finance again.

These factors could admit an argument that such instruments are equivalent to perpetual debt, which give rise to a financial liability of the issuer (see section 4.7 below), in all respects, except that the holder has no right to sue for non-payment of the discretionary dividend. However, the analysis in IAS 32 is based on the implicit counter-argument that the position of a holder of an instrument, all payments on which are discretionary, is equivalent to that of an ordinary shareholder. Ordinary shares do not cease to be equity instruments simply because an entity that failed to pay dividends to its ordinary shareholders, when clearly able to do so, would be subject to adverse economic pressures from those shareholders, and might find it very difficult to raise additional share capital.

Aviva plc has issued instruments with 'dividend blocker' clauses that are accounted for as equity instruments (see, in particular, the final sentences of Practical example 4-1 below).

Practical example 4-1: Aviva plc (2019)

United Kingdom

Annual report and accounts 2019 [extract]

IFRS financial statements [extract]

Notes to the consolidated financial statements [extract]

37 – Direct capital instrument and tier 1 notes

Notional amount	2019 £m	2018 £m
5.9021% £500 million direct capital instrument – Issued November 2004	500	500
6.875% £210 million STICS – Issued November 2003	—	231
Total	500	731

The direct capital instrument (the DCI) was issued on 25 November 2004. The DCI has no fixed redemption date but the Company may, at its sole option, redeem all (but not part) of the principal amount on 27 July 2020, at which date the interest rate changes to a variable rate, or on any respective coupon payment date thereafter. The variable rate will be the six month sterling deposit rate plus margin.

The Step-up Tier one Insurance Capital Securities ('STICS') were issued on 21 November 2003 by Friends Life Holdings plc, substituted as issuer by Aviva plc on 1 October 2015. These had no fixed redemption date, however, on 17 October 2019 notification was given that the Group would redeem the tier one notes at the first call date on 21 November 2019. On the notification date the instruments were reclassified as a financial liability of £210 million, representing the fair value and redemption cost at that date. The resulting difference of £21 million between the carrying amount of £231 million and fair value of £210 million has been charged to retained earnings. The instruments were cancelled on 25 November 2019.

The Company has the option to defer coupon payments on the DCI on any relevant payment date. Deferred coupons shall only be satisfied should the Company exercise its sole option to redeem the instruments.

No interest will accrue on any deferred coupon on the DCI. Deferred coupons on the DCI will be satisfied by the issue and sale of ordinary shares in the Company at their prevailing market value, to a sum as near as practicable to (and at least equal to) the relevant deferred coupons. In the event of any coupon deferral, the Company will not declare or pay any dividend on its ordinary or preference share capital. These instruments have been treated as equity. Please refer to accounting policy AE.

4.5.3.B Instruments with a 'dividend pusher'

A variation of the financial instrument discussed in section 4.5.3.A above is one with a so called 'dividend pusher' clause which, in practice, often comes with the following broad terms:

- A discretionary annual coupon or dividend will be paid up to a capped maximum amount
 - Payment of the annual coupon or dividend is required if the entity pays dividends to ordinary shareholders
- And
- The instrument is non-redeemable (or redeemable only at the issuer's option)

The annual coupons or dividends are at the discretion of the issuer and the instrument is non-redeemable, indicating an unconditional right of the issuer to avoid delivering cash or another financial asset to the holder of the instrument. Whether the 'dividend pusher' clause introduces a contractual obligation to deliver cash or another financial asset depends on whether the payments of dividends to ordinary shareholders (referenced in the dividend pusher clause) are themselves discretionary. In general, payments of dividends to ordinary shareholders are at the discretion of the issuer of those shares. The 'dividend pusher' clause therefore does not introduce a contractual obligation, meaning that the issuer has an unconditional right to avoid delivering cash or another financial asset. Thus, the instrument is classified as equity in its entirety.

4.5.4 Perpetual instruments with a 'step-up' clause

Some perpetual instruments are issued on terms that they are not required to be redeemed. However, if they are not redeemed on or before a given future date, any coupon or dividend paid after that date is increased, usually to a level that would give rise to a cost of finance higher than the entity would normally expect to incur. This effectively compels the issuer to redeem the instrument before the increase occurs. A provision for such an increase in the coupon or dividend is colloquially referred to as a 'step-up' clause. A 'step-up' clause is often combined with a 'dividend-blocker' or 'dividend pusher' clause (see sections 4.5.3.A and 4.5.3.B above).

Paragraph 22 of the version of IAS 32 in issue before its revision in December 2003 (see section 1.2 above) specifically addressed 'step-up' clauses as follows:

"A preferred share that does not provide for mandatory redemption or redemption at the option of the holder may have a contractually provided accelerating dividend such that, within the foreseeable future, the dividend yield is scheduled to be so high that the issuer would be economically compelled to redeem the instrument".¹¹

The Basis for Conclusions to the current version of IAS 32 indicates that this example was removed because it was insufficiently clear, but there was no intention to alter the general principle of IAS 32 that an instrument that does not explicitly establish an obligation to deliver cash or other financial assets may establish an obligation indirectly through its terms and conditions (see section 4.2.2 above). [IAS 32.BC9]. This has led some to suggest that any instrument with a 'step-up' clause contains a financial liability.

How we see it

In our view, the existence of a step-up clause in an issued financial instrument is irrelevant to the analysis required by IAS 32. If an instrument, whether redeemable or not, contains a contractual obligation to pay a coupon or dividend, it is a liability, irrespective of the 'step-up' clause. However, if the coupon or dividend, both before and after the step-up date, is wholly discretionary, then the instrument, absent other contractual terms that make it a liability, is an equity instrument, again irrespective of the step-up clause. (see sections 4.5.1 and 4.5.2 above).

This analysis was confirmed by the IFRS IC in March 2006 in its discussion of the classification of an instrument that included a 'step-up' dividend clause that would increase the dividend at a pre-determined date in the future. The IFRS IC agreed that this instrument included no contractual obligation ever to pay the dividends or to call the instrument and must therefore be classified as equity under IAS 32.¹²

4.5.5 Relative subordination

Some have argued that instruments with 'dividend-blocker', 'dividend-pusher' or 'step-up' clauses (see sections 4.5.3 and 4.5.4 above) do not meet the definition of an equity instrument. Those that take this view, point out that IAS 32.11 defines an equity instrument as "any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities" (see section 3 above), whereas many instruments of the type described in sections 4.5.3 and 4.5.4 above are typically entitled only to a return of the amount originally subscribed on a winding up, rather than to any 'residual interest' in the assets. However, such an instrument does not meet the definition of a liability either, for all the reasons set out above.

Moreover, as noted in section 4.1 above, IAS 32.16 indicates that, in applying the definition in IAS 32.11, an entity concludes that an instrument is equity if and only if the criteria in IAS 32.16 are met. In other words, an instrument is equity if it satisfies the criteria of IAS 32.16, whatever construction might be placed on IAS 32.11.

In March 2006, the IFRS IC considered various issues relating to the classification of instruments under IAS 32, and agreed that IAS 32 was clear that the relative subordination on liquidation of a financial instrument was not relevant to its classification under IAS 32, even where the instrument ranks above an instrument classified as a liability.¹³ This supports the view that an instrument can be classified as equity even if there are restrictions on participation by its holder in a liquidation or on winding up.

¹¹ IAS 32, (pre-2003 version - issued March 1995 and revised December 1998 and October 2000), para. 22.

¹² [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

¹³ [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

However, in February 2008, the IASB issued an amendment to IAS 32 (see section 1.2 above) which, in very specific circumstances, requires the relative subordination of an instrument to be taken into account in determining its classification as debt or equity (see section 4.6 below).

4.5.6 Economic compulsion

The discussion in sections 4.5.1 to 4.5.5 above illustrates that, while IAS 32 requires the issuer of a financial instrument to classify a financial instrument by reference to its substance rather than its legal form, in reality the substance is determined, if not by the legal form, then certainly by the precise legal rights of the holder of the financial instrument concerned. Ultimately, the key determinant of whether an instrument is a financial liability or an equity instrument of the issuer is whether the terms of the instrument give the holder a contractual right to receive cash or other financial assets which can be sued for at law, subject only to restrictions outside the terms of the instrument (e.g., statutory dividend controls).

By contrast, terms of an instrument that effectively force the issuer to transfer cash or other financial assets to the holder, although not legally required to do so (often referred to as 'economic compulsion'), are not taken into account.

In response to a submission for a possible agenda item, in March 2006, the IFRS IC discussed the role of contractual and economic obligations in the classification of financial instruments under IAS 32.

The IFRS IC agreed that IAS 32 is clear that, in order for an instrument to be classified as a liability, a contractual obligation must be established (either explicitly or indirectly) through the terms and conditions of the instrument. Economic compulsion, by itself, would not result in a financial instrument being classified as a liability.

The IFRS IC also noted that IAS 32 restricts the role of 'substance' to consideration of the contractual terms of an instrument, and that anything outside the contractual terms is not considered for the purpose of assessing whether an instrument is classified as a liability under IAS 32.¹⁴

4.5.7 'Linked' instruments

An entity may issue an instrument (the 'base' instrument) that requires a payment to be made if, and only if, a payment is made on another instrument issued by the entity (the 'linked' instrument). An example of such an instrument would be a perpetual instrument with a 'dividend blocker' clause (see section 4.5.3.A above), on which the issuing entity is required to pay a coupon only if it pays a dividend to ordinary shareholders. Absent other terms requiring the perpetual instrument to be classified as a liability, it is classified as equity on the basis that the event that triggers a contractual obligation to make a payment (i.e., payment of an ordinary dividend) is itself not a contractual obligation.

If, however, where payments on the linked instrument are contractually mandatory (such that the linked instrument contains a liability), it is obvious that the base instrument must also contain a liability. This is due to the fact that, in this case, the event that triggers a contractual obligation to make a payment on the base instrument (i.e., a payment on the linked instrument) is a contractual obligation that the issuing entity cannot avoid. This analysis was confirmed by the IFRS IC in March 2006 following discussion of linked instruments with similar terms to these.¹⁵

This issue had arisen in practice in the context that the linked instrument was often very small and callable by the issuer, but on terms that required its classification as a liability under IAS 32. This would allow the issuer, with no real difficulty, to redeem the linked instrument at will and thus convert the base instrument from a liability to equity at any time. This had led some to argue that only the linked instrument must be classified as a liability.

¹⁴ [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

¹⁵ [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

4.5.8 'Change of control', 'taxation change' and 'regulatory change' clauses

A number of entities have issued instruments with 'dividend blocker', 'dividend pusher' and 'step-up' clauses (see sections 4.5.3 and 4.5.4 above), which would otherwise have been treated as equity by IAS 32, but have wished to account for them as liabilities, perhaps because they can then be hedged in a way that allows hedge accounting to be applied (see section 10 below). Methods of achieving this have included the use of a *de minimis* linked liability instrument, or the inclusion of a clause requiring the repayment of the instrument in the event of a change of control. This raises the question of whether a change of control is within the control of the entity (such that the instrument is equity) or not (such that the instrument is debt), which is discussed in more detail in section 4.3.4 above.

Another common method of converting an instrument that would otherwise be classified by IAS 32 as equity into debt is to add a clause requiring repayment of the instrument in the event of a fiscal or regulatory change (that in reality may be a remote possibility), see section 4.3.2 above.

4.6 Puttable instruments and instruments repayable only on liquidation

4.6.1 The issue

A 'puttable instrument' is essentially a financial instrument that gives the holder the right to put the instrument back to the issuer for cash or another financial asset (see section 3 above). Prior to its amendment in February 2008 (see section 1.2 above), IAS 32 classified any puttable instrument as a financial liability, including instruments where the legal form gives the holder a right to a residual interest in the assets of the issuer.

This classification produced what some regarded as an inappropriate result in the financial statements of entities such as open-ended mutual funds, unit trusts, partnerships and some co-operative entities. Such entities often provide their unit holders or members with a right to redeem their interests in the issuer at any time for cash. Under IAS 32, prior to the February 2008 amendment, an entity whose holders had such rights might report net assets of nil, or even negative net assets, since what would, in normal usage, have been regarded as its 'equity' (i.e., assets less external borrowings) was classified as a financial liability.

For example, the owners of some co-operatives and professional partnerships are entitled to have their ownership interests repurchased at fair value. However, such entities typically do not reflect that fair value in their financial statements, because a significant part of the value may be represented by property accounted for at cost rather than fair value or by internally generated goodwill, which cannot be recognised in financial statements prepared under IFRS accounting standards.

Clearly, if such an entity were to recognise a liability for the right of its owners to be bought out at fair value, it would show net liabilities, which would increase (creating accounting losses) the more the fair value of the entity increases, and decrease (creating accounting profits) the more the fair value decreases. Moreover, any distributions to the owners of such entities would be shown as a charge to, rather than a distribution of profit.

Similar concerns were raised in relation to limited-life entities. In some jurisdictions, certain types of entity are required to be wound up after a certain period of time, either automatically, or unless the members resolve otherwise. Some entities may also have a limited life under their own governing charter, or equivalent document. For example:

- A collective investment fund might be required to be liquidated on, say, the tenth anniversary of its foundation.
- Or
- A partnership might be required to be dissolved on the death or retirement of a partner.

Such an entity arguably had no equity under IAS 32 prior to the February 2008 amendment, since its limited life imposes an obligation, outside the entity's control, to distribute all its assets. Again, some questioned whether it was very meaningful to show such an entity as having no equity.

To deal with these concerns, IAS 32 was amended in February 2008. In the meantime, the IFRS IC had published IFRIC 2 which addresses the narrower issue of the classification of certain types of puttable instrument, typically issued by co-operative entities (see section 4.6.6 below).

The effect of the amended standard is that certain narrowly defined categories of puttable instruments (see section 4.6.2 below) and instruments repayable on a pre-determined liquidation (see section 4.6.3 below) are classified as equity, notwithstanding that they have features that would otherwise require their classification as financial liabilities.

Moreover, as discussed further in section 4.6.5 below, one of the criteria for classifying such an instrument as equity, is that it is the most subordinated instrument issued by the reporting entity. This represents a significant, and controversial, departure from the normal approach of IAS 32 that the classification of an instrument must be determined only by reference to the contractual terms of that instrument, rather than those of other instruments in issue. This may mean that two entities may classify an identical instrument differently, if it is the most subordinated instrument of one entity but not of the other. It may also mean that the same entity may classify the same instrument differently at different reporting dates.

It was essentially these departures from the normal requirements of IAS 32 that led two members of the IASB to dissent from the amendment. In their view, it is not based on a clear principle, but comprises “several paragraphs of detailed rules crafted to achieve a desired accounting result ... [and] ... to minimise structuring opportunities”.¹⁶

Where the exceptions in sections 4.6.2 and 4.6.3 below do not apply, IAS 32 takes the view that the effect of the holder’s option to put the instrument back to the issuer for cash or another financial asset is that the puttable instrument meets the definition of a financial liability (see section 3 above). [IAS 32.18(b)].

The IASB believes that the accounting treatment required by IAS 32 for instruments not subject to the exceptions in sections 4.6.2 and 4.6.3 below is appropriate, but points out that the classification of members’ interests in such entities as a financial liability does not preclude:

- The use of captions such as ‘net asset value attributable to unitholders’ and ‘change in net asset value attributable to unitholders’ on the face of the financial statements of an entity that has no equity capital (such as some mutual funds and unit trusts).
- Or
- The use of additional disclosure to show that total members’ interests comprise items such as reserves that meet the definition of equity and puttable instruments that do not. [IAS 32.18(b), IAS 32.BC7, IAS 32.BC8].

The illustrative examples appended to IAS 32 give specimen disclosures to be used in such cases (see Chapter 50).

4.6.2 Puttable instruments

Extract from IAS 32

Puttable instruments

- 16A A puttable financial instrument includes a contractual obligation for the issuer to repurchase or redeem that instrument for cash or another financial asset on exercise of the put. As an exception to the definition of a financial liability, an instrument that includes such an obligation is classified as an equity instrument if it has all the following features:
- (a) It entitles the holder to a pro rata share of the entity's net assets in the event of the entity's liquidation. The entity's net assets are those assets that remain after deducting all other claims on its assets. A pro rata share is determined by:
 - (i) dividing the entity's net assets on liquidation into units of equal amount; and
 - (ii) multiplying that amount by the number of the units held by the financial instrument holder.
 - (b) The instrument is in the class of instruments that is subordinate to all other classes of instruments. To be in such a class the instrument:
 - (i) has no priority over other claims to the assets of the entity on liquidation; and
 - (ii) does not need to be converted into another instrument before it is in the class of instruments that is subordinate to all other classes of instruments.
 - (c) All financial instruments in the class of instruments that is subordinate to all other classes of instruments have identical features. For example, they must all be puttable, and the formula or other method used to calculate the repurchase or redemption price is the same for all instruments in that class.
 - (d) Apart from the contractual obligation for the issuer to repurchase or redeem the instrument for cash or another financial asset, the instrument does not include any contractual obligation to deliver cash or another financial asset to another entity, or to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity, and it is not a contract that will or may be settled in the entity's own equity instruments as set out in subparagraph (b) of the definition of a financial liability.
 - (e) The total expected cash flows attributable to the instrument over the life of the instrument are based substantially on the profit or loss, the change in the recognised net assets, or the change in the fair value of the recognised and unrecognised net assets of the entity over the life of the instrument (excluding any effects of the instrument).
- 16B For an instrument to be classified as an equity instrument, in addition to the instrument having all the above features, the issuer must have no other financial instrument or contract that has:
- (a) total cash flows based substantially on the profit or loss, the change in the recognised net assets or the change in the fair value of the recognised and unrecognised net assets of the entity (excluding any effects of such instrument or contract) and
 - (b) the effect of substantially restricting or fixing the residual return to the puttable instrument holders.
- For the purposes of applying this condition, the entity shall not consider non-financial contracts with a holder of an instrument described in paragraph 16A that have contractual terms and conditions that are similar to the contractual terms and conditions of an equivalent contract that might occur between a non-instrument holder and the issuing entity. If the entity cannot determine that this condition is met, it shall not classify the puttable instrument as an equity instrument.

IAS 32 classifies a puttable instrument as an equity instrument if it has all the above features. [IAS 32.16A, IAS 32.16B]. Profit or loss and the change in recognised net assets must be determined in accordance with relevant IFRS accounting standards. [IAS 32.AG14E].

In applying this condition in section 16B, the entity must not consider non-financial contracts with a holder of an instrument described in (a) to (e) above that have contractual terms and conditions that are similar to the contractual terms and conditions of an equivalent contract that might occur between a non-instrument holder and the issuing entity. If the entity cannot determine that this condition is met, it must not classify the puttable instrument as an equity instrument. [IAS 32.16B].

Some of these criteria raise issues of interpretation, which are addressed in section 4.6.4 below.

4.6.3 Instruments entitling the holder to a *pro rata* share of net assets only on liquidation

Extract from IAS 32

Instruments, or components of instruments, that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation

- 16C Some financial instruments include a contractual obligation for the issuing entity to deliver to another entity a pro rata share of its net assets only on liquidation. The obligation arises because liquidation either is certain to occur and outside the control of the entity (for example, a limited life entity) or is uncertain to occur but is at the option of the instrument holder. As an exception to the definition of a financial liability, an instrument that includes such an obligation is classified as an equity instrument if it has all the following features:
- (a) It entitles the holder to a pro rata share of the entity's net assets in the event of the entity's liquidation. The entity's net assets are those assets that remain after deducting all other claims on its assets. A pro rata share is determined by:
 - (i) dividing the net assets of the entity on liquidation into units of equal amount; and
 - (ii) multiplying that amount by the number of the units held by the financial instrument holder.
 - (b) The instrument is in the class of instruments that is subordinate to all other classes of instruments. To be in such a class the instrument:
 - (i) has no priority over other claims to the assets of the entity on liquidation; and
 - (ii) does not need to be converted into another instrument before it is in the class of instruments that is subordinate to all other classes of instruments.
 - (c) All financial instruments in the class of instruments that is subordinate to all other classes of instruments must have an identical contractual obligation for the issuing entity to deliver a pro rata share of its net assets on liquidation.
- 16D For an instrument to be classified as an equity instrument, in addition to the instrument having all the above features, the issuer must have no other financial instrument or contract that has:
- (a) total cash flows based substantially on the profit or loss, the change in the recognised net assets or the change in the fair value of the recognised and unrecognised net assets of the entity (excluding any effects of such instrument or contract) and
 - (b) the effect of substantially restricting or fixing the residual return to the instrument holders.
- For the purposes of applying this condition, the entity shall not consider non-financial contracts with a holder of an instrument described in paragraph 16C that have contractual terms and conditions that are similar to the contractual terms and conditions of an equivalent contract that might occur between a non-instrument holder and the issuing entity. If the entity cannot determine that this condition is met, it shall not classify the instrument as an equity instrument.

Some of the criteria for classifying as equity financial instruments that entitle the holder to a *pro rata* share of assets only on liquidation are similar to those (in section 4.6.2 above) for classifying certain puttable instruments as equity. The difference between these criteria and those for puttable instruments are:

- There is no requirement for there to be no contractual obligations other than those arising on liquidation.
- There is no requirement to consider the expected total cash flows throughout the life of the instrument.

And

- The only feature that must be identical among the instruments in the class is the obligation for the issuing entity to deliver to the holder a *pro rata* share of its net assets on liquidation.

The reason for the more relaxed criteria in this case is that the IASB took the view that, given that the only obligation in this case arises on liquidation, there was no need to consider obligations other than those on liquidation. However, the IASB notes that, if an instrument does contain other obligations, these may need to be accounted for separately under IAS 32. [IAS 32.BC67].

Some of these criteria raise some issues of interpretation, which are addressed in section 4.6.4 below. [IAS 32.16C, IAS 32.16D].

4.6.4 Clarification of the exemptions in sections 4.6.2 and 4.6.3 above

The conditions for treating certain types of puttable instruments (see section 4.6.2 above) and instruments repaying a *pro rata* share of net assets on liquidation (see section 4.6.3 above) as equity are complex.

IAS 32 provides some clarification in respect of the following matters:

- Instruments issued by a subsidiary (see section 4.6.4.A below)
- Determining the level of subordination of an instrument (see condition (b) in sections 4.6.2 and 4.6.3 above), (see section 4.6.4.B below)
- The meaning of ‘no obligation to deliver cash or another financial asset’ (see condition (d) in section 4.6.2 above) in respect of instruments with a requirement to distribute a minimum proportion of profit to shareholders (see section 4.6.4.D below)
- Other instruments that substantially fix or restrict the residual return to the holder of an instrument (see section 4.6.2 above [IAS 32.16B(b)] and section 4.6.3 above [IAS 32.16D(b)]), (see section 4.6.4.E below)

And

- Transactions entered into by an instrument holder other than as owner of the entity (see section 4.6.4.F below)

One matter on which IAS 32 does not provide further clarification is the meaning of ‘identical features’ (see condition (c) in section 4.6.2 above). This is dealt with in section 4.6.4.C below.

4.6.4.A Instruments issued by a subsidiary

A subsidiary may issue an instrument that is classified as equity in its separate financial statements under one of the exceptions summarised in sections 4.6.2 and 4.6.3 above. However, in the consolidated financial statements of the subsidiary’s parent, such an instrument is not recorded as a non-controlling interest, but as a financial liability. [IAS 32.AG29A]. This reflects the fact that the exceptions in sections 4.6.2 and 4.6.3 above are both subject to the condition that the instrument concerned is the most subordinated instrument issued by the reporting entity. The IASB took the view that a non-controlling interest, by its nature, can never be regarded as the residual ownership interest in the consolidated financial statements. [IAS 32.BC68].

4.6.4.B Relative subordination of the instrument

The exceptions in sections 4.6.2 and 4.6.3 above are both subject to the criterion, condition (b), that the instrument concerned is the most subordinated instrument issued by the reporting entity. As noted in section 4.6.1 above, this represents a departure from the normal principle of IAS 32 that the classification of an issued instrument as a financial liability or equity is determined by reference only to the contractual terms of that instrument.

To determine whether an instrument is in the most subordinate class, the entity calculates the instrument’s claim on a liquidation as at the date when it classifies the instrument. The entity reassesses the classification if there is a change in relevant circumstances (for example, if it issues or redeems another financial instrument). [IAS 32.AG14B]. This is discussed further in section 4.6.5 below.

An instrument that has a preferential right on liquidation of the entity is not regarded as an instrument with an entitlement to a *pro rata* share of the net assets of the entity. An example might be an instrument that entitles the holder to a fixed dividend on liquidation, in addition to a share of the entity’s net assets, when other instruments in the subordinate class with a right to a *pro rata* share of the net assets of the entity do not have the same right on liquidation. [IAS 32.AG14C].

If an entity has only one class of financial instruments, that class is treated as if it were subordinate to all other classes. [IAS 32.AG14D].

How we see it

In our view, the test of whether the instrument is the most subordinated has to be applied according to the legal rights of the various classes of instruments, even where what is legally the most subordinated instrument in issue is entitled to the return of only a nominal sum on liquidation, which may be dwarfed by the entitlement of other classes of shares.

The requirement for a puttable instrument to be in the most subordinate class of instruments issued by an entity does not preclude other, non-puttable, instruments from being classified as equity at the same time. In an agenda decision issued in March 2009, the IFRS IC noted that a financial instrument is first classified as a liability or equity instrument in accordance with the general requirements of IAS 32. That classification is not affected by the existence of puttable instruments.¹⁷ Thus, for example, founders' shares in an investment fund, which are entitled only to the return of their par value on liquidation, would be classified as equity even if less subordinate than a class of puttable shares which also qualify for equity classification. Conversely, if the founders' shares were the most subordinate instruments, the puttable shares would have to be classified as liabilities.

4.6.4.C Meaning of 'identical features'

Condition (c) in IAS 32.16C requires that "all financial instruments in the class of instruments that is subordinate to all other classes of instruments" have identical features. For example, they must all be puttable, and the formula or other method used to calculate the repurchase or redemption price is the same for all instruments in that class. The word 'identical' does not normally need much further explanation in the English language. Nevertheless, some have questioned how literally the word must be interpreted in this case. Consider, for example, an investment fund that issues several types of puttable shares, each equally subordinate, having identical redemption and dividend rights, but different minimum subscription thresholds and subscription fees. Do all these instruments have identical features for the purpose of this exemption?

How we see it

In our view the identical features condition in IAS 32.16C(c) is primarily designed to ensure that the redemption rights of the shares do not differ. Terms with features that do not have the potential to impact the redemption rights of the instrument will not necessarily fail the 'identical features' test.

Accordingly, terms that take effect before the shares are issued (as in the example above), or are not financial, do not cause instruments to fail the 'identical features' test. Examples of features which are not financial might include rights to information or management powers.

When considering whether instruments have identical features, it is important to consider whether rights and obligations arise as a result of holding the instrument or from some other cause. Consider, as an example, a closed end fund with a predetermined maturity, incorporated as a partnership limited by shares, which has two classes of shares: a management share subscribed for by the general partner; and ordinary shares subscribed for by the limited partners. Upon the dissolution of the entity, the general partner is entitled to a fixed rate management fee and a fee based on the performance of the fund, otherwise the assets are distributed to both classes of shareholder on a *pro rata* basis. As the management and ordinary shares rank *pari passu* with each other, neither is subordinate to the other and both the management share and the ordinary shares would be classified as equity. The management and performance fees payable to the general partner are returns for managing the fund rather than equity returns in their capacity as a shareholder. For transactions entered into by an instrument holder other than as an owner of equity, see section 4.6.4.F below. The fact that the different classes of shares have different names is irrelevant to the analysis.

4.6.4.D No obligation to deliver cash or another financial asset

One of the conditions for classifying a financial instrument as equity in section 4.6.2 above is that the instrument does not include any contractual obligation to deliver cash or another financial asset to another entity, or to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity.

Some entities, particularly ones with limited lives, are required by their constitution to distribute a minimum proportion of profits to shareholders or partners each year. Subject to the matters discussed in section 4.2 above, such a requirement will normally result in the puttable instrument being considered a liability. It might be argued, firstly, that no obligation arises in these circumstances until profits are made, and secondly that such distributions only represent advance payments of the residual interest in the entity and so are consistent with equity classification. However, the IASB discussed this issue while developing the 2008 amendment and concluded that a contractual obligation existed, the measurement of which was uncertain. Nevertheless, the IASB declined to provide further guidance on this issue as they considered that it would have implications for other projects.

¹⁷ [IFRIC Update](#), March 2009, available on the IFRS Foundation's website.

In May 2010, the IFRS IC considered a request to clarify whether puttable income trust units, that include contractual provisions to make distributions on a *pro rata* basis, can be classified as equity. The submission to the IFRS IC argued that such *pro rata* obligations would not prevent the instrument from being classified as equity, by analogy to the *Classification of Rights Issues* amendment to IAS 32 (October 2009). The IFRS IC decided not to propose any amendment to IAS 32 to deal with this issue, making it fairly clear in the process that they did not believe such an instrument would qualify to be classified as equity.

4.6.4.E Instruments that substantially fix or restrict the residual return to the holder of an instrument

A condition for classifying a financial instrument as equity in sections 4.6.2 or 4.6.3 above is that the issuing entity has no other financial instrument or contract that has:

- Total cash flows based substantially on the profit or loss, the change in the recognised net assets or the change in the fair value of the recognised and unrecognised net assets of the entity.
- And
- The effect of substantially restricting or fixing the residual return.

IAS 32 notes that the following instruments, when entered into on normal commercial terms with unrelated parties, are unlikely to prevent instruments that otherwise meet the criteria in sections 4.6.2 or 4.6.3 above from being classified as equity:

- Instruments with total cash flows substantially based on specific assets of the entity
- Instruments with total cash flows based on a percentage of revenue
- Contracts designed to reward individual employees for services rendered to the entity
- And
- Contracts requiring the payment of an insignificant percentage of profit for services rendered or goods provided [IAS 32.AG14J]

4.6.4.F Transactions entered into by an instrument holder other than as owner of the entity

IAS 32 observes that the holder of a financial instrument subject to one of the exceptions in sections 4.6.2 or 4.6.3 above may enter into transactions with the entity in a role other than that of an owner. For example, an instrument holder also may be an employee of the entity. IAS 32 requires that only the cash flows and the contractual terms and conditions of the instrument that relate to the instrument holder as an owner of the entity be considered when assessing whether the instrument must be classified as equity under conditions (a) to (e) in IAS 32.16A or conditions (a) to (c) in IAS 32.16C. [IAS 32.AG14F].

An example might be a limited partnership that has limited and general partners. Some general partners may provide a guarantee to the entity and be remunerated for providing that guarantee. In such situations, the guarantee and the associated cash flows relate to the instrument holders in their role as guarantors and not in their roles as owners of the entity. Therefore, such a guarantee and the associated cash flows would not result in the general partners being considered subordinate to the limited partners and would be disregarded when assessing whether the contractual terms of the limited partnership instruments and the general partnership instruments are identical. [IAS 32.AG14G].

Another example might be a profit or loss sharing arrangement that allocates profit or loss to the instrument holders based on services rendered or business generated during the current and previous years. Such arrangements are regarded as transactions with instrument holders in their role as non-owners and must not be considered when assessing the criteria in conditions (a) to (e) in IAS 32.16A above or conditions (a) to (c) in IAS 32.16C above. By contrast, profit or loss sharing arrangements, that allocate profit or loss to instrument holders based on the nominal amount of their instruments relative to others in the class, represent transactions with the instrument holders in their roles as owners and must be considered when assessing the criteria in conditions (a) to (e) in IAS 32.16A above or conditions (a) to (c) in IAS 32.16C above. [IAS 32.AG14H].

IAS 32 notes that, in order for a transaction with an owner to be assessed as being undertaken in that person's capacity as a non-owner, the cash flows and contractual terms and conditions of the transaction must be similar to those of an equivalent transaction that might occur between a non-instrument holder and the issuing entity. [IAS 32.AG14I].

4.6.5 Reclassification of puttable instruments and instruments imposing an obligation only on liquidation

As noted in section 4.6.4.B above, IAS 32 requires the entity to continually reassess the classification of such an instrument. The entity classifies a financial instrument as an equity instrument from the date on which it has all the features and meets the conditions set out in sections 4.6.2 or 4.6.3 above, and reclassifies the instrument from the date on which it ceases to have all those features or meet all those conditions.

For example, if an entity redeems all its issued non-puttable instruments, any puttable instruments that remain outstanding and that have all of the features and meet all the conditions in section 4.6.2 above, are reclassified as equity instruments from the date of redemption of the non-puttable instruments. [IAS 32.16E].

Where an instrument, previously classified as an equity instrument, is reclassified as a financial liability, the financial liability is measured at fair value at the date of reclassification, with any difference between the carrying value of the equity instrument and the fair value of the financial liability at the date of reclassification being recognised in equity. [IAS 32.16F(a)].

Where an instrument, previously classified as a financial liability, is reclassified as an equity instrument, the equity instrument is measured at the carrying value of the financial liability at the date of reclassification. [IAS 32.16F(b)].

4.6.6 IFRIC 2

The issue that ultimately led to the publication of IFRIC 2 was the appropriate accounting treatment for the members' contributed capital of a co-operative entity, where the members are entitled to ask for the return of their investment. However, the scope of IFRIC 2 is not confined to co-operative entities and extends to any entity whose members may ask for a return of their capital. [IFRIC 2.1, IFRIC 2.2, IFRIC 2.3, IFRIC 2.4].

IFRIC 2 states that the contractual right of the holder of a financial instrument to request redemption does not, in itself, require that financial instrument to be classified as a financial liability. Rather, the entity must consider all the terms and conditions of the financial instrument in determining its classification as a financial liability or equity. Those terms and conditions include relevant local laws, regulations and the entity's governing charter in effect at the date of classification, but not expected future amendments to those laws, regulations or charter. [IFRIC 2.5].

Accordingly, IFRIC 2 provides that an instrument, that would be classified as equity if the holder did not have the right to request redemption, must be classified as an equity instrument where:

- The entity has the unconditional right to refuse redemption
 - Local law, regulation or the entity's governing charter imposes an unconditional prohibition on redemption
- Or
- The members' shares meet the criteria in sections 4.6.2 or 4.6.3 above for classification as equity [IFRIC 2.6, IFRIC 2.7, IFRIC 2.8]

IFRIC 2 distinguishes between those prohibitions on redemption in local law, regulation or the entity's governing charter that are 'unconditional' (i.e., they apply at any time) and those which prohibit redemption only when certain conditions, such as liquidity constraints, are met or not met. Prohibitions that apply only in certain circumstances are ignored and therefore would not result in equity classification. [IFRIC 2.8]. This is consistent with the fact that under IAS 32 the classification of an instrument as debt or equity is not influenced by considerations of liquidity (see section 4.2 above).

In some cases, there may be a partial prohibition on redemption. For example, redemption may be prohibited where its effect would be to reduce the number of members' shares or the amount of paid-in capital below a certain minimum. In such cases, only the amount subject to a prohibition on redemption is treated as equity, unless:

- The entity has the unconditional right to refuse redemption as described above.
- Or
- The members' shares meet the criteria in sections 4.6.2 or 4.6.3 above for classification as equity.

If the minimum number of members' shares or amount of paid-in capital changes, an appropriate transfer is made between financial liabilities and equity. [IFRIC 2.9].

Any financial liability for the redemption of instruments not classified as equity, is measured at fair value. In the case of members' shares with a redemption feature, the entity measures the fair value of the financial liability for redemption at no less than the maximum amount payable under the redemption provisions of its governing charter or applicable law, discounted from the first date that the amount could be required to be paid. [IFRIC 2.10].

In accordance with the general provisions of IAS 32 regarding interest and dividends (see section 8 below), distributions to holders of equity instruments are recognised directly in equity, net of any income tax benefits. Interest, dividends and other returns relating to financial instruments classified as financial liabilities are expenses, regardless of whether those amounts paid are legally characterised as dividends, interest or otherwise. [IFRIC 2.11].

IFRIC 2 clarifies that, where members act as customers of the entity (for example, where it is a bank and members have current or deposit accounts or similar contracts with the bank), such accounts and contracts are financial liabilities of the entity. [IFRIC 2.6].

It should be noted that in the FICE DP (see section 12 below), the IASB noted that the requirements in IFRS accounting standards to account for financial instruments have been designed around the concept of a contract. They further noted that IFRIC 2 was developed for a very specific fact pattern and that they did not believe that the analysis in IFRIC 2 is more broadly applicable.¹⁸ The effects of laws or regulations is an area the IASB intends to clarify as part of the ongoing FICE project and proposed amendments to the requirements in the FICE Exposure Draft published in November 2023 (see section 12.5 below).

4.7 Perpetual debt

'Perpetual debt' instruments are those that provide the holder with the contractual right to receive payments on account of interest at fixed dates, extending into the indefinite future, either with no right to receive a return of principal or a right to a return of principal under terms that make it very unlikely or very far in the future. However, this does not mean that 'perpetual debt' is to be classified as equity, since the issue proceeds will typically represent the net present value of the liability for interest payments.

For example, an entity may issue a financial instrument requiring it to make annual payments in perpetuity equal to a stated interest rate of 8% applied to a stated par or principal amount of CU1 million. Assuming 8% to be the market rate of interest for the instrument when issued, the issuer assumes a contractual obligation to make a stream of future interest payments having a fair value (present value) of CU1 million. Thus, perpetual debt gives rise to a financial liability of the issuer. [IAS 32.AG6].

4.8 Differences of classification between consolidated and single entity financial statements

4.8.1 Consolidated financial statements

In consolidated financial statements, IAS 32 requires an entity to present non-controlling interests (i.e., the interests of other parties in the equity and income of its subsidiaries) within equity, in accordance with IAS 1 (see Chapter 3) and IFRS 10 *Consolidated Financial Statements* (see Chapter 8 and Chapter 10). [IAS 32.AG29].

When classifying a financial instrument (or a component of it) in consolidated financial statements, an entity must consider all the terms and conditions agreed between all members of the group and the holders of the instrument in determining whether the group as a whole has an obligation to deliver cash or another financial asset, in respect of the instrument or to settle it in a manner that results in its classification as a financial liability. [IAS 32.AG29].

For example, a subsidiary in a group may issue a financial instrument and a parent or other group entity may then agree additional terms directly with the holders of the instrument to guarantee some or all of the payments to be made under the instrument. The effect of this is that the subsidiary may have discretion over distributions or redemption, but the group as a whole does not. [IAS 32.AG29].

18 Discussion Paper [DP/2018/1](#): *Financial Instruments with Characteristics of Equity*, IASB, June 2018, para. 8.33-34. Available on the IFRS Foundation's website.

Accordingly, the subsidiary may appropriately classify the instrument without regard to these additional terms in its individual financial statements. For the purposes of the consolidated financial statements, however, the effect of the other agreements between members of the group and the holders of the instrument is to create an obligation or settlement provision, so that the instrument (or the component of it that is subject to the obligation) is classified as a financial liability. [IAS 32.AG29].

Thus, it is quite possible for a financial instrument to be classified as an equity instrument in the financial statements of the issuing subsidiary but as a financial liability in the financial statements of the group.

4.8.2 Single entity financial statements

The converse of the discussion in section 4.8.1 above is that it is not uncommon for instruments that are classified as equity in the consolidated financial statements to give rise to liabilities and embedded derivatives in the financial statements of individual members of the group.

This is because a group wishing to raise finance for its operations will generally do so through a group entity specialising in finance-raising, which will then on-lend the proceeds of the finance raised to the relevant operating subsidiaries. The terms of the intragroup on-lending transactions will often be such that finance which constitutes equity from the perspective of group as a whole, may be a liability in the individual financial statements of the finance-raising entity itself.

For example, the finance-raising entity might issue an irredeemable instrument with a 'dividend blocker' clause (see section 4.5.3.A above), under the terms of which that entity is not required to make any payments to the holder unless the ultimate parent entity of the group pays a dividend to ordinary shareholders. Absent any other terms requiring its classification, in whole or in part, as a liability under IAS 32, the instrument will be treated as equity in the consolidated financial statements, since payments under the instrument are contingent on an event within the control of the group (payment of a dividend by the parent entity). In the finance-raising entity's single entity financial statements, however, the instrument must be classified as a liability, because the subsidiary cannot control the dividend policy of its parent and could therefore be forced to make payments to the holder of the instrument as a consequence of its parent entity paying a dividend.

Another common example is that a group may issue a convertible bond which is actually structured as a series of transactions along the following lines:

- A finance-raising subsidiary issues a bond, giving the holder a right to receive fixed, non-discretionary interest payments, which converts into preference shares of that subsidiary.
- And
- At the time that this conversion occurs, the parent entity is required to acquire the preference shares of the subsidiary from the holder (i.e., the previous bondholder) in exchange for equity of the parent.

Absent any other terms requiring classification as a liability under IAS 32, the instrument will be treated as a compound instrument, consisting of a liability and an equity component (see section 6 below) in the consolidated financial statements. The instrument as a whole might be classified as a liability in the subsidiary's financial statements, if (for example) the preference shares issued on conversion by the subsidiary have terms that require them to be classified as a liability by IAS 32. In that case, the subsidiary will have issued an instrument that the holder can exchange either for cash or for a debt instrument.

From the subsidiary's perspective, therefore, there is no equity component to the instrument and the overall instrument would be classified as a liability that, under the general rules of IFRS 9, must be recorded at fair value on initial recognition, which will typically be lower than the proceeds received. This is because the pricing of the instrument as a whole considers the conversion option that the holder receives, so that the interest is typically paid at a rate below the rate that would apply to a liability without a conversion option. In other words, the holder of the instrument 'pays' for the conversion option through a reduced entitlement to interest. The group accounts reflect the difference between the proceeds of issue and the fair value of the liability component as the equity component (see section 6 below).

How we see it

In the financial statements of a subsidiary that has issued a debt instrument that is convertible into its parent's shares, the most appropriate accounting treatment, in our view, would be to treat the difference between the proceeds of issue and the fair value of the subsidiary's liability as an equity contribution by the parent, reflecting the fact that the subsidiary can borrow on a reduced interest basis due to the conversion option issued by the parent.

Moreover, in the period prior to conversion, the parent is required to account for its contingent forward contract to acquire the preference shares in the finance company, in its separate accounts.

4.9 Reclassification of instruments

It happens from time to time that the terms of a financial instrument are modified in such a way that an instrument, that was an equity instrument at the original date of issue, would be classified as a financial liability if issued at the date of modification, or *vice versa*. Alternatively, the terms of the instrument may remain unaltered, but external circumstances may change. For example:

- An instrument might have been issued subject to a contingent settlement provision (see section 4.3 above) that, at the date of issue, was within the control of the issuer, but ceases to be so at a later date.
- An instrument might have been issued subject to a contingent settlement provision (see section 4.3 above) that, at the date of issue, was not considered genuine, but becomes so at a later date.

Or

- An instrument might have been issued, requiring interest payments to be made when contractually mandatory interest payments are made on another instrument issued by the entity, the 'linked' instrument (see section 4.5.7 above), but this linked instrument is later repaid by the entity.

Such situations raise the question of whether such changes of terms or circumstances would lead to reclassification of the instruments affected in the financial statements and, if so, how the reclassification would be accounted for.

4.9.1 Change of terms

IAS 32 gives no guidance as to whether reclassification is required, permitted or prohibited. The requirement of IAS 32.15 that an instrument be classified 'on initial recognition' (see section 4 above) could be read as implying that classification occurs only on initial recognition and is not subsequently revisited.

However, an agenda decision by the IFRS IC (see section 4.9.1.A below) indicated that a change in the terms of an instrument is equivalent to the issue of a new instrument in settlement of the original instrument if the change in the terms of the instrument results in the instrument being classified as a financial liability. Such an exchange transaction would be accounted for by derecognising the settled instrument and recognising (and classifying as a financial liability or equity) the new replacement instrument.

4.9.1.A Equity instrument to financial liability

At its meeting in November 2006, the IFRS IC considered a situation in which an amendment to the contractual terms of an equity instrument resulted in the instrument being classified as a financial liability. Two issues were discussed:

- The measurement of the financial liability at the date of the amendment to the terms.
And
- The treatment of any difference between the carrying amount of the previously recognised equity instrument and the amount of the financial liability recognised.

The IFRS IC decided not to add this issue to its agenda because, in its view, the accounting treatment is clear. The financial liability is initially recognised at fair value under the general provisions of IFRS 9 (see Chapter 45). Any difference between the carrying amount of the liability and that of the previously recognised equity instrument is recognised in equity in accordance with the general principle of IAS 32 (see section 8 below) that no gain or loss is recognised in profit or loss on the purchase, sale, issue or cancellation of an entity's own equity instruments.¹⁹

4.9.1.B Financial liability to equity instrument

How we see it

Where the terms of a financial liability are changed such that the instrument then meets the definition of an equity instrument, we believe, as above, that the instrument must be reclassified to equity.

¹⁹ [IFRIC Update](#), November 2006, available on the IFRS Foundation's website.

That situation is analogous to a debt-for-equity swap as discussed in section 7 below and, therefore, must be accounted for in accordance with IFRIC 19, where that interpretation applies. The most likely situation in which IFRIC 19 would not apply would be in a transaction with shareholders in their capacity as shareholders, as discussed in section 7.3 below.

4.9.2 Change of circumstances - passage of time

The nature and risk profile of a financial instrument may change as a result of a change in circumstances. Such a change may occur simply as the result of the passage of time. For example, in 20X1 an entity might issue a bond mandatorily convertible at the end of 20X4. The conversion terms are that the holder will receive a number of the issuer's equity shares, being the lower of 100 shares or a number of shares determined according to a formula based on the share price at 31 December 20X1.

At the date of issue, this instrument is a financial liability since it involves an obligation to deliver a variable number of equity instruments. At 31 December 20X1, however, the number of shares to be delivered on conversion can be determined and becomes fixed.

How we see it

In our view, the liability component of a bond representing the obligation to deliver a variable number of equity instruments could be regarded as expiring if the number of equity instruments that must be delivered subsequently becomes fixed. This liability component could therefore be derecognised (see Chapter 48), to be replaced with an equity component (see the discussion in section 7 below of the appropriate accounting treatment in such circumstances). This issue was discussed by the IFRS IC in March 2021, who however, noted that IAS 32 contains no general requirement for reclassifying financial liabilities and equity instruments (see paragraph below).

In March 2021, the IFRS IC received a request about the application of IAS 32 in respect of the reclassification of warrants. Specifically, the request described a warrant that provided the holder with the right to buy a fixed number of equity instruments of the issuer of the warrant for an exercise price that would be fixed at a future date. At initial recognition, because of the variability in the exercise price, the issuer classified these instruments as financial liabilities. The request asked whether the issuer reclassifies the warrant as an equity instrument following the fixing of the warrant's exercise price after initial recognition as specified in the contract, given that the fixed-for-fixed condition would be met at that stage. The IFRS IC observed that IAS 32 contains no general requirements for reclassifying financial liabilities and equity instruments after initial recognition when the instrument's contractual terms are unchanged. The IFRS IC also acknowledged that similar questions about reclassification arise in other circumstances and that reclassification by the issuer has been identified as one of the practice issues being addressed as part of the FICE project. The IFRS IC concluded that the matter described in the request was too narrow for the Board or the IFRS IC to address and instead would more appropriately be considered as part of the Board's discussions on the FICE project. The IASB proposed amendments to the requirements for this area in the FICE Exposure Draft published in November 2023 (see section 12 below).²⁰

4.9.3 Change of circumstances - other than passage of time

Changes of circumstances for reasons other than the passage of time are more challenging. For example, an entity might issue a convertible bond denominated in its functional currency at that time. Such a bond would have an equity component (see section 6 below). Subsequently, the entity's functional currency changes but the bond remains outstanding, now denominated in a currency other than the entity's functional currency. If a bond with these terms were issued after the change in functional currency, it would be classified in its entirety as a financial liability, since the principal of the bond would not be a 'fixed' amount by reference to the entity's functional currency (see section 5.2.3 below). This raises the question of whether the equity component of the bond must be reclassified as a financial liability on the change in functional currency.

In our view, there are arguments both for and against reclassification. As the arguments for reclassification are to some extent a rebuttal of those against reclassification, we discuss the latter first.

²⁰ [IFRIC Update](#), March 2021, available on the IFRS Foundation's website.

4.9.3.A Arguments against reclassification

The principal arguments against reclassification are:

- (a) The requirement of IAS 32.15 to classify an instrument as a financial liability or equity 'on initial recognition' (see section 4 above) could be read as implying that such classification occurs only on initial recognition and is not subsequently revisited.
- (b) The implementation guidance to IFRS 1 *First-time Adoption of International Financial Reporting Standards*, requires a compound instrument to be analysed into its components, based on the substance of the contractual arrangement, as at the date on which the instrument first satisfied the recognition criteria in IAS 32. [IFRS 1.IG35, IFRS 1.IG36]. Changes to the terms of the instrument after that date are taken into account on first-time adoption, but changes in circumstances are not.
This could be construed as establishing a more general principle that changes in the terms of instruments must be accounted for but changes in circumstances must not.
- (c) IFRS 9 clarifies that the assessment of whether or not an embedded derivative is required to be separated from its host contract is undertaken when the entity first becomes party to the contract, and is not revisited in the light of any subsequently changing circumstances (see Chapter 42). [IFRS 9.B4.3.11].
- (d) IFRIC 2 and the provisions of IAS 32 requiring certain types of puttable and redeemable instrument to be classified as equity (see section 4.6 above). Each require accounting recognition to be given to some changes in the classification of a financial instrument as the result of changing circumstances. This implies that, absent such specific guidance, the 'default' position would be that there would be no accounting consequences, an inference reinforced by the requirement that the provisions of IAS 32 requiring certain types of puttable and redeemable instrument to be classified as equity must not be applied by analogy to other transactions.

4.9.3.B Arguments for reclassification

The principal arguments in favour of reclassification are:

- (a) The definitions of financial liability and equity both use the present tense, implying that the definitions are to be applied at each reporting date, absent any more specific provision against doing so.
This is consistent with our view that some transactions falling within the scope of IFRS 2 *Share-based Payment*, must be reclassified from equity-settled to cash-settled and *vice versa* in the light of changing circumstances (see Chapter 30). However, it could be argued that such an analogy is inappropriate given the significant differences between the definitions of equity and financial liability in IAS 32 and those of equity-settled and cash-settled share-based payment transaction in IFRS 2 (see section 5.1.1 below).
- (b) The provisions of IFRS 1 referred to in (b) in section 4.9.3.A above are contained in implementation guidance, which is not part of the standard. Moreover, it refers only to compound financial instruments, and appears to be implicitly addressing changes in market interest rates that might alter the arithmetical split of the instrument into its financial liability and equity components (see section 6 below), rather than more general changes in circumstances.
- (c) The fact that IFRS 9 (see (c) in section 4.9.3.A above) was issued after IFRS 1 indicates that a general prohibition on reassessment must not be inferred from IFRS 1. Had the IASB wished to clarify that this was the case, they could easily have done so in IFRS 9.
However, it is equally difficult to argue that there is an implied 'default' requirement for reclassification, given the specific requirement for reclassification of certain puttable and redeemable instruments on a change in circumstances referred to in (d) in section 4.9.3.A above.

How we see it

What emerges from the analysis above is a lack of definitive general guidance as to whether reclassification of an instrument is permitted, required or prohibited. Accordingly, we believe that in some circumstances, such as a change in the entity's functional currency, the entity may choose, as a matter of accounting policy, either to reclassify or not to reclassify an instrument following that change of circumstances which, had it occurred before initial recognition of the instrument, would have changed its classification. The policy adopted must, in our view, be followed consistently in respect of all changes of circumstances of a similar nature, although changes in circumstances of different natures could have different accounting policies, e.g., a change in functional currency could have a different accounting policy from a change resulting from the passage of time.

However, some changes in circumstances can be more fundamental to the nature of the contract. For example, the change in circumstances could lead to the instruments delivered under a contract ceasing to be equity instruments of the reporting entity. This situation could arise where a parent had entered into a derivative involving delivery of the equity instruments of a subsidiary and subsequently loses control of that subsidiary. Here the former subsidiary's equity instruments would now represent financial assets rather than non-controlling interests (equity) of the group. In these circumstances, it may be more difficult to argue that not reclassifying the derivative contract is appropriate.

4.10 Special purpose acquisition companies (SPACs)

A SPAC is an entity that raises capital from investors in an IPO for the sole purpose of the future business acquisition of a target which typically has not been identified at the time of the SPAC's IPO.

4.10.1 Financial instruments issued by the SPAC

Through the life cycle of a SPAC transaction, the SPAC issues various financial instruments.

At formation, the SPAC typically issues shares, or a combination of founder shares and founder warrants, to the SPAC's sponsors, including the management team, at a nominal price in return for forming the SPAC. The shares can be ordinary shares or a special class of shares that will allow them to have a significant ownership interest in the SPAC if a successful acquisition occurs.

On its IPO, the SPAC will typically issue units consisting of ordinary shares (public shares) and warrants (public warrants) to third-party investors. The SPAC sponsors may also purchase warrants to acquire ordinary shares at the time of the IPO through a private placement (private warrants).

Finally, upon acquisition, the SPAC generally will issue additional ordinary shares to the selling shareholders of the target and will typically enter into earn-out arrangements with the selling shareholders, the SPAC sponsors and/or employees of the target based on the future share price of the combined entity.

4.10.2 Shares and warrants

Careful consideration should be given to whether ordinary shares and warrants issued by a SPAC before acquisition and upon acquisition are accounted for under IAS 32. If the shares or warrants are determined to be within the scope of IAS 32, their classification as financial liabilities or equity, must be determined by reference to the requirements in section 4 above. In particular, section 4.1 provides guidance on the definition of an equity instrument and section 4.2 on a contractual obligation to deliver cash or other financial assets, i.e., a financial liability.

It must also be assessed whether the issued shares and warrants represent share-based payments to which IFRS 2 must be applied. For example, if the shares or warrants are issued for nominal consideration in exchange for goods or services, then, generally, there would be a share-based payment arrangement and IFRS 2 applies. Likewise, if the identifiable consideration, if any, received appears to be less than the fair value of equity instruments granted or liabilities incurred, this may indicate that goods or services have been received, and that an expense may need to be recognised in accordance with IFRS 2. See Chapter 30 for further guidance, which addresses the IFRS 2 scope requirements being applied to an entity issuing new ordinary shares and warrants to acquire a SPAC. The further discussion in relation to SPACs in section 4.10.3 to 4.10.6 below, relates to those issued financial instruments that are accounted for under IAS 32 and does not consider the treatment under IFRS 2. For a comparison of IAS 32 to IFRS 2, see section 5.1.1 below.

4.10.3 Founder shares

In many cases, founder shares convert into public shares upon successful completion of an acquisition. If an acquisition is not completed and the SPAC is liquidated, the founder shares are not redeemable and do not receive any proceeds on liquidation. If, as discussed in section 4.10.2 above, these shares are within the scope of IAS 32 rather than IFRS 2, their classification will be driven by whether the conversion passes the 'fixed-for-fixed' test. This test is described further in section 5 below.

Additionally, if the public shares into which the founder shares will be converted are not within the scope of IFRS 2 and will, themselves, be classified as financial liabilities at the conversion date, and the SPAC has no discretion over the conversion into public shares, the founder shares will also be classified as financial liabilities.

4.10.4 Public shares

Public shares often become redeemable at the option of the holder if an acquisition is approved. They may also become mandatorily redeemable if an acquisition is not completed within a prescribed period. Redemption features have the potential to result in an outflow of cash for the SPAC. This would result in the shares being classified as a financial liability under IAS 32, unless the SPAC has the unconditional ability to avoid such an outflow. See section 5.3 below for further guidance.

Where key decisions affecting potential redemptions, such as the approval of an acquisition or the extension of the period to complete an acquisition, are made via shareholder votes at a general meeting of the SPAC, it is important to assess whether the voting process forms part of the corporate governance decision-making processes of the SPAC and is, therefore, seen to be an action of the SPAC. Alternatively, it may reflect the private actions of shareholders in their capacity as holders of particular instruments, in which case, the outcome of the vote would not be within the control of the SPAC. For further guidance on this assessment, see section 4.2.1 above.

In July 2022, the Board ratified the IFRS IC's agenda decision that considered whether a SPAC, in applying IAS 32, classifies public shares it issues as financial liabilities or equity instruments when the SPAC is a listed entity established to acquire a yet-to-be-identified target entity.

In the fact pattern described, a SPAC has two classes of shares: founder shares and public shares. The public shareholders individually have the contractual right to demand a reimbursement of their shares if the SPAC's shareholders approve the acquisition of a target entity. The public shareholders are reimbursed if the SPAC is liquidated. The SPAC is liquidated if no target entity is acquired within a specified period. In addition, along with the founder shareholders, the public shareholders have the contractual right to extend the SPAC's life indefinitely if no target entity is acquired.

The request asked about the effect of the shareholders' contractual right to extend the SPAC's life indefinitely on the classification of its shares; in particular, whether the decision by shareholders to extend the SPAC's life is considered to be within the control of the SPAC. The IFRS IC observed that IAS 32 contains no requirements for how to assess whether a decision by shareholders is treated as a decision by the entity and acknowledged that similar questions about shareholder decisions arise in other circumstances. The IFRS IC concluded that the matter described in the request is, in isolation, too narrow to address in a cost-effective manner. As a result, it is being considered as part of the broader discussions on the FICE project, and proposed amendments to the requirements were included in the FICE Exposure Draft published in November 2023, as described in section 12.6 below.

4.10.5 Warrants

Warrants normally give the holder the right to purchase public shares at an agreed price. Classification of the warrants is driven by similar factors to the founder shares. If they are within the scope of IAS 32 (rather than IFRS 2 as discussed in section 4.10.2 above), the warrants need to be assessed against the 'fixed-for-fixed' test. It is also important to consider whether the underlying public shares would be classified as financial liabilities at the exercise dates. Additionally, net settlement features would result in the warrants being classified as liabilities.

The Illustration below demonstrates some of the relevant considerations when determining the accounting for public warrants by a SPAC when they are within the scope of IAS 32.

Illustration 4-1: Accounting for public warrants by a SPAC

SPAC A has issued public warrants as part of its IPO process. It has not approved an acquisition yet. After completion of an acquisition, each warrant gives the holder the right to subscribe for one public share in exchange for a fixed amount of cash in the SPAC's functional currency. At the exercise date, the public shares will be classified as equity. If exercised, the SPAC would have a choice over whether to gross or net settle the warrant in shares.

In this case, the warrant will be classified as a financial liability due to the existence of the net settlement option. The warrant does not meet the definition of an equity instrument because it can be settled otherwise than by the SPAC issuing a fixed number of its own shares in exchange for receiving a fixed amount of cash or another financial asset, as discussed in section 5.2.7 below.

If the warrants are required to be physically settled (i.e., delivery of shares in exchange for cash), they would be eligible for equity classification given that the conversion ratio is fixed, as discussed in section 5 below.

4.10.6 Classification of ordinary shares and warrants by a SPAC upon acquisition

Following the acquisition, the accounting for shares and warrants that were already outstanding and those that were newly issued upon the acquisition, the accounting in the consolidated financial statements of the combined entity will depend on various factors. These include the specific terms and conditions of the shares and warrants and the facts and circumstances of the acquisition including who is identified as the accounting acquirer. For example:

- The acquisition may trigger features in the shares and warrants that had been conditional upon the successful completion of an acquisition, such as redemption rights, or it may change the discretion that the issuing entity was deemed to have over such features. If this is the case and the SPAC is identified as the accounting acquirer, it could be necessary to consider whether instruments previously classified as equity should be de-recognised and re-recognised as liabilities if the equity criteria are no longer met, or vice versa. See section 4.9 above for further guidance on reclassification.
- In cases when the target is identified as the accounting acquirer, some of the newly issued instruments upon the acquisition could potentially be accounted for as a share-based payment. As noted in section 4.10.2, Chapter 30 provides guidance on accounting for share-based payments and section 2.2.4.L in particular describes the decision reached by the IFRS IC and ratified by the IASB in October 2022. The IFRS IC concluded that, in applying IFRS 2, the target receives a stock exchange listing service for which it has issued equity instruments as part of a share-based payment transaction, and it is measured as the difference between the fair value of the instruments issued to acquire the SPAC and the fair value of the identifiable net assets acquired. If IAS 32 applies, it could be necessary to assess the accounting for conditional features as discussed in section 4.9 above.

5 Contracts settled by delivery of the entity's own equity instruments

This Section deals with contracts, other than those within the scope of IFRS 2 (see Chapter 30), settled in equity instruments issued by the settler. Throughout the discussion here in section 5, 'equity instrument(s)' excludes certain puttable and redeemable instruments classified as equity under the exceptions discussed in sections 4.6.2 and 4.6.3 above (any contract involving the receipt or delivery of such instruments is a financial asset or liability - see section 4.1 above).

For an instrument to be classified as an equity instrument under IAS 32, it is not sufficient that it involves the reporting entity delivering or receiving its own equity (as opposed to cash or another financial asset). The number of equity instruments delivered, and the consideration for them, must be fixed - the so called 'fixed-for-fixed' requirement. Contracts that will be settled other than by delivery of a fixed number of shares for a fixed amount of cash do not generally meet the definition of equity. The IASB considered that to treat any transaction settled in the entity's own shares as an equity instrument would not deal adequately with transactions in which an entity is using its own shares as 'currency', for example, where it has an obligation to pay a fixed or determinable amount that is settled in a variable number of its own shares. [IAS 32.BC21(a)]. In such transactions the counterparty bears no share price risk and is therefore not in the same position as a 'true' equity shareholder.

Where such a contract is not classified as an equity instrument by IAS 32, it will be accounted for in accordance with the general provisions of IFRS 9 as either a financial liability or a derivative.

Broadly speaking:

- A non-derivative contract involving the issue of a fixed number of own equity instruments is an equity instrument (see section 5.1 below).
- A non-derivative contract involving the issue of a variable number of own equity instruments is a financial liability (see section 5.2.1 below).
- A derivative contract involving the sale or purchase of a fixed number of own equity instruments for a fixed amount of cash or other financial assets is an equity instrument (see section 5.1 below).
- A derivative contract for the purchase by an entity of its own equity instruments, even if for a fixed amount of cash or other financial assets (and therefore an equity instrument) may give rise to a financial liability in respect of the cash or other financial assets to be paid. However, the initial recognition of the liability results in a reduction in equity and not in an expense (see section 5.3 below). In other words, whilst there is a liability to pay cash under the contract, the contract itself is an equity instrument (and is therefore not subject to periodic remeasurement to fair value).
- A derivative contract involving the delivery or receipt of:
 - A fixed number of own equity instruments for a variable amount of cash or other financial assets
 - A variable number of own equity instruments for a variable amount of cash or other financial assets
 Or
 - An amount of cash or own equity instruments with a fair value equivalent to the difference between a fixed number of own equity instruments and a fixed amount of cash or other financial assets (i.e., a net-settled derivative contract)

Is a financial asset or financial liability (see section 5.2 below).

And

- A derivative financial instrument with settlement options is a financial asset or liability, unless all possible settlement options would result in classification as equity (see section 5.2.8 below).

There are some difficulties of interpretation surrounding the treatment of certain contracts to issue equity (see section 5.4 below).

In undertaking the analysis required by IAS 32, it is sometimes helpful, where the detailed guidance in the standard is not entirely clear, to consider whether the instrument or contract under discussion exposes the holder or the issuer to the risk of movements in the fair value of the issuer's equity. If the holder is at risk to the same degree as equity investors in the entity, it is likely that the instrument or contract must be classified as equity. If, however, the entity bears the risk of movements in the fair value of the entity's equity, or the holder bears some risk, but less than that borne by equity investors in the entity, it is likely that the contract must be classified, at least in part, as a liability.

It is important to remember that IAS 32.16(b) sets out two tests. Where an entity can control the circumstances under which a variable number of shares may be required to be delivered (e.g., as in the case of a down round clause (see section 6.6.8 below)) this can lead to different accounting treatments depending on whether the instrument or compound instrument is regarded as a derivative or non-derivative. Where the instrument is a non-derivative, the requirement is that there is no contractual obligation which could result in the issuer having to deliver a variable number of shares, in other words, all contractual requirements need to be considered. So, a non-derivative instrument which allows the issuer to settle for a variable number of shares would not necessarily lead to an instrument being classified as a liability as there is no contractual obligation on the issuer to do so. Whereas, if the instrument is a derivative, the requirement is solely whether the fixed-for-fixed test is met, other contractual terms of the instrument are not considered. Therefore, a written option to subscribe for a variable number of shares (or a conversion option within a convertible bond) under the conditions described above would result in the derivative or component being classified as a liability as the issuer's ability to avoid delivering a variable number of shares is not considered.

5.1 Contracts accounted for as equity instruments

A contract that will be settled by the entity delivering or receiving a fixed number of its own equity instruments in exchange for a fixed amount of cash (see section 5 above) or another financial asset is an equity instrument, although a liability may be recorded for any cash payable by the entity on settlement of the contract. An example would be an issued share option that gives the counterparty a right to buy a fixed number of the entity's shares for a fixed price or for a fixed stated principal amount of a bond (see section 6.3.2.A below). [IAS 32.22].

The fair value of such a contract may change due to variations in market interest rates and the share price. However, provided that such changes in fair value do not affect the amount of cash or other financial assets to be paid or received, or the number of equity instruments to be received or delivered on settlement of the contract, the contract is an equity instrument and accounted for as such. [IAS 32.22].

Any consideration received (such as the premium received for a written option or warrant on the entity's own shares) is added directly to equity. Any consideration paid (such as the premium paid for a purchased option) is deducted directly from equity. Changes in the fair value of an equity instrument are not recognised in the financial statements. [IAS 32.22, IAS 32.AG27(a)].

IAS 32 requires some types of puttable instruments (see section 4.6.2 above) and instruments that impose an obligation to deliver a *pro rata* share of net assets only on liquidation (see section 4.6.3 above) to be treated as equity instruments. However, a contract that is required to be settled by the entity receiving or delivering either of these types of equity instrument is a financial asset or financial liability, even when it involves the exchange of a fixed amount of cash or other financial assets for a fixed number of such instruments. [IAS 32.22A, IAS 32.AG13].

5.1.1 Comparison with IFRS 2 *Share-based Payment*

The approach in IAS 32 differs from that in IFRS 2. IFRS 2 essentially treats any transaction that falls within its scope and can be settled only in shares (or other equity instruments) as an equity instrument, regardless of whether the number of shares to be delivered is fixed or variable (see Chapter 30). The two standards also differ as regards to:

- The classification of financial instruments that can be settled at the issuer's option in either equity instruments or cash (or other financial assets). Broadly, IFRS 2 requires the classification to be based on the likely outcome, whereas IAS 32 focuses on the strict legal obligations imposed by the contract. And
- The definition of equity instrument. IFRS 2 refers to the exchange of a 'fixed or determinable' amount of cash, whereas IAS 32 refers to the exchange of a 'fixed' amount of cash. This means that written options to issue own equity with a foreign currency strike price are typically equity instruments under IFRS 2, but financial assets or liabilities under IAS 32, subject to the limited exception for short-term rights issues (see section 5.2.3.A below).

The IASB offers some (pragmatic rather than conceptual) explanation for these differences in the Basis for Conclusions to IFRS 2. First, it is argued that to apply IAS 32 to share option plans would mean that a variable share option plan (i.e., one where the number of shares varied according to performance) would give rise to more volatile (and typically greater) cost than a fixed plan (i.e., one where the number of shares to be awarded is fixed from the start), even if the same number of shares was ultimately delivered under each plan, which would have 'undesirable consequences'. [IFRS 2.BC109]. This serves only to beg the question of why it is not equally 'undesirable' for the same result to arise in accounting for share-settled contracts within the scope of IAS 32 rather than IFRS 2. Second, it is noted that this is just one of several inconsistencies between IFRS 2 and IAS 32 which will remain unaddressed for the foreseeable future as the IASB's review of accounting for debt and equity as part of the FICE project is addressing only a narrow and limited number of application issues, which does not include this one. [IFRS 2.BC110]. The topics covered in the FICE project are discussed further in section 12 below.

5.1.2 Number of equity instruments issued adjusted for capital restructuring or another event

Entities, particularly larger listed companies, routinely restructure their equity capital. This may take many forms, including:

- Structural changes in the issuer's ordinary shares (such as a share split, a share consolidation, or a reclassification of the outstanding ordinary shares of the issuer)
 - A repurchase of shares
 - A distribution of reserves or premiums, by way of extraordinary dividend
 - A payment of a dividend, or extraordinary dividend, in shares
- Or
- A bonus share or rights issue to existing shareholders

Accordingly, contracts for the purchase or delivery of an entity's own equity often provide that the number of shares specified in the contract is modified in the event of such a restructuring. This provides protection to both the holder of the contract and to existing shareholders, by ensuring that their relative rights remain the same before and after the restructuring. For example, an entity with shares with a nominal (par) value of CU1 might enter into an agreement that requires it to issue '100 shares'. If, before execution of that agreement, the entity has split each CU1 share into ten CU0.10 shares, it must issue 1,000 (not 100) shares in order to give effect to the intention of the contract.

Such adjustment formulae are most commonly seen in the terms of convertible instruments (see section 6 below for convertible instrument classification), so that the number of shares into which the bonds eventually convert will take account of any capital restructuring between issue and conversion of the bond, with the broad intention of putting the holders of the bond in the same position with respect to other equity holders before and after the restructuring. In addition, the terms of many convertible instruments provide for similar adjustment upon the occurrence of other actions or events which would affect the position of the convertible bondholders relative to other equity holders. Such actions or events may include, for example:

- The payment of ordinary dividends
 - An issue of equity at less than current market value
 - The repurchase of equity at more than current market value
 - The issue of further convertible securities at less than fair market value
- Or
- The acquisition of assets in exchange for equity at more than fair market value

This raises the question of whether a contract with any such terms can be classified as equity under IAS 32, since the number of shares ultimately issued on conversion is not fixed at the outset, but may vary depending on whether a restructuring or other event occurs before conversion.

How we see it

In our view, an adjustment to the number of equity instruments to be issued in the circumstances described above is not considered to result in the issue of a variable number of shares, where its purpose is to ensure that the bondholder's equity interest is not diluted or augmented.

In other words, if the adjustment attempts to put the holders of the instruments into the same economic position relative to ordinary shareholders after the restructuring as they were in before the restructuring, then the fixed-for-fixed criterion is still met. We consider that the potential dilution or augmentation in the bondholder's equity interest which is to be adjusted for must be determined in comparison to the effect of the event on the other equity holders in aggregate. Thus, if shares are issued to new shareholders at a discount, the dilution suffered by the bondholders must be calculated by reference to the total number of shares in existence following the new issue.

The effect of such an adjustment is that the risks and rewards of the bondholder are more closely aligned to those of a holder of ordinary shares. IAS 32 generally treats contracts involving a variable number of equity instruments as a financial liability because the effect of the variability is that the counterparty is not exposed to any movement in the fair value of the equity instruments between the inception and execution of the contract. In this case, however, the variability is introduced to ensure that the counterparty remains exposed to any movement in the fair value of the equity instruments and maintains the same interest in the equity relative to other shareholders.

The same question arises in circumstances where a convertible bond is convertible into a fixed percentage of equity. This is discussed in section 6.6.7 below.

However not all convertible securities with adjustable conversion ratios can be classified as equity. Where a convertible security has a contractual feature for the conversion ratio to be adjusted down to the lower price of any later issue in the underlying shares, the instrument will fail equity classification as this adjustment does not put the bondholders into the same economic position relative to other equity holders, but puts them into a better position. The modification feature is not fixed-for-fixed and therefore the conversion option is a financial liability. [IAS 32.11(b)(ii)]. As such it is an embedded derivative of a debt host rather than an equity component. The entity's ability to control the non-fixed-for-fixed settlement is not relevant to the assessment. This is because a derivative instrument that gives either party the choice over settlement is a financial asset or liability unless all the settlement alternatives would result in it being an equity instrument. [IAS 32.26]. The conversion option will therefore be treated as a derivative liability. This is discussed in more detail in section 6.6.8 below.

In practice, the dilution adjustment from issuance of shares or other securities is often based on average market prices of the underlying securities prior to the date a binding and irreversible issue or grant is announced (instead of the market price immediately prior to the announcement), usually to mitigate the risk of market manipulation.

How we see it

While the value of an adjustment based on an average market price, could exceed the value of the rights to a residual interest in the entity's equity caused by the transaction (as evidenced by the market price immediately prior to the announcement), and is not based entirely on the decrease in value, we believe the use of a 'market price' based on an average of several days prior is acceptable. This is because the intent of the averaging is to mitigate the risk of using prices that do not represent the 'true' market price due to price manipulation. Evaluating these adjustments is complex and requires the use of judgement.

The IFRS IC considered a number of 'fixed-for-fixed' issues raised by constituents at its November 2009 meeting. However, the IFRS IC concluded that the Board's project *Financial Instruments with Characteristics of Equity* (FICE) was expected to address issues relating to the fixed-for-fixed condition, and that the IFRS IC would therefore not add this to its agenda. The IASB proposed amendments to the guidance which relates to 'fixed-for-fixed' in the FICE Exposure Draft published in November 2023 (see section 12.2 below).

5.1.3 Stepped up exercise price

Another type of adjustment which is commonly found is where an entity issues subscription shares that have a stepped exercise price, which is fixed at inception and increases with the passage of time. Such subscription shares are typically issued as bonus shares on a *pro rata* basis to existing shareholders and give the holder the right (but not the obligation) to subscribe for a certain number of ordinary shares, at a certain price and at a certain time in the future.

How we see it

Our view is that subscription shares that have a stepped exercise price meet the 'fixed-for-fixed' condition only if the exercise prices are fixed at inception and for the entire term of the instrument, such that at any point in time the exercise price is pre-determined at the issuance of the subscription shares. If the exercise price per share is linked to an index of any kind, the 'fixed-for-fixed' condition is not met and the contract to issue the shares would not be classified as an equity instrument.

5.1.4 Exchange of fixed amounts of equity (equity for equity)

As discussed above, IAS 32 requires a contract settled in own equity to be classified as equity if, *inter alia*, it involves the exchange of a fixed amount of cash (or other financial assets) for a fixed amount of equity. This begs the question of how to classify a contract that provides for the exchange of a fixed amount of one class of the entity's equity for a fixed amount of another class. Examples might be:

- A warrant allowing the holder of a preference share classified as equity (see section 4.5 above) to exchange it for an ordinary equity share.
- Or
- In consolidated financial statements, an option for a shareholder of a partly-owned subsidiary (classified within equity in the consolidated financial statements) to exchange a fixed number of shares in the subsidiary for a fixed number of shares in the parent.

One view might be that, as a contract to exchange equity instruments does not fall within the definition of an 'equity instrument' in accordance with IAS 32, it must therefore be accounted for as a derivative.

The contrary view would be that the contract does not meet the definitions of either a financial asset or a financial liability either and given that it involves the exchange of equity instruments on a fixed-for-fixed basis must be accounted for as an equity instrument. Those who hold the latter view would argue that the absence of any reference to such 'fixed equity for fixed equity' contracts in IAS 32 does not reflect a conscious decision by the IASB, but rather indicates that the IASB never considered such contracts at all.

A third view might be that the analysis may depend upon the specific terms of the equity instruments. For example, if the equity instrument being exchanged has debt-like features (e.g., it pays regular, but discretionary, coupons), and is denominated in the same currency as the entity's functional currency, the contract would be classified as equity, but if it were denominated in a different currency, the contract would, for the reasons discussed in section 5.2.3 below, be classified as a derivative.

The IASB is considering this issue as part of the FICE project as reflected in the FICE Exposure Draft published in November 2023 (see section 12.2 below).

5.2 Contracts accounted for as financial assets or financial liabilities

5.2.1 Variable number of equity instruments

An entity may have a contractual right or obligation to receive or deliver a number of its own shares or other equity instruments that varies so that the fair value of the entity's own equity instruments to be received or delivered equals the amount of the contractual right or obligation.

The right or obligation may be for:

- A fixed amount, e.g., as many shares as are worth CU100.
- Or
- An amount that fluctuates in part or in full in response to changes in a variable other than the market price of the entity's own equity instruments, such as movements in interest rates, commodity prices, or the price of a financial instrument, e.g., as many shares as are worth:
 - 100 ounces of gold
 - CU100 plus interest at SONIA plus 200 basis points
 - 100 government bonds
- Or
- 100 shares in a particular entity

Such a contract is a financial asset or liability. Even though the contract must, or may, be settled through receipt or delivery of the entity's own equity instruments, the number of own equity instruments required to settle the contract will vary. The contract will therefore not fulfil the requirements of an equity instrument and is therefore a financial asset or financial liability. [IAS 32.21, IAS 32.AG27(d)].

5.2.2 Fixed number of equity instruments for variable consideration

A contract that will be settled by the entity delivering or receiving a fixed number of its own equity instruments in exchange for a variable amount of cash or another financial asset is a financial asset or financial liability. An example is a contract for the entity to deliver 100 of its own equity instruments in return for an amount of cash calculated to equal the value of 100 ounces of gold, [IAS 32.24], or 100 specified government bonds. As discussed in section 5.2.3 below, it would also include a contract for the entity to deliver 100 of its own equity instruments in return for a fixed amount of cash denominated in a currency other than its own functional currency.

5.2.3 Fixed amount of cash (or other financial assets) denominated in a currency other than the entity's functional currency

Some contracts require an entity to issue a fixed number of equity instruments in exchange for a fixed amount of cash denominated in a currency other than the entity's functional currency. Such contracts raise a problem of interpretation illustrated by the example in IAS 32.24 (referred to in section 5.2.1 above) of a contract being a financial asset or financial liability where the reporting entity is required "to deliver 100 of its own equity instruments in return for an amount of cash calculated to equal the value of 100 ounces of gold". If one substitutes '100 US dollars' for '100 ounces of gold', the latent problem becomes apparent.

Suppose a UK entity (with the pound sterling as its functional currency) issues a £100 bond convertible into a fixed number of its equity shares. As discussed in more detail in section 6 below, IAS 32 requires this to be accounted for by splitting it into a liability component (the obligation to pay interest and repay principal) and an equity component (the holder's right to convert into equity). In this case, the equity component is the right to convert the fixed stated £100 principal of the bond (see section 6.3.2.A below) into a fixed number of shares.

Suppose instead, however, that the UK entity (with the pound sterling as its functional currency) issues a 100 US dollar bond convertible into a fixed number of its shares. The conversion feature effectively gives the bondholder the right to acquire a fixed number of shares for a fixed stated principal (see section 6.3.2.A below) of \$100. Is the \$100 a 'fixed amount' of cash, or is it to be regarded as being just as variable, in terms of its conversion into the functional currency of the pound sterling, as 100 ounces of gold?

If the conclusion is that \$100 is a fixed amount of cash, the conversion right is accounted for as an equity component of the bond, in other words a value is assigned to it on initial recognition and it is not subsequently remeasured (see section 6.2.1 below). If, on the other hand, the conclusion is that \$100 is not a fixed amount of cash, then the conversion right (as an embedded derivative not regarded by IFRS 9 as closely related to the host contract, see Chapter 42) is accounted for as a separate derivative financial liability, introducing potentially significant volatility into the financial statements.

There is no obvious answer to this. A contention that the \$100 is a 'fixed amount' of cash is hard to reconcile with the fact that a contract to issue shares for 'as many pounds sterling as are worth \$100' would clearly involve the issue of a fixed number of shares for a variable amount of cash and would therefore not be an equity instrument.

The IFRS IC considered this issue at its meeting in April 2005. The IFRS IC noted that although this matter was not directly addressed in IAS 32, it was clear that, when the question is considered in conjunction with guidance in other standards, particularly IFRS 9, any obligation denominated in a foreign currency represents a variable amount of cash. Consequently, the IFRS IC concluded that a contract settled by an entity delivering a fixed number of its own equity instruments in exchange for a fixed amount of foreign currency must be classified as a liability.²¹

21 [IFRIC Update](#), April 2005, available on the IFRS Foundation's website.

5.2.3.A Rights issues with a price fixed in a currency other than the entity's functional currency

In July 2009, as a result of a recommendation from the IFRS IC, the IASB reconsidered this matter in the specific context of rights issues (options to purchase additional shares at a fixed price) where the price is denominated in a currency other than the entity's functional currency. The IASB was advised that the IFRS IC's conclusion was being applied to rights issues, with the result that the rights were being accounted for as derivative liabilities with changes in fair value being recognised in profit or loss. As shown in Practical example 5-1 below. HSBC Holdings plc explained that such accounting would result in the recognition of a loss of \$4.7 billion in the first quarter of 2009.

Practical example 5-1:	HSBC Holdings plc (2009)	United Kingdom
INTERIM MANAGEMENT STATEMENT - 11 May 2009 [extract]		
<u>Note</u>		
Accounting impact of HSBC's Rights Issue		
<p>On 2 March 2009, HSBC announced a 5 for 12 Rights Issue of 5,060 million new ordinary shares at 254 pence per share, which was authorised by the shareholders in a general meeting on 19 March 2009. The offer period commenced on 20 March 2009, and closed for acceptance on 3 April 2009. Under IFRSs, the offer of rights is treated as a derivative because substantially all of the issue was denominated in currencies other than the Company's functional currency of US dollars, and accordingly HSBC was not able to demonstrate that it was issuing a fixed number of shares for a fixed amount of US dollars, which is the criterion under IFRSs for HSBC to account for the offer of rights in shareholders' equity. The derivative liability was measured at inception of the offer as the difference between the share price at that date and the rights price, with a corresponding debit to shareholders' equity. The revaluation of this derivative liability over the offer period, arising from an increase in the share price, has resulted in the recognition of a loss in the income statement of US\$4.7 billion. The derivative liability expired on acceptance of the offer, and the closing balance was credited to shareholders' equity. Accordingly, there is no overall impact on the Group's shareholders' equity, capital position or distributable reserves.</p>		

Consequently, in October 2009, the IASB made a limited amendment to IAS 32 so as to require a rights issue granted *pro rata* to an entity's existing shareholders for a fixed amount of cash to be classified as equity, regardless of the currency in which the exercise price is denominated. [IAS 32.11].

This amendment does not apply to other instruments that grant the holder the right to purchase the entity's own equity instruments, such as the conversion feature in a convertible bond. It also does not apply to long-dated foreign currency rights issues, which are therefore classified as financial liabilities if the strike price is denominated in a foreign currency. The reason for the restricted scope of the amendment is that the IASB countenanced an exception to the 'fixed-for-fixed' concept in IAS 32 for short-dated rights issues only because the rights are distributed *pro rata* to existing shareholders, and can therefore be seen as a transaction with owners in their capacity as such. [IAS 32.BC4I]. The IASB does not consider long-dated transactions as primarily transactions with owners in their capacity as owners. [IAS 32.BC4K].

5.2.4 Instrument with equity settlement alternative of significantly higher value than cash settlement alternative

A financial instrument is also a financial liability if it provides that on settlement the entity will deliver either:

(a) Cash or another financial asset

Or

(b) A number of its own shares whose value is determined to exceed substantially the value of the cash or other financial asset

IAS 32 explains that, although the entity does not have an explicit contractual obligation to deliver cash or another financial asset, the value of the share settlement alternative is such that the entity will settle in cash. In any event, the holder has in substance been guaranteed receipt of an amount that is at least equal to the cash settlement option (see section 4.2.2 above). [IAS 32.20].

5.2.5 Fixed number of equity instruments with variable value

A contract is a financial asset or financial liability if it is to be settled in a fixed number of shares, the value of which will be varied (e.g., by modification of the rights attaching to them) so as to be equal to a fixed amount or an amount based on changes in an underlying variable. [IAS 32.AG27(d)].

5.2.6 Fixed amount of cash determined by reference to share price

An entity might enter into an option or forward contract to sell a fixed number of equity shares for a fixed price, where the price is determined by reference to the share price. For example, it might contract to sell 100 shares for CU10 each if the share price is between CU0 and CU10, and for CU15 each if the price is higher than CU10. Considered as a whole, the contract provides for the exchange of a fixed number of equity instruments for a variable amount of cash and is therefore a derivative financial liability.

5.2.7 Net-settled contracts over own equity

The value of a contract over an entity's own equity instruments at the date of settlement is the difference between the value of the fixed number of equity instruments to be delivered by one party and the fixed amount of cash (or other financial assets) to be delivered by the other party. If such a contract allows for net settlement, it can then be settled by a transfer (of cash, other financial assets, or the entity's own equity) of a fair value equal to this difference. It is inherent in the general definition of an equity instrument in IAS 32 that a contract settled by a single net payment (generally referred to as net cash-settled or net equity-settled as the case may be) is a financial asset or financial liability and not an equity instrument. This is notwithstanding the fact that an economically equivalent contract settled gross (i.e., by physical delivery of the equity instruments in exchange for cash or other financial assets) would be treated as an equity instrument.

5.2.8 Derivative financial instruments with settlement options

Extract from IAS 32

26 When a derivative financial instrument gives one party a choice over how it is settled (eg the issuer or the holder can choose settlement net in cash or by exchanging shares for cash), it is a financial asset or a financial liability unless all of the settlement alternatives would result in it being an equity instrument.

A derivative financial instrument may have settlement options, whereby it gives one or other party a choice over how it is settled (e.g., the issuer or the holder can choose settlement net in cash, net in shares, or by exchanging shares for cash). A derivative that gives one party a choice of settlement options is required to be treated as a financial asset or a financial liability, unless all possible settlement alternatives would result in it being an equity instrument. [IAS 32.26]. An example of a derivative financial instrument with a settlement option that is a financial liability is a share option that the issuer can decide to settle net in cash or by exchanging its own shares for cash. [IAS 32.27].

These provisions will apply mostly to contracts involving the sale or purchase by an entity of its own equity instruments. However, they will also be relevant to those contracts to buy or sell a non-financial item in exchange for the entity's own equity instruments that are within the scope of IAS 32 (rather than IFRS 2) because they can be settled either by delivery of the non-financial item or net in cash or another financial instrument. Such contracts are financial assets or financial liabilities and not equity instruments. [IAS 32.27].

Where an instrument is subject to multiple contingent events, there needs to be an assessment of whether the contingent events give rise to separate instruments embedded within the overall contract or whether there is one single instrument. If the contingent events give rise to components that are separable and independent of each other and relate to different risks, then they must be classified and accounted for separately from the host contract. If the components are not readily separable or independent of each other, then the contract will be classified based on its overall features, i.e., if the instrument does not satisfy the fixed-for-fixed test overall then it is classified as a liability even if individual components do meet the fixed-for-fixed criteria. For example, an instrument which obliges an issuer to deliver a fixed number of shares upon the consecutive occurrence of two contingent events, i.e., delivery under the second contingent event can only happen if the first contingent event has occurred, which relate to the same risks (such as interest rates, share price or performance of the entity in successive years), must be considered as one overall contract. Thus, while each individual contingency may satisfy the fixed-for-fixed test on their own, overall, the contract will result in a variable number of shares being delivered and so would be classified as debt.

5.3 Liabilities arising from gross-settled contracts for the purchase of the entity's own equity instruments

The following discussion relates only to contracts that must be settled by the counterparty delivering equity instruments (other than those classified as such under the exceptions discussed in section 4.6 above) and the entity paying cash (gross-settled contracts). Contracts which can be settled net (i.e., by payment of the difference between the fair value, at the time of settlement, of the equity instruments and that of the consideration given) are accounted for as financial assets or financial liabilities, [IAS 32.AG27(c)], (see section 5.2.8 above and section 11 below).

IAS 32 requires some types of puttable instruments (see section 4.6.2 above) and instruments that impose an obligation to deliver a *pro rata* share of net assets only on liquidation (see section 4.6.3 above) to be treated as equity instruments. However, a contract that is required to be settled by the entity receiving or delivering either of these types of equity instrument is a financial asset or financial liability, even when it involves the exchange of a fixed amount of cash or other financial assets for a fixed number of such instruments. [IAS 32.22A, IAS 32.AG27].

Entering into a gross-settled contract for the purchase of own equity instruments gives rise to a financial liability in respect of the obligation to pay the purchase or redemption price, [IAS 32.23, IAS 32.AG27(a), IAS 32.AG27(b)], (but resulting, on initial recognition, in a reduction of equity rather than an expense). This treatment is intended to reflect the idea that a forward contract or written option to repurchase an equity share gives rise to a liability similar to that contained within a redeemable share (see section 4.5 above and section 11 below). [IAS 32.BC12].

This is the case even if:

- The contract is an equity instrument
- The contract is a written put option (i.e., a contract that gives the counterparty the right to require the entity to buy its own shares) rather than a forward contract (i.e., a firm commitment by the entity to purchase its own shares)

Or

- The number of shares subject to the contract is not fixed [IAS 32.23, IAS 32.AG27(a), IAS 32.AG27(b)]

The final bullet point above refers to, for example, a put option written by the entity whereby the counterparty can require the entity to purchase between 1,000 and 5,000 of its own equity shares at CU2 per share. In other words, the entity cannot avoid recognising a liability for the contract on the basis that it does not know exactly how many of its own shares it will be compelled to purchase.

When such a liability first arises it must be recognised, in accordance with IFRS 9, at its fair value, i.e., the net present value of the redemption amount. Subsequently, the financial liability is measured in accordance with IFRS 9 (see Chapter 46). [IAS 32.23, IAS 32.AG27(b)]. IAS 32 offers no guidance as to how this is to be calculated when, as might be the case with respect to a written put option such as that described in the previous paragraph, the number of shares to be purchased and/or the date of purchase is not known.

How we see it

In our view, for the purpose of determining fair value on initial recognition under IFRS 9, an instrument with a demand feature must adopt a 'worse case' approach, i.e., based on the maximum amount payable and at the earliest possible date. This would be consistent with the requirement of IFRS 13 that liabilities with a demand feature such as a demand bank deposit must be measured at the amount payable on demand (see Chapter 15).

In other words, it must be assumed that the purchase will take place on the earliest possible date for the maximum number of shares, i.e., in the example above, the liability is for a written option on 5,000 shares. This is also consistent with IAS 32's emphasis, in the general discussion of the differences between liabilities and equity instruments, on a liability arising except to the extent that an entity has an 'unconditional' right to avoid delivering cash or other financial assets (see section 4.2 above).

The treatment discussed in the previous paragraph would lead to a different accounting treatment for written 'American' put options (i.e., those that can be exercised at any time during a period ending on a future date) and written 'European' put options (i.e., those that can be exercised only at a given future date). In the case of an American option, a liability would be recorded immediately for the full potential liability. In the case of a European option, a liability would be recorded for the net present value of the full potential liability, on which interest would be accrued until the date of potential exercise. This interpretation has the effect that:

- A gross-settled written American put option that is an equity instrument has no effect on profit or loss (because the full amount payable on settlement would be charged to equity on inception of the contract).
- But
- A gross-settled European put option that is an equity instrument does affect profit or loss (because the net present value of the amount payable on settlement would be charged to equity on inception of the contract and accrued to the full settlement amount through profit or loss).

If the contract expires without delivery of the shares, the carrying amount of the financial liability is reclassified to equity. This has the rather counterintuitive effect that a share purchase contract that expires unexercised (and therefore has no impact on the entity's net assets, other than the receipt or payment of the option premium) can nevertheless give rise to a loss to the extent that interest has been recognised on the liability between initial recognition and its transfer to equity (see Illustration 11-7 in section 11.3.2 below).

5.3.1 Contracts to purchase own equity during 'closed' or 'prohibited' periods

Financial markets often impose restrictions on an entity trading in its own listed securities for a given period (sometimes referred to as a 'closed' or 'prohibited' period) in the run-up to the announcement of its financial results for a period. However, an entity may well wish to continue to purchase its own listed equity throughout the closed period, for example as part of an ongoing share-buyback programme.

One method of achieving this may be for the entity, in advance of the closed period, to enter into a contract with a counterparty (such as a broker) whereby the counterparty purchases shares in the entity, which the entity is then obliged to acquire from the counterparty. Such a contract will give rise to a financial liability for the entity from the day on which it is entered into. As discussed above, this would initially be recorded at the net present value of the amount to be paid, with the unwinding of the discount on that liability recorded as a finance charge in profit or loss.

In addition, if the contract is for the purchase of a fixed number of shares for their market price (as opposed to the exchange of a fixed amount of cash for as many shares as are worth that amount), it will be necessary to remeasure the liability to reflect movements in the share price.

5.3.2 Contracts to acquire non-controlling interests

IFRS 10 requires non-controlling interests to be shown within equity in consolidated financial statements (see Chapter 8). Accordingly, the requirements of IAS 32 relating to contracts over own equity instruments also generally apply, in consolidated financial statements, to forward contracts and put and call options over non-controlling interests.

This analysis was confirmed by the IFRS IC in November 2006, when it considered a request to clarify the accounting treatment of contracts to acquire non-controlling interests that are put in place at the time of a business combination. It is arguable that such contracts are more appropriately accounted for under the provisions of IFRS 3 *Business Combinations*, relating to deferred consideration. It may also be the case that such contracts have the effect that, while there is a non-controlling interest as a matter of law, the relevant subsidiary is nevertheless regarded by IFRS 10 as wholly-owned, in which case the acquirer also recognises a financial liability for the price payable to the non-controlling interest. A further discussion of these issues may be found in Chapter 8.

The IFRS IC agreed that there was likely to be divergence in practice in how the related equity is classified, but did not believe that it could reach a consensus on this matter on a timely basis. Accordingly, the IFRS IC decided not to add this item to its agenda.

However, the IFRS IC noted that the requirements of IAS 32 relating to the purchase of own equity apply to the purchase of a minority interest. After initial recognition any liability, to which IFRS 3 is not being applied, will be accounted for in accordance with IFRS 9. The parent will reclassify the liability to equity if a put expires unexercised (See Chapter 8).²² Whilst this comment was made in the context of the original version of IFRS 3 (issued in 2004), it would be equally applicable where the current version (issued in 2008) is applied.

5.3.2.A Put options over non-controlling interests - IFRS IC and IASB developments

The accounting for put options over non-controlling interests has been the subject of much debate over the years. For a summary of the IFRS IC and IASB developments on this issue see Chapter 8, and Chapter 10. The IASB is developing new guidance in this area as reflected in the FICE Exposure Draft, published in November 2023 (see section 12.3 below).

5.4 Gross-settled contracts for the sale or issue of the entity's own equity instruments

The following discussion relates only to contracts which must be settled by the entity delivering its own equity instruments (other than those classified as such under the exceptions discussed in section 4.6 above) and the counterparty paying cash (gross-settled contracts). Contracts which can be settled net (i.e., by payment of the difference between the fair value, at the time of purchase, of the shares and that of the consideration given) are accounted as financial assets or financial liabilities (see section 5.2.7 above). [IAS 32.AG27(c)].

IAS 32 requires some types of puttable instruments (see section 4.6.2 above) and instruments that impose an obligation to deliver a *pro rata* share of net assets only on liquidation (see section 4.6.3 above) to be treated as equity instruments. However, a contract that is required to be settled by the entity receiving or delivering either of these types of equity instrument is a financial asset or financial liability, even when it involves the exchange of a fixed amount of cash or other financial assets for a fixed number of such instruments. [IAS 32.22A, IAS 32.AG27].

If an entity enters into a gross-settled contract to sell its own equity instruments, the contract is economically the 'mirror image' of a contract for the purchase of own equity. However, there is no provision in IAS 32 that the contract gives rise to a financial asset in respect of the cash to be received from the counterparty, as compared to the specific provision that a contract to purchase own equity gives rise to a financial liability in respect of the cash to be paid to the counterparty (see section 5.3 above). Consequently, it appears that such contracts give rise to no accounting entries until settlement. This analysis is confirmed by an illustrative example to IAS 32 (see Illustration 11-2 in section 11.1.2 below).

²² [IFRIC update](#), November 2006, available on the IFRS Foundation's website.

Contracts for the sale or issue of an entity's own equity arise in situations such as those in Illustration 5-1 and Illustration 5-2 below.

Illustration 5-1: Share issue payable in fixed instalments

A government intends to privatise a nationalised industry with a functional currency of Euro (€) through an initial public offering (IPO) at €5 per share. In order to encourage widespread share ownership, the terms of the issue are that shares are issued on 1 January 20X8, but subscribers to the IPO are required to pay only €3 per share on 1 January 20X8 followed by two further instalments of €1 per share on 1 January 20X9 and 1 January 20Y0.

Illustration 5-2: Right to call for additional equity capital

A start-up technology entity with a functional currency of UK pounds sterling is unsure of its working capital requirements for the first few years of its operations. It therefore enters into an agreement with its major shareholders whereby it can require those shareholders to contribute an additional £2 per share at any time during the next seven years.

One view might be that the situation in Illustration 5-1 above is not a contract for the future issue of equity, the share has already been issued, and so it would be quite appropriate to record a receivable for the deferred subscription payments. The accounting standard *IFRS for Small and Medium-Sized Entities* (IFRS for SMEs) indicates that a receivable must be recognised only for shares that have been issued, but that such a receivable must be recognised as a deduction from equity, not as an asset.²³ The standard states that this proposal is derived from IAS 32,²⁴ an assertion difficult to reconcile with the discussion above. Interestingly, an early IASB staff draft of the exposure draft of IFRS for SMEs (as made available on the IASB's website as at September 2006) admitted, with perhaps unintended candour, that this treatment is "not in any standard".²⁵

How we see it

In our view, IAS 32 requires any receivable for a deferred subscription payment recognised in respect of an issued share to be shown as an asset.

On the other hand, it is clear from IAS 32 that no receivable would be recognised if the arrangement provided for the entity actually to issue further shares (*pro rata* to the shares initially issued) for CU1 on 1 January 20X9 and 1 January 20Y0.

²³ *IFRS for SMEs*®, IASB, July 2009, para. 21.2.

²⁴ *IFRS for SMEs*®, IASB, July 2009, Derivation Table.

²⁵ IASB staff draft of proposed exposure draft International Financial Reporting Standard for Small and Medium-Sized Entities (as made available on the IASB's website as at September 2006) paras. 22.2-22.4.

6 Compound financial instruments

6.1 Background

Extract from IAS 32

- 28** The issuer of a non-derivative financial instrument shall evaluate the terms of the financial instrument to determine whether it contains both a liability and an equity component. Such components shall be classified separately as financial liabilities, financial assets or equity instruments in accordance with paragraph 15.

While many financial instruments are either a liability or equity in their entirety, that is not true for all financial instruments issued by an entity. Some, referred to as compound instruments in IAS 32, contain both elements. A compound financial instrument is a non-derivative financial instrument that, from the issuer's perspective, contains both a liability and an equity component. [IAS 32.28, IAS 32.AG30]. Examples include:

- A bond, in the same currency as the functional currency of the issuing entity, convertible into a fixed number of equity instruments, which effectively comprises:
 - A financial liability (the issuer's obligation to pay interest and, potentially, to redeem the bond in cash)
 - And
 - An equity instrument (the holder's right to call for shares of the issuer)
- IAS 32 states that the economic effect of issuing such an instrument is substantially the same as simultaneously issuing a debt instrument with an early settlement provision and warrants to purchase ordinary shares or issuing a debt instrument with detachable share purchase warrants. [IAS 32.29]. However, this analysis is questionable in the sense that, if an entity did issue such instruments separately, it is extremely unlikely that one would lapse as the result of the exercise of the other (as is the case on the conversion or redemption of a convertible bond).
- A mandatorily redeemable preference share with dividends paid at the issuer's discretion, which effectively comprises:
 - A financial liability (the issuer's obligation to redeem the shares in cash)
 - And
 - An equity instrument (the holder's right to receive dividends if declared) [IAS 32.AG37]

IAS 32 requires the issuer of a non-derivative financial instrument to evaluate the terms of the financial instrument to determine whether it contains both a liability and an equity component. This evaluation is based on the contractual terms of the financial instruments, the substance of the arrangement and the definition of a financial liability, financial asset and an equity instrument. If such components are identified, they must be accounted for separately as financial liabilities, financial assets or equity, [IAS 32.28], and the liability and equity components shown separately in the statement of financial position. [IAS 32.29].

This treatment, commonly referred to as 'split accounting', is discussed in more detail in sections 6.2 to 6.6 below. For simplicity, the discussion below (like that in IAS 32 itself) is framed in terms of convertible bonds, by far the most common form of compound financial instrument, but is equally applicable to other types of compound instruments, such as preference shares with different contractual terms in respect of dividends and re-payments of principal (see section 4.5 above).

6.1.1 Treatment by holder and issuer contrasted

'Split accounting' is to be applied only by the issuer of a compound financial instrument. The accounting treatment by the holder is dealt with in IFRS 9 and is significantly different. [IAS 32.AG30]. In particular:

- In the issuer's financial statements, under IAS 32:
 - On initial recognition of the instrument, the fair value of the liability component is calculated first and the equity component is treated as a residual.
 - And
 - The equity component is never remeasured after initial recognition.
- In the holder's financial statements, under IFRS 9:
 - The instrument fails the criteria for measurement at amortised cost (in particular the 'contractual cash flow characteristics test') and is therefore almost always carried at fair value through profit or loss (see Chapter 44).

6.2 Initial recognition - 'split accounting'

On initial recognition of a compound instrument such as a convertible bond, IAS 32 requires the issuer to:

- (a) Identify the various components of the instrument
- (b) Determine the fair value of the liability component (see below)

And

- (c) Determine the equity component as a residual amount, essentially the issue proceeds of the instrument less the liability component determined in (b) above

The liability component of a convertible bond must be measured first, at the fair value of a similar liability that does not have an associated equity conversion feature, but including any embedded non-equity derivative features, such as an issuer's or holder's right to require early redemption of the bond, if any such terms are included.

In practical terms, this will be done by determining the net present value of all potential contractually determined future cash flows under the instrument, discounted at the rate of interest applied by the market at the time of issue to instruments of comparable credit status and providing substantially the same cash flows, on the same terms, but without the conversion option. The fair value of any embedded non-equity derivative features is then determined and 'included in the liability component', however, see the further discussion of this point in section 6.4.2 below. [IAS 32.31].

Thereafter, the liability component is accounted for in accordance with the requirements of IFRS 9, for the measurement of financial liabilities (see Chapter 46). [IAS 32.31, IAS 32.32].

IAS 32 notes that:

- The equity component of a convertible bond is an embedded option to convert the liability into equity of the issuer.
- The fair value of the option comprises its time value and its intrinsic value, if any.

And

- This option has value on initial recognition even when it is out of the money. [IAS 32.AG31(b)].

However, not all these features are directly relevant to the accounting treatment since the equity component is not (other than by coincidence) recorded at its fair value. Instead, in accordance with the general definition of equity as a residual, the equity component of the bond is simply the difference between the fair value of the compound instrument (total issue proceeds of the bond) and the liability component as determined above. Because of this 'residual' treatment, IAS 32 does not address the issue of how, or whether, the issue proceeds are to be allocated where more than one equity component is identified. It is important to note, that the equity component will not be remeasured subsequently.

The methodology of 'split-accounting' in IAS 32 has the effect that the sum of the carrying amounts assigned to the liability and equity components on initial recognition is always equal to the fair value that would be ascribed to the instrument as a whole. No gain or loss arises from the initial recognition of the separate components of the instrument. [IAS 32.31].

This treatment is shown in Illustration 6-1 and Illustration 6-5 below in section 6.4.2.A. [IAS 32.IE34, IAS 32.IE35, IAS 32.IE36].

Illustration 6-1: Convertible bond - basic 'split accounting'

An entity, whose functional currency is the Euro, issues 2,000 convertible bonds. The bonds have a three-year term and are issued at par with a face value of €1,000 per bond, giving total proceeds of €2,000,000. Interest is payable annually in arrears at a nominal annual interest rate of 6% (i.e., €120,000 per annum). Each bond is convertible at any time up to maturity into 250 ordinary shares. When the bonds are issued, the prevailing market interest rate for similar debt without conversion options is 9% per annum. The entity incurs issue costs of €100,000.

The economic components of this instrument are:

- A liability component, being a discounted fixed rate debt, perhaps with an imputed holder's put option (due to the holder's right to convert at any time).
- And
- An equity component, representing the holder's right to convert at any time before maturity. In effect this is a written call option (from the issuer's perspective) on American terms (i.e., it can be exercised at any time until maturity of the bond).

The practical problem with this analysis is that it is not clear what is the strike price of the holder's options to put the debt and call for shares, specifically whether it is the €2,000,000 face value of the bonds or the discounted amount at which they are recorded until maturity. Perhaps for this reason, IAS 32 does not require the true fair values of these components to be calculated.

Instead, the liability component is measured first at the net present value of the maximum potential cash payments that the issuer could be required to make. The difference between the proceeds of the bond issue and the calculated fair value of the liability is assigned to the equity component. The net present value (NPV) of the liability component is calculated as €1,848,122, using a discount rate of 9%, being the market interest rate for similar bonds having no conversion rights, as shown below.

Year	Cash flow		Discount factor	NPV of cash flow
		€	(at 9%)	€
1	Interest	120,000	1/1.09	110,092
2	Interest	120,000	1/1.09 ²	101,001
3	Interest and principal	2,120,000	1/1.09 ³	1,637,029
	Total liability component			1,848,122
	Total equity component (balance)			151,878
	Total proceeds			2,000,000

Next, it is necessary to deal with the issue costs of €100,000. In accordance with the requirements of IAS 32 for such costs (see section 8.1 below), these would be allocated to the liability and equity components on a *pro rata* basis. This would give the following allocation of the net issue proceeds.

	Liability component	Equity component	Total
	€	€	€
Gross proceeds (allocated as above)	1,848,122	151,878	2,000,000
Issue costs (allocated <i>pro rata</i> to gross proceeds)	(92,406)	(7,594)	(100,000)
Net proceeds	1,755,716	144,284	1,900,000

The €144,284 credited to equity is not subsequently remeasured (see section 6.2.1 below). On the assumption that the liability is not classified as at fair value through profit or loss, the €1,755,716 liability component would be accounted for under the effective interest rate method. It must be borne in mind that, after taking account of the issue costs, the effective interest rate is not the 9% used to determine the gross value of the liability component, but 10.998%, as shown below.

Year	Liability b/f	Interest at 10.998%	Cash paid	Liability c/f
	€	€	€	€
1	1,755,716	193,094	(120,000)	1,828,810
2	1,828,810	201,134	(120,000)	1,909,944
3	1,909,944	210,056	(2,120,000)	-
	Total finance cost	604,284		

The total finance cost can be proved as follows:

	€
Cash interest at 6%	360,000
Gross issue proceeds originally allocated to equity component	151,878
Issue costs allocated to liability component	92,406
	604,284

6.2.1 Accounting for the equity component

On initial recognition of a compound financial instrument, the equity component (i.e., the €144,284 identified in Illustration 6-1 above) is credited direct to equity and is not subsequently remeasured. IAS 32 does not prescribe:

- Whether the credit must be to a separate component of equity (although a transitional provision relating to the February 2008 amendment of IAS 32 suggests that there is such a requirement).
Or
- If the entity chooses to treat it as such, how it must be described.

This ensures that there is no conflict between, on the one hand, the basic requirement of IAS 32 that there must be a credit in equity and, on the other, the legal requirements of various jurisdictions as to exactly how that credit must be allocated within equity.

After initial recognition, the classification of the liability and equity components of a convertible instrument is not revised, for example as a result of a change in the likelihood that a conversion option will be exercised, even when exercise of the option may appear to have become economically advantageous to some holders. IAS 32 points out that holders may not always act in the way that might be expected because, for example, the tax consequences resulting from conversion may differ among holders. Furthermore, the likelihood of conversion will change from time to time. The entity's contractual obligation to make future payments remains outstanding until it is extinguished through conversion, maturity of the instrument or some other transaction. [IAS 32.30].

The amount originally credited to equity is subsequently neither remeasured nor reclassified to profit or loss. Thus, as shown in Illustration 6-1 above, the effective interest rate shown in profit or loss for a simple convertible bond will be equivalent to the rate that would have been paid for non-convertible debt. In effect, the dilution of shareholder value represented by the embedded conversion right is shown as an interest expense.

However, on conversion of a convertible instrument, it may be appropriate to transfer the equity component within equity (see section 6.3.1 below).

6.2.2 Temporary differences arising from split accounting

In many jurisdictions it is only the cash interest paid, and sometimes also the issue costs, that are deductible for tax purposes, rather than the full amount of the finance cost recognised in profit or loss under IAS 32. Moreover, some of these costs may be deductible in periods different from those in which they are recognised in the financial statements. These factors will give rise to temporary differences between the carrying value of the liability component of the bond and its tax base, giving rise to deferred tax required to be accounted for under IAS 12 *Income Taxes* (see Chapter 29,).

6.3 Conversion, early repurchase and modification

6.3.1 Conversion at maturity

On conversion of a convertible instrument at maturity, IAS 32 requires the entity to derecognise the liability component and recognise it as equity. There is no gain or loss on conversion at maturity.

[IAS 32.AG32].

Thus, for example, if the bond in Illustration 6-1 in section 6.2 above were converted at maturity, the accounting entry required by IAS 32 would be:

Dr	Liability	€2,000,000	
	Cr	Equity	€2,000,000

The precise allocation of the credit to equity (e.g., as between share capital, additional paid-in capital, share premium, other reserves and so on) would be a matter of local legislation. In addition, IAS 32 permits the €144,284 originally allocated to the equity component in Illustration 6-1 above to be reallocated within equity. [IAS 32.AG32].

6.3.2 Conversion before maturity

6.3.2.A 'Fixed stated principal' of a bond

The consideration given for the issue of equity instruments on conversion of a bond is the discharge by the holder of the issuer from the liability to pay any further interest or principal on the bond. If conversion can take place only at maturity, the amount of the liability transferred to equity on conversion will always (as in Illustration 6-1 in section 6.2 above) be €2,000,000. Hence, the conversion right involves the delivery of a fixed number of shares for the waiver of the right to receive a fixed amount of cash and so is clearly an equity instrument.

However, the bond in Illustration 6-1 above allows conversion at some point before the full term. Therefore, conversion might occur at the end of year 2, when the carrying value of the bonds would have been accreted to only €1,909,944. Hence, the carrying amount of the liability that is forgiven on conversion can vary depending on when conversion occurs. This begs the question as to whether the conversion right now involves the delivery of a fixed number of shares for the waiver of the right to receive a variable amount of cash, suggesting that it is no longer an equity instrument.

It is for this reason, in our view, that IAS 32 defines an equity instrument as one that involves the exchange of a fixed number of shares for the 'fixed stated principal' rather than the 'carrying amount' of a bond. In other words, IAS 32 regards the 'fixed stated principal' of the bond in Illustration 6-1 above as a constant €2,000,000. The intention is to clarify that the variation in the carrying amount of the bond during its term does not preclude the conversion right from being classified as an equity instrument.

6.3.2.B Accounting treatment

IAS 32 refers to the treatment summarised in section 6.3.1 above being applied on conversion 'at maturity'. This begs the question of the treatment required if a holder converts prior to maturity (as would have been possible under the terms of the bond in Illustration 6-1 above).

As noted in section 6.3.2.A above, IAS 32 concludes that the equity component of the bond is an equity instrument on the grounds that it represents the holder's right to call for a fixed number of shares for a fixed consideration, in the form of the 'fixed stated principal' of the bond.

It could be argued that the logical implication of this is that, on a holder's early conversion of the bond in Illustration 6-1 above, the issuer must immediately recognise a finance cost for the difference between the then carrying amount of the liability component of the bond and the fixed stated principal of €2,000,000. This would create a liability of €2,000,000 immediately before conversion, so as to acknowledge that the strike price under the holder's call option is the waiver of the right to receive a fixed stated principal of €2,000,000, rather than whatever the carrying value of the bond happens to be at the time.

How we see it

We take the view, supported by general practice, that on early conversion of a bond, as described above, all that is required is to transfer to equity the carrying value of the liability at the date of conversion.

In such a case, the consideration for the issue of equity instruments is the release, by the bondholder, of the issuer from its liability to make future contractual payments under the bond, measured at the net present value of those payments.

IFRIC 19 (which generally applies to debt for equity swaps (see section 7 below)) does not apply to the conversion of a convertible instrument in accordance with its original terms.

6.3.2.C Treatment of embedded derivatives on conversion

IAS 32 does not specifically address the treatment of any separated non-equity embedded derivatives outstanding at the time of conversion. The issue of principle is that, when a holder exercises its right to convert, it is effectively requiring the issuer to issue equity in consideration for the bondholder ceding its rights. These may include any right to receive future payments of principal and/or interest or to require early repayment of the bond. It seems entirely appropriate that any amounts carried in respect of such rights, including those reflected in the carrying amount of separated embedded derivatives, must be transferred to equity on conversion.

Where, however, conversion has the effect of removing an issuer's right (for example, to compel early redemption or conversion), an alternative view is that this could be seen as a loss to the issuer rather than as consideration given by the holder for an issue of equity.

How we see it

In our view, the loss of any rights by the issuer on conversion of a convertible bond by the holder simply represents a reduction in the proceeds received for the issue of equity and must therefore be accounted for as a charge to equity (see also section 8.1 below).

6.3.3 Early redemption or repurchase

It is not uncommon for the issuer of a convertible bond to redeem or repurchase it before the end of its full term, either through exercise of rights inherent in the bond, such as an embedded issuer call option, or through subsequent negotiation with bondholders.

IAS 32 contains guidance for the accounting treatment of an early redemption or repurchase of compound instruments following a tender offer to bondholders (see section 6.3.3.A below).

It is not entirely clear whether this guidance applies only to redemption pursuant to a subsequent negotiation with bondholders, or whether it also applies where redemption occurs through exercise of a right inherent in the original terms of the bond.

How we see it

If redemption of a convertible bond is based on a right inherent in the original terms of the bond, we believe an entity has an accounting policy choice, between allocating the consideration paid on early redemption, consistent with the original allocation of liability and equity, or accounting for a modification gain or loss on the financial liability (see section 6.3.4 below).

6.3.3.A Early repurchase through negotiation with bondholders

When an entity extinguishes a convertible instrument before maturity through an early redemption or repurchase in which the original conversion privileges are unchanged, IAS 32 requires the entity to allocate the consideration paid and any transaction costs for the repurchase or redemption to the liability and equity components of the instrument at the date of the transaction. [IAS 32.AG33].

It is not entirely clear what is meant by a 'redemption or repurchase in which the original conversion privileges are unchanged'. However, we assume that it is intended to imply that the repurchase must occur without modification of the original terms of the compound instrument, and at a price representing a fair value for the instrument on its original terms. A repurchase based on a modification of the original terms of the instrument, or at a price implying a modification of them, must presumably be dealt with according to the provisions of IAS 32 for the modification of a compound instrument (see section 6.3.4 below) or those in IFRS 9 for the exchange and modification of debt (see Chapter 48).

The method used for allocating the consideration paid and transaction costs to the separate components must be consistent with that used in the original allocation to the separate components of the proceeds received by the entity when the convertible instrument was issued (see section 6.2 above). [IAS 32.AG33].

The issuer is therefore required to:

- Determine the fair value of the liability component and allocate this part of the purchase price to the liability component.
 - Allocate the remainder of the purchase price to the equity component.
- And
- Allocate the transaction costs between the liability and equity component on a *pro rata* basis.

Once this allocation of the consideration has been made:

- The difference between the consideration allocated to the liability component and the carrying amount of the liability is recognised in profit or loss.
- And
- The amount of consideration relating to the equity component is recognised in equity. [IAS 32.AG34].

The treatment of a negotiated repurchase at fair value of a convertible instrument is shown in Illustration 6-2 below, which is based on an illustrative example in IAS 32. [IAS 32.IE39-46].

Illustration 6-2: Early repurchase of convertible instrument

For simplicity this example:

- Assumes that at inception, the face amount of the instrument was equal to the carrying amount of its liability and equity components in the financial statements - i.e., there was no premium or discount on issue. And
- Ignores transaction costs and tax.

On 1 January 20W7, an entity issued a convertible bond with a face value of CU100 million maturing on 31 December 20X6, at which point the holder may opt for repayment of CU100 million or conversion into 4 million shares. Interest is paid half-yearly in arrears at a nominal annual interest rate of 10% (i.e., CU5m per half year). At the date of issue, the entity could have issued non-convertible debt with a ten-year term bearing interest at 11%. On issue, the carrying amount of the bond was allocated as follows:

	CU million
Present value of the principal - CU100m payable at the end of ten years ¹	34.3
Present value of the interest - 20 half-yearly interest payments of CU5m ²	59.7
Total liability component	94.0
Equity component (balance)	6.0
Proceeds of the bond issue	100.0

The amounts above are discounted using a semi-annual rate of 5.5% (11%÷2) as follows:

- $CU100m/1.055^{20}$
- $CU5m \times (1/1.055 + 1/1.055^2 + 1/1.055^3 + \dots + 1/1.055^{20})$

On 1 January 20X2, the entity makes a tender offer to the holder of the bond to repurchase the bond at its then fair value of CU170 million, which the holder accepts. At the date of repurchase, the entity could have issued non-convertible debt with a five-year term with interest payable half-yearly in arrears at an annual coupon interest rate of 8%.

At the time of repurchase, the carrying amount of the liability component of the bond, discounted at the original semi-annual rate of 5.5% is as follows.

	CU million
Present value of the principal - CU100m payable at the end of five years ¹	58.5
Present value of the interest - 10 half yearly interest payments of CU5m ²	37.7
Carrying value of liability component	96.2

- $CU100m/1.055^{10}$
- $CU5m \times (1/1.055 + 1/1.055^2 + 1/1.055^3 + \dots + 1/1.055^{10})$

The fair value of the liability component of the bond, discounted at the current semi-annual rate of 4% (8%÷2) is as follows.

	CU million
Present value of the principal - CU100m payable at the end of five years ¹	67.6
Present value of the interest - 10 6-monthly payments of CU5m ²	40.5
Fair value of liability component	108.1

- $CU100m/1.04^{10}$
- $CU5m \times (1/1.04 + 1/1.04^2 + 1/1.04^3 + \dots + 1/1.04^{10})$

The fair value calculation indicates that, of the repurchase price of CU170 million, CU108.1 million is to be treated as redeeming the liability component of the bond, and the balance of CU61.9 million as redeeming the equity component. This gives rise to the accounting entry:

	CU million	CU million
Dr Liability component of bond	96.2	
Dr Equity	61.9	
Dr Debt settlement expense (profit or loss)	11.9	
Cr Cash		170.0

The debt settlement expense represents the difference between the carrying value of the debt component (CU96.2m) and its fair value (CU108.1m).

Any costs of the repurchase would have been allocated between profit or loss and equity in proportion to the fair value of the liability and equity components at the time of redemption.

6.3.3.B Early repurchase through exercising an embedded call option

It is not entirely clear whether the guidance in section 6.3.3.A above applies only on early redemption or repurchase to a subsequent negotiation with bondholders, or whether it also applies where redemption occurs through exercise of rights inherent in the terms of the bond (for example an issuer call option at par allocated to the liability component and considered to be clearly and closely related to the host contract). One way of accounting for such redemptions would be by applying the accounting treatment as discussed in section 6.3.3.A above.

If, however, this early repayment option was determined, on initial recognition of the convertible bond, to be clearly and closely related to the liability host contract (see section 6.4.2.A below), then it might be argued that the general measurement rules of IFRS 9 apply. In such a case the liability (including the embedded call option) would be measured at amortised cost (assuming that it was not designated at fair value through profit or loss on initial recognition). Accounting under the amortised cost method is based on an effective interest rate, calculated initially based on expected future cash flows. Any change in those expected cash flows is reflected in the carrying amount of the financial instrument, by computing the present value of the revised estimated future cash flows at the instrument's original effective interest rate, with any difference from the previous amortised cost carrying amount recorded in profit or loss. [IFRS 9.B5.4.6].

A change in the expected repayment date would therefore require the amortised cost of the financial liability component to be remeasured. This treatment has the effect that the overall repayment amount at par is allocated to the liability portion of the compound instrument.

6.3.4 Modification

An entity may amend the terms of a convertible instrument to induce early conversion, for example by offering a more favourable conversion ratio or paying other additional consideration in the event of conversion before a specified date. At the date the terms are amended, the difference between the following two amounts is recognised in profit or loss:

- The fair value of the consideration the holder receives on conversion of the instrument under the revised terms
- And
- The fair value of the consideration the holder would have received under the original terms [IAS 32.AG35].

IAS 32 illustrates this treatment, as shown in Illustration 6-3 below. [IAS 32.IE47, IAS 32.IE48, IAS 32.IE49, IAS 32.IE50].

Illustration 6-3: Modification of the terms of a bond to induce early conversion

Suppose that the entity in Illustration 6-2 in section 6.3.3.A above wished, on 1 January 20X1, to induce the bondholder to convert the bond early. The original terms of the bond allowed for conversion into 4 million shares. The entity offers the bondholder the right to convert into 5 million shares during the period 1 January to 28 February 20X1. The market value of the entity's shares is CU40 per share.

The enhanced conversion terms offer the bondholder the right to receive an additional 1 million shares. Accordingly, the entity recognises a loss of CU40m (1m shares × share price CU40/share) in profit or loss.

6.4 The components of a compound instrument

6.4.1 Determining the components of a compound instrument

The most difficult aspect of 'split accounting' is often the initial assessment of whether the instrument consists of different components and if it does, what the various components of the instrument actually are. In the examples above, it is fairly clear that the instruments consist of different components and what the various components are. However, in some instruments the analysis is far from straightforward, as shown in Illustration 6-4 below.

Illustration 6-4: Analysis of compound financial instrument into components

An entity issues a bond for CU100, paying an annual cash coupon of 5% on the issue price and mandatorily convertible after five years on the following terms. If, at the date of conversion, the entity's share price is:

- CU1.25 or higher, the holder will receive 80 shares
- CU1.00 or lower, the holder will receive 100 shares
- In the range CU1.00 to CU1.25, the holder will receive such number of shares (between 80 and 100) as have a fair value of CU100.

Any analysis must begin by determining whether the bond as whole is a non-derivative instrument. This is the case, since the issuing entity receives full consideration for its issue. The next step is to assess whether the instrument consists of different components and, if it does, to break the instrument down into these components to identify any equity components in the whole.

The difficulty of this assessment is evidenced by two requests received by the IFRS IC to address the accounting for two instruments with substantially the same features as the one in Illustration 6-4 above, but with an additional early settlement option for the issuer, to settle the instrument at any time by delivering a maximum (fixed) number of shares (see section 6.6.4.A below).²⁶ While the request focused only on the additional early settlement option, and not on the classification of the 'basic' instrument (an instrument with the features described in Illustration 6-4 above), the accounting treatment of the 'basic instrument' was added to the IFRS IC's agenda. It was discussed during the January 2014 and May 2014 IFRS IC meetings.²⁷ Four alternative views with significantly different accounting outcomes, ranging from classifying the whole financial instrument as a financial liability to various combinations of financial liabilities, equity instruments and/or derivative financial liabilities, were considered by the IFRS IC. In the end, the IFRS IC noted that:

- The issuer's obligation to deliver a variable number of the entity's own equity instruments is a non-derivative that meets the definition of a financial liability in IAS 32.11(b)(i) in its entirety (see sections 3 and 4.1 above).

And

- The definition of a liability in IAS 32 does not have any limits or thresholds regarding the degree of variability that is required.

Therefore, the contractual substance of the instrument is a single obligation to deliver a variable number of equity instruments at maturity, with the variation based on the value of those equity instruments. The IFRS IC noted further that such a single obligation to deliver a variable number of own equity instruments cannot be subdivided into components for the purposes of evaluating whether the instrument contains a component that meets the definition of equity. Even though the number of equity instruments to be delivered is limited and guaranteed by the cap and the floor, the overall number of equity instruments that the issuer is obliged to deliver is not fixed and therefore the entire obligation meets the definition of a financial liability.

The IFRS IC noted that the cap and the floor are embedded derivative features, whose values change in response to the price of the issuer's equity shares. Therefore, assuming that the issuer has not elected to designate the entire instrument under the fair value option, the issuer must separate those features and account for the embedded derivative features separately from the host liability contract, at fair value through profit or loss in accordance with IFRS 9 (see Chapter 42).

The fact that the issue was submitted to the IFRS IC in the first place together with the fact that four possible accounting views were drawn up under the guidance of IAS 32, demonstrates how difficult and judgemental any analysis of increasingly complex instruments can be under the provisions of IAS 32.

6.4.2 Compound instruments with embedded derivatives

As noted above, in order to qualify for split accounting, a financial instrument, when considered as a whole, must be a non-derivative instrument. However, one or more of its identified components may well be embedded derivatives. Indeed, the conversion right in any convertible bond represents a holder's call option whereby the entity can be required to issue a fixed number of shares for a fixed consideration (the 'fixed stated principal' of the bond - see section 6.3.2.A above), which is accordingly identified as an equity component.

A bond may well contain other (non-equity) derivatives, such as options for either the issuer or the holder to require early repayment or conversion or to extend the period until conversion. The detailed guidance in IAS 32 requires the fair value of any embedded non-equity derivative features to be determined and included in the liability component when split accounting is applied (see section 6.2 above). [IAS 32.31]. They are then subject to the normal requirement of IFRS 9 for embedded derivatives to be accounted for separately if they are not considered to be closely related to the host contract (see Chapter 42).

²⁶ [IFRIC Update](#), July 2013, available on the IFRS Foundation's website.

²⁷ [IFRIC Update](#), January 2014 and [IFRIC Update](#), May 2014. Available on the IFRS Foundation's website.

The issuer of a compound financial instrument with other embedded derivatives is therefore required to go through the following steps:

- **First step:**
Determine the fair value of the liability component that does not have an associated equity conversion feature but including any embedded non-equity derivatives features.
- **Second step:**
Determine the equity component as a residual amount by deducting the fair value of the liability component, including any embedded non-equity derivative features, from the fair value of the compound instrument (essentially its issue proceeds).
And
- **Third step:**
Assess whether the embedded non-equity derivative features are closely related to the host liability component. Any not closely related embedded non-equity derivative features are accounted for separately and therefore separated from the host liability component (see Chapter 42).

Note, on initial recognition, the sum of the initial carrying amounts of the various components, determined as indicated above, must equal the overall fair value of the compound instrument.

The separation of the liability and equity components of a compound financial instrument with multiple embedded derivative features is demonstrated in Illustration 6-5 below which is based on an illustrative example in IAS 32. [IAS 32.IE37, IAS 32.IE38].

6.4.2.A Issuer call option - 'closely related' embedded derivatives

Illustration 6-5: Convertible bond - split accounting with multiple embedded derivative features

The proceeds received on the issue of a convertible bond, callable at par, are CU60 million, which equals the nominal amount of the convertible bond. The value of a similar bond without a call or equity conversion option is CU57 million. Based on an option-pricing model, it is determined that the value to the entity of the embedded call feature in a similar bond without an equity conversion option is CU2 million. In this case, the value is allocated to the liability component, to reduce the liability component to CU55 million (CU57m - CU2m) and the value allocated to the equity component is CU5 million (CU60m - CU55m). Because IFRS 9 requires the embedded derivative assessment to be done before separating the equity component and the call option is at par, the option is considered to be clearly and closely related and therefore not separated from the liability host contract.

Where (as is often the case) a convertible bond is callable at par, the call option would not be a separable derivative. IFRS 9 states that a call option is generally closely related to the host debt contract if the exercise price is approximately equal to the amortised cost of the host on each exercise (which would not, *prima facie* be the case). However, as an exemption to the general rule, IFRS 9 requires this assessment to be made in respect of any embedded call, put or prepayment option in a convertible bond before separating the equity component. [IFRS 9.B4.3.5(e)]. This has the effect that an issuer's call over a convertible bond at par is effectively deemed to be equal to its amortised cost for the duration of the instrument. This is discussed further in Chapter 42.

6.4.2.B Issuer call option - 'not closely related' embedded derivatives

If a non-equity embedded derivative is considered not to be closely related to the host contract, then it must be accounted for separately. If, in Illustration 6-5 above, the issuer call option was at an amount that was not approximately equal to the amortised cost of the host, and not intended to reimburse the approximate present value of lost interest (see Chapter 42), say at par plus CU5 million, then the call option would not be considered clearly and closely related and therefore must be accounted for separately. The issuer in Illustration 6-5 in section 6.4.2.A above would therefore record a derivative financial asset at its fair value of CU2 million, assuming it would have the same fair value as in Illustration 6-5 above, a liability component of CU57 million and an equity component of CU5 million. The call option would subsequently be remeasured at fair value through profit or loss.

There are cases where over-enthusiastic trawling for embedded derivatives may dredge up results so counter-intuitive that it is hard to believe that they were really intended by the IASB, as shown in Illustration 6-6 below.

Illustration 6-6: Foreign currency denominated equity instrument with issuer's redemption right

An entity with a functional currency of pounds sterling issues a Euro-denominated capital instrument for €145 million (equivalent to £100 million at the date of issue). Coupons on the instrument are paid entirely at the entity's discretion. The entity has the right, but not the obligation, in certain circumstances to redeem the instrument (in Euros) for an amount equal to the original issue proceeds.

Taken as a whole, this is an equity instrument, because it gives rise to no obligation to transfer cash or other financial assets to the holder. However, the issuer's right to redeem, if considered in isolation is not an equity instrument, but a financial asset (a call option over own equity), since it is a derivative involving the purchase of a fixed number of equity instruments for €145 million which, although fixed in Euros, is variable when translated into sterling. Suppose that the fair value of the call option, at the date of issue was £15 million.

This analysis would result in the following accounting entry on issue of the instrument:

	£m	£m
Dr Cash	100	
Dr Call option (statement of financial position)	15	
Cr Equity		115

How we see it

In our view, it would be inappropriate to show an increase in net assets of £115 million in this example, when the only real transaction has been the raising of £100 million of equity for cash. In this particular case, split accounting is, in our view, not required since IAS 32.28 requires split accounting to be applied only where an instrument is determined to contain 'both a liability and an equity component'.

In this case, there is no liability component, since the embedded derivative that has potentially been identified is, and can only ever be, an asset; accordingly, 'split accounting' is not required.

6.5 Other issues

The following issues discussed earlier in this chapter are of particular relevance to convertible bonds:

- The IFRS IC's conclusion that a fixed amount of cash denominated in a currency other than the entity's functional currency is not a 'fixed amount' of cash (see section 5.2.3 above and sections 6.6.5 and 6.6.5.A below).

And

- The treatment of instruments settled with equity instruments, the number of which varies to reflect major capital restructurings before settlement (see section 5.1.2 above).

These and other issues noted at various points above reinforce an increasing concern that the 'split accounting' rules in IAS 32 are implicitly based on a bond with terms much more straightforward than those of many, if not most, bonds currently in issue. See section 12 below for possible future developments.

6.6 Common forms of convertible bonds

6.6.1 Functional currency bond convertible into a fixed number of shares

The most common form of convertible bond, a functional currency bond convertible into a fixed number of own equity instruments at the discretion of the holder, is discussed in Illustration 6-1 in section 6.2 above.

6.6.2 Contingent convertible bond

A contingent convertible bond is a bond that is convertible, at the option of the holder, only on the occurrence of a contingent event outside of the control of the holder or the issuer. If the contingent event occurs then the holder has the option, but not the obligation, to convert. If the contingent event does not occur, then the bond will be settled in cash at maturity.

The fact that conversion is only contingent does not mean the instrument has no equity component. If, on occurrence of the contingent event, exercise of the conversion option would result in the exchange of a fixed number of the issuer's own equity instruments for a fixed amount of cash (in the functional currency of the issuing entity), the conversion option would meet the definition of an equity instrument under IAS 32 and the overall instrument would be treated as a compound instrument.

6.6.3 Bond convertible at the option of the issuer

Where a fixed rate convertible bond has a fixed conversion rate with conversion at the entity's discretion and with any accrued interest also being converted at the same rate then the instrument is equity in its entirety. For example, an entity with a Euro functional currency, issues a bond with the principal amount of €500,000. The principal amount may be converted into newly issued ordinary shares of the issuer at the sole discretion of the issuer at any time. The bond bears a mandatory annual fixed interest rate of 5%. The interest accrued may be converted at the sole discretion of the issuer and at the same fixed conversion ratio as the principal of the bond. In this case both the principal and interest are classified as equity because the conversion rate is fixed and conversion is at the entity's discretion.

6.6.4 Mandatorily convertible bond

A mandatorily convertible bond is an instrument that, at a certain time in the future, converts into shares of the issuing entity, rather than the conversion being at the option of either the holder or the issuer of the bond. The classification of a mandatorily convertible bond on initial recognition as debt or equity depends on:

- How the convertible bond will be settled
And
- Whether the issuer is required to pay interest up to the point of conversion

If the fixed stated principal will be settled through the delivery of a fixed number of the issuer's own shares, and the principal of the convertible bond is in the functional currency of the issuing entity, then this feature of the bond is an equity instrument and accounted for as such (see sections 4.1 and 5.2.3 above). If interest on the bond is payable only at the discretion of the entity, then there is no liability component, and the entire bond is classified as an equity instrument. If, however, the entity is required to pay interest, the obligation to pay interest establishes a liability component, which is measured at the present value of the required interest payments.

If settlement can only occur through the delivery of a variable number of the issuer's own shares, calculated so that the fair value of these shares issued equals the principal amount (see section 5.2.1 above), and the entity is required to pay interest, then the entire bond is classified as a financial liability.

Illustration 6-7: Mandatorily convertible bond classified as equity

An entity, with a functional currency of Euro, issues 2,000 convertible bonds with a nominal value of €1,000 per bond, giving total proceeds of €2,000,000. The bonds have a three-year term, and interest is payable, at the discretion of the entity, annually in arrears at a nominal annual interest rate of 6% (i.e., €120,000 per annum). At maturity of the bond, each bond converts into 250 ordinary shares. Because the conversion option meets the definition of an equity instrument and payment of interest is at the discretion of the entity, the entire instrument is classified as an equity instrument. The entity records the following accounting entry.

Dr	Cash	€2,000,000	
	Cr	Equity	€2,000,000

Illustration 6-8: Mandatorily convertible bond classified as a compound instrument

Assume the same fact pattern as in Illustration 6-7 above, except that the entity has an obligation to pay interest annually in arrears at a nominal annual interest rate of 6% (i.e., €120,000 per annum). The obligation to pay interest over three years represents a liability of the issuing entity at the net present value, using a discount rate of 9%, which is the market interest rate.

Year	Cash flow		Discount factor	NPV of cash flow
		€	(at 9%)	€
1	Interest	120,000	1/1.09	110,092
2	Interest	120,000	1/1.09 ²	101,001
3	Interest	120,000	1/1.09 ³	92,662
	Total liability component			303,755
	Total equity component (balance)			1,696,245
	Total proceeds			2,000,000

The entity records the following accounting entry.

Dr	Cash	€2,000,000	
	Cr Equity		€1,696,245
	Cr Liability		€303,755

6.6.4.A Bond which is mandatorily convertible into a variable number of shares with an option for the issuer to settle early for a maximum number of shares

At its meeting in July 2013, the IFRS IC considered the IAS 32 classification for a financial instrument that is mandatorily convertible into a variable number of shares, subject to a cap and floor, but with an issuer option to settle by delivering the maximum (fixed) number of shares.²⁸ This is a financial instrument with essentially the same features as the one described in Illustration 6-4 above in section 6.4.1, but with an additional option for the issuer to settle the instrument at any time before maturity (see section 6.4.1 above for IAS 32 classification considerations for the 'basic financial instrument', ignoring the early settlement option). If the issuer chooses to exercise its early settlement option, it must deliver the maximum number of shares specified in the contract (e.g., 100 shares in Illustration 6-4 above and pay in cash all of the interest that would have been payable if the instrument had remained outstanding until its maturity date (a so called 'make-whole provision').

Applying the IAS 32 definitions of a financial liability and of an equity instrument to such a financial instrument would result in accounting for it as a compound instrument (i.e., a financial instrument consisting of an equity element and a financial liability element). IAS 32 states that a non-derivative financial instrument is an equity instrument if the instrument will be settled in the issuer's own equity instruments and includes no contractual obligation for the issuer to deliver a variable number of its own equity instruments. [IAS 32.11(b)(i)]. With the early settlement option, the issuer has the right to avoid delivering a variable number of shares. A portion of the financial instrument would therefore meet the definition of equity and would be accounted for as such. The interest payments on the instrument, on the other hand, impose a contractual obligation on the issuer to deliver cash in all cases and therefore meet the definition of a financial liability and would be accounted for as such.

However, this analysis ignores the fact that in exercising the early settlement option, the issuer must deliver at an earlier time a potentially greater number of its own shares, plus all the interest in cash which would have been payable over the instrument's life. The issuer can avoid delivering a variable number of its own shares but only by giving away a potentially larger amount of economic value. The question asked of the IFRS IC was whether such an early settlement option must be considered when classifying the financial instrument under IAS 32.

²⁸ [IFRIC Update](#), July 2013, available on the IFRS Foundation's website.

In its analysis, the IFRS IC noted that the definitions of financial asset, financial liability and equity instrument in IAS 32 are based on the financial instrument's contractual rights and contractual obligations.²⁹ However, IAS 32 requires the issuer of a financial instrument to classify the instrument in accordance with the substance of the contractual arrangement. [IAS 32.15]. An issuer cannot assume that a financial instrument (or any component) meets the definition of an equity instrument simply because the issuer has the contractual right to settle the financial instrument by delivering a fixed number of equity instruments. The issuer would need to consider whether the early settlement option is substantive and, if it was concluded that it lacks substance, then it must be ignored for the classification assessment of the instrument.

It was noted that the guidance in IAS 32.20(b) is relevant because it provides an example of a situation in which one of an instrument's settlement alternatives is excluded from the classification assessment. Specifically, the example in that paragraph describes an instrument that the issuer will settle by delivering either cash or its own shares, and states that one of the settlement alternatives must be excluded from the classification assessment in some circumstances (see section 5.2.4 above).

To determine whether the early settlement option is substantive, the issuer would need to understand whether there are actual economic or business reasons that would lead the issuer to exercise the option. In making that assessment, the issuer could consider whether the instrument would have been priced differently if the issuer's early settlement option had not been included in the contractual terms. The IFRS IC also noted that factors such as the term of the instrument, the width of the range between the cap and the floor, the issuer's share price and the volatility of the share price could be relevant to the assessment of whether the issuer's early settlement option is substantive. For example, the early settlement option may be less likely to have substance, especially if the instrument is short-lived, if the range between the cap and the floor is wide and the current share price would equate to the delivery of a number of shares that is close to the floor. That is because the issuer may have to deliver significantly more shares to settle early than it may otherwise be obliged to deliver at maturity. The IFRS IC considered that in light of its analysis of the existing IFRS requirements, it would not add this issue to its agenda.

6.6.4.B Bond which is mandatorily convertible into a variable number of shares upon a contingent 'non-viability' event

Since the financial crisis, regulators have been looking to strengthen the capital base of financial institutions, particularly in the banking sector. Rising requirements for capital adequacy have resulted in banks looking into new forms of capital instruments. One form of such capital instruments are financial instruments that convert into a variable number of the issuer's own ordinary shares if the institution breaches a minimum regulatory requirement. This type of contingent event is called a 'non-viability' event. While the exact terms of these instruments vary in practice, they do generally come with the following key features:

- No stated maturity, but the issuer can call the instrument for the par amount of cash.
- While the instrument has a stated interest rate (e.g., 5%), payment of interest is at the discretion of the issuer.
And
- If the issuer breaches a minimum regulatory requirement (e.g., 'Tier 1 Capital ratio'), the instrument mandatorily converts into a variable number of the issuer's own ordinary shares. The number of shares delivered would depend on the current share price, i.e., the issuer must deliver as many shares as are worth the par amount of the instrument at conversion.

In July 2013, the IFRS IC considered a request to clarify the accounting for such instruments.³⁰ In its tentative agenda decision, the IFRS IC noted that the instrument is a compound instrument that is composed of the following two components:

- A liability component, which reflects the issuer's obligation to deliver a variable number of its own equity instruments, if the contingent non-viability event occurs.
And
- An equity component, which reflects the issuer's discretion to pay interest.

²⁹ [IFRIC Update](#), January 2014, available on the IFRS Foundation's website.

³⁰ [IFRIC Update](#), July 2013, available on the IFRS Foundation's website.

To measure the liability component, the IFRS IC noted that the issuer must consider the fact that the contingent non-viability event could occur immediately because it is beyond the control of the issuer. Hence the liability component must be measured at the full amount that the issuer could be required to pay immediately. The equity component would be measured as a residual and thus would be measured at zero, because the instrument is issued at par and the value of the variable number of shares that will be delivered on conversion is equal to that fixed par amount.

The IFRS IC received 12 comment letters on the tentative agenda decision, many accepting that the IFRS IC's view is one way of analysing the financial instrument under IAS 32, but generally expressing the view that the relevant guidance in IAS 32 is unclear and that equally valid arguments could be made for other views. For instance, one view discussed at the time was that, when measuring the liability component, the issuer must consider the expected timing of the contingent non-viability event occurring and discount the liability accordingly. Therefore, if the issuer believed that the contingency would not occur in the near-term, the liability component would be recognised at an amount of less than par. The comments provided focused in particular on (a) the measurement of the liability component and (b) whether interest paid on the instrument, if any, would need to be recognised in equity or as interest in profit or loss. Based on the comments received, the IFRS IC decided, after further discussions in its January 2014 meeting, not to add this issue to its agenda and noted that the scope of the issues raised in the submission was too broad to be addressed in an efficient manner.³¹ There is therefore the potential for diversity in practice until this issue is clarified by the IASB. This is shown by the following Illustration:

Illustration 6-9: Convertible bond mandatorily convertible upon 'non-viability' event

A bank issues €100 million of contingent convertible bonds. The bonds notionally pay fixed interest of 7% annually, however interest payments are at the sole discretion of the issuer provided that no dividend is paid on the ordinary shares of the issuer. The bonds are perpetual, but the issuer has the right to call the shares after five years and on every succeeding fifth anniversary thereafter.

The instrument is immediately converted into ordinary shares with a fair value equal to the par value of the bonds upon either:

- The bank's fully loaded Common Equity Tier 1 (CET 1) ratio falling below 7%
- Or
- The local regulator declaring a non-viability event

The instrument has both debt and equity features. The contingent settlement provision, which requires settlement in a variable number of shares upon a non-viability event, is a debt feature and the perpetual nature of the instrument and the discretionary interest payments are equity features. As discussed above there are a number of views that could be taken on how to classify this instrument.

Based on the IFRS IC's discussion, the view could be taken that the bonds are a compound instrument and that because the contingent settlement provision might be activated immediately, a liability for the par amount of the bond must be recorded. The equity component of the instrument representing the discretionary interest payments would therefore have no value.

However, this could be viewed as odd given that there is usually no expectation that a trigger event will occur when the instrument is first issued. As such, it might be considered more reasonable to estimate when a trigger event is most likely to occur and calculate the liability component on that basis, with the residual amount being classified as equity.

There is a further argument that the whole instrument falls within the definition of a liability rather than a compound instrument, as the entity may be required to deliver a variable number of shares for a non-derivative instrument. [IAS 32.11(b)(i)].

The conversion trigger itself is not a separable embedded derivative as redemption at amortised cost is regarded as being closely related to the host contract. This is the case even if the debt and equity components of the instrument are separated, as the evaluation of the embedded derivative has to be performed prior to the separation of the equity component. [IFRS 9.B4.3.5(e)]. Similarly, the call option exercisable to extend the term of the instrument is not a separable embedded derivative as the option is at par and so is also closely related.

In the income statement any discretionary interest payments would be classified depending on whether the host is classified as a liability, in which case the payments would be interest, or as a compound instrument, in which case payments would be dividends (see section 8 below).

³¹ [IFRIC Update](#), January 2014, available on the IFRS Foundation's website.

A further complication arises with the introduction of bank resolution regimes, such as the European Union's Banking Recovery and Resolution Directive (BRRD). These regimes subject certain financial instruments to bail-in, where banking regulators have the power to write down an instrument or convert it into another CET 1 instrument at their discretion.

As the right to convert the instrument is at the option of the regulator and not the issuer, the question arises whether this would mean that the instrument cannot be classified as equity. The exception for settlement in case of liquidation (see section 4.3.3 above) does not apply here as the regulator is likely to invoke the resolution tool well before liquidation occurs. IFRIC 2, which was developed with co-operatives and similar entities in mind, specifies that, if local laws and regulations in effect at the classification date unconditionally prevent the exercise of rights in accordance with the terms contained in the instrument's documentation, those rights must be ignored for the purpose of assessing whether the contract meets the definition of equity under IAS 32. [IFRIC 2.8]. However, this scenario is different from a scenario where the rights (e.g., the conversion or write-down of a financial instrument) are not part of the terms contained in the instrument's documentation but could be exercised by a regulator using local laws or regulation, which is generally the case with bank resolution regimes. It is important to note that, in the FICE DP (see section 12 below), the IASB wrote that IFRIC 2 was developed for a very specific fact pattern and that they did not intend to apply the analysis in IFRIC 2 more broadly.³²

The main conclusion to be drawn from examples such as these is that the provisions of IAS 32, which were originally drafted in the mid-1990s to deal with 'traditional' convertible instruments, are not always adequate for dealing with the increasingly complex range of instruments available in the financial markets now. The IASB is endeavouring to address these issues as reflected in the FICE Exposure Draft, which was published by the IASB in November 2023, as discussed in section 12 below.

6.6.5 Foreign currency convertible bond

If an entity issues a bond in a currency other than its functional currency, the conversion option will not meet the definition of equity in IAS 32, even if the bond is convertible into a fixed number of shares. This is because a fixed amount of foreign currency (a currency different to the functional currency of the bond) is not a fixed amount of cash (see section 5.2.3 above). A foreign currency convertible bond is therefore classified as a financial liability under IAS 32, and then measured under the requirements of IFRS 9. An equity conversion option embedded in a financial liability is not considered by IFRS 9 to be clearly and closely related to the host contract and must be accounted for as a separate derivative financial instrument measured at fair value through profit or loss.

6.6.5.A Instrument issued by a foreign subsidiary convertible into equity of the parent

The IFRS IC's conclusion that (other than in the context of certain rights issues, see section 5.2.3.A above) a fixed amount of cash denominated in a currency other than the entity's functional currency is not a 'fixed amount' of cash (see section 5.2.3 above) leads to the rather counter-intuitive result that the classification of certain instruments in consolidated financial statements depends on the functional currency of the issuing entity.

If, in the Illustration in section 5.2.3 above, the UK entity's US subsidiary (with a functional currency of US dollars) issued the same \$100 bond convertible into its own equity, convertible in turn into the UK parent's equity, the conversion right would (from the perspective of the US subsidiary) involve the issue of a fixed number of shares for a fixed amount of cash and thus be an equity instrument. Moreover, this classification would not change on consolidation since IFRS accounting standards has no concept of a group functional currency (see Chapter 16).

The IFRS IC discussed this issue at its meetings in July and November 2006. Specifically, it was asked to consider whether the fixed stated principal of the convertible instrument exchanged for equity of the parent on conversion can be considered 'fixed' if it is denominated in the functional currency of either the issuer of the exchangeable financial instruments (i.e., the US subsidiary in the example above) or the issuer of the equity instruments (i.e., the UK parent in the example).

³² Discussion Paper [DP/2018/1](#): *Financial Instruments with Characteristics of Equity*, IASB, June 2018, para. 8.34. Available on the IFRS Foundation's website.

The IFRS IC noted that a group does not have a functional currency. It therefore discussed whether a project needed to be added to its agenda to address which currency must be the reference point in determining whether the embedded conversion options are denominated in a foreign currency. The IFRS IC believed that the issue was sufficiently narrow that it was not expected to have widespread relevance in practice and therefore, decided not to take the issue onto its agenda.³³

How we see it

In our view, given the absence of specific guidance, an entity may, as a matter of accounting policy, determine the classification, in its consolidated financial statements, of an instrument issued by a subsidiary that is convertible into the parent's shares, by reference either to that subsidiary's own functional currency or to the functional currency of the parent into whose equity the bond is convertible. This is because you can view the functional currency as being that of either:

- The subsidiary, because it is the party which is contractually obliged to deliver equity instruments, and therefore has exposure to the variability in the cash flows from the holders.
- Or
- The parent, as under the consolidation model in IFRS 10 Consolidated Financial Instruments a group is treated as a single entity, therefore, equity instruments issued by an entity in the group are treated as the equity of the group in the same way as if the parent had issued them.

The effect of a policy choice will be that, where the convertible instrument is denominated in a currency other than the designated reference functional currency, the consolidated financial statements will contain no equity component. This policy, and its consequences under IAS 32, must be applied consistently, as shown in Illustration 6-10 below.

Illustration 6-10: Convertible bond issued by a subsidiary with a functional currency different to that of the parent

Suppose that a UK entity with a functional currency of the pound sterling (GBP) has a US trading subsidiary with a functional currency of the US dollar (USD). The US subsidiary issues a bond convertible, at the holder's option, into equity of the UK parent.

If the parent's functional currency (GBP) is the reference currency, the accounting treatment of the holder's conversion right in the consolidated financial statements will be as follows:

- If the fixed stated principal of the bond is denominated in GBP: equity (stated principal of bond is fixed by reference to GBP).
- But
- If the fixed stated principal of the bond is denominated in a currency other than GBP: derivative (stated principal of bond is variable by reference to GBP).

If, however, the subsidiary's functional currency (USD) is the reference currency, a converse analysis applies, and the accounting treatment of the holder's conversion right in the consolidated financial statements will be as follows:

- If the fixed stated principal of the bond is denominated in USD: equity (stated principal of bond is fixed by reference to USD).
- But
- If the fixed stated principal of the bond is denominated in a currency other than USD: derivative (stated principal of bond is variable by reference to USD).

It may be that the IFRS IC's reluctance to issue guidance on this matter was influenced by the more subtle point that, in most cases, the issuing entity will not be, as in Illustration 6-10 above, a trading subsidiary, but rather a subsidiary created only for the purposes of the bond issue. IAS 21 suggests that the functional currency of such a 'single transaction' entity is the same as that of the parent for whose equity the bond will be exchanged, irrespective of the currency in which the bond is denominated (see Chapter 16). In short, the IFRS IC was perhaps hinting that the real problem may be the misapplication of IAS 21 in the financial statements of the issuing subsidiary rather than the interpretation of IAS 32.

³³ [IFRIC Update](#), July 2006, available on the IFRS Foundation's website.

6.6.6 Convertibles with cash settlement at the option of the issuer

As discussed in section 5.2.8 above, IAS 32 requires a derivative with two or more settlement options to be treated as a financial asset or a financial liability unless all possible settlement alternatives would result in it being an equity instrument. Many convertible bonds currently in issue contain a provision whereby, if the holder exercises its conversion option, the issuer may instead pay cash equal to the fair value of the shares that it would otherwise have been required to deliver. This is to allow for unforeseen circumstances, such as an inability to issue the necessary number of shares to effect conversion at the appropriate time.

Where a bond has such a term, the conversion right is a derivative (in effect, a written call option over the issuer's own shares) which may potentially be settled in cash, such that there is a settlement alternative that does not result in it being an equity instrument. This means that the 'equity component' of a bond with an issuer cash settlement option is not in fact an equity instrument, but a financial liability. The financial reporting implication of this is that the conversion right must be accounted for as a derivative at fair value, with changes in value included in profit or loss, in other words, the financial statements will reflect gains and losses based on the movement of the reporting entity's own share price.

6.6.7 Bond convertible into fixed percentage of equity

The terms of a convertible bond may allow conversion into a fixed percentage of outstanding shares of the issuer at the time of the conversion, so that the absolute number of shares to be issued is not fixed and is not known until conversion occurs. This raises the question of whether such a clause violates the 'fixed-for-fixed' criterion, or whether it can be seen as an anti-dilutive mechanism to keep the holder in the same economic position relative to other shareholders at all times (similarly to bonds whose conversion ratio is adjusted for changes in share capital, as discussed in section 5.1.2 above).

How we see it

Our view is that a conversion option that allows conversion into a fixed percentage of outstanding shares of the issuer cannot normally be classified as equity, because the entity's capital structure could change in ways that put the convertible bond holder into a better economic position relative to other shareholders.

6.6.8 Convertible bonds with down round or ratchet features

Some instruments that are convertible at a fixed price have clauses which provide that, if additional equity is subsequently issued at a price lower than the conversion price, then the conversion price is amended down to ensure the holders of the convertible instrument are not economically disadvantaged. These clauses are often called 'down round' or 'ratchet' clauses.

When assessing instruments with down round or ratchet clauses it is necessary to know whether the instrument or component being assessed is a non-derivative or a derivative instrument (see section 5.1.2 above, and also Chapter 42). This is because, as discussed in section 5 above, there are two fixed-for-fixed tests in IAS 32.16(b).

In the case of a non-derivative instrument the test is whether there is a contractual obligation or not for the issuer to deliver a variable number of its own equity instruments. [IAS 32.16(b)(i)]. Therefore, the ability of the entity to prevent a down round or ratchet clause taking effect (by choosing not to issue shares at a lower price) is important and where that is the case the down round or ratchet feature is ignored.

In the case of a derivative instrument or derivative component of an instrument, the test is simply whether it will always be settled by exchanging a fixed number of shares for a fixed amount of cash or another financial instrument. [IAS 32.16(b)(ii)]. Therefore, the entity's ability to prevent the down round or ratchet clause taking effect does not affect the classification.

Illustration 6-11: Convertible bond with ratchet feature

A company, issues preference shares. The preference shares carry a discretionary dividend of 2%. The preference shareholders have a right to convert the preference shares into ordinary shares if there is an IPO or earlier if agreed by 60% of the preference shareholders. If not converted, preference shares are redeemable at par at the end of eight years from the issue date. The conversion ratio is fixed at inception at one ordinary share for one preference share. However, the ratio is subject to an anti-dilution clause. If the entity in future issues any new ordinary shares or convertible shares at a price or conversion price lower than the conversion price of the existing preference shares, the conversion price of the existing preference shares is adjusted down using a prescribed formula.

The requirement to redeem the issue at par after eight years creates a liability component which would be extinguished if the conversion option is exercised. As such, the presence of the redemption obligation makes the conversion option a derivative. In this case, the fact that the company has control over whether the ratchet feature is triggered through the issuance of new shares is not relevant. The derivative component cannot be settled only on a fixed-for-fixed basis and so the redemption obligation is a liability component.

7 Settlement of financial liability with equity instrument

Neither IAS 32 nor IFRS 9 specifically addresses the accounting treatment to be adopted where an entity issues non-convertible debt, but subsequently enters into an agreement with the debt holder to discharge all or part of the liability in exchange for an issue of equity. These transactions, which are sometimes referred to as 'debt for equity swaps', most often occur when the entity is in financial difficulties.

The IFRS IC noted that divergent accounting treatments for such transactions were being applied and decided to address this by developing an interpretation. As a result, IFRIC 19 was published in November 2009. [IFRIC 19.1].

7.1 Scope and effective date of IFRIC 19

IFRIC 19 addresses the accounting by an entity when the terms of a financial liability are renegotiated and result in the entity issuing equity instruments to a creditor to extinguish all or part of the financial liability. It does not address the accounting by the creditor. [IFRIC 19.2].

Further, the interpretation does not apply to transactions in situations where: [IFRIC 19.3]

- The creditor is also a direct or indirect shareholder and is acting in its capacity as a direct or indirect existing shareholder (see section 7.3 below).
 - The creditor and the entity are controlled by the same party or parties before and after the transaction and the substance of the transaction includes an equity distribution by, or contribution to, the entity (see section 7.3 below).
- Or
- The extinguishment of the financial liability by issuing equity shares is in accordance with the original terms of the financial liability. This will most commonly arise on conversion of a convertible bond that has been subject to 'split accounting', the accounting for which is covered in section 6 above.

7.2 Requirements of IFRIC 19

Equity instruments issued to a creditor to extinguish all or part of a financial liability are treated as consideration paid and must normally be measured at their fair value at the date of extinguishment. However, if that fair value cannot be reliably measured, the equity instruments must be measured to reflect the fair value of the financial liability extinguished. The difference between the carrying amount of the financial liability and the consideration paid (including the equity instruments issued) must be recognised in profit or loss and must be disclosed separately. [IFRIC 19.5, IFRIC 19.6, IFRIC 19.7, IFRIC 19.9, IFRIC 19.10, IFRIC 19.11].

These requirements are shown in the following simple Illustration:

Illustration 7-1: Discharge of liability for fresh issue of equity

During 20W4 an entity issued CU100 million bonds due to be repaid in 20X4. By 20X2 the entity is in some financial difficulty and reaches an agreement with the holders of the bonds whereby they will accept equity shares in the entity in full and final settlement of all amounts due under the bonds. On the date the agreement concludes, the carrying amount of the bonds is CU99 million and the fair value of the equity shares issued is CU60 million.

In this situation the entity would measure the equity instruments issued at their fair value of CU60 million and recognise a profit on extinguishment of CU39 million [CU99 million - CU60 million].

Debt for equity swaps often take place in situations when the terms of the financial liability such as covenants are breached and the liability has become, or will become, repayable on demand. Normally, the fair value of a financial liability with a demand feature is required by IFRS 13 to be measured at no less than the amount payable on demand, discounted from the first date that the amount could be required to be paid (see Chapter 15). However, in the IASB's view, the fact that a debt for equity swap has occurred indicates that the demand feature is no longer substantive. Consequently, where the fair value of the equity instruments issued is based on the fair value of the liability extinguished, this particular aspect of IFRS 13 is not applied. [IFRIC 19.7, IFRIC 19.BC22].

If only part of the financial liability is extinguished, some of the consideration paid might relate to a modification of the terms of the liability that remains outstanding. If so, the consideration paid must be allocated between the part of the liability extinguished and the part of the liability that remains outstanding. All relevant facts and circumstances relating to the transaction must be considered in making this allocation. [IFRIC 19.8]. Any consideration so allocated forms part of the assessment of whether the terms of that remaining liability have been substantially modified. If the remaining liability has been substantially modified, the modification must be accounted for as an extinguishment of the original liability and the recognition of a new liability in accordance with IFRS 9 (see Chapter 48). [IFRIC 19.10].

7.3 Debt for equity swaps with shareholders

As noted in section 7.1 above, a debt for equity swap is outside the scope of IFRIC 19 when the creditor is a shareholder acting in its capacity as such, or where the entity and the creditor are under common control and the substance of the transaction includes a distribution by, or capital contribution to, the entity.

How we see it

In our view, such transactions may be accounted for either in a manner similar to that required by IFRIC 19 or by recording the equity instruments issued at the carrying amount of the financial liability extinguished so that no profit or loss is recognised.

This latter method was in fact commonly applied to debt for equity swaps before the publication of IFRIC 19.

8 Interest, dividends, gains and losses

Extract from IAS 32

35 Interest, dividends, losses and gains relating to a financial instrument or a component that is a financial liability shall be recognised as income or expense in profit or loss. Distributions to holders of an equity instrument shall be recognised by the entity directly in equity. Transaction costs of an equity transaction shall be accounted for as a deduction from equity.

The basic principle of IAS 32 is that inflows and outflows of cash (and other assets) associated with equity instruments are recognised in equity and the net impact of inflows and outflows of cash (and other assets) associated with financial liabilities is ultimately recognised in profit or loss. Accordingly, IAS 32 requires:

- Interest, dividends, losses and gains relating to a financial instrument or a component that is a financial liability to be recognised as income or expense in profit or loss.
- Distributions to holders of an equity instrument to be debited directly to equity.

And

- The transaction costs of an equity transaction to be accounted for as a deduction from equity. [IAS 32.35]. This applies also to the costs of issuing equity instruments that are issued in connection with the acquisition of a business. [IFRS 3.53].

The treatment of the costs and gains associated with instruments is determined by their classification in the financial statements under IAS 32, and not by their legal form. Thus, dividends paid on shares classified as financial liabilities (see section 4.5 above) will be recognised as an expense in profit or loss, not as an appropriation of equity.

The basic principle summarised above also applies to compound instruments and requires any payments in relation to the equity component to be recorded in equity and any payments in relation to the liability component to be recorded in profit or loss. (As discussed in section 6.6.4.B above, it is not clear whether this basic principle also applies when the full amount of the issuance proceeds of a compound instrument is allocated to the liability). A mandatorily redeemable preference share with dividends paid at the discretion of the entity results in the classification of a liability, equal to the net present value of the redemption amount and an equity classification equal to the excess of the proceeds over the liability component (the net present value of the redemption amount) (see section 4.5.1 above). Because the redemption obligation is classified as a liability, the unwinding of the discount on this component is recorded and classified as an interest expense. Any dividends paid, on the other hand, relate to the equity component and are therefore recorded as a distribution of profit. [IAS 32.AG37].

Gains and losses associated with redemptions or refinancings of financial liabilities are recognised in profit or loss, whereas redemptions or refinancings of equity instruments are recognised as changes in equity. [IAS 32.36]. Similarly, gains and losses related to changes in the carrying amount of a financial liability are recognised as income or expense in profit or loss, even when they relate to an instrument that includes a right to the residual interest in the assets of the entity in exchange for cash or another financial asset (see section 4.6 above). However, IAS 32 notes that IAS 1 requires any gain or loss arising from the remeasurement of such an instrument to be shown separately in the statement of comprehensive income, where it is relevant in explaining the entity's performance. [IAS 32.41].

Changes in the fair value of an instrument that meets the definition of an equity instrument are not recognised in the financial statements. [IAS 32.36].

IAS 32 permits dividends classified as an expense (i.e., because they relate to an instrument, or component of an instrument, that is legally a share but classified as a financial liability under IAS 32) to be presented in the statement of comprehensive income or separate income statement (if presented), either with interest on other liabilities or as a separate item. The standard notes that, in some circumstances, separate disclosure is desirable, because of the differences between interest and dividends with respect to matters such as tax deductibility. Disclosure of interest and dividends is required by IAS 1 (see Chapter 3) and IFRS 7 (see Chapter 50). [IAS 32.40].

8.1 Transaction costs of equity transactions

An entity typically incurs various costs in issuing or acquiring its own equity instruments, such as registration and other regulatory fees, amounts paid to legal, accounting and other professional advisers, printing costs and stamp duties. The transaction costs of an equity transaction are accounted for as a deduction from equity, but only to the extent they are incremental costs directly attributable to the equity transaction that otherwise would have been avoided. The costs of an equity transaction that is abandoned are recognised as an expense. [IAS 32.37].

Although IAS 32 does not provide a definition of directly attributable incremental costs, IFRS 9 does define an incremental cost as “one that would not have been incurred if the entity had not acquired, issued or disposed of the financial instrument”. [IFRS 9 Appendix A]. IFRS 9 also gives as examples of costs which do meet this criterion: fees and commission paid to agents, advisors, brokers and dealers, levies by regulatory agencies and security exchanges, and transfer taxes and duties. [IFRS 9.B5.4.8]. Such costs together with other directly related costs such as underwriting and printing costs are usually considered to be incremental and directly attributable to the issue of equity. Internal administrative or holding costs e.g., costs which would have been incurred in any case if the equity instrument had not been issued, are not considered to be incremental or directly attributable.

IAS 32 requires that only the costs of ‘issuing or acquiring’ equity are recognised in equity. Accordingly, it seems clear that the costs of listing shares already in issue must not be set off against equity but recognised as an expense.

The standard also requires that transaction costs that relate jointly to more than one transaction (for example, costs of a concurrent offering of some shares and a stock exchange listing of other shares) are allocated to those transactions using a basis of allocation that is rational and consistent with similar transactions. [IAS 32.38]. In its agenda decision of September 2008, the IFRS IC declined to provide further guidance on the extent of the transaction costs to be accounted for as a deduction from equity and how to allocate costs that relate jointly to more than one transaction, believing existing guidance to be adequate.

The IFRS IC noted that only incremental costs directly attributable to issuing new equity instruments or acquiring previously issued equity instruments are considered to be related to an equity transaction under IAS 32, but that the terms ‘incremental’ and ‘directly attributable’ are used with similar but not identical meanings in many Standards and Interpretations, leading to diversity in practice. It therefore recommended that the IASB develop common definitions for both terms to be added to the Glossary as part of the annual improvements process.³⁴ However, the IASB did not propose any such amendments in the next exposure draft published in August 2009.

It may well be that, in an initial public offering (‘IPO’), for example, an entity simultaneously lists its existing equity and additional newly issued equity.

How we see it

Where an entity simultaneously lists its existing equity and additional newly issued equity, the total costs of the IPO are, in our view, allocated between the newly issued shares and the existing shares on a rational basis (e.g., by reference to the ratio of the number of new shares to the number of total shares), with only the proportion relating to the issue of new shares being deducted from equity.

However, in certain exceptional instances, facts and circumstances may indicate other possible bases of allocation of such costs. Examples of such different allocations could include:

- an allocation based on the proportion of the number of newly issued shares compared to the total number of shares sold through the offering (i.e., including the shares of existing shareholders who are selling shares as part of the offering). This approach may be appropriate if shareholders are using the listing as an exit strategy and the remaining existing shareholders have not incentivised or encouraged the entity to list for their benefit and there is evidence to support that the remaining shareholders do not intend to sell shares in the foreseeable future.
- an allocation entirely to the new shares sold. This approach may be appropriate if no existing shareholders are selling shares as part of the offering. Further, existing investors have not incentivised or encouraged the entity to list for their own benefit (i.e., the purpose of the listing is only to raise new capital) and there is evidence to support that the existing shareholders do not intend to sell shares in the foreseeable future.

³⁴ [IFRIC Update](#), September 2008, available on the IFRS Foundation’s website.

Transaction costs that relate to the issue of a compound financial instrument are allocated to the liability and equity components of the instrument in proportion to the allocation of proceeds (see Illustration 6-1 in section 6.2 above). [IAS 32.38].

IAS 32 does not specifically address the treatment of transaction costs incurred to acquire a non-controlling interest in a subsidiary, or to dispose of such an interest without loss of control in the consolidated financial statements of the parent entity. IFRS 10 indicates that “changes in a parent’s ownership interest in a subsidiary that do not result in the parent losing control of the subsidiary are equity transactions”. [IFRS 10.23].

How we see it

We believe that the transaction costs to acquire a non-controlling interest in a subsidiary, or to dispose of such an interest without loss of control, must be deducted from equity in accordance with the principles described above.

IAS 32 and IFRS 10 do not specify whether such costs must be allocated to the parent’s equity or to the non-controlling interest, to the extent it is still reflected in the statement of financial position. In our view, this is a matter of choice based on the facts and circumstances surrounding the transaction, and any local legal requirements.

On any subsequent disposal of the subsidiary involving loss of control, the transaction costs previously recognised in equity must not be reclassified from equity to profit or loss, since they represent transactions with owners in their capacity as owners rather than components of other comprehensive income. [IAS 1.106, IAS 1.109]. The amount of transaction costs accounted for as a deduction from equity in the period is required to be disclosed separately under IAS 1 (see Chapter 3) and IFRS 7 (see Chapter 50).

Where a subsidiary issues shares, the transaction costs are accounted for as a deduction from equity, as discussed above. Where the subsidiary issues shares to a non-controlling interest as well as its parent, it gives rise to the question of how the transaction costs must be accounted for in the consolidated financial statements.

How we see it

In our view, transaction costs on the issue of shares by a subsidiary to a non-controlling interest and its parent must be allocated between the non-controlling interest and parent on a rational basis. The portion relating to shares issued to the non-controlling shareholders must be accounted for in the non-controlling interest. The portion relating to the parent entity no longer relates to an equity transaction at the group level and therefore is recognised as an expense in the consolidated financial statements.

8.2 Tax effects of equity transactions

As originally issued, IAS 32 required distributions to shareholders and transaction costs of equity instruments to be shown net of any tax benefit. *Annual Improvements to IFRSs 2009-2011 Cycle* issued in May 2012 amended IAS 32 to remove the reference to income tax benefit from IAS 32. This means that all tax effects of equity transactions are allocated in accordance with the general principles of IAS 12. [IAS 32.35A].

Unfortunately, it is not entirely clear how IAS 12 requires the tax effects of certain equity transactions to be dealt with and judgement will be necessary in determining whether tax benefits in respect of distributions are to be recognised in equity or profit or loss (see Chapter 29).

9 Treasury shares

Extract from IAS 32

- 33** If an entity reacquires its own equity instruments, those instruments ('treasury shares') shall be deducted from equity. No gain or loss shall be recognised in profit or loss on the purchase, sale, issue or cancellation of an entity's own equity instruments. Such treasury shares may be acquired and held by the entity or by other members of the consolidated group. Consideration paid or received shall be recognised directly in equity.

Treasury shares are shares issued by an entity that are held by the entity. [IAS 32.33]. In consolidated financial statements, this will include shares issued by any group entity that are held by that entity or by any other members of the consolidated group. They will also include shares held by an employee benefit trust that is consolidated or treated as an extension of the reporting entity. Treasury shares will generally not include shares in a group entity held by any associates or the entity's pension fund. However, IAS 1 requires disclosure of own shares held by subsidiaries or associates, [IAS 1.79(a)(vi)], and IAS 19 *Employee Benefits* requires disclosure of own shares held by defined benefit plans. [IAS 19.143]. Holdings of treasury shares may arise in a number of ways. For example:

- The entity holds the shares as the result of a direct transaction, such as a market purchase, or a buy-back of shares from shareholders as a whole, or a particular group of shareholders.
- The entity is in the financial services sector with a market-making operation that buys and sells its own shares along with those of other listed entities in the normal course of business, or holds them in order to 'hedge' issued derivatives.
- In consolidated financial statements:
 - The shares were purchased by another entity which subsequently became a subsidiary of the reporting entity, either through acquisition or changes in financial reporting requirements.
 Or
 - The shares have been purchased by an entity that is a consolidated SPE of the reporting entity.

The circumstances in which an entity is permitted to hold treasury shares are a matter for legislation in the jurisdiction concerned.

Treasury shares do not include own shares held by an entity on behalf of others, such as when a financial institution holds its own equity on behalf of a client. In such cases, there is an agency relationship and as a result those holdings are not included in the entity's statement of financial position, either as assets or as a deduction from equity. [IAS 32.AG36].

If an entity reacquires its own equity instruments, IAS 32 requires those instruments to be deducted from equity. They are not recognised as financial assets, regardless of the reason for which they are reacquired. No gain or loss is recognised in profit or loss on the purchase, sale, issue or cancellation of an entity's own equity instruments. Accordingly, any consideration paid or received in connection with treasury shares must be recognised directly in equity. [IAS 32.33, IAS 32.AG36].

IAS 1 requires the amount of treasury shares to be disclosed separately either on the face of the statement of financial position or in the notes (see Chapter 3). In addition, IAS 32 requires an entity to make disclosure in accordance with IAS 24 *Related Party Disclosures* if the entity reacquires its own equity instruments from related parties (see Chapter 35). [IAS 32.34].

As in the case of the requirements for the treatment of the equity component of a compound financial instrument (see section 6 above), IAS 32 does not prescribe precisely what components of equity must be adjusted as the result of a treasury share transaction. This may have been to ensure that there was no conflict between, on the one hand, the basic requirement of IAS 32 that there must be an adjustment to equity and, on the other hand, the legal requirements of various jurisdictions as to exactly how that adjustment must be allocated within equity.

9.1 Transactions in own shares not at fair value

The requirement of IAS 32 that no profits or losses must ever be recognised on transactions in own equity instruments differs from the approach taken in IFRS 2. If an employee share award is characterised as an equity instrument under IFRS 2 (a 'share-settled' award) and settled in cash (or other assets) at more than its fair value, the excess of the consideration over the fair value is recognised as an expense (see Chapter 30).

It is not clear whether or not the IASB specifically considered transactions in own equity other than at fair value in the context of IAS 32, particularly since the relevant provisions of IAS 32 essentially reproduce requirements previously contained in SIC-16 *Share Capital - Reacquired Own Equity Instruments (Treasury Shares)*, which was implicitly addressing market purchases and sales at fair value. In other words, the provision can be seen merely as clarifying that, if an entity buys one of its own shares in the market for CU10 which it later reissues in the market at CU12 or CU7, it has not made, respectively, a profit of CU2 or a loss of CU3.

This is slightly different to the situation where an entity purchases an equity instrument for more than its fair value i.e., if the original purchase had been for CU11 when the market price was CU10. Such a transaction could occur, for example where the entity wishes to rid itself of a troublesome shareholder or group of shareholders. In this case, the entity might have to offer a premium specific to the holder over and above the 'true' fair value of the equity instruments concerned. However, in general, where an entity purchases an equity instrument for more than its fair value, this can be indicative that other consideration has been received by the entity. It must be noted that IFRS 2 is explicit that any excess of the consideration over the fair value of an equity instrument is recognised as an expense. [IFRS 2.28(b)].

A transaction in which the entity issues shares (or reissues treasury shares) for cash or other assets with a fair value lower than the fair value of the shares would *prima facie* fall within the scope of IFRS 2, requiring the shortfall to be accounted for under IFRS 2 (see Chapter 30).

9.2 IFRS 17 treasury share election

An entity applying IFRS 17 *Insurance Contracts* may elect not to deduct a treasury share from equity, when it either:

- Operates an investment fund that provides investors with benefits determined by units in the fund and recognises the amounts to be paid to those investors as financial liabilities.
- Or
- Issues groups of insurance contracts with direct participation features while holding the underlying items.

Where an entity reacquires its own equity to hold in an investment fund or as an underlying item in the above arrangements, it may elect to continue to account for the treasury share as equity with the reacquired instrument being accounted as if it were a financial asset measured through profit or loss in accordance with IFRS 9. The election is irrevocable and made on an instrument-by-instrument basis.

[IAS 32.33A].

10 'Hedging' of instruments classified as equity

A consequence of the requirement, discussed in sections 4.5.2 to 4.5.6 above, to treat discretionary instruments with certain debt-like characteristics as equity is that the issuer will not be able to adopt hedge accounting in respect of any instrument taken out as a hedge of the instrument (e.g., a receive fixed, pay floating interest rate swap taken out to hedge a fixed rate discretionary dividend on non-redeemable shares). This is because neither IFRS 9 nor IAS 39 *Financial Instruments: Recognition and Measurement*, if applicable, recognises a hedge of own equity as a valid hedging relationship (see Chapter 49).

Accordingly, if an issuer of an equity instrument bearing a fixed-rate discretionary coupon or dividend enters into an interest rate swap to hedge its cash outflows, the swap will be accounted for under the normal rules for derivatives not forming part of a hedging relationship i.e., at fair value with all value changes recognised in profit or loss (see Chapter 49 and Chapter 50). Although, economically speaking, any such gains and losses are offset by equal gains and losses (due to interest rate movements) on the shares, the latter, like all movements in the fair value of own equity, are ignored for financial reporting purposes under IFRS accounting standards.

11 Derivatives over own equity instruments

IAS 32 provides several detailed examples of the accounting treatment required, under the provisions of revised IAS 32 and IFRS 9, to be adopted by an entity for derivative contracts over its own equity instruments. Examples are given of each of the main possible permutations, namely:

- A forward purchase (see section 11.1.1 below)
- A forward sale (see section 11.1.2 below)
- 'Back-to-back' forward contracts (see section 11.1.3 below)
- A purchased call option (see section 11.2.1 below)
- A written call option (see section 11.2.2 below)
- A purchased put option (see section 11.3.1 below)
- And
- A written put option (see section 11.3.2 below)

All such contracts can be either:

- (a) Net cash-settled (i.e., the contract provides that the parties will compare the fair value of the shares to be delivered by the seller to the amount of cash payable by the buyer and make a cash payment between themselves for the difference).
- (b) Net share-settled (i.e., the contract provides that the parties will compare the fair value of the shares to be delivered by the seller to the amount of cash payable by the buyer and make a transfer between themselves of as many of the entity's shares as have a fair value equal to the difference).
- (c) Gross settled (i.e., the contract provides that the seller will deliver shares to the buyer in exchange for cash).

Or

- (d) Subject to various settlement options, whereby the manner of settlement is not predetermined, and instead one or other party can choose the manner of settlement (i.e., gross, net cash or net shares).

The examples consider the above settlement options in turn for the main possible permutations of derivatives over own equity instruments.

All derivative contracts over own equity, where settlement is not exclusively by an exchange of a fixed number of shares for a fixed amount of cash, do not meet the definition of equity instruments in IAS 32 and are, in general, treated as derivative financial assets or liabilities (see section 5.2.8 above). IFRS 9, requires such contracts to be accounted for at fair value through profit or loss (see Chapter 45). Exemption to this rule applies to forward purchases and written put options with an option to settle gross (see sections 11.1.1 and 11.3.2 below).

11.1 Forward contracts

11.1.1 Forward purchase

In a forward purchase transaction, the entity and a counterparty agree that on a given future date the counterparty will sell a given number of the entity's shares to the entity. Such a contract is shown in Illustration 11-1 below. [IAS 32.IE2-6].

Illustration 11-1: Forward purchase of shares

The reporting entity (A), which has a functional currency of CU and a year end of 31 December, and another party (B) enter into a forward contract for the purchase of A's shares by A, for which the following are the major assumptions.

Contract date	1 February 20X2
Maturity date	31 January 20X3

Fixed forward price to be paid on 31 January 20X3	CU104
Present value of forward price on 1 February 20X2	CU100
Number of shares under contract	1,000

Market price per share on 1 February 20X2	CU100
Market price per share on 31 December 20X2	CU110
Market price per share on 31 January 20X3	CU106

Fair value of forward to A on 1 February 20X2	CU0
Fair value of forward to A on 31 December 20X2	CU6,300
Fair value of forward to A on 31 January 20X3	CU2,000

For simplicity, it is assumed that no dividends are paid on the underlying shares (i.e., the 'carry return' is zero) so that the present value of the forward price equals the spot price when the fair value of the forward contract is zero. The fair value of the forward has been computed as the difference between the market share price and the present value of the fixed forward price. At settlement date this is CU2,000 representing 1,000 shares at CU2, being the difference between the market price of CU106 and the contract price of CU104.

A Net cash settlement

If the contract is entered into as net cash-settled on 1 February 20X2, settlement on 31 January 20X3 will take the form of receipt or delivery by A of a cash payment for the difference between the fair value of 1,000 of A's own shares, at 31 January 20X3, and CU104,000 (i.e., 1,000 shares at the forward price of CU104 per share). Since IAS 32 classifies such contracts as derivative financial assets or liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

No entry is required because the fair value of the contract is zero at inception and no cash is paid or received

31 December 20X2

Dr	Forward contract (statement of financial position)	CU6,300	
	Cr	Gain on forward (profit or loss)	CU6,300

To record movement in fair value of forward from zero to CU6,300

31 January 20X3

Dr	Loss on forward (profit or loss)	CU4,300	
	Cr	Forward contract (statement of financial position)	CU4,300

To record movement in fair value of forward from CU6,300 to CU2,000

Dr	Cash	CU2,000	
	Cr	Forward contract (statement of financial position)	CU2,000

To record settlement of forward by payment of CU2,000 by B to A

B Net share settlement

If the contract is entered into as net share-settled on 1 February 20X2, settlement on 31 January 20X3 will take the form of receipt or delivery by A of as many of A's shares as have a fair value equal to the difference between the fair value, at 31 January 20X3, of 1,000 of A's own shares and CU104,000 (i.e., 1,000 shares at the forward price of CU104 per share). Because IAS 32 classifies such contracts as derivative financial assets or liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

No entry is required because the fair value of the contract is zero at inception and no cash is paid or received

31 December 20X2

Dr	Forward contract (statement of financial position)	CU6,300	
	Cr	Gain on forward (profit or loss)	CU6,300

To record movement in fair value of forward from zero to CU6,300

31 January 20X3

Dr	Loss on forward (profit or loss)	CU4,300	
	Cr	Forward contract (statement of financial position)	CU4,300

To record movement in fair value of forward from CU6,300 to CU2,000

Dr	Equity	CU2,000	
	Cr	Forward contract (statement of financial position)	CU2,000

To record net settlement of forward by transfer of CU2,000 worth of A's shares (CU2,000/106=18.9 shares) by B to A. This is shown as a deduction from equity in accordance with IAS 32's requirements for treasury shares (see section 9 above).

C Gross settlement

If the contract is entered into as gross-settled on 1 February 20X2, settlement on 31 January 20X3 will take the form of receipt of 1,000 own shares by A in exchange for a payment of CU104,000 to B. IAS 32 classifies this derivative contract as an equity instrument giving rise to a financial liability for the present value of the purchase price amount payable in one year's time (see section 5.3 above). On the assumption that A accounts for this liability under the effective interest method in IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Equity	CU100,000	
	Cr	Liability for forward contract (statement of financial position)	CU100,000

To record net present value of liability on forward contract

31 December 20X2

Dr	Interest expense	CU3,660	
	Cr	Liability for forward contract (statement of financial position)	CU3,660

To accrue interest, under the effective interest rate method, on the liability to settle forward contract

31 January 20X3

Dr	Interest expense	CU340	
	Cr	Liability for forward contract (statement of financial position)	CU340

To accrue further interest, under the effective interest rate method, on the liability to settle forward contract

Dr	Liability for forward contract (statement of financial position)	CU104,000	
	Cr	Cash	CU104,000

To record settlement of the liability in cash

D Settlement options

If there are settlement options (such as net in cash, net in shares or by an exchange of a fixed amount of cash for a fixed number of shares), the forward contract is a financial asset or a financial liability - see section 5.2.7 above. The contract does not meet the definition of an equity instrument, because it can be settled otherwise than by delivery of a fixed amount of cash for a fixed number of equity instruments. If one of the settlement alternatives is gross settlement by an exchange of cash for shares, A recognises a liability for the obligation to deliver cash. Otherwise, A accounts for the forward contract as a derivative.

The implementation guidance to IAS 32 states that A must recognise a liability "if one of the settlement alternatives is to exchange cash for shares". As drafted, this applies whether the choice of settlement rests with A or B. This seems curious since, where A would always have the choice of net settlement, there would be no obligation for A to settle gross. We assume that the example is written on the presumption that the choice of settlement would normally rest with the counterparty rather than the entity or circumstances could arise in which the entity could not prevent gross settlement occurring, e.g., if the shares ceased to be listed before settlement of the contract. Paragraph 23 in the main body of the standard is clear that an equity contract gives rise to a liability for the purchase price of the shares only where there is an obligation for the entity to purchase its own equity.

How we see it

In our view, where the entity could in all circumstances choose to net settle a derivative on own shares, it is acceptable not to record a gross liability, and to account for the contract as a derivative financial asset or derivative financial liability.

If the only situation in which the entity could be forced to settle gross rather than net is where the obligation is not specified in the contract but in statute or regulation, it will also be necessary to assess whether this obligation is required to be considered (see sections 4.2 and 4.6.6 above).

11.1.2 Forward sale

In a forward sale transaction, the entity and a counterparty agree that on a given future date the entity will sell (or issue) a given number of the entity's shares to the counterparty. Such a contract is shown in Illustration 11-2 below. [IAS 32.IE7-11].

Illustration 11-2: Forward sale of shares

The reporting entity (A), which has a functional currency of CU and a year end of 31 December, and another party (B) enter into a forward contract for the purchase of A's shares by B, for which the following are the major assumptions.

Contract date	1 February 20X2
Maturity date	31 January 20X3
Fixed forward price to be paid on 31 January 20X3	CU104
Present value of forward price on 1 February 20X2	CU100
Number of shares under contract	1,000
Market price per share on 1 February 20X2	CU100
Market price per share on 31 December 20X2	CU110
Market price per share on 31 January 20X3	CU106
Fair value of forward to A on 1 February 20X2	CU0
Fair value of forward to A on 31 December 20X2	CU(6,300)
Fair value of forward to A on 31 January 20X3	CU(2,000)

For simplicity, it is assumed that no dividends are paid on the underlying shares (i.e., the 'carry return' is zero) so that the present value of the forward price equals the spot price when the fair value of the forward contract is zero. The fair value of the forward has been computed as the difference between the market share price and the present value of the fixed forward price. At settlement date this is negative CU2,000 representing 1,000 shares at CU2, being the difference between the market price of CU106 and the contract price of CU104.

A Net cash settlement

If the contract is entered into as net cash-settled on 1 February 20X2, settlement on 31 January 20X3 will take the form of receipt or delivery by A of a cash payment for the difference between the fair value of 1,000 of A's own shares, at 31 January 20X3, and CU104,000 (i.e., 1,000 shares at the forward price of CU104 per share). Since IAS 32 classifies such contracts as derivative financial assets or liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

No entry is required because the fair value of the contract is zero at inception and no cash is paid or received.

31 December 20X2

Dr	Loss on forward (profit or loss)	CU6,300	
	Cr	Forward contract (statement of financial position)	CU6,300

To record movement in fair value of forward from zero to CU(6,300)

31 January 20X3

Dr	Forward contract (statement of financial position)	CU4,300	
	Cr	Gain on forward (profit or loss)	CU4,300

To record movement in fair value of forward from CU(6,300) to CU(2,000)

Dr	Forward contract (statement of financial position)	CU2,000	
	Cr	Cash	CU2,000

To record net settlement of forward by payment of CU2,000 cash by A to B

B Net share settlement

If the contract is entered into as net share-settled on 1 February 20X2, settlement on 31 January 20X3 will take the form of receipt or delivery by A of a payment of as many of A's shares as have a fair value equal to the difference between the fair value, at 31 January 20X3, of 1,000 of A's own shares and CU104,000 (i.e., 1,000 shares at the forward price of CU104 per share). As IAS 32 classifies such contracts as derivative financial assets or liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

No entry is required because the fair value of the contract is zero at inception

31 December 20X2

Dr	Loss on forward (profit or loss)	CU6,300	
	Cr	Forward contract (statement of financial position)	CU6,300

To record movement in fair value of forward from zero to CU(6,300)

31 January 20X3

Dr	Forward contract (statement of financial position)	CU4,300	
	Cr	Gain on forward (profit or loss)	CU4,300

To record movement in fair value of forward from CU(6,300) to CU(2,000)

Dr	Forward contract (statement of financial position)	CU2,000	
	Cr	Equity	CU2,000

To record net settlement of forward by delivery of CU2,000 worth of A's shares to B (CU2,000/106=18.9 shares)

C Gross settlement

If the contract is entered into as gross-settled on 1 February 20X2, settlement on 31 January 20X3 will take the form of delivery of 1,000 own shares by A to B in exchange for a payment of CU104,000. IAS 32 classifies this derivative contract as an equity instrument (see section 5.4 above) and therefore no entries are recorded other than on settlement on the contract. While a forward sale is economically a 'mirror' of a forward purchase and both are classified as equity instruments, the accounting impact is different. A forward sale does not result in any accounting entries until the shares are finally issued/delivered, while a forward purchase establishes an obligation to pay the settlement amount and therefore meets the definition of a financial liability which needs to be recorded upon entering the contract (see part C of Illustration 11-1 above in section 11.1.1).

31 January 20X3

Dr	Cash	CU104,000	
	Cr	Equity	CU104,000

To record settlement of forward contract through delivery of 1,000 shares for the payment of CU104,000

D Settlement options

If there are settlement options (such as net in cash, net in shares or by an exchange of cash and shares), the forward contract is a financial asset or a financial liability - see section 5.2.8 above. A accounts for the forward contract as a derivative (as in A and B above), with the accounting entry made on settlement determined by the manner of settlement (i.e., equity or cash).

11.1.3 'Back-to-back' forward contracts

The accounting treatment in sections 11.1.1 and 11.1.2 above produces rather strange results when applied to 'back-to-back' forward contracts, such as might be entered into by a financial institution with two different clients. Illustration 11-3 below illustrates the point.

Illustration 11-3: 'Back-to-back' forward contracts

Suppose that a bank entered into the forward purchase contract in Illustration 11-1 in section 11.1.1 above with a client and laid off its risk by entering into the reciprocal forward sale contract in Illustration 11-2 in section 11.1.2 above with a second client. If both contracts are required to be settled gross, the overall effect of the accounting entries required to be made by the bank (assuming that the bank was the reporting entity) in Illustration 11-1 and Illustration 11-2 above can be summarised as set out below. Note that these are not the actual entries that would be made, but the arithmetical sum of all the entries:

	CU	CU
Profit or loss (interest expense on liability for purchase contract)	4,000	
Equity (CU104,000 on sale less CU100,000 on purchase)		4,000

If the purchase contract is required to be settled gross, but the sale contract net in cash, the required accounting entries (again, not the actual entries, but the arithmetical sum of all the entries) can be summarised as:

	CU	CU
Profit or loss (loss on sale contract CU2,000 plus interest on liability for purchase contract CU4,000)	6,000	
Equity (purchase contract)	100,000	
Cash (CU104,000 on purchase, CU2,000 on sale)		106,000

If the purchase contract is required to be settled net in cash, but the sale contract gross, the required accounting entries (again, not the actual entries, but the arithmetical sum of all the entries) can be summarised as:

	CU	CU
Cash (CU104,000 in on sale, CU2,000 in on purchase)	106,000	
Profit or loss (gain on purchase contract)		2,000
Equity (sale contract)		104,000

If both contracts are net settled, no net gain or loss arises.

Some might argue that this exposes a flaw in the requirements of IAS 32. Self-evidently, these contracts are matched and therefore, if both run to term, will give rise to no economic profit or loss, irrespective of how they are settled. However, IAS 32 requires three different results to be shown depending on whether both contracts are settled gross, or one gross and the other net. This is less understandable in the case where both contracts are settled gross. However, in cases where one contract is settled net and that contract gives rise to an initial receipt or payment of cash, then some difference is bound to occur due to interest effects.

11.2 Call options

11.2.1 Purchased call option

In a purchased call option, the entity pays a counterparty for the right, but not the obligation, to purchase a given number of its own equity instruments from the counterparty for a fixed price at a future date. The accounting for such a contract is shown in Illustration 11-4 below. [IAS 32.IE12-16].

Illustration 11-4: Purchased call option on own shares

The reporting entity (A), which has a functional currency of CU and a year end of 31 December, purchases a call option over its own shares from another party (B), for which the following are the major assumptions.

Contract date	1 February 20X2
Exercise date (European terms - i.e., can be exercised only on maturity)	31 January 20X3
Fixed exercise price to be paid on 31 January 20X3	CU102
Number of shares under contract	1,000
Market price per share on 1 February 20X2	CU100
Market price per share on 31 December 20X2	CU104
Market price per share on 31 January 20X3	CU104
Fair value of option to A on 1 February 20X2	CU5,000
Fair value of option to A on 31 December 20X2	CU3,000
Fair value of option to A on 31 January 20X3	CU2,000

The fair value of the option would be computed using an option pricing model and would be a function of a number of factors, principally the market value of the shares, the exercise price, and the time value of money.

A Net cash settlement

If the contract is entered into as net cash-settled on 1 February 20X2, then A can, on the exercise date 31 January 20X3, require B to make a cash payment to A for the excess, if any, of the fair value of 1,000 of A's own shares, as of 31 January 20X3, over CU102,000 (i.e., 1,000 shares at the option price of CU102 per share). Since IAS 32 classifies such contracts as derivative financial assets (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Call option asset	CU5,000	
	Cr	Cash	CU5,000

Payment of option premium (equal to fair value of option) to B

31 December 20X2

Dr	Loss on option (profit or loss)	CU2,000	
	Cr	Call option asset	CU2,000

To record movement in fair value of option from CU5,000 to CU3,000

31 January 20X3

Dr	Loss on option (profit or loss)	CU1,000	
	Cr	Call option asset	CU1,000

To record movement in fair value of option from CU3,000 to CU2,000

Dr	Cash	CU2,000	
	Cr	Call option asset	CU2,000

To record net settlement of option by payment of CU2,000 cash by B to A

B Net share settlement

If the contract is entered into as net share-settled on 1 February 20X2, then A can, on the exercise date 31 January 20X3, require B to deliver to A as many of A's own shares as have a fair value equal to any excess of 1,000 of A's own shares fair value, as of 31 January 20X3 over CU102,000 (i.e., 1,000 shares at the option price of CU102 per share). Since IAS 32 classifies such contracts as derivative financial assets (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Call option asset	CU5,000	
	Cr Cash		CU5,000

Payment of option premium (equal to fair value of option) to B

31 December 20X2

Dr	Loss on option (profit or loss)	CU2,000	
	Cr Call option asset		CU2,000

To record movement in fair value of option from CU5,000 to CU3,000

31 January 20X3

Dr	Loss on option (profit or loss)	CU1,000	
	Cr Call option asset		CU1,000

To record movement in fair value of option CU3,000 to CU2,000

Dr	Equity	CU2,000	
	Cr Call option asset		CU2,000

*To record net settlement of option by transfer of CU2,000 worth of A's shares by B to A.
This is shown as a deduction from equity in accordance with IAS 32's requirements for treasury shares (see section 9 above).*

C Gross settlement

If the contract is entered into as gross-settled, on 1 February 20X2, then A can, on the exercise date 31 January 20X3, require B to deliver 1,000 of A's shares in return for a payment by A of CU102,000. IAS 32 classifies such a derivative contract as an equity instrument (see section 5.4 above); therefore no entries are recorded, other than to record the cash flows arising under the contract:

1 February 20X2

Dr	Equity	CU5,000	
	Cr Cash		CU5,000

Payment of option premium (equal to fair value of option) to B

31 January 20X3

Dr	Equity	CU102,000	
	Cr Cash		CU102,000

To record gross settlement of option by payment of CU102,000 cash to B in exchange for 1,000 own shares. This is shown as a deduction from equity in accordance with IAS 32's requirements for treasury shares (see section 9 above).

If the option had lapsed unexercised, because the market price of A's shares had fallen below CU102 as at 31 January 20X3, the CU5,000 premium would remain in equity, even though it is, from an economic perspective, clearly a loss rather than an amount paid to repurchase A's own shares. This is because IFRS accounting standards regards any holder of an instrument classified as equity under IAS 32 as an 'owner'. In contrast to the treatment of a gross-settled forward purchase (see section 11.1.1 above) and a gross-settled written put option (see section 11.3.2 below), which also require a gross outflow of cash on settlement, there is no requirement to record a liability at the outset of the contract on which interest is accrued during the period of the contract. This is because:

- In a gross-settled forward purchase or written put option, the entity can be required to make a payment of cash.
But
- In a purchased call option, there is no liability since the entity has no obligation to exercise its right to call for the shares even if the option is 'in the money' and it is in the entity's interest to do so.

D Settlement options

If there are different settlement options (such as net in cash, net in shares or by an exchange of cash and shares), the option is a financial asset. A accounts for the forward contract as a derivative (as in A and B above), with the accounting entry made on settlement determined by the manner of settlement (i.e., equity or cash).

11.2.2 Written call option

In a written call option, the entity receives a payment from a counterparty for granting to the counterparty the right, but not the obligation, to purchase a given number of the entity's own equity instruments from the entity for a fixed price at a future date. The accounting for such a contract is shown in Illustration 11-5 below. [IAS 32.1E17-21].

Illustration 11-5: Written call option on own shares

The reporting entity (A), which has a functional currency of CU and a year end of 31 December, writes a call option over its own shares with another party (B), for which the following are the major assumptions.

Contract date	1 February 20X2
Exercise date (European terms - i.e., can be exercised only on maturity)	31 January 20X3
Fixed exercise price to be paid on 31 January 20X3	CU102
Number of shares under contract	1,000
Market price per share on 1 February 20X2	CU100
Market price per share on 31 December 20X2	CU104
Market price per share on 31 January 20X3	CU104
Fair value of option to A on 1 February 20X2	CU(5,000)
Fair value of option to A on 31 December 20X2	CU(3,000)
Fair value of option to A on 31 January 20X3	CU(2,000)

The fair value of the option would be computed using an option pricing model and would be a function of a number of factors, principally the market value of the shares, the exercise price, and the time value of money.

A Net cash settlement

If the contract is entered into as net cash-settled on 1 February 20X2, then B can, on the exercise date 31 January 20X3, require A to make a cash payment to B for the excess, if any, of the fair value of 1,000 of A's own shares, as of 31 January 20X3, over CU102,000 (i.e., 1,000 shares at the option price of CU102 per share). Since IAS 32 classifies such contracts as derivative financial liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Cash	CU5,000	
	Cr	Call option liability	CU5,000

Receipt of option premium (equal to fair value of option) from B

31 December 20X2

Dr	Call option liability	CU2,000	
	Cr	Gain on option (profit or loss)	CU2,000

To record movement in fair value of option from CU(5,000) to CU(3,000)

31 January 20X3

Dr	Call option liability	CU1,000	
	Cr	Gain on option (profit or loss)	CU1,000

To record movement in fair value of option from CU(3,000) to CU(2,000)

Dr	Call option liability	CU2,000	
	Cr	Cash	CU2,000

To record net settlement of option by payment of CU2,000 cash to B

B Net share settlement

If the contract is entered into as net share-settled on 1 February 20X2, then B can, on the exercise date 31 January 20X3, require A to deliver to B as many of A's own shares as have a fair value equal to any excess of 1,000 of A's own shares, as of 31 January 20X3, over CU102,000 (i.e., 1000 shares at the option price of CU102 per share). Since IAS 32 classifies such contracts as derivative financial liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Cash	CU5,000	
	Cr	Call option liability	CU5,000

Receipt of option premium (equal to fair value of option) from B

31 December 20X2

Dr	Call option liability	CU2,000	
	Cr	Gain on option (profit or loss)	CU2,000

To record movement in fair value of option from CU(5,000) to CU(3,000)

31 January 20X3

Dr	Call option liability	CU1,000	
	Cr	Gain on option (profit or loss)	CU1,000

To record movement in fair value of option from CU(3,000) to CU(2,000)

Dr	Call option liability	CU2,000	
	Cr	Equity	CU2,000

To record net settlement of option by issue of CU2,000 worth of A's shares to B

C Gross settlement

If the contract is entered into as gross-settled, on 1 February 20X2, then B can, on the exercise date 31 January 20X3, require A to deliver 1,000 of A's shares in return for a payment by B of CU102,000. IAS 32 classifies this derivative contract as an equity instrument (see section 5.4 above); therefore no entries are recorded, other than to record the cash flows arising under the contract:

1 February 20X2

Dr	Cash	CU5,000	
	Cr	Equity	CU5,000

Receipt of option premium (equal to fair value of option) to B

31 January 20X3

Dr	Cash	CU102,000	
	Cr	Equity	CU102,000

To record gross settlement of option by receipt of CU102,000 cash from B in exchange for 1,000 of A's own shares.

If the option had lapsed unexercised, because the market price of A's shares had fallen below CU102 as at 31 January 20X2, the CU5,000 premium would remain in equity, even though it is, from an economic perspective, clearly a gain rather than an amount received from an owner. This is because IFRS accounting standards regards any holder of an instrument classified as equity under IAS 32 as an 'owner'.

D Settlement options

If there are different settlement options (such as net in cash, net in shares or by an exchange of cash and shares), the option is a financial liability. A accounts for the forward contract as a derivative (as in A and B above), with the accounting entry made on settlement determined by the manner of settlement (i.e., equity or cash).

11.3 Put options

11.3.1 Purchased put option

In a purchased put option, the entity makes a payment to a counterparty for the right, but not the obligation, to require the counterparty to purchase a given number of the entity's own equity instruments from the entity for a fixed price at a future date. The accounting for such a contract is shown in Illustration 11-6 below. [IAS 32.IE22-26].

Illustration 11-6: Purchased put option on own shares

The reporting entity (A), which has a functional currency of CU and a year end of 31 December, purchases a put option over its own shares from another party (B), for which the following are the major assumptions.

Contract date	1 February 20X2
Exercise date (European terms - i.e., can be exercised only on maturity)	31 January 20X3
Fixed exercise price to be paid on 31 January 20X3	CU98
Number of shares under contract	1,000
Market price per share on 1 February 20X2	CU100
Market price per share on 31 December 20X2	CU95
Market price per share on 31 January 20X3	CU95
Fair value of option to A on 1 February 20X2	CU5,000
Fair value of option to A on 31 December 20X2	CU4,000
Fair value of option to A on 31 January 20X3	CU3,000

The fair value of the option would be computed using an option pricing model and would be a function of number of factors, principally the market value of the shares, the exercise price, and the time value of money.

A Net cash settlement

If the contract is entered into as net cash-settled on 1 February 20X2, then A can, on the exercise date 31 January 20X3, require B to make a cash payment to A for the excess, if any, of CU98,000 (i.e., 1,000 shares at the option price of CU98 per share) over the fair value of 1,000 of A's own shares, as of 31 January 20X3. Because IAS 32 classifies such contracts as derivative financial assets or financial liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Put option asset	CU5,000	
	Cr	Cash	CU5,000

Payment of option premium (equal to fair value of option) to B

31 December 20X2

Dr	Loss on option (profit or loss)	CU1,000	
	Cr	Put option asset	CU1,000

To record movement in fair value of option from CU5,000 to CU4,000

31 January 20X3

Dr	Loss on option (profit or loss)	CU1,000	
	Cr	Put option asset	CU1,000

To record movement in fair value of option from CU4,000 to CU3,000

Dr	Cash	CU3,000	
	Cr	Put option asset	CU3,000

To record net settlement of option by receipt of CU3,000 cash from B

B Net share settlement

If the contract is entered into as net share-settled on 1 February 20X2, then A can, on the exercise date 31 January 20X3, require B to deliver to A as many of A's own shares as have a fair value equal to any excess of CU98,000 (i.e., 1,000 shares at the option price of CU98 per share) over the fair value of 1,000 of A's own shares, as of 31 January 20X3. Because IAS 32 classifies such contracts as derivative financial assets (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Put option asset	CU5,000	
	Cr Cash		CU5,000

Payment of option premium (equal to fair value of option) to B

31 December 20X2

Dr	Loss on option (profit or loss)	CU1,000	
	Cr Put option asset		CU1,000

To record movement in fair value of option from CU5,000 to CU4,000

31 January 20X3

Dr	Loss on option (profit or loss)	CU1,000	
	Cr Put option asset		CU1,000

To record movement in fair value of option from CU4,000 to CU3,000

Dr	Equity	CU3,000	
	Cr Put option asset		CU3,000

To record net settlement of option by receipt of CU3,000 worth of A's shares from B. This is shown as a deduction from equity in accordance with IAS 32's requirements for treasury shares (see section 9 above).

C Gross settlement

If the contract is entered into as gross-settled, on 1 February 20X2, then A can, on the exercise date 31 January 20X3, require B to take delivery 1,000 of A's shares in return for a payment by B of CU98,000. IAS 32 classifies this derivative contract as an equity instrument (see section 5.4 above); therefore no entries are recorded, other than to record the cash flows arising under the contract:

1 February 20X2

Dr	Equity	CU5,000	
	Cr Cash		CU5,000

Payment of option premium (equal to fair value of option) to B

31 January 20X3

Dr	Cash	CU98,000	
	Cr Equity		CU98,000

To record gross settlement of option by delivery of 1,000 own shares to B in exchange for CU98,000.

If the option had lapsed unexercised, because the market price of A's shares had risen above CU98 as at 31 January 20X3, the CU5,000 premium would remain in equity, even though it is, from an economic perspective, clearly a loss rather than an amount paid to repurchase A's own shares. This is because IFRS accounting standards regards any holder of an instrument classified as equity under IAS 32 as an 'owner'.

D Settlement options

If there are different settlement options (such as net in cash, net in shares or by an exchange of cash and shares), the option is a financial asset. A accounts for the forward contract as a derivative (as in A and B above), with the accounting entry made on settlement determined by the manner of settlement (i.e., equity or cash).

11.3.2 Written put option

In a written put option, the entity receives a payment from a counterparty for granting to the counterparty the right, but not the obligation, to sell a given number of the entity's own equity instruments to the entity for a fixed price at a future date. The accounting for such a contract is shown in Illustration 11-7 below. [IAS 32.IE27-31].

Illustration 11-7: Written put option on own shares

The reporting entity (A), which has a functional currency of CU and a year end of 31 December, writes a put option over its own shares with another party (B), for which the following are the major assumptions.

Contract date	1 February 20X2
Exercise date (European terms - i.e., can be exercised only on maturity)	31 January 20X3
Fixed exercise price to be paid on 31 January 20X3	CU98
Number of shares under contract	1,000
Market price per share on 1 February 20X2	CU100
Market price per share on 31 December 20X2	CU95
Market price per share on 31 January 20X3	CU95
Fair value of option to A on 1 February 20X2	CU(5,000)
Fair value of option to A on 31 December 20X2	CU(4,000)
Fair value of option to A on 31 January 20X3	CU(3,000)

The fair value of the option would be computed using an option pricing model and would be a function of a number of factors, principally the market value of the shares, the exercise price, and the time value of money.

A Net cash settlement

If the contract is entered into as net cash-settled on 1 February 20X2, then B can, on the exercise date 31 January 20X3, require A to make a cash payment to B for the excess, if any, of CU98,000 (i.e., 1,000 shares at the option price of CU98 per share) over the fair value of 1,000 of A's own shares, as of 31 January 20X3. Because IAS 32 classifies such contracts as derivative financial liabilities (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Cash	CU5,000	
	Cr	Put option liability	CU5,000

Receipt of option premium (equal to fair value of option) from B

31 December 20X2

Dr	Put option liability	CU1,000	
	Cr	Gain on option (profit or loss)	CU1,000

To record movement in fair value of option from CU(5,000) to CU(4,000)

31 January 20X3

Dr	Put option liability	CU1,000	
	Cr	Gain on option (profit or loss)	CU1,000

To record movement in fair value of option from CU(4,000) to CU(3,000)

Dr	Put option liability	CU3,000	
	Cr	Cash	CU3,000

To record net settlement of option by payment of CU3,000 cash to B

B Net share settlement

If the contract is entered into as net share-settled on 1 February 20X2, then B can, on the exercise date 31 January 20X3, require A to deliver to B as many of A's own shares as have a fair value equal to any excess of CU98,000 (i.e., 1,000 shares at the option price of CU98 per share) over the fair value of 1,000 of A's own shares, as of 31 January 20X3. Because IAS 32 classifies such contracts as derivative financial assets (see sections 11 and 5.2.7 above), which are carried at fair value through profit or loss under IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Cash	CU5,000	
	Cr	Put option liability	CU5,000

Receipt of option premium (equal to fair value of option) from B

31 December 20X2

Dr	Put option liability	CU1,000	
	Cr	Gain on option (profit or loss)	CU1,000

To record movement in fair value of option from CU(5,000) to CU(4,000)

31 January 20X3

Dr	Put option liability	CU1,000	
	Cr	Gain on option (profit or loss)	CU1,000

To record movement in fair value of option from CU(4,000) to CU(3,000)

Dr	Put option liability	CU3,000	
	Cr	Equity	CU3,000

To record net settlement of option by issue of CU3,000 worth of own shares to B

C Gross settlement

If the contract is entered into as gross-settled on 1 February 20X2, then B can, on the exercise date 31 January 20X3, require A to take delivery of 1,000 of A's own shares in return for a payment by A of CU98,000. IAS 32 classifies this derivative contract as an equity instrument giving rise to a financial liability for the present value of the purchase price amount payable in one year's time (see section 5.3 above). On the assumption that A accounts for this liability under the effective interest method in IFRS 9, A records the following accounting entries:

1 February 20X2

Dr	Cash	CU5,000	
	Cr	Equity	CU5,000

Receipt of option premium (equal to fair value of option) from B

Dr	Equity	CU95,000	
	Cr	Liability (net present value of CU98,000 potentially payable under option)	CU95,000

Recording of potential liability to settle option

31 December 20X2

Dr	Interest (profit or loss)	CU2,750	
	Cr	Liability	CU2,750

To accrue interest, under the effective interest rate method, on the liability

31 January 20X3

Dr	Interest expense (profit or loss)	CU250	
	Cr	Liability	CU250

To accrue further interest, under the effective interest rate method, on the liability

Dr	Liability	CU98,000	
	Cr	Cash	CU98,000

To record gross settlement of option by delivery of by B of 1,000 shares in A in exchange for CU98,000

If the option had lapsed unexercised, because the market price of A's shares had risen above CU98 as at 31 January 20X3, the premium of CU5,000 would remain in equity and the liability of CU98,000 would be reclassified to equity. The economic consequence is clearly that A has made a profit of CU5,000 - the premium that it received from B, for which it has ultimately had to give nothing in return. However, the overall effect of the treatment that would be required by IAS 32 can be summarised as follows:

	CU	CU
Cash	5,000	
Profit or loss (interest on potential liability to pay cash)	3,000	
Equity (CU98,000 carrying amount of liability transferred at date of lapse less CU90,000 debited on 1 February 20X0)		8,000

To record a loss on a transaction that makes a profit might seem a distortion of economic reality; but in this case is a consequence of applying the *Conceptual Framework*.

D Settlement options

If there are different settlement options (such as net in cash, net in shares or by an exchange of cash and shares), the option is a financial liability. A accounts for the forward contract as a derivative (as in A and B above), with the accounting entry made on settlement determined by the manner of settlement (i.e., equity or cash). If one of the settlement alternatives is to exchange cash for shares, A recognises a liability for the obligation to deliver cash (as in C above). Otherwise, Entity A accounts for the put option as a derivative liability.

The implementation guidance to IAS 32 states that A must recognise a liability "if one of the settlement alternatives is to exchange cash for shares". [IAS 32.IE31]. As drafted, this applies whether the choice of settlement rests with A or B. This seems curious since, where A has the choice of settlement, there would be no obligation for A to settle gross. We assume that the example is written on the presumption that the choice of settlement of an option would normally rest with the buyer rather than the writer of the option. IAS 32.23 is clear that an equity contract gives rise to a liability for the purchase price of the shares only where there is an obligation for the entity to purchase its own equity (see section 5.3 above).

How we see it

In our view, where the choice of settlement of a derivative on own shares is at the sole discretion of the entity, it is acceptable not to record a gross liability, and to account for the contract as a derivative financial liability.

12 Future developments

A number of commentators have questioned whether the current criteria used to distinguish equity from financial liabilities, both under IFRS accounting standards and US GAAP, are entirely satisfactory. In an agenda paper for the IASB board meeting in January 2007, the IASB staff highlighted the following broad categories of implementation issues arising from IAS 32:

- *Issues arising from specific rules in the standard*

The specific provisions in IAS 32 were written with particular types of capital instrument in mind. Where these rules are applied to instruments that differ from those for which they were written, the result may be the classification of an item as debt or equity that does not faithfully represent the underlying instrument.

- *Counter-intuitive results*

The classification of an instrument under IAS 32 can produce results that conflict with the general perception of how the instrument would be faithfully represented. An example is the treatment of certain puttable instruments, which was the subject of the amendment to IAS 32 in February 2008 discussed in sections 4.6.2 and 4.6.3 above.

- *Conflicts with the conceptual framework*

Some provisions of IAS 32 conflict with the IASB's own conceptual framework. For example, IAS 32 requires some contracts over the entity's own equity, which are to be executed at a future date, to be accounted for as if they had been executed on inception of the contract. This contrasts with the required treatment under IFRS accounting standards of nearly all other executory contracts, such as purchase orders and contracts of employment, for which no liability is recorded, except to the extent that the contract is onerous.

The IASB staff noted that the first of these issues could potentially be resolved by a more principles-based revision to the drafting of IAS 32, whilst the other two issues raised more fundamental questions about the whole approach of the standard.³⁵

The Memorandum of Understanding published by the IASB and the FASB in February 2006 set as one of its goals for 2008 "to have issued one or more due process documents relating to a proposed standard" on the distinction between liabilities and equity. The IASB fulfilled that commitment by publishing a discussion paper in February 2008. Following receipt of comments on the discussion paper, the IASB and the FASB ('the Boards') began further deliberations and proposed an exposure draft. In May 2010, this was distributed to a small group of external reviewers, who raised significant challenges. The reviewers felt that the proposed approach lacked clear principles and could produce inconsistent results when applied to broadly similar instruments.

12.1 Financial instruments with characteristics of equity project (FICE)

At a joint meeting in October 2010, the Boards suspended the project, acknowledging that they did not have the time necessary to deliberate the key issues. In October 2014, the IASB decided to resume the FICE project, to investigate potential improvements to:

- The classification of liabilities and equity in IAS 32, including investigating potential amendments to the definitions of liabilities and equity in the Conceptual Framework.
- And
- The presentation and disclosure requirements for financial instruments with characteristics of equity, irrespective of whether they are classified as liabilities or equity.

A key issue is that certain financial instruments, which have a wide range of differing characteristics, often cannot be easily classified as debt or equity as they can have features of both. The IASB looked at addressing this issue by modifying the approach in IAS 32 by:

- Clarifying what set of features is most useful in distinguishing between financial liabilities and equity.
- Using presentation to reflect similarities and differences not apparent from the liability and equity classification.
- And
- Using disclosures to bring out other similarities and differences.

³⁵ [Information for observers](#): Board meeting: January 2007, London, Project: Liability and Equity, Subject: Overview of IAS 32 (Agenda paper 12B), para. 48. Available on the IFRS Foundation's website.

The FICE DP was published in June 2018.³⁶ In it, the IASB put forward a preferred approach which would classify a financial instrument as a financial liability if it contained:

- An unavoidable contractual obligation to transfer cash or another financial asset at a specified time other than at liquidation.
- And/or
- An unavoidable contractual obligation for an amount independent of the entity's available economic resources.

Because the FICE DP proposed to classify more instruments as liabilities, it suggested that the revaluation of such liabilities must be recorded in other comprehensive income if they did not contain an unavoidable contractual obligation for an amount independent of the entity's available economic resources. This would include, for instance, shares puttable at fair value.

The FICE DP also proposed that total comprehensive income must be attributed between the different classes of equity.

After considering comments on the DP, the IASB decided in 2020 not to go ahead with the ideas proposed in the DP but to concentrate on addressing certain known practice issues by clarifying some of the underlying principles in IAS 32 and improving the information provided in the financial statements about the financial instruments issued by the entity. In particular, they identified the following areas:

- The classification of financial instruments that will or may be settled in the issuer's own equity instruments, e.g., the application of the fixed-for-fixed condition to particular derivatives on own equity and the classification of mandatorily convertible financial instruments (see sections 5.1, 5.2 and 6.6.4 above).
- Classification of particular financial instruments that contain obligations that arise only on liquidation of the entity, e.g., perpetual financial instruments (see section 4.7 above).
- Accounting for financial instruments that contain contingent settlement provisions, e.g., financial instruments with a non-viability clause (see section 6.6.4.B above).
- The effect of laws or regulations on the classification of financial instruments.
- The reclassification between financial liability and equity instruments, e.g., when circumstances change, or contractual terms are modified (see section 4.9 above).
- Accounting for obligations to redeem own equity instruments, e.g., accounting for put options over non-controlling interests (see section 5.3.2.A above and Chapter 10).

Following completion of the Board's discussions on the topics listed above, in November 2023 the IASB published *Exposure Draft (IASB/ED/2023/5) Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1*, with a 120 day comment period which closed in March 2024.³⁷ At its meeting in July 2024, the IASB discussed an overview of feedback received on the Exposure Draft (ED)³⁸ with a view to agreeing next steps including a preliminary project timeline.³⁹ The IASB commenced further discussions on each of the topics in Q4 2024 and expects to complete its discussions and publish the final amendments to IAS 32, IFRS 7 and IFRS 18 during 2026.

12.2 Fixed-for-fixed

On the classification of financial instruments that will or may be settled in the issuer's own equity instruments, the Board's tentative decisions are reflected in the FICE ED, published in November 2023.⁴⁰

36 Discussion Paper [DP/2018/1: Financial Instruments with Characteristics of Equity](#), IASB, June 2018. Available on the IFRS Foundation's website.

37 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), along with the [Basis for Conclusions](#) and [Illustrative Examples and Implementation Guidance](#), November 2023, available on the IFRS Foundation's website.

38 [Financial Instruments with Characteristics of Equity, Summary of feedback - users of financial statements](#), July 2024, available on the IFRS Foundation's website.

39 [Financial Instruments with Characteristics of Equity, Project plan](#), July 2024, available on the IFRS Foundation's website.

40 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), paragraphs 16, 22, 22B to 22D, AG27A and AG29B, November 2023, available on the IFRS Foundation's website.

The proposals include that for a derivative on own equity to meet the fixed-for-fixed condition in IAS 32, the amount of consideration to be exchanged for each of an entity's own equity instruments is required to be denominated in the entity's functional currency and must be fixed or vary only due to an adjustment which varies solely because of:

- Preservation adjustments that require the entity to preserve the relative economic interest of future shareholders to an equal or lesser extent than those of existing shareholders.

Or

- Passage-of-time adjustments that are pre-determined and vary only with the passage of time and have the effect of fixing on initial recognition the present value of the amount of consideration exchanged for each of the entity's own equity instruments.

The ED proposes to classify as equity, a contract that can be settled by exchanging a fixed number of one class of an entity's own non-derivative equity instruments with a fixed number of another class of its own non-derivative equity instruments.

The ED also proposes that in classifying a derivative that gives one party a choice of settlement between two or more classes of an entity's own equity instruments the entity would consider whether the fixed-for-fixed condition is met for each class of its own equity instruments that may be delivered.

In response to feedback to the ED, the IASB will redeliberate the proposals to the classification of financial instruments that will or may be settled in the issuer's own equity instruments, before the amendments are finalised in 2026.

12.3 Disclosures for financial instruments that contain obligations that arise only on liquidation of the entity

The FICE ED includes proposed amendments to IFRS 7 to require an entity to disclose information on the nature and priority of claims against the entity on liquidation arising from financial liabilities and equity instruments.

The ED proposes that an entity disclose the carrying amount of each class of claims arising from these financial instruments and the line item in the statement of financial position where the claim is included. An entity must group the claims into classes based on their contractual nature and priority on liquidation, with specific requirements for the separate and consolidated financial statements.⁴¹

The objective is not to provide information about the priority of individual financial instruments on liquidation, but rather a categorisation of the capital structure to show differences in the quality of capital within the structure to help users assess the nature of the claims and how they affect the entity's liquidity and solvency.

The ED proposes that, for financial instruments with both financial liability and equity characteristics (except for stand-alone derivatives), an entity would be required to disclose in the notes to the financial statements:⁴²

- 'Debt-like features' in financial instruments that are classified as equity instruments (for example, fixed coupons payable on a preference share).
- 'Equity-like features' in financial instruments that are classified as financial liabilities (for example, embedded derivatives on own equity that do not meet the fixed-for-fixed criterion, or 'write-down bonds', where the principal is reduced if the issuer's capital falls below a trigger level).
- The terms and conditions that determine the classification of such financial instruments as financial liabilities, equity instruments or compound financial instruments. This includes information about terms that become, or stop being effective with the passage of time before the end of the instrument's contractual term. In response to feedback to the ED, the IASB tentatively decided to not require disclosure of amounts allocated on initial recognition to the liability and equity components of compound financial instruments and to require disclosure of the terms and conditions of compound instruments in IFRS 7. They also decided not to require disclosure of terms and conditions for instruments such as those with only subordination features and those that will be settled by delivering its own equity instruments.

41 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1, IFRS 7, IFRS 7 new paragraph 30A and 30B](#), November 2023, available on the IFRS Foundation's website.

42 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1, IFRS 7 new paragraphs 30C, 30D, 30E and 30F](#), November 2023, available on the IFRS Foundation's website.

- The ED also proposes to require entities to disclose the potential dilution of ordinary shares arising from financial instruments that could be settled by delivering ordinary shares, such as convertible bonds and derivatives on own equity.⁴³ The disclosure also applies to share-based payment transactions to which IFRS 2, *Share-based Payment* applies and would be in addition to the normal IAS 33 *Earnings per share* diluted earnings per share disclosure.

In response to feedback received on the ED, the IASB redeliberated the proposals in relation to disclosing the nature of claims against an entity, and tentatively decided to retain them subject to:

- Requiring the disclosure be based on the nature of the claims at the reporting date instead of on liquidation.
- Clarifying that the disclosure requirement would apply to non-derivative financial liabilities within the scope of the liquidity risk disclosures required by IFRS 7, and non-derivative equity instruments issued by the entity.
- To combine them with the disclosures of the terms and conditions about an instrument's priority on liquidation, limiting the disclosure to those terms that could lead to a change in their nature, and to describe intra-group arrangements that might affect the nature of the financial instruments.

12.4 Accounting for financial instruments that contain contingent settlement provisions

For financial instruments with contingent settlement provisions, proposed changes to IAS 32 were included in the FICE ED.⁴⁴ The ED proposes to clarify the following:

- Financial instruments with contingent settlement provisions may be compound financial instruments with liability and equity components.
- The probability and estimated timing of occurrence or non-occurrence of uncertain future events (or the outcome of uncertain circumstances) have no effect on the initial and subsequent measurement. As a result, the liability component of a compound financial instrument with contingent settlement provisions, which could require immediate settlement if a contingent event occurs, is measured on initial recognition and subsequently at the present value of the settlement amount.
- Payments at the discretion of the issuer (such as dividends) are recognised in equity, even if all the proceeds are initially allocated to the liability component of a compound financial instrument such that the equity component has an initial carrying amount of zero.
- The term 'liquidation' in paragraph 25(b) of IAS 32 refers to the process that begins after an entity has permanently ceased its operations.

And

- The assessment of whether a contractual term that is 'not genuine' under paragraph 25(a) of IAS 32 requires judgement based on the specific facts and circumstances and is not based on the probability or likelihood of the contingent event occurring.

The accounting for types of contingent settlement provisions that are not embedded in a financial instrument would not be subject to these potential future changes to IAS 32. Examples of such contingent settlement provision could include those which arise in the context of asset acquisitions in the extractive industries (see Chapter 39) and contingent consideration in business combinations (see Chapter 10).

In response to feedback to the ED, the IASB will redeliberate the proposals to the accounting for financial instruments that contain contingent settlement provisions, before the amendments are finalised in 2026.

43 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IFRS 7 new paragraphs 30G and 30H, November 2023, available on the IFRS Foundation's website.

44 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IAS 32 paragraphs 16, 22, 22B to 22D, AG27A and AG29B, November 2023, available on the IFRS Foundation's website.

12.5 The effect of laws or regulations

For the effect of laws or regulations, proposed changes to IAS 32 were included in the FICE ED.⁴⁵

The FICE ED proposes that, when considering the classification of a financial instrument (or its component parts) as a financial asset, financial liability or equity instrument, an entity should consider only those contractual rights and obligations that are enforceable by law and that are in addition to those created by relevant laws or regulations. If a right or obligation is created by relevant laws or regulations, and would arise regardless of whether it is included in the contractual arrangement, an entity would not consider that right or obligation in its assessment.

In July 2025, the IASB redeliberated the proposals in response to feedback received on the ED and tentatively decided to withdraw the requirements related to the effects of relevant laws and regulations.

12.6 Shareholders' discretion

For shareholders' discretion, proposed changes to IAS 32 were included in the FICE ED.⁴⁶ The ED proposes to clarify that whether an entity has an unconditional right to avoid delivering cash or another financial asset (or otherwise to settle a financial instrument in such a way that it would be a financial liability, see section 4.2 above) depends on the facts and circumstances in which shareholder discretion arises. Judgement is required to assess whether shareholder decisions are treated as entity decisions.

The ED proposes examples of the potential factors an entity would be required to consider in making the assessment (each of which would not be determinative on their own), including whether:

- A shareholder decision is a routine part of the operating and corporate governance process (e.g., the approval of dividends at an annual general meeting) or not (e.g., the approval of a change of control, which will often occur at a 'special' meeting and require more than a simple majority).
- The shareholder decision relates to an action proposed or a transaction initiated by the entity's management, so that shareholders merely approve or reject management's proposals, or if it is initiated by the shareholders or third parties.
- The shareholder decision affects different share classes differently, so that, for example, discretion by preference shareholders would be treated as indicative of a liability and separate voting by class would suggest voting as a class and not as part of the entity.
- A shareholder decision-making right may enable a shareholder to require the entity to redeem or pay a return on its shares in cash. Such decision making rights indicate that the shareholders would make their decisions as investors in the shares and is unlikely to be an entity decision.

In response to feedback received on the ED, the IASB redeliberated the proposals and tentatively decided to proceed with the proposed factors-based approach for assessing at initial recognition whether shareholder decisions are treated as entity decisions. The IASB also tentatively decided to clarify the principles underlying the approach with respect to the areas of judgement an entity considers.

12.7 Reclassification of financial liabilities and equity instruments

The proposed changes to IAS 32 for the reclassification of financial liabilities and equity instruments were included in the FICE ED.⁴⁷ The ED proposes to add a general requirement that prohibits reclassification of a financial instrument after initial recognition, unless paragraph 16E of IAS 32 applies (see section 4.6.5 above) or the substance of the contractual terms changes because of a change in circumstances external to the contractual arrangement.

45 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IAS 32 paragraphs 15A and AG24A to AG24B, November 2023, available on the IFRS Foundation's website.

46 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IAS 32 paragraphs AG28A to AG28C, November 2023, available on the IFRS Foundation's website.

47 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IAS 32 paragraphs 32B to 32D and AG35A, November 2023, available on the IFRS Foundation's website.

If the substance of the contractual terms change because of changes in circumstance external to the contractual arrangement, an entity would:

- Measure a financial liability reclassified from equity at the fair value at the date of reclassification. Any difference between the carrying amount of the equity instrument and the fair value of the financial liability would be recognised in equity.
- Measure an equity instrument reclassified from a financial liability at the carrying value of the financial liability at the date of reclassification. No gain or loss would be recognised on reclassification.
- The reclassification would be accounted for prospectively from the date when the change in circumstances occurs. An entity must not reverse in profit or loss any previously recognised income, expense, gains or losses.

The ED also proposes examples of changes in circumstances that are external to the contractual arrangement requiring reclassification.

In response to feedback to the ED, the IASB redeliberated the proposals and tentatively decided to finalise the amendments subject to some targeted refinements to:

- (a) Clarify that the reclassification requirements only apply to changes in the substance of a contractual arrangement that do not:
 - (i) create or extinguish contractual rights or obligations; or
 - (ii) modify the contractual terms.
- (b) Further clarify that 'circumstances external to the contractual arrangement' are events that:
 - (i) arose after a financial instrument is classified; and
 - (ii) are significant to the entity's operations, demonstrable to external parties and are expected to occur infrequently.
- (c) Require an entity to reclassify a financial instrument containing an obligation to deliver own equity instruments from financial liability to equity when the substance of the contractual arrangement changes due to a contractual term ceasing to be effective with the passage of time.

12.8 Obligations to purchase an entity's own equity instruments

For an entity's obligations to repurchase its own equity instruments (e.g., put options on non-controlling interests), the FICE ED proposes clarifications to the existing IAS 32 requirements.⁴⁸ These are as follows:

- The requirements in IAS 32 paragraph 23 for contracts containing an obligation for an entity to purchase its own equity instruments for cash or another financial asset, also apply to contracts for an entity to redeem its own equity instruments that will be settled in a variable number of another class of the entity's own equity instruments. [IAS 32.23].
- On initial recognition of an obligation to redeem an entity's own equity instruments, if the entity does not yet have access to the rights and returns associated with ownership of the equity instruments to which the obligation relates, those equity instruments would continue to be recognised. The initial amount of the financial liability would be recognised as a debit entry in a component of equity other than non-controlling interests (NCI) (in the case of obligations involving NCI) or issued share capital (in the case of other obligations to purchase own shares).
- An entity is required to use the same approach for the initial and subsequent measurement of the financial liability that arises from a contingent settlement provision. In other words, the entity would measure the liability at the present value of the redemption amount and ignore the probability and estimated timing of the counterparty exercising that redemption right.
- When remeasuring the financial liability that arises from an obligation to purchase its own equity instruments, an entity is required to recognise any gain or loss in profit or loss.

48 [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IAS 32 paragraphs 23, AG27B to AG27D, November 2023, available on the IFRS Foundation's website.

- On expiry without delivery of an obligation for an entity to purchase its own equity instruments:
 - The carrying amount of the financial liability would be removed from financial liabilities and included in the same component of equity as that from which it was reclassified on initial recognition of the financial liability.
 And
 - Any gains or losses previously recognised in profit or loss from remeasuring the financial liability would not be reversed. However, the entity may transfer the cumulative amount of those gains and losses from retained earnings to another component of equity.
- Written put options and forward purchase contracts on an entity's own equity instruments that are gross physically settled are presented gross. This is to align with the accounting for other obligations that are conditional on events or choices that are beyond the entity's control, and to better allow users to assess the entity's exposure to liquidity risk.

In response to feedback to the ED, the IASB will redeliberate the proposals for obligations to purchase an entity's own equity instruments, before the amendments are finalised in 2026.

12.9 Presentation of equity instruments and financial liabilities

The FICE ED includes the proposed amendments to IAS 1 for the presentation of equity instruments and financial liabilities.⁴⁹ For the presentation of equity instruments, the ED proposes amendments to meet the needs of users of financial statements (particularly investors in ordinary shares), including transparency about whether an entity has issued other instruments classified as equity and to make a clear distinction of the returns to ordinary shareholders. The ED proposes to make amounts attributable to ordinary shareholders clearly visible in the entity's financial statements. This includes disclosing the amount of dividends recognised as distributions to ordinary shareholders separately from dividends recognised as distributions to other owners during the period.

In response to feedback to the ED, the IASB redeliberated the proposed amendments and tentatively decided to require an entity:

- To present separately in the statement of profit or loss the profit or loss attributable to owners of the parent, disaggregated between ordinary shareholders, participating rights holders and non-participating rights holders.
- To categorise equity instruments based on the instrument holders' contractual rights to profit or loss participation as at the reporting date, including an attribution for participating and non-participating rights for instruments that contain both.
- To disclose information on how the entity's equity instruments relate to the attribution of profit or loss in the statement of profit or loss and the amount of dividends recognised as distributions on these instruments during the reporting period. Also to disclose terms and conditions affecting the nature, amount, timing and uncertainty of cash flows of equity instruments with participating rights.
- To disclose a reconciliation of cumulative undeclared dividends for equity instruments with non-participating rights, showing separately the amounts allocated for the reporting period and any amounts declared during the reporting period.

The IASB tentatively decided to define 'participating right' as 'the right to participate in profit or loss with ordinary shares, with the amount varying based on the entity's profit or loss for the period' and to define non-participating right' as 'the right to contractually specified amounts (for example, fixed dividends or coupons) before the determination of the profit or loss that is allocated to ordinary shareholders and participating rights holders'.

For the presentation of financial liabilities, the IASB considered whether it is appropriate for an entity to recognise changes in the carrying amount of a financial liability in profit or loss when the financial liability contains a contractual obligation to pay the holder based on the entity's performance or changes in the entity's net assets. The IASB tentatively decided not to add to the existing presentation requirements for financial liabilities but to require disclosure of the total gains or losses in each reporting period that arise from measuring such financial liabilities.

⁴⁹ [Exposure Draft: Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1](#), IAS 1 paragraphs 54, 81B, 107 and 108, November 2023, available on the IFRS Foundation's website.

12.10 Disclosures

The proposed amendments for the disclosure of equity instruments and financial liabilities were included in the FICE ED.⁵⁰ The ED proposes:

- To expand the objective of IFRS 7 to enable users of financial statements to understand how an entity is financed and what its current and potential ownership structure is, including potential dilution to the ownership structure from financial instruments issued at the reporting date.
- To delete the current references in IFRS 7 paragraph 3(a) which exclude derivatives that meet the definition of an equity instrument in IAS 32 from the scope of IFRS 7.
- To relocate the disclosure requirement currently in IAS 1 paragraph 80A to IFRS 7 and expand it to cover reclassifications when changes in the substance of the contractual terms arise from changes in circumstances external to the contractual arrangement. An entity would be required to disclose the amounts reclassified into and out of financial liabilities or equity, and the timing and reason for that reclassification.
- To amend IFRS 7 paragraph 20(a)(i) to require the separate disclosure of gains or losses in each reporting period that arise from remeasuring financial liabilities containing contractual obligations to pay amounts based on an entity's performance or changes in the entity's net assets.
- To include disclosure requirements for compound financial instruments in IFRS 7 paragraph 17A.

The ED also proposes to require entities to disclose information about obligations that arise only on liquidation of the entity, as discussed in section 12.3 above.

In response to feedback to the ED, the IASB tentatively decided to retain the proposed disclosures related to maximum dilution of ordinary shares subject to:

- (a) Clarifying that off balance sheet commitments that could result in dilution are in the scope of the requirements,
- (b) Adding a requirement to disclose the fact that the number of shares in share buy-back arrangements is unknown, if the maximum spend amount is capped, and
- (c) Adding examples of terms and conditions that entities could disclose to help explain the potential maximum dilution that could occur and the likelihood of maximum dilution occurring.

12.11 Transition

The proposed transition requirements for the amendments to IAS 32, IFRS 7 and IAS 1 were included in the FICE ED.⁵¹ The ED proposes that for an entity already applying IFRS accounting standards:

- If it is impracticable (as defined in IAS 8) for the entity to apply the effective interest method in IFRS 9 retrospectively, the entity is required to treat the fair value at the beginning of the earliest comparative period presented as the amortised cost of the financial liability at that date.
 - The entity is not required to separate the liability and equity components if the liability component of a compound financial instrument with a contingent settlement provision was no longer outstanding at the date of initial application.
 - To require the entity to disclose, in the reporting period that includes the date of initial application of the amendments, the nature and amount of any changes in classification resulting from initial application of the amendments. This includes the classification and carrying amount of the financial instrument immediately before applying the amendments and immediately after applying the amendments.
 - To provide transition relief from the quantitative disclosures in IAS 8 paragraph 28(f).
- Not to provide any transition relief from the requirements in IAS 34 *Interim Financial Reporting* for interim financial statements issued within the annual period in which the entity first applies the amendments.
- For first-time adopters, not to provide any additional transition relief.

In response to feedback to the ED, the IASB will redeliberate the transition proposals before the amendments are finalised in 2026.

Appendix B - Defined terms

Extract from IFRS standards - Definitions

derivative	<p>A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.</p> <ul style="list-style-type: none"> (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying'). (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. (c) it is settled at a future date. [IFRS 9 Appendix A].
equity instrument	<p>An <i>equity instrument</i> is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. [IAS 32.11].</p>
fair value	<p>The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. [IFRS 13 Appendix A].</p>
financial asset	<p>A <i>financial asset</i> is any asset that is:</p> <ul style="list-style-type: none"> (a) cash; (b) an equity instrument of another entity; (c) a contractual right: <ul style="list-style-type: none"> (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. <p>For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. [IAS 32.11].</p>
financial instrument	<p>A <i>financial instrument</i> is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity. [IAS 32.11].</p>

financial liability

A *financial liability* is any liability that is:

- (a) a contractual obligation:
 - (i) to deliver cash or another financial asset to another entity; or
 - (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or
- (b) a contract that will or may be settled in the entity's own equity instruments and is:
 - (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or
 - (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments.

As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D. [IAS 32.11].

puttable instrument

A *puttable instrument* is a financial instrument that gives the holder the right to put the instrument back to the issuer for cash or another financial asset or is automatically put back to the issuer on the occurrence of an uncertain future event or the death or retirement of the instrument holder. [IAS 32.11].

4.2 Hold to collect contractual cash flows	3682
4.2.1 Impact of sales on the assessment	3682
4.2.1.A Assessing whether sales are 'infrequent'	3683
4.2.1.B Assessing whether sales are 'insignificant in value'	3683
4.2.2 Transferred financial assets that are not derecognised	3684
4.3 Hold to collect contractual cash flows and selling financial assets	3684
4.4 Other business models	3685
4.5 Business model for financial assets owned by a subsidiary that is held for sale	3685
4.6 Applying the business model test in practice	3686
5 Characteristics of the contractual cash flows of the instrument	3691
5.1 The meaning of 'principal'	3691
5.2 The meaning of 'interest'	3692
5.3 Contractual features that normally pass the test	3693
5.3.1 Conventional subordination features	3693
5.3.2 Full recourse loans secured by collateral	3693
5.3.3 Bonds with a capped or floored interest rate	3694
5.3.4 Lender has discretion to change the interest rate	3694
5.3.5 Unleveraged inflation-linked bonds	3695
5.3.6 Features which compensate the lender for changes in tax or other related costs	3695

5.4	Contractual features that may affect the classification	3695
5.4.1	<i>De minimis</i> and non-genuine features	3696
5.4.1.A	<i>De minimis</i> features	3696
5.4.1.B	Non-genuine features	3697
5.4.2	Contractual features that modify the consideration for the time value of money	3697
5.4.3	Regulated interest rates	3701
5.4.4	Contractual features that change the timing or amount of contractual cash flows	3701
5.4.4.A	Prepayment - negative compensation	3704
5.4.4.B	Prepayment - assets originated at a premium or discount	3706
5.4.4.C	Further examples of features that modify the timing or amount of contractual cash flows	3707
5.4.5	Contractual features that normally do not represent payments of principal and interest	3710
5.4.6	Loan commitments	3712
5.4.7	Environmental, social and governance (ESG) linked loans	3713
5.4.7.A	Compensation for credit risk	3713
5.4.7.B	<i>De minimis</i> or non-genuine ESG features	3715
5.4.7.C	Compensation for other basic lending risks	3715
5.5	Non-recourse assets	3717
5.6	Contractually linked instruments	3719
5.6.1	The scope of the 'contractually linked' guidance	3720
5.6.2	Assessing the characteristics of the underlying pool	3723
5.6.2.A	Non-financial assets in the underlying pool	3723
5.6.2.B	Liquidity facilities in the underlying pool	3723
5.6.2.C	Changes in the composition of the underlying pool	3724
5.6.2.D	Assets with prepayment options in the underlying pool	3724
5.6.2.E	Derivatives and financial guarantee contracts in the underlying pool	3724
5.6.2.F	Assets transferred to the underlying pool which have failed derecognition	3725
5.6.3	Application of expected credit loss requirements to junior tranches that pass SPPI	3725
5.6.4	Assessing the exposure to credit risk in the tranche held	3725
5.7	Transferred financial assets held by a transferee and not qualifying for derecognition by the transferor	3727
6	Designation at fair value through profit or loss	3728
6.1	Designation eliminates or significantly reduces a measurement or recognition inconsistency (accounting mismatch)	3728
6.2	A group of financial liabilities (or financial assets and financial liabilities) is managed and its performance is evaluated on a fair value basis	3729
6.3	Hybrid contracts with a host that is not an asset within the scope of IFRS 9	3730
7	Presentation of fair value changes on an equity investment in other comprehensive income instead of profit or loss	3732
7.1	Gains and losses on investments in equity instruments designated at fair value through other comprehensive income	3733

Overview

On 1 January 2018, IFRS 9 *Financial Instruments* (IFRS 9 or the standard) came into effect. The standard includes revised classification requirements for financial assets. Classification determines how financial instruments are accounted for in the financial statements and, in particular, how they are measured on an ongoing basis.

The more principle-based approach of IFRS 9 requires the careful use of judgement in its application. Some fact patterns have no simple and distinct outcome, and we highlight in this chapter the factors that need to be considered in arriving at a conclusion.

This chapter deals with the classification of financial assets and liabilities under IFRS 9. Other aspects of IFRS 9 are dealt with in the other financial instruments chapters. Definitions and scope are covered in Chapter 41. Derivatives and embedded derivatives are dealt with in Chapter 42. Recognition and initial measurement are dealt with in Chapter 45. Subsequent measurement is dealt with in Chapter 46. Chapter 47 deals with impairment of financial assets. Chapter 48 deals with derecognition. Chapter 49 deals with hedge accounting.

In May 2024, the IASB amended IFRS 9 to provide additional guidance and clarity on specific matters following completion of the IFRS 9 post-implementation review (PIR) for Classification and Measurement ('the 2024 Amendments'). The 2024 Amendments are applicable for annual periods beginning on or after 1 January 2026. Entities are permitted to early adopt either all amendments, or only the amendments that relate to the classification of financial assets plus the related disclosures in IFRS 7 *Financial Instruments: Disclosures* (refer to Chapter 50) before applying the other amendments later. [IFRS 9(2026).7.1.13].

The 2024 Amendments are applied retrospectively, and an entity is not required to restate prior periods. Restatement of prior periods is permitted if, and only if, it is possible to do so without the use of hindsight. If an entity does not restate prior periods, it shall recognise the effect of initially applying these amendments as an adjustment to the opening balance of financial assets and financial liabilities and the cumulative effect, if any, as an adjustment to the opening balance of retained earnings at the date of initial application. [IFRS 9(2026).7.2.48].

The 2024 Amendments relating to the classification of financial assets are covered in section 5.4.4. for classification of financial assets with contingent features; section 5.4.7 for ESG linked loans; section 5.5 for non-recourse loans; and 5.6 for contractually linked instruments. These sections use separate headings to specify the requirements applicable under these 2024 Amendments for periods beginning on or after 1 January 2026, as well as those applying before 1 January 2026.

Differences between the IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter as the standards are not converged. Therefore, the differences between IFRS accounting standards and US GAAP that exist are not discussed in this chapter.

What you need to know

- Financial assets are classified at amortised cost, fair value through other comprehensive income (FVOCI) or at fair value through profit or loss. This classification is based on the cash flow characteristics test and the business model assessment.
- A conditional fair value option through profit or loss may be elected for investments in debt instruments.
- A FVOCI option, with no recycling through profit or loss, is available for certain investments in equity instruments.
- Financial liabilities are classified at amortised cost or fair value through profit or loss.
- A conditional fair value option through profit or loss may be elected for financial liabilities. Under this approach, movements in fair value caused by own credit risk are generally recognised in other comprehensive income (OCI).
- Embedded derivatives within financial liability host contracts are classified separately from the host instrument if they meet the separation criteria. This is not the case for embedded derivatives in financial asset host contracts.
- Reclassification is only allowed for financial assets and even then, under limited circumstances.

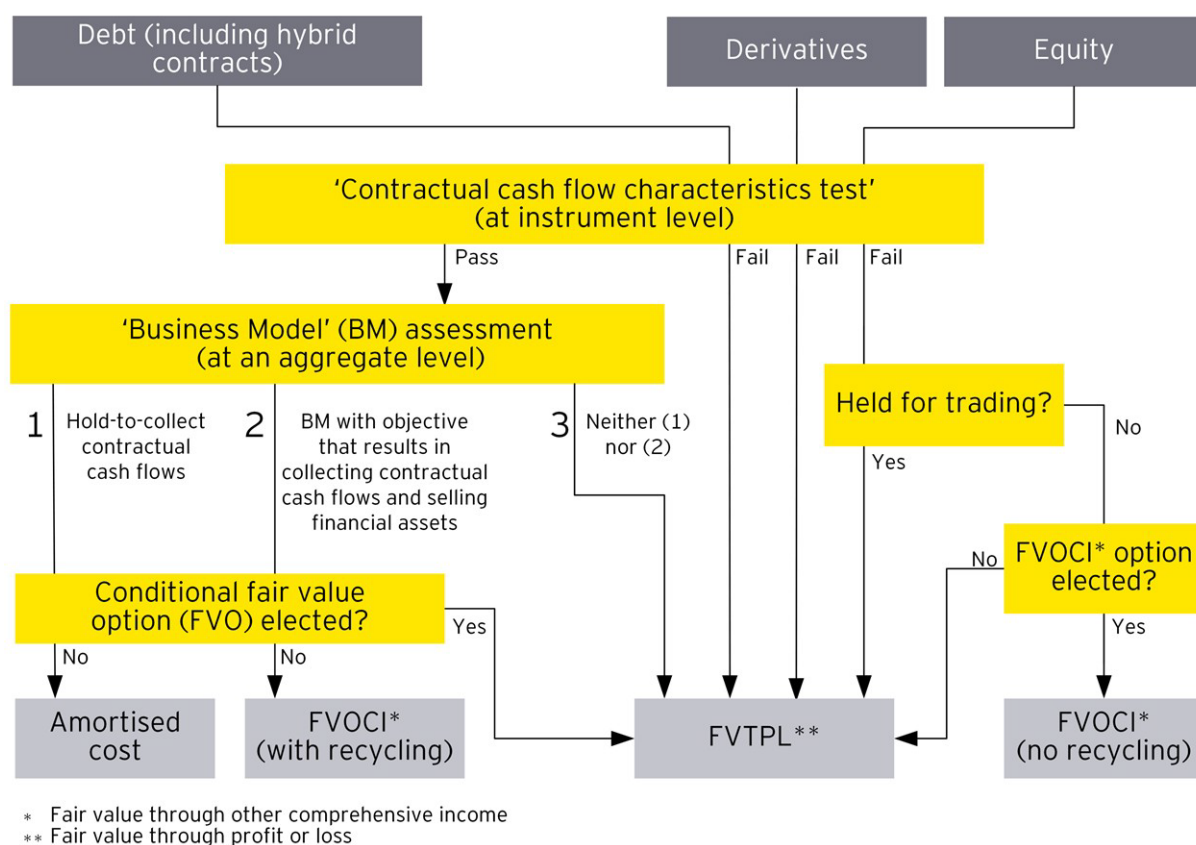

1 Classifying financial assets: An overview

IFRS 9 has the following measurement categories for financial assets:

- Debt instruments at amortised cost
 - Debt instruments at fair value through other comprehensive income with cumulative gains and losses reclassified to profit or loss upon derecognition
 - Debt instruments, derivatives, and equity instruments at fair value through profit or loss
- And
- Equity instruments designated as measured at fair value through other comprehensive income with gains and losses remaining in other comprehensive income, i.e., without recycling to profit or loss upon derecognition

Apart from specific designation options, which are described in more detail in sections 6 and 7 below, the classification is based on both the entity's business model for managing the financial assets and the contractual cash flow characteristics of the financial assets. [IFRS 9.4.1.1].

The diagram below illustrates the tests and assessments on which the classification of financial assets is based. It should be noted that either the business model test or the contractual cash flow characteristics test, can be conducted first in practice. The diagram also illustrates that the default category for measuring financial assets is fair value through profit or loss:

Subsequent measurement is covered in Chapter 46. This includes the effective interest method and expected credit loss impairment model for financial assets measured at amortised cost and fair value through other comprehensive income. Fair value is determined in accordance with IFRS 13 *Fair Value Measurement* see Chapter 15.

1.1 Debt instruments

A debt instrument is normally measured at amortised cost if both of the following conditions are met: *[IFRS 9.4.1.2]*

- (a) The financial asset is held within a business model whose objective is to hold financial assets in order to collect contractual cash flows.

And

- (b) The contractual terms of the financial asset give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding.

A debt instrument is normally measured at fair value through other comprehensive income if both of the following conditions are met: *[IFRS 9.4.1.2A]*

- (a) The financial asset is held within a business model in which financial assets are managed to achieve a particular objective by both collecting contractual cash flows and selling financial assets.

And

- (b) The contractual terms of the financial asset give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding.

The application of these conditions (the 'business model' assessment and 'contractual cash flow characteristics' test) is covered in more detail in sections 4 and 5 below, respectively.

The above requirements are applied to an entire financial asset, even if it contains an embedded derivative. *[IFRS 9.4.3.2]*. The assessment of the characteristics results in the entire financial asset either passing or failing the 'Solely Payments of Principal and Interest' (SPPI) test in its entirety. This differs from the treatment of embedded derivatives contained in financial liability host contracts (see section 2 below).

The application of these requirements to debt instruments means that, apart from the exceptions described in section 5.4 below, only relatively simple 'plain vanilla' debt instruments qualify to be measured at amortised cost or at fair value through other comprehensive income. Debt instruments that are neither measured at amortised cost nor at fair value through other comprehensive income are measured at fair value through profit or loss. *[IFRS 9.4.1.4]*. As will be shown in section 4.4 below, this includes instruments that are held for trading (see section 3 below).

Notwithstanding the criteria for debt instruments to be classified at amortised cost or at fair value through other comprehensive income, as described above, an entity may irrevocably designate a debt instrument as measured at fair value through profit or loss at initial recognition. This is allowed if doing so eliminates, or significantly reduces, a measurement or recognition inconsistency (sometimes referred to as an 'accounting mismatch'). Such mismatches would otherwise arise from measuring assets or liabilities, or recognising the gains and losses on them, on different bases. *[IFRS 9.4.1.5]*. This is covered further in section 6 below.

In its Basis for Conclusions, the IASB noted that the fair value through other comprehensive income measurement category is intended for debt instruments for which both amortised cost information and fair value information are relevant and useful. This will be the case if their performance is affected by both the collection of contractual cash flows and the realisation of fair values through sales. *[IFRS 9.BC4.150]*.

The fair value through other comprehensive income measurement category may also help some insurers achieve consistency of measurement for assets held to back insurance liabilities under IFRS 17 *Insurance Contracts*. Under IFRS 17, insurers may, in certain circumstances, have a policy choice between including insurance finance income or expenses for the period in profit or loss in their entirety or disaggregating insurance finance income or expenses between profit or loss and other comprehensive income. To minimise accounting mismatches, we expect that insurance entities that have financial assets measured at fair value through other comprehensive income would elect to disaggregate insurance finance income and expenses. This is discussed in further detail in Chapter 51. The fair value through other comprehensive income category should also help to address concerns raised by preparers who expect to sell financial assets in greater volume than would be consistent with a business model whose objective is to hold financial assets to collect contractual cash flows and would, without this category, have to record such assets at fair value through profit or loss.

It must be noted that:

- (a) The fair value through other comprehensive income classification under IFRS 9 reflects a business model evidenced by facts and circumstances and is neither a residual classification nor an election.
- (b) Debt instruments measured at fair value through other comprehensive income will be subject to the same impairment model as those measured at amortised cost. Accordingly, although the assets are recorded at fair value, the profit or loss treatment will be the same as for an amortised cost asset, with the difference between amortised cost, including impairment allowance, and fair value recorded in other comprehensive income.

And

- (c) Only relatively simple debt instruments will qualify for measurement at fair value through other comprehensive income as they will also need to pass the contractual cash flow characteristics test.

1.2 Equity instruments and derivatives

Equity instruments and derivatives are normally measured at fair value through profit or loss. [IFRS 9.5.7.1]. However, on initial recognition, an entity may make an irrevocable election (on an instrument-by-instrument basis) to present in other comprehensive income subsequent changes in the fair value of an investment in an equity instrument within the scope of IFRS 9. This option only applies to instruments that are neither held for trading (see section 3 below) nor contingent consideration recognised by an acquirer in a business combination to which IFRS 3 *Business Combinations* applies. [IFRS 9.5.7.1(b), IFRS 9.5.7.5]. For this election, the term equity instrument uses the definition in IAS 32 *Financial Instruments: Presentation*. The use of this election is covered further in section 7 below.

2 Classifying financial liabilities

Financial liabilities are classified and measured either at amortised cost or at fair value through profit or loss.

In addition, IFRS 9 specifies the accounting treatment for liabilities arising from certain financial guarantee contracts (see Chapter 41 and Chapter 46) and commitments to provide loans at below-market rates of interest (see Chapter 41 and Chapter 46).

Financial liabilities are measured at fair value through profit or loss when they meet the definition of held for trading (see section 3 below), [IFRS 9 Appendix A], or when they are designated as such on initial recognition (see section 6 below). Designation at fair value through profit or loss is permitted when either: [IFRS 9.4.2.2, IFRS 9.4.3.5]

- (a) It eliminates or significantly reduces a measurement or recognition inconsistency (sometimes referred to as an 'accounting mismatch'). Such mismatches would otherwise arise from measuring assets or liabilities or recognising the gains and losses on them on different bases.
- (b) A group of financial liabilities, or financial assets and financial liabilities, is managed and its performance is evaluated on a fair value basis in accordance with a documented risk management or investment strategy, and information is provided internally on that basis to the entity's key management personnel (as defined in IAS 24 *Related Party Disclosures* see Chapter 35).

Or

- (c) A financial liability contains one or more embedded derivatives that meet certain conditions.

For financial liabilities designated as at fair value through profit or loss, the element of gains or losses attributable to changes in own credit risk is normally recognised in other comprehensive income with the remaining gains and losses recognised in profit or loss. [IFRS 9.5.7.7]. The amounts recognised in other comprehensive income are not recycled to profit or loss, even if the liability is repurchased. However, if this treatment of changes in fair value attributable own credit risk creates or enlarges an accounting mismatch in profit or loss, then the entity shall present all gains and losses on that liability in profit or loss.

[IFRS 9.5.7.8]. The guidance indicates that an economic relationship is required in these cases. In other words, the designated liability's own credit risk must be offset by changes in the fair value of the other instrument. If there is no economic relationship between the liability's own credit risk and the fair value of the other instrument, then the gains and losses arising from the changes in credit risk cannot be recognised in profit or loss. 'Economic relationship' is not defined in the standard, but the IASB noted that the relationship need not be contractual, [IFRS 9.BC5.41], and that such a relationship does not arise by coincidence. [IFRS 9.BC5.40]. However, judging from the example given in the standard (see Illustration 2-1 below) the IASB would not expect this to be very common.

Illustration 2-1: Liabilities at fair value through profit or loss: accounting mismatch in profit or loss

A mortgage bank provides loans to customers and funds those loans by selling bonds with matching characteristics (e.g., amount outstanding, repayment profile, term and currency) in the market. The contractual terms of the loans permit the mortgage customer to prepay its loan (i.e., satisfy its obligation to the bank) by buying the corresponding bond at fair value in the market and delivering that bond to the mortgage bank.

As a result of that contractual prepayment right, if the credit quality of the bond worsens (and, thus, the fair value of the mortgage bank's liability decreases), the fair value of the mortgage bank's loan asset also decreases. The change in the fair value of the asset reflects the mortgage customer's contractual right to prepay the mortgage loan by buying the underlying bond at fair value (which, in this example, has decreased) and delivering the bond to the mortgage bank. Therefore, the effects of changes in the credit risk of the liability (the bond) will be offset in profit or loss by a corresponding change in the fair value of a financial asset (the loan).

If the effects of changes in the liability's credit risk were presented in other comprehensive income there would be an accounting mismatch in profit or loss. Therefore, the mortgage bank is required to present all changes in fair value of the liability (including the effects of changes in the liability's credit risk) in profit or loss.

[IFRS 9.B5.7.10].

The standard also requires increased disclosure about an entity's methodology for making determinations about potential mismatches. The subsequent measurement of financial liabilities designated at fair value through profit or loss is discussed in further detail in Chapter 46.

The definition of held for trading is dealt with in section 3 below and designation at fair value through profit or loss is covered further in section 6 below.

All other financial liabilities, other than derivatives, are generally classified as subsequently measured at amortised cost using the effective interest method. [IFRS 9.4.2.1].

In contrast to the treatment for hybrid contracts with financial asset hosts, derivatives embedded within a financial liability host within the scope of IFRS 9 will often be separately accounted for. That is, they must be separated if they are not closely related to the host contract, they meet the definition of a derivative, and the hybrid contract is not measured at fair value through profit or loss (see Chapter 42). Where an embedded derivative is separated from a financial liability host, the requirements of IFRS 9 dealing with the classification of financial instruments is applied separately to each of the host liability and the embedded derivative.

3 Financial assets and financial liabilities held for trading

The fact that a financial instrument is held for trading is important for its classification. Trading generally reflects active and frequent buying and selling, and financial instruments held for trading are normally used with the objective of generating a profit from short-term fluctuations in price or a dealer's margin.

[IFRS 9.BA.6].

For financial assets that are debt instruments, held for trading is a business model objective that results in measurement at fair value through profit or loss, as indicated in section 1.1 above and covered in more detail in section 4.4 below. Investments in equity instruments that are held for trading are disqualified from the option to present fair value movements in other comprehensive income (see section 7 below). They are therefore also required to be measured at fair value through profit or loss. Like financial assets, if a financial liability is held for trading it is classified as measured at fair value through profit or loss (see section 2 above).

Financial assets and liabilities held for trading are defined as those that: [IFRS 9 Appendix A]

- Are acquired or incurred principally for the purpose of sale or repurchase in the near term
 - On initial recognition are part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking
- Or
- Are derivatives (except for those that are financial guarantee contracts - see Chapter 41 - or are designated effective hedging instruments - see Chapter 49)

In respect of the first criterion above, it follows that if an entity originates a loan with an intention of syndicating all, or part, of it, the amount of the loan to be syndicated must be classified as held for trading, even if the bank subsequently fails to find sufficient commitments from other participants (a so called 'failed' loan syndication).

The term 'portfolio' in the second criterion is not explicitly defined in IFRS 9, but the context in which it is used suggests that a portfolio is a group of financial assets and/or financial liabilities that are managed together. If there is evidence of a recent actual pattern of short-term profit taking on financial instruments included in such a portfolio, those financial instruments qualify as held for trading even though an individual financial instrument may be held for a longer period of time. [IFRS 9.IG B.11].

IFRS 9 also specifies that, in addition to derivatives that are not accounted for as hedging instruments, financial liabilities held for trading include: [IFRS 9.BA.7]

- (a) Obligations to deliver financial assets borrowed by a short seller (i.e., an entity that sells financial assets it has borrowed and does not yet own).
- (b) Financial liabilities that are incurred with an intention to repurchase them in the near term, such as quoted debt instruments that the issuer may buy back in the near term depending on changes in fair value.

And

- (c) Financial liabilities that are part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent pattern of short-term profit-taking. [IFRS 9.BA.7(d)]. However, the fact that a liability is used merely to fund trading activities does not in itself make that liability one that is held for trading. [IFRS 9.BA.8].

4 Financial assets: The 'business model' assessment

The business model assessment is one of the two criteria assessed to classify financial assets. An entity's business model reflects how it manages its financial assets in order to generate cash flows and determines whether cash flows will result from collecting contractual cash flows, selling the financial assets or both. This assessment is performed based on scenarios that the entity reasonably expects to occur. This means the assessment excludes so-called 'worst case' or 'stress case' scenarios. For example, if an entity expects that it will sell a particular portfolio of financial assets only in a stress case scenario, this will not affect the entity's assessment of the business model for those assets if the entity does not reasonably expect it to occur. [IFRS 9.B4.1.2A].

If cash flows are realised in a way that is different from the entity's expectations at the date that the entity assessed the business model (for example, if the entity sells more, or fewer, financial assets than it expected when it classified the assets), this does not give rise to a prior period error in the entity's financial statements (as defined in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* see Chapter 3). Nor does it change the classification of the remaining financial assets held in that business model (i.e., those assets that the entity recognised in prior periods and still holds), as long as the entity considered all relevant and objective information that was available at the time that it made the business model assessment. Classification of a financial asset is determined in accordance with the business model in place at the point of initial recognition and does not change thereafter except in the event of a reclassification. Reclassifications of financial assets are only permitted, or required, in rare circumstances (see section 8 below) which do not include a simple change in business model. However, when an entity assesses the business model for newly originated or newly purchased financial assets, it must consider information about how cash flows were realised in the past, along with all other relevant information. For instance, if a business model changes from being held to collect due to increasing sales out of the portfolio, any new assets recognised in the portfolio after such change would be classified in terms of the new business model (see Illustration 8-1 in section 8 below). Existing assets within the portfolio would continue to be measured at amortised cost. This means that if there is a change in the way that cash flows are realised then this will only affect the classification of new assets when first recognised in the future.

[IFRS 9.B4.1.2A].

An entity's business model for managing the financial assets is a matter of fact and typically observable through particular activities that the entity undertakes to achieve its objectives. An entity will need to use judgement when it assesses its business model for managing financial assets and that assessment is not determined by a single factor or activity. Rather, the entity must consider all relevant and objective evidence that is available at the date of the assessment. Such relevant and objective evidence includes but is not limited to: [IFRS 9.B4.1.2B]

- (a) How the performance of the business model and the financial assets held within that business model are evaluated and reported to the entity's key management personnel
 - (b) The risks that affect the performance of the business model (and the financial assets held within) and, in particular, the way those risks are managed
- And
- (c) How managers of the business are compensated (for example, whether the compensation is based on the fair value of the assets managed or on the contractual cash flows collected)

In addition to these three forms of evidence, in most circumstances the expected frequency, value and timing of sales are important aspects of the assessment. These are covered in more detail in section 4.2.1 below. Entities will need to consider how and to what extent they document the evidence supporting the assessment of their business model.

4.1 The level at which the business model assessment is applied

The business model assessment should be performed based on the entity's business model as determined by the entity's key management personnel (as defined in IAS 24 see Chapter 35). [IFRS 9.B4.1.1].

An entity's business model is determined at a level that reflects how groups of financial assets are managed together to achieve a particular business objective. This does not need to be the reporting entity level. The entity's business model does not depend on management's intentions for an individual instrument.

Accordingly, this condition is not an instrument-by-instrument approach to classification and is determined on a higher level of aggregation. However, a single entity may have more than one business model for managing its financial instruments (for example, one portfolio that it manages in order to collect contractual cash flows and another portfolio that it manages in order to trade to realise fair value changes).

[IFRS 9.B4.1.2].

Similarly, in some circumstances, it may be appropriate to split a portfolio of financial assets into sub-portfolios to reflect how an entity manages them. [IFRS 9.B4.1.2]. Those portfolios would be split and treated as separate portfolios, provided the assets belonging to each sub-portfolio are defined. A sub-portfolio approach would not be appropriate in cases where an entity is not able to define which assets would be held to collect contractual cash flows and which assets would potentially be sold. It is clear that judgement will need to be applied when determining the level of aggregation to which the business model assessment is applied. Splitting a portfolio into two sub-portfolios might allow an entity to achieve amortised cost accounting for most of the assets within the portfolio, even if it is required to sell a certain volume of assets. The entity could define the assets it intends (or is required) to sell as one sub-portfolio while it defines the assets it intends to keep as another.

4.2 Hold to collect contractual cash flows

A financial asset which is held within a business model whose objective is to hold assets in order to collect contractual cash flows is measured at amortised cost (provided the asset also meets the contractual cash flow characteristics test). [IFRS 9.4.1.2]. An entity manages such assets to realise cash flows by collecting contractual payments over the life of the instrument instead of managing the overall return on the portfolio by both holding and selling assets. [IFRS 9.B4.1.2C].

4.2.1 Impact of sales on the assessment

In determining whether cash flows are going to be realised by collecting the financial assets' contractual cash flows, it is necessary to consider the frequency, value and timing of sales in prior periods, whether the sales were of assets close to their maturity, the reasons for those sales, and expectations about future sales activity. However, the standard states that sales, in themselves, do not determine the business model and therefore cannot be considered in isolation. It goes on to say that, instead, information about past sales and expectations about future sales provide evidence related to how the entity's stated objective for managing the financial assets is achieved and, specifically, how cash flows are realised. An entity must consider information about past sales within the context of the reasons for those sales and the conditions that existed at that time as compared to current conditions. [IFRS 9.B4.1.2C].

The key point is that the standard requires the consideration of expected future sales while past sales are of relevance only as a source of evidence. Under IFRS 9 there is no concept of tainting, whereby assets are reclassified if sales activity differs from what was originally expected. [IFRS 9.B4.1.3].

Extract from IFRS 9

B4.1.3 Although the objective of an entity's business model may be to hold financial assets in order to collect contractual cash flows, the entity need not hold all of those instruments until maturity. Thus, an entity's business model can be to hold financial assets to collect contractual cash flows even when sales of financial assets occur or are expected to occur in the future.

The following scenarios might be consistent with a hold to collect business model:

- The business model may be to hold assets to collect contractual cash flows even if the entity sells financial assets when there is an increase in the assets' credit risk. To determine whether there has been an increase in the assets' credit risk, the entity considers reasonable and supportable information, including forward looking information. Irrespective of their frequency and value, sales due to an increase in the assets' credit risk are not inconsistent with a business model whose objective is to hold financial assets to collect contractual cash flows because the credit quality of financial assets is relevant to the entity's ability to collect contractual cash flows. Credit risk management activities that are aimed at mitigating potential credit losses due to credit deterioration are integral to such a business model. Selling a financial asset because it no longer meets the credit criteria specified in the entity's documented investment policy is an example of a sale that has occurred due to an increase in credit risk. However, in the absence of such a policy, the entity may still be able to demonstrate in other ways that the sale occurred due to an increase in credit risk. [IFRS 9.B4.1.3A].
- Sales that occur for other reasons, such as sales made to manage credit concentration risk (without an increase in the assets' credit risk), may also be consistent with a business model whose objective is to hold financial assets in order to collect contractual cash flows. However, such sales are likely to be consistent with a business model whose objective is to hold financial assets in order to collect contractual cash flows only if those sales are infrequent (even if significant in value) or insignificant in value both individually and in aggregate (even if frequent). [IFRS 9.B4.1.3B].

- In addition, sales may be consistent with the objective of holding financial assets in order to collect contractual cash flows if the sales are made close to the maturity of the financial assets and the proceeds from the sales approximate the collection of the remaining contractual cash flows. [IFRS 9.B4.1.3B]. How an entity defines 'close' and 'approximate' will be a matter of judgement.

The overarching principle is whether the entity's key management personnel have decided that collecting contractual cash flows rather than selling financial assets is integral to achieving the objective of the business model. Under this objective, an entity will not normally expect that sales will be more than infrequent and more than insignificant in value. IFRS 9 does not explain how 'infrequent' and 'insignificant in value' is interpreted in practice. Those thresholds could lead to diversity in application, although it is an area where we expect that consensus and best practices will emerge over time.

4.2.1.A Assessing whether sales are 'infrequent'

If more than an infrequent number of sales are made from a portfolio and those sales are more than insignificant in value (either individually or in aggregate), the entity needs to assess whether and how such sales are consistent with an objective of collecting contractual cash flows. An increase in the frequency or value of sales in a particular period is not necessarily inconsistent with an objective to hold financial assets in order to collect contractual cash flows, if an entity can explain the reasons for those sales and demonstrate why those sales do not reflect a change in the entity's business model and, hence, sales will in future be lower in frequency or value. [IFRS 9.B4.1.3B]. This assessment is about expectations and not about intent. For instance, the fact that it is not the entity's objective to realise fair value gains or losses is not sufficient in itself to be able to conclude that measurement at amortised cost is appropriate.

Infrequent sales resulting from unanticipated funding needs (e.g., in a stress case scenario) would not contradict a hold to collect objective, even if such sales are significant in value. Assessing what constitutes a stress scenario is judgemental. However, the standard suggests relatively extreme circumstances by illustrating a stress scenario as a run on a bank's deposits (see Illustration 4-7 in section 4.6 below). Also, IFRS 9.B4.1.2A refers to 'worst case' and 'stress case' scenarios as scenarios that the entity does not reasonably expect to occur.

If a stress scenario that was previously not reasonably expected to occur becomes more probable due to new facts and circumstances, an entity will need to re-assess whether the scenario continues to constitute a stress scenario for the purpose of classifying new financial assets. For example, when sales have recently occurred as a result of unanticipated funding needs, an entity may assess that such a scenario is currently no longer reasonably expected not to recur within this portfolio, resulting in newly originated or newly purchased financial assets in this portfolio no longer being classified as in a hold to collect business model. Furthermore, whether a third party (such as a banking regulator in the case of some liquidity portfolios held by banks) imposes the requirement to sell the financial assets, or that activity is at the entity's discretion, is not relevant to the business model assessment. [IFRS 9.B4.1.3B].

Many organisations hold portfolios of financial assets for liquidity purposes. Assets in those portfolios are regularly sold because sales are required by a regulator to demonstrate liquidity, because the entity needs to cover everyday liquidity needs or because the entity tries to maximise the yield of the portfolio. It follows that such portfolios (except those that may be sold only in stress case scenarios) will probably not be measured at amortised cost depending on facts and circumstances (see also section 4.6 below).

4.2.1.B Assessing whether sales are 'insignificant in value'

With reference to measuring 'insignificant in value', the standard refers to more than an infrequent number of such sales being made out of a portfolio. [IFRS 9.B4.1.3B]. The reference point to measuring 'insignificant in value' could therefore be the portfolio, particularly as it is the portfolio that is subject to the business model assessment. The assessment of more than 'insignificant in value' therefore requires consideration of the sales value against the total size of the portfolio. In addition to the sales to value-based assessment, an entity could also consider whether the gain or loss on sale is significant compared to the total return on the portfolio. However, the gain or loss approach, on its own, would not be an appropriate method as the standard is specific about the importance of the value of sales in making the assessment. Loans could be sold at amounts close to their carrying value making it possible for very significant volumes of sales to generate insignificant gains or losses.

The standard is not explicit as to whether any test of insignificance is performed period-by-period, or by considering sales over the entire life of the portfolio. However, if a period-by-period approach were to be used, the determination of whether sales are insignificant in value would depend on the length of the period, which means that two entities with identical portfolios but with different lengths of the reporting period would arrive at different assessments. This could occur, for example, where one entity reports quarterly and the other semi-annually. Further, if a bank holds a portfolio of bonds with an average maturity of 20 years, sales of, say, 5% each year would mean that a considerable portion of the portfolio will have been sold before it matures, which would not seem to be consistent with a business model of holding to collect. Therefore, applying the average life of the portfolio would seem to be more relevant than applying the reporting period.

4.2.2 Transferred financial assets that are not derecognised

There are a number of circumstances where an entity may sell a financial asset, but those assets will remain on the selling entity's statement of financial position. For example, a bank may enter into a 'repo' transaction whereby it sells a debt security and at the same time agrees to repurchase it at a fixed price. Similarly, a manufacturer may sell trade receivables as part of a factoring programme and provide a guarantee to the buyer to compensate it for any defaults by the debtors. In each case, the seller retains substantially all risks and rewards of the financial assets and they would not be derecognised in accordance with the requirements of IFRS 9.

The inevitable question that arises in these circumstances is whether these transactions are regarded as sales when applying the business model assessment. In this context, Example 3 in IFRS 9.B4.1.4 contains only one passing reference to derecognition, but it does suggest that it is the accounting treatment and not the legal form of a transaction that determines whether the entity has ceased to hold an asset to collect contractual cash flows (see also Illustration 4-6 in section 4.6 below). Application of such an approach would give an intuitively correct answer for repo transactions, in which the seller is required to repurchase the asset at an agreed future date and price, and which are, in substance, secured financing transactions rather than sales. However, as the IASB did not provide the basis for the treatment in the example quoted above, it is not clear if accounting derecognition is always the basis for the assessment. For instance, if a loan is sold under an agreement by which the seller will indemnify the purchaser for any credit losses (for instance if it is factored with recourse) and so the asset is not derecognised, it is not clear whether there has been a sale for the purposes of the IFRS 9 business model assessment, given that the transferor will never retake possession of the asset. In contrast, in a repo transaction the transferor will ultimately regain possession of the asset and these are generally regarded as not being a sale for the purposes of the business model test.

How we see it

Except for instruments such as repos which are, in substance, secured financing transactions where the seller retains substantially all the risks and rewards and will regain possession of the asset, we believe an entity has an accounting policy choice of whether it considers the legal form of the sale or the economic substance of the transaction when analysing whether sales within a portfolio provide evidence related to how cash flows are realised.

4.3 Hold to collect contractual cash flows and selling financial assets

The fair value through other comprehensive income measurement category is a mandatory category for portfolios of financial assets that are held within a business model whose objective is achieved by both collecting contractual cash flows and selling financial assets (provided the asset also meets the contractual cash flow test). [IFRS 9.4.1.2A].

In this type of business model, the entity's key management personnel have decided that both collecting contractual cash flows and selling are fundamental to achieving the objective of the business model. There are various objectives that may be consistent with this type of business model. For example, the objective of the business model may be to manage everyday liquidity needs, to maintain a particular interest yield profile or to match the duration of the financial assets to the duration of the liabilities that those assets are funding. To achieve these objectives, the entity will both collect contractual cash flows and sell the financial assets. [IFRS 9.B4.1.4A].

Compared to the business model with an objective to hold financial assets to collect contractual cash flows, this business model will typically involve greater frequency and value of sales. This is because selling financial assets is integral to achieving the business model's objective rather than only incidental to it. There is no threshold for the frequency or value of sales that can or must occur in this business model. [IFRS 9.B4.1.4B].

How we see it

As set out in the standard, the fair value through other comprehensive income is a defined category and is neither a residual classification nor an election. However, in practice, entities may identify those debt instruments which are held to collect contractual cash flows (see section 4.2 above), those which are held for trading, those managed on a fair value basis (see section 4.4 below) and those for which the entity applies the fair value option to avoid a measurement mismatch, (see section 6.1 below), and then measure the remaining debt instruments at fair value through other comprehensive income. As a consequence, the fair value through other comprehensive income category might, in effect, be used as a residual, just because it is far easier to articulate business models that would be classified at amortised cost or at fair value through profit or loss.

4.4 Other business models

IFRS 9 requires financial assets to be measured at fair value through profit or loss if they are not held within either a business model whose objective is to hold assets to collect contractual cash flows or within a business model whose objective is achieved by both collecting contractual cash flows and selling financial assets. A business model that results in measurement at fair value through profit or loss is where the financial assets are held for trading (see section 3 above). Another is where the financial assets are managed on a fair value basis (see Illustration 4-13 in section 4.6 below).

When the standard explains what it means by a portfolio of financial assets that is managed and whose performance is evaluated on a fair value basis it refers to the requirements for designating financial liabilities as measured at fair value through profit or loss [IFRS 9.B4.1.6] and stipulates that such portfolios are present where a group of financial liabilities or financial assets and financial liabilities is managed and its performance is evaluated on a fair value basis, in accordance with a documented risk management or investment strategy, and information about the group is provided internally on that basis to the entity's key management personnel (as defined in IAS 24), for example, the entity's board of directors and chief executive officer. [IFRS 9.4.2.2(b)]. Further, if an entity manages and evaluates the performance of a group of financial assets on a fair value basis, measuring that group at fair value through profit or loss results in more relevant information. [IFRS 9.B4.1.33]. Documentation of the entity's strategy need not be extensive but must be sufficient to demonstrate that the classification at fair value through profit or loss is consistent with the entity's risk management or investment strategy. [IFRS 9.B4.1.36].

Both cases (both where assets are held for trading and where assets are managed on a fair value basis), are examples of an entity managing financial assets with the objective of realising cash flows through the sale of the assets. The entity makes decisions based on the assets' fair values and manages the assets to realise those fair values. As a consequence, the entity's objective will typically result in active buying and selling. Even though the entity will collect contractual cash flows while it holds financial assets in the fair value through profit or loss category, this is only incidental and not integral to achieving the business model's objective. [IFRS 9.B4.1.5, IFRS 9.B4.1.6].

4.5 Business model for financial assets owned by a subsidiary that is held for sale

A question that arises over the application of IFRS 9 concerns how to apply the business model test in the consolidated accounts to a subsidiary which is classified as held for sale in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*. In particular, when the financial assets of a subsidiary are held with the objective of collecting contractual cash flows but the subsidiary itself is held for sale under IFRS 5, should newly originated or acquired financial assets of the subsidiary be considered to be within a hold to collect or a hold to sell business model? Additionally, should existing financial assets of the subsidiary that are classified as measured at amortised cost be reclassified due to a change in business model?

The IFRS IC were asked precisely this question in November 2016. They noted that, in its consolidated financial statements, an entity assesses the relevant requirements of IFRS 9 from the group perspective. The IFRS IC will advise the IASB when it comes to discuss this issue, however it is not currently on the IASB's agenda and so until the IASB concludes on this issue, it is unclear how the business model test would be applied in these circumstances.¹

¹ [IFRIC Update](#), November 2016, available on the IFRS Foundation's website.

4.6 Applying the business model test in practice

The application of the business model test is illustrated through a number of examples, in all the following illustrations in this section it is assumed that the instruments will meet the contractual cash flows characteristics test.

Illustration 4-1: The level at which the business model assessment is applied

A global banking group operates two business lines, retail banking and investment banking. These businesses both operate in the same five locations by means of separate subsidiaries. Each subsidiary has its own Board of Directors that is responsible for carrying out the strategic objectives as set by the group's Board of Directors.

The financial assets held by the investment banking business are measured at fair value through profit or loss in line with the group's strategy, which defines the business model, to actively trade these financial assets. Within the retail banking business, four of the five subsidiaries hold debt securities in line with the group's objective to collect contractual cash flows. However, the fifth subsidiary holds a portfolio of debt securities that it expects to sell before maturity. These assets are not held for trading, but individual assets are sold if the portfolio manager believes he or she can reinvest the funds in assets with a higher yield. As a result, a more than infrequent number of sales that are significant in value are anticipated for this portfolio and it is unlikely that this portfolio would meet the amortised cost criteria if it were assessed on its own.

The bank will need to exercise judgement to determine the appropriate level at which to assess its business model(s). Hence, different conclusions are possible depending on the facts and circumstances.

This does not mean that the bank has an accounting policy choice, but it is, rather, a matter of fact that can be observed by the way the organisation is structured and managed. In many organisations, key management personnel may determine the overall strategy and then delegate their authority for executing the strategy to others. The combination of the overall strategy and the effect of the delegated authority are among the factors that can be considered in the determination of business models.

In the specified fact pattern, the determining factor is whether the fifth subsidiary is managed independently from the other four subsidiaries (and performance is assessed, and management is compensated accordingly). If it is separately managed, the number of business models is three (i.e., investment banking, one business model for the first four subsidiaries and a third business model for the fifth subsidiary). If not, the number of business models is two (i.e., one for retail banking and one for investment banking). In the case of two business models, all the debt securities held by the retail banking business would be accounted for at fair value through other comprehensive income, unless the sales activity of the fifth subsidiary is not significant to the retail banking portfolio.

Illustration 4-2: Splitting portfolios

Entity A has debt instruments worth CU100m, comprising notes with maturities of three to five years. CU3m of the portfolio is sold and reinvested at least once a year, while the remaining CU97m of investments are typically held to near their maturity. First, the entity needs to use judgement to determine whether it has:

- (a) Two business models: (i) CU97m of debt instruments held to near their maturity; and (ii) CU3m of debt instruments which are actively bought and sold, provided those assets can be separately identified

Or

- (b) One business model applied to the overall portfolio of CU100m debt investments

If scenario (a) above is considered more appropriate (e.g., the entity intends to continue to sell and reinvest a distinct part of the portfolio in the same proportions as it has in past years), the entity could achieve amortised cost classification for a majority of the debt instruments and would probably need to account for the remaining debt instruments at fair value through profit or loss. This is more likely to be the case where there is clearly a different management objective for the two groups of assets and their performance is measured, and management is compensated, accordingly.

Alternatively, if scenario (b) is considered more appropriate, the entity needs to determine whether the level of expected sales and repurchases is more than infrequent and is significant in value, requiring the whole portfolio to be measured at fair value through profit or loss or fair value through other comprehensive income (see section 4.2.1 above). Whether the assets are required to be measured at fair value through profit or loss instead of fair value through other comprehensive income also depends on whether the portfolio is managed on a fair value basis and fair value information is primarily used to assess asset's performance and to make decisions.

Illustration 4-3: Credit risk management activities

An entity holds investments to collect their contractual cash flows. The funding needs of the entity are predictable, and the maturity of its financial assets is matched to its estimated funding needs.

The entity performs credit risk management activities with the objective of maintaining the credit risk of the portfolio within defined risk limits. In the past, sales have typically occurred when the financial assets' credit risk has increased such that the assets no longer meet the entity's documented investment policy.

Reports to key management personnel focus on the credit quality of the financial assets and the contractual return. The entity also monitors fair values of the financial assets, among other information.

Irrespective of their frequency and value, sales due to an increase in the assets' credit risk are not inconsistent with a business model whose objective is to hold financial assets to collect contractual cash flows, because the credit quality of financial assets is relevant to the entity's ability to collect contractual cash flows.

Credit risk management activities that are aimed at avoiding potential credit losses due to credit deterioration are integral to such a business model. Selling a financial asset because it no longer meets the credit criteria specified in the entity's documented investment policy is an example of a sale that has occurred due to an increase in credit risk. However, this conclusion cannot be extended to sales to avoid excessive credit concentration (see also Illustration 4-4 below).

Although the entity considers, among other information, the financial assets' fair values from a liquidity perspective (i.e., the cash amount that would be realised if the entity needs to sell assets), the entity's objective is to hold the financial assets in order to collect the contractual cash flows.

Therefore, under the fact pattern specified, the entity will still be able to measure the portfolio at amortised cost.

In the absence of a documented investment or similar policy, the entity may be able to demonstrate in other ways that a sale only occurred due to an increase in credit risk. *[IFRS 9.B4.1.4 Example 1].*

Illustration 4-4: Sales to manage concentration risk

An entity sells financial assets to manage the concentration of the entity's credit risk to a particular obligor, country, or industrial sector, without an increase in the assets' credit risk.

Such sales may be consistent with a business model whose objective is to hold financial assets in order to collect contractual cash flows, but only to the extent that they are infrequent (even if significant in value) or insignificant in value both individually and in aggregate (even if frequent). That means such sales are treated no differently than sales for any other reason. Thus, if such sales are more than infrequent and are not insignificant in value (both individually and in aggregate), then the business model would not qualify to be held to collect, but is likely to be consistent with a business model whose objective is to hold financial assets in order to collect contractual cash flows and to sell financial assets. *[IFRS 9.B4.1.3B].*

Illustration 4-5: Credit-impaired financial assets in a hold to collect business model

An entity's business model is to purchase portfolios of financial assets, such as loans. Those portfolios may or may not include financial assets that are credit-impaired, that is, loans for which there have already been one or more events occurring before purchase that have had a detrimental impact on future cash flows. If payment on the loans is not made on a timely basis, the entity attempts to realise the contractual cash flows through various means - for example, by contacting the debtor by mail, telephone or other methods. The entity's objective is to collect contractual cash flows and the entity does not manage any of the loans in this portfolio with an objective of realising cash flows by selling them. In some cases, the entity enters into interest rate swaps to change the interest rate on particular financial assets in a portfolio from a floating interest rate to a fixed interest rate.

The objective of the entity's business model is to hold the financial assets in order to collect the contractual cash flows. The same analysis would apply even if the entity does not expect to receive all of the contractual cash flows (e.g., some of the financial assets are credit impaired at initial recognition). The fact that the entity has entered into derivatives to modify the cash flows of the portfolio does not in itself change the entity's business model. *[IFRS 9.B4.1.4 Example 2].*

Illustration 4-6: Securitisation

An entity has a business model with the objective of originating loans to customers and subsequently to sell those loans to a securitisation vehicle. The securitisation vehicle issues instruments to investors. The originating entity controls the securitisation vehicle and thus consolidates it. The securitisation vehicle collects the contractual cash flows from the loans and passes them on to its investors.

It is assumed for the purposes of this example that the loans continue to be recognised in the consolidated statement of financial position because they are recognised by the securitisation vehicle.

The consolidated group originated the loans with the objective of holding them to collect the contractual cash flows and, therefore, measures them at amortised cost. The same conclusion may be drawn if the securitisation vehicle is not consolidated but the originating entity is unable to derecognise the assets (see section 4.2.2 above).

However, the originating entity has an objective of realising cash flows on the loan portfolio by selling the loans to the securitisation vehicle, so for the purposes of its separate financial statements it would not be considered to be managing this portfolio in order to collect the contractual cash flows, but to sell them. The loans would probably need to be recorded at fair value through profit or loss as long as they continue to be recognised. [IFRS 9.B4.1.4 Example 3].

Illustration 4-7: Liquidity portfolio for stress case scenarios

A financial institution holds financial assets to meet liquidity needs in a 'stress case' scenario (e.g., a run on the bank's deposits). The entity does not anticipate selling these assets except in such a scenario. The entity monitors the credit quality of the financial assets and its objective in managing the financial assets is to collect the contractual cash flows. The entity evaluates the performance of the assets based on interest revenue earned and credit losses realised.

However, the entity also monitors the fair value of the financial assets from a liquidity perspective to ensure that the cash amount that would be realised if the entity needed to sell the assets in a stress case scenario would be sufficient to meet the entity's liquidity needs. Periodically, the entity makes sales that are insignificant in value to demonstrate liquidity.

The objective of the entity's business model is to hold the financial assets to collect contractual cash flows.

The analysis would not change even if during a previous stress case scenario, the entity made sales that were significant in value in order to meet its liquidity needs. However, see the discussion in section 4.2.1.A above regarding considerations for new financial assets when scenarios that were previously considered stress scenarios are no longer reasonably expected not to occur. Similarly, recurring sales activity that is insignificant in value is not inconsistent with holding financial assets to collect contractual cash flows.

However, the assessment would change if the entity periodically sells debt instruments that are significant in value to demonstrate liquidity, or if the entity sells the debt instruments to cover everyday liquidity needs. See Illustration 4-9 below. [IFRS 9.B4.1.4 Example 4].

Illustration 4-8: Anticipated capital expenditure

A non-financial entity anticipates capital expenditure in a few years. The entity invests its excess cash in short-term and long-term financial assets so that it can fund the expenditure when the need arises. Many of the financial assets have contractual lives that exceed the entity's anticipated investment period. Therefore, the entity will need to sell some of the assets before maturity to meet those funding needs.

The objective of the business model is achieved by both collecting contractual cash flows and selling financial assets.

In contrast, consider an entity that anticipates a cash outflow in five years to fund capital expenditures and invests excess cash in short-term financial assets. When the investments mature, the entity reinvests the cash into new short-term financial assets. The entity maintains this strategy until the funds are needed, at which time the entity uses the proceeds from the maturing financial assets to fund the capital expenditures. Only insignificant sales occur before maturity (unless there is an increase in credit risk). The objective of such a business model is to hold financial assets in order to collect contractual cash flows. [IFRS 9.B4.1.4C Example 5].

Illustration 4-9: Liquidity portfolio for everyday liquidity needs

A financial institution holds financial assets to meet its everyday liquidity needs. In the past, this has resulted in frequent sales activity and such sales have been significant in value. This activity is expected to continue in the future as everyday liquidity needs can rarely be forecast with any accuracy.

The objective of the business model is meeting everyday liquidity needs. The entity achieves this objective by both collecting contractual cash flows and selling financial assets. This means that both collecting contractual cash flows and selling financial assets are integral to achieving the business model's objective and the financial assets are measured at fair value through other comprehensive income. [IFRS 9.B4.1.4C Example 6]. The frequent and significant sales activity does not necessarily mean that the portfolio is held for trading because under the business model objective above, assets are not sold with the intention of short-term profit taking.

Illustration 4-10: Opportunistic portfolio management

A financial institution holds a portfolio of financial assets. The entity actively manages the return on the portfolio on an opportunistic basis trying to increase the return, without a clear intention of holding the financial assets to collect contractual cash flows (although it might end up holding the assets if no other investment opportunities arise). That return consists of collecting contractual payments as well as gains and losses from the sale of financial assets.

As a result, the entity holds financial assets to collect contractual cash flows and sells financial assets to reinvest in higher yielding financial assets. In the past, this strategy has resulted in frequent sales activity and such sales have been significant in value. It is expected that the sales activity will continue in the future.

The entity achieves the objective stated above by both collecting contractual cash flows and selling financial assets. Both collecting contractual cash flows and selling financial assets are integral to achieving the business model's objective and, thus, the financial assets are measured at fair value through other comprehensive income. [IFRS 9.B4.1.4C Example 6].

Sometimes, entities may manage a portfolio to manage its yield. In such cases, the portfolio manager may be remunerated based on the overall yield of the portfolio and fair value gains or losses may not be considered in his or her remuneration. Furthermore, management's documented strategy and defined key performance indicators may emphasise optimising long-term yield rather than fair value gains or losses and accordingly, the entity's management reporting focuses on yield rather than fair value of the debt instruments within the portfolio. However, the fact that it is not the entity's objective to realise fair value gains or losses is not sufficient in itself to be able to conclude that measurement at amortised cost is appropriate as the business model objective is not only holding financial assets to collect contractual cash flows but also results in sales which are more than infrequent and significant in value. Thus, such a portfolio would be measured at fair value through other comprehensive income.

Illustration 4-11: Replication portfolios**Fact pattern 1: Insurance company**

An insurer holds financial assets in order to fund insurance contract liabilities. The insurer uses the proceeds from the contractual cash flows on the financial assets to settle insurance contract liabilities as they come due. To ensure that the contractual cash flows from the financial assets are sufficient to settle those liabilities, the insurer undertakes significant buying and selling activity on a regular basis to rebalance its portfolio of assets and to meet cash flow needs as they arise.

The objective of the business model is to fund the insurance contract liabilities. To achieve this objective, the entity collects contractual cash flows as they come due and sells financial assets to maintain the desired profile of the asset portfolio. Thus, both collecting contractual cash flows and selling financial assets are integral to achieving the business model's objective and it follows that the financial assets are measured at fair value through other comprehensive income. [IFRS 9.B4.1.4C Example 7].

Fact pattern 2: Bank

A bank allocates investments into maturity bands to match the expected duration of customers' time deposits. The invested assets have a similar maturity profile and amount to the corresponding deposits. The target ratio of assets to deposits for each maturity band has pre-determined minimum and maximum levels. For example, if the ratio exceeds the maximum level because of an unexpected withdrawal of deposits, the bank will sell some assets to reduce the ratio.

Meanwhile, new assets will be acquired when necessary (i.e., when the ratio of assets to deposits falls below the pre-determined minimum level). The expected repayment profile of the deposits would be updated on a quarterly basis, based on changes in customer behaviour.

The question is whether adjusting the assets/deposits ratio by selling assets to correspond with a change in the expected repayment profile of the deposits would mean that the business model is inconsistent with the objective of holding to collect the contractual cash flows. In these circumstances, an analogy can be drawn to the insurance company above.

If the bank has a good track record of forecasting its deposit repayments, so that sales are expected to be infrequent, it is possible that the objective of the business model is to hold the investments to collect contractual cash flows. But, if significant sales take place each year, it is likely to be difficult to rationalise such practice with this objective. Due consideration will need to be given to the magnitude of sales and the reasons for the sales.

Illustration 4-12: Loans that are to be sub-participated

An entity originates loans so that it holds part of the portfolio to maturity, but 'sub-participates' a portion of the loans to other banks, so that it transfers substantially all the risks and rewards and so achieves derecognition. The question arises whether, for the purposes of application of IFRS 9, the entity has one business model or two.

The entity could consider the activities of lending to hold and lending to sell or sub-participate as two separate business models, requiring different skills and processes. Whilst the financial assets resulting from the former would typically qualify for amortised cost measurement, those from the latter would probably not and would, therefore, most likely need to be measured at fair value through profit or loss. This split approach is likely to be acceptable as long as the entity is able to forecast with reasonable confidence that it will indeed hold the assets (or the proportion of a group of identical assets) that it determines to be measured at amortised cost.

How we see it

If a loan is assessed, in part, to be sold or sub-participated, this raises the additional issue of whether a single financial asset can be classified into two separate business models. We believe that this split classification is consistent with the derecognition principles of IFRS 9 (see Chapter 48) and is applied in practice.

In some cases, an entity may fail to achieve the intended disposal, having previously classified a portion of a loan at fair value through profit or loss because of the intention to sell.

The standard requires classification to be determined in accordance with the business model applicable at the point of initial recognition of the asset. In this example, the fact that the entity fails to achieve an intended disposal does not trigger a reclassification in accordance with the standard as the threshold for reclassification requires a change in business model that must be significant to the entity's operations and demonstrable to external parties. Therefore, loans or portions of loans that the entity fails to dispose of would continue to be recorded at fair value through profit or loss.

Illustration 4-13: Portfolio managed on a fair value basis

An entity manages a portfolio and measures its performance on a fair value basis and makes decisions based on the fair value of the financial assets. Such an objective typically results in frequent sales and purchases of financial assets.

A portfolio of financial assets that is managed and whose performance is evaluated on a fair value basis is neither held to collect contractual cash flows nor held both to collect contractual cash flows and to sell financial assets. In addition, a portfolio of financial assets that meets the definition of held for trading is not held to collect contractual cash flows or held both to collect contractual cash flows and to sell financial assets. The entity is primarily focused on fair value information and uses that information to assess the assets' performance and to make decisions.

Even though the entity will collect contractual cash flows while it holds financial assets in the fair value through profit or loss category, this is only incidental and not integral to achieving the business model's objective. Consequently, such portfolios of financial assets must be measured at fair value through profit or loss. [IFRS 9.B4.1.5].

5 Characteristics of the contractual cash flows of the instrument

The assessment of the characteristics of a financial asset's contractual cash flows aims to identify whether they are 'solely payments of principal and interest on the principal amount outstanding'. Hence, the assessment is colloquially referred to as the 'SPPI test'.

The contractual cash flow characteristics test is designed to screen out financial assets on which the application of the effective interest method either is not viable from a pure mechanical standpoint or does not provide useful information about the uncertainty, timing and amount of the financial asset's contractual cash flows.

Because the effective interest method is essentially an allocation mechanism that spreads interest revenue or expense over time, amortised cost is only appropriate for simple cash flows that have low variability such as those of traditional unleveraged loans and receivables, and 'plain vanilla' debt instruments. Accordingly, the contractual cash flow characteristics test is based on the premise that it is only when the variability in the contractual cash flows maintains the holder's return in line with a 'basic lending arrangement' that the application of effective interest method provides useful information. [IFRS 9.BC4.23, IFRS 9.BC4.158, IFRS 9.BC4.171, IFRS 9.BC4.172].

In this context, the term 'basic lending arrangement' is used broadly to capture both originated and acquired financial assets, the lender or the holder of which is looking to earn a return that compensates primarily for the time value of money and credit risk. However, such an arrangement can also include other elements that provide consideration for other basic lending risks such as liquidity risks, costs associated with holding the financial asset for a period of time (e.g., servicing or administrative costs) and a profit margin. [IFRS 9.B4.1.7A, IFRS 9.BC4.182(b)].

In contrast, contractual terms that introduce a more than *de minimis* exposure (see section 5.4.1 below) to risks or volatility in the contractual cash flows that is unrelated to a basic lending arrangement, such as exposure to changes in equity prices or commodity prices, do not give rise to contractual cash flows that are solely payments of principal and interest on the principal amount outstanding. [IFRS 9.B4.1.7A, IFRS 9.B4.1.18].

The IASB noted that it believes that amortised cost would provide relevant and useful information if the contractual cash flows do not introduce risks or volatility that are inconsistent with a basic lending arrangement. [IFRS 9.BC4.180].

The following sections cover the main aspects of the contractual cash flow characteristics test, starting with the meaning of the terms 'principal' and 'interest' in sections 5.1 and 5.2 below, and discusses instruments that normally pass the test in section 5.3 below. So called 'modified' contractual cash flows and their effect on the contractual cash flow characteristics test are dealt with in section 5.4 below. Non-recourse assets are separately covered in section 5.5 below. Contractually linked instruments are covered in section 5.6 below. Loans with ESG features are specifically dealt with in section 5.4.7 below.

5.1 The meaning of 'principal'

'Principal' is not a defined term in IFRS 9. However, the standard states that, for the purposes of applying the contractual cash flow characteristics test, the principal is "the fair value of the asset at initial recognition" and that it may change over the life of the financial asset (for example, if there are repayments of principal). [IFRS 9.4.1.3(a), IFRS 9.B4.1.7B].

The IASB believes that this usage reflects the economics of the financial asset from the perspective of the current holder; in other words, the entity would assess the contractual cash flow characteristics by comparing the contractual cash flows to the amount that it actually invested. [IFRS 9.BC4.182(a)].

Illustration 5-1: The meaning of 'principal'

Entity A issued a bond with a contractually stated principal of CU1,000,000. The bond was originally issued at CU990,000. Because interest rates have risen sharply since the bond was originally issued, Entity B, the current holder of the bond, acquired the bond in the secondary market for CU975,000. From the perspective of entity B, the principal amount is CU975,000. The principal will increase over time as the discount of CU25,000 amortises out until it reaches the contractual amount of CU1,000,000 at the bond's maturity.

The principal is, therefore, not necessarily the contractual par amount, nor (when the holder has acquired the asset subsequent to its origination) is it necessarily the amount that was advanced to the debtor when the instrument was originally issued.

The description of 'principal' as the fair value of an instrument on initial recognition avoids a concern that any financial asset acquired or issued at a substantial discount would be leveraged and hence would not have economic characteristics of interest.

A clear understanding of what the standard means by 'principal' is also necessary for the appropriate and consistent application of the contractual cash flow characteristics test to prepayable financial assets (see section 5.4.4 below).

An entity must assess whether contractual cash flows are solely payments of principal and interest on the principal amount outstanding for the currency in which the financial asset is denominated. In assessing the time value of money element of the return, the entity must consider the currency in which the financial asset is denominated, because interest rates vary by currency (see Illustration 5-18 in section 5.4.5 below). [IFRS 9.B4.1.8, IFRS 9.BC4.177].

5.2 The meaning of 'interest'

IFRS 9 states that the most significant elements of interest within a basic lending arrangement are typically the consideration for the time value of money and credit risk. In addition, interest may also include consideration for other basic lending risks (for example, liquidity risk) and costs (for example, administrative costs) associated with holding the financial asset for a particular period of time. Furthermore, interest may include a profit margin that is consistent with a basic lending arrangement.

In extreme economic circumstances, interest can be negative if, for example, the holder of a financial asset effectively pays a fee for the safekeeping of its money for a particular period of time and that fee exceeds the consideration the holder receives for the time value of money, credit risk and other basic lending risks and costs.

However, contractual terms that introduce exposure to risks or volatility in the contractual cash flows that is unrelated to a basic lending arrangement, such as exposure to changes in equity prices or commodity prices, do not give rise to contractual cash flows that are solely payments of principal and interest on the principal amount outstanding. An originated or a purchased financial asset can be a basic lending arrangement irrespective of whether it is a loan in its legal form. [IFRS 9.4.1.3(b), IFRS 9.B4.1.7A].

Leverage increases the variability of the contractual cash flows with the result that they do not have the economic characteristics of interest. For example, stand-alone option, forward and swap contracts are financial assets that include such leverage. Thus, such contracts do not meet the SPPI test and cannot be subsequently measured at amortised cost or fair value through other comprehensive income. [IFRS 9.B4.1.9].

The IASB notes that the assessment of interest focuses on what the entity is being compensated for (i.e., whether the entity is receiving consideration for basic lending risks, costs and a profit margin or is being compensated for something else), instead of how much the entity receives for a particular element. For example, the Board acknowledges that different entities may price the credit risk element differently. [IFRS 9.BC4.182(b)]. Although two entities may receive different amounts for the same element of interest, e.g., credit risk, they could both conclude that their consideration for credit risk is appropriate within a basic lending arrangement.

If the contractual cash flows are inconsistent with a basic lending arrangement, no further analysis is required and the instrument will fail the SPPI requirements.

Time value of money is the element of interest that provides consideration for only the passage of time. The time value of money element does not provide consideration for other risks or costs associated with holding the financial asset. To make this assessment, an entity applies judgement and considers relevant factors such as the currency in which the financial asset is denominated, and the period for which the interest rate is set. [IFRS 9.B4.1.9A].

The IASB also notes that, as a general proposition, the market in which the transaction occurs is relevant to the assessment of the time value of money element. For example, in Europe, it is common to reference interest rates to EURIBOR and in the United States it is common to reference interest rates to the prime rate. However, a particular interest rate does not necessarily reflect consideration for only the time value of money merely because that rate is considered 'normal' in a particular market. For example, if an interest rate is reset every year but the reference rate is always a 15-year rate, it would be difficult for an entity to conclude that such a rate provides consideration for only the passage of time, even if such pricing is commonly used in that particular market. Accordingly, the IASB believes that an entity must apply judgement to conclude whether the stated time value of money element meets the objective of providing consideration for only the passage of time. [IFRS 9.BC4.178].

As part of the IASB's work to address the effects of IBOR reform on financial reporting, the IASB discussed in October 2019, whether or not backward-looking interest rates would satisfy the contractual characteristics test. See section 5.4.2 below for further consideration of when there are contractual features that modify the consideration for the time value of money.

2024 Amendments applicable for annual periods beginning on or after 1 January 2026 (with earlier application permitted)

As part of the 2024 Amendments, the IASB has clarified the guidance above for the assessment of whether the lender's compensation is consistent with a basic lending arrangement and the different elements of interest. The Amendments clarify that:

- The assessment of interest focuses on what the lender is compensated for rather than how much. However, the amount of compensation may indicate that the lender is being compensated for something other than basic lending risks and costs.
- Contractual cash flows are inconsistent with a basic lending arrangement if they are indexed to a variable that is not a basic lending risk or cost (for example, the value of equity instruments, the price of a commodity) or if they represent a share of the debtor's revenue or profit.
- Contractual cash flows that are inconsistent with a basic lending arrangement remain inconsistent even if such contractual terms are common to the market in which the entity operates. [IFRS 9(2026).B4.1.8A]. The term 'basic lending arrangement' refers to the nature of a lending arrangement, rather than to an arrangement that is common or widespread in a particular market or jurisdiction. [IFRS 9(2026).BC4.262].

5.3 Contractual features that normally pass the test

The most common instruments that normally pass the test are plain vanilla debt instruments which are acquired at par, have a fixed maturity and pay interest that is fixed at inception. Instruments that pay variable interest also normally pass the test, although further consideration is required in that case (see section 5.4.4 below).

There are several features that are common in many financial assets and which would not usually cause the contractual cash flow characteristics test to be failed. This section describes some of those features and instruments that are normally unproblematic, but also highlights cases that might result in an asset failing the contractual cash flow characteristics test. Features that are more complex and need more consideration are described in section 5.4 below.

5.3.1 Conventional subordination features

In many lending transactions the instrument is ranked relative to amounts owed by the borrower to its other creditors. An instrument that is subordinated to other instruments may be considered to have contractual cash flows that are payments of principal and interest on the principal amount outstanding if the debtor's non-payment arises only on a breach of contract and the holder has a contractual right to unpaid amounts of principal and interest on the principal amount outstanding even in the event of the debtor's bankruptcy.

For example, a trade receivable that ranks its creditor as a general creditor would qualify as having payments of principal and interest on the principal amount outstanding. This is the case even if the debtor has issued loans that are collateralised, which in the event of bankruptcy would give that loan holder priority over the claims of the general creditor in respect of the collateral but does not affect the contractual right of the general creditor to unpaid principal and other amounts due. [IFRS 9.B4.1.19].

On the other hand, if the subordination feature limits the contractual cash flows in any other way or introduces any kind of leverage, the instrument would fail the contractual cash flow characteristics test.

5.3.2 Full recourse loans secured by collateral

The fact that a full recourse loan is collateralised does not in itself affect the analysis of whether the contractual cash flows are solely payments of principal and interest on the principal amount outstanding. [IFRS 9.B4.1.13 Instrument D]. However, a full recourse loan may, in substance, be non-recourse if the borrower has limited other assets, in which case an entity would need to assess the particular underlying assets (i.e., the collateral) to determine whether or not the contractual cash flows of the loan are payments of principal and interest on the principal amount outstanding. [IFRS 9.B4.1.17]. If there is insufficient equity or collateral in the borrower to ensure that payments of the contractual cash flows are made, then the loan may fail the contractual cash flow characteristics test. However, if sufficient equity or collateral is available then the contractual cash flow characteristics test may be met (see Illustration 5-28 in section 5.5 below). Judgement may be necessary in determining whether there is adequate collateral or equity to ensure that all the contractual cash payments will be made.

As part of the IFRS 9 PIR, the IASB has made amendments to IFRS 9 in order to clarify the application of the contractual cash flow characteristics guidance to financial assets with non-recourse features (see section 5.5 below).

5.3.3 Bonds with a capped or floored interest rate

Some bonds may have a stated maturity date but pay a variable market interest rate that is subject to a cap or a floor. The contractual cash flows of such instrument could be seen as being an instrument that has a fixed interest rate and an instrument that has a variable interest rate.

These both represent payments of principal and interest on the principal amount outstanding as long as the interest reflects consideration for the time value of money, for the credit risk associated with the instrument during the term of the instrument and for other basic lending risks and costs, as well as a profit margin.

Therefore, such an instrument can have cash flows that are solely payments of principal and interest on the principal amount outstanding. A feature such as an interest rate cap or floor may reduce cash flow variability by setting a limit on a variable interest rate or increase the cash flow variability because a fixed rate becomes variable. [IFRS 9.B4.1.13 *Instrument C*]. If there is no leverage and no mismatch of term with respect to interest, then the instrument will pass the contractual cash flows characteristics test.

There is no requirement to determine whether the cap or floor is in the money on initial recognition.

Caps and floors will generally pass the SPPI test without further analysis, apart from some instruments, namely those with features that create leverage. These 'exotic' instruments would require detailed assessment and judgement. An instrument with a floor which is deeply in the money at origination is not seen as a problem for passing the contractual cash flows characteristics test.

We assume that a variable rate debt instrument that is subject to both a cap and a floor (known as a collar) would also satisfy the contractual cash flow characteristics test for the same reasons.

In many jurisdictions interest rates on loans are capped by law to an absolute amount or a multiple of an index rate. Whereas a capped interest rate meets the contractual cash flow characteristics test when the interest reflects the time value of money as discussed above, where the cap is referenced to a multiple of an index rate, it can be argued that the cap introduces leverage into the instrument. However, it can also be argued that the feature is not intended to introduce leverage into the market but to protect consumers, as a cap will only limit the total interest paid by the borrower. IFRS 9 also permits interest rates that are regulated to meet the contractual cash flow characteristics test if the interest rate represents consideration that is broadly consistent with the passage of time. [IFRS 9.B4.1.9E]. If the cap is introduced by the regulator to protect consumers by providing an estimate of the fair market interest rate it could be considered to represent consideration for the passage of time (see section 5.4.3 below).

The issue of whether regulator driven caps are consistent with the SPPI criteria was considered by the IASB as part of the IFRS 9 PIR of Classification and Measurement, but not taken forward as it was not considered to be sufficiently widespread to merit amending IFRS 9 for.

5.3.4 Lender has discretion to change the interest rate

In some instances, the lender may have the right to unilaterally adjust the interest rates of its loans in accordance with its own business policy. However, if the borrower rejects the new rate, it has the right to terminate the contract and prepay the loan at either par, or par plus a pre-payment penalty. The prepayment terms would need to be assessed in combination with the lender's discretion to change the rate in order to assess overall SSPI compliance of the loan.

These features do not *per se* result in the loans failing the contractual cash flow characteristics test. However, whether the loan passes the test depends on facts and circumstances which require assessment on a case-by-case basis, specifically whether the adjusted interest rate represents consideration for the time value of money, credit risk and other basic lending risk and costs, as well as a profit margin. As part of this assessment, an entity might consider whether the change in interest rate applies to all similar loans, including new loans and the ones in issue, or only to one or certain individual borrowers (this excludes changes in interest rates due to changes in the credit spread of the borrower). The more targeted the increase is, the higher the likelihood that it is reflective of risks specific to the borrower and hence SPPI compliant.

Note that in practice a bank is likely to be restricted as to how much it can increase the interest rate: if it is set too high the borrower will prepay and the bank is unlikely to remain competitive.

5.3.5 Unleveraged inflation-linked bonds

For some financial instruments, payments of principal and interest on the principal amount outstanding are linked to an inflation index of the currency in which the instrument is issued. The inflation link is not leveraged. Linking payments of principal and interest on the principal amount outstanding to an unleveraged inflation index resets the time value of money to a current level. In other words, the interest rate on the instrument reflects 'real' interest. Thus, the interest amounts are consideration for the time value of money on the principal amount outstanding.

We believe measurement at amortised cost is possible even if the principal of an inflation-indexed bond is not protected, provided the inflation link is not leveraged. Payments on both the principal and interest will be inflation-adjusted and representative of 'real' interest which is consideration for the time value of money on the principal amount outstanding. [IFRS 9.B4.1.13 Instrument A].

Illustration 5-2: Unleveraged inflation linked bond

Entity A invests in euro-denominated bonds with a fixed maturity issued by Entity B. Interest on the bond is linked directly to the inflation index of Eurozone Country C, which is Entity B's principal place of business. The question arises whether Entity A can measure the euro bonds at amortised cost or fair value through other comprehensive income given that interest is not linked to the inflation index of the entire Eurozone area.

The bond is denominated in euros and Eurozone Country C is part of the Eurozone, therefore, we consider the inflation link to be acceptable. The inflation index reflects the inflation rate of the currency in which the bond is issued since it is the inflation index of Entity B's economic environment, and the euro is the currency for that economic environment.

By linking the inflation index to the inflation rate of Eurozone Country C, Entity B is reflecting 'real' interest for the economic environment in which it operates. Hence, in these circumstances, Entity A may regard the interest as consideration for the time of value of money and credit risk associated with the principal amount outstanding on the bond.

As part of the post-implementation review of IFRS 9 - Classification and Measurement, respondents to RFI asked whether linkage to an inflation index might cause some loans to fail the SPPI test as the adjustments may be considered as introducing leverage in the context of recent significant rises in inflation rates. In April 2022 the Staff expressed the view that the conclusion in IFRS 9 that a contractual link to an unleveraged inflation index represents consideration for the time value of money on the principal amount outstanding, remains relevant regardless of the level of inflation. In September 2022, the Board decided not to take further action on this matter.

5.3.6 Features which compensate the lender for changes in tax or other related costs

Some loans include clauses which require the borrower to compensate the lender for changes in tax or regulatory costs during the life of the loan. The interest rate for such loans is usually set at a rate which takes into account the specific tax or regulatory environment, e.g., interest receivable may be exempt from tax and the lender will consequently offer the borrower a below market rate. Any change to the tax laws which affect such an arrangement could result in a loss to the lender as tax could become deductible from interest receivable. The compensation clause is therefore intended to make the lender whole in the event of such a change. As the effect of such a clause is to enable the lender to maintain its profit margin it can be considered to be consistent with a basic lending arrangement.

5.4 Contractual features that may affect the classification

Sometimes, contractual provisions may affect the cash flows of an instrument such that they do not give rise to only a straightforward repayment of principal and interest. An entity is required to carefully assess those features in order to conclude whether the instrument passes the contractual cash flow characteristics test. It is important to note that the standard grants an exception for all features that are non-genuine or have only a *de minimis* impact and can be disregarded when making the assessment (see section 5.4.1 below).

Furthermore, the standard allows the time value of money element of interest to be 'modified' but only when the resulting cash flows could not be significantly different from an instrument that has an unmodified time value of money element (see section 5.4.2 below). It also allows regulated interest rates if they provide consideration that is broadly consistent with the passage of time and do not introduce risks that are inconsistent with a basic lending arrangement (see section 5.4.3 below).

An instrument may have other features that change the timing or amount of contractual cash flows which need to be assessed as to whether they represent payments of principal and interest on the principal outstanding. Examples of such features are variable interest rates, interest rates that step up, prepayment and extension options (see section 5.4.4 below) and sustainability-linked cash flows (see section 5.4.7 below). Lastly, there are features that most likely result in an instrument failing the contractual cash flow characteristics test because they introduce cash flow volatility caused by risks that are inconsistent with a basic lending arrangement (see section 5.4.5 below).

5.4.1 *De minimis* and non-genuine features

A contractual cash flow characteristic does not affect the classification of the financial asset if it could have only a *de minimis* effect on the contractual cash flows of the financial asset (see section 5.4.1.A below).

In addition, if a contractual cash flow characteristic could have an effect on the contractual cash flows that is more than *de minimis* (either in a single reporting period or cumulatively) but that cash flow characteristic is not genuine, it does not affect the classification of a financial asset (see section 5.4.1.B below).

5.4.1.A *De minimis* features

The *de minimis* threshold concerns the magnitude of the possible effects of the contractual cash flow characteristics. To be considered *de minimis*, the impact of the feature on the cash flows of the financial asset must be expected to be *de minimis* in each reporting period and cumulatively over the life of the financial asset. This assessment is made at initial recognition of the instrument.

To make this determination, an entity must consider the possible effect of the contractual cash flow characteristics in each reporting period and cumulatively over the life of the financial instrument. That would be the case even if the feature could lead to a significant increase in cash flows in one period and a significant decrease in another period and these amounts offset each other on a cumulative basis. Likewise, if the feature's impact on a period's cash flows is always *de minimis* but its cumulative effect over time could be more than *de minimis* such a feature would not be considered *de minimis*. For such instruments the nature of the variability determines whether amortised cost would provide useful information by allocating cash flows over time.

Entities must consider what is meant by '*de minimis*'. This is not specifically defined within IFRS 9, however, the IASB Staff noted² that an entity should be able to conclude, without a detailed quantitative analysis, whether a feature is *de minimis*. If an entity is not able to conclude without a detailed quantitative analysis that a feature is *de minimis*, that would indicate that the feature is not *de minimis*. The same Staff paper includes the following example.

Illustration 5-3: The meaning of '*de minimis*'

A financial asset contains a contractual provision that requires the issuer to comply with applicable regulatory requirements, including filing its financial statements with a regulatory body on a timely basis. If the issuer fails to do so, it is required to pay a fixed fee for each day until the financial statements are filed. The amount of such a daily fee is *de minimis*. The maximum amount of the fee that the issuer could be required to pay until the repayment feature is triggered is also *de minimis*.

In this example, the existence of a fee that could be triggered if the issuer fails to file its financial statements on time is not inconsistent with the SPPI condition because its impact on the asset's contractual cash flows is always *de minimis*. This analysis would apply to any feature regardless of its nature or trigger as long as its impact on the asset's contractual cash flows is always *de minimis*.

The analysis of whether a contractual feature is '*de minimis*' requires judgement, in particular in a low-interest environment where an adjustment can easily become significant in relative terms.

² [IASB Staff paper 6D](#): Project: *Financial Instruments: Classification and Measurement*, Paper topic: *Contractual Cash Flow Characteristics: The Meaning of 'Interest'*, IASB Meeting, September 2013. Available on the IFRS Foundation's website.

5.4.1.B Non-genuine features

Non-genuine features, as used in this context, are contingent features. A cash flow characteristic is not genuine if it affects the instrument's contractual cash flows only on the occurrence of an event that is extremely rare, highly abnormal and very unlikely to occur. This means that although the feature can potentially lead to cash flows which are not solely payments of principal and interest, and those cash flows may even be significant, the instrument would still qualify for amortised cost or fair value through other comprehensive income measurement, depending on the business model. (See also Chapter 43).

Illustration 5-4: The meaning of 'non-genuine'

IAS 32 requires terms of contracts that are not genuine to be ignored when assessing whether a financial instrument gives rise to an obligation to pay cash. An example of a clause that has caused some debate in this context is a 'regulatory change' clause, generally found in the terms of capital instruments issued by financial institutions such as banks and insurance companies. Such entities are generally required by local regulators to maintain certain minimum levels of equity or highly subordinated debt (generally referred to as regulatory capital) in order to be allowed to do business. [IAS 32.25, IAS 32.AG29]

A 'regulatory change' clause could typically require an instrument which, at the date of issue, is classified as regulatory capital to be repaid in the event that it ceases to be so classified. The practice so far of the regulators in many markets has been to make changes to a regulatory classification with prospective effect only, such that any instruments already in issue continue to be regarded as regulatory capital even though they would no longer be so under the new rules.

This has led some to question whether a 'regulatory change' clause can be regarded as a contingent settlement provision which is 'not genuine'. This is ultimately a matter for the judgement of entities in the context of the relevant regulatory environment(s). This judgement has not been made easier by the greater unpredictability of the markets (and therefore of regulators' responses to it) since the financial crisis. However, as the clause was inserted to provide regulators with flexibility in their actions, even if they do not normally exercise that flexibility, it would be difficult to argue that it is 'non-genuine'.

How we see it

Normally, terms are included in a contract for an economic purpose and therefore are, in general, genuine. The threshold 'not genuine' is presumably intended to deal with clauses that are inserted into the terms of financial instruments for some legal or tax reasons, but have no real economic purpose or consequence.

Disregarding non-genuine features also means that the classification requirements of IFRS 9 cannot be overridden by introducing a contractual non-genuine cash flow characteristic in order to achieve a specific accounting outcome.

5.4.2 Contractual features that modify the consideration for the time value of money

In some cases, the time value of money element may be what the standard describes as 'modified' and so 'imperfect'. It cites, as an example, instances where the tenor of the interest rate does not correspond with the frequency with which it resets. In such cases, an entity must assess the modification to determine whether the contractual cash flows represent solely payments of principal and interest on the principal outstanding.

While the relationship between principal and the consideration for time value of money and credit risk does not need to be perfect, only relatively minor modifications of that relationship are consistent with payments that are SPPI. [IFRS 9.BC4.174]. In assessing whether or not any modification to the time value of money is consistent with the SPPI test, entities need to apply their own judgement.

In some circumstances, the entity may be able to make that determination by performing a qualitative assessment whereas, in other circumstances, it may be necessary to perform a quantitative analysis. [IFRS 9.B4.1.9B]. The IASB decided not to prescribe when an entity must perform a quantitative versus a qualitative assessment. [IFRS 9.BC4.177(b)]. The objective of a quantitative assessment is to determine whether or not the contractual (undiscounted) cash flows could be significantly different from the (undiscounted) cash flows that would arise if the time value of money element was not modified (referred to as 'the benchmark' cash flows).

For example, if the financial asset under assessment contains a variable interest rate that is reset every month to a one-year interest rate, the entity compares that financial asset to a financial instrument with identical contractual terms and credit risk, except the variable interest rate is reset monthly to a one-month interest rate. If the modified time value of money element could result in contractual (undiscounted) cash flows that are significantly different from the (undiscounted) benchmark cash flows, the financial asset fails the contractual cash flow characteristics test. To make this determination, the entity must consider the effect of the modified time value of money element in each reporting period and cumulatively over the life of the financial instrument. The reason for the interest rate being set this way is not relevant to the analysis. If it is clear, with little or no analysis, whether the contractual (undiscounted) cash flows on the financial asset under the assessment could (or could not) be significantly different from the (undiscounted) benchmark cash flows, an entity need not perform a detailed assessment. [IFRS 9.B4.1.9C]. 'Significantly different' is not defined in IFRS 9 and is a matter for management judgement.

When assessing a modified time value of money element, an entity must consider every interest rate scenario that is reasonably possible instead of every scenario that could possibly arise. This requirement is illustrated in Illustration 5-9 below.

If an entity concludes that the contractual (undiscounted) cash flows could be significantly different from the (undiscounted) benchmark cash flows, the financial asset does not pass the contractual cash flow characteristics test and therefore cannot be measured at amortised cost or fair value through other comprehensive income. [IFRS 9.B4.1.9D].

The following table lists examples of modifications of the consideration for the time value of money which possibly meet the contractual cash flow characteristics test, depending on the outcome of the assessment described above.

Illustration 5-5: Examples of a modified time value of money component

Modification	Fact pattern
1 Average interest rate	The stated coupon on a debt instrument is referenced to an average of long- and short-term benchmark interest rates for a specified period. For example, 3-month EURIBOR rate determined as an average of six-month and one-month rates during the previous quarter.
2 Lagging interest rate	The stated interest rate is referenced to lagging interest rates. For example, 6-month EURIBOR rate set for a 6-month period, but where the rate is fixed 2 months before the start of the interest period.
3 Tenor mismatch	The stated interest rate is reset to a reference interest rate, but the frequency of reset does not match the tenor of the reference rate. For example, the interest rate on a retail mortgage is reset semi-annually based on 3-month US LIBOR.
4 Combination of the above	The stated interest rate is reset monthly to an average 12-month reference rate. The interest rate is fixed based on the average 12-month rate for every working day in the month before the start of the interest period.

The IASB staff paper for a Board meeting in September 2013³ when the standard was being finalised, discussed this topic extensively. The staff noted that there is not a single appropriate way to determine the appropriate consideration for the time value of money for a particular instrument. Useful points that come from this discussion which entities could consider in their assessment are the following:⁴:

- Determining whether rates that are determined by averaging observed rates for a particular period, or that are set by referencing a recent historical interest rate, or whether interest rate tenor mismatch features only provide consideration for the passage of time for a particular currency requires judgement.
 - Determining whether the rate used is normal for the particular market (for the relevant duration and currency) in which the transaction occurs and whether the stated time value component of the interest rate provides compensation for just the passage of time also requires judgement. As a general proposition, the market is relevant (for example, because specific markets commonly use specific reference interest rates and because the passage of time has a link to the funding costs of the lender, which in its turn provides another link to the market). However, just because something is 'normal' in the market, that must not necessarily be accepted as the consideration just for the passage of time.
- And
- The indicators that could inform a qualitative assessment of whether any modification to the time value of money element would still be consistent with providing consideration just for the passage of time could include whether the feature has a meaningful fair value (i.e., whether the feature results in the premium or discount to the contractually stated notional amount - if it does, that would indicate consideration for other risks than just the passage of time).

Frequently asked questions

Question 5-1: Do backward-looking term rates cause instruments to fail the SPPI assessment?

In October 2019,⁵ the IASB considered whether, as part of IBOR reform, where some IBORs are replaced with backward-looking term rates (such as a rate for the next six months based on the average overnight rate for the previous six months), this would cause instruments to fail the SPPI assessment.

The IASB noted that there are no specific conditions or exceptions that would automatically disqualify contractual cash flows to be SPPI. The focus on any assessment of interest must be on what the entity is being compensated for (i.e., whether the entity is receiving consideration for basic lending risks, costs and a profit margin). The IASB concluded that the current guidance in IFRS 9 provides an adequate basis to determine whether alternative benchmark rates meet SPPI and that, provided the interest rate continues to reflect the time value of money and does not reflect other risks and features, the new instrument will pass the SPPI assessment. Entities will therefore need to apply judgement in assessing whether there are any modifications to the time value of money element in replacement benchmark rates and if there are, whether these modifications will pass the SPPI test.

Illustration 5-6: SPPI evaluation for SONIA

SONIA is a daily rate that has replaced LIBOR as the risk-free rate for sterling loans. Daily SONIA rates are compounded to determine the rate for an interest payment period such as three months. The interest to be paid is, therefore, only known at the end of the interest period. To facilitate timely payment of interest, it is useful for borrowers to know in advance what amount of interest is required to be paid. As such, the interest is determined five working days prior to the interest payment date, based on the compounded rate over a period starting and finishing five business days before the interest period begins and ends. In this instance, an entity may be able to assess from a qualitative perspective that there is no significant modification to the time value of money and, hence, the financial asset meets the SPPI criterion.

Illustration 5-7: SPPI evaluation for Adjustable-Rate Mortgages (ARMs)

ARMs are US dollar floating rate mortgages, that are reset once a year, 45 days in advance of the period, and were historically based on LIBOR. After transition from LIBOR to SOFR (Secured Overnight Financing Rate), it was recommended by the Alternative Reference Rates Committee (ARRC) that rates would be reset 45 days in advance, every six months, based on a 30-day compounded SOFR average plus a spread adjustment. The recommended spread adjustment was similar to that introduced by ISDA in its fallback for derivatives.

It was not the intent of the ARRC to introduce features that deviate from the time value of money. Rather, it has sought to achieve the optimal lending terms, considering the needs of both issuers and investors. The market is familiar with a rate that is fixed in advance once a year and the frequency of reset has been amended to once every six months in order to continue to provide certainty as to the next interest payment, and also to make the rate more responsive to changes in market rates. The rate is calculated 45 days in advance, consistent with previous practice, and given that SOFR term rates were not available yet, the rate was based on overnight SOFR plus a spread adjustment. The 30-day average was chosen to smooth out day-to-day SOFR volatility. Meanwhile, the spread adjustment was designed to reconcile SOFR (collateralised) to LIBOR (uncollateralised) and to capture the theoretical forward interest rate curve out to 6 months.

Although term-SOFR rates are now available, we understand that 30-day average SOFR is still used as the index for many ARMs. On the basis that the lender is being compensated only for credit risk and the time value of money, with a profit margin, and based on the quantitative analysis performed by the ARRC and published together with their recommendations to document their thought process,⁶ it can be assessed qualitatively that an ARM would still satisfy the SPPI criterion and may be recorded by the lender at amortised cost or at fair value through OCI, depending on the IFRS 9 business model.

Time value of money does not include credit risk, so it is important to exclude it from the assessment. The standard suggests this is done by comparing the instrument with a benchmark instrument with the same credit risk, but presumably the comparison could be against an instrument with a different credit risk, as long as the effect of the difference can be excluded. [IFRS 9.B4.1.9C].

The following Illustrations show instruments with a modified time value of money element and how the benchmark test is applied to them.

Illustration 5-8: Interest rate period selected at the discretion of the borrower

An entity holds an instrument that is a variable interest rate instrument with a stated maturity date that permits the borrower to choose the market interest rate on an ongoing basis. For example, at each interest rate reset date, the borrower can choose to pay three-month LIBOR for a three-month term or one-month LIBOR for a one-month term.

The contractual cash flows are solely payments of principal and interest on the principal amount outstanding as long as the interest paid over the life of the instrument reflects consideration for basic lending risks and costs as well as a profit margin. Basic lending risks and costs include consideration for the time value of money, for the credit risk associated with the instrument and for other basic lending risks and costs. The fact that the LIBOR interest rate is reset during the life of the instrument does not in itself disqualify the instrument.

However, if the borrower is able to choose to pay a one-month interest rate that is reset every three months, the interest rate is reset with a frequency that does not match the tenor of the interest rate. Therefore, the time value of money element is modified. That is because the interest payable in each period is disconnected from the interest period.

In such cases, the entity must qualitatively or quantitatively assess the contractual cash flows against the cash flows of a benchmark instrument to determine whether the mismatch between the two sets of cash flows could be significantly different. The benchmark instrument is identical in all respects except that the tenor of the interest rate matches the interest period. If the analysis results in the conclusion that the two sets of cash flows could be significantly different, payments would not represent principal and interest on the principal amount outstanding.

The same analysis would apply if the borrower were able to choose between the lender's various published interest rates (e.g., the borrower can choose between the lender's published one-month variable interest rate and the lender's published three-month variable interest rate). [IFRS 9.B4.1.13 Instrument B].

⁶ [Options for using SOFR in Adjustable Rate Mortgages](#), The Alternative Rates Committee, July 2019.

Illustration 5-9: Five-year constant maturity bond

Some bonds pay what is called a constant maturity interest rate. For example, an instrument with an original five-year maturity may pay a variable rate that is reset semi-annually but always reflects a five-year rate. In such cases, the time value of money element is modified. The entity must determine whether the instrument's cash flows could be significantly different from those on a bond with a similar maturity, credit risk and interest rate reset frequency, but that pays a semi-annual rate of interest.

In making this assessment, the entity cannot conclude that the contractual cash flows are solely payments of principal and interest on the principal amount outstanding, simply because the interest rate curve at the time of the assessment is such that the difference between a five-year interest rate and a semi-annual interest rate is not significant. Rather, the entity must also consider whether the relationship between the five-year interest rate and the semi-annual interest rate could change over the life of the instrument such that the contractual (undiscounted) cash flows over the life of the instrument could be significantly different from the (undiscounted) benchmark cash flows. [IFRS 9.B4.1.9D].

In this example, if the entity considers future developments, it is unlikely that it can conclude that the contractual cash flows could not be significantly different from the benchmark cash flows, considering the magnitude of the mismatch between the interest rate tenor and reset frequency. The bond will always pay a five-year rate even though, except at the outset, this exceeds the instrument's remaining life. Therefore, the instrument is not likely to meet the SPPI test.

5.4.3 Regulated interest rates

As noted in section 5.3.3. above, in some jurisdictions the government or a regulatory authority sets interest rates. For example, such governmental regulation of interest rates may be part of a broad macroeconomic policy or it may be introduced to encourage entities to invest in a particular sector of the economy. In some of these cases, the objective of the time value of money element is not to provide consideration for only the passage of time. However, the Board notes that the rates are set for public policy reasons and thus are not subject to structuring to achieve a particular accounting result. [IFRS 9.BC4.180]. Consequently, as a concession, a regulated interest rate is considered by the IASB to serve as a proxy for the time value of money element for the purpose of applying the contractual cash flow characteristics test if that regulated interest rate:

- Provides consideration that is broadly consistent with the passage of time
- And
- Does not provide exposure to risks or volatility in the contractual cash flows that are inconsistent with a basic lending arrangement [IFRS 9.B4.1.9E]

As the standard does not establish criteria to determine whether a regulated rate provides consideration that is 'broadly consistent' with the passage of time, this is an area which clearly requires judgement based on the facts and circumstances. However, in the Basis for Conclusions, the board implies that the particular instrument described in the following Illustration would satisfy the two criteria above.

Illustration 5-10: Regulated interest rates - 'Livret A'

In France the interest rate on 'Livret A' savings products issued by retail banks is determined by the central bank and the government according to a formula that reflects protection against inflation and an adequate remuneration to provide incentive for investment. The legislation requires a particular portion of the amounts collected by the retail banks to be lent to a governmental agency that uses the proceeds for social programmes. The IASB noted that the time value element of interest on these accounts may not provide consideration for only the passage of time; however, the IASB believes that amortised cost would provide relevant and useful information as long as the contractual cash flows do not introduce risks or volatility that are inconsistent with a basic lending arrangement. [IFRS 9.BC4.180].

5.4.4 Contractual features that change the timing or amount of contractual cash flows

Some financial assets contain contractual provisions that change the timing or amount of contractual cash flows. For example, the asset may be prepaid before maturity, or its term may be extended. In such cases, the entity must determine whether the contractual cash flows that could arise over the life of the instrument due to those contractual provisions are solely payments of principal and interest on the principal amount outstanding.

To make this determination, the entity must assess the contractual cash flows that could arise both before, and after, the change in contractual cash flows. The entity may also need to assess the nature of any contingent event (i.e., the trigger) that would change the timing or amount of contractual cash flows. While the nature of the contingent event is not a determinative factor in assessing whether the contractual cash flows are solely payments of principal and interest, it may be an indicator.

For example, compare a financial instrument with an interest rate that is reset to a higher rate if the debtor misses a particular number of payments and a financial instrument with an interest rate that is reset to a higher rate if a specified equity index reaches a particular level. It is more likely in the former case that the contractual cash flows over the life of the instrument will be solely payments of principal and interest on the principal amount outstanding, because of the relationship between missed payments and an increase in credit risk. In contrast, in the latter case, the contingent event introduces equity price risk which is not a basic lending risk. [IFRS 9.B4.1.10].

The following are examples of contractual terms that result in contractual cash flows that are solely payments of principal and interest on the principal amount outstanding: [IFRS 9.B4.1.11]

- (a) A variable interest rate that is consideration for the time value of money and for the credit risk associated with the principal amount outstanding during a particular period of time (the consideration for credit risk may be determined at initial recognition only, and so may be fixed) and other basic lending risks and costs, as well as a profit margin (which are also likely to be fixed).
- (b) A contractual term that permits the issuer (i.e., the debtor) to prepay a debt instrument or permits the holder (i.e., the creditor) to put a debt instrument back to the issuer before maturity and the prepayment amount substantially represents unpaid amounts of principal and interest on the principal amount outstanding, which may include reasonable additional compensation for the early termination of the contract.

And

- (c) A contractual term that permits the issuer or holder to extend the contractual term of a debt instrument (i.e., an extension option) and the terms of the extension option result in contractual cash flows during the extension period that are solely payments of principal and interest on the principal amount outstanding, which may include reasonable additional compensation for the extension of the contract.

Unfortunately, neither the standard itself nor the Basis for Conclusions specify what the IASB meant by 'reasonable additional compensation', although it seems clear that the IASB regards compensation to mean a payment by the party exercising the prepayment option to the other party. It also seems appropriate to include as reasonable additional compensation direct or indirect costs attributable to early termination or extension, ranging from costs for the additional paperwork to costs for adjusting a bank's hedging relationships. Penalties imposed by the lender on the borrower with the aim of reducing the lender's interest rate risk and discouraging the borrower from prepaying the debt, could also, in certain circumstances, be reasonable additional compensation. If the penalty clause is assessed not to be reasonable additional compensation, consideration should also be given to whether the penalty clause is genuine and how likely the penalty is to be triggered. If the borrower is not expected to exercise the prepayment option except in extremely rare or highly abnormal situations that are very unlikely to occur, then the penalty feature would not be genuine and the asset could still pass the SPPI test. [IFRS 9.B4.1.18].

2024 Amendments applicable for annual periods beginning on or after 1 January 2026 (with earlier application permitted)

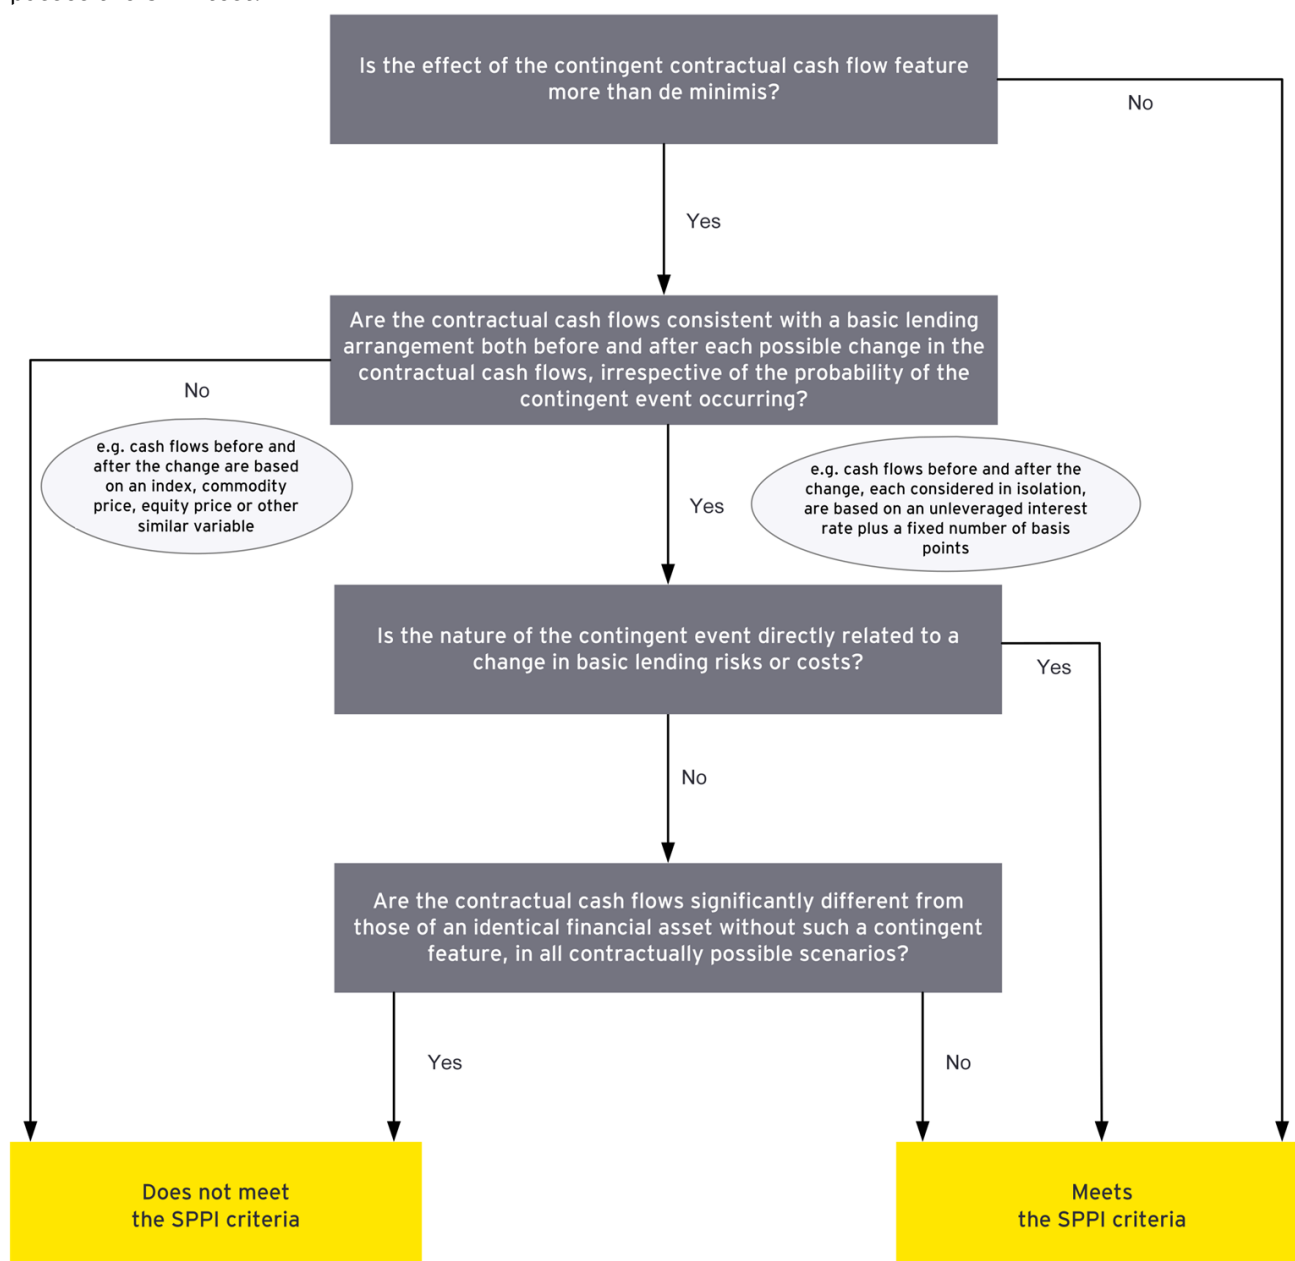

As part of the IFRS 9 PIR, the IASB have amended IFRS 9 for financial assets with contingent features. The amendments clarify that:

- The assessment of whether the contractual cash flows that could arise both before and after the change would meet the SPPI requirements is made "irrespective of the probability of the change in contractual cash flows occurring". The contractual cash flow assessment is based on all contractual cash flows that could arise over the life of the financial instrument - it is not a probability-based assessment. This means an entity is required to consider the effect on contractual cash flows of any contingent event specified in the contract, however likely or unlikely the event is to occur (unless the terms are not genuine, as described in section 5.4.1.B). [IFRS 9(2026).BC4.268].
- If the nature of the contingent event relates directly to, and the contractual cash flows change in the same direction as, changes in basic lending risks and costs, it is more likely that the contractual cash flows over the life of the instrument will be solely payments of principal and interest on the principal amount outstanding (for example, a financial instrument with an interest rate that is reset to a higher rate if the debtor misses a particular number of payments). [IFRS 9(2026).B4.1.10]

- If a contingent feature gives rise to contractual cash flows that are consistent with a basic lending arrangement both before and after the change in contractual cash flows but the nature of the contingent event does not relate directly to changes in basic lending risks and costs (for example, the interest rate on a loan is adjusted by a specified amount if the debtor achieves a contractually specified reduction in carbon emissions), the SPPI requirements are only met if the contractual cash flows would not be 'significantly different' from the cash flows for an identical financial asset without such a contingent feature. The purpose of this analysis is to assess the effect the contingent feature could have on contractual cash flows. [IFRS 9(2026).B4.1.10A, IFRS 9(2026).BC4.272].

Entities will need to consider all scenarios in which the contractual cash flows could possibly change and apply judgement to assess whether contractual cash flows arising from a contingent feature are 'significantly different' to an identical financial asset without such a feature. Entities are required to consider all possible combinations of contingent events occurring because all these possible scenarios are contractually specified. In some circumstances, an entity may be able to determine that with a qualitative assessment, but in other circumstances it may be necessary to perform a quantitative assessment.

The following diagram is a flowchart for determining whether a financial asset with contingent features passes the SPPI test:

Examples to demonstrate application of the new requirements are included in section 5.4.7.C below.

How we see it

It is worth noting that as the 'de minimis' requirements in IFRS 9.B4.1.18 remain in IFRS 9, the initial assessment is whether the effect of the contingent cash flows are 'de minimis' (similar to all contractual cash flow assessments) (see 5.4.1.A and 5.4.7.B), which is a separate test from 'significantly different'. Entities will need to apply judgement to determine what is considered 'significantly different', and how this differs from 'de minimis'.

The assessment of 'significantly different' is meant to provide a lower threshold and, therefore, make it easier for instruments to pass SPPI than under the 'de minimis' guidance in paragraph B4.1.18 of IFRS 9, although the IASB has not introduced a specific quantitative threshold and entities will need to exercise judgement. In some circumstances, an entity may be able to make this determination with a qualitative assessment, but in other circumstances, it may be necessary to perform a quantitative assessment.

When making the assessment of 'significantly different', entities are generally expected to be consistent with the accounting policies developed to assess a 'modified time value of money' feature in accordance with paragraphs B4.1.9C and B4.1.9D of IFRS 9, which also refer to cash flows being not 'significantly different'. The IASB refer in the 2024 Amendments to their intention to develop a similar requirement. However, there are some differences between the two tests, e.g., the 2024 Amendments refer to assessing the impact of the contingent feature in all contractually specified scenarios while B4.1.9D refers only to reasonably possible scenarios. Additionally, B4.1.9C refers to the cash flows being undiscounted and the assessment being performed both in each reporting period and cumulatively over the life of the financial instrument while the 2024 Amendments do not have specific guidance in this respect. Therefore, entities will need to exercise judgement in developing an accounting policy in this area.

5.4.4.A Prepayment - negative compensation

A financial asset can still meet the SPPI condition and be eligible for classification at amortised cost even if the contractual prepayment amount is more or less than the unpaid amounts of the principal and interest. This is because IFRS 9 contemplates either the borrower or the lender terminating the contract early. If the borrower terminates the loan early, the borrower may have to compensate the lender and the prepayment amount might be more than the unpaid amount of principal and interest. If the lender terminates the loan early, then the lender may need to compensate the borrower and so, in this case, the prepayment amount might be less than the unpaid amounts of principal and interest. In other words, with these asymmetrical break clauses, depending upon which party terminates the contract early, 'reasonable additional compensation' can include a prepayment amount which is more or less than the unpaid amounts of principal and interest.

But this is not the case with a symmetrical break clause which results in the party triggering early termination of the loan receiving rather than paying compensation ('negative compensation'). This could occur if the current market interest rate is higher than the effective interest rate of the debt instrument. In that case, with a symmetrical break clause, a prepayment by the borrower will be less than the unpaid amounts of principal and interest and therefore lead to the lender effectively compensating the borrower for the increase in interest rates even if the borrower chooses to prepay the debt instrument. As set out in the version of IFRS 9 originally issued in July 2014, such a feature would fail the SPPI test and result in the instrument being measured at fair value through profit and loss.

In October 2017, the IASB issued a narrow scope amendment to IFRS 9 to address this issue. The amendment clarified that a financial asset with a symmetrical prepayment option can be measured at amortised cost or fair value through other comprehensive income. A financial asset meets the contractual cash flow requirements if a contractual term permits (or requires) the issuer to prepay, or the holder to put back to the issuer, a debt instrument before maturity and the prepayment amount substantially represents unpaid amounts of principal and interest on the principal amount outstanding including reasonable compensation for the early termination of the contract, which irrespective of the event or circumstance that causes the early termination of the contract, may be paid or received. For example, a party may pay or receive reasonable compensation when it chooses to terminate the contract early or otherwise causes the early termination to occur. [IFRS 9.B4.1.12A].

This condition ensures that the amendment only captures those financial assets that would otherwise have contractual cash flows that are solely payments of principal and interest but do not meet that criterion solely because a prepayment feature may give rise to negative compensation.

The IASB noted that compensation that reflects the effect of the change in the relevant market interest rate (e.g., interest lost as a result of early terminating the contract) did not introduce any contractual cash flows that were different from cash flows which were already accommodated by the existing exemption for prepayments which contain positive compensation. [IFRS 9.BC4.225].

The IASB also noted that some financial assets are prepayable at their current fair value and others are prepayable at an amount that includes the fair value cost to terminate an associated hedging instrument. The IASB acknowledged that there may be circumstances in which such features meet the contractual cash flow requirements. It provided, as an example, the case when the calculation of the prepayment amount is intended to approximate to unpaid amounts of principal and interest plus or minus an amount that reflects the effect of the change in a relevant benchmark interest rate. However, the IASB also noted that this will not always be the case. [IFRS 9.BC4.232]. Therefore, an entity will have to assess the specific contractual cash flows for such instruments rather than automatically assuming that they will meet the contractual cash flow requirements.

The narrow scope amendment only applies to situations where the compensation is symmetrical and the signage is negative. Prepayments that include cash flows that reflect changes in an equity or commodity index will not meet this requirement.

The amendment was effective for annual periods beginning on or after 1 January 2019.

UBS Group AG, in its 2019 consolidated financial statements, considered the classification of instruments with two-way compensation clauses.

Practical example 5-1: UBS Group AG (2019)	Switzerland
<p>Annual Report 2019 [extract] Notes to the UBS Group AG consolidated financial statements [extract] Note 1 Summary of significant accounting policies [extract] 3) Financial Instruments [extract] b) Classification, measurement and presentation [extract]</p> <div data-bbox="341 1048 1251 1765"> <p><i>Contractual cash flow characteristics</i></p> <p>In assessing whether the contractual cash flows are SPPI, the Group considers whether the contractual terms of the financial asset contain a term that could change the timing or amount of contractual cash flows arising over the life of the instrument, which could affect whether the instrument is considered to meet the SPPI criterion.</p> <p>For example, the Group holds portfolios of private mortgage contracts and corporate loans in Personal & Corporate Banking that commonly contain clauses that provide for two-way compensation if prepayment occurs. The amount of compensation paid by or to UBS reflects the effect of changes in market interest rates. The Group has determined that the inclusion of the change in market interest rates in the compensation amount is reasonable for the early termination of the contract, and therefore results in contractual cash flows that are SPPI.</p> </div>	

The IASB issued a webcast in June 2018, clarifying that a prepayment feature must be analysed to determine whether it gives rise to contractual cash flows that meet the contractual cash flows characteristics test, rather than relying on:

- How the feature is labelled
- Whether it is likely to be triggered
- Or
- Whether it reflects market practice

It also confirmed that in order to be eligible to be measured at amortised cost or fair value through other comprehensive income, a prepayable financial asset must meet the criteria outlined above or all the conditions relating to assets originated at a premium or discount described in section 5.4.4.B below.

5.4.4.B Prepayment - assets originated at a premium or discount

The strict application of the definition of principal in section 5.1 above would mean that debt instruments originated or acquired at a premium or discount, and which are prepayable at par, must be measured at fair value through profit or loss. This is because, if the issuer prepays, the holder may receive a gain that is less than or in excess of a basic lending return. The IASB, however, decided to provide a narrow scope exception to address this matter. Financial assets originated or acquired at a premium or discount that would otherwise have cash flows that are principal and interest, except for the effect of a prepayment option, are deemed to meet the above conditions, but only so long as:

- (a) The prepayment amount substantially represents the contractual par amount and accrued (but unpaid) interest, which may include reasonable additional compensation for the early termination of the contract. And
- (b) The fair value of the prepayment feature on initial recognition of the financial asset is insignificant. *[IFRS 9.B4.1.12].*

As a result of the amendment for prepayments with negative compensation, discussed above, the IASB also amended the criteria for (a) to clarify that reasonable compensation includes compensation paid or received for the early termination of a contract. *[IFRS 9.B4.1.12A].*

The conditions described above apply regardless of whether (i) the prepayment provision is exercisable by the issuer or by the holder; (ii) the prepayment provision is voluntary or mandatory; or (iii) the prepayment feature is contingent.

This exception would allow some financial assets that otherwise do not have contractual cash flows that are solely payments of principal and interest to be measured at amortised cost or fair value through other comprehensive income (subject to the assessment of the business model in which they are held). In particular, the IASB observed that this exception will apply to many purchased credit-impaired financial assets with contractual prepayment features. If such an asset was purchased at a deep discount, the contractual cash flows would not be solely payments of principal and interest if, contractually, the asset could be repaid immediately at the par amount. However, that contractual prepayment feature would have an insignificant fair value if it is very unlikely that prepayment will occur. *[IFRS 9.BC4.193].* Prepayment might be very unlikely because the debtor of a credit-impaired financial asset might not have the ability to prepay the financial asset.

Similarly, the IASB observed that this exception will apply to some prepayable financial assets that are originated at below-market interest rates. For example, this scenario may arise when an entity sells an item (for example, an automobile) and, as a marketing incentive, provides financing to the customer at an interest rate that is below the prevailing market rate. At initial recognition, the entity would measure the financial asset at fair value and, because of the below-market interest rate, the fair value would be at a discount to the contractual par amount. The IASB observed that in that case a contractual prepayment feature would likely have an insignificant fair value because it is unlikely that the customer will choose to prepay; in particular, because the interest rate is below-market and thus the financing is advantageous. *[IFRS 9.BC4.194].*

For instruments that are initially recognised at a discount, the fair value of the prepayment option will usually be insignificant, because the discount is a function of either an increased credit risk of the borrower (as in the first example above) or a below-market interest rate (as in the second example), and in each case the prepayment option is unlikely to be exercised and so will have little fair value.

For instruments that are initially recognised at a premium because the coupon rate is above the current market rate, the application of this guidance is more difficult. While the prepayment option will likely have a more than insignificant fair value, this will usually also be reflected in the fair value at which the asset is acquired. For instance, an investor is unlikely to pay above par for a bond that pays an above market rate of interest if it can be prepaid at par at any time. It would seem that for the prepayment option to be relevant for the asset's classification, it would need to be constrained. The expectation would be that the borrower will exercise the option at the earliest opportunity as it will be in the economic interest of the borrower to do so. An example would be a bond that pays an above market rate of interest, with a remaining maturity of five years that can be prepaid but only after three years. Hence the bond will have an initial fair value greater than par due to the above market rate for the first three years, but will amortise to par after three years as the borrower is highly likely to exercise the prepayment option after three years. Consequently, the prepayment amount will substantially represent unpaid amounts of principal and interest on the principal amount outstanding at the point the option is exercised and will therefore pass the SPPI test. *[IFRS 9.B4.1.11(b)].* This assessment will be performed only when the asset is first recognised. For example:

Illustration 5-11: Prepayable corporate loan recognised at a premium to par

Bank A buys a loan with a notional amount of CU10m from another bank for CU11m. The loan has ten years remaining to maturity and it is to a corporate that has the right to prepay the loan at par in five years' time. The loan is acquired at a premium as interest rates have fallen significantly since the loan was first advanced. Bank A believes that exercise of the prepayment option will be beneficial to the corporate issuer and that the borrower is highly likely to exercise the option. It therefore concludes that the premium on the loan is amortised over the following five years and not over the full remaining contractual term of ten years. It further concludes that when the prepayment option is exercised it will substantially represent unpaid amounts of principal and interest on the principal amount outstanding and consequently classifies the loan as an amortised cost instrument.

However, it is possible that the borrower may not exercise the option even if it is beneficial to do so and this makes the assessment more complicated. If there is uncertainty over whether the prepayment option will be exercised, then the SPPI test may not be met and neither classification as amortised cost nor fair value through other comprehensive income can be applied unless the fair value of the prepayment amount is insignificant. [IFRS 9.B4.1.12(c)].

This is particularly likely to be an issue with retail loans as, collectively, retail borrowers can act irrationally and not in accordance with their own best economic interests. Such behavioural factors are likely to force any entity acquiring a portfolio of retail loans at a premium to have to assess whether the fair value of the prepayment feature is insignificant or not. In practice, this will probably mean that the entity will need to compare the fair value of the retail loans with the fair value of similar hypothetical instruments without the prepayment option and determine whether the difference is insignificant or not. If the difference is deemed to be significant, then the portfolio would need to be classified as debt instruments at fair value through profit and loss. In contrast, an instrument which is prepayable at fair value does not fall under the exception stated above (see discussion in section 5.4.4.A above).

5.4.4.C Further examples of features that modify the timing or amount of contractual cash flows

The following Illustrations show further instruments with contractual features that modify the timing and amount of contractual cash flows such that the instruments pass the contractual cash flow characteristics test, in addition to those in section 5.4.7.C below. Some examples include possible changes to the fact pattern which may change that assessment.

Illustration 5-12: Debt covenants

A loan agreement contains a covenant whereby the contractual spread above the benchmark rate will increase if the borrower's earnings before interest, tax, depreciation and amortisation (EBITDA) or its debt-to-equity ratio deteriorate by a specified amount by a specified date.

Whether this instrument passes the contractual cash flow characteristics test depends on the specific terms. The loan will pass the contractual cash flow characteristics test if the covenant serves to compensate the lender for taking on higher credit or liquidity risks.

However, if the covenant results in more than just credit or liquidity protection or provides for an increase in the rate of return which is not considered appropriate under a basic lending arrangement, the instrument will fail the test. For example, an increase in interest rate to reflect an increase in EBITDA would not satisfy the criteria.

Illustration 5-13: Auction Rate Securities (ARs)

ARs have long-term maturity dates, but their interest rate resets more frequently based on the outcome of an auction. As a result of the auction process, the interest rates are short-term and the instruments are treated like short-term investments.

If an auction fails (i.e., there are insufficient buyers of the bond to establish a new rate), the rate resets to a penalty rate. The penalty rate is established at inception and does not necessarily reflect the market rate when the auction fails. It is often intended to compensate the holder for the instrument's lack of liquidity as demonstrated by the auction failure. The auction process for many such securities failed during the financial crisis.

The classification at initial recognition must be based on the contractual terms over the life of the instrument. Although the presumption on acquisition may have been that the auctions were not expected to fail, the potential penalty rate is still considered in the assessment of the instrument's characteristics at initial recognition. If the penalty rate could be considered to compensate the holder for the longer-term credit risk of the instrument following the auction failure because of a reduction in market liquidity, it may be possible that the penalty rate reflects interest. However, as such instruments usually have multiple issues with different penalty rates (including some leverage in the form of multiples of the market rate), each different case would need to be carefully evaluated before a conclusion could be reached.

Illustration 5-14: Perpetual instruments with potentially deferrable coupons

An entity holds a perpetual instrument, but the issuer may call the instrument at any time, paying the holder the par amount plus accrued interest due.

The instrument pays interest, but payment of interest cannot be made unless the issuer is able to remain solvent immediately afterwards. There are two scenarios.

Scenario (a) interest is accrued on the deferred amounts.

The contractual cash flows could be payments of principal and interest on the principal amount outstanding.

An example in the standard states that the fact that the instrument is perpetual does not in itself mean that the contractual cash flows are not payments of principal and interest on the principal amount outstanding. In effect, a perpetual instrument has continuous (multiple) extension options. Such options may result in contractual cash flows that are payments of principal and interest on the principal amount outstanding if interest payments are mandatory and must be paid in perpetuity.

Also, the fact that the instrument is callable does not mean that the contractual cash flows are not payments of principal and interest on the principal amount outstanding, unless it is callable at an amount that does not substantially reflect payment of outstanding principal and interest on that principal amount outstanding. Even if the callable amount includes an amount that reasonably compensates the holder for the early termination of the instrument, the contractual cash flows could be payments of principal and interest on the principal amount outstanding. (See section 5.4.4 above).

Scenario (b) deferred interest does not accrue additional interest.

The contractual cash flows are not payments of principal and interest on the principal amount outstanding.

This is because the issuer may be required to defer interest payments and additional interest does not accrue on those deferred interest amounts. As a result, interest amounts are not consideration for the time value of money on the principal amount outstanding.

Note that, in this example, the holder is not entitled to assess whether it is probable that interest may ever be deferred. As long as the feature is genuine, the deferral of interest must be considered in assessing whether interest amounts are consideration for the time value of money on the principal outstanding.

[IFRS 9.B4.1.14 Instrument H].

Illustration 5-15: Write-down or conversion imposed by regulator**Scenario (a) the provision is not a contractual feature.**

A regulated bank issues an instrument with a stated maturity date. The instrument pays a fixed interest rate and all contractual cash flows are non-discretionary.

However, the issuer is subject to legislation that permits or requires a national resolution authority to impose losses on holders of particular instruments, including the above-mentioned instrument, in particular circumstances. For example, the national resolution authority has the power to write-down the par amount of such an instrument or to convert it into a fixed number of the issuer's ordinary shares if the national resolution authority determines that the issuer is having severe financial difficulties, needs additional regulatory capital or is failing.

The holder would analyse the contractual terms of the financial instrument to determine whether they give rise to cash flows that are solely payments of principal and interest on the principal amount outstanding and thus are consistent with a basic lending arrangement.

According to an example in the standard, this analysis would not consider the write-down or conversion that arises only because of the national resolution authority's power under statutory law to impose losses on the holders of such an instrument. That is because that power is not a contractual term of the financial instrument. [IFRS 9.B4.1.13 Instrument E].

Although this example makes use of a principle that is widely applied in accounting for financial instruments, we note that it may seem inconsistent with the position taken in IFRIC 2 *Members' Shares in Co-operative Entities and Similar Instruments*, which requires an entity to include 'relevant local laws, regulations and the entity's governing charter in effect at the date of classification' when classifying a financial instrument as a liability or equity. However, in the IASB Discussion Paper on Financial Instruments with Characteristics of Equity (see Chapter 43), it was noted that IFRIC 2 was developed for a very specific fact pattern and that the analysis in IFRIC 2 should not be applied more broadly, and as part of the Exposure Draft on Financial Instruments with Characteristics of Equity it was stressed that IFRIC 2 is a case where the law limits the enforceability of the contractual right and should only be read in that context. In this Exposure Draft, the IASB has proposed amendments to IAS 32.15A to require an entity to classify financial instruments as financial liabilities or equity by considering only those contractual rights and obligations that are enforceable by law and are in addition to those created by relevant laws or regulations. These proposals are consistent with the requirements for classification of financial assets in IFRS 9. [IFRS 9.B4.1.13 Instrument E].

Scenario (b) the provision is a contractual feature.

The contractual terms of the financial instrument permit or require the issuer or another entity to impose losses on the holder (e.g., by writing down the par amount or by converting the instrument into a fixed number of the issuer's ordinary shares), if the issuer fails to meet particular regulatory capital requirements (a non-viability event).

Provided the 'non-viability' provision is genuine, which will normally be the case, the instrument will fail the contractual cash flow characteristics test even if the probability is remote that such a loss will be imposed. [IFRS 9.B4.1.13 Instrument E].

Note that payments that arise as a result of a regulator's statutory power and that are only referenced to in the contractual terms of the instrument are not considered in the analysis of the contractual payment features of the instrument. However, where such features are specific to the contract, they clearly need to be considered in such an analysis. This typically can happen where such an instrument is entered into by entities within the same group as a way of providing a mechanism for recapitalising subsidiaries and passing losses up within the group to the ultimate shareholders. Where a regulator does not have the statutory power to enforce the terms of instruments entered into between entities within the same group, the regulator will usually require the conversion/write-down features to be included in the contractual terms. This can result in such contracts failing the SPPI test.

In April 2022, as part of the Post-implementation Review of IFRS 9, the IASB discussed whether an entity needs to consider cash flows arising from bail-in legislation when the relevant legal requirements are reproduced or referred to in a contract. The Board agreed to consider this issue after its Financial Instruments with Characteristics of Equity project (see scenario (a)) has developed further.⁷

⁷ [IASB Update](#), April 2022, available on the IFRS Foundation's website.

Illustration 5-16: Fixed rate bond prepayable by the issuer at fair value

A company acquires a bond which requires the issuer to pay a fixed rate of interest and repay the principal on a fixed date. However, the issuer has the right to prepay (or call) the bond before maturity, although the amount the issuer must pay is the fair value of the bond at the time of prepayment, i.e., the fair value of the contractual interest and principal payments that remain outstanding at the point of exercise. For example, if the bond has a term of five years and the call option is exercised at the end of the second year, the fair value would be calculated by discounting the principal and interest payments due over the remaining three years at the current market interest rate for a three-year bond with similar characteristics.

The exercise price represents the fair value of unpaid amounts of principal and interest on the principal amount outstanding at the date of exercise, albeit discounted at the current market interest rate rather than the original market interest rate.

The fact that the exercise price is the fair value could be interpreted as providing reasonable additional compensation to the holder for early termination, although this only holds true in a scenario where the market rate has fallen since the issue of the bond. If interest rates rise, the holder will not receive additional compensation for early termination and will receive less than the principal amount. In these circumstances, due to the negative compensation, the bond holder would not be receiving principal and interest, however prepayments with negative compensation can still meet the contractual cash flows characteristics test (see section 5.4.4.A above).

5.4.5 Contractual features that normally do not represent payments of principal and interest

In some cases, financial assets may have contractual cash flows that are not solely payments of principal and interest. [IFRS 9.B4.1.14]. Unless such a feature is *de minimis* or non-genuine, the instrument would fail the contractual cash flow characteristics test. [IFRS 9.B4.1.18]. Examples of such instruments with contractual cash flows that may not represent solely payments of principal and interest include instruments subject to leverage, instruments with contractual cash flows indexed to a variable that is not a basic lending risk or cost (for example, the value of equity instruments or the price of a commodity) or that represent a share of the debtor's revenue or profit and instruments that represent investments in particular assets or cash flows.

Leverage is a contractual cash flow characteristic of some financial assets. It increases the variability of the contractual cash flows with the result that they do not have the economic characteristics of just principal and interest. Stand-alone options, forwards and swap contracts are examples of financial assets that include such leverage. Thus, such contracts fail the contractual cash flow characteristics test and cannot be measured at amortised cost or fair value through other comprehensive income. [IFRS 9.B4.1.9].

Illustration 5-17: Multiple of a benchmark interest rate

An entity holds an instrument for which the interest rate is quoted as a multiple of a benchmark interest rate (e.g., 2 times 3-month EURIBOR for a 3-month term).

Such features introduce leverage and the standard is explicit that leverage increases the variability of the contractual cash flows, resulting in them not having the economic characteristics of interest. As a result, such instruments would need to be measured at fair value through profit or loss. [IFRS 9.B4.1.9].

However, a variable rate asset at a deep discount will not normally fail the contractual cash flow characteristics test. When the IASB deliberated the meaning of principal in September 2013, they did not distinguish between fixed and variable rate assets and do not seem to have intended a variable rate plain vanilla instrument to fail the contractual cash flow characteristics test. Moreover, a variable rate asset which is acquired or originated at a deep discount will normally be a purchased or originated credit impaired asset. As such, the effective interest rate used will be the credit-adjusted effective interest rate.

In addition to leverage features, contractual terms that introduce a more than *de minimis* exposure (see section 5.4.1 above) to risks or volatility in the contractual cash flows that is unrelated to a basic lending arrangement, such as exposure to changes in equity prices or commodity prices, do not give rise to contractual cash flows that are solely payments of principal and interest on the principal amount outstanding. [IFRS 9.B4.1.7A, IFRS 9.B4.1.18].

The IASB noted that it believes that amortised cost would provide relevant and useful information if the contractual cash flows do not introduce risks or volatility that are inconsistent with a basic lending arrangement. [IFRS 9.BC4.180].

Leverage in relation to a regulator-imposed cap that is set as a multiple of an indexed rate are discussed in section 5.3.3 above.

Illustration 5-18: Dual currency instruments

For some financial assets the interest payments are denominated in a currency that is different from the principal of the financial asset. IFRS 9 requires the assessment of “whether contractual cash flows are solely payments of principal and interest on the principal outstanding for the currency in which the financial asset is denominated”. [IFRS 9.B4.1.8].

This implies that any instrument in which interest is calculated based on a principal amount other than that payable on maturity will not pass the contractual cash flow characteristics test. For instance, if variable interest payments are computed based on a fixed principal amount in another currency, e.g., US dollars, although repayment of the principal is in sterling, the financial asset is not considered to have cash flows that are solely payments of principal and interest.

However, there may be instances where interest is denominated in a currency that is different from the principal currency, but the contractual cash flows could possibly constitute solely payments of principal and interest. For example, the principal amount of the bond is denominated (and redeemed at a fixed maturity) in Canadian dollars (CAD) and interest payments are fixed in Indian Rupees (INR) at inception based on the market interest rates and foreign exchange spot and forward rates at that time.

How we see it

While not explicit in the standard, if the bond can be separated into two components that, on their own, would meet the contractual cash flow characteristics test, then the combined instrument would do so. That is, if the bond can be viewed as the combination of a zero-coupon bond denominated in CAD and a stream of fixed payments denominated in INR, and if both instruments can be analysed as a stream of cash flows that are solely payments of principal and interest, then the sum of the two would do so as well.

The defining criterion is the fact that the interest payments have been fixed at inception and there is no exposure to changes in cash flows in the currency of denomination of the cash flows.

In September 2018, the IFRS IC was asked whether an instrument with the features described in Illustration 5-18 above met the SPPI test. The Committee observed that the financial instrument described was not common and consequently decided not to add this matter to its standard-setting agenda.⁸

Illustration 5-19: Convertible debt

An entity holds a bond that is convertible into equity instruments of the issuer.

The holder would analyse the convertible bond in its entirety, since IFRS 9 does not separate embedded derivatives from financial assets.

The contractual cash flows are not payments of principal and interest on the principal amount outstanding because they reflect a return that is inconsistent with a basic lending arrangement (see section 5 above) i.e., the return is also linked to the value of the equity of the issuer. [IFRS 9.B4.1.14 Instrument F].

The assessment would change if the issuer were to use its own shares as ‘currency’. That is, if the bond is convertible into a variable number of shares with a fair value equal to unpaid amounts of principal and interest on the principal amount outstanding. In this case, the bond might satisfy the contractual cash flow characteristics test and would be derecognised on conversion. However, such conversion features are often capped because, otherwise, the issuer could be required to deliver a potentially unlimited number of shares. The existence of such a cap, if genuine, would result in the failure of the test. Additionally, the use of a volume weighted average price approach to calculating the fair value of the shares at the conversion date could also result in the failure of the test.

Illustration 5-20: Inverse floater

An entity holds a loan that pays an inverse floating interest rate (i.e., the interest rate has an inverse relationship to market interest rates, such as 6% minus SONIA).

The contractual cash flows are not solely payments of principal and interest on the principal amount outstanding because an inverse floating rate does not represent consideration for the time value of money. [IFRS 9.B4.1.14 Instrument G].

⁸ [IFRIC Update](#), September 2018, available on the IFRS Foundation’s website.

Illustration 5-21: Investment in open-ended money market or debt funds

In an open-ended fund, existing investors have the option of leaving the fund at any time. The price at which leavers exit the fund is normally based on the fair value of the fund's assets. Given that investors exit the fund at a price based on fair value, the cash flows of an investment in such a fund are not solely payments of principal and interest. In addition, such investments would not normally qualify for the option for equity instruments, to present gains and losses in other comprehensive income, as they do not normally meet the definition of an equity instrument from the perspective of the fund (i.e., the issuer). See also section 7 below.

Illustration 5-22: Interest payments indexed to an equity index or the debtor's performance

If interest payments are indexed to a variable such as an equity index, the contractual cash flows are not payments of principal and interest on the principal amount outstanding. Payments indexed to the debtor's performance (e.g., the debtor's net income) would not pass the contractual cash flows characteristics test, unless it can be demonstrated that the indexing to the debtor's performance results in an adjustment that only compensates the holder for changes in the credit risk of the instrument. That is because the contractual cash flows would otherwise reflect a return that is inconsistent with a basic lending arrangement (see section 5 above). [IFRS 9.B4.1.13 Instrument A].

5.4.6 Loan commitments

Some loan commitments are scoped into IFRS 9 in full. All other loan commitments are only in scope of IFRS 9 for impairment purposes (see Chapter 41). This is because the IASB decided to exclude particular loan commitments from the scope of IAS 39 *Financial Instruments: Recognition and Measurement* (which was carried forward into IFRS 9) to simplify the accounting for holders and issuers of loan commitments. The effect of the exclusion is that an entity will not recognise and measure changes in fair value of these loan commitments that result from changes in market interest rates or credit spreads. This is consistent with the measurement of the loan that results if the holder of the loan commitment exercises its right to obtain financing, because changes in market interest rates do not affect the measurement of an asset measured at amortised cost. [IFRS 9.2.1(g), IFRS 9.2.3, IFRS 9.BC22.3]. This rationale applies well where the drawn commitment results in an amortised cost loan, but less so in other cases.

Where a loan commitment is granted long periods may elapse before the commitment is drawn down. The question therefore arises as to whether the drawdown of loans under an irrevocable loan commitment is assessed for classification based on conditions when the loan commitment came into being or when the loan is drawn down.

IFRS 9 requires that an entity shall recognise a financial asset in its statement of financial position when the entity becomes party to the contractual provisions of the instrument. When an entity first recognises a financial asset, it shall classify it in accordance with IFRS 9. [IFRS 9.3.1.1]. As the issuer of the irrevocable loan commitment becomes a party to the entire contractual cash flows of the loan at date the commitment is granted, it could be argued that any drawdowns could be treated as continuations of the original facility and that any loans drawn down are classified based on the conditions at the date of the origination of the loan commitment. Such an interpretation is consistent with how the expected credit losses are measured on loan commitments, "for the purpose of applying the impairment requirements, a financial asset that is recognised following a draw down on a loan commitment shall be treated as a continuation of that commitment instead of as a new financial instrument". [IFRS 9.B5.5.47].

However, if a long period elapses between the origination of the irrevocable loan commitment and draw down it is possible that conditions affecting the assessment of classification might have changed considerably. For instance, a bank may grant a loan commitment to an SPE that has sufficient equity at the date the commitment is originated for the loan to be classified as measured at amortised cost but not at the time the loan is drawn down. This is something that could be usefully clarified by the IFRS IC or the Board.

If an entity has a past practice of selling the assets resulting from its loan commitments shortly after origination, it is required to apply IFRS 9 to all its loan commitments in the same class, meaning that there will be consistency in the measurement of the loan commitment and the resulting loan. However, if the resulting loan will be classified at fair value through profit or loss (FVPL), not because of the entity's business model, but because it will fail the contractual cash flow test, the default position in IFRS 9 is that the entity would apply the ECL model to the undrawn loan commitment and the FVPL model to the same commitment once it is drawn. To reduce this measurement inconsistency, the entity could designate the loan commitment at FVPL if it meets the criteria in paragraph 4.2.2 of IFRS 9. However, if the drawn portion would be classified and measured at fair value through other comprehensive income, there does not seem to be a way to completely eliminate the measurement inconsistency between the drawn and undrawn portions. [IFRS 9.4.2.2]. See Chapter 45 for further detail on initial recognition of assets and liabilities arising from loan commitments.

5.4.7 Environmental, social and governance (ESG) linked loans

ESG loans are structured such that the interest rate varies based on whether the borrower achieves pre-determined ESG targets defined in the loan agreement. For example, the terms may include a reduction or increase in the interest rate if the borrower does, or does not, attain a certain rating on a type of green-building rating system for an agreed number of the borrower's manufacturing buildings. ESG targets can also include diversity-related targets such as gender representation targets at a defined level of management.

Such contingent rate adjustments may introduce additional variability to the cash flows of the loan which is linked to the underlying ESG performance of the borrower, that may not be consistent with a basic lending arrangement. Careful analysis of the terms of ESG loans is required to assess whether the cash flows represent solely payments of principal and interest.

Loans with ESG, green or sustainability-linked features that can cause changes to their contractual cash flows are different from what are commonly called 'green loans'. Green loans may refer to loans granted to borrowers who operate in environmentally friendly sectors such as solar power or to loans that are granted to finance activities that are 'green'. However, crucially, they do not necessarily include any terms which can cause their contractual cash flows to change due to 'green' targets after the loan has been issued.

In a basic lending arrangement, consideration for the time value of money and credit risk are typically the most significant elements of interest. However, in such an arrangement, interest can also include consideration for other basic lending risks (for example, liquidity risk) and costs (for example, administrative costs) associated with holding the financial asset for a particular period of time.

Contractual terms that introduce exposures to risks or volatility in the contractual cash flows that are unrelated to a basic lending arrangement, such as an exposure to changes in equity prices or commodity price, do not give rise to contractual cash flows that are solely payments of principal and interest.

[IFRS 9.B4.1.7A].

The requirements applicable to contractual terms that modify the timing and amount of cash flows as described in section 5.4.4 are applicable for contingent ESG features.

How we see it

There is no bright line to determine whether ESG features cause an instrument to fail the SPPI test. It is important to consider whether they provide commensurate compensation for basic lending risks, such as credit risk (see section 5.4.7.A below), or whether they introduce compensation for new risks that are inconsistent with basic lending arrangements (see section 5.4.7.C below). Some features may be *de minimis* or non-genuine (see section 5.4.7.B below). It is important to exercise judgement based on the facts and circumstances. As part of the IFRS 9 PIR, the IASB has amended IFRS 9 to clarify the requirements for assessing financial assets with contingent features, including ESG-features (see section 5.4.4 above and related illustrations on contingent ESG features below).

5.4.7.A Compensation for credit risk

Instruments are more likely to meet the SPPI requirements if the attainment of the target resulting in a decrease (or an increase) in the interest rate is likely to result in the improvement (or the deterioration) of the borrower's credit risk during the life of the loan such that the change in interest rate is commensurate with the change in credit risk of the borrower. IFRS 9 acknowledges that clauses which allow changes to the timing and amount of contractual cash flows may not fail the SPPI test if there is a relationship between the changes and an increase in credit risk.

It is often difficult to demonstrate a commensurate link between the interest rate change due to the attainment of an ESG target and the credit risk of the borrower. This may be easier to prove if the entity can demonstrate that it takes the ESG metric into account when pricing and monitoring the credit risk on the loan. This could be the case if there is a link between the feature and the value of the collateral pledged against the loan (see Illustration 5-23 below); or if there is a link between the feature and the probability of default on the loan (see Illustration 5-24 below). If the link to credit risk is too indirect (see Illustration 5-25 below), the feature will have to be further assessed (see sections 5.4.7.B and 5.4.7.C below).

Some ESG features may affect the credit risk of the borrower over the long-term but not necessarily the credit risk of the loan. For example, continuous failure to meet ESG targets in the long-term might lead to the borrower's business becoming unsustainable and ultimately lead to its demise, but this may have very little effect on the borrower's ability to repay the loan (i.e., credit risk) over the expected remaining life of the loan.

If there is a link between the feature and the credit risk of the loan, the lender must also establish whether the magnitude of the change in the contractual cash flows due to the feature is commensurate with the anticipated change in credit risk. If the feature gives rise to leveraged exposure to the resulting credit risk, the loan is likely to fail the SPPI test. The exception to this is where the feature gives rise to non-commensurate changes in interest rates, not in an attempt to introduce leverage to the contract, but in an attempt to introduce a punitive interest rate to act as a disincentive against the borrower allowing its credit risk to deteriorate. In such cases, the objective of the non-commensurate change in interest is to reduce the lender's risk, similar to other common features of basic lending arrangements such as default penalties, rather than increasing its risk by introducing leverage.

This exception regarding punitive rates is not specific to ESG loans. In September 2013, the IASB Staff noted that even if an interest rate could be described by some as 'punitive' in the sense that the terms of the instrument require a significant increase in the interest rate upon a credit event and such feature is intended, in part, to discourage a specific behaviour (such as missing payments on a credit card), the increased rate could still be commensurate with the consideration for credit risk of the instrument if such behaviour occurs.⁹

The following Illustrations demonstrate these considerations.

Illustration 5-23: ESG-linked loans

A bank grants a loan to fund the acquisition of a new fleet of vessels. The loan is collateralised by that fleet. In addition, the loan contains an ESG feature that reduces or increases the interest rate based on the borrower's performance against a commonly used metric in the industry for carbon emissions. The metric is based on the carbon emissions of the entity's fleet after factoring in the distance travelled by the fleet and the ships' size.

In this scenario, there may be a link between the emissions targets and the value of the collateral (the fleet). The bank would need to consider:

- Whether the value of the collateral (the fleet) is linked to the attainment of the carbon emission targets:
 - This might be the case, as, all things being equal, a better maintained and therefore more efficient fleet will attract a higher resale value than a less efficient fleet.
 - However, better efficiency may not necessarily indicate that the fleet is in a better condition. Efficiency will depend on other factors such as the ships' payloads, the skill of the crews in operating it, the time spent waiting to dock at busy ports and weather conditions.
 - Judgement would need to be exercised in determining the strength of the link based on the facts and circumstances.
- Whether the change in value of the fleet would affect the entity's assessment of the credit risk on the loan:
 - In this scenario, the fleet has been pledged as collateral on the loan. A more valuable fleet could therefore reduce the loss given default on the loan and therefore decrease the entity's assessment of the loans' credit risk.
 - However, if the loan is not collateralised, or if the metric considers the performance of additional ships that have not been pledged as collateral against the loan, the link with credit risk may be harder to demonstrate.
- Whether the change in the interest rate in response to the attainment of the emissions target can be considered appropriate compensation for the associated change in credit risk.

⁹ [IASB Staff paper 6D](#): Project: *Financial Instruments: Classification and Measurement*, Paper topic: *Contractual Cash Flow Characteristics: The Meaning of 'Interest'*. Available on the IFRS Foundation's website.

Illustration 5-24: ESG-linked loans

A ten-year loan is granted to a power generating entity to finance an overhaul of a coal-fired power plant. Operating this power plant is the entity's sole business. New local legislation will prohibit the power plant from continuing to operate if a specified CO₂ emissions target is not met on, or after, a date in 3 years' time. Therefore, the bank has included a series of annual targets in the loan terms, building up to the final deadline. If the power plant does not meet these contractual emissions targets, the interest rate on the loan increases.

The lender is likely to be able to demonstrate a link between the ESG feature and the credit risk of the loan. If the final emissions target is not met, the plant will not be able to operate. As this is the borrower's sole business, it would be unlikely that it will be able to repay the loan if that was to happen. The contractual emissions targets are designed to incentivise the borrower to incrementally work towards meeting the overall legislative target. The closer the borrower gets to the legislative deadline and the further it is from achieving it, the higher its credit risk becomes. The contractual features increase the interest rate in response to this increase in credit risk. Therefore, there is a clear link between the contractual targets and the credit risk on the loan.

The lender would also need to establish whether the magnitude of the change in the interest rate is commensurate with the change in credit risk. If the change is not commensurate, the lender must consider whether the feature is designed as a punitive feature to disincentivise against the borrower allowing its credit risk to increase by making slow progress towards the important legislative deadline. If that is the case, the feature is likely to be consistent with the SPPI criterion.

In practice, this link to credit risk may not be so clear. For example, the link may be blurred when the entity's credit risk is a function of multiple comingled businesses, but the loan and the ESG-feature relate to a single business, or portion thereof, or when the cost of attaining the ESG target is high and could out-weigh the benefits.

Illustration 5-25: ESG-linked loans

A short-term loan is granted to a food group. The interest rate on the loan varies depending on the performance of the group against an ESG scorecard. The scorecard includes three targets

- (a) One based on the reduction in the Group's CO₂ emissions
- (b) One based on the percentage of new hires that are female
- And
- (c) One based on the number of training hours in sustainable food production provided to previously underprivileged people

The group's performance against each target is weighted and used to determine an overall score. The interest rate will be reduced if the Group achieves a score above a predetermined level.

In this Illustration, achievement of the ESG target benefits the entity in a broader, intangible manner. For example, the Group could achieve the training target by providing training as a corporate social initiative to people who are not employed by the Group and have no contractual or financial relationship with the Group. While this may improve its reputation, and therefore possibly improve its business performance and credit risk in the long-term, such a link is indirect and, most likely, weak. Additionally, the loan is a short-term loan and therefore it will be difficult to demonstrate a link between the feature and the credit risk on the loan.

5.4.7.B De minimis or non-genuine ESG features

Lenders or holders must also consider whether the ESG feature is *de minimis* (see section 5.4.1.A above) or non-genuine (see section 5.4.1.B above). A lender may decide, as an operational simplification, to introduce a quantitative threshold below which features would be considered '*de minimis*' without a detailed analysis. There is judgement to be exercised in determining what the appropriate threshold is. This is especially relevant in a low-interest environment, whereby sustainability-linked discounts or penalties could easily become significant in relative terms.

5.4.7.C Compensation for other basic lending risks

In some markets, the presence of ESG features within certain types of lending arrangements is becoming increasingly common because of lenders being expected to support the transition towards greener businesses. In these cases, if the ESG feature is not *de minimis* and introduces cash flows that are not commensurate with the change in the credit risk on the loan, further analysis will be necessary to assess whether the feature causes the loan to fail the SPPI test.

In July 2021, as part of the IFRS 9 PIR on Classification and Measurement, the IASB Staff considered the classification of loans with sustainability-linked features. They noted that the key question to ask in analysing these loans is what the entity (the holder) is being compensated for. The nature of the contingent event (i.e., the trigger) of sustainability-linked adjustments is the borrower's performance against specified sustainability targets, but this does not automatically mean that the adjustments represent compensation for the entity's exposure to an actual sustainability risk of the borrower and therefore cause the loan to fail the SPPI test.¹⁰

Key to this argument was the feedback from stakeholders that many ESG-linked adjustments of these loans are a standardised fixed spread and represent a relatively small fraction of the total interest of the loans. They are standardised in a sense that they are not determined based on the assessment of the specific risks of the borrower meeting, or not meeting, the ESG targets. Although the ESG targets are bespoke to the individual borrower, the size and design of the ESG-linked adjustments are often standardised, regardless of what the ESG targets are and how likely it is they will be met. Where this is the case, it could indicate that the ESG features do not introduce compensation for bearing a specific ESG risk that is unrelated to a basic lending arrangement (like equity prices or commodity prices). Therefore, the feature would not cause the loan to fail the SPPI assessment.

In contrast, the Staff highlighted that they were not implying that ESG-linked adjustments may be SPPI because their size is small or because they are standard or common features. A small or common feature may well be inconsistent with a basic lending arrangement and contractual cash flows that are SPPI. However, while the size of the adjustment is not a determinative factor of the assessment, the Staff observed that the larger the adjustments are relative to the total interest of a loan, the more it might be an indication that adjustments represent compensation for a particular type of risk or exposure. In such cases, the borrower and the lender would have a stronger incentive to ensure that a large ESG-linked adjustment reflects the compensation for the relevant ESG risks assumed. If a financial asset compensates an entity for its exposure to ESG risks of the borrower, in the Staff's preliminary view, such compensation is often unlikely to be consistent with contractual cash flows that are SPPI.

In addition to the size of the feature, as a further step in the analysis of ESG features that are not *de minimis* and which introduce cash flows that are not commensurate with the change in the credit risk on the loan, we believe that the following considerations may clarify whether the ESG feature introduces compensation for a new risk that is inconsistent with a basic lending arrangement:

- **The record of contract negotiations between the borrower and the lender**
The negotiations between the counterparties may indicate whether the feature was included as a necessary concomitant to a basic lending arrangement; in response to one of the more traditional basic lending risks such as credit risk; or to introduce ESG risk and compensation into the loan.
- **The nature of the ESG feature**
Paragraph 4.182 of the Basis for Conclusions to IFRS 9 expands on this concept of a basic lending arrangement and emphasises the importance of the pricing approach. If the ESG feature is priced to compensate the lender for a specific lending risk, such as credit risk, rather than to incentivise common 'good corporate citizen' behaviour, it would be more appropriate to assess the feature against the credit risk guidance in section 5.4.7.A above.
- **The lender's pricing decisions**
The lower the level of precision used by the lender to measure and price the risks and volatility arising from the ESG feature, the greater an indication it is that the lender has not attempted to introduce compensation for an ESG risk and is simply trying to conclude a basic lending arrangement.
- **The extent to which the counterparties monitor and manage the resulting ESG risk**
The less prominence that the counterparties give to measuring and managing the resulting ESG volatility and risk on the loan, the greater an indication it is that they were trying to conclude a basic lending arrangement rather than introducing compensation for a separate risk.
- **The level and frequency of data on the ESG feature that the borrower is required to report to the lender**
Similar to the previous point, if the parties intended to introduce compensation for ESG risk, the borrower would be expected to provide more granular, frequent updates to the lender in respect of the ESG feature to enable the lender to monitor and manage its exposure.

2024 Amendments applicable for annual periods beginning on or after 1 January 2026 (with earlier application permitted)

The 2024 Amendments to IFRS 9 provide new guidance on how to apply the contractual cash flow test in the context of contingent contractual cash flows, including those applicable to sustainability-linked loans (See section 5.4.4). The new guidance for financial assets with contingent features has evolved from the considerations described above. In the context of loans with ESG features, the 2024 Amendments also provide an example of an instrument that passes the SPPI test and an instrument that does not, demonstrating how to apply the guidance when there is a contingent event that does not relate to changes in basic lending risks and costs.

Illustration 5-26: Loan with interest rate adjusted for reductions in carbon emissions

A bank originates a loan with an interest rate that is adjusted every reporting period by a fixed number of basis points if the debtor achieves a contractually specified reduction in carbon emissions during the preceding reporting period. The maximum possible cumulative adjustments would not significantly change the interest rate on the loan.

In this scenario, the contractual cash flows are solely payments of principal and interest on the principal amount outstanding. The entity considers whether the contractual cash flows that could arise both before and after each change in contractual cash flows are solely payments of principal and interest. If the contingent event of achieving the carbon emissions target occurs, the interest rate is adjusted by a fixed number of basis points, resulting in contractual cash flows that are consistent with a basic lending arrangement. It is only because the nature of the contingent event itself does not relate directly to changes in basic lending risks and costs that the entity cannot conclude - without further assessment - whether the cash flows on the financial assets are solely payments of principal and interest. The entity therefore assesses whether, in all contractually possible scenarios, the contractual cash flows would not be significantly different from the contractual cash flows on a financial instrument with identical contractual terms, but without the contingent feature linked to carbon emissions. Because any adjustments over the life of the instrument would not result in contractual cash flows that are significantly different, the entity concludes that the loan has contractual cash flows that pass SPPI.

[IFRS 9(2026).B4.1.13 Instrument EA].

Illustration 5-27: Loan with interest rate adjusted to track movements in a carbon price index

A bank originates a loan with an interest rate that is adjusted every reporting period to track the movements in a market-determined carbon price index during the preceding reporting period. The contractual cash flows are indexed to a variable (the carbon price index), which is not a basic lending risk or cost. The contractual cash flows are therefore inconsistent with a basic lending arrangement, and do not meet the SPPI criterion.

[IFRS 9(2026).B4.1.14 Instrument I].

How we see it

The new criteria laid out by the IASB include additional specific guidance for instruments with contingent features, including those which are ESG-linked, and may result in different outcomes for the classification of such instruments than under the current guidance. Therefore, entities should reassess their previous conclusions when transitioning to the new requirements.

5.5 Non-recourse assets

A financial asset may have contractual cash flows that are described as principal and interest, but those cash flows do not, in economic substance, represent the payment of principal and interest on the principal amount outstanding. [IFRS 9.B4.1.15]. For example, under some contractual arrangements, a creditor's claim is limited to specified assets of the debtor or the cash flows from specified assets (described in the standard as a 'non-recourse' financial asset). Another example given in the standard is contractual terms stipulating that a financial asset's cash flows increase as more automobiles use a particular toll road. Those contractual cash flows are inconsistent with a basic lending arrangement. [IFRS 9.B4.1.16]. As a result, the instrument would not pass the contractual cash flow characteristics test unless such a feature is *de minimis* or non-genuine. [IFRS 9.B4.1.18].

The fact that a financial asset is non-recourse does not in itself necessarily preclude the financial asset from passing the contractual cash flow characteristics test (see also section 5.3.2 above). Furthermore, conventional subordination features do not preclude an asset from passing the test (see section 5.3.1 above).

The non-recourse provision in IFRS 9 is intended to prevent instruments that are linked to the performance of another asset from being classified as amortised cost or FVOCI without supporting analysis. Where an asset is non-recourse, the creditor is required to assess ('look through to') the particular underlying assets or cash flows to determine whether the contractual cash flows characteristics test is being met.

[IFRS 9.B4.1.17]. When assessing a non-recourse asset, various factors could be considered, such as:

- Nature of borrower and its business
- Adequacy of loss absorbing capital (particularly for SPEs)
- Pricing of the loan, which (may indicate returns above a lending return)
- Performance figures such as Loan to Value ratios (LTVs), Debt Service Coverage Ratios (DSCR) and Interest Coverage Ratios (ICR)
- Expected sources of repayment

Or

- Existence of other forms of economic recourse such as guarantees

The contractual cash flow characteristics are assessed at initial recognition of the asset and are not reassessed subsequently. For example, if at initial recognition the asset is non-recourse but is assessed as passing SPPI, there is no need to reassess subsequently.

The following Illustrations show instruments which normally fail the contractual cash flow characteristics test because their cash flows are not solely payments of principal and interest on the principal amount outstanding.

Illustration 5-28: Non-recourse loans

Non-recourse loans need careful consideration and many instruments that are non-recourse will fail the test. The following examples illustrate how the guidance above might be applied to non-recourse instruments that are common in practice and under which circumstances those instruments pass the contractual cash flow characteristics test:

(a) Project finance loans

Where a loan is given for the construction and maintenance of a toll road and the payments of cash flows to the lender are reduced or cancelled if less than a certain number of vehicles travel on that road, the loan is unlikely to pass the contractual cash flow characteristics test. Similarly, a loan with cash flows specifically referenced to the performance of an underlying business will not pass the test.

In other cases, where there is no such reference and there is adequate equity in the project to absorb losses before affecting the ability to meet payments on the loan, it may well pass the contractual cash flow characteristics test. In these cases, the adequacy of equity to absorb losses will be key.

(b) Loans to a special purpose entity (SPE)

Where a loan is provided to an SPE that funds the acquisition of other assets, whether that loan passes the contractual cash flow characteristics test will depend on the specific circumstances of the arrangement.

If the assets of the SPE are all debt instruments which would themselves pass the contractual cash flow characteristics test, the loan to the SPE might well pass it too. Furthermore, if the SPE uses the loan from the entity to fund investments in assets which will not themselves pass the contractual cash flow characteristics test, such as equity securities or non-financial assets, but the SPE has sufficient equity to cover the losses on its investments, the loan may again pass the contractual cash flow characteristics test. However, if the loan is the only source of finance to the SPE so that it absorbs any losses from the equity securities, it would not pass the contractual cash flow characteristics test. Whether the loan is legally non-recourse does not matter in this scenario because the SPE has limited other assets to which the lender can have recourse. Therefore, the SPE must have adequate equity for the interest to represent compensation for basic lending risk.

(c) Mortgages

There are many different types of mortgage loans and some are structured so that in the event of default the lender has legal recourse only to the property provided as collateral and not to the borrower. This type of arrangement is common in some states of the USA. Other mortgages may, in substance, be non-recourse if the borrower has limited resources with which to repay the loan.

In addition to the above examples, other loans could also be in substance non-recourse if there is a high loan to value ratio and the borrower has limited resources with which to repay the loan.

How we see it

IFRS 9 was not intended to require all normal collateralised loans which are legally non-recourse or in substance non-recourse due to the limited resources of the borrower (such as certain mortgages) to be accounted for at fair value through profit or loss. If a loan is granted at a rate of interest that compensates the lender for the time value of money and for the credit risk associated with the principal amount, it would, in our view, usually pass the contractual cash flow characteristics test, whether or not it is legally non-recourse.

However, if at inception, the expected repayment of a legally non-recourse loan is primarily driven by future movements in the value of the collateral so that the loan is, in substance, an investment in the real estate market, then measurement at amortised cost or fair value through other comprehensive income classification would most likely be inappropriate.

Under certain circumstances purchased or originated credit-impaired loans backed by collateral could also be non-recourse in substance, such as if the lender could only recover the loan by realising the collateral. This would in substance be similar to the lender buying the collateral directly.

2024 Amendments applicable for annual periods beginning on or after 1 January 2026 (with earlier application permitted)

The 2024 Amendments clarify that for a financial asset to have non-recourse features, the creditor's ultimate right to receive cash flows must be contractually limited to the cash flows generated by specified assets, i.e., the entity is primarily exposed to the specified assets' performance risk not the debtor's credit risk. [IFRS 9(2026).B4.1.16A].

The IASB confirmed that there has to be a contractual, rather than a purely economic, limitation on the creditor's rights to receive contractual cash flows. This limitation can be established through a combination of contracts, such as in the case of a loan to a structured entity. [IFRS 9(2026).BC4.286].

This is different from financial assets that are secured by collateral as the creditor has recourse to the debtor throughout the life of the instrument in addition to the claim on the collateral in the case of default. Also, if a creditor's claim is limited to the value of the assets pledged as collateral but the creditor has a contractual right to require a debtor to 'top-up' pledged assets, the creditor has recourse to the debtor. A right to 'top-up' the pledged assets is a right to require the debtor to add new assets in the pool of pledged assets or replace them if they do not generate sufficient cash flows or their value decreases below a specified threshold. [IFRS 9(2026).BC4.282].

The fact that a financial asset has non-recourse features does not, in itself, preclude the financial asset from passing SPPI. The link between the cash flows of the specified underlying assets (whether financial assets or not) and the financial asset being classified should be assessed (by looking through to the underlying assets). The 2024 Amendments clarify that consideration should be given to how this link is affected by other contractual arrangements, such as subordinated debt or equity instruments issued by the debtor. These junior ranking instruments may absorb potential shortfalls in the cash flows from the underlying assets such that the more senior ranking instruments may pass SPPI.

How we see it

The clarification in the 2024 Amendments that the non-recourse features must be contractual may impact loans that have, to date, been considered in-substance non-recourse on initial classification but are not contractually non-recourse (including those described in example (c) above). This could include purchased or originated credit impaired loans (e.g., mortgages that are purchased credit-impaired).

5.6 Contractually linked instruments

In some types of transactions, an entity may prioritise payments to the holders of financial assets using multiple contractually linked instruments (CLI) that create concentrations of credit risk (known as tranches). Each tranche has a subordination ranking that specifies the order in which any cash flows generated by the issuer are allocated to the tranche. The mechanism for allocating cash flows to tranches is often referred to as a 'waterfall'. With these instruments, the holders of a tranche have the right to payments of principal and interest on the principal amount outstanding only if the issuer generates sufficient cash flows to satisfy the higher-ranking tranches. [IFRS 9.B4.1.20]. Examples of such types of instruments would be notes issued by securitisation structures such as collateralised debt obligations (CDOs).

Essentially, these investments can contain leveraged credit risk and, accordingly, the IASB believes that measuring such investments at amortised cost or fair value through other comprehensive income may be inappropriate in certain circumstances, hence the requirements for contractually linked instruments were developed.

In multi-tranche transactions that concentrate credit risk in the way described above, a tranche is considered to have cash flow characteristics that are payments of principal and interest on the principal amount outstanding only if the following three criteria are met: *[IFRS 9.B4.1.21]*

- (a) The contractual terms of the tranche being assessed for classification (without looking through to the underlying pool of financial instruments) give rise to cash flows that are solely payments of principal and interest on the principal amount outstanding (e.g., the interest rate on the tranche is not linked to a commodity index).
- (b) The underlying pool of financial instruments must contain one or more instruments that have contractual cash flows that are solely payments of principal and interest on the principal amount outstanding (the primary instruments) and any other instruments in the underlying pool must either: *[IFRS 9.B4.1.23, IFRS 9.B4.1.24, IFRS 9.B4.1.25]*
 - (i) Reduce the cash flow variability of the primary instruments in the pool and, when combined with the primary instruments in the pool, result in cash flows that are solely payments of principal and interest on the principal amount outstanding.
 - Or
 - (ii) Align the cash flows of the tranches with the cash flows of the underlying primary instruments in the pool to address differences in and only in:
 - Whether the interest rate is fixed or floating
 - The currency in which the cash flows are denominated, including inflation in that currency
 - Or
 - The timing of the cash flows.

For these purposes, when identifying the underlying pool of financial instruments, the holder must 'look through' the structure until it can identify an underlying pool of instruments that are creating (rather than passing through) the cash flows. *[IFRS 9.B4.1.22]*.

- (c) The exposure to credit risk in the underlying pool of financial instruments inherent in the tranche is equal to, or lower than, the exposure to credit risk of all of the underlying pool of instruments (for example, the credit rating of the tranche is equal to or higher than the credit rating that would apply to a single borrowing that funded the underlying pool).

If any instrument in the pool does not meet the conditions in (b) above, then the tranche fails the SPPI test. In making this assessment, a detailed instrument-by-instrument analysis of the pool may not be necessary, however an entity must use judgement and perform sufficient analysis to determine whether the instruments in the pool meet the conditions in (b) above. *[IFRS 9.B4.1.25]*.

If the holder cannot assess whether a financial asset meets criteria (a) to (c) above at initial recognition, the tranche must be measured at fair value through profit or loss. *[IFRS 9.B4.1.26]*.

An entity would apply the above criteria listed in (a) to (c) to all contractually linked tranches that it holds. Therefore, if the criteria in (b) are not met, it would not be met for all tranches, and this will result in all the tranches failing the SPPI test, including the most senior tranche. This result may not seem intuitive, and consequently it is important that entities carefully consider when instruments would fall within the scope of the contractually linked instruments guidance.

5.6.1 The scope of the 'contractually linked' guidance

To determine when the contractually linked instrument guidance, as discussed in section 5.6 above, needs to be applied, one needs to assess what it means for instruments to be 'contractually linked'. IFRS 9 does not provide an explicit definition of contractually linked instruments, but rather describes the general characteristics of such instruments. These include the following: *[IFRS 9.B4.1.20]*

- The existence of multiple contractually linked instruments that create concentrations of credit risk (so called 'tranches')
- Tranche subordination ranking specifying the order in which any cash flows are allocated
- And
- The holder has a right to receive payments only if the cash flows on higher-ranking tranches have been satisfied.

In addition, the Basis for Conclusions refers to such instruments being issued by 'structured investment vehicles'. *[IFRS 9.BC.4.26]*. Moreover, the guidance refers to 'the pool of underlying financial instruments', which are exposed to credit risk, as opposed to other types of assets. *[IFRS 9.B4.1.21]*.

How we see it

The reference to 'multiple' contractually linked instruments, in our view, means that there must be more than one tranche. If there is only a single tranche, consideration must be given to the non-recourse guidance (see section 5.6.2.A below).

There are various financing structures and types of instruments that can be issued by entities and so it may be unclear when the contractually linked instrument guidance as set out in section 5.6 above, must be applied. The assessment of whether there are multiple contractually linked instruments is an area of judgement which requires careful consideration of the specific facts and circumstances.

A number of other questions arise when evaluating the scope of the contractually linked instruments guidance. These include:

- (i) Whether it only applies to such instruments that are issued by structured investment vehicles, or whether it covers a broader range of entities.
- (ii) Whether the features must be explicitly set out in the instrument's contractual terms, or whether an instrument can be 'implicitly contractually linked'. For example, a structured investment vehicle could issue two instruments, one debt and one equity or it could issue two contractually linked debt instruments where the junior debt instrument is expected to behave more like equity, because it absorbs residual risk. Economically, these two structures may be very similar.

And

- (iii) Whether the guidance only applies where the underlying assets are financial instruments (see section 5.6.2.A below).

The Basis for Conclusions, in discussing the development of this guidance, states that it was revised so as to focus on the economic characteristics rather than the form and legal structure, [IFRS 9.BC4.29], and is not based solely on the contractual features. [IFRS 9.BC4.33]. Furthermore, to make the judgement about whether an instrument has the required features to be classified as contractually linked, an entity must understand the characteristics of the underlying issuer. [IFRS 9.BC4.34]. The challenge in applying this guidance is that, despite the desire of the Board not to focus on legal form, the wording, including the title, 'contractually linked', frequently refers to the contractual form.

Consequently, while we believe that the guidance might also apply to some situations other than where the instruments are issued by structured investment vehicles and that the analysis must not focus on only the instruments' legal form, it does need to be guided by the general characteristics of contractually linked instruments as set out in the standard.

Further, the Basis for Conclusions states that subordination in itself must not preclude amortised cost measurement. The ranking of an entity's instruments is a common form of subordination that affects almost all lending transactions. Commercial law (including bankruptcy law) typically sets out a basic ranking for creditors. The IASB believes that it is reasonable to assume that commercial law does not intend to create leveraged credit exposure for credit risk associated with general creditors such as trade creditors and the credit risk associated with general creditors does not preclude the contractual cash flows representing the payments of principal and interest on the principal amount outstanding. [IFRS 9.BC4.28].

To make the judgement as to whether the guidance must be applied to a particular financial asset, two of the considerations that could be evaluated include the following, noting that each consideration listed below will probably not be conclusive in isolation and the evaluation will depend on the specific facts and circumstances of the structure and how the instruments that are issued are linked together:

- (a) Whether the subordination features are only applicable in the event of default:

If the subordination features only apply in the event of default (i.e., there is no cash flow 'waterfall' in the ordinary course of business), the subordination would not specify the order in which 'any cash flows generated by the issuer are allocated to the tranche', hence, one of the specific characteristics of contractually linked instruments referred to in IFRS 9.B4.1.20 as discussed above, would not be met.

- (b) Whether non-payment of a junior tranche constitutes a breach of contract:

The nature of a contractually linked instrument is to introduce credit concentration features linked with higher yielding returns for junior instruments in exchange for providing credit protection to senior instruments. As such, if non-payment on the junior ranking instrument, because cash flows are directed to a more senior instrument, constitutes a breach of contract resulting in an event of default (so that the structure must be restructured or liquidated), it could be argued that the instrument does not provide such credit protection.

Application of some of the considerations is shown in the following Illustrations:

Illustration 5-29: Assessing whether instruments are contractually linked

Entity X sets up a special purpose vehicle (Entity Y) in order to finance the acquisition of a pool of financial instruments. Entity Y finances the acquisition of the pool of financial instruments through the following:

- Equity of CU50m from X
- Junior loan from Bank A of CU30m
- Senior loan from Bank B of CU20m

The terms of the loans stipulate that in the normal course of business, payments on the junior loan cannot be made unless all amounts due on the senior loan from Bank B has been settled. Non-payment of the junior loan does not trigger liquidation of Entity Y. The subordination features of the loans are not only applicable in the event of default. There is a 'waterfall' feature, that determines how profits from the pool of financial instruments must be allocated to the individual loans in the ordinary course of business.

Bank A and B would conclude, based on the terms of the junior and senior loans, that these two instruments are contractually linked. Therefore, they would need to assess both loans against the criteria as set out in IFRS 9.B4.1.21 in order to determine whether or not they qualify to be measured at amortised cost.

Illustration 5-30: Property development company with debt and equity

A property development company (Entity P) sets up a separate subsidiary to fund each development. The subsidiary (Entity S) obtains funding in the form of ordinary shares issued to its parent and a loan from the bank. Entity S uses the funds to develop a property. Entity S is not permitted to declare dividends prior to the repayment of the loan and the parent funding is considered sufficient to absorb any losses that are likely to arise. In addition to this the parent is required to inject further capital if the loan-to-value ratio of the collateral, deteriorates below a certain threshold.

In this example, there is only a single tranche of debt. Although the structure would result in the ordinary shares being exposed to the residual cash flows in this structure, the equity instrument is not contractually linked to the debt instrument in the ordinary course of business (i.e., there is no pre-defined 'waterfall' which would give the ordinary shareholders the right to receive payments if the cash flows on the loan have been satisfied). In addition, given that the shareholder funding is not only contractually established as equity but also imposes an obligation to inject sufficient capital to absorb any losses, the loan has the characteristics of normal bank lending. Consequently, the loan has the characteristics of a conventional bank loan and holder of the financial asset (the bank) would conclude that the contractually linked instrument guidance is not applicable.

2024 Amendments applicable for annual periods beginning on or after 1 January 2026 (with earlier application permitted)

As part of the IFRS 9 PIR, the IASB have amended IFRS 9 for assessing the contractual cash flow characteristics of a financial asset with CLI features. This guidance was designed primarily to address securitisation of debt instruments, but feedback from the RFI identified that the scope and meaning of several terms used in the guidance is unclear. This feedback led the IASB to include amendments to IFRS 9 to clarify that:

- Transactions that are CLI are a sub-set of transactions with non-recourse features, rather than a separate class of instrument.
- The underlying pool of assets must be exclusively financial instruments for the transaction to qualify as a CLI. However, this can include financial instruments that are not in the scope of IFRS 9 classification and measurement, such as some lease receivables. Nevertheless, lease receivables must have cash flows that are equivalent to SPPI (i.e., not subject to residual value risk nor indexed to a variable that is not a basic lending risk or cost, such as a market rental rate). [IFRS 9.B4.1.23]. Structures that include non-financial assets are to be assessed under the non-recourse guidance (refer to sections 5.5).
- The prioritisation of payments to the holders of tranches is established through a 'waterfall' payment structure that creates concentration of credit risk and results in a disproportionate allocation of cash shortfalls from the pool of underlying assets between the tranches.
- CLIs are not created where multiple debt instruments of differing seniority are issued to facilitate lending with enhanced credit protection to a creditor (or a group of creditors). This is the case, for example, if the structured entity issues senior and junior notes and the entity sponsoring the structured entity that holds the junior debt instrument has no practical ability to sell the junior instrument without the senior debt instrument becoming payable. In this case non-recourse guidance is to be applied. [IFRS 9.B4.1.20A].

5.6.2 Assessing the characteristics of the underlying pool

5.6.2.A Non-financial assets in the underlying pool

As already mentioned, the guidance on whether a contractually linked instrument would be SPPI refers to the need to look through to 'the underlying pool of financial instruments'. [IFRS 9.B4.1.21(b), IFRS 9.B4.1.21(c), IFRS 9.B4.1.22]. This has prompted the question as to whether the contractually linked instrument guidance only applies to structures where the underlying assets are financial instruments, as opposed to other assets such as property.

How we see it

Currently, the scope of contractually linked instruments is based on the features of the instruments issued and not on the nature of the pool of assets underlying the instruments. As such, if a structure contains contractually linked instruments, then it would apply the contractually linked instruments guidance and not the requirements for non-recourse assets, irrespective of the nature of the underlying assets. However, the IASB have amended IFRS 9 as part of the PIR in order to clarify that the CLI guidance only applies where the underlying pool exclusively consists of financial instruments, including lease receivables.

Contractually linked instruments referencing a pool of non-financial instruments do not meet the contractual cash flow characteristics test and cannot be classified at amortised cost. Additionally, in a structure where an SPE issues contractually linked notes referenced to a note issued by another SPE referencing a pool of non-financial assets, IFRS guidance would require the entity holding the instrument to look through all contractually linked instruments.

Because of the way the standard is written, the outcome of the contractual cash flow characteristics assessment will depend on the form of the arrangement. Arrangements which involve using multiple contractually linked instruments are assessed under the contractually linked instruments requirements while arrangements with non-recourse features, but without multiple tranches, are assessed under the non-recourse requirements. Therefore, the accounting outcome can vary depending on the structure employed. For instance, a non-recourse financial asset whose cash flows depend on vehicles using a toll road would be required to be assessed under the non-recourse requirement if structured as a single instrument but, if structured into tranches, would be assessed differently using the contractually linked instrument criteria. If the contractually linked instrument criteria are required to be applied, the underlying asset (the toll road in this example) would not be a financial instrument passing SPPI, and therefore the criteria in (b) as discussed in section 5.6 above, would not be met and the tranches would therefore not pass SPPI. However, as mentioned above, the IASB have amended IFRS 9 as part of the PIR to clarify that the CLI guidance will only apply where the underlying pool consists of financial instruments.

2024 Amendments applicable for annual periods beginning on or after 1 January 2026 (with earlier application permitted)

The 2024 Amendments clarify that the CLI guidance only applies where the underlying pool exclusively consists of financial instruments, including financial instruments that are not within the scope of the classification requirements of IFRS 9 but have contractual cash flows that are equivalent to SPPI, for example lease receivables. Nevertheless, lease receivables that are subject to residual value risk or are indexed to a variable that is not a basic lending risk or cost, such as a market rental rate, do not have cash flows that are equivalent to SPPI. [IFRS 9 (2026).B4.1.23]. Structures that include non-financial assets are to be assessed under the non-recourse guidance (refer to sections 5.5).

5.6.2.B Liquidity facilities in the underlying pool

Some structures contain liquidity facilities which provide short-term funding to enable interest to be paid on notes when cash flows from the underlying assets are delayed, for instance a facility which provides liquidity to cover the cash flows needed for the SPE to operate and to pay interest to the noteholders for a short period. These facilities usually have a seniority above all other notes in the structure and a failure to pay on the facility would be considered a default of the SPE. Normally these liquidity features would not be considered a tranche of the structure and are seen as being an instrument in the pool rather than a tranche. This is because they are short-term and designed to align the cash flows in the structure in a similar way to plain vanilla derivative instruments in criterion (b) in section 5.6 above, rather than to absorb risks by the holder and thereby create concentrations of credit risk.

The characteristics of the liquidity facility are sufficiently different from the notes. If the liquidity facility passes SPPI, it does not taint the analysis of whether the notes pass SPPI.

5.6.2.C Changes in the composition of the underlying pool

How we see it

In practice, it may be difficult for the holder to perform the look through test because the underlying reference assets of a collateralised debt obligation (CDO) may not all have been acquired at the time of investment. In such circumstances, the holder will need to consider, amongst other things, the intended objectives of the CDO as well as the manager's investment mandate before determining whether the investment qualifies for measurement at amortised cost or fair value through other comprehensive income.

If, after this consideration, the holder is able to conclude that all the underlying reference assets of the CDO will always have contractual cash flows that are solely payments of principal and interest on the principal amount outstanding, the interest in the CDO can qualify for measurement at amortised cost or fair value through other comprehensive income. Otherwise, the investment in the CDO must be accounted for at fair value through profit or loss because it fails the contractual cash flow characteristics test, unless the effect is *de minimis*.

If the underlying pool of instruments can change after initial recognition in a way that does not meet condition (b) in section 5.6 above, the tranche must be measured at fair value through profit or loss. However, if the underlying pool includes instruments that are collateralised by assets that do not meet the conditions above (as will often be the case), the ability to take possession of such assets is disregarded for the purposes of applying this paragraph, unless the entity acquired the tranche with the intention of controlling the collateral. [IFRS 9.B4.1.26].

5.6.2.D Assets with prepayment options in the underlying pool

The IASB noted that a key principle underlying the contractual cash flow provisions for contractually linked instruments was that an entity should not be disadvantaged simply by holding an asset indirectly if the underlying asset has cash flows that are solely principal and interest, and the holding is not subject to more-than-insignificant leverage or a concentration of credit risk relative to the underlying assets.

Accordingly, the IASB clarified that a tranche may have contractual cash flows that are solely payments of principal and interest even if the tranche is prepayable in the event that the underlying pool of financial instruments is prepaid. The Board noted that because the underlying pool of assets must have contractual cash flows that are solely payments of principal and interest, then, by extension, any prepayment features in those underlying financial assets are also required to be solely payments of principal and interest.

[IFRS 9.BC4.206(a)].

The Board's clarification that a prepayment feature in the underlying pool of assets does not necessarily prevent a tranche from meeting the contractual cash flow characteristics test is helpful. But, unless the underlying pool can only be acquired at origination, it may be difficult to 'look through' to the underlying pool to determine if its prepayment features would themselves be solely payments of principal and interest. This is because the information will often not be available to determine whether the assets were acquired at a premium or discount, and whether the fair value of any prepayment feature was insignificant on acquisition (see section 5.4.4 above). However, there may be instances where the investment vehicle has a clearly defined investment mandate or design which will provide the investor with sufficient information as to the nature of the underlying pool of assets.

5.6.2.E Derivatives and financial guarantee contracts in the underlying pool

For the purposes of criterion (b) in section 5.6 above, the underlying pool may contain financial instruments such as interest rate swaps. In order for these instruments not to preclude the use of amortised cost or fair value through other comprehensive income accounting for holders of a tranche, they must reduce the variability of cash flows, or align the cash flows of the tranches with the cash flows of the underlying pool of the primary instruments. Accordingly, an underlying pool that contains government bonds and an instrument that swaps government credit risk for (riskier) corporate credit risk would not have cash flows that represent solely principal and interest on the principal amount outstanding. [IFRS 9.BC4.35(d)].

If the underlying pool of financial instruments contained a purchased credit default swap, this would not prejudice the use of amortised cost or fair value through other comprehensive income accounting provided it paid out only to compensate for the loss of principal and interest. In practice, however, it is far more common for underlying pools to contain written, rather than purchased, credit default swaps. Written credit default swaps and financial guarantees are a feature of 'synthetic' CDOs that typically gain exposure to instruments through derivatives rather than through purchasing financial instruments. As a consequence, while it may often be possible to obtain amortised cost or fair value through other comprehensive income accounting treatment for the more senior investments in 'cash' CDOs (i.e., those where the underlying pool comprises the reference debt instruments) tranches of 'synthetic' CDOs, would not pass the SPPI test.

5.6.2.F Assets transferred to the underlying pool which have failed derecognition

An underlying pool containing instruments which have failed derecognition in the books of the transferee will need to be assessed carefully to understand the cash flows involved. It should be noted that just because an asset has failed derecognition does not mean that the transferee is not exposed to any of the risks and rewards of that asset. Repo balances transferred into the underlying pool will probably not impact the pool's ability to pass the SPPI test, given the nature of the cash flows in a repo. However, in other cases, the transferee could be exposed to some of the risks or rewards associated with the failed sale asset. So, depending on the analysis of the instruments involved, it is possible that the nature of the transferred risks could result in an instrument held within the pool failing the contractual cash flows characteristic test.

5.6.3 Application of expected credit loss requirements to junior tranches that pass SPPI

While some contractually linked instruments may pass the SPPI test and consequently may be measured at amortised cost or fair value through other comprehensive income, the contractual cash flows of the individual tranches are normally based on a pre-defined waterfall structure (i.e., principal and interest are first paid on the most senior tranche and then successively paid on more junior tranches). Accordingly, one could argue that more junior tranches could never suffer a credit loss because the contractually defined cash flows under the waterfall structure are always equal to the cash flows that an entity expects to receive, and so would never be regarded as impaired. This is, because Appendix A of IFRS 9 defines 'credit loss' as the difference between all contractual cash flows that are due to an entity in accordance with the contract and all the cash flows that the entity expects to receive, discounted at the original effective interest rate.

However, consistent with treating these assets as having passed the contractual cash flow characteristics test, we believe that the impairment requirements of IFRS 9 (see Chapter 47) apply to such tranches if they are measured at amortised cost or fair value through other comprehensive income. Instead of the cash flows determined under the waterfall structure, an entity needs to consider the deemed principal and interest payments as contractual cash flows when calculating expected credit losses.

5.6.4 Assessing the exposure to credit risk in the tranche held

IFRS 9 does not prescribe a method for comparing the exposure to credit risk in the tranche held to that of the underlying pool of financial instruments.

For the more senior and junior tranches, it may become obvious with relatively little analysis whether the tranche is more or less risky than the underlying assets. In some cases, it might be possible to compare the credit rating allocated to the tranche as compared with that for the underlying pool of financial instruments, provided they are all rated.

However, in some circumstances involving complex securitisation structures, a more detailed assessment may be required. For example, it might be appropriate to prepare an analysis that involves developing various credit loss scenarios for the underlying pool of financial instruments, computing the probability weighted outcomes of those scenarios, determining the probability weighted effect on the tranche held, and comparing the relative variability of the tranche held with that of the underlying assets, which is shown in the following Illustration.

Illustration 5-31: Assessing the exposure to credit risk in the tranche held

Bank A is the sponsor of a securitisation vehicle (the SPE) and holds the junior notes issued by the SPE. The SPE's assets consist of a portfolio of residential mortgages that were originated and transferred to the SPE by Bank A. The SPE does not hold any derivatives. A number of other banks invest in the mezzanine, senior and super senior tranches of notes issued by the SPE. None of the banks has any further involvement with the SPE and all banks have assessed that the SPE is not required to be consolidated in their respective financial statements. The total notional amount of mortgage assets and notes issued is CU1,000m.

The following table shows a range of expected credit losses for the portfolio of mortgages as at inception and the estimated probability that those scenarios will occur.

	Loss	Estimated probability of loss	Estimated weighted average loss
	CU million	%	CU million
Scenario I	40	10%	4
Scenario II	70	25%	18
Scenario III	110	30%	33
Scenario IV	180	25%	45
Scenario V	230	10%	23
Weighted average loss expectancy			123

The probability weighted expected losses of the underlying assets therefore represent 12.3%.

The following table illustrates how an entity may compare the credit risk of the tranche with that of the underlying pool of financial instruments:

Tranche	Super senior	Senior	Mezzanine	Junior	Total
Notional amount (A) CU million	630	200	90	80	1,000
Probability	Probability weighted expected losses of the tranches (CU million)*				
Scenario I	10%	-	-	4	4
Scenario II	25%	-	-	18	18
Scenario III	30%	-	9	24	33
Scenario IV	25%	2	23	20	45
Scenario V	10%	6	9	8	23
Expected loss by tranche (B)	-	8	41	74	123
Expected loss % by tranche (B)/(A)	0.0%	4.0%	45.6%	92.5%	12.3%
Credit risk of tranche is less than the credit risk of the underlying assets?	Yes	Yes	No	No	
Tranche passes the contractual cash flow characteristic test	Yes	Yes	No	No	

* For each scenario, expected losses are first allocated to the junior tranches and progressively to the more senior tranches until all expected losses are absorbed. For example, in Scenario IV, the loss of CU180m would be absorbed by the Junior tranche (CU80m), mezzanine tranche (CU90m) and senior tranche (CU10m). The probability weight of 25% for Scenario IV is then applied to the expected losses allocated to each tranche.

The junior notes have an expected loss which is, in percentage terms, greater than the overall expected loss on the underlying portfolio. Therefore, these notes must be accounted for at fair value through profit or loss. Similarly, the mezzanine notes have a greater expected loss than the underlying pool and would not pass the contractual cash flow characteristics test.

The expected losses on the senior notes and the super senior notes are lower than the overall expected loss on the underlying pool of instruments and may qualify for amortised cost or fair value through other comprehensive income treatment, provided all other IFRS 9 requirements are met and the instruments are not held for trading.

In this example, it might have been possible to come to the same conclusion without a numerical calculation for the junior and super senior tranches, but the technique is helpful to determine the treatment of the intermediary notes. In practice, it may also be necessary to apply judgement through a qualitative assessment of specific facts and circumstances.

5.7 Transferred financial assets held by a transferee and not qualifying for derecognition by the transferor

IFRS 9 states that, where a financial asset is transferred from one party to another in circumstances that preclude the transferor from derecognising the asset, the transferee should not recognise the transferred asset. Instead, the transferee derecognises the cash or other consideration paid and recognises a receivable from the transferor. [IFRS 9.B3.2.15].

There may be various reasons for the transferor not achieving derecognition of transferred financial assets. Refer to Chapter 48 for further considerations on derecognition. In addition, depending on how the transfer is structured, there may be diversity in practice in terms of how the transferee accounts for the receivable and any related liabilities. Refer to Chapter 45 for initial recognition considerations.

In certain securitisations, the transferor may retain an interest in the securitisation vehicle resulting in the transferor retaining substantially all the risks and rewards of the transferred assets, and the transferred assets failing derecognition. Examples of such an interest retained by the transferor include: the provision of guarantees or put options; an obligation to substitute non-performing loans; deferred consideration; or the investment by the transferor in a junior tranche of the notes issued by the securitisation vehicle. The transferee needs to assess whether the 'failed sale' receivable it recognises as due from the transferor meets the SPPI criterion. The receivable due from the transferor would be dependent on the cash flows of the underlying transferred asset which failed to qualify for derecognition. Therefore, it is necessary for the transferee to assess the nature of these underlying cash flows and whether it results in the transferee receiving payments on its receivable that are solely principal and interest.

In the situation where the transferor invests in a subordinated tranche of the securitisation vehicle, the transferee could consider the non-recourse guidance (as discussed in section 5.5 above), as the return on the receivable due from the transferor, is limited to the cash flows from the underlying pool of transferred assets. In assessing whether the transferee's receivable meets the SPPI test, the transferee would 'look through' to the underlying cash flows from the transferred assets that it has rights to. Alternatively, the transferee could consider whether the contractually linked instruments guidance (as discussed in section 5.6 above) could be applied. In this assessment the transferee could view itself as holding the more senior tranche, with the transferor owning the junior tranche in the underlying assets (by virtue of its investment in the subordinated tranche of the securitisation), with both tranches being linked to the underlying pool of transferred assets. Applying either of these two approaches, the receivable is likely to be considered to pass the SPPI test if the underlying assets themselves pass the SPPI test. If the transferee can conclude the receivable meets the SPPI requirements and measures it at amortised cost, then it would need to apply the expected credit loss requirements to this receivable. Refer to Chapter 47 for further considerations on impairment.

6 Designation at fair value through profit or loss

Financial assets or financial liabilities may be designated as measured at fair value through profit or loss at initial recognition if doing so eliminates or significantly reduces a measurement or recognition inconsistency (sometimes referred to as an 'accounting mismatch') that would otherwise arise. [IFRS 9.4.1.5, IFRS 9.4.2.2(a)].

Financial liabilities may also be designated at fair value through profit or loss where a group of financial liabilities, or financial assets and financial liabilities, is managed and its performance is evaluated on a fair value basis. [IFRS 9.4.2.2(b)]. Such a designation is not required for financial assets that are managed on a fair value basis as they will automatically be classified at fair value through profit or loss (see section 4.4 above).

Designation at fair value through profit or loss in the two situations described above is only permitted provided doing so results in the financial statements presenting more relevant information. [IFRS 9.B4.1.27]. Such a designation can be made only at initial recognition and cannot be revoked subsequently.

The decision to designate a financial asset or financial liability as measured at fair value through profit or loss is similar to an accounting policy choice, although, unlike an accounting policy choice, it is not required in all cases to be applied consistently to all similar transactions. However, for a group of financial assets and financial liabilities that are managed, and its performance is evaluated on a fair value basis, all eligible financial liabilities that are managed together should be designated. [IFRS 9.B4.1.35]. When an entity has a policy choice, IAS 8 requires the chosen policy to result in the financial statements providing reliable and more relevant information about the effects of transactions, other events and conditions on the entity's financial position, financial performance or cash flows. For example, in the case of the designation of a financial liability at fair value through profit or loss, an entity needs to demonstrate that it falls within at least one of the circumstances set out in IFRS 9.4.2.2. [IFRS 9.B4.1.28].

In addition to the designations that result in more relevant information set out in IFRS 9.4.2.2, a hybrid contract with a host that is not an asset within the scope of IFRS 9 that contains one or more embedded derivatives meeting particular conditions may also be designated, in its entirety, at fair value through profit or loss. [IFRS 9.4.3.5]. These conditions are discussed in detail in section 6.3 below.

The fair value option cannot be applied to a portion or component of a financial instrument, e.g., changes in the fair value of a debt instrument attributable to one risk such as changes in a benchmark interest rate, but not credit risk. Further, it cannot be applied to proportions of an instrument. However, if an entity simultaneously issues two or more identical financial instruments, it is not precluded from designating only some of those instruments as being subject to the fair value option (e.g., if doing so achieves a significant reduction in an accounting mismatch). Therefore, if an entity issued a bond totalling CU100 million in the form of 100 certificates each of CU1 million, the entity could designate 10 specified certificates if to do so would meet at least one of the criteria noted above. [IFRS 9.BCZ4.74, IFRS 9.BCZ4.75, IFRS 9.BCZ4.76].

The conditions under which financial instruments may be designated at fair value through profit or loss are discussed further in sections 6.1 to 6.3 below.

6.1 Designation eliminates or significantly reduces a measurement or recognition inconsistency (accounting mismatch)

The notion of an accounting mismatch necessarily involves two propositions. First, that an entity has particular assets and liabilities that are measured, or on which gains and losses are recognised, on different bases; and second, that there is a perceived economic relationship between those assets and liabilities. [IFRS 9.BCZ4.61].

For example, absent any designation, a financial asset might be classified as subsequently measured at fair value and a liability the entity considers related would be subsequently measured at amortised cost (with changes in fair value not recognised). In such circumstances, an entity may conclude that its financial statements would provide more relevant information if both the asset and the liability were measured as at fair value through profit or loss. [IFRS 9.B4.1.29].

IFRS 9 gives the following examples of situations in which designation of a financial asset or financial liability as measured at fair value through profit or loss might eliminate or significantly reduce an accounting mismatch and produce more relevant information: [IFRS 9.B4.1.30]

- (a) An entity has liabilities under insurance contracts whose measurement incorporates current information (as permitted by IFRS 17), and financial assets it considers related that would otherwise be measured at fair value through other comprehensive income or amortised cost.
- (b) An entity has financial assets, financial liabilities, or both that share a risk, such as interest rate risk, that gives rise to changes in fair value that tend to offset each other. However, only some of the instruments would be measured at fair value through profit or loss (e.g., derivatives or those classified as held for trading). It may also be the case that the requirements for hedge accounting are not met, for example, because the requirements for hedge effectiveness are not met.
- (c) An entity has financial assets, financial liabilities, or both that share a risk, such as interest rate risk, that gives rise to changes in fair value that tend to offset each other and the entity does not use hedge accounting. This could be for different reasons, for example, because items giving rise to the accounting mismatch would not qualify for hedge accounting or because the entity does not want to use hedge accounting because of operational complexity. Furthermore, in the absence of hedge accounting there is a significant inconsistency in the recognition of gains and losses. For example, the entity has financed a specified group of loans by issuing traded bonds, the changes in the fair value of which tend to offset each other. If, in addition, the entity regularly buys and sells the bonds but rarely, if ever, buys and sells the loans, reporting both the loans and the bonds at fair value through profit or loss eliminates the inconsistency in the timing of recognition of gains and losses that would otherwise result from measuring them both at amortised cost and recognising a gain or loss each time a bond is repurchased.

For practical purposes, an entity need not acquire all the assets and incur all the liabilities giving rise to the measurement or recognition inconsistency at exactly the same time. A reasonable delay is permitted provided that each transaction is designated as at fair value through profit or loss at its initial recognition and, at that time, any remaining transactions are expected to occur. [IFRS 9.B4.1.31].

It would not be acceptable to designate only some of the financial assets giving rise to the inconsistency as at fair value through profit or loss if to do so would not eliminate or significantly reduce the inconsistency and would therefore not result in more relevant information. However, it would be acceptable to designate only some of a number of similar financial assets if doing so does achieve a significant reduction (and possibly a greater reduction than other allowable designations) in the inconsistency. [IFRS 9.B4.1.32].

For example, assume an entity has a number of similar financial assets totalling CU100 million and a number of similar financial liabilities totalling CU50 million, but these are measured on a different basis. The entity may significantly reduce the measurement inconsistency by designating at initial recognition all the liabilities but only some of the assets (for example, individual assets with a combined total of CU45 million) as at fair value through profit or loss. However, because designation as at fair value through profit or loss can be applied only to the whole of a financial instrument, the entity in this example must designate one or more assets in their entirety. It could not designate either a component of an asset (e.g., changes in value attributable to only one risk, such as changes in a benchmark interest rate) or a proportion (i.e., percentage) of an asset. [IFRS 9.B4.1.32].

6.2 A group of financial liabilities (or financial assets and financial liabilities) is managed and its performance is evaluated on a fair value basis

The second situation in which the fair value option may be used for financial liabilities is where a group of financial liabilities, or financial assets and financial liabilities, is managed, and its performance evaluated, on a fair value basis. In order to meet this condition, it is necessary for the group of instruments to be managed in accordance with a documented risk management or investment strategy and for information, prepared on a fair value basis, about the group of instruments to be provided internally to the entity's key management personnel (as defined in IAS 24 see Chapter 35), for example, the entity's board of directors and chief executive officer. [IFRS 9.4.2.2(b)].

If an entity manages and evaluates the performance of a group of financial liabilities or financial assets and financial liabilities in such a way, measuring that group at fair value through profit or loss results in more relevant information. The focus in this instance is on the way the entity manages and evaluates performance, rather than on the nature of its financial instruments. [IFRS 9.B4.1.33]. Accordingly, subject to the requirement of designation at initial recognition, an entity that designates financial instruments as at fair value through profit or loss on the basis of this condition should so designate all eligible financial instruments that are managed and evaluated together. [IFRS 9.B4.1.35].

An entity may designate financial liabilities as at fair value through profit or loss if it has financial assets and financial liabilities that share one or more risks and those risks are managed and evaluated on a fair value basis in accordance with a documented policy of asset and liability management. For example, the entity may issue 'structured products' containing multiple embedded derivatives and manage the resulting risks on a fair value basis using a mix of derivative and non-derivative financial instruments. [IFRS 9.B4.1.34].

An entity's documentation of its strategy need not be extensive (e.g., it need not be at the level of detail required for hedge accounting) but should be sufficient to demonstrate that using the fair value option is consistent with the entity's risk management or investment strategy. Such documentation is not required for each individual item but may be on a portfolio basis. The IASB notes that in many cases, the entity's existing documentation, as approved by its key management personnel, should be sufficient for this purpose. For example, if the performance management system for a department (as approved by the entity's key management personnel) clearly demonstrates that its performance is evaluated on a total return basis, no further documentation is required. [IFRS 9.B4.1.36].

The IASB made it clear in its basis for conclusions that in looking to an entity's documented risk management or investment strategy, it makes no judgement on what an entity's strategy should be. However, the IASB believes that users, in making economic decisions, would find useful a description both of the chosen strategy and of how designation at fair value through profit or loss is consistent with that strategy. Accordingly, IFRS 7 requires these to be disclosed (see Chapter 50). [IFRS 9.BCZ4.66].

6.3 Hybrid contracts with a host that is not an asset within the scope of IFRS 9

Extract from IFRS 9

- 4.3.5** Despite paragraphs 4.3.3 and 4.3.4, if a contract contains one or more embedded derivatives and the host is not an asset within the scope of this Standard, an entity may designate the entire hybrid contract as at fair value through profit or loss unless:
- (a) the embedded derivative(s) do(es) not significantly modify the cash flows that otherwise would be required by the contract; or
 - (b) it is clear with little or no analysis when a similar hybrid instrument is first considered that separation of the embedded derivative(s) is prohibited, such as a prepayment option embedded in a loan that permits the holder to prepay the loan for approximately its amortised cost.

[IFRS 9.4.3.5]

As discussed in Chapter 42, when an entity becomes a party to a hybrid financial instrument that contains one or more embedded derivatives and the host is not an asset within the scope of IFRS 9, the entity is required to identify any such embedded derivative, assess whether it is required to be separated from the host contract and, if so, measure it separately at fair value at initial recognition and subsequently. These requirements can be more complex, or result in less reliable measures, than measuring the entire instrument at fair value through profit or loss. For that reason, the entire instrument is normally permitted to be designated as at fair value through profit or loss. [IFRS 9.B4.3.9].

Such designation may be used whether the entity is required to, or prohibited from, separating the embedded derivative from the host contract, except for those situations in (a) or (b) above - this is because doing so would not reduce complexity or increase reliability. [IFRS 9.B4.3.10].

Little further guidance is given on what instruments might fall within (a) and (b) above. The Basis for Conclusions explains that, at one extreme, the terms of a prepayment option in an ordinary residential mortgage is likely to mean that the fair value option is unavailable to such a mortgage (unless it met one of the conditions in sections 6.1 and 6.2 above). At the other extreme, it is likely to be available for 'structured products' that contain several embedded derivatives which are typically hedged with derivatives that offset all (or nearly all) of the risks they contain irrespective of the accounting treatment applied to the embedded derivatives. [IFRS 9.BCZ4.68, IFRS 9.BCZ4.69, IFRS 9.BCZ4.70].

Essentially, the IASB explains, the standard seeks to strike a balance between reducing the costs of complying with the embedded derivatives provisions and the need to respond to concerns expressed regarding possible inappropriate use of the fair value option. Allowing the fair value option to be used for any instrument with an embedded derivative would make other restrictions on the use of the option ineffective, because many financial instruments include an embedded derivative. In contrast, limiting the use of the fair value option to situations in which the embedded derivative must otherwise be separated would not significantly reduce the costs of compliance and could result in less reliable measures being included in the financial statements. [IFRS 9.BCZ4.70].

Another question that arises is whether the fair value option applies to hybrid contracts with a host that would not otherwise be within the scope of IFRS 9. The standard refers broadly to “a contract in which the host is not an asset within the scope of IFRS 9”. [IFRS 9.4.3.5].

The IFRS IC considered this issue in 2007. It recommended, and the Board proposed, to clarify IAS 39.11A (now IFRS 9.4.3.5) as part of the annual improvements to IFRSs in 2008. As part of these deliberations, in December 2007,¹¹ the Board decided to replace the term ‘contract’ with the term ‘financial instrument in the scope of IAS 39’ to clarify that IAS 39.11A applies only to financial instruments. However, the Board did not finalise its proposal and the existing wording was carried over to IFRS 9 without amendment.

How we see it

In the absence of a finalised amendment, IFRS 9 remains unclear whether the fair value option applies to hybrid contracts with a host that would not otherwise be within the scope of IFRS 9.

11 [IASB Update](#), December 2007, available on the IFRS Foundation’s website.

7 Presentation of fair value changes on an equity investment in other comprehensive income instead of profit or loss

An entity may acquire an investment in an equity instrument that is not held for trading. At initial recognition, the entity may make an irrevocable election (on an instrument-by-instrument basis) to present in other comprehensive income subsequent changes in the fair value of such an investment. [IFRS 9.5.7.5, IFRS 9.B5.7.1]. IFRS 7 requires granular disclosures for each instrument so designated (see Chapter 50).

For the purpose of this election, the term equity instrument is the one defined in IAS 32, application of which for issuers is dealt with in detail in Chapter 43. In particular circumstances, a puttable instrument (or an instrument that imposes on the entity an obligation to deliver to another party a *pro rata* share of the net assets of the entity only on liquidation) is classified by the issuer as if it were an equity instrument. This classification is an exception to the general requirements for financial liabilities and equity instruments. Consequently, such instruments do not actually meet the definition of an equity instrument and therefore the related asset cannot be designated at fair value through other comprehensive income by the holder. [IFRS 9.BC5.21].

This conclusion was confirmed by the IFRS IC in September 2017, after they received a request to clarify exactly this point. The IFRS IC observed that 'equity instrument' is a defined term, and IAS 32 defines an 'equity instrument' as "any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities". The IFRS IC also observed that IAS 32.11 specifies that, as an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument by the issuer if it has all the features and meets the conditions in IAS 32.16A and 16B or IAS 32.16C and 16D (see Chapter 43).

Accordingly, the IFRS IC concluded that a financial instrument that has all the features and meets the conditions in IAS 32.16A and 16B or IAS 32.16C and 16D does not meet the definition of an equity instrument in IAS 32 and as such is not eligible for the presentation election in IFRS 9.4.1.4.¹²

The Committee concluded that the requirements in IFRS 9 provide an adequate basis for the holder of the particular instruments described in the submission to classify such instruments. In light of the existing requirements in IFRS accounting standards, the IFRS IC determined that neither an IFRIC Interpretation nor an amendment to a standard was necessary. Consequently, the Committee decided not to add this matter to its standard-setting agenda.

Under IFRS 9 all derivatives are deemed to be held for trading. Consequently, this election cannot be applied to a derivative such as a warrant that is classified as equity by the issuer. However, it could be applied to investments in preference shares, 'dividend stoppers' and similar instruments (see Chapter 43) provided they are classified as equity by the issuer.

The IASB had originally intended this accounting treatment to be available only for those equity instruments that represented a 'strategic investment'. These might include investments held for non-contractual benefits rather than primarily for increases in the value of the investment, for example where there is a requirement to hold such an investment if an entity sells its products in a particular country. However, the Board concluded that it would be difficult, and perhaps impossible, to develop a clear and robust principle that would identify investments that are different enough to justify a different presentation requirement and abandoned this restriction. [IFRS 9.BC5.25(c)].

The example below illustrates the requirements for the designation of a non-derivative equity investment at fair value through other comprehensive income, specifically, the requirement that the instrument meets the definition of an equity instrument in accordance with IAS 32.

Illustration 7-1: Callable, perpetual 'Tier 1' debt instrument

Consider the example where entity A invests in a perpetual Tier 1 debt instrument, which is redeemable at the option of the issuer (entity B). The instrument carries a fixed coupon that is deferred if entity B does not pay a dividend to its ordinary shareholders. If a coupon is not paid it will not accrue additional interest. The instrument does not have a maturity date.

Under IFRS 9, such an instrument would not be eligible for amortised cost accounting by the holder. However, given that Entity B does not have a contractual obligation to pay cash, the instrument will qualify for classification at fair value through other comprehensive income, as it meets the definition of equity from the perspective of the issuer in accordance with IAS 32.

¹² [IFRIC Update](#), September 2017, available on the IFRS Foundation's website.

The subsequent measurement of instruments designated in this way, including recognition of dividends, is summarised in section 7.1 below and covered in detail in Chapter 46.

The IASB discussed feedback from constituents on how this election operates as part of the IFRS 9 Post-implementation review, concluding that no changes were needed to the standard.

7.1 Gains and losses on investments in equity instruments designated at fair value through other comprehensive income

Although most gains and losses on investments in equity instruments designated at fair value through other comprehensive income will be recognised in other comprehensive income, dividends will normally be recognised in profit or loss. [IFRS 9.5.7.6]. However, the IASB noted that dividends could sometimes represent a return of investment instead of a return on investment. Consequently, the IASB decided that dividends that clearly represent a recovery of part of the cost of the investment are not recognised in profit or loss. [IFRS 9.BC5.25(a)]. Meanwhile, gains or losses recognised in other comprehensive income are never reclassified from equity to profit or loss on derecognition of the asset, and consequently, there is no need to review such investments for possible impairment.

Determining when a dividend does or does not clearly represent a recovery of cost could prove somewhat judgemental in practice, especially as the standard contains no further explanatory guidance. Also, because it is an exception to a principle, it could open up the possibility of structuring transactions to convert fair value gains into dividends through the use of intermediate holding vehicles. However, in the IASB's view, those structuring opportunities would be limited because an entity with the ability to control or significantly influence the dividend policy of the investee would generally not account for those investments in accordance with IFRS 9. [IFRS 9.BC5.25(a)]. The main exception to this would be investment entities, as defined in IFRS 10 *Consolidated Financial Statements*, but they are required to account for investments in subsidiaries (other than those providing investment-related services or activities) at fair value through profit or loss, hence for them this issue would not arise. Furthermore, the IASB requires disclosures that would allow the user to compare the dividends recognised in profit or loss and other fair value changes easily. [IFRS 9.BC5.25(a)].

8 Reclassification of financial assets

In certain rare circumstances, non-derivative debt assets are required to be reclassified between the amortised cost, fair value through other comprehensive income and fair value through profit or loss categories. More specifically, when (and only when) an entity changes its business model for managing financial assets, it shall reclassify all affected financial assets in accordance with the requirements set out in IFRS 9. [IFRS 9.4.4.1]. Refer to Chapter 46 for further details on how the reclassification requirements should be applied. In drafting IFRS 9, the IASB debated whether reclassifications should be permissible. In the October 2009 IASB meeting, the board tentatively decided to require reclassification where there is a change in business model, however, the “Board noted that such reclassifications would be expected to occur infrequently, if ever.”¹³

IFRS 9 sets out the circumstances under which changes in the business model for managing financial assets will occur and notes that these changes are expected to be very infrequent. They must be determined by an entity’s senior management as a result of external or internal changes and must be significant to the entity’s operations and demonstrable to external parties. Accordingly, a change in the objective of an entity’s business model will occur only when an entity either begins or ceases to carry on an activity that is significant to its operations; for example, when the entity has acquired or disposed of a business line (see section 4.5 above for the interaction between IFRS 9 and IFRS 5). Examples of a change in business model include the following: [IFRS 9.B4.4.1]

- (a) An entity has a portfolio of commercial loans that it holds to sell in the short-term. The entity acquires a company that manages commercial loans and has a business model that holds the loans in order to collect the contractual cash flows. The portfolio of commercial loans is no longer for sale, and the portfolio is now managed together with the acquired commercial loans and all are held to collect the contractual cash flows.
- (b) A financial services firm decides to shut down its retail mortgage business. That business no longer accepts new business and the financial services firm is actively marketing its mortgage loan portfolio for sale.

The examples above show that there needs to be a significant activity that has commenced or ceased before assets can qualify to be reclassified. The activity that is commencing or ceasing does not refer to the act of implementing different buying or selling decisions with regards to a portfolio of financial assets, but rather the ‘activity’ needs to be evidenced by a fundamental change in the operation of the business. These examples are also consistent with a high threshold being required for a business model change being “demonstrable to external parties”.

In example (a) above, there is an acquisition of a company which ostensibly would be accompanied by the commencement of new business processes. For example, there may be new processes regarding managing the new product (such as new credit and collections process) there may also be new marketing processes to manage new clients. These changes could therefore evidence a significant change in the entity’s operations. Similarly, in example (b) above, the financial services firm has ceased a significant operation by shutting down its retail mortgage business. This change in business line would be demonstrable to external parties as there would be an entire product line of the financial services firm (with all associated business activities to support that product line) which has discontinued. In both examples above, there would be noticeably significant changes to the entity which would evidence the significant change in operations. Moreover, any assets that are reclassified because of a change in business model, must be reclassified as a direct result of that model change.

In the absence of these types of changes in business activity, it would not be appropriate to reclassify financial assets. In some instances, entities may be prompted to change the manner in which they manage existing assets in response to external events such as changes in regulatory requirements (e.g., criteria regarding which assets constitute high quality liquid assets), or changes that are prompted due to certain assets no longer meeting internal credit quality requirements. In these examples, even if the entity is committed to changing the way in which they manage an existing, significant portfolio of financial assets, this change in intention by management would not be accompanied by the commencement or cessation of a significant operational activity. A change in intention alone, is one of the examples provided in IFRS 9 of changes that would not result in reclassification. [IFRS 9.B4.4.3(a)]. However, the entity would need to consider how this change in intention affects new financial assets originated or acquired within the portfolio (see Illustration 8-1 below).

13 [IASB Update](#), October 2009, available on the IFRS Foundation’s website.

The following are not considered to be changes in business model: [IFRS 9.B4.4.3]

- (a) A change in intention related to particular financial assets (even in circumstances of significant changes in market conditions)
 - (b) A temporary disappearance of a particular market for financial assets
- And
- (c) A transfer of financial assets between parts of the entity with different business models

Illustration 8-1: Change in the way a portfolio is managed

An entity's business model objective for a portfolio meets the criteria for amortised cost measurement but, subsequently, the entity changes the way it manages the assets.

Having determined that the objective for a portfolio originally met the business model test to be classified at amortised cost, if the entity subsequently changes the way it manages the assets (which results in a more than an infrequent number of sales), so that the business model would no longer qualify for amortised cost accounting, the question of how the entity must measure the existing assets and any newly acquired assets then arises.

Although more than an infrequent number of sales have occurred, unless there has been a fundamental change in the entity's business model, the requirements of the standard regarding reclassification are unlikely to be triggered. Changes in the business model for managing financial assets that trigger reclassification of financial assets must be significant to the entity's operations and demonstrable to external parties. They are expected to be very infrequent.

Assuming that the assets are not reclassified, it is likely that the entity will have to divide the portfolio into two sub-portfolios going forward - one for the old assets and one for any new assets acquired.

Financial assets previously held will remain at amortised cost. New financial assets acquired will be measured at fair value through profit or loss or at fair value through other comprehensive income. Whether the assets are measured at fair value through profit or loss or at fair value through other comprehensive income depends on the new business model and the characteristics of the assets (see section 4 above).

Illustration 8-2: Change in business model by a subsidiary

Subsidiary S is acquired by Parent P.

Scenario A

Prior to the acquisition, Subsidiary S had a significant portfolio of loans which met the criteria for amortised cost measurement. Post the acquisition of S by P, S changes the way it manages the loans in line with the strategy of the group. The group intends to manage the portfolio of loans in S together with an existing portfolio of loans held by P, that are held for sale in the short-term. As a result of the alignment with the group strategy, S discontinues its debt collection function which is now no longer needed as the sales activity of the loans will be managed and performed by the existing sales division in P. The change has been assessed by the key management of S to be demonstrable to external parties as it results in a significant change in the business activities of S.

Even though Subsidiary S has not acquired a business line, but rather the subsidiary itself has been acquired, we believe that this would follow the principles established in paragraph B.4.4.1 of IFRS 9 such that in the absence of any other contrary indicators, a reclassification of Subsidiary S's portfolio of loans, in the separate financial statements of S, is required.

Scenario B

Prior to the acquisition, Subsidiary S had a portfolio of bonds within its banking portfolio which met the criteria for amortised cost measurement. Due to market movements, S transferred these bonds to its trading portfolio. S now holds bonds in this portfolio for trading purposes. However, there were no changes to S' business and the internal transfer did not qualify as a reclassification in line with paragraph B4.4.3(c) of IFRS 9. Therefore, S continued to classify and measure the bonds at amortised cost following the transfer. Further, there were no changes to S' business as a result of the acquisition that would trigger a reclassification for this portfolio of bonds. S therefore continues to classify the bonds at amortised cost following the acquisition.

At the acquisition date, P would classify these bonds in its consolidated financial statements based on its business model for them at the acquisition date. Given that the bonds are held for trading at the acquisition date, P would classify the bonds as fair value through profit or loss.

Reclassification on the basis of a change in a financial asset's contractual cash flows is not permitted, unless the asset is sufficiently modified that it is derecognised. [IFRS 9.BC4.117]. Also, the contractual cash flows may vary over that asset's life based on its original contractual terms. However, because an entity classifies a financial asset at initial recognition based on the contractual terms over the life of the instrument, reclassification on the basis of a financial asset's contractual cash flows is not permitted.

For instance, no reclassification is permitted or required if the conversion option of a convertible bond lapses. If, however, a convertible bond is converted into shares, the shares represent a new financial asset to be recognised by the entity. The entity would then need to determine the classification category for the new equity investment.

A related question to the above is to what extent the contractual cash flow characteristics test influences the test of whether a financial asset is sufficiently modified such that it is derecognised. It has been suggested that a modification which would result in the asset failing the contractual cash flow characteristics test is a 'substantial modification' that would result in derecognition of the asset (see also Chapter 48). That is because an asset that is measured at fair value through profit or loss is substantially different to an asset measured at amortised cost or fair value through other comprehensive income. Whether or not a modified asset would still meet the contractual cash flow characteristics test or not could be a helpful indicator for the derecognition assessment.

8.1 When should reclassifications be applied?

The reclassification should be applied prospectively from the 'reclassification date', [IFRS 9.5.6.1], which is defined as: [IFRS 9 Appendix A]

Extract from IFRS 9

Appendix A

Defined terms

reclassification date	The first day of the first reporting period following the change in business model that results in an entity reclassifying financial assets.
-----------------------	--

Accordingly, any previously recognised gains, losses or interest should not be restated. [IFRS 9.5.6.1].

How we see it

'Reporting period' includes both annual (full IFRS) and interim (IAS 34 *Interim Financial Reporting*) financial reporting periods, if any. For example, an entity with a reporting date of 31 December might determine that there is a change in its business model in August 20X1. If the entity publishes quarterly reports in accordance with IAS 34, the reclassification date would be 1 October 20X1. However, if the entity only publishes half-yearly interim reports or no interim reports at all, the reclassification date would be 1 January 20X2. An entity may not set the reclassification date for a financial asset at any date before the beginning of the reporting period following the change in business model.

A change in the objective of an entity's business model must be affected before the reclassification date. For example, if a financial services firm decides on 15 February to shut down its retail mortgage business and hence must reclassify all affected financial assets on 1 April (i.e., the first day of the entity's next reporting period, assuming it reports quarterly), the entity must not accept new retail mortgage business or otherwise engage in activities consistent with its former business model after 15 February. [IFRS 9.B4.4.2].

Where reclassifications occur, IAS 1 *Presentation of Financial Statements* and IFRS 7 contain disclosure requirements that may be relevant to explaining the impact of the reclassification. [IAS 1.82(ca), IAS 1.82(cb), IFRS 7.20A].

8.2 Reassessment of IFRS 9 classifications upon initial application of IFRS 17

As an exception to the general reclassification requirements (see sections 8 and 8.1 above), IFRS 17 allows entities that have already adopted IFRS 9 to reassess certain aspects of the classification of their eligible financial assets and liabilities upon initial application of IFRS 17 (see Chapter 51).

9 Contracts with insurance risk - interaction between IFRS 17 and IFRS 9

9.1 Loan contracts that transfer significant insurance risk only on settlement of the policyholder's obligation created by the contract

Some contracts meet the definition of an insurance contract but limit the compensation for insured events to the amount otherwise required to settle the policyholder's obligation created by the contract (for example, loans with death waivers). An entity may choose to apply either IFRS 17 or IFRS 9 to such contracts that it issues unless such contracts are excluded from the scope of IFRS 17. The election would be made at a portfolio level and would be irrevocable. [IFRS 17.8A]. Refer to Chapter 51 and Chapter 41 for further detail.

If an entity elects to apply IFRS 9 to such loan contracts and the insurance element is contractual (and not imposed as a result of laws or regulations), then it would cause the contract to fail the SPPI test. Note that any terms imposed by laws or regulations would not be considered in the analysis of the contractual payment features of the loan (refer to Illustration 5-15 above for further consideration of the impact of non-contractual features).

The insurance coverage might alternatively be issued as a separate contract to the underlying loan contract to which the coverage relates. In those situations, the separate insurance contract is in the scope of IFRS 17 and the loan contract could still pass the SPPI test, as it will not have the insurance cover embedded in the loan contract itself.

9.2 Credit card contracts (and other similar contracts) that provide insurance coverage

In certain jurisdictions, an entity issuing a credit card may be required to provide coverage for purchases made by the customer using the credit card. The coverage could include refunding the customer for any breach of contract by the supplier that is not rectified by the supplier. The issuer of the credit card would be entitled to be indemnified by the supplier for any loss incurred in satisfying its liability with the customer. It is common in these circumstances for the issuer of the credit card not to explicitly charge any fee for this coverage. The question then arises as to if the credit card is assessed as having transferred insurance risk that is significant, whether it would be an insurance contract within the scope of IFRS 17.

IFRS 4 *Insurance Contracts* had different criteria for separating components of an insurance contract when compared to IFRS 17 with the result that most entities separated the components of such contracts. For example, an entity applying IFRS 4 might account for the credit card component applying IFRS 9 (or IAS 39 for entities still applying that standard), the insurance component applying IFRS 4 and any other service component applying IFRS 15 *Revenue from Contracts with Customers*. The IASB acknowledged that entities had already identified methods to separate the components of such contracts, and so concluded that changing the existing accounting for these contracts would impose costs and disruption to entities for no significant benefit. [IFRS 17.BC94B].

IFRS 17 excludes from its scope, credit card contracts (and other similar contracts that provide credit or payment arrangements) that meet the definition of an insurance contract if, and only if, the entity does not reflect an assessment of the insurance risk associated with an individual customer in setting the price of the contract with that customer.

Once a credit card contract is out of scope of IFRS 17, an entity needs to determine whether it provides the insurance coverage because it is required by law or regulation, or as part of the contractual terms of the credit card contract. For insurance coverage that is provided as part of the contractual terms of the credit card contract, the issuer will be required to separate the insurance coverage component and apply IFRS 17 to it, and then apply IFRS 9 to the remainder of the contract. There is therefore no insurance element that remains in the scope of IFRS 9 and hence the insurance element would not cause the credit card arrangement to fail the SPPI test. [IFRS 17.7(h), IFRS 9.2.1(e)(iv)]

Refer to Chapter 51 for further detail regarding the scoping requirements of IFRS 17 and to Chapter 41 for further detail regarding the scoping of IFRS 9.

Question 5-1:	Do backward-looking term rates cause instruments to fail the SPPI assessment?	3699
---------------	---	------

Appendix C - Defined terms

Extract from IFRS standards - Definitions

amortised cost of a financial asset or financial liability	The amount at which the financial asset or financial liability is measured at initial recognition minus the principal repayments, plus or minus the cumulative amortisation using the effective interest method of any difference between that initial amount and the maturity amount and, for financial assets, adjusted for any loss allowance . <i>[IFRS 9 Appendix A].</i>
credit loss	The difference between all contractual cash flows that are due to an entity in accordance with the contract and all the cash flows that the entity expects to receive (ie all cash shortfalls), discounted at the original effective interest rate (or credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets). An entity shall estimate cash flows by considering all contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) through the expected life of that financial instrument. The cash flows that are considered shall include cash flows from the sale of collateral held or other credit enhancements that are integral to the contractual terms. There is a presumption that the expected life of a financial instrument can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the expected life of a financial instrument, the entity shall use the remaining contractual term of the financial instrument. <i>[IFRS 9 Appendix A].</i>
derivative	<p>A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.</p> <ul style="list-style-type: none"> (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying'). (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. (c) it is settled at a future date. <i>[IFRS 9 Appendix A].</i>
dividends	Distributions of profits to holders of equity instruments in proportion to their holdings of a particular class of capital. <i>[IFRS 9 Appendix A].</i>
effective interest method	The method that is used in the calculation of the amortised cost of a financial asset or a financial liability and in the allocation and recognition of the interest revenue or interest expense in profit or loss over the relevant period. <i>[IFRS 9 Appendix A].</i>

effective interest rate	The rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial asset or financial liability to the gross carrying amount of a financial asset or to the amortised cost of a financial liability . When calculating the effective interest rate, an entity shall estimate the expected cash flows by considering all the contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) but shall not consider the expected credit losses . The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs B5.4.1-B5.4.3), transaction costs , and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the expected life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments). <i>[IFRS 9 Appendix A]</i> .
equity instrument	An equity instrument is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. <i>[IAS 32.11]</i> .
expected credit losses	The weighted average of credit losses with the respective risks of a default occurring as the weights. <i>[IFRS 9 Appendix A]</i> .
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. <i>[IFRS 13 Appendix A]</i> .
financial asset	<p>A financial asset is any asset that is:</p> <ul style="list-style-type: none"> (a) cash; (b) an equity instrument of another entity; (c) a contractual right: <ul style="list-style-type: none"> (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. <p>For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <i>[IAS 32.11]</i>.</p>
financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument. <i>[IFRS 9 Appendix A]</i> .

financial instrument	A <i>financial instrument</i> is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity. [IAS 32.11].
financial liability	<p>A <i>financial liability</i> is any liability that is:</p> <ul style="list-style-type: none"> (a) a contractual obligation: <ul style="list-style-type: none"> (i) to deliver cash or another financial asset to another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or (b) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <p>As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D. [IAS 32.11].</p>
financial liability at fair value through profit or loss	<p>A financial liability that meets one of the following conditions:</p> <ul style="list-style-type: none"> (a) it meets the definition of held for trading. (b) upon initial recognition it is designated by the entity as at fair value through profit or loss in accordance with paragraph 4.2.2 or 4.3.5. (c) it is designated either upon initial recognition or subsequently as at fair value through profit or loss in accordance with paragraph 6.7.1. [IFRS 9 Appendix A].
held for trading	<p>A financial asset or financial liability that:</p> <ul style="list-style-type: none"> (a) is acquired or incurred principally for the purpose of selling or repurchasing it in the near term; (b) on initial recognition is part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking; or (c) is a derivative (except for a derivative that is a financial guarantee contract or a designated and effective hedging instrument). [IFRS 9 Appendix A].
impairment gain or loss	Gains or losses that are recognised in profit or loss in accordance with paragraph 5.5.8 and that arise from applying the impairment requirements in Section 5.5. [IFRS 9 Appendix A].

interim financial report	<i>Interim financial report</i> means a financial report containing either a complete set of financial statements (as described in IAS 1 <i>Presentation of Financial Statements</i> (as revised in 2007)) or a set of condensed financial statements (as described in this Standard) for an interim period. [IAS 34.4].
lessee	An entity that obtains the right to use an underlying asset for a period of time in exchange for consideration. [IFRS 16 Appendix A].
loans payable	Loans payable are financial liabilities, other than short-term trade payables on normal credit terms. [IFRS 7 Appendix A].
reclassification date	The first day of the first reporting period following the change in business model that results in an entity reclassifying financial assets. [IFRS 9 Appendix A].

Overview

This chapter deals with the recognition and initial measurement of financial instruments as per IFRS 9 *Financial Instruments*. Chapter 41 provides a general background to financial instruments and discusses which financial instruments are within the scope of which standards. Chapters 43 and 44 detail the classification requirements. This chapter then deals with the question of when financial instruments should be recognised in the financial statements, and the amount that they are measured at initially.

IFRS 9 requires that an entity must recognise a financial asset or a financial liability in its statement of financial position when, and only when, the entity becomes a party to the contractual provisions of the instrument. There are however certain exceptions to this general principle, and these are dealt with in this chapter.

Initial measurement is normally based on the fair value of an instrument and most, but not all, of the detailed requirements of IFRS accounting standards governing fair values are dealt with in IFRS 13 *Fair Value Measurement*, which is covered in Chapter 15. However, IFRS 9 also contains certain requirements addressing fair value measurements of financial instruments, and these are covered in this chapter.

The treatment of financial instruments after initial recognition is dealt with in subsequent chapters. In particular, Chapter 46 deals with the subsequent measurement of financial instruments, Chapter 47 deals with the impairment of financial assets, and Chapter 48 deals with the derecognition of financial instruments.

What you need to know

- The general principle for recognition is that an entity recognises a financial instrument when, and only when, it becomes a party to the contractual provisions of the instrument.
- As an exception, assets subject to regular way transactions are permitted to be recognised, or derecognised, either at the trade date or at the settlement date.
- The general principles for initial measurement are:
 - Financial instruments classified at fair value through profit or loss are normally measured at fair value.
 - Other financial instruments not classified at fair value through profit or loss are normally measured at fair value, but are adjusted for incremental and directly attributable transaction costs.
- There is an exception to the general initial measurement principles for certain trade receivables within the scope of IFRS 15 *Revenue from Contracts with Customers*.
- There are situations where the initial measurement of financial instruments requires additional consideration, such as when there is a difference between the fair value at initial recognition, and the transaction price of the financial instrument. Some examples of where this difference may arise include where an entity has an interest free or low interest rate loan, or acquires financial assets and liabilities as part of a group that does not constitute a business, or simply that an entity has priced an instrument in a way that appears to result in it making an immediate (Day 1) profit. When such a difference arises, IFRS 9 has additional requirements and limitations about the recognition of such a difference.

1 Introduction

Initial measurement is normally based on the fair value of the financial instrument and most, but not all, of the detailed requirements of IFRS accounting standards governing fair values are dealt with in IFRS 13, which is covered in Chapter 15. IFRS 9 also contains requirements addressing the fair value measurement of financial instruments and these are covered in section 3.3 below.

Differences between the IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter as the standards are not converged. Therefore, differences between IFRS accounting standards and US GAAP may exist that are not discussed further in this chapter.

2 Initial recognition

2.1 General requirements

IFRS 9 provides that an entity must recognise a financial asset or a financial liability in its statement of financial position when, and only when, the entity becomes a party to the contractual provisions of the instrument. [IFRS 9.3.1.1, IFRS9(2026).B3.1.2A]. Before that, the entity does not have contractual rights or contractual obligations. Hence, there is no financial asset or financial liability, as defined in IAS 32 *Financial Instruments: Presentation*, to recognise. IFRS 9 provides a practical exception to the application of this general principle for 'regular way' purchases and sales (see section 2.2 below). Listed in the sections below are examples of the application of this principle.

In September 2021, the IFRS IC was asked when a financial asset settled by a cash payment received via an electronic transfer system is derecognised. The discussion was extended to the derecognition of a financial liability settled by a payment made through an electronic transfer system. Divergent practices were identified in different jurisdictions, whereby entities adjusted cash balances at the end of the reporting period to reflect cash payments and receipts in-transit. This affected the timing of derecognition and recognition of financial assets and financial liabilities.

As a result, in May 2024 the IASB issued amendments to the Classification and Measurement of Financial Instruments, which clarify and reinforce the recognition and derecognition requirements [IFRS9(2026).B3.1.2A]. The amendments are consistent with the recognition requirements under paragraph 3.1.1 of IFRS 9, however, some entities may need to change their existing practice to align with the clarified requirements. The amendments are effective for annual reporting periods beginning on or after 1 January 2026, with early application allowed.

How we see it

Given that the IASB had to amend IFRS 9 to clarify the requirements in this area, in our view, an entity is not required to change its accounting policy on the timing of recognition or derecognition of a financial asset or financial liability to conform with the amendments until they are adopted. At that point, an entity can make use of the transitional guidance in paragraph 7.2.48 of IFRS 9 (2026). See Chapter 48 for further guidance on transition requirements.

2.1.1 Receivables and payables

Unconditional receivables and payables are recognised as assets or liabilities when the entity becomes a party to the contract and, as a consequence, has a legal right to receive, or a legal obligation to pay cash. [IFRS 9.B3.1.2(a)].

2.1.2 Firm commitments to purchase or sell goods or services

Under IFRS, assets to be acquired and liabilities to be incurred as a result of a firm commitment to purchase or sell goods or services are generally not recognised until at least one of the parties has performed under the agreement. For example, an entity that receives a firm order for goods or services does not generally recognise an asset for the consideration receivable (and the entity that places the order does not generally recognise a liability for the consideration to be paid) at the time of the commitment, but instead delays recognition until the ordered goods or services have been shipped, delivered or rendered. [IFRS 9.B3.1.2(b)].

This accounting applies on the assumption that the firm commitment to buy or sell non-financial items is not:

- Net settled and treated as if it were a derivative (see Chapter 41)
 - Irrevocably designated at fair value through profit or loss on initial recognition. This is only allowed if an accounting mismatch is eliminated or significantly reduced (see Chapter 41)
- Or
- Designated as a hedged item in a fair value hedge (see Chapter 49)

If any of the above situations apply, the firm commitment would be recognised as an asset or liability before delivery of the underlying goods or services. [IFRS 9.B3.1.2(b), IFRS 9.2.4].

2.1.3 Forward contracts

A forward contract obliges one party to the contract to buy, and the other party to sell, an underlying asset that is the subject of the contract, for a fixed price at a future date (for further discussion on the treatment of a forward contract, see Chapter 41).

In most cases, a forward contract to purchase or sell a financial asset is within the scope of IFRS 9. However, in certain cases it will not be in the scope, for example, a forward contract between an acquirer and a selling shareholder to buy or sell an acquiree that will result in a business combination at a future acquisition date (see Chapter 41).

Certain forward contracts to buy or sell non-financial items that can be settled net, including where the non-financial item is readily convertible into cash, will be within the scope of IFRS 9 (see Chapter 41). If a forward contract is within the scope of IFRS 9, it is recognised as an asset or a liability at commitment date, rather than on the date on which settlement takes place. When an entity becomes a party to a forward contract, the fair values of the right and obligation are often equal, so that the net fair value of the forward at inception is zero. If the net fair value of the right and obligation is not zero, the contract is recognised as an asset or liability. [IFRS 9.B3.1.2(c)].

2.1.4 Option contracts

An option contract is a contract which gives one party to the contract the right, but not the obligation, to buy from, or sell to, the other party to the contract the underlying asset, for a fixed price, at a future date (or during a period of time). An option giving the right to buy an asset is referred to as a 'call' option, and one giving the right to sell an asset as a 'put' option. An option is referred to as a 'bought' or 'purchased' option from the perspective of the party with the right to buy or sell (the 'holder') and as a 'written' option from the perspective of the party with the potential obligation to buy or sell.

Option contracts that are within the scope of IFRS 9 are recognised as assets or liabilities when the holder or writer becomes a party to the contract (see Chapter 41). [IFRS 9.B3.1.2(d)].

2.1.5 Planned future transactions (forecast transactions)

Planned future transactions, no matter how likely, are not assets and liabilities because the entity has not become a party to a contract. They are therefore, not recognised under IFRS 9. [IFRS 9.B3.1.2(e)]. However, transactions that have been entered into as a cash flow hedge of certain 'highly probable' future transactions are recognised under IFRS 9 (see Chapter 49).

2.1.6 Transfers of financial assets not qualifying for derecognition by transferor - impact on recognition

IFRS 9 states that, where a financial asset is transferred from one party to another in circumstances that preclude the transferor from derecognising the asset, the transferee must not recognise the transferred asset. Instead, the transferee derecognises the cash or other consideration paid, and recognises a receivable from the transferor. [IFRS 9.B3.1.1]. If the transferor has both a right, and an obligation, to reacquire control of the entire transferred asset for a fixed amount (such as under a repurchase agreement - see Chapter 48), the transferee will account for its receivable at amortised cost, if the criteria for classification as measured at amortised cost are met [IFRS 9.B3.2.15].

Underlying this principle appears to be a concern that more than one party cannot satisfy the criteria in IFRS 9 for recognition of the same financial asset at the same time. However, this principle may not hold in all circumstances, since it is sometimes possible for the same asset to be simultaneously recognised by more than one entity, for example if a seller adopts settlement date accounting, and a purchaser trade date accounting (see section 2.2 below).

In addition, IFRS 9 clarifies that to the extent that a transfer does not qualify for derecognition, the transferor does not account for its contractual rights or obligations related to the transfer separately as derivatives, if recognising both the derivative and either the transferred asset, or the liability arising from the transfer, would result in recognising the same rights or obligations twice. For example, a call option retained by the transferor may prevent a transfer of financial assets from being accounted for as a sale. In that case, the call option is not separately recognised as a derivative asset. [IFRS 9.B3.2.14].

Sometimes a transfer of financial assets (the 'underlying assets') can involve the transferee issuing to the transferor a non-derivative financial instrument, such as subordinated debt, the effect of which is that substantially all the risks and rewards of the assets are not transferred and therefore, the transferor does not derecognise the underlying assets. This is particularly common when the transferee is a securitisation vehicle. The subordinated debt could be issued as part of the consideration for the transferred assets, alongside the cash consideration. Alternatively, part of the cash consideration received in exchange for the underlying assets could be reinvested in the subordinated debt.

How we see it

In the circumstances described above, we would normally expect the transferor to apply by analogy the guidance for derivatives outlined above in IFRS 9 B3.2.14. As a result, the transferor would not recognise the non-derivative financial instrument as a separate asset. Instead, the transferor would recognise a financial liability equal to the net cash received. This will prevent the transferor from recognising as a financial asset the subordinated debt, while also still recognising the underlying asset that failed derecognition.

However, IFRS 9 is less clear about the transferee's position and an entity will need to determine whether it should recognise the subordinated loan as a separate financial liability, or to regard the subsequent cash flows on this loan as part of the cash flows arising on the receivable. The guidance in Chapter 42 addresses whether two financial instruments should be accounted for as one (which in those cases would lead to the recognition of a derivative), and these principles can help the transferee determine whether it recognises both a financial liability and a receivable, or a derivative. However, this can be very judgemental, and we see a degree of diversity in the way securitisation vehicles account for these arrangements.

2.1.7 Collateral

The implementation guidance accompanying IFRS 9 addresses the recognition of cash collateral. When an entity receives cash collateral that is not legally segregated (e.g., not treated as 'client money'), it must recognise the cash, and a related payable to the entity providing such collateral. The reason for this is that the ultimate realisation of a financial asset is its conversion into cash, and hence, no further transformation is required before the economic benefits of the cash received can be realised. [IFRS 9.IG D.1.1].

On the other hand, the entity providing the cash collateral derecognises the cash and recognises a receivable from the receiving entity. [IFRS 9.IG D.1.1].

The accounting treatment of 'client money' is discussed in detail in Chapter 48. The requirements related to non-cash collateral are addressed in Chapter 48.

2.1.8 Principal versus agent

When an entity acts as an intermediary in transactions involving financial instruments, the question of whether it is acting as an agent, or a principal may arise. This is a particularly relevant matter for brokers and similar institutions. A question was put to the IFRS IC in June 2017 about how brokers should account for back-to-back derivatives with their client and the central clearing counterparty.

Frequently asked questions

Question 2-1: In relation to clearing brokers and similar institutions, when dealing with centrally cleared client derivatives, is the clearing broker acting as an agent or a principal?

In June 2017, the IFRS IC concluded that the clearing broker first applies the requirements for financial instruments, and observed that:

- If the transaction(s) results in contracts that are within the scope of IFRS 9, then the clearing member applies to those contracts the recognition requirements of IFRS 9. In the statement of financial position, the clearing member presents the assets and liabilities arising from its contracts with the clearing house separately from those arising from its contracts with its clients, unless net presentation is required pursuant to the offsetting requirements in IAS 32. This implies that the clearing member is considered to act as principal in both the derivative contracts with the clearing house, and its clients.
- If the transaction is not within the scope of IFRS 9, and another standard does not specifically apply, only then would the clearing member apply the hierarchy in paragraphs 10-12 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* to determine an appropriate accounting policy for the transaction(s) (see Chapter 3), e.g., using the principal versus agent guidance in IFRS 15 (see Chapter 28).¹

2.2 'Regular way' transactions

2.2.1 Financial assets: general requirements

As discussed in section 2.1 above, the general requirement under IFRS 9 is to recognise a financial asset or a financial liability in the statement of financial position when, and only when, an entity becomes a party to the contractual provisions of the instrument (i.e., the trade date). [IFRS 9.3.1.1]. However, the application of this general requirement to certain transactions, known as 'regular way' purchases and sales, presents some challenges. Below, we discuss those challenges and the accounting policy choice that IFRS 9 has provided as a solution.

A regular way purchase or sale is defined as: [IFRS 9 Appendix A]

Extract from IFRS 9

Appendix A

Defined terms

regular way purchase or sale	A purchase or sale of a financial asset under a contract whose terms require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned.
-------------------------------------	--

A contract that does not require delivery of the asset, and can be net settled (i.e., payment or receipt of cash or other financial assets equivalent to the change in value of the contract) is not a regular way transaction. Rather, it is accounted for between the trade date and settlement date as a derivative, in accordance with the requirements of IFRS 9 (see Chapter 46). [IFRS 9.B3.1.4].

Many financial markets provide a mechanism whereby all transactions in certain financial instruments (particularly quoted equities and bonds) entered into on a particular date are settled by delivery within a fixed number of days after that date. The date on which the entity commits itself to purchase or sell an asset is called the 'trade date', and the date on which it is settled by delivery of the assets that are the subject of the agreement, is called the 'settlement date'. [IFRS 9.B3.1.5, IFRS 9.B3.1.6].

In practice, because entitlement to interest often accrues from the due settlement date, the settlement date is often determined with reference to the date that delivery is actually due. Consequently, if settlement is temporarily delayed, an entity using settlement date accounting will account for the purchase or sale of the security on the settlement due date, and recognise a payable or receivable until settlement actually occurs. This results in a disconnect between what occurs in practice, and the stated requirements of IFRS 9 whereby settlement date is the date on which settlement occurs.

¹ [IFRIC Update](#), June 2017, available on the IFRS Foundation's website.

Another practical implication of settlement date accounting is that, while legal title to the assets that are the subject of the transaction passes only on or after settlement date, the buyer is effectively exposed to the risks and rewards of ownership of the assets from the trade date.

Absent of any special provisions, the accounting treatment for regular way transactions under IFRS 9 would be that, between trade date and settlement date, an entity has a forward contract to purchase an asset (see section 2.1.3 above). Consequently, as for all derivatives, this forward contract would be recorded at fair value, with all changes in fair value recognised in profit or loss (see Chapter 46), unless the special rules for hedge accounting apply (see Chapter 49). This would not only be somewhat onerous, but would also have the effect that changes in a financial asset's fair value between trade date and settlement date would be recognised in profit or loss, even though the asset itself may not be measured at fair value through profit or loss after initial recognition.

To avoid this, IFRS 9 permits assets subject to regular way transactions to be recognised, or derecognised, either as at the trade date ('trade date accounting') or as at the settlement date ('settlement date accounting'). [IFRS 9.3.1.2, IFRS 9.B3.1.3]. This accounting policy choice can be made separately for each of the main classification categories of financial assets identified by IFRS 9, i.e., debt instruments measured at amortised cost, debt instruments at fair value through other comprehensive income (FVOCI), financial assets mandatorily measured at fair value through profit or loss, debt instruments designated as measured at fair value through profit or loss and equity investments designated as measured at FVOCI (see Chapter 44 for further discussion on the classification of financial assets). Once chosen, the accounting policy needs to be applied consistently and symmetrically (i.e., to acquisitions and disposals) to each category. [IFRS 9.B3.1.3].

Discussed below is additional guidance for determining whether a transaction meets the definition of 'regular way', as well as requirements relating to trade date and settlement date accounting.

2.2.1.A No established market

The definition of 'regular way' transactions refers to terms that require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned. Marketplace in this context is not limited to a formal stock exchange or organised over-the-counter market. Rather, it means the environment in which the financial asset is customarily exchanged. For example, a market for private issue financial instruments can be a marketplace. An acceptable time frame would be the period reasonably and customarily required for the parties to complete the transaction and prepare and execute closing documents. [IFRS 9.IG B.28].

2.2.1.B Contracts not settled according to marketplace convention: derivatives

The contract must be accounted for as a derivative when it is not settled in the way established by regulation or convention in the marketplace concerned.

Illustration 2-1: Regular way transactions - forward contract

Entity A enters into a forward contract to purchase 1 million of B's ordinary shares in two months for CU10 per share. The contract requires A to take physical delivery of the shares and pay the counterparty CU10 million in cash. B's shares trade in an active public market at an average of 100,000 shares a day. Regular way delivery is three days.

As the transaction is not settled in the way established by regulation or convention in the marketplace concerned, it cannot be regarded as a regular way contract. Therefore, the transaction must be accounted for as a derivative. [IFRS 9.IG B.29].

2.2.1.C Multiple active markets: settlement provisions

If an entity's financial instruments trade in more than one active market, and the settlement provisions differ in the various active markets, the provisions that apply are those in the market in which the purchase actually takes place.

For instance, an entity purchasing shares of a public company listed on a US stock exchange through a broker, where the settlement date of the contract is six business days later, could not apply the regular way trade exemption since trades for equity shares on US exchanges customarily settle in three business days. However, if the entity did the same transaction on an exchange outside the US that has a customary settlement period of six business days, the contract would meet the exemption for a regular way trade. [IFRS 9.IG B.30].

2.2.1.D Exercise of an option

An option is typically accounted for as a derivative. However, following its exercise, the settlement of the option by delivery may be governed by regulation or convention in the options market, and could therefore, represent a regular way transaction. This is illustrated as outlined below.

Illustration 2-2: Regular way transactions - share purchase by call option

Entity A purchases a call option in a public market permitting it to purchase 100 shares of Entity X at any time over the next three months at a price of CU100 per share. If Entity A exercises its option, it has 14 days to settle the transaction according to regulation or convention in the options market. X shares are traded in an active public market that requires three-day settlement.

In this case, while the option will be accounted for as a derivative prior to being exercised, the purchase of shares by exercising the option is a regular way purchase of shares because settlement by delivery of the shares within 14 days is a regular way transaction. [IFRS 9.IG B.31]. This is the case even though if the shares had been acquired directly in the market, the market convention for settlement would have been three days.

2.2.2 Financial liabilities

The requirements above relating to regular way transactions apply only to transactions in financial assets. IFRS 9 does not contain any specific requirements about trade date and settlement date accounting for transactions in financial liabilities. Therefore, the general recognition and derecognition requirements for financial liabilities in IFRS 9 apply (see above in section 2.1). [IFRS 9.IG B.32]. Consequently, financial liabilities are recognised on the date the entity becomes a party to the contractual provisions of the instrument (see section 2.1 above). Such contracts are not recognised unless one of the parties has performed, or the contract is a derivative contract not exempted from the scope of IFRS 9 (see Chapter 41). However, in practice the IFRS requirements relating to trade date and settlement date accounting (covered in section 2.2.1 above) have been applied as outlined below.

Frequently asked questions

Question 2-2: How are short sales of securities accounted for when the transaction terms require delivery of the securities within the time frame established generally by regulation or convention in the marketplace?

In January 2007, the IFRS IC addressed the accounting for short sales of securities, when the transaction terms require delivery of the securities within the time frame established generally by regulation or convention in the marketplace concerned. Constituents explained that in practice, many entities apply trade date accounting to such transactions. Specifically, industry practice recognised the short sales as financial liabilities at fair value with changes in fair value recognised in profit or loss. Profit or loss would be the same as if the short sales were accounted for as derivatives, but the securities would be presented differently in the statement of financial position.

The IFRS IC acknowledged that requiring entities to account for short positions as derivatives may create considerable practical problems for their accounting systems and controls with little, if any, improvement to the quality of financial information presented. For these reasons, and because there was little diversity in practice, the IFRS IC decided not to take the issue onto its agenda and thus this industry practice remains prevalent.²

² [IFRIC Update](#), January 2007, available on the IFRS Foundation's website. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9 as the related requirements were brought into IFRS 9 unchanged.

2.2.3 Trade date accounting

As noted above, the trade date is the date on which an entity commits itself to purchase or sell an asset. Trade date accounting requires: [IFRS 9.B3.1.5]

- (a) In respect of an asset to be bought: recognition on the trade date of the asset, and the liability to pay for it. This means that during the period between trade date and settlement date, the entity accounts for the asset as if it already owned it.
- (b) In respect of an asset to be sold: derecognition on the trade date of the asset, together with recognition of any gain or loss on disposal, and the recognition of a receivable from the buyer for payment.

IFRS 9 notes that, generally, interest does not start to accrue on the asset and corresponding liability until the settlement date when title passes (see section 2.2.1 above where the difference between the date the asset is delivered, and the date it is due to be delivered, is discussed). [IFRS 9.B3.1.5].

2.2.4 Settlement date accounting

As noted in section 2.2.1 above, IFRS 9 defines the settlement date as the date when an asset is delivered to or by an entity. Settlement date accounting requires [IFRS 9.B3.1.6]:

- (a) In respect of an asset to be bought: Recognition of the asset on the settlement date (i.e., the date it is received by the entity). Any change in the fair value of the asset to be received during the period between the trade date and the settlement date is accounted for in the same way as the acquired asset. In other words:
 - For assets carried at amortised cost, the change in fair value is not recognised (other than impairment losses which are considered from the trade date). This means that such financial assets are not measured at their fair value on the date of initial recognition (i.e., settlement date), but at the amount that represented the asset's fair value on the trade date. This is illustrated in Illustration 2-3A at section 2.2.5 below.
 - For assets classified as financial assets at fair value through profit or loss, the change in fair value is recognised in profit or loss.

And

 - For financial assets measured at FVOCI, the change in fair value is recognised in other comprehensive income.

Where such changes in fair value are recognised, the entity also recognises a corresponding receivable or payable. At settlement date, this receivable or payable is eliminated by adjusting the amount initially recognised for the financial asset. This results in the asset being recognised at its fair value at the settlement date (see Illustration 2-3 B and Illustration 2-3 C below for an example of the journal entries that would occur). [IFRS 9.5.7.4].
- (b) In respect of an asset to be sold: On the settlement date (i.e., the date the asset is delivered by the entity) the asset is derecognised, and any gain or loss on disposal is recognised along with a receivable, or cash from the buyer. [IFRS 9.B3.1.6]. Any change in the fair value of the asset between trade date and settlement date is not recorded in the financial statements of the seller, even though the asset continues to be held by seller (see Illustration 2-4 below for an example of the journal entries that would occur). This is because the seller's right to the changes in the fair value ceases on the trade date. [IFRS 9.IG D.2.2].

The subsequent measurement of assets accounted for as regular way transactions is addressed in Chapter 46.

2.2.5 Illustrative examples

Illustration 2-3 and Illustration 2-4 below (which are based on those examples in the implementation guidance appended to IFRS 9) illustrate the application of trade date and settlement date accounting to the various categories of financial asset identified by IFRS 9. [IFRS 9.IG D.2.1, IFRS 9.IG D.2.2]. For simplicity, these Illustrations do not address the accounting entries related to impairment charges.

Illustration 2-3: Trade date and settlement date accounting - regular way purchase

On 29 December 20X1 (trade date), an entity commits itself to purchase a financial asset for CU1,000, which is its fair value on trade date. On 31 December 20X1 (financial year-end) and on 4 January 20X2 (settlement date) the fair value of the asset is CU1,002 and CU1,003, respectively. The accounting entries to be recorded for the transaction will depend on how it is classified and whether trade date or settlement date accounting is used, as shown in the tables below:

A Financial asset accounted for at amortised cost

Trade date accounting			Settlement date accounting			
		CU	CU		CU	CU
29 December 20X1						
Dr	Financial asset	1,000		<i>No accounting entries</i>		
Cr	Liability to counterparty		1,000			
	<i>To record purchase of asset and liability thereof</i>					
31 December 20X1						
	<i>No accounting entries</i>				<i>No accounting entries</i>	
4 January 20X2						
Dr	Liability to counterparty	1,000		Dr	Financial asset	1,000
Cr	Cash		1,000	Cr	Cash	1,000
	<i>To record settlement of liability</i>				<i>To record purchase of asset</i>	

B Financial asset accounted for at fair value through profit or loss

Trade date accounting			Settlement date accounting			
		CU	CU		CU	CU
29 December 20X1						
Dr	Financial asset	1,000		No accounting entries		
Cr	Liability to counterparty		1,000			
	To record purchase of asset and liability thereof					
31 December 20X1						
Dr	Financial Asset	2		Dr	Receivable	2
Cr	Profit or loss		2	Cr	Profit or loss	2
	To record change in fair value of asset			To record change in fair value of contract		
4 January 20X2						
Dr	Liability to counterparty	1,000		Dr	Financial asset	1,003
Cr	Cash		1,000	Cr	Cash	1,000
Dr	Financial asset	1		Cr	Receivable	2
Cr	Profit or loss		1	Cr	Profit or loss	1
	To record settlement of liability and change in fair value of asset			To record purchase of asset, change in fair value and settlement of contract		

C Financial asset measured at FVOCI*

Trade date accounting				Settlement date accounting			
		CU	CU			CU	CU
29 December 20X1							
Dr	Financial asset	1,000		No accounting entries			
Cr	Liability to counterparty		1,000				
To record purchase of asset and liability thereof							
31 December 20X1							
Dr	Financial Asset	2		Dr	Receivable	2	
Cr	OCI		2	Cr	OCI		2
To record change in fair value of asset				To record change in fair value of contract			
4 January 20X2							
Dr	Liability to counterparty	1,000		Dr	Financial asset	1,003	
Cr	Cash		1,000	Cr	Cash		1,000
Dr	Financial asset	1		Cr	Receivable		2
Cr	OCI		1	Cr	OCI		1
To record settlement of liability and change in fair value of asset				To record purchase of asset, change in fair value and settlement of contract			

* The same analysis applies whether the financial assets measured at FVOCI are debt instruments or equity instruments.

As illustrated above, for a regular way purchase, the key difference between trade date and settlement date accounting is the timing of recognition of a financial asset. Regardless of the method used, the net impact on profit or loss, OCI and net assets is the same.

Illustration 2-4: Trade date and settlement date accounting - regular way sale

On 29 December 20X1 (trade date) an entity enters into a contract to sell a financial asset for its then current fair value of CU1,010. The asset was acquired one year earlier for CU1,000 and its amortised cost is CU1,000. On 31 December 20X1 (financial year-end), the fair value of the asset is CU1,012. On 4 January 20X2 (settlement date), the fair value is CU1,013. The accounting entries to be recorded for this transaction will depend on how the asset is classified and whether trade date or settlement date accounting is used as shown in the tables below (any interest that might have accrued on the asset is disregarded).

A change in the fair value of a financial asset that is sold on a regular way basis is not recorded in the financial statements between trade date and settlement date, even if the entity applies settlement date accounting, because the seller's right to changes in the fair value ceases on the trade date.

A Financial asset accounted for at amortised cost

Trade date accounting				Settlement date accounting			
		CU	CU			CU	CU
Before 29 December 20X1 (cumulative net entries)							
Dr	Financial asset	1,000		Dr	Financial asset	1,000	
Cr	Cash		1,000	Cr	Cash		1,000
	<i>To record acquisition of the asset a year earlier</i>				<i>To record acquisition of the asset a year earlier</i>		
29 December 20X1							
Dr	Receivable from counterparty	1,010		<i>No accounting entries</i>			
Cr	Financial asset		1,000				
Cr	Gain on disposal (profit or loss)		10				
	<i>To record disposal of asset</i>						
4 January 20X2							
Dr	Cash	1,010		Dr	Cash	1,010	
Cr	Receivable from counterparty		1,010	Cr	Financial asset		1,000
				Cr	Gain on disposal (profit or loss)		10
	<i>To record settlement of sale contract</i>				<i>To record disposal of asset</i>		

B Financial asset accounted for at fair value through profit or loss

Trade date accounting				Settlement date accounting

<p>* The same analysis will apply to equity investments measured at FVOCI, except that IFRS 9 does not permit ‘recycling’ (i.e., transfers) of cumulative gains and losses from OCI to profit or loss. However, an entity may transfer the cumulative gains and losses within equity (e.g., from accumulated OCI to retained earnings).</p> <p>** The transfers from OCI to profit or loss represent the ‘recycling’ of cumulative gains and losses required by IFRS 9 on disposal of a debt instrument accounted for at FVOCI (see Chapter 46). Disposal is regarded as occurring on trade date when trade date accounting applies and on settlement date when settlement date accounting applies.</p>							

As illustrated above, for a regular way sale the key difference between trade date and settlement date accounting is the timing of the derecognition of a financial asset. There is also a consequential difference in the timing of the recognition of any gain or loss in profit and loss arising from the disposal of financial assets measured at amortised cost or FVOCI. For financial assets measured at fair value through profit and loss, there is no timing difference.

2.2.5.A Exchanges of non-cash financial assets

The implementation guidance to IFRS 9 addresses the situation in which an entity enters into a regular way transaction whereby it commits to sell a non-cash financial asset in exchange for another non-cash financial asset. In essence, the buying and selling legs of the exchange transaction are accounted for independently, reflecting the settlement date or trade date accounting policy selection for the relevant classification of asset, as illustrated below. [IFRS 9.IG D.2.3].

Illustration 2-5: Trade date and settlement date accounting - exchange of non-cash financial assets

On 29 December 20X1 (trade date), an entity enters into a contract to sell Note Receivable A, which is carried at amortised cost, in exchange for Bond B, which will be classified as held for trading and measured at fair value. Both assets have a fair value of CU1,010 on 29 December 20X1, while the amortised cost of Note Receivable A is CU1,000. The entity uses settlement date accounting for financial assets at amortised cost and trade date accounting for assets held for trading.

On 31 December 20X1 (financial year-end), the fair value of Note Receivable A is CU1,012 and the fair value of Bond B is CU1,009.

On 4 January 20X2 (settlement date), the fair value of Note Receivable A is CU1,013 and the fair value of Bond B is CU1,007.

The following entries are made:

29 December 20X1

Dr	Bond B	CU1,010	
	Cr	Liability to counterparty	CU1,010

To record purchase of Bond B (trade date accounting)

31 December 20X1

Dr	Loss on Bond B (profit or loss)	CU1	
	Cr	Bond B	CU1

To record change in fair value of Bond B

4 January 20X2

Dr	Liability to counterparty	CU1,010	
	Cr	Note Receivable A	CU1,000
	Cr	Gain on disposal (profit or loss)	CU10

To record disposal of receivable A (settlement date accounting)

Dr	Loss on Bond B (profit or loss)	CU2	
	Cr	Bond B	CU2

To record change in fair value of Bond B

The simultaneous recognition, between 29 December and 4 January, of both the asset being bought, and the asset being given in consideration, may seem counter-intuitive. However, it is no different from the accounting treatment of any purchase of goods for credit which results in the period between delivery of, and payment for the goods, in the simultaneous recognition of the goods, the liability to pay the supplier, and the cash that will be used to settle the liability.

3 Initial measurement

3.1 General requirements

On initial recognition, financial assets and financial liabilities at fair value through profit or loss are normally measured at their fair value on the date they are initially recognised. The initial measurement of other financial instruments is based on their fair value, but adjusted in respect of any transaction costs that are incremental and directly attributable to the acquisition or issue of the financial instrument. [IFRS 9.5.1.1]. Furthermore, as outlined in Chapter 46, there is also an adjustment to the fair value at initial recognition for fees received as these are included in the calculation of the effective interest rate. [IFRS 9 Appendix A].

There are also certain exceptions and additional considerations to these general requirements that are addressed in the sections 3.2 to 3.7 below.

If at initial recognition, there is uncertainty about the collection of future cash flows relating to financial assets, this uncertainty is reflected in the fair value measurement at initial recognition. As a result, a separate allowance for expected credit losses relating to uncertain future cash flows is not recognised at initial recognition. However, at the first reporting date after initial recognition, for a financial asset subject to the impairment requirements of IFRS 9, an impairment assessment will be required. [IFRS 9.5.5.3].

3.2 Short-term receivables and payables and trade receivables

With the exception of trade receivables arising from transactions within the scope of IFRS 15 dealt with below, short-term receivables and payables with no stated interest rate could be measured at invoice amounts, without discounting, when the effect of not discounting is immaterial. This approach is permitted because IAS 8 allows the application of accounting policies that are not in accordance with IFRS when the effect is immaterial. [IFRS 13.BC138A, IAS 8.8].

In relation to trade receivables arising from transactions within the scope of IFRS 15, IFRS 9.5.1.3 indicates the following:

Extract from IFRS 9

5.1.3 Despite the requirement in paragraph 5.1.1, at initial recognition, an entity shall measure trade receivables at their transaction price (as defined in IFRS 15) if the trade receivables do not contain a significant financing component in accordance with IFRS 15 (or when the entity applies the practical expedient in accordance with paragraph 63 of IFRS 15).

Trade receivables within the scope of IFRS 15 are not always measured at fair value on initial recognition (see Chapter 28). Trade receivables that do not have a significant financing component are required to be measured at initial recognition based on their transaction price as defined by IFRS 15.

Entities may also apply the practical expedient (i.e., for trade receivables with a significant financing component when at contract inception the entity expects that the period between the entity transferring a promised good or service to the customer, and the customer settling that trade receivable, is one year or less), in which case the trade receivables are also initially measured at their transaction price as defined by IFRS 15. [IFRS 9.5.1.1, IFRS 9.5.1.3].

Other trade receivables (for example, those arising from an arrangement with a significant financing component where the practical expedient is not applied) must be recognised at their fair value in accordance with the general requirements in section 3.1 above.

In summary:

- If there is no significant financing component, or if the entity has applied the practical expedient in IFRS 15, the receivable is initially recognised at the transaction price, measured in accordance with IFRS 15.
- If there is a significant financing component, and the practical expedient has not been applied, the receivable is initially measured at fair value.

If as outlined above, upon initial measurement there is a difference between the measurement of the receivable under IFRS 9, and the corresponding amount of revenue, in most cases the difference is presented immediately in profit or loss (e.g., as an impairment loss). [IFRS 15.108]. However, in certain circumstances, further analysis of the reason for such a difference might be needed and that may lead to a different accounting treatment. For example, an entity may have an unconditional right to payment for the full invoiced amount (i.e., a receivable), but the amount ultimately received could potentially be subject to a refund in the future. This could occur for example, where a customer is entitled to a retrospective volume rebate if the customer subsequently meets the agreed conditions. In such a case, the entity would recognise the difference between the revenue recognised and the receivable as a rebate liability, rather than in profit or loss (see Chapter 28 for more detail). [IFRS 15.IE208].

IFRS 13 has requirements relating to the fair value measurement of a financial liability with a demand feature (see Chapter 15). [IFRS 13.47].

3.3 Initial fair value, transaction price and 'day 1' profits

IFRS 9 and IFRS 13 acknowledge that the best evidence of the fair value of a financial instrument on initial recognition is normally the transaction price (i.e., the fair value of the consideration given or received), although this will not necessarily be the case in all circumstances (see Chapter 15). [IFRS 9.B5.1.1, IFRS 9.B5.1.2A, IFRS 13.58, IFRS 13.B4]. Although IFRS 13 specifies how to measure fair value, IFRS 9 contains restrictions on recognising differences between the transaction price and the initial fair value as measured under IFRS 13 (referred to here as day 1 profits), which apply in addition to the requirements of IFRS 13 (see Chapter 15). [IFRS 9.5.1.1A, IFRS 13.60, IFRS 13.BC138].

It may be the case that the transaction price is determined to represent the fair value of a financial instrument at initial recognition, and a valuation technique that uses unobservable inputs will be used to measure the fair value of the item in subsequent periods. In this case, the valuation technique must be calibrated at initial recognition to ensure that the result of the valuation technique equals the transaction price, reflecting current conditions (see Chapter 15). [IFRS 13.64].

If an entity determines that the fair value on initial recognition differs from the transaction price, then the facts and circumstances leading to that difference need to be assessed to determine if part of the consideration is for something other than the financial instrument. For example, the difference may qualify for recognition as another type of asset, liability or other transaction such as an equity contribution from an owner (see section 3.3.1 below). [IFRS 9.B5.1.1]. Another illustration is given in Chapter 24 with regards to security deposits received in lease agreements where the deposit earns interest below the market rate.

If it is determined that the difference does not qualify for recognition as another type of asset, liability or as an equity transaction, then the day 1 profit is recognised as a gain or loss on initial recognition only if the fair value is based on a quoted price in an active market for an identical asset or liability (i.e., a Level 1 input), or based on a valuation technique that uses only data from observable markets. Otherwise, the day 1 profit is deferred. [IFRS 9.B5.1.2A].

The deferred profit is recognised as an adjustment to the initial carrying amount of the financial asset or financial liability. This is on the basis that the financial asset or financial liability represents a single unit of account, and IFRS 9 requires that it be initially measured at the fair value, adjusted to defer the difference between the fair value and the transaction price. [IFRS 9.B5.1.2A(b)].

However, there may be practical difficulties in adjusting the carrying amount of the financial instrument directly. For example, a portfolio approach may be used on initial recognition to measure the fair value of a number of financial instruments for which there is a resulting deferred profit, and the entity may have difficulty in allocating the deferred profit to the individual financial instruments. In such cases, the entity performs an analysis based on the facts and circumstances, and the general principles in IFRS accounting standards (including an assessment of materiality), to determine the appropriate treatment. Accordingly, in practice we have observed cases where the deferred profit is recognised separately from the individual financial assets and liabilities.

The deferred day 1 profit is subsequently recognised as a gain or loss only to the extent that it arises from a change in a factor (including time) that market participants would take into account when pricing the asset or liability. [IFRS 9.B5.1.2A(b)].

As a result of the day 1 profit provisions discussed above, entities that trade in financial instruments are prevented from immediately recognising a profit on the initial recognition of many financial instruments that are not quoted in active markets, or whose fair value is not measured based on valuation techniques that use only observable inputs. Consequently, locked-in profits will emerge over the life of the financial instrument, although precisely how they should emerge is not at all clear.

The IASB has previously been asked to clarify whether straight-line amortisation was an appropriate method of recognising the day 1 profits, but it decided not to do so. IFRS 9 does not discuss this, although IAS 39 *Financial Instruments: Recognition and Measurement* used to state (without further explanation) that straight-line amortisation may be an appropriate method in some cases, but will not be appropriate in others. [IAS 39(2017).BC222(v)(ii)].

As a result, one interpretation is that the deferred day 1 profit is recognised on a systematic basis over time (for example using straight line amortisation). However, if the underlying instrument has non-linear features (such as option based contracts), then non-linear amortisation may be more appropriate than straight-line amortisation. An alternative interpretation is that the deferred day 1 profit should remain unrecognised until all market inputs have become observable. The appropriate approach for the recognition of the deferred day 1 profit will depend on the particular facts and circumstances, and must be applied consistently to underlying financial instruments of a similar nature and type.

3.3.1 Interest-free and low-interest long-term loans

As noted in section 3.3 above, the fair value of a financial instrument on initial recognition is normally the transaction price. IFRS 9 further explains that if part of the consideration given or received was for something other than the financial instrument, the entity must measure the fair value of the financial instrument in accordance with IFRS 13. For example, the fair value of a long-term loan or receivable that carries no interest can be estimated as the present value of all future cash receipts, discounted using the prevailing market rate(s) of interest for instruments that are similar as to currency, term, type of interest rate, credit risk and other factors. Any additional amount advanced is an expense or a reduction of income unless it qualifies for recognition as some other type of asset. [IFRS 9.B5.1.1]. IFRS 13 requires the application of a similar approach in such circumstances. [IFRS 13.60]. For example, an entity may provide an interest free loan to a supplier in order to receive a discount on goods or services purchased in the future, and the difference between the fair value and the amount advanced might well be recognised as an asset, for example under IAS 38 *Intangible Assets*, if the entity obtains a contractual right to the discounted supplies.

Similar issues often arise from transactions between entities under common control. In fact, IFRS 13 suggests a related party transaction might indicate that the transaction price is not the same as the fair value of an asset or liability [IFRS 13.B4(a)] (see Chapter 15).

How we see it

Parent entities may lend money to subsidiaries on an interest-free or low-interest basis, where the loan is not repayable on demand. Where, in its separate financial statements, the parent (or subsidiary) is required to record a receivable (or payable) on initial recognition at a fair value that is lower than cost, the additional consideration will normally represent an additional investment in the subsidiary (or equity contribution from the parent). This is covered further in Chapter 9.

Another example is a loan received from a government at a rate that appears to be below-market. If there is a benefit of a below-market rate loan (i.e., the excess of the consideration received over the initial carrying amount of the loan), then this may have to be accounted for as a government grant. [IAS 20.10A]. The treatment of government grants is discussed further in Chapter 25.

If a financial instrument is recognised where the terms are 'off-market' (e.g., the stated interest rate is lower than the market rate for similar loans), but instead a fee is paid or received in compensation, the instrument is recognised at its fair value i.e., net of the fee that is paid or received. [IFRS 9.B5.1.2]. This is outlined in the Illustration below.

Illustration 3-1: Off-market loan with origination fee

Bank J lends CU1,000 to Company K. The loan carries interest at 5% and is repayable in full in five years' time, even though the market rate for similar loans is 8%. To compensate J for the below market rate of interest, K pays J an origination fee of CU120. There are no other directly related payments by either party.

The loan is recorded at its fair value of CU880 (in this Illustration, assumed to be the net present value of CU50 interest payable annually for five years and CU1,000 principal repaid after five years, all discounted at 8%). This equals the net amount of cash exchanged (CU1,000 loan less CU120 origination fee), and hence no gain or loss is recognised on initial recognition of the loan. The upfront fee received of CU120 compensates Bank J for the interest shortfall of CU30 for each of the next five years, discounted at the market rate of 8%.

Applying the requirements of IFRS 9 to the simple fact pattern provided by the IASB is a relatively straightforward exercise. In practice, however, it may be more difficult to identify those fees that are required by IFRS 9 to be treated as part of the financial instrument, and those that are to be dealt with in another way, for example under IFRS 15. In particular, it may be difficult to determine the extent to which fees associated with a financial instrument that is not quoted in an active market represent compensation for off-market terms, or for the genuine provision of services.

3.3.2 Measurement of financial instruments following modification of contractual terms that leads to initial recognition of a new instrument

An entity may agree (with the holder or the issuer) to modify the terms of an instrument that it already recognises in its financial statements as a financial asset, a financial liability, or an equity instrument.

For modifications of financial assets and financial liabilities, an entity needs to consider whether the modification of the terms triggers derecognition of the existing instrument and recognition of a new instrument (see Chapter 48 for assets and section 6.2 for liabilities). If derecognition is triggered, then on the derecognition of the financial asset (or financial liability), the difference between:

- The carrying amount as at the derecognition date,
And
- The consideration received (or paid), including the value of the new instrument obtained, less any new liability assumed,
Is recognised in profit or loss (see Chapter 48). [IFRS 9.3.2.12].

The new instrument would initially be measured at fair value in accordance with the general requirements discussed in section 3.1 above. Any costs or fees incurred would usually be recognised as part of the gain or loss on derecognition, rather than as an adjustment to the carrying amount of the new debt. However, there may be very limited circumstances when fees or costs associated with the issue of new debt are not included in the gain or loss on derecognition. Where it is obvious that the fees have not been incurred as part of the modification or exchange, and instead are third party costs which are clearly incremental to the issue of new debt, for example payments of taxes or listing fees on the issue of new debt, then an entity may choose to adopt a policy whereby such costs are deducted from the carrying value of the new debt and amortised over its term, as long as the new debt is not classified as held at fair value through profit or loss (see Chapter 48).

The accounting for a modification of a financial asset (or financial liability) that results in the recognition of a new financial asset (or financial liability) is dealt with in more detail in Chapter 48.

If the contractual terms of an issued equity instrument are modified, resulting in a conversion to a financial liability, the resulting treatment will depend on the terms of the modification. This is discussed in more detail below.

Frequently asked questions

Question 3-1: What is the appropriate treatment of an issued equity instrument where the contractual terms are modified such that it is subsequently reclassified as a financial liability?

This matter was previously discussed by the IFRS IC. When the contractual terms of an issued equity instrument are modified in such a manner that it is subsequently reclassified as a financial liability, it is measured at its fair value on the date it is initially recognised as a financial liability, with any difference between this amount, and the amount previously recorded in equity, taken to equity.

This is consistent with the requirements of IAS 32, which prohibit the recognition of gains or losses on the purchase, issue, or cancellation of an entity's own equity. [IAS 32.36, IAS 32.33].³

³ [IFRIC Update](#), November 2006, available on the IFRS Foundation's website. Whilst the IFRS IC discussion was held in the context of IAS 39, the discussion also holds true under IFRS 9 as the related requirements were brought into IFRS 9 unchanged.

Illustration 3-2: Changes in the contractual terms of an existing equity instrument

On 1 January 20X1, Company L issues a fixed rate cumulative perpetual instrument with a face value of CU10 million at par. Dividends on the instrument are cumulative but discretionary, and therefore, it is initially classified as equity. On 1 January 20X2, L adds a new clause to the instrument so that if L is subject to a change of control, L will be required to redeem the instrument at an amount equal to the face value plus any accumulated unpaid dividends. Upon assessment of the facts and circumstances, it is determined that this results in a reclassification of the instrument from equity to liability (see Chapter 43 for the considerations in this determination). The fair value of the instrument on 1 January 20X2 is CU12 million.

Upon reclassification, L recognises the financial liability at its then fair value of CU12 million and the difference of CU2 million is recognised in equity (e.g., retained earnings).

3.3.3 Financial guarantee contracts and off-market loan commitments

The requirement to measure financial instruments at fair value on initial recognition also applies to issued financial guarantee contracts that are within the scope of IFRS 9, as well as to commitments to provide a loan at a below-market interest rate (see Chapter 41).

When issued to an unrelated party in a stand-alone arm's length transaction, the fair value of a financial guarantee contract at inception is likely to equal the premium received, or receivable, unless there is evidence to the contrary. [IFRS 9.B2.5(a)]. There is likely to be such evidence where, say, a parent provided to a bank a financial guarantee in respect of its subsidiary's borrowings and charged no fee.

When an off-market loan is provided to an entity's subsidiary (see section 3.3.1 above), a 'spare debit' arises in the separate financial statements of the parent as a result of the recognition of the loan at fair value. The same situation can arise when a parent provides a subsidiary with an off-market loan commitment. Again, it is normally appropriate to treat this difference as an additional cost of investment in the subsidiary in the separate accounts of the parent (and as an equity contribution from the parent in the accounts of the subsidiary).

3.3.4 Loans and receivables acquired in a business combination

Consistent with IFRS 9 and IFRS 13, IFRS 3 *Business Combinations* requires financial assets acquired in a business combination to be measured by the acquirer on initial recognition at their fair value. [IFRS 3.18].

IFRS 3 contains application guidance explaining that an acquirer does not recognise a separate valuation allowance (e.g., an expected credit loss allowance) in respect of loans and receivables for contractual cash flows that are deemed to be uncollectible at the acquisition date. This is because the effects of uncertainty in relation to the collection of future cash flows are included in the fair value measure at initial recognition (see Chapter 10). [IFRS 3.27, IFRS 3.B41, IFRS 3.BC252].

However, at the end of the first subsequent accounting period, a financial asset subject to the impairment requirements of IFRS 9 will be assessed for impairment. [IFRS 9.5.5.3]. This interaction between the initial and subsequent measurement of debt instruments acquired in a business combination, and the impairment model of IFRS 9, is discussed in more detail in Chapter 47.

3.3.5 Acquisition of a group of assets that does not constitute a business

When acquiring a group of assets, an entity is required to assess whether a business has been acquired (see Chapter 10). Where the group of assets does not constitute a business, IFRS 3 requires the acquiring entity to:

- Identify and recognise the individual identifiable assets acquired and liabilities assumed
And
- Allocate the cost of the group to the individual identifiable assets and liabilities based on their relative fair values at the date of the acquisition [IFRS 3.2(b)]

Frequently asked questions

Question 3-2: What is the appropriate treatment in a transaction that does not constitute the acquisition of a business, when there are differences noted at initial recognition in the fair value, and measurement bases, of the underlying assets and liabilities acquired?

The IFRS IC considered how to allocate the transaction price to the identifiable assets acquired and liabilities assumed when:

- The sum of the individual fair values of the identifiable assets and liabilities is different from the transaction price
And
- The group of assets includes identifiable assets and liabilities initially measured both at cost, and at an amount other than cost, e.g., financial instruments which are measured on initial recognition at their fair value

Such a transaction or event does not give rise to goodwill. The IFRS IC observed that if an entity initially considers that there might be a difference between the transaction price for the group, and the sum of the individual fair values of the identifiable assets and liabilities, it first reviews the procedures used to determine those individual fair values to assess whether such a difference truly exists, before allocating the transaction price.

The IFRS IC concluded that a reasonable reading of the requirements of IFRS 3 results in two possible ways of accounting for the acquisition of the group of assets:

(a) Under the first approach, the entity accounts for the acquisition of the group as follows:

- It identifies the individual identifiable assets acquired and liabilities assumed that it recognises at the date of the acquisition.
- It determines the individual transaction price for each identifiable asset and liability by allocating the cost of the group based on the relative fair values of those assets and liabilities at the date of the acquisition.
And
- It applies the initial measurement requirements in applicable IFRS to each identifiable asset acquired and liability assumed. The entity accounts for any difference between the amount at which the asset or liability is initially measured, and its individual transaction price, by applying the relevant requirements. In the case of any financial instruments within the group, the entity treats the difference between the fair value and allocated transaction price as a day 1 profit, the requirements for which are discussed in section 3.3 above.

(b) Under the second approach:

- Any identifiable asset or liability that is initially measured at an amount other than cost is initially measured at the amount specified in the applicable IFRS, i.e., fair value in the case of a financial instrument.
- The entity deducts from the total transaction price the amounts allocated to the assets and liabilities initially measured at an amount other than cost.
And
- Using this residual transaction price, the entity then determines the cost of the remaining identifiable assets and liabilities by allocating the residual transaction price, based on their relative fair values at the date of the acquisition.

The IFRS IC observed that an entity must apply one of the above approaches consistently, as an accounting policy choice, to all such acquisitions.⁴

⁴ [IFRIC Update](#), November 2017, available on the IFRS Foundation's website.

3.4 Transaction costs

3.4.1 Accounting treatment

As noted in section 3.1 above, the initial measurement of some financial instruments is based on their fair value, but adjusted in respect of any transaction costs that are incremental and directly attributable to the acquisition or issue of the financial instrument. [IFRS 9.5.1.1]. The consequences of this requirement are:

- For financial instruments subsequently measured at amortised cost and, financial assets that are debt instruments subsequently measured at fair value through other comprehensive income, transaction costs are included in the calculation of the amortised cost using the effective interest method, in effect reducing (increasing) the amount of interest income (expense) recognised over the life of the instrument. [IFRS 9.IG E.1.1].
- For financial assets that are equity instruments that are subsequently measured at fair value through other comprehensive income, transaction costs are recognised in other comprehensive income as part of the change in fair value at the next remeasurement and are never reclassified into profit or loss. [IFRS 9.B5.7.1, IFRS 9.IG E.1.1].

And

- Transaction costs relating to the acquisition or incurrence of financial instruments at fair value through profit or loss are recognised in profit or loss as they are incurred.

Transaction costs that relate to the issue of a compound financial instrument are allocated to the liability and equity components of the instrument in proportion to the allocation of proceeds. [IAS 32.38]. The initial recognition of a compound instrument is discussed in more detail in Chapter 43.

Section 3.5 below addresses the accounting for transaction costs associated with the recognition of a hybrid financial liability where the embedded derivative is separated from the host.

For a revolving facility, costs incurred are not associated with any specific financial asset or financial liability since the borrower can borrow and repay the funds numerous times over the life of the facility. These costs, if directly attributable and incremental to the facility, are expensed by the borrower over the life of the facility, for example on a straight-line basis. This is on the basis that the costs paid by the borrower meet the definition of a prepayment made to the lender for liquidity services made available to the borrower [IAS 38.70]. The lender accounts for the fees received under IFRS 15 as compensation for the service of providing the facility, and the fees are recognised when the performance obligations in making the facility available are fulfilled. Chapter 46 further discusses the accounting for fees received (or paid) upfront to secure a loan commitment.

Transaction costs, such as sale or disposal costs, that would be expected to be incurred on transfer or disposal of a financial instrument, are not included in the initial or subsequent measurement of the financial instrument. [IFRS 9.IG E.1.1].

The following Illustration shows the accounting treatment of transaction costs for a financial asset classified as measured at fair value through other comprehensive income.

Illustration 3-3: Transaction costs - initial measurement of the related asset

Company A acquires an equity security that will be classified as measured at fair value through other comprehensive income. The security has a fair value of CU100, and this is the amount A is required to pay. In addition, A also pays a purchase commission of CU2. If the asset was to be sold, a sales commission of CU3 would be payable.

The initial measurement of the asset is CU102, i.e., the sum of its initial fair value and the purchase commission. The commission payable on sale is not considered for this purpose. If A had a reporting date immediately after the purchase of this security, it would measure the security at CU100 and recognise a loss of CU2 in other comprehensive income, which is never reclassified to profit or loss. [IFRS 9.B5.2.2].

In the Illustration above, if the financial asset was a debt instrument measured at fair value through other comprehensive income, on initial recognition the transaction costs of CU2 would be included in the initial measurement, and subsequently amortised to profit or loss using the effective interest method. [IFRS 9.B5.2.2]. This is further discussed in Chapter 46.

3.4.2 Identifying transaction costs

Transaction costs are defined as: *[IFRS 9 Appendix A]*

Extract from IFRS 9

Appendix A Defined terms

transaction costs	Incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or financial liability (see paragraph B5.4.8). An incremental cost is one that would not have been incurred if the entity had not acquired, issued or disposed of the financial instrument.
--------------------------	---

Transaction costs include fees and commissions paid to agents (including employees acting as selling agents), advisers, brokers, and dealers. They also include levies by regulatory agencies and securities exchanges, transfer taxes and duties. *[IFRS 9.B5.4.8]*.

Chapter 46 addresses whether certain financial services fees should be considered an integral part of the effective interest rate of a financial instrument, which are accounted for similarly to transaction costs, and those that are not.

Debt premiums or discounts, financing costs and allocations of internal administrative or holding costs are not transaction costs. *[IFRS 9.B5.4.8]*.

In certain circumstances, it can be appropriate to regard the premium paid to acquire a financial guarantee contract as a transaction cost of the guaranteed financial asset. This is discussed further in Chapter 47. Treating internal costs as transaction costs could open a number of possibilities for abuse by allowing entities to defer expenses inappropriately. Consequently, internal costs are treated as transaction costs only if they are incremental and directly attributable to the acquisition, issue or disposal of a financial asset or financial liability. *[IAS 39(2017).BC222(d)]*.⁵ Therefore, it will be rare for internal costs (other than, for instance, commissions paid to sales staff in respect of a product sold that results in the origination or issuance of a financial instrument) to be treated as transaction costs.

The determination of which costs are incremental and directly attributable can be highly judgemental, particularly when costs are incurred in advance of the instrument being recognised. For example, a lender may incur professional fees to value a property that would serve as collateral for a loan in advance of providing a quote to the customer. In this case, it is useful to consider the guidance in IAS 32 which specifies that if an equity transaction is abandoned, then the costs are recognised as an expense (see Chapter 43). *[IAS 32.37]*. This suggests that the possibility of a transaction ultimately not occurring is not by itself a reason to not consider those costs as transaction costs. Where transaction costs are incurred in advance of the underlying financial instrument, they are normally capitalised as a prepayment.

3.5 Embedded derivatives and financial liability hosts

Under IFRS 9, an embedded derivative is separated from a financial liability host contract when certain conditions are met (see Chapter 42). Embedded derivatives are not separated from financial assets within the scope of IFRS 9, and the requirements of IFRS 9 are applied to the hybrid contract as a whole.

[IFRS 9.4.3.2].

If there is a difference between the transaction price, and the fair value of the financial instrument as a whole, a day 1 profit will arise. However, this day 1 profit may only be recognised as a gain or loss on initial recognition if the hybrid instrument has a quoted price in an active market for an identical instrument (i.e., a level 1 input), or if it is valued using a valuation technique that uses only data from observable markets (see section 3.3 above). *[IFRS 9.B5.1.2A(a)]*.

In Chapter 42, the treatment at initial recognition of an embedded derivative and the financial liability host contract is discussed. It is explained that an embedded non-option derivative is required to have a fair value of zero on initial recognition. By contrast, at initial recognition an embedded option-based derivative would not normally have a fair value of zero. Furthermore, the financial liability host instrument shall initially be measured based on the residual amount, after separating out the embedded derivative. *[IFRS 9.B4.3.3]*.

⁵ This discussion was included in the Basis for Conclusions to IAS 39. However, it holds true under IFRS 9 as the related requirements were brought into IFRS 9 unchanged.

IFRS 9 does not address how to allocate transaction costs that relate to a hybrid financial liability where an embedded derivative is separated from the financial liability host. Therefore, when allocating transaction costs to a hybrid financial instrument, entities should choose an accounting policy and apply it consistently. The approaches more commonly observed are:

- Approach 1: To allocate the transaction costs exclusively to the non-derivative financial liability host, in which case the transaction costs are included in full in the host liability's initial measurement.
- Approach 2: To allocate the transaction costs to the non-derivative financial liability host and the embedded derivative in proportion to their fair values at initial recognition, i.e., in a similar fashion to compound financial instruments. Under this approach:
 - The proportion attributable to the non-derivative financial liability host will be included in the host liability's initial measurement
 - The proportion attributable to the embedded derivative will be expensed as incurred as the embedded derivative is measured at fair value through profit or loss

If the embedded derivative is required to have an initial fair value of zero, then in essence, under Approach 2, no transaction costs will be allocated to the embedded derivative. Hence the choice of approach will usually only lead to a different outcome on initial recognition when the embedded derivative has a non-zero fair value, for example the embedded derivative has an option feature.

Approach 2 would need to be adapted if the embedded derivative is an asset, for example by allocating the transaction costs in proportion to the absolute fair values of the host and embedded derivative.

Illustration 3-4: Initial recognition of embedded derivatives and financial liability hosts (with transaction costs)

Background Information

- Entity E with a functional currency of euros, issues a zero-coupon bond with a par value of €100, which is determined to be the fair value of the hybrid instrument on that date. The proceeds received were €100.
- The bond has a maturity of 3 years. At that point the counterparty has the option to demand settlement at US\$100 or €100.
- Transaction costs of €5 were incurred by Entity E.
- Entity E will account for the bond at amortised cost.
- As the settlement feature at maturity could be in a currency that is different to the nominal value, there is a resulting cross currency option.
- This embedded derivative is not considered to be closely related to the host liability measured at amortised cost, and therefore separation is required (see Chapter 42).
- The embedded derivative is assessed to be a liability, with a fair value on initial recognition of €20.

At initial recognition

- €20 is allocated to the derivative liability as the fair value at initial recognition.
- The financial liability host instrument is measured based on the residual amount, after separating out the embedded derivative. Therefore, a value of €80 ($€100 - €20 = €80$) is allocated initially to the liability.

Allocation of the transaction costs

- If Approach 1 is followed, the transaction costs are allocated exclusively to the non-derivative financial liability host. Consequently, the full €5 is allocated to the host liability. As the bond is carried at amortised cost, the transaction costs are included in full in the bond's initial measurement. As a result, the bond is initially recognised at €75; and the embedded derivative is initially measured at €20.
- If Approach 2 is followed, the transaction costs are allocated to the non-derivative financial liability host and the embedded derivative in proportion to their fair values. Consequently:
 - Transaction costs of €1 ($€5 \times 20/100$) are allocated to the derivative. As the derivative is carried at fair value, the transaction costs of €1 are recognised immediately in profit and loss, and the embedded derivative is recognised initially at €20.
 - Transaction costs of €4 ($€5 \times 80/100$) are allocated to the liability, and deducted from its initial carrying amount. As a result, the bond liability is initially recognised at €76 ($€80 - €4$).

3.6 Regular way transactions

When settlement date accounting is used for 'regular way' transactions (see section 2.2.4 above) and those transactions result in the recognition of assets that are subsequently measured at amortised cost, there is an exception to the general requirement to measure the asset on initial recognition at its fair value (see section 3.1 above). In such circumstances, rather than being initially measured by reference to their fair value on the date they are first recognised, i.e., settlement date, these financial instruments are initially measured by reference to their fair value on the trade date (see Illustration 2-3A at section 2.2.5 above). [IFRS 9.5.1.2].

In practice, the difference will rarely be significant because of the short time scale involved between trade date and settlement date. It is because of this short duration that regular way transactions are not recognised as derivative financial instruments, but accounted for as set out in section 2.2 above.

[IFRS 9.BA.4].

3.7 Assets and liabilities arising from loan commitments

Loan commitments are a form of derivative financial instrument, although for pragmatic reasons the IASB decided that certain loan commitments could be excluded from most of the recognition and measurement requirements of IFRS 9 (see Chapter 41). Nevertheless IFRS 9 does require issuers to apply its impairment rules to such loan commitments (see Chapter 47). [IFRS 9.2.1(g)].

This creates a degree of uncertainty over how assets and liabilities arising from such arrangements should be measured on initial recognition, as discussed in the Illustration below.

For simplicity, any other amounts payable by the borrower to the lender (such as commitment and non-utilisation fees), have not been illustrated. The treatment of commitment fees received or paid is addressed in the frequently asked questions within Chapter 46.

Illustration 3-5: Drawdown under a committed borrowing facility

- Company H obtains from Bank Q a committed facility allowing it to borrow up to CU10,000 at any time over the following five years, provided certain covenants specified in the facility agreement are not breached.
- Interest on any drawdowns is payable at the risk-free rate, plus a fixed margin, representing Q's initial assessment of H's credit risk, resulting in a variable market rate.
- Any such borrowings can be repaid at any time at the option of H, but must be repaid by the end of five years, unless the facility is renegotiated and extended. They also become repayable immediately in the event that H breaches the covenants.
- After one year, no drawdowns have been made and H's credit risk has increased (although it has not breached any of the covenants and there is no expectation of default). As a result of this change in credit risk, the fair value of the facility is CU200 (positive value to H, negative value to Q).
- Shortly afterwards, H draws down the maximum CU10,000 available under the facility.
- Because of the change in credit risk, the loan resulting from the drawdown has a fair value at that date of CU9,800. The CU200 difference between the fair value of CU9,800 of the financial instrument created, and the CU10,000 cash transferred effectively represents the change in fair value of the commitment arising from the change in H's credit risk.

Questions:

- Should Q (H) initially measure the resulting asset (liability) at its CU9,800 fair value or at CU10,000, being the amount of cash actually exchanged?
- If it is recognised at CU9,800, how is the 'spare' CU200 accounted for, and does Q (H) recognise this as a loss (profit)?

In order to be able to answer this question, we need to consider the accounting for the loan commitment up until the date of drawdown and how its carrying amount impacts the initial measurement of the resulting loan.

3.7.1 Loan commitments outside the scope of IFRS 9

In Illustration 3-5 above, the commitment cannot be settled net and it is not at a below-market interest rate. Therefore, unless H or Q designate the loan commitment at fair value through profit or loss, it will be outside the scope of IFRS 9.

The accounting for the loan commitment outside the scope of IFRS 9 would be as follows:

- At the next reporting date after Q and H enter into the loan commitment, Q would assess and record a provision for expected credit losses under the impairment requirements of IFRS 9 (see Chapter 47), say CU10. Nothing else is recognised in the accounts of H in respect of the facility because the loan commitment is not recognised.
- When the credit risk increases in the following year, Q assesses and recognises any impact the increase in credit risk may have had on the provision for expected credit loss. Assume the ECL provision at this point has increased from CU10 to CU35.

Therefore, until the time of drawdown, the only accounting entries for Q are in relation to the impairment requirements applicable to loan commitments.

At the time the loan is drawn down, Q classifies the loan within financial assets at amortised cost and H classifies it within financial liabilities at amortised cost. The general requirement under IFRS 9 as noted in section 3.1 above would require the asset (liability) to be initially measured at its fair value, i.e., CU9,800.

This would result in:

- For Q, the recognition of a further loss of CU165 (CU200 - CU35).
- For H, the recognition of a profit of CU200.

This is because the spare CU200 arising as the difference between the fair value (CU9,800) and the amount delivered (CU10,000) does not represent any other asset or liability arising from the transaction.

However, the Basis for Conclusions on IFRS 9 explains that the effect of the loan commitment exception is to achieve consistency with the measurement basis of the resulting loan when the holder exercises its right, i.e., amortised cost. Changes in the fair value of these commitments arising from changes in market interest rates or credit spreads will therefore not be recognised or measured, in the same manner that changes in such rates and spreads would not affect the amortised cost of the financial asset (or financial liability) recognised once the right is exercised. [IFRS 9.BC22.3]. This is exactly what the 'spare' CU200 represents, so in accordance with the underlying rationale and objective of allowing loan commitments to be excluded from the scope of IFRS 9, it is appropriate to initially measure the asset or liability arising in this case at CU10,000. It is worth mentioning that the expected credit loss provision previously recognised for the loan commitment is incorporated into the allowance for the drawn down loan upon initial recognition, and then subsequently reassessed at each reporting date.

The treatment under the loan commitment exception is consistent with that of similar assets arising from regular way transactions recognised using settlement date accounting (see section 3.6 above). This is relevant because the IASB introduced the loan commitment exception as a result of issues identified by the IAS 39 Implementation Guidance Committee (IGC) and the only solution the IGC could identify at the time involved treating loan commitments as regular way transactions and using settlement date accounting.⁶

⁶ IAS 39 Implementation Guidance Committee (IGC), Q&A 30-1, July 2002.

The Illustration below is a continuation of Illustration 3-5 above, and demonstrates the accounting by Bank Q for the loan commitment and, subsequently, for the asset that results from the draw down.

Illustration 3-6: Drawdown under a committed borrowing facility - journals when outside the scope of IFRS 9

The journals below illustrate the accounting for a loan commitment that is outside the scope of IFRS 9 in line with the information provided in Illustration 3-5 and section 3.7.1 above.

To record loan on draw down

Immediately after draw down

		CU	CU
Dr	ECL on commitment	35	
	Cr ECL on loan receivable		35

ECL previously recognised on loan commitment incorporated into ECL for the loan

The above discussion outlines the treatment for a loan commitment when the resulting asset is classified at amortised cost. The scope exemption for loan commitments does not apply where an entity has a past practice of selling the assets resulting from the loan commitments shortly after origination (see Chapter 41). [IFRS 9.2.3(a)]. Consequently, where the resulting loan is classified as held for trading, the loan commitment would be within the scope of IFRS 9 and would be dealt with as per section 3.7.2 below.

3.7.2 Loan commitments within the scope of IFRS 9

If in the above example, Q accounted for the loan commitment at fair value through profit or loss (in line with IFRS 9.2.3(a), see Chapter 41), the issue of the spare CU200 would not arise. At the time the loan was drawn down, the commitment would have already been recognised as a CU200 liability and an equivalent loss would have been recorded in profit or loss. The loan would then be recognised at its fair value of CU9,800 and the CU200 balance of the cash movement over this amount would be treated as the settlement of the loan commitment liability. Therefore, no further gain or loss would need to be recognised at this point. Once the loan is recognised, it will be accounted for in accordance with IFRS 9 in line with its classification.

Illustration 3-7: Drawdown under a committed borrowing facility - journals when within the scope of IFRS 9

The journals below illustrate the accounting for a loan commitment that is within the scope of IFRS 9 in line with the information provided in Illustration 3-5 and accounted for at fair value through profit or loss as set out above.

Bank Q Journals
After 1 year

Question 2-1:	In relation to clearing brokers and similar institutions, when dealing with centrally cleared client derivatives, is the clearing broker acting as an agent or a principal?	3752
Question 2-2:	How are short sales of securities accounted for when the transaction terms require delivery of the securities within the time frame established generally by regulation or convention in the marketplace?	3754
Question 3-1:	What is the appropriate treatment of an issued equity instrument where the contractual terms are modified such that it is subsequently reclassified as a financial liability?	3764
Question 3-2:	What is the appropriate treatment in a transaction that does not constitute the acquisition of a business, when there are differences noted at initial recognition in the fair value, and measurement bases, of the underlying assets and liabilities acquired?	3766

Appendix C - Defined terms

Extract from IFRS accounting standards - Definitions

amortised cost of a financial asset or financial liability	<p>The amount at which the financial asset or financial liability is measured at initial recognition minus the principal repayments, plus or minus the cumulative amortisation using the effective interest method of any difference between that initial amount and the maturity amount and, for financial assets, adjusted for any loss allowance.</p> <p><i>[IFRS 9 Appendix A].</i></p>
derivative	<p>A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.</p> <ul style="list-style-type: none"> (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying'). (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. (c) it is settled at a future date. <i>[IFRS 9 Appendix A].</i>
equity instrument	<p>An equity instrument is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities.</p> <p><i>[IAS 32.11].</i></p>
fair value	<p>The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. <i>[IFRS 13 Appendix A].</i></p>
financial asset	<p>A financial asset is any asset that is:</p> <ul style="list-style-type: none"> (a) cash; (b) an equity instrument of another entity; (c) a contractual right: <ul style="list-style-type: none"> (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. <p>For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <i>[IAS 32.11].</i></p>

financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument. <i>[IFRS 9 Appendix A].</i>
financial instrument	A <i>financial instrument</i> is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity. <i>[IAS 32.11].</i>
financial liability	<p>A <i>financial liability</i> is any liability that is:</p> <ul style="list-style-type: none"> (a) a contractual obligation: <ul style="list-style-type: none"> (i) to deliver cash or another financial asset to another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or (b) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <p>As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D. <i>[IAS 32.11].</i></p>
financial liability at fair value through profit or loss	<p>A financial liability that meets one of the following conditions:</p> <ul style="list-style-type: none"> (a) it meets the definition of held for trading. (b) upon initial recognition it is designated by the entity as at fair value through profit or loss in accordance with paragraph 4.2.2 or 4.3.5. (c) it is designated either upon initial recognition or subsequently as at fair value through profit or loss in accordance with paragraph 6.7.1. <i>[IFRS 9 Appendix A].</i>

held for trading	<p>A financial asset or financial liability that:</p> <ul style="list-style-type: none"> (a) is acquired or incurred principally for the purpose of selling or repurchasing it in the near term; (b) on initial recognition is part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking; or (c) is a derivative (except for a derivative that is a financial guarantee contract or a designated and effective hedging instrument). <p><i>[IFRS 9 Appendix A].</i></p>
regular way purchase or sale	<p>A purchase or sale of a financial asset under a contract whose terms require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned.</p> <p><i>[IFRS 9 Appendix A].</i></p>
transaction costs	<p>Incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or financial liability (see paragraph B5.4.8). An incremental cost is one that would not have been incurred if the entity had not acquired, issued or disposed of the financial instrument. <i>[IFRS 9 Appendix A].</i></p>
transaction price (for a contract with a customer)	<p>The amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties.</p> <p><i>[IFRS 15 Appendix A].</i></p>

Overview

This chapter discusses the subsequent measurement of financial instruments under IFRS 9 *Financial Instruments*, including the requirements relating to amortised cost, the effective interest method, modifications of 'financial assets and liabilities' and 'foreign currency' revaluation. The subsequent measurement of financial assets and liabilities is dependent on their classification, which is covered in Chapter 44.

This chapter also discusses fees that are considered an integral part of the effective interest rate (EIR) and provides examples of how the effective interest method is applied to fixed and floating rate instruments, including those with additional features such as prepayment options or an inflation feature. Guidance is also provided on accounting for modifications of financial assets and liabilities that do not result in derecognition, including the treatment of modification fees.

Subsequent measurement of contingent consideration recognised by an acquirer in a business combination to which IFRS 3 *Business Combinations* applies, that falls within the scope of IFRS 9, is discussed in Chapter 10. The impairment of financial instruments is addressed in Chapter 47.

Most, but not all, of the detailed requirements of IFRS accounting standards governing the measurement of fair values are dealt with in IFRS 13 *Fair Value Measurement*, which is covered in Chapter 15. The measurement of a financial liability with a demand feature is also covered in Chapter 15. IFRS 9 contains certain requirements addressing fair value measurements of financial instruments and these are covered in sections 2.3 to 2.5 below.

What you need to know

- Subsequent to initial recognition, financial assets and liabilities are accounted for based on their classification at:
 - (a) amortised cost,
 - (b) fair value through other comprehensive income (FVOCI)
 Or
 - (c) fair value through profit or loss (FVTPL).
- Amortised cost is determined using the EIR method. This calculation includes all fees and points that are an integral part of the EIR, as well as transaction costs, and all other premiums and discounts. The EIR method amortises all such fees, points, costs, premiums or discounts over the expected life of the instrument rather than the contractual life.
- For a fixed rate instrument, changes to estimated cash flows that do not result in derecognition of the instrument are accounted for by discounting the revised cash flows using the original EIR and recognising a catch-up adjustment in profit or loss. For a floating rate instrument, such revisions to estimated cashflows are accounted for by discounting the revised cash flows using a revised EIR with respect to floating features (such as the risk-free rate and, or, the credit spread).
- When a financial instrument is modified, and the modification does not result in derecognition, fees incurred or paid in connection with the modification are added to the carrying value of the instrument. IFRS 9 explicitly addresses certain issues, but in other cases judgement needs to be applied to determine the appropriate treatment.
- For FVOCI debt instruments, interest income, foreign exchange gains or losses and impairments (calculated based on the amortised cost of the instrument) are recognised immediately in profit or loss. All other changes in fair value are recognised in other comprehensive income (OCI). Fair value changes that have been recognised in OCI are recycled to profit or loss upon derecognition of the debt instrument.
- Equity instruments are normally measured at FVTPL. However, for equity instruments designated at FVOCI, gains and losses are recognised in OCI, while dividends are recognised in profit or loss, unless the dividend clearly represents a recovery of part of the cost of the investment. Unlike for FVOCI debt instruments, gains or losses recognised in OCI for equity instruments are never reclassified from equity to profit or loss. Consequently, there is no need to review such investments for impairment.
- IAS 21 *The Effects of Changes in Foreign Exchange Rates* applies to foreign currency denominated financial instruments.

1 Introduction

The initial classification of financial assets and liabilities determines their subsequent measurement at either fair value or amortised cost (see Chapter 44 for the requirements relating to classification). Most of the requirements for determining fair value are covered in IFRS 13 (see Chapter 15), although the International Accounting Standards Board (IASB or Board) included guidance in IFRS 9 about how to determine fair values for financial instruments for which no quoted market price is available (see section 2.6 below). Amortised cost and the effective interest method are covered in section 3 below.

2 Subsequent measurement and recognition of gains and losses

As explained in Chapter 44, financial assets and financial liabilities are classified into one of the following measurement categories: [IFRS 9.4.1.1, IFRS 9.4.2.1]

- Debt financial assets at amortised cost
- Debt financial assets at fair value through other comprehensive income (with cumulative gains and losses reclassified to profit or loss upon derecognition)
- Debt financial assets, derivatives and investments in equity instruments at fair value through profit or loss
- Investments in equity instruments designated as measured at fair value through other comprehensive income (with gains and losses remaining in other comprehensive income, without recycling)
- Financial liabilities at amortised cost

Or

- Financial liabilities at fair value through profit or loss

Following the initial recognition of financial assets and financial liabilities, their subsequent accounting treatment depends principally on the classification of the instrument, although there are a small number of exceptions. These requirements are summarised in Figure 2-1 below and are considered in more detail in the remainder of this section.

Figure 2-1: Classification and subsequent measurement of financial assets and financial liabilities

Classification	Instrument type	Statement of financial position	Fair value gains and losses	Interest or dividends	Impairment	Foreign exchange
Financial assets and liabilities at amortised cost	Debt	Amortised cost	-	Profit or loss: interest calculated using the EIR	Profit or loss (financial assets)	Profit or loss
Debt financial assets at fair value through other comprehensive income	Debt	Fair value	OCI and recycled to profit or loss when derecognised	Profit or loss: interest calculated using the EIR	Profit or loss	Profit or loss (foreign exchange differences on the amortised cost) OCI (other changes)
Fair value through profit or loss (including derivatives not designated in effective hedges)	Debt, equity or derivative	Fair value	Profit or loss (see Chapter 50 on presentation requirements) and OCI for changes in own credit risk for financial liabilities designated at FVTPL	Profit or loss (see Chapter 50 on presentation requirements)	-	Profit or loss
Equity investments at fair value through other comprehensive income	Equity	Fair value	OCI (no recycling to profit or loss when derecognised)	Profit or loss: dividends (unless recovery of part of the cost of investment)	-	OCI (no recycling to profit or loss when derecognised)

In addition, IFRS 9 sets out the accounting treatment for certain financial guarantee contracts (see Chapter 41) and loan commitments (see Chapter 41).

2.1 Debt financial assets measured at amortised cost

Financial assets that are measured at amortised cost require the use of the effective interest method and are subject to the IFRS 9 impairment rules. [IFRS 9.5.2.1, IFRS 9.5.2.2]. Gains and losses are recognised in profit or loss when the instrument is derecognised or impaired, through the amortisation process and, if applicable, through modification or reclassification. [IFRS 9.5.7.2]. The effective interest method of accounting is dealt with in section 3 below, foreign currency translation in section 4 below, reclassification of financial assets in section 2.7 below, modification of financial assets in section 3.8 below and impairment is addressed in Chapter 47.

2.2 Financial liabilities measured at amortised cost

Liabilities that are measured at amortised cost require the use of the effective interest method with gains or losses recognised in profit or loss when the instrument is derecognised, as well as through the amortisation process and, if applicable, through modification if the modification does not result in derecognition. [IFRS 9.5.3.1, IFRS 9.5.7.2]. The effective interest method of accounting is dealt with in section 3 below, foreign currency retranslation is discussed in section 4 below and modification of financial liabilities is covered in section 3.8 below.

2.3 Debt financial assets measured at fair value through other comprehensive income

For financial assets that are debt instruments measured at fair value through other comprehensive income (see Chapter 44), the IASB decided that both amortised cost and fair value information are relevant because debt instruments held by entities in this measurement category are held for both the collection of contractual cash flows and the realisation of fair values. [IFRS 9.BC4.150].

After initial recognition, investments in debt instruments that are classified as measured at fair value through other comprehensive income are measured at fair value in the statement of financial position (with no deduction for sale or disposal costs). The amounts recognised in profit or loss are the same as the amounts that would have been recognised in profit or loss if the investment had been recorded at amortised cost. [IFRS 9.5.7.11, IFRS 9.B5.7.1A]. For example, the following amounts are recognised in profit or loss:

- Impairment gains and losses (see Chapter 47) derived using the same methodology that is applied to financial assets measured at amortised cost. [IFRS 9.5.2.2, IFRS 9.5.5.2].
 - Foreign exchange gains and losses (see section 4 below) calculated based on the amortised cost of the debt instruments. [IFRS 9.B5.7.2, IFRS 9.B5.7.2A].
 - Interest revenue calculated using the effective interest method (see section 3 below). [IFRS 9.5.4.1].
- And
- Modification gains or losses for debt instruments that are modified (see section 3.8 below and Chapter 47). [IFRS 9.5.4.3, IFRS 9.5.7.10, IFRS 9.5.7.11].

Furthermore, the subsequent measurement of debt instruments at fair value through other comprehensive income involves the following:

- Other fair value gains and losses are recognised in OCI. [IFRS 9.B5.7.1A, IFRS 9.5.7.1(d)].
- And
- When the debt instruments are derecognised, the cumulative gains or losses previously recognised in OCI are reclassified (i.e., recycled) from equity to profit or loss as a reclassification adjustment. [IFRS 9.5.7.10].

It follows that the amount recognised in OCI (prior to derecognition) is the difference between the total change in fair value, and the amounts recognised in profit or loss (excluding any amounts received in cash, e.g., the coupon on a bond).

How we see it

Whilst IFRS 9.5.7.10 does not mention modification gains or losses as a component of a financial asset measured at FVOCI to be recorded in profit or loss and could therefore be read as suggesting that the modification gains or losses should not be recognised in profit or loss, we understand that it was the IASB's intention that they should be recognised in profit or loss. This is clear from reading IFRS 9.5.7.11 in conjunction with IFRS 9.5.4.3, which clarifies the accounting treatment of modifications as IFRS 9.5.7.11 clearly states that the amounts that are recognised in profit or loss are the same as the amounts that would have been recognised in profit or loss if the financial asset had been measured at amortised cost.

2.4 Financial assets and financial liabilities measured at fair value through profit or loss

After initial recognition, financial assets and financial liabilities that are classified as measured at fair value through profit or loss (including derivatives that are not designated in effective hedging relationships) are measured at fair value, with no deduction for sale or disposal costs (see Chapter 45). [IFRS 9.5.2.1, IFRS 9.5.3.1].

The standard helpfully points out that if the fair value of a financial asset falls below zero it becomes a financial liability (assuming it is measured at fair value). [IFRS 9.B5.2.1]. The standard does not explain what happens if the fair value of a financial liability becomes positive, but it is safe to assume that it becomes a financial asset and not a negative liability.

Gains and losses arising from remeasuring a financial asset or financial liability at fair value, that is not in a hedging relationship, are normally recognised in profit or loss. [IFRS 9.5.7.1]. However, there is an exception for non-derivative financial liabilities that are designated as measured at fair value through profit or loss. For these liabilities, the element of the gain or loss attributable to changes in credit risk (see section 2.4.1 below) is recognised in other comprehensive income (with the remainder of the fair value change recognised in profit or loss). [IFRS 9.5.7.7]. These amounts presented in other comprehensive income are not subsequently transferred to profit or loss. However, the cumulative gain or loss may be transferred within equity. [IFRS 9.B5.7.9].

This exception does not apply to loan commitments or financial guarantee contracts, nor does it apply if it would create or enlarge an accounting mismatch in profit or loss (see section 2.4.2 below). [IFRS 9.5.7.8, IFRS 9.5.7.9]. In these cases, all changes in the fair value of the liability (including the effects of changes in the credit risk) are recognised in profit or loss. [IFRS 9.B5.7.8].

2.4.1 Liabilities at fair value through profit or loss: calculating the gain or loss attributable to changes in credit risk

IFRS 7 *Financial Instruments: Disclosures* defines credit risk as: [IFRS 7 Appendix A]

Extract from IFRS 7

Appendix A Defined terms

credit risk	The risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation.
-------------	--

Credit risk is also part of non-performance risk as defined in IFRS 13 (see Chapter 15). The change in fair value of a financial liability that is attributable to credit risk relates to the risk that the issuer will fail to pay that liability. It may not solely relate to the creditworthiness of the issuer but may be influenced by other factors, such as collateral.

For example, if an entity issues a collateralised liability and a non-collateralised liability that are otherwise identical, the credit risk of those two liabilities will be different, even though they are issued by the same entity. The credit risk on the collateralised liability will be less than the credit risk of the non-collateralised liability. In fact, the credit risk for a collateralised liability may be close to zero. [IFRS 9.B5.7.13]. It is important to distinguish between the terms 'credit risk' and 'the risk of default' as referred to in the impairment requirements of the standard (see Chapter 47), since the latter does not include the benefit of collateral.

For these purposes, credit risk is different from asset-specific performance risk. IFRS 9.B5.7.14 notes that "...Asset-specific performance risk is not related to the risk that an entity will fail to discharge a particular obligation but instead it is related to the risk that a single asset or a group of assets will perform poorly (or not at all)". [IFRS 9.B5.7.14]. For example, consider the following two situations: [IFRS 9.B5.7.15]

- (a) A liability with a unit-linking feature whereby the amount due to investors is contractually determined on the basis of the performance of specified assets. The effect of that unit-linking feature on the fair value of the liability is asset-specific performance risk, not credit risk.
- (b) A liability issued by a structured entity with the following characteristics:
 - The structured entity is legally isolated so the assets in the structured entity are ring-fenced solely for the benefit of its investors, even in the event of bankruptcy.
 - The structured entity enters into no other transactions and the assets in the structured entity cannot be hypothecated.

And

 - Amounts are due to the structured entity's investors only if the ring-fenced assets generate cash flows.

Thus, in both cases, changes in the fair value of the liability primarily reflect changes in the fair value of the assets. The effect of the performance of the assets on the fair value of the liability is asset-specific performance risk, not credit risk.

Unless an alternative method more faithfully represents the change in fair value of a financial liability that is attributable to credit risk, the standard states that this amount shall be determined as the amount of change in the fair value of the liability that is not attributable to changes in market conditions that give rise to what it defines as 'market risk'. [IFRS 9.B5.7.16]. Examples of changes in market conditions that give rise to market risk include changes in a benchmark interest rate, the price of another entity's financial instrument, a commodity price, foreign exchange rate or index of prices or rates. [IFRS 9.B5.7.17].

The standard says that if the only significant relevant changes in market conditions for a financial liability are changes in 'an observed (benchmark) interest rate', the amount to be recognised in other comprehensive income can be estimated as follows: [IFRS 9.B5.7.18]

- (a) First, to arrive at an instrument-specific component of the internal rate of return; the liability's internal rate of return at the start of the period is computed using the fair value and contractual cash flows at that time and the observed (benchmark) interest rate at the start of the period is deducted from this.
 - (b) Next, the present value of the cash flows associated with the liability is calculated using the liability's contractual cash flows at the end of the period and a discount rate equal to the sum of the observed (benchmark) interest rate at the end of the period and the instrument-specific component of the internal rate of return at the start of the period as determined in (a).
- And
- (c) The difference between the fair value of the liability at the end of the period and the amount determined in (b) is the change in fair value that is not attributable to changes in the observed (benchmark) interest rate and this is the amount to be presented in other comprehensive income.

It should be noted that 'market risk' is defined to include movements in 'a benchmark rate'. The latter term is not itself defined but typically it would encompass both risk free rates, such as AAA rated government bond rates or overnight rates, and interbank offer rates (IBOR) such as 3-month EURIBOR, which include an element of credit risk. It would therefore appear that the standard is ambivalent as to whether the amount of change in fair value that is attributable to changes in credit risk of a liability is measured by reference to risk free rates, or by comparison to the credit risk already present in an IBOR. Using the former, the amount will reflect all changes in credit risk of the liability, whereas using the latter, it will only reflect a portion of the changes in credit risk to the liability. Further, the change in credit risk will differ depending on which tenor is selected such as 3-month EURIBOR, 6-month EURIBOR or 12-month EURIBOR. From 2022, most benchmark rates are risk free rates (RFRs) based on actual transactions (see *Supplement: IBOR Reform* for more details). It would follow that the change in the amount attributable to credit risk reflects all changes in credit risk if using the new RFRs as benchmarks.

This method is illustrated in the following Illustration, adapted from that provided in the Illustrative Examples attached to the standard. [IFRS 9.IE1, IFRS 9.IE2, IFRS 9.IE3, IFRS 9.IE4, IFRS 9.IE5].

Illustration 2-1: Estimating the change in fair value of an instrument attributable to its credit risk

On 1 January 20X1 Company J issues a 10-year bond with a par value of €150,000 and an annual fixed coupon rate of 8%, which is consistent with market rates for bonds with similar characteristics. J uses 3-month EURIBOR as its observable (benchmark) interest rate. At the date of inception of the bond, 3-month EURIBOR is 5%. At the end of the first year:

- 3-Month EURIBOR has decreased to 4.75%.
- And
- The fair value of the bond is €153,811 which is consistent with an interest rate of 7.6% (i.e., the remaining cash flows on the bond, €12,000 per year for nine years and €150,000 at the end of nine years, discounted at 7.6% equals €153,811).

For simplicity, this Illustration assumes a flat yield curve, that all changes in interest rates result from a parallel shift in the yield curve, and that the changes in 3-month EURIBOR are assumed to be the only relevant changes in market conditions.

The amount of change in the fair value of the bond that is not attributable to changes in market conditions that give rise to market risk is estimated as follows:

Step (a)

The bond's internal rate of return at the start of the period is 8%. Because the observed (benchmark) interest rate (3-month EURIBOR) is 5%, the instrument-specific component of the internal rate of return is deemed to be 3%.

Step (b)

The contractual cash flows of the instrument at the end of the period are:

- Interest: €12,000 [$€150,000 \times 8\%$] per year for each of years 20X2 (year 2) to 20Y0 (year 10).
- Principal: €150,000 in 20Y0 (year 10).

The discount rate to be used to calculate the present value of the bond is thus 7.75%, which is the 4.75% end of period 3-month EURIBOR rate, plus the 3% instrument-specific component calculated as at the start of the period, which gives a notional present value of €152,367 ($€12,000 \times (1 - 1.0775^{-9}) \div 0.0775 + €150,000 \times 1.0775^{-9}$), on the assumption that there has been no change in the instrument-specific component.

Step (c)

The market price of the liability at the end of the period (which will reflect the real instrument-specific component at the end of the period within the 7.6% yield) is €153,811. Therefore, J accounts for €1,444 ($€153,811 - €152,367$) as the increase in fair value of the bond that is not attributable to changes in market conditions that give rise to market risk.

This method assumes that changes in fair value other than those arising from changes in the instrument's credit risk or from changes in the 'observed (benchmark) interest rate' are not significant. It would not be appropriate to use this method if changes in fair value arising from other factors are significant. In such cases, an alternative method should be used that more faithfully measures the effects of changes in the liability's credit risk. For example, if the instrument in the Illustration contained an embedded derivative, the change in fair value of the embedded derivative must be excluded in determining the amount to be presented in other comprehensive income. [IFRS 9.B5.7.19, IFRS 9.B5.7.16(b)]. This ensures that only fair value changes attributable to credit risk are reflected in other comprehensive income and excludes the fair value changes attributable to the embedded derivative.

The above method will also produce an amount which includes any changes in the liquidity spread charged by market participants, over say 3-month EURIBOR, since such changes are not considered to be attributable to changes in market conditions that give rise to market risk. This method is applied in practice as the effect of a liquidity spread cannot normally be isolated from that of the credit spread.

As with all estimates of fair value, the measurement method used for determining the portion of the change in the liability's fair value that is attributable to changes in its credit risk should make maximum use of observable market inputs. [IFRS 9.B5.7.20].

2.4.2 Liabilities at fair value through profit or loss: assessing whether an accounting mismatch is created or enlarged

If a financial liability is designated as at fair value through profit or loss, it must be determined whether presenting the effects of changes in the liability's credit risk in OCI would create or enlarge an accounting mismatch in profit or loss. The IASB expects this to be a rare occurrence. An accounting mismatch would be created or enlarged if presenting changes in credit risk in OCI would result in a greater mismatch in profit or loss, than if those amounts had been presented in profit or loss. [IFRS 9.B5.7.5, IFRS 9.BC5.39].

In making that determination, an assessment should be made as to whether the effects of changes in the liability's credit risk are expected to be offset in profit or loss by a change in the fair value of another financial instrument measured at fair value through profit or loss. Such an expectation should be based on an economic relationship between the characteristics of the liability and the characteristics of the other financial instrument. [IFRS 9.B5.7.6].

The determination is made at initial recognition and is not reassessed. For practical purposes, all the assets and liabilities giving rise to an accounting mismatch do not need to be entered into at exactly the same time - a reasonable delay is permitted provided that any remaining transactions are expected to occur. An entity's methodology for making the determination of whether an accounting mismatch is created or enlarged must be applied consistently for similar types of transactions. IFRS 7 requires an entity to provide qualitative disclosures in the notes to the financial statements about its methodology for making the accounting mismatch determination - see Chapter 50. [IFRS 9.B5.7.7].

If an accounting mismatch would be created or enlarged, the entity is required to present all changes in fair value (including the effects of changes in the credit risk of the liability) in profit or loss. In the absence of an accounting mismatch being created or enlarged, the entity is required to present the effects of changes in the liability's credit risk in OCI. [IFRS 9.B5.7.8].

The following Illustration describes a situation in which an accounting mismatch would be created in profit or loss if the effects of changes in the credit risk of the liability were presented in OCI. [IFRS 9.B5.7.10].

Illustration 2-2: Liabilities at fair value through profit or loss: accounting mismatch in profit or loss

A mortgage bank provides loans to customers and these are funded by issuing bonds with matching characteristics (e.g., amount outstanding, repayment profile, term and currency) in the market. The loans contain a prepayment feature which allows the mortgage customer to prepay its loan (i.e., satisfy its obligation to the bank) by buying the corresponding bond (which were originally used by the bank to fund the loans) at fair value in the market and delivering that bond to the mortgage bank.

As a result of that contractual prepayment right, if the credit quality of the bond worsens (resulting in the fair value of the mortgage bank's liability decreasing), the fair value of the mortgage bank's loan asset also decreases. The change in the fair value of the loan asset reflects the mortgage customer's contractual right to prepay the mortgage loan by buying the underlying bond at fair value (which, in this Illustration, has decreased) and delivering the bond to the mortgage bank. Therefore, the effects of changes in the credit risk of the liability (the bond) will be offset in profit or loss by a corresponding change in the fair value of a financial asset (the loan).

If the effects of changes in the liability's credit risk were presented in OCI there would be an accounting mismatch in profit or loss. Therefore, the mortgage bank is required to present all changes in fair value of the liability (including the effects of changes in the liability's credit risk) in profit or loss.

In Illustration 2-2 above, there is a contractual link between the effects of changes in the credit risk of the liability and changes in the fair value of the financial asset (i.e., as a result of the mortgage customer's contractual right to prepay the loan by buying the bond at fair value and delivering the bond to the mortgage bank). The standard states that an accounting mismatch may also occur in the absence of a contractual link, but does not provide any examples of when this might be the case. [IFRS 9.B5.7.11].

However, the standard makes it clear that a mismatch that arises solely as a result of the measurement method does not affect the determination of whether presenting the effects of changes in the liability's credit risk in OCI would create or enlarge an accounting mismatch. For instance, an entity may not be able to isolate changes in a liability's credit risk from changes in liquidity risk. Consequently, when the entity presents the combined effect of both factors in OCI, a mismatch may occur because changes in liquidity risk are included in the fair value measurement movement of the entity's financial assets presented in profit or loss. However, such a mismatch is caused by measurement imprecision, not an offsetting relationship, and, therefore, does not affect the determination of an accounting mismatch. [IFRS 9.B5.7.12].

The following Illustration presents another situation in which an accounting mismatch is not due to an economic relationship (in the sense intended by the IASB) between the movement in the fair value of the financial assets and the movement in the fair value of the financial liabilities related to the liabilities' own credit risk.

Illustration 2-3: Liabilities at fair value through profit or loss: no accounting mismatch in profit or loss

A bank issues structured products (consisting of a host debt contract and one or more embedded derivatives) in the market. These financial liabilities are designated as at fair value through profit or loss because they are managed on a fair value basis.

The bank invests the funds received in highly rated bonds, which are also designated as at fair value through profit or loss, and derivatives whose terms mirror those of the embedded derivatives in the structured products.

In periods when market credit spreads are volatile, it is expected that the effect of changes in credit spreads on the fair value of the structured products will be mainly compensated for by the effect of an offsetting credit spread movements on the bonds. This is because the credit quality of the bank is similar to the credit quality of the highly rated bonds in which the bank has invested.

Unlike Illustration 2-2 above, there is no direct link between the bank's own credit risk of the structured financial liabilities and the credit risk of the financial assets. The credit quality of the financial assets may be similar to that of the financial liabilities and these may move in a correlated manner as they are affected by similar movements in the general price of credit and other market risks, but the fair value of the financial assets will not move directly in response to changes in the bank's own credit risk.

Therefore, the requirements for an economic relationship are not met and all fair value changes attributable to changes in the credit risk of the financial liabilities should be taken to OCI.

2.5 Investments in equity instruments designated at fair value through other comprehensive income

After initial recognition, investments in equity instruments not held for trading that are designated as measured at fair value through other comprehensive income (see Chapter 44) are measured at fair value, with no deduction for sale or disposal costs. [IFRS 9.5.7.5]. With the exception of dividends, the associated gains and losses (including any related foreign exchange component) are recognised in OCI. These investments are not subject to impairment testing. Amounts presented in OCI are not subsequently transferred to profit or loss, although the cumulative gain or loss may be transferred within equity. [IFRS 9.B5.7.1, IFRS 9.B5.7.3].

The following Illustration demonstrates the presentation of gains or losses that arise on disposal of investments in equity instruments designated at FVOCI:

Illustration 2-4: Presentation of gains or losses on disposal of equity instruments designated at FVOCI

On 1 January 20X1 an entity purchases equity instruments for an amount equal to their fair value of CU100 and designates them at FVOCI on initial recognition. At 31 December 20X1 the equity instruments have a fair value of CU115 and the entity recognises a gain of CU15 in OCI. During 20X2, the entity sells the equity instruments for an amount equal to their fair value of CU125 and recognises a gain of CU10 in OCI. This gain is not recognised in profit or loss because all fair value gains or losses on equity instruments designated at FVOCI, recognised up to the date of disposal, are recognised in OCI. [IFRS 9.B5.7.1]. As the equity instruments are sold for an amount equal to their fair value, there is no difference between their carrying amount (measured at the date of derecognition) and the consideration received on derecognition. As such, there is no impact on profit or loss in terms of IFRS 9.3.2.12 which requires the difference between the carrying amount of a financial asset (measured at the date of derecognition) and the consideration received on derecognition to be recognised in profit or loss. Dividends from equity instruments at FVOCI are recognised in profit or loss. [IFRS 9.5.7.6].

The disclosure requirements of IFRS 7 for investments in equity instruments designated at FVOCI are discussed in Chapter 50.

Extract from IFRS 9

Appendix A

Defined terms

dividends	Distributions of profits to holders of equity instruments in proportion to their holdings of a particular class of capital.
------------------	---

[IFRS 9 Appendix A].

Dividends from these investments are recognised in profit or loss when the right to receive payment is established, the amount of the dividend can be measured reliably and it is probable that economic benefits will flow to the entity. [IFRS 9.5.7.1A, IFRS 9.5.7.6]. However, if the dividend clearly represents a recovery of part of the cost of the investment, it is not recognised in profit and loss (see Chapter 9). [IFRS 9.B5.7.1]. In the Basis for Conclusions to IFRS 9 the IASB distinguish between dividends that represent a return *of* investment, and those dividends that are a return *on* the investment. [IFRS 9.BC5.25(a)]. However, determining when a dividend does or does not clearly represent a recovery of the cost of the investment can be highly judgemental, and a thorough understanding of the particular facts and circumstances is needed.

2.6 Unquoted equity instruments and related derivatives

IFRS 9 requires all investments in equity instruments and contracts on those instruments to be measured at fair value (see Chapter 15). However, it is recognised that in limited circumstances, cost may be an appropriate estimate of fair value. That may be the case if insufficient recent information is available to determine fair value, or if there is a wide range of possible fair value measurements and cost represents the best estimate of fair value within that range. [IFRS 9.B5.2.3].

Such guidance was provided to alleviate some of the concerns expressed by constituents and also, to replace the cost exception that was not brought forward to IFRS 9 from IAS 39 *Financial Instruments: Recognition and Measurement*, the previous standard for accounting for financial instruments. IAS 39 contained an exception from fair value measurement for investments in equity instruments (and some derivatives linked to those investments) that did not have a quoted price in an active market and whose fair value could not be reliably measured. Those equity investments were required to be measured at cost less impairment, if any. [IFRS 9.BC5.13, IFRS 9.BC5.16, IFRS 9.BC5.18].

Extract from IFRS 9

B5.2.4 Indicators that cost might not be representative of fair value include:

- (a) a significant change in the performance of the investee compared with budgets, plans or milestones.
- (b) changes in expectation that the investee's technical product milestones will be achieved.
- (c) a significant change in the market for the investee's equity or its products or potential products.
- (d) a significant change in the global economy or the economic environment in which the investee operates.
- (e) a significant change in the performance of comparable entities, or in the valuations implied by the overall market.
- (f) internal matters of the investee such as fraud, commercial disputes, litigation, changes in management or strategy.
- (g) evidence from external transactions in the investee's equity, either by the investee (such as a fresh issue of equity), or by transfers of equity instruments between third parties.

[IFRS 9.B5.2.4].

This list is not intended to be exhaustive. All information about the performance and operations of the investee that becomes available after the date of initial recognition should be used and to the extent that any such relevant factors exist, they may indicate that cost might not be representative of fair value. In such cases, fair value should be estimated. [IFRS 9.B5.2.5].

For the avoidance of doubt, IFRS 9 emphasises that cost is never the best estimate of fair value for investments in quoted equity instruments (or contracts on quoted equity instruments). [IFRS 9.B5.2.6]. Also, the IASB noted that for financial institutions and investment funds, the cost of an equity investment cannot be considered representative of fair value. [IFRS 9.BC5.18].

2.7 Reclassifications of financial assets

In certain situations, financial assets are reclassified, and the situations in which a reclassification might arise are considered in more detail in Chapter 44.

The reclassification must be applied prospectively from the reclassification date which is defined as:

[IFRS 9.5.6.1, IFRS 9 Appendix A]

Extract from IFRS 9

Appendix A Defined terms

reclassification date	The first day of the first reporting period following the change in business model that results in an entity reclassifying financial assets.
------------------------------	--

Accordingly, any previously recognised gains, losses (including impairment gains and losses) or interest should not be restated. [IFRS 9.5.6.1]. For example, when a financial asset is reclassified so that it is measured at fair value, its fair value is determined at the reclassification date. Any gain or loss arising from a difference between the previous carrying amount and fair value should be recognised in profit or loss of the current period without restating prior periods. [IFRS 9.5.6.2]. Moreover, when a financial asset is reclassified so that it is measured at amortised cost, its fair value at the reclassification date becomes its new gross carrying amount. [IFRS 9.5.6.3]. The effective interest rate is determined on the basis of the fair value of the asset at the date of reclassification. [IFRS 9.B5.6.2]. Below is a table summarising the treatment of financial assets on reclassification. [IFRS 9.5.6.2, IFRS 9.5.6.3, IFRS 9.5.6.4, IFRS 9.5.6.5, IFRS 9.5.6.6, IFRS 9.5.6.7, IFRS 9.B5.6.1, IFRS 9.B5.6.2].

Original classification	New classification	Accounting
Amortised cost	FVTPL	The fair value of the asset is measured at the reclassification date. Any gain or loss arising from a difference between the fair value and the previous amortised cost of the financial asset is recognised in profit or loss.
FVTPL	Amortised cost	The fair value of the asset at the reclassification date is the new gross carrying amount. The EIR is determined on the basis of the fair value at reclassification date and impairment is calculated based on this EIR and as if the date of reclassification date was the date of initial recognition.
Amortised cost	FVOCI	The fair value of the asset is measured at the reclassification date. Any gain or loss arising from a difference between the previous amortised cost and the fair value, is recognised in OCI. The EIR and the measurement of expected credit losses are not adjusted.
FVOCI	Amortised cost	The fair value of the asset at reclassification date is new gross carrying amount. At reclassification date, the cumulative gain or loss previously recognised in OCI is removed from equity and adjusted against the fair value. The EIR and the measurement of expected credit losses are not adjusted.
FVTPL	FVOCI	The asset continues to be carried at fair value. The EIR is determined on the basis of the fair value at reclassification date.
FVOCI	FVTPL	The asset continues to be carried at fair value. At reclassification date, the cumulative gain or loss previously recognised in OCI is reclassified from equity to profit and loss as a reclassification adjustment.

2.8 Financial guarantees and loan commitments

Loan commitments are generally excluded from IFRS 9, with the exception of the impairment requirements and derecognition provisions (see Chapters 47 and 48). However, loan commitments are within the scope of IFRS 9 if they have been designated as financial liabilities at fair value through profit or loss, can be settled net in cash or by delivering or issuing another financial instrument, or if they are commitments to provide a loan at a below-market interest rate (see Chapter 41 for more details on the scoping).

[IFRS 9.2.1(g), IFRS 9.2.3].

Loan commitments that can be settled net in cash or by delivering or issuing another financial instrument are derivatives and are therefore measured at fair value through profit and loss.

Loan commitments issued to provide a loan at a below-market interest rate, and financial guarantees issued, are measured on initial recognition at their (negative) fair value which is generally equal to the premium received where the transaction is undertaken at an arm's length (see Chapter 45). [IFRS 9.2.3(c), IFRS 9.B2.5(a)]. Subsequently these are measured on the statement of financial position at the higher of: [IFRS 9.4.2.1(c), IFRS 9.4.2.1(d)]

- The amount of the loss allowance determined in accordance with the impairment requirements of IFRS 9 (see Chapter 47).

And

- The amount initially recognised less, when appropriate, the cumulative amount of income recognised in accordance with the principles of IFRS 15 *Revenue from Contracts with Customers* (see Chapter 28). Typically, any upfront premium will be amortised over the related guarantee period.

For a financial guarantee contract, this assumes that it did not arise from a failed derecognition transaction (see section 2.9.3 below). [IFRS 9.4.2.1(b), IFRS 9.4.2.1(c)].

While the requirements outlined above address the statement of financial position presentation, the income statement presentation is not specified. For example, it is unclear whether the initial premium received should be recognised as 'revenue' with a separate additional remeasurement for the impairment allowance or whether a single net amount should be presented in the profit and loss account shown in the revenue or impairment line depending on the comparison of the 'higher of' test. There is a further issue of whether any amounts recorded in the impairment line should be restricted to ensure there is no reversal of impairment that would exceed the cumulative impairment losses recorded in prior periods. Due to the lack of guidance in this area, diversity may arise in practice.

For financial guarantees, there were discussions by the IFRS Transition Resource Group for Impairment of Financial Instruments (ITG) on whether future premiums to be received affect the measurement of the expected credit loss (ECL) allowance and this is discussed further at Chapter 47.

The discussions above deal with the accounting implications for the issuer of financial guarantees and loan commitments. There are also accounting implications for the holder to consider. For example, in November 2018 the IFRS IC discussed whether the cash flows expected, in general, from a financial guarantee contract or any other credit enhancement can be included in the measurement of expected credit losses (see Chapter 47). A further issue to consider is how fees paid or received in relation to loan commitments are treated. This is dealt with in more detail below.

Frequently asked questions

Question 2-1: How should fees received (or paid) upfront to secure a loan commitment be accounted for in the Statement of Comprehensive Income?

Fees paid to obtain a loan commitment from an issuer may be paid up-front, over the life of the commitment, or in arrears on the undrawn amount (sometimes called non-utilisation fees). The fees may be paid to obtain a term loan, a line-of-credit, or a revolving debt arrangement.

The accounting treatment of all types of fees received or paid depends on whether:

- It is probable (more likely than not) at inception that the loan commitment will be utilised in whole or in part.
- And
- Once utilised, the loan commitment expires (that is, if the loan is repaid no further amount can be drawn).

Usually, the second criterion is met when the commitment includes a specified repayment schedule. Therefore, this criterion is not met for a revolving debt arrangement or a line-of-credit when the borrower can borrow and repay funds at the borrower's option numerous times during the life of the loan commitment (see Question 2-4 below).

When both criteria above are met, and it is probable that the total loan commitment will be utilised, the fees payable for the loan commitment are recognised by both the issuer and the borrower over the life of the loan using the EIR method. [IFRS 9.B5.4.2(b), IFRS 9.B5.4.3(b)]. As the fees are integral to the EIR they are apportioned consistently with the amounts borrowed and recognised over the resulting loan's expected life using the EIR method (see section 3.1 below). The exception to this is when the borrower or issuer will account for draw downs on the facility at fair value through profit or loss. In this case, the fees would be recognised in profit or loss when the draw down occurs.

Although the guidance in IFRS 9.B5.4.2(b) and IFRS 9.B5.4.3(b) is in the context of the accounting for commitment fees received by the issuer, this guidance can also be applied to the accounting by the borrower. Furthermore, the deferral of the commitment fees paid by the borrower when it is probable there will be a drawdown of a specific loan is also consistent with the definition of an asset in the IASB's *Conceptual Framework* because there are potential economic benefits. [CF 4.3, CF 4.4, CF 4.14, CF 4.16].

Question 2-2: How should fees received (or paid) to secure a loan commitment be accounted for when management initially expects only a portion of the loan commitment to be utilised?

If both criteria outlined in Question 2-1 above have been met for a portion of the loan commitment only, then the fees are apportioned between the amount expected to be utilised, and the amount not expected to be utilised. The fees related to the amount expected to be utilised are recognised over the resulting loans' expected life using the EIR method in line with the reasoning outlined in Question 2-1 above.

[IFRS 9.B5.4.2(b)].

The remaining portion of the fees is expensed by the borrower over the commitment period, for example on a straight-line basis. This is on the basis that the commitment fees paid by the borrower meet the definition of a prepayment made to the lender for liquidity services made available to the borrower.

[IAS 38.70].

The issuer accounts for the remaining portion of the fee income under IFRS 15 as compensation for the service of providing the facility and recognises it when (or as) it fulfils its performance obligation in making the facility available. [IFRS 9.B5.4.3(b)]. This is on the basis, that the issuer has a performance obligation to stand ready to make the facility available to the borrower (i.e., a promise to provide a service of making a certain amount of cash available to the borrower during the commitment period).

[IFRS 15.26(e)]. For each performance obligation identified, it needs to be determined whether it is satisfied over time or at a point in time, and is accounted for accordingly (see Chapter 28). [IFRS 15.32,

IFRS 15.35(a)].

Question 2-3: How should fees received (or paid) to secure a loan commitment be accounted for when management does not expect any of the loan commitment to be utilised?

In line with the reasoning outlined in Question 2-2 above, if management do not expect any of the loan commitment to be utilised, the fees are expensed by the borrower over the commitment period, for example on a straight-line basis. The issuer accounts for the fee income under IFRS 15 as compensation for the service of providing the facility and recognises it when (or as) it fulfils its performance obligation in making the facility available.

Question 2-4: How should fees received (or paid) to secure a loan commitment be accounted for when the loan commitment does not expire after being utilised?

Some loan commitments, once drawn, do not expire. For example, access bond and credit card arrangements normally provide a loan facility which can be drawn down, repaid and then drawn again without any additional commitment fees being charged. When this is the case, the fees are not integral to any particular financial asset or liability resulting from draw downs on the loan commitment, and therefore, are not part of any EIR. Consequently, the fees are expensed by the borrower over the commitment period, for example on a straight-line basis.

The issuer accounts for the fee income under IFRS 15 as compensation for the service of providing the facility and recognises it when (or as) it fulfils its performance obligation in making the facility available (see Chapter 28). [IFRS 15.35(a)].

2.9 Exceptions to the general principles

2.9.1 Hedging relationships

Financial assets and financial liabilities that are designated as hedged items are subject to measurement under the hedge accounting requirements of IFRS 9, or IAS 39 if the entity chooses as its accounting policy to continue to apply the hedge accounting requirements of IAS 39. [IFRS 9.5.2.3, IFRS 9.5.3.2, IFRS 9.5.7.3, IFRS 9.7.2.21].

Furthermore, derivatives and non-derivative debt financial instruments may be designated as hedging instruments which can affect whether fair value or foreign exchange gains and losses are recognised in profit or loss or in other comprehensive income. [IFRS 9.B5.7.2].

Hedge accounting is covered in Chapter 49.

2.9.2 Regular way transactions

Except for its rules on transfers of assets, IFRS 9 requires an entity to recognise a financial asset in its statement of financial position when, and only when, the entity becomes party to the contractual provisions of the instrument and to derecognise a financial asset when, and only when, the contractual rights to the cash flows from the financial asset expire (see Chapter 48). [IFRS 9.3.1.1, IFRS 9.3.2.3]. In other words, IFRS 9 requires a financial asset to be recognised or derecognised on a trade date basis, i.e., the date that an entity commits itself to purchase or sell an asset. [IFRS 9.B3.1.5]. However, the standard permits financial assets subject to so called 'regular way purchase or sale' to be recognised, or derecognised, either as at the trade date or as at the settlement date (see Chapter 45). [IFRS 9.3.1.2, IFRS 9.B3.1.3]. Whichever method is used, it is applied consistently and symmetrically (i.e., to acquisitions and disposals) to each of the main measurement categories of financial asset identified by IFRS 9 (see Chapter 45). [IFRS 9.B3.1.3].

Where settlement date accounting is used for regular way purchases or sales, any change in the fair value of the asset to be received arising between trade date and settlement date is not recognised for those assets that will be measured at amortised cost. For assets that will be recorded at fair value, such changes in value are recognised: [IFRS 9.5.7.4, IFRS 9.B3.1.6]

- In profit or loss for assets classified as measured at fair value through profit or loss
- And
- In other comprehensive income for debt instruments classified, and equity instruments designated, as measured at fair value through other comprehensive income

On disposal, changes in value of such assets between trade date and settlement date are not recognised because the right to changes in fair value ceases on the trade date. [IFRS 9.IG D.2.2]. The accounting for trade date and settlement date accounting on initial recognition, and derecognition, is dealt with in more detail in Chapter 45.

For financial assets measured at amortised cost or at fair value through other comprehensive income, IFRS 9 requires entities to use the trade date as the date of initial recognition for the purposes of applying the impairment requirements. [IFRS 9.5.7.4]. This means that entities that use settlement date accounting may have to recognise a loss allowance for financial assets which they have purchased but not yet recognised and, correspondingly, no loss allowance for assets that they have sold but not yet derecognised (see Chapter 47).

2.9.3 Liabilities arising from failed derecognition transactions

There are special requirements for financial liabilities (including financial guarantee contracts) that arise when transfers of financial assets do not qualify for derecognition, or are accounted for using the continuing involvement approach. [IFRS 9.4.2.1(b)]. These are dealt with in Chapter 48.

3 Amortised cost and the effective interest method

IFRS 9 contains four key definitions relating to measurement at amortised cost, which are set out below:
[IFRS 9 Appendix A]

Extract from IFRS 9

Appendix A

Defined terms

amortised cost of a financial asset or financial liability	The amount at which the financial asset or financial liability is measured at initial recognition minus the principal repayments, plus or minus the cumulative amortisation using the effective interest method of any difference between that initial amount and the maturity amount and, for financial assets, adjusted for any loss allowance .
effective interest method	The method that is used in the calculation of the amortised cost of a financial asset or a financial liability and in the allocation and recognition of the interest revenue or interest expense in profit or loss over the relevant period.
effective interest rate	The rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial asset or financial liability to the gross carrying amount of a financial asset or to the amortised cost of a financial liability . When calculating the effective interest rate, an entity shall estimate the expected cash flows by considering all the contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) but shall not consider the expected credit losses . The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs B5.4.1–B5.4.3), transaction costs , and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the expected life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments).
gross carrying amount of a financial asset	The amortised cost of a financial asset , before adjusting for any loss allowance .

3.1 Effective interest rate (EIR)

For financial assets held at amortised cost, interest revenue is calculated by applying the EIR to the gross carrying amount. When calculating the EIR, an entity should estimate the expected cash flows by considering all the contractual terms of the financial instrument (e.g., prepayment, extension, call and similar options). However, IFRS 9 does not contain clear guidance on how the expected cash flows are estimated when calculating EIR. For example, it is unclear how to reflect conditionality attached to the contractual interest rate in the EIR (see section 3.1.3 below where this has been raised as part of the post implementation review of IFRS 9). The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the EIR, transaction costs, and all other premiums or discounts. [IFRS 9 Appendix A]. Except for purchased or originated financial assets that are credit-impaired on initial recognition, ECLs are not considered in the calculation of the EIR. This is because the recognition of ECLs is separate from the recognition of interest revenue (see Chapter 47). [IFRS 9 Appendix A, IFRS 9.BC25.67].

When applying the effective interest method, an entity generally amortises any fees, points paid or received, transaction costs and other premiums or discounts that are included in the calculation of the EIR over the expected life of the financial instrument. However, there may be situations when discounts or premiums are amortised over a shorter period (see section 3.1.1 below).

Guidance related to what fees should and should not be considered integral is included in IFRS 9. Fees that are an integral part of the EIR of a financial instrument are treated as an adjustment to the EIR, unless the financial instrument is measured at fair value through profit or loss. In those cases, the fees are recognised as revenue or expense when the instrument is initially recognised. [IFRS 9.B5.4.1].

Extract from IFRS 9

B5.4.2 Fees that are an integral part of the effective interest rate of a financial instrument include:

- (a) origination fees received by the entity relating to the creation or acquisition of a financial asset. Such fees may include compensation for activities such as evaluating the borrower's financial condition, evaluating and recording guarantees, collateral and other security arrangements, negotiating the terms of the instrument, preparing and processing documents and closing the transaction. These fees are an integral part of generating an involvement with the resulting financial instrument.
- (b) commitment fees received by the entity to originate a loan when the loan commitment is not measured in accordance with paragraph 4.2.1(a) and it is probable that the entity will enter into a specific lending arrangement. These fees are regarded as compensation for an ongoing involvement with the acquisition of a financial instrument. If the commitment expires without the entity making the loan, the fee is recognised as revenue on expiry.
- (c) origination fees paid on issuing financial liabilities measured at amortised cost. These fees are an integral part of generating an involvement with a financial liability. An entity distinguishes fees and costs that are an integral part of the effective interest rate for the financial liability from origination fees and transaction costs relating to the right to provide services, such as investment management services.

B5.4.3 Fees that are not an integral part of the effective interest rate of a financial instrument and are accounted for in accordance with IFRS 15 include:

- (a) fees charged for servicing a loan;
- (b) commitment fees to originate a loan when the loan commitment is not measured in accordance with paragraph 4.2.1(a) and it is unlikely that a specific lending arrangement will be entered into; and
- (c) loan syndication fees received by an entity that arranges a loan and retains no part of the loan package for itself (or retains a part at the same effective interest rate for comparable risk as other participants).

[IFRS 9.B5.4.2, IFRS 9.B5.4.3].

It is important to note that the EIR is normally based on estimated, not contractual, cash flows and there is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to estimate reliably the cash flows or the expected life of a financial instrument (or group of instruments), the contractual cash flows over the full contractual term of the financial instrument (or group of instruments) should be used. [IFRS 9 Appendix A].

For fair value hedges in which the hedged item is recorded at amortised cost, the adjustment to the hedged item arising from the application of hedge accounting is amortised to profit or loss. This adjustment is based on a recalculated EIR at the date amortisation begins (see Chapter 49).

The application of the effective interest method to floating-rate instruments and inflation-linked debt is considered in more detail in sections 3.3 and 3.6 below.

As set out in Chapter 43, an issued compound financial instrument such as a convertible bond is accounted for as a financial liability component and an equity component. In accounting for the financial liability at amortised cost, the expected cash flows should be those of the liability component only and the estimate should not take account of the bond being converted.

3.1.1 The amortisation period

A key element in the EIR calculation is the determination of the amortisation period. Payments, receipts, discounts and premiums included in the effective interest method calculation are normally amortised over the expected life of the instrument and it will often be acceptable to amortise transaction costs on a straight-line basis over the life of the instrument on a basis of materiality.

However, there may be situations when discounts or premiums are amortised over a shorter period if this is the period to which the fees, points paid or received, transaction costs, premiums or discounts relate. This will be the case when the related variable (e.g., interest rates) to which the fees, points paid or received, transaction costs, premiums or discounts relate is repriced to market rates before the instrument's expected maturity. In such cases, the appropriate amortisation period is to the next repricing date.

[IFRS 9.B5.4.4].

For example, changes in market rates since the floating interest rate was reset to market rates will be amortised to the next date when the interest rate is reset to market rates. This is because the difference relates to the period to the next interest reset date as, at that date, the variable to which the difference relates (i.e., the interest rate) is reset to market rates. If, however, a premium or discount results from a change in the credit spread over the floating-rate specified in the financial instrument, or other variables that are not reset to market rates, it is amortised over the expected life of the instrument. [IFRS 9.B5.4.4].

The following Illustration demonstrates the requirements of applying a discount arising on acquisition of a debt instrument resulting from a credit downgrade.

Illustration 3-1: Effective interest method - amortisation of discount arising from credit downgrade

A twenty-year bond is issued at CU100, has a principal amount of CU100, and requires quarterly interest payments equal to current three-month EURIBOR plus 1% over the life of the instrument. The interest rate reflects the market-based required rate of return associated with the bond issue at issuance. Subsequent to issuance, the credit quality of the bond deteriorates resulting in a rating downgrade. It therefore trades at a discount, although it is assessed not to be credit-impaired (see Chapter 47). Company A purchases the bond for CU95 and classifies it as measured at amortised cost and not determined to be purchased credit-impaired on initial recognition.

The discount of CU5 is amortised to income over the period to the maturity of the bond and not to the next date interest rate payments are reset as it results from a change in credit spreads.¹ This is because it relates to an adjustment for credit quality which is not a variable that reprices to market rates before the expected maturity.

There are financial instruments which pay a fixed or lower rate of interest in an initial period of their life and subsequently convert to a standard variable rate. An issue arises as to whether the EIR should be calculated on a 'blended' basis, so as to obtain a consistent rate of return over the instrument's expected life or whether the initial period and subsequent period of different interest rates should be treated as two discrete periods, such that blending is not necessary.

Previously, under IAS 39, entities were required to calculate the EIR by discounting estimated "future cash payments, or receipts through the expected life of the instrument, or when appropriate, a shorter period". [IAS 39(2017).9]. Whilst IFRS 9 has removed 'when appropriate, a shorter period' in its definition in Appendix A to the standard, it has kept the reference to a 'shorter period' in IFRS 9.B5.4.4. It was, and still is, unclear as to what is meant by 'when appropriate' and this has led to some diversity in practice with some entities applying a blended rate rather than having different EIRs for discrete periods of interest.

Illustration 3-2 and Illustration 3-3 below demonstrates a loan whose interest is partially fixed and partially variable.

Illustration 3-2: Fixed rate mortgage which reprices to market interest rate

Bank E offers fixed-rate mortgages to customers with an initial fixed-rate for a term of 5 years, which is shorter than the overall term of the loan of 25 years. The fixed rate is a market rate at the date of the mortgage offer. After the fixed 5-year term, the initial rate on the loan reverts to a market rate to be determined at that point in time.

How we see it

The change in interest rate is to a current market rate and is made in accordance with the terms of the original instrument.

Consequently, it may be appropriate to treat this as a change in EIR, similar to the repricing of a floating-rate instrument. Therefore, the fixed rate may be applied for the initial 5 years followed by the new market rate when applying the effective interest method.

¹ IAS 39 Implementation Guidance Committee (IGC), Q&A 76-1, July 2001.

Illustration 3-3: Bargain rate mortgage which reprices to market interest rate

Bank F issues the same mortgage as in Illustration 3-2 above, except that the initial fixed rate is determined to be a bargain rate.

How we see it

When the initial rate is a bargain rate, it may be required to calculate a blended rate, so as to obtain a consistent rate of return over the expected life of the mortgage.

The blended rate would be recalculated as and when the estimated future cash flows change.

3.1.2 Purchased or credit-impaired financial assets**Extract from IFRS 9****Appendix A****Defined terms****credit-impaired financial asset**

A financial asset is credit-impaired when one or more events that have a detrimental impact on the estimated future cash flows of that financial asset have occurred. Evidence that a financial asset is credit-impaired include observable data about the following events:

- (a) significant financial difficulty of the issuer or the borrower;
- (b) a breach of contract, such as a default or **past due** event;
- (c) the lender(s) of the borrower, for economic or contractual reasons relating to the borrower's financial difficulty, having granted to the borrower a concession(s) that the lender(s) would not otherwise consider;
- (d) it is becoming probable that the borrower will enter bankruptcy or other financial reorganisation;
- (e) the disappearance of an active market for that financial asset because of financial difficulties; or
- (f) the purchase or origination of a financial asset at a deep discount that reflects the incurred **credit losses**.

It may not be possible to identify a single discrete event - instead, the combined effect of several events may have caused financial assets to become credit-impaired.

purchased or originated credit-impaired financial asset

Purchased or originated financial asset(s) that are **credit-impaired** on initial recognition.

For a purchased or originated credit-impaired financial asset (see Chapter 47), the credit-adjusted EIR is applied when calculating the interest revenue and it is the rate that exactly discounts the estimated future cash payments or receipts through the expected life of the financial asset to the amortised cost of a financial asset. An entity is required to include the initial ECLs in the estimated cash flows when calculating the credit-adjusted EIR for such assets. [IFRS 9.5.4.1(a), IFRS 9.B5.4.7, IFRS 9.Appendix A].

However, this does not mean that a credit-adjusted EIR should be applied solely because the financial asset has high credit risk at initial recognition. Rather, as outlined above, IFRS 9 contains specific definitions outlining the requirements relating to a credit impaired asset. Furthermore, the application guidance explains that a financial asset is only considered credit-impaired at initial recognition when the credit risk is very high or, in the case of a purchase, it is acquired at a deep discount. [IFRS 9.B5.4.7].

For financial assets that are not purchased or originated credit-impaired but have subsequently become credit impaired, interest revenue is calculated by applying the EIR to the *amortised cost* in subsequent reporting periods. [IFRS 9.5.4.1(b)]. In subsequent reporting periods, if the credit quality of the financial asset improves so that the financial asset is no longer credit-impaired and the improvement can be related objectively to the occurrence of an event (such as an improvement in the borrower's credit rating), then on a prospective basis an entity should once again calculate the interest revenue by applying the EIR to the *gross carrying amount* of the financial asset (and there is no catch up of contractual interest that was not recognised while the asset was credit impaired). [IFRS 9.5.4.2].

Frequently asked questions

Question 3-1: Does 'subsequent reporting period' refer only to annual periods or does it also extend to interim reporting periods?

'Reporting period' refers to a period for which financial statements are produced in accordance with IFRS accounting standards. In some instances, the standards specifically refer to 'annual reporting period' (e.g., IFRS 9.7.2.15 and IFRS 9.7.2.33), which indicates that the more general references to 'reporting period' extend beyond annual reporting periods. Paragraph 4 of IAS 34 *Interim Financial Reporting* defines interim period as a 'financial reporting period shorter than a full financial year'. [IAS 34.4].

Therefore, both interim and annual reporting periods for which financial statements are prepared in compliance with IFRS (full or IAS 34) are 'reporting periods'. 'Subsequent reporting period' therefore refers to the next interim or annual reporting period, whichever comes sooner.

In line with the discussions above, it should be noted that if an entity produces quarterly financial statements that are not in compliance with IFRS (full or IAS 34), then the period cannot be considered a 'reporting period'.

Question 3-2: IAS 34.28 requires that the frequency of an entity's reporting shall not affect the measurement of its annual results. If interim reporting periods are 'reporting periods', are the IFRS 9 requirements to give effect to changes between gross and net interest calculation in the 'subsequent reporting period' inconsistent with the requirement in IAS 34.28, and in that case, which standard's guidance should be followed?

There is an internal conflict between the requirements of IFRS 9 and IAS 34.28.

How we see it

In our view, in the absence of further clarity, the specific requirements in IFRS 9 to give effect to changes between the gross and net interest calculation in the 'subsequent reporting period' take precedence over the more general requirements of IAS 34.28 that the frequency of an entity's reporting shall not affect the measurement of its annual results.

Question 3-3: Are entities allowed to perform the impairment assessments, with the resulting changes to the interest calculation, more frequently than their interim reporting periods, for example, monthly?

The IASB believes that, conceptually, the credit impairment of financial assets should be assessed on an ongoing basis, thus altering the interest revenue determination as the underlying economics change. However, it was noted that such an approach would be unduly onerous for preparers. Therefore, the IASB introduced a practical expedient that the assessment of whether a financial asset is credit impaired be required at the reporting date, with changes in the interest calculation effected from the beginning of the following reporting period. [IFRS 9.BC5.78]. This seems to prevent entities from having to update their staging and interest calculations on an ongoing basis. However, if entities voluntarily perform their staging assessment, and changes to interest calculations, more frequently than their reporting periods, this is not contrary to the objectives of IFRS 9, provided that the approach is applied consistently.

How we see it

An entity may assess whether a financial asset has become (or ceased to be) credit impaired more frequently than at its reporting dates. If it does so, any resulting changes between gross and net interest income presentation will occur more frequently than its next reporting period. The timing of these assessments is an accounting policy choice and should be evenly spaced and consistently applied.

For further guidance on 'reporting period' in the context of reclassifications of financial assets and hedge accounting, see Chapter 44 and Chapter 49, respectively.

See Chapter 47 for a more detailed discussion on the application of the EIR to credit impaired assets.

3.1.3 Post implementation review

The post implementation review (PIR) of the classification and measurement requirements of IFRS 9 was completed in 2022. In December 2022, the IASB issued a report² containing feedback from the classification and measurement PIR and concluded the requirements are working as intended, however they noted that clarification was needed in certain areas to improve the understandability of the requirements.

In particular, the feedback on the EIR method highlighted that respondents found the following as the most challenging and interpretive areas:

- How to reflect conditions that are attached to the contractual interest rate in the EIR i.e., what expectations or uncertainties to consider in calculating the EIR and how to reflect conditionality. For example, how to treat an adjustment to the contractual interest rate based on the borrower's performance in meeting sustainability linked targets.

And

- How to account for subsequent changes in estimates of future cash flows.

A related challenge is identifying when subsequent changes to estimated contractual cash flows are accounted for under IFRS 9.B5.4.5 because the change relates to a change in a floating market rate of interest. The alternative is that the change would be accounted for by applying IFRS 9.B5.4.6 such that the carrying value is updated for the present value of the revised estimated contractual cash discounted at the original EIR, which remains unchanged.

Other areas that the Board will consider developing clarifications and further explanations on are the following:

- The meaning of a 'floating rate' financial instrument and whether this refers to the overall contractual rate or only a component thereof
- The meaning of 'movements in market rates' and whether this includes contractually specified adjustments to the contractual interest rate

And

- The effect modifications have on determining the EIR

In response to the above, the IASB added the "Amortised Cost Measurement" project to its research pipeline in July 2022 and moved the project to a research work plan in September 2024. The project will aim to clarify, through targeted improvements, the requirements for applying the effective interest rate method and the requirements for modification, derecognition and write-off of financial instruments. As discussed in Chapter 47, the IASB has also completed its PIR of the impairment requirements in IFRS 9. In July 2024, the IASB published the project summary and feedback statement, in which the IASB concluded that the impairment requirements are working as intended, however decided to add to the Amortised Cost Measurement project a topic on the interaction between the impairment requirements and the requirements for modification and write-off of financial assets.³

In February 2025, the IASB determined the objectives, scope and timeline of the project.⁴ The scope is split into two themes, being i) changes in expected cash flows that affect the EIR (both at initial recognition and subsequent measurement), and ii) changes in expected cash flows that affect the carrying amount. The first theme will cover determining the EIR when there are conditions attached to contractual cash flows, accounting for subsequent changes in estimated cash flows and the effect of modifications on EIR. The second theme will explore what constitutes a 'modification', assess which modifications lead to derecognition and will compare partial derecognition versus modifications of financial instruments accounting, as well as explore the boundaries between modifications, derecognition and impairment, amongst other topics. See section 3.8.4 below for further details. In June 2025, the IASB decided to move the Amortised Cost Measurement project to the standard-setting work plan.⁵ Deliberations on the first theme began in Q2 2025 and Q3 2025 and those on the second theme are planned to begin in Q4 2025 and Q1 2026.

3.2 Fixed interest rate instruments

The effective interest method is most easily applied to instruments that have fixed payments and a fixed term. The following Illustrations, adapted from the Implementation Guidance to the IFRS accounting standard, explain this. [IFRS 9.IG B.26, IFRS 9.IG B.27].

Illustration 3-4: Effective interest method - amortisation of premium or discount on acquisition

At the start of 20X1, a company purchases a debt instrument with five years remaining to maturity for its fair value of CU1,000 (including transaction costs). The instrument has a principal amount of CU1,250 and carries fixed interest of 4.7% payable annually ($\text{CU1,250} \times 4.7\% = \text{CU59}$ per year). In order to allocate interest receipts and the initial discount over the term of the instrument at a constant rate on the carrying amount, it can be shown that interest needs to be accrued at the rate of 10% annually. In each period, the amortised cost at the beginning of the period is multiplied by the EIR of 10% and added to the gross carrying amount. Any cash payments in the period are deducted from the resulting balance.

The table below provides information about the gross carrying amount, interest income, and cash flows of the debt instrument in each reporting period: [IFRS 9.IG B.26]

	(a)	(b = a × 10%)	(c)	(d = a + b - c)
	Gross carrying amount at the start of the year	Interest income	Cash flows	Gross carrying amount at the end of the year
Year	(CU)	(CU)	(CU)	(CU)
20X1	1,000	100	59	1,041
20X2	1,041	104	59	1,086
20X3	1,086	109	59	1,136
20X4	1,136	113	59	1,190
20X5	1,190	119	1,250 + 59	-

Illustration 3-5: Effective interest method - stepped interest rates

On 1 January 20X1, Company A issues a debt instrument for a price of CU1,250 (including transaction costs). The principal amount is CU1,250 which is repayable on 31 December 20X5. The rate of interest is specified in the debt agreement as a percentage of the principal amount as follows: 6% in 20X1 (CU75), 8% in 20X2 (CU100), 10% in 20X3 (CU125), 12% in 20X4 (CU150) and 16.4% in 20X5 (CU205). It can be shown that the interest rate that exactly discounts the stream of future cash payments to maturity is 10%. In each period, the amortised cost at the beginning of the period is multiplied by the EIR of 10% and added to the gross carrying amount. Any cash payments in the period are deducted from the resulting balance. Accordingly, the gross carrying amount, interest income and cash flows of the debt instrument in each period are as follows: [IFRS 9.IG B.27]

	(a)	(b = a × 10%)	(c)	(d = a + b - c)
	Gross carrying amount at the start of the year	Interest income	Cash flows	Gross carrying amount at the end of the year
Year	(CU)	(CU)	(CU)	(CU)
20X1	1,250	125	75	1,300
20X2	1,300	130	100	1,330
20X3	1,330	133	125	1,338
20X4	1,338	134	150	1,322
20X5	1,322	133	1,250 + 205	-

It can be seen that, although the instrument is issued for CU1,250 and has a maturity amount of CU1,250, its gross carrying amount (i.e., the amortised cost) does not equal CU1,250 at each reporting date.

Methods for determining the EIR for a given set of cash flows (as in the Illustrations above) include simple trial and error techniques as well as more methodical iterative algorithms. Alternatively, many spreadsheet applications contain goal-seek or similar functions that can also be used to derive EIRs.

3.3 Floating interest rate instruments

In most cases, a floating rate will be specified as a benchmark rate, such as EURIBOR or SONIA, plus (or for a very highly rated borrower, less) a fixed credit spread. Hence it might be more accurate to say that the rate has a floating component and a fixed component. But it is also possible for the credit spread to be periodically reset to a market rate. Neither 'floating-rate' nor 'market rates of interest' are defined in the standard. However, the IFRS IC noted in its January 2016 agenda decision on separation of an embedded floor from a floating rate host contract that the term 'market rate of interest' is linked to the concept of fair value as defined in IFRS 13 and is described in IAS 39.AG64 as the rate of interest for a similar instrument (similar as to currency, term, type of interest rate and other factors) with a similar credit rating (or the equivalent in IFRS 9.B5.1.1).⁶ This implies that the market rate of interest may include the credit spread appropriate for the transaction and not just the benchmark component of the rate.

For floating-rate instruments, the periodic re-estimation of cash flows to reflect the movements in the market interest rates alters the EIR. The standard goes on to explain that where a floating rate financial asset or a floating-rate financial liability is initially recognised at an amount equal to the principal receivable or repayable on maturity, re-estimating the future interest payments normally has no significant effect on the carrying amount of the asset or the liability. [IFRS 9.B5.4.5]. This is normally interpreted to mean that entities should simply account for periodic floating-rate payments on an accrual basis in the period they are earned. An alternative treatment would consist of calculating the EIR based on a market-derived yield curve applicable for the entire life of the instrument. Applying this alternative approach, the calculated EIR is applied until estimated future cash flows are revised, at which point a new EIR is calculated based on the revised cash flow expectations and the current carrying amount. This more complicated treatment is explained in the following Illustration in which it is assumed that the instrument meets the criteria for measurement at amortised cost under IFRS 9. This is in line with the IFRS IC's discussion on inflation-linked instruments in May 2008 (see section 3.6 below). Any proposed change in the use of either approach described above, would need to be assessed against the requirements of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* to determine whether this would represent a change in estimate or change in accounting policy. For more details see Chapter 3.

Illustration 3-6: Effective interest method - variable rate loan

At the start of July 20X1, Company G originates a floating-rate debt instrument. Its fair value is equal to its principal amount of CU1,000 and no transaction costs are incurred. The instrument pays, in arrears at the end of June, a variable rate coupon, determined by reference to 12-month EURIBOR at the start of each previous July. It has a term of five years and is repayable at its principal amount at the end of June 20X6.

On origination, 12-month EURIBOR is 5% and this establishes the first payment, to be made in June 20X2, at CU50. Based on a market-derived yield curve, G estimates that the subsequent floating-rate payments will be CU60, CU70, CU80 and CU90 (the yield curve rises steeply). It can be demonstrated that the interest rate that exactly discounts these estimated coupon payments and the CU1,000 principal at maturity to the current carrying amount of CU1,000 is 6.87%. This would be the EIR for the debt instrument. The EIR is recalculated as and when the estimated future cash flows change.

In the context of applying IFRS 9.B5.4.5, principal is understood to be the fair value of the financial instrument at initial recognition, and importantly that the principal amount may change over the life of the instrument (for example, if there are repayments of principal) (see Chapter 44). [IFRS 9.B4.1.7B]. This would mean that floating rate financial instruments where there are repayments over the life, for example a floating rate loan with capital repayments required over the life, would still fall into the scope of IFRS 9.B5.4.5.

⁶ [IFRIC Update](#), January 2016, available on the IFRS Foundation's website.

3.4 Prepayment, call and similar options

When calculating the EIR, all contractual terms of the financial instrument, for example prepayment, call and similar options, should be taken into account in the estimate of expected cash flows. [IFRS 9 Appendix A]. This assumes that the presence of such contractual terms does not cause the contractual cash flow characteristics test to fail, i.e., the contractual terms of the debt instrument give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding (see Chapter 44). The following simple Illustration shows how this principle is applied.

Illustration 3-7: Effective interest rate - embedded prepayment options

Bank ABC originates 1,000 ten-year loans of CU10,000 with 10% stated interest, prepayable at par. Prepayments are probable and it is possible to reasonably estimate their timing and amount. ABC determines that the EIR including loan origination fees received by ABC is 10.2% based on the contractual payment terms of the loans as the fees received reduce the initial carrying amount.

However, if the *expected* prepayments were considered, the EIR would be 10.4% since the difference between the initial amount and maturity amount is amortised over a shorter period.

The EIR that should be used by ABC for the loans in this portfolio is 10.4%.⁷

If a hybrid contract contains a host that is a liability within the scope of IFRS 9, any embedded derivative (e.g., a prepayment option) that is separated from the host must be accounted for as a derivative (see Chapter 42). [IFRS 9.4.3.3]. Once separated, the embedded derivative should not be taken into account in applying the effective interest method of the host. However, if the embedded derivative is closely related and not separated from the host instrument, entities that measure the whole instrument at amortised cost must apply the effective interest method inclusive of the embedded derivative to determine the amount of interest to be recognised in profit or loss for each period (see Chapter 42).

3.4.1 Revisions to estimated cash flows

The standard contains an explanation of how changes to estimates of payments or receipts (e.g., because of a reassessment of the extent to which prepayments will occur) should be dealt with.

When there is a change in estimates of payments or receipts, excluding changes in estimates of ECLs, the gross carrying amount of the financial asset or amortised cost of a financial liability (or group of instruments) should be adjusted to reflect actual and revised estimated cash flows. More precisely, the gross carrying amount of the financial asset or amortised cost of the financial liability should be recalculated by computing the present value of estimated future contractual cash flows that are discounted at the financial instrument's original EIR. Any consequent adjustment should be recognised immediately in profit or loss. [IFRS 9.B5.4.6].

The revision of estimates is demonstrated in the following Illustration adapted from the Implementation Guidance to the IFRS accounting standard. [IFRS 9.IG B.26].

⁷ IAS 39 Implementation Guidance Committee (IGC), Q&A 10-19, July 2001.

Illustration 3-8: Effective interest method - revision of estimates

At the start of 20X1, a company purchases in a quoted market a debt instrument with five years remaining to maturity for its fair value of CU1,000 (including transaction costs). The instrument has a principal amount of CU1,250 and carries fixed interest of 4.7% payable annually ($\text{CU1,250} \times 4.7\% = \text{CU59}$ per year). In order to allocate interest receipts and the initial discount over the term of the instrument at a constant rate on the carrying amount, it can be shown that interest needs to be accrued at the rate of 10% annually. In each period, the amortised cost at the beginning of the period is multiplied by the EIR of 10% and added to the gross carrying amount. Any cash payments in the period are deducted from the resulting balance.

In effect, this instrument has the same terms as the instrument in Illustration 3-4 in section 3.2 above, except that the contract also specifies that the borrower has an option to prepay the instrument and that no penalty will be charged for prepayment (i.e., any prepayment will be made at the principal amount of CU1,250 or a proportion thereof).

At inception, there is an expectation that the borrower will not prepay and so the information about the instrument's EIR, gross carrying amount, interest income and cash flows in each reporting period would be the same as that in Illustration 3-4 above. The table is repeated below and provides information about the gross carrying amount, interest income, and cash flows of the debt instrument in each reporting period.

	(a)	(b = a × 10%)	(c)	(d = a + b - c)
	Gross carrying amount at the start of the year	Interest income	Cash flows	Gross carrying amount at the end of the year
Year	(CU)	(CU)	(CU)	(CU)
20X1	1,000	100	59	1,041
20X2	1,041	104	59	1,086
20X3	1,086	109	59	1,136
20X4	1,136	113	59	1,190
20X5	1,190	119	1,250 + 59	-

On the first day of 20X3, the investor revises its estimate of cash flows. It now expects that 50% of the principal will be prepaid at the end of 20X3 and the remaining 50% at the end of 20X5. Therefore, the opening balance of the debt instrument in 20X3 is adjusted to an amount calculated by discounting the amounts expected to be received in 20X3 and subsequent years using the original EIR (10%). This results in a revised balance of CU1,138. The adjustment of CU52 ($\text{CU1,138} - \text{CU1,086}$) is recorded in profit or loss in 20X3.

The table below provides information about the gross carrying amount, interest income and cash flows as they would be adjusted taking into account this change in estimate.

	(a)	(b = a × 10%)	(c)	(d = a + b - c)
	Gross carrying amount at start of year	Interest and similar income	Cash flows	Gross carrying amount at end of year
Year	(CU)	(CU)	(CU)	(CU)
20X1	1,000	100	59	1,041
20X2	1,041	104	59	1,086
20X3	1,086 + 52	114	625 + 59	568
20X4	568	57	30	595
20X5	595	60	625 + 30	-

This above calculation would be applicable whether the instruments were classified as measured at amortised cost or fair value through other comprehensive income under IFRS 9.

The standard and its related guidance do not state whether the catch-up adjustment in the Illustration above (CU52 in 20X3 in this case) should be classified as interest income or as some other income or expense, simply that it should be recognised in profit or loss.

This Illustration assumes that the prepayment option does not cause the debt financial asset to fail to comply with the amortised cost classification criteria. For this to be the case, the fair value of the prepayment feature on initial recognition would have to be insignificant. [IFRS 9.4.1.2(b), IFRS 9.B4.1.12].

3.5 Perpetual debt instruments

Accounting for perpetual debt instruments is discussed in Chapter 43. The fact that an instrument is perpetual does not change how the gross carrying amount is calculated. The present value of the perpetual stream of future cash payments, discounted at the EIR, equals the gross carrying amount in each period. [IFRS 9.IG B.24].

However, in cases where interest is only paid over a limited amount of time, some or all the interest payments are, from an economic perspective, repayments of the gross carrying amount, as illustrated in the following Illustration. [IFRS 9.IG B.25].

Illustration 3-9: Amortised cost - perpetual debt with interest payments over a limited amount of time

On 1 January 20X1, Company A subscribes CU1,000 for a perpetual debt instrument which yields 25% interest for the first five years and 0% in subsequent periods. The instrument is classified as measured at amortised cost. It can be determined that the effective yield is 7.93% and the gross carrying amount is shown in the table below.

	(a)	(b = a × 7.93%)	(c)	(d = a + b - c)
	Gross carrying amount at the start of the year	Interest income	Cash flows	Gross carrying amount at the end of the year
Year	(CU)	(CU)	(CU)	(CU)
20X1	1,000	79	250	829
20X2	829	66	250	645
20X3	645	51	250	446
20X4	446	36	250	232
20X5	232	18	250	-
20X6	-	-	-	-

3.6 Inflation-linked debt instruments

As noted in Chapter 42, the issue of debt instruments whose cash flows are linked to changes in an inflation index is quite common. IFRS 9 often allows inflation-linked financial assets to be recorded at amortised cost or at fair value through other comprehensive income, as shown in Chapter 44. Entities that record these instruments at amortised cost must apply the effective interest method to determine the amount of interest to be recognised in profit or loss for each period. In May 2008, the IFRS IC was asked to consider a request for guidance on this issue. The key issue is whether the changes in the cash flows on inflation-linked debt are equivalent to a repricing to the market rate and, therefore, inflation-linked debt can be treated as a floating rate instrument. Three ways of applying the effective interest method that were being used in practice were included in the request. These are summarised in the following Illustration that has been revised to reflect the requirements in IFRS 9 instead of IAS 39.⁸

⁸ [IFRIC Update](#), July 2008, available on the IFRS Foundation's website.

Illustration 3-10: Application of the effective interest method to inflation-linked debt instruments

On 1 January 20X1, Company A issues a debt instrument for CU100,000 that is linked to the local Consumer Prices Index (CPI). The terms of the instrument require it to be repaid in full after five years at an amount equal to CU100,000 adjusted by the cumulative change in the CPI over those five years. Interest on the loan is paid at each year end at an amount equal to 5% of the principal (CU100,000) adjusted by the cumulative change in the CPI from issuance of the instrument. For IFRS 9 purposes, it is assumed that the debt instrument is not held for trading or designated at fair value through profit or loss and thereby, the debt instrument is classified as subsequently measured at amortised cost.

The following table sets out the expected annual inflation rates on issuance of the instrument and one year later:

Expected annual inflation rates		
	At start of 20X1	At start of 20X2
20X1	0.7%	1.2%
20X2	2.6%	1.4%
20X3	2.8%	1.9%
20X4	2.8%	3.5%
20X5	2.8%	3.5%

During 20X1, actual inflation is 1.2%.

Approach 1 - application of IFRS 9.B5.4.6 (or the previous IAS 39.AG8 approach)

This approach follows the requirements set out in section 3.4.1 above. As outlined below, it does not view the debt as a floating-rate instrument and so calculates a fixed EIR. This is established on 1 January 20X1 based on expected cash flows at that time:

Date: end of	Expected cash flow	Calculation
	(CU)	
20X1	5,035	$=5,000 \times 1.007$
20X2	5,166	$=5,000 \times 1.007 \times 1.026$
20X3	5,311	$=5,000 \times 1.007 \times 1.026 \times 1.028$
20X4	5,459	$=5,000 \times 1.007 \times 1.026 \times 1.028 \times 1.028$
20X5	117,854	$=105,000 \times 1.007 \times 1.026 \times 1.028 \times 1.028 \times 1.028$

It can be demonstrated that these expected cash flows produce an EIR of 7.4075%, i.e., the net present value of these cash flows, discounted at 7.4075%, equals CU100,000.

During 20X1, A applies the EIR to the financial liability to recognise an interest expense of CU7,408 ($\text{CU}100,000 \times 7.4075\%$), increasing the carrying amount of the financial liability to CU107,408 ($\text{CU}100,000 + \text{CU}7,408$). At the end of the year, A pays cash interest of CU5,060 ($\text{CU}5,000 \times 101.2\%$) reducing the liability to CU102,348 ($\text{CU}107,408 - \text{CU}5,060$). In addition, A must adjust the carrying amount of the financial liability so that it equals the net present value of expected future cash flows discounted at the original expected interest rate as determined based on original expectations.

The expected future cash flows are now as follows:

Date: end of	Cash flow	Calculation
	(CU)	
20X2	5,131	$=5,000 \times 1.012 \times 1.014$
20X3	5,228	$=5,000 \times 1.012 \times 1.014 \times 1.019$
20X4	5,411	$=5,000 \times 1.012 \times 1.014 \times 1.019 \times 1.035$
20X5	117,615	$=105,000 \times 1.012 \times 1.014 \times 1.019 \times 1.035 \times 1.035$

The net present value of these cash flows discounted at 7.4075% is CU102,050. Therefore, A recognises a gain as a result of the revision of estimated cash flows in profit and loss of CU298 ($\text{CU}102,050 - \text{CU}102,348$).

Approach 2 - application of IFRS 9.B5.4.5 using forecast future cash flows (or the previous IAS 39 AG7 approach)

This approach is referred to in section 3.3 above for simple floating-rate instruments. In outline, it calculates a floating-rate EIR based on current market expectations of future inflation.

The initial EIR is calculated and applied in the same way as Approach 1. However, no adjustment is made to the carrying amount of the financial liability at the end of 20X1 of CU102,348 or to the interest expense for 20X1 CU7,408 ($\text{CU}100,000 \times 7.4075\%$) as a result of A revising its expectations about inflation over the remaining term of the instrument at the start of 20X1.

Instead, a revised EIR is calculated at the start of 20X2 using the revised forecast cash flows (shown above under Approach 1, i.e., CU5,131 at the end of 20X2, CU5,228 at the end of 20X3, CU5,411 at the end of 20X4 and CU117,615 at the end of 20X5) and the current carrying amount (CU102,348). It can be demonstrated that this produces a revised EIR of 7.3236%, i.e., the net present value of those cash flows, discounted at 7.3236% equals CU102,348.

Applying this revised rate prospectively in 20X2 (and assuming estimates of future inflation are not revised again until the start of 20X3) there will be interest expense for 20X2 of CU7,496 ($\text{CU}102,348 \times 7.3236\%$).

Approach 3 - application of IFRS 9 B5.4.5 without forecasting future cash flows

This method is based on the traditional approach of accounting for floating-rate debt instruments and is commonly used under other bodies of GAAP. Rather than taking account of expectations of future inflation it takes account of inflation only during the reporting period.

Therefore, in 20X1, A would recognise interest expense of CU5,060 ($\text{CU}100,000 \times 5\% \times 1.012$) as a result of accruing the variable interest payment in respect of 20X1. In addition, the actual inflation experienced during 20X1 increases the amount of principal that will be paid from CU100,000 to CU101,200 ($\text{CU}100,000 \times 1.012\%$). This increase, i.e., CU1,200, is effectively a premium to be paid on the redemption of the financial liability. IFRS 9 explains that a premium should normally be amortised over the expected life of an instrument. However, it goes on to explain that a shorter period should be used if this is the period to which the premium relates. [IFRS 9.B5.4.4]. In this case, the premium clearly relates to 20X1 as it arises from inflation during that year and so it is appropriately amortised in that year.

Consequently, the total interest expense for 20X1 using this approach would be CU6,260 ($\text{CU}5,060 + \text{CU}1,200$).

In analysing the submission, it initially appeared as if the IFRS IC staff completely rejected Approach 3. The submission argued that Approach 3 was justified by reference to IAS 29 *Financial Reporting in Hyperinflationary Economies*. The staff concluded that it was inappropriate to apply IAS 29 because that standard applies only to the financial statements of an entity whose functional currency is the currency of a hyperinflationary economy and instead the guidance in IAS 39 should be applied.

However, in their final rejection notice the IFRS IC noted that IAS 39.AG6 to AG8 provide the relevant application guidance and that judgement is required to determine whether an instrument is floating-rate and within the scope of IAS 39.AG7 or is within the scope of IAS 39.AG8.⁹ Further, it was noted that IAS 39 was unclear as to whether future expectations about interest rates (and presumably, therefore, inflation) should be taken into account when applying IAS 39.AG7. This would appear to suggest that all three approaches noted in the Illustration would be consistent with the requirements of IAS 39 and therefore, since the requirements are unchanged, of IFRS 9. Any proposed change in the approach used by an entity would need to be assessed against the requirements of IAS 8 to determine whether this would represent a change in estimate or change in accounting policy. For more details see Chapter 3.

3.7 Financial liabilities

3.7.1 Amortised cost financial liabilities with embedded features

Under IFRS 9, most complex financial assets are accounted for at fair value through profit or loss. The treatment of financial liabilities is, however, unchanged from that under IAS 39. The application of the effective interest method to liabilities with embedded derivatives that are deemed closely related to the host, or other embedded features not deemed to meet the definition of a derivative, is not always straightforward or intuitive. Specifically, it is not always clear how to deal with changes in the estimated cash flows of the instrument and in any given situation one needs to assess which is the most appropriate approach:

- The general requirements for changes in cash flows set out in IFRS 9.B5.4.6, equivalent to the previous IAS 39 AG8 approach, assuming a fixed original EIR (see section 3.4.1 above).
- Or
- Specific requirements for floating-rate instruments under IFRS 9.B5.4.5, equivalent to the previous IAS 39 AG7 approach (see section 3.3 above).

⁹ [IFRIC Update](#), July 2008, available on the IFRS Foundation's website.

To illustrate the differences between the two approaches, consider an entity that issues a debt instrument for its par value of CU10m which is repayable in ten years' time on which an annual coupon is payable comprising two elements: a fixed amount of 2.5% of the par value and a variable amount equating to 0.01% of the entity's annual revenues. The instrument is not designated at fair value through profit or loss and it is judged that the embedded feature is not a derivative as outlined in Chapter 42.

The requirements under IFRS 9.B5.4.5 and IFRS 9.B5.4.6 could give rise to significantly different accounting treatments. In the latter case, the issuer would need to estimate the amount of payments to be made over the life of the bond (which will depend on its estimated revenues for the next ten years) in order to determine the EIR to be applied. Any changes to these estimates would result in a catch-up adjustment, based on the rate as estimated on origination, to profit or loss and the carrying amount of the bond which, potentially, could give rise to significant volatility. In the former case the annual coupon would simply be accrued each year and changes in estimated revenues of future periods would have no impact on the accounting treatment until the applicable year.

In 2009, the IFRS IC was asked for guidance on how an issuer should account for a financial liability that contains participation rights by which the instrument holder shares in the net income and losses of the issuer. The holder receives a percentage of the issuer's net income and is allocated a proportional share of the issuer's losses. Losses are applied to the nominal value of the instrument to be repaid on maturity. Losses allocated to the holder in one period can be offset by profits in subsequent periods. The submission was asking how the issuer should account for such instruments in periods in which the issuer records a loss and allocates a portion of that loss to the participating financial instruments. Two possible views were submitted to IFRS IC:

- In the first view the requirements in IAS 39.AG8 (equivalent to IFRS 9.B5.4.6) do not apply. Rather, the requirements for derecognition should be applied and a gain equal to the allocated loss should be recognised in the current period (with an offsetting reduction in the carrying amount of the instrument).
- In a second view, the requirements in IAS 39.AG8 (equivalent to IFRS 9.B5.4.6) apply. Current period losses are one factor that the issuer would consider when it evaluates whether it needs to revise its estimated future cash flows and adjust the carrying amount of the participating financial instrument.

The IFRS IC noted that IAS 39.AG6 and AG8 (equivalent to IFRS 9.B5.4.4. and IFRS 9.B5.4.6) provide the relevant application guidance for measuring financial liabilities at amortised cost using the EIR method. The IFRS IC also noted that it was inappropriate to analogise to the derecognition guidance in IAS 39 because the liability has not been extinguished. Therefore, a gain equal to the allocated loss should not be recognised in the current period. Rather, current period losses should be considered together with further expectations when the issuer evaluates the need to revise its estimated future cash flows and adjust the carrying amount of the participating financial instrument.

It should be noted that the IFRS IC considered the issue without reconsidering the assumptions described in the request, namely that the financial liability: (a) did not contain any embedded derivatives, (b) was measured at amortised cost using the effective interest method, and (c) did not meet the definition of a floating-rate instrument.¹⁰

How we see it

In these situations, we believe that it would often be inappropriate to apply the requirements under IFRS 9.B5.4.5, principally because the entity's revenue does not represent a floating-rate that changes to reflect movements in market rates of interest. However, IFRS 9 does not contain clear guidance on how the expected cash flows are estimated when calculating EIR. Consequently, the EIR should be determined by estimating what the resultant cashflows will be. This may involve the use of judgement or assumptions based on the latest available, reliable information. The expected cash flows could be estimated using the most likely outcome method or a probability-weighted approach. The estimation technique used should remain consistent, unless there are changes in the circumstances on which the accounting estimate was based or as a result of new information, new developments or more experience.

¹⁰ [IFRIC Update](#), May 2009, available on the IFRS Foundation's website.

In determining which estimation technique to use (i.e., the most likely outcome or a probability-weighted method), an entity could consider the principles in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* for determining a best estimate, see Chapter 27, as well as the principles in IFRIC 23 *Uncertainty over Income Tax Treatments* which requires an entity to use whichever method better predicts the resolution of the uncertainty, see Chapter 29.

There are some financial liabilities for which re-estimation of cash flows will only reflect movements in market interest rates but for which the use of IFRS 9.B5.4.5 would, arguably, not be appropriate. An example would be an 'inverse floater', on which coupons are paid at a fixed-rate minus EURIBOR (subject to a floor of zero).

For some financial liabilities, it might be considered appropriate to apply a combination of both the IFRS 9.B5.4.5 and IFRS 9.B5.4.6 approaches. An example would be the situation outlined above where the liability contains participation features, together with a floating rate element. In these situations, the EIR would be a combination of the current floating rate and initial expected revenue assumptions.

IFRS 9.B5.4.6. would be applied to the revision of expected revenues, but the remainder of the interest coupon would be the floating-rate (also see section 3.3 above and section 3.8.1 below where further situations are outlined where a combination of both the IFRS 9.B5.4.5 and IFRS 9.B5.4.6 would be required).

In addition to determining whether IFRS 9.B5.4.5 or IFRS 9.B5.4.6 is applicable, there are further complexities involving the estimation of the expected cash flows both initially, and if required, on revision of the cashflows. There are also complications when distinguishing between a partial derecognition and a modification, and accounting for fees and costs as a result of modifying the original contract. To a large extent these complexities were raised as part of IFRS 9 PIR (see section 3.8.4 below).
