According to IAS 23, borrowing costs are “interest and other costs that an entity incurs in connection with the borrowing of funds”. [IAS 23.5, IAS 23.6]. Interest expense arising from customer contracts with a significant financing component might qualify as borrowing costs eligible for capitalisation if they are directly attributable to the acquisition, construction or production of a qualifying asset (see the discussion in Chapter 28).

Treatment of borrowing costs incurred by an operator in a service concession arrangement will depend on the accounting model used by the operator in accordance with IFRIC 12 *Service Concession Arrangements*, see the discussions in Chapter 26.

4.2 Other finance costs

IAS 23 does not address many of the ways in which an entity could finance its operations or other finance costs that it might incur. For example, the standard does not address any of the following:

- The many derivative financial instruments such as interest rate swaps, floors, caps and collars that are commonly used to manage interest rate risk on borrowings
- Gains and losses on derecognition of borrowings, for example early settlement of directly attributable borrowings that have been renegotiated prior to completion of an asset in the course of construction
And
- Dividends payable on shares classified as financial liabilities (such as certain redeemable preference shares)

The eligibility of these other finance costs for capitalisation under IAS 23 is discussed in section 5.5 below.

IAS 23 does not preclude the classification of costs, other than those it identifies, as borrowing costs. However, they must meet the basic criterion in the standard, i.e., that they are costs that are directly attributable to the acquisition, construction or production of a qualifying asset, which would, therefore, preclude treating the unwinding of discounts as borrowing costs.

Many of the effects of the unwinding of discounts are treated as finance costs in profit or loss. These include discounts relating to various provisions such as those for onerous contracts and decommissioning costs. These finance costs will not be borrowing costs under IAS 23 because they do not arise in respect of funds borrowed by the entity that can be attributed to a qualifying asset. Therefore, they cannot be capitalised.

5 Borrowing costs eligible for capitalisation

5.1 Directly attributable borrowing costs

Borrowing costs are eligible for capitalisation as part of the cost of an asset if they are directly attributable to the acquisition, construction or production of a qualifying asset, when it is probable that such costs will result in future economic benefits to the entity and the costs can be measured reliably. [IAS 23.8, IAS 23.9].

IAS 23 starts from the premise that borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset are those that would have been avoided if the expenditure on the qualifying asset had not been made. [IAS 23.10]. Recognising that it might not always be easy to identify a direct relationship between particular borrowings and a qualifying asset and to determine the borrowings that could otherwise have been avoided, the standard includes separate requirements for specific borrowings and general borrowings (see sections 5.2 and 5.3, respectively, below).

5.2 Specific borrowings

When an entity borrows funds specifically to obtain a particular qualifying asset, the borrowing costs that are directly related to that qualifying asset can be readily identified. The borrowing costs eligible for capitalisation would be the actual borrowing costs incurred on that specific borrowing during the period.

[IAS 23.10, IAS 23.12].

Entities frequently borrow funds in advance of expenditure on qualifying assets and could temporarily invest the borrowings. The standard makes it clear that any investment income earned on the temporary investment of those borrowings needs to be deducted from the borrowing costs incurred and only the net amount capitalised (see Illustration 5-2 below). [IAS 23.12, IAS 23.13].

How we see it

There is no restriction in IAS 23 on the type of investment in which the funds can be invested but, in our view, to maintain the conclusion that the funds are specific borrowings, the investment must be of a nature that does not expose the principal amount to the risk of not being recovered. The riskier the investment, the greater is the likelihood that the borrowing is not specific to the qualifying asset. If the investment returns a loss rather than income, such losses are not added to the borrowing costs to be capitalised.

5.3 General borrowings

IAS 23 concedes that there could be practical difficulties in identifying a direct relationship between particular borrowings and a qualifying asset and in determining the borrowings that could otherwise have been avoided. [IAS 23.11].

This could be the case, for example, if the financing activity of an entity is co-ordinated centrally, with borrowings arranged to meet its funding requirements as a whole, the construction of the qualifying asset is therefore financed out of general borrowings.

Other circumstances that might cause difficulties are identified by the standard as follows:

- A group has a treasury function that uses a range of debt instruments to borrow funds at varying rates of interest and lends those funds on various bases to other entities in the group.
- Or
- Loans are denominated in or linked to foreign currencies and the group operates in highly inflationary economies or there are fluctuations in exchange rates. [IAS 23.11].

In these circumstances, determining the amount of borrowing costs that are directly attributable to the acquisition of a qualifying asset could be difficult and require judgement. [IAS 23.11].

When general borrowings are used in part to obtain a qualifying asset, IAS 23 requires the application of a capitalisation rate to the expenditure on that qualifying asset in determining the amount of borrowing costs eligible for capitalisation. However, the amount of borrowing costs capitalised during a period cannot exceed the amount of borrowing costs incurred during that period. [IAS 23.14].

The capitalisation rate applied is the weighted average of the borrowing costs applicable to all borrowings of the entity that are outstanding during the period, excluding borrowing costs applicable to borrowings made specifically for the purpose of obtaining a qualifying asset until substantially all the activities necessary to prepare that asset for its intended use or sale are complete (see section 5.3.1.A below). [IAS 23.14]. The capitalisation rate is then applied to the expenditure on the qualifying asset. The capitalisation rate is discussed further in section 5.3.2 below.

Expenditure on a qualifying asset includes only that expenditure resulting in the payment of cash, the transfer of other assets or the assumption of interest-bearing liabilities. Such expenditure must be reduced by any progress payments and grants received in connection with the asset (see IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* and Chapter 25). The standard accepts that, when funds are borrowed generally, the average carrying amount of the asset during a period, including borrowing costs previously capitalised, is normally a reasonable approximation of the expenditure to which the capitalisation rate is applied in that period. [IAS 23.18].

In contrast to investment income earned on specific borrowings (see section 5.2 above), the standard does not provide specific guidance regarding interest income earned from temporarily investing excess general funds.

How we see it

We believe that any interest income earned from temporarily investing excess general funds is unlikely to be directly attributable to the acquisition or construction of a qualifying asset. In addition, the capitalisation rate required by IAS 23 focuses on the borrowings of the entity outstanding during the period of construction or acquisition and does not include temporary investments. As such, borrowing costs capitalised must not be reduced by interest income earned from the investment of general borrowings nor can such income be included in determining the appropriate capitalisation rate.

In some circumstances, it is appropriate for all borrowings made by the group (i.e., borrowings of the parent and its subsidiaries) to be taken into account in determining the weighted average of the borrowing costs. In other circumstances, it is appropriate for each subsidiary to use a weighted average of the borrowing costs applicable to its own borrowings. [IAS 23.15]. It is likely that this will largely be determined by the extent to which borrowings are made centrally (and, perhaps, interest expenses met in the same way) and passed through to individual group companies via intercompany accounts and intra-group loans.

5.3.1 Definition of general borrowings

5.3.1.A Borrowing costs on borrowings related to completed qualifying assets

As noted in section 5.3 above, determining general borrowings will not always be straightforward and, as a result, the determination of the amount of borrowing costs that are directly attributable to the acquisition of a qualifying asset could be difficult and judgement is required.

The question has arisen as to whether a specific borrowing undertaken to obtain a qualifying asset ever changes its nature into a general borrowing. Historically, different views existed as to whether or not borrowings change their nature throughout the period they are outstanding. Some considered that once the asset for which the borrowing was incurred has been completed, and the entity chooses to use its funds on constructing other assets rather than repaying the loan, this changes the nature of the loan into a general borrowing. However, to the extent that the contract links the repayment of the loan to specific proceeds generated by the entity, its nature as a specific borrowing would be preserved. Others took the view that once the borrowing has been classified as specific, its nature does not change while it remains outstanding.

To address this diversity in practice, the IASB amended the relevant part of IAS 23.14 to read as follows (emphasis added):

“The capitalisation rate shall be the weighted average of the borrowing costs applicable to *all* borrowings of the entity that are outstanding during the period. *However, an entity shall exclude from this calculation borrowing costs applicable to borrowings made specifically for the purpose of obtaining a qualifying asset until substantially all the activities necessary to prepare that asset for its intended use or sale are complete.*”⁵

⁵ Annual Improvements to IFRS Standards 2015-2017 Cycle, IASB, December 2017, p15.

The IASB concluded that the reference to “borrowings made specifically for the purpose of obtaining a qualifying asset” in IAS 23.14 prior to the amendment should not apply to a borrowing originally made specifically to obtain a qualifying asset if that qualifying asset is now ready for its intended use or sale. [IAS 23.BC14B].

The IASB observed that IAS 23.8 requires an entity to capitalise borrowing costs directly attributable to the acquisition, construction or production of a qualifying asset as part of the cost of that asset. [IAS 23.8]. Paragraph 10 of IAS 23 states that borrowing costs are directly attributable to a qualifying asset if those borrowing costs would have been avoided had the expenditure of the qualifying asset not been made. [IAS 23.10]. In other words, an entity could have repaid that borrowing if the expenditure on the qualifying asset had not been made. Accordingly, IAS 23.14 requires an entity to use all outstanding borrowings in determining the capitalisation rate, except those made specifically to obtain a qualifying asset not yet ready for its intended use or sale. [IAS 23.14, IAS 23.BC14C].

The IASB concluded that if a specific borrowing remains outstanding after the related qualifying asset is ready for its intended use or sale, it becomes part of the funds an entity borrows generally. Accordingly, the IASB amended IAS 23.14 as described above, to clarify this requirement. [IAS 23.BC14D].

Refer also to further discussion in section 6.3 below to determine when all the activities necessary to prepare the qualifying asset for its intended use or sale are ‘substantially’ complete.

5.3.1.B General borrowings related to specific non-qualifying assets

Prior to amendments referred to in section 5.3.1.A above, another question arose regarding the treatment of general borrowings used to purchase a specific asset other than a qualifying asset for the purpose of capitalising borrowing costs in accordance with IAS 23.

In July 2009, the IFRS IC noted that because IAS 23.14 prior to the amendment refers only to qualifying assets:

- Some conclude that borrowings related to specific assets other than qualifying assets cannot be excluded from determining the capitalisation rate for general borrowings.
And
- Others note the general principle in IAS 23.10 that the borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset are borrowing costs that would have been avoided if the expenditure on the qualifying asset had not been made.⁶

The IASB subsequently considered the issue of whether debt incurred specifically to acquire a non-qualifying asset could be excluded from general borrowings and noted that IAS 23 excludes only debt used to acquire qualifying assets from the determination of the capitalisation rate.⁷

Consequently, in June 2017, the IFRS IC recommended, and the IASB subsequently agreed, to clarify this issue when finalising the amendments to IAS 23.14 discussed in section 5.3.1.A above.⁸ As a result, the IASB clarified that an entity includes funds borrowed specifically to obtain an asset other than a qualifying asset as part of general borrowings. As described in section 5.3.1.A above, the amendments to IAS 23.14 referring to ‘all’ borrowings clarify the requirements in this respect. [IAS 23.BC14E].

5.3.2 Calculation of capitalisation rate

As the standard acknowledges that determining general borrowings will not always be straightforward, it will be necessary to exercise judgement to meet the main objective, i.e., a reasonable measure of the directly attributable finance costs.

Illustration 5-1 below sets out the practical application of the method of calculating the amount of finance costs to be capitalised:

⁶ [IFRIC Update](#), July 2009, available on the IFRS Foundation’s website.

⁷ [IASB Update](#), July 2009, available on the IFRS Foundation’s website.

⁸ [IFRIC Update](#), June 2017, available on the IFRS Foundation’s website.

Illustration 5-1: Calculation of capitalisation rate (no investment income)

On 1 April 20X2 a company engages in the development of a property, which is expected to take five years to complete, at a cost of CU6,000,000. The statements of financial position at 31 December 20X1 and 31 December 20X2, prior to capitalisation of interest, are as follows:

	31 December 20X1	31 December 20X2
	CU	CU
Development property	-	1,200,000
Other assets	6,000,000	6,000,000
	<u>6,000,000</u>	<u>7,200,000</u>
Loans		
5.5% debenture stock	2,500,000	2,500,000
Bank loan at 6% p.a.	-	1,200,000
Bank loan at 7% p.a.	1,000,000	1,000,000
	<u>3,500,000</u>	<u>4,700,000</u>
Shareholders' equity	<u>2,500,000</u>	<u>2,500,000</u>

The bank loan with an effective interest rate of 6% was drawn down to match the development expenditure on 1 April 20X2, 1 July 20X2 and 1 October 20X2.

Expenditure was incurred on the development as follows:

	CU
1 April 20X2	600,000
1 July 20X2	400,000
1 October 20X2	200,000
	<u>1,200,000</u>

As the bank loan at 6% p.a. is a new borrowing specifically to finance the development, the amount of interest to be capitalised for the year ended 31 December 20X2 would be the amount of interest charged by the bank of CU42,000 ((CU600,000 × 6% × 9/12) + (CU400,000 × 6% × 6/12) + (CU200,000 × 6% × 3/12)).

However, if all the borrowings were general (i.e., the bank loan at 6% was not specific to the development) and would have been avoided but for the development, then the amount of interest to be capitalised would be:

$$\frac{\text{Total interest expense for period}}{\text{Weighted average total borrowings}} \times \text{Development expenditure}$$

Total interest expense for the period:

	CU
CU2,500,000 × 5.5%	137,500
CU1,200,000 (as above)	42,000
CU1,000,000 × 7%	70,000
	<u>249,500</u>

Therefore, the capitalisation rate would be calculated as:

$$\frac{249,500}{3,500,000 + 700,000^*} = 5.94\%$$

* Weighted average amount of total borrowings is computed as the sum of CU3,500,000 (or CU3,500,000 × 12/12) and CU700,000 (or (CU600,000 × 9/12) + (CU400,000 × 6/12) + (CU200,000 × 3/12)).

The capitalisation rate would then be applied to the expenditure on the qualifying asset, resulting in an amount to be capitalised of CU41,580 as follows:

	CU
CU600,000 × 5.94% × 9/12	26,730
CU400,000 × 5.94% × 6/12	11,880
CU200,000 × 5.94% × 3/12	2,970
	<u>41,580</u>

In the Illustration above, all borrowings are at fixed rates of interest and the period of construction extends at least until the end of the period, and the general borrowings have remained unchanged during the year, simplifying the calculation. The same principle is applied if borrowings are at floating rates i.e., only the interest costs incurred during that period, and the weighted average borrowings for that period, will be taken into account.

Note that the company's shareholders' equity (i.e., equity instruments - see further discussion in section 5.5.4 below) cannot be taken into account. All of the outstanding borrowings are presumed to be general borrowings - unless they are specific borrowings used to obtain the same or another qualifying asset not yet ready for its intended use or sale (see discussions in sections 5.3.1.A and 5.3.1.B above).

The above Illustration also assumes that loans are drawn down to match expenditure on the qualifying asset. If, however, a loan is drawn down immediately and investment income is received on the unapplied funds, then the calculation differs from that in Illustration 5-1 above. This is explained further in Illustration 5-2 below.

Illustration 5-2: Calculation of amount to be capitalised - specific borrowings with investment income

On 1 April 20X2 a company engages in the development of a property, which is expected to take five years to complete, at a cost of CU6,000,000. In this scenario, a bank loan of CU6,000,000 with an effective interest rate of 6% was taken out on 31 March 20X2 and fully drawn. The total interest charge for the year ended 31 December 20X2 was consequently CU270,000.

However, investment income was also earned at 3% on the unapplied funds during the period as follows (assume the same timings and expenditures incurred as in Illustration 5-1 above):

	CU
$\text{CU}5,400,000 \times 3\% \times 3/12$	40,500
$\text{CU}5,000,000 \times 3\% \times 3/12$	37,500
$\text{CU}4,800,000 \times 3\% \times 3/12$	36,000
	<u>114,000</u>

Consequently, the amount of interest to be capitalised for the year ended 31 December 20X2 is:

	CU
Total interest charge	270,000
Less: investment income	<u>(114,000)</u>
	<u>156,000</u>

5.3.3 Accrued costs and trade payables

As noted in section 5.3 above, IAS 23 states that expenditure on qualifying assets includes only that expenditure resulting in the payment of cash, the transfer of other assets or the assumption of interest-bearing liabilities. [IAS 23.18]. Therefore, in principle, costs of a qualifying asset that have only been accrued but have not yet been paid in cash must be excluded from the amount on which interest is capitalised, as by definition no interest can have been incurred on an accrued payment. The same principle can be applied to non-interest-bearing liabilities e.g., non-interest-bearing trade payables or retention money that is not payable until the asset is completed.

The effect of applying this principle is often merely to delay the commencement of the capitalisation of interest since the capital expenditure will be included in the calculation once it has been paid in cash. If the time between incurring the cost and cash payment is not that large, the impact of this might not be material.

5.3.4 Assets carried below cost in the statement of financial position

An asset can be recognised in the financial statements during the period of production on a basis other than cost, i.e., it might have been written down below cost as a result of being impaired. An asset is impaired when its carrying amount or expected ultimate cost, including costs to complete and the estimated capitalised interest thereon, exceeds its estimated recoverable amount or net realisable value (see section 6.2.1 below).

The question then arises as to whether the calculation of interest to be capitalised is based on cost or the carrying amount of the impaired asset.

How we see it

We believe that the calculation of interest to be capitalised must be based on the cost as this is the amount that the entity or group has had to finance. In the case of an impaired asset, the continued capitalisation based on the cost of the asset could necessitate a further impairment. Accordingly, although the amount capitalised will be different, this will not affect net profit or loss as this is simply an allocation of costs between finance costs and impairment expense.

5.4 Exchange differences as a borrowing cost

An entity might borrow funds in a currency that is not its functional currency e.g., a US dollar loan financing a development in a company which has the Indian Rupee as its functional currency. This might have been done on the basis that, over the period of the development, the borrowing costs, even after allowing for exchange differences, were expected to be less than the interest cost of an equivalent Rupee loan.

IAS 23 defines borrowing costs as including exchange differences arising from foreign currency borrowings to the extent that they are regarded as an adjustment to interest costs. [IAS 23.6(e)]. The standard does not expand on this point. In January 2008, the IFRS IC considered a request for guidance on the treatment of foreign exchange gains and losses and on the treatment of any derivatives used to hedge such foreign exchange exposures. The IFRS IC noted that the principle set out in IAS 23.8 states “an entity shall capitalise borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset as part of the cost of that asset”. [IAS 23.8]. It also noted that IAS 23.11 states “the determination of the amount of borrowing costs that are directly attributable to the acquisition of a qualifying asset is difficult and the exercise of judgement is required”. [IAS 23.11]. Consequently, how an entity applies IAS 23 to foreign currency borrowings is a matter of accounting policy requiring the exercise of judgement. IAS 1 requires clear disclosure of significant accounting policies and judgements that are relevant to an understanding of the financial statements.

The IFRS IC decided not to add the issue to its agenda because:

- The standard acknowledges that judgement will be required in its application and appropriate disclosure of accounting policies and judgements would provide users with the information they need to understand the financial statements.
- And
- The IASB had considered this issue when revising IAS 23 in 2007 and had decided not to provide any guidance.⁹

How we see it

In our view, as exchange rate movements are partly a function of differential interest rates, in many circumstances the foreign exchange differences on directly attributable borrowings will be an adjustment to interest costs that can meet the definition of borrowing costs. However, care is needed if there are fluctuations in exchange rates that cannot be attributed to interest rate differentials. In such cases, we believe that a practical approach is to limit exchange losses taken as borrowing costs such that the total borrowing costs capitalised do not exceed the amount of borrowing costs that would be incurred on functional currency equivalent borrowings, taking into consideration the corresponding market interest rates and other conditions that existed at inception of the borrowings.

If the approach discussed above is used - if exchange losses taken as borrowing cost has been limited - and the construction of the qualifying asset takes more than one accounting period, there could be situations where in one period only a portion of foreign exchange differences could be capitalised (i.e., discrete period approach). However, in subsequent years, if the borrowings are assessed on a cumulative basis, foreign exchange losses previously expensed might now meet the recognition criteria (i.e., cumulative approach).

How we see it

In our view, whether foreign exchange gains and losses are assessed on a discrete period basis or cumulatively over the construction period as described above, is a matter of accounting policy which must be consistently applied.

⁹ [IFRIC Update](#), January 2008, available on the IFRS Foundation's website.

The impact of the two approaches described above are demonstrated in Illustration 5-3 below.

Illustration 5-3: Foreign exchange differences in more than one period

Method A - The discrete period approach

The amount of foreign exchange differences eligible for capitalisation is determined for each period separately. Foreign exchange losses that did not meet the criteria for capitalisation in previous years are not capitalised in subsequent years.

Method B - The cumulative approach

The borrowing costs to be capitalised are assessed on a cumulative basis based on the cumulative amount of interest expense that would have been incurred had the entity borrowed in its functional currency. The amount of foreign exchange differences capitalised cannot exceed the amount of foreign exchange losses incurred on a cumulative basis at the end of the reporting period. The cumulative approach looks at the construction project as a whole as the unit of account ignoring the occurrence of reporting dates. Consequently, the amount of the foreign exchange differences eligible for capitalisation as an adjustment to the borrowing cost in the period is an estimate, which can change as the exchange rates vary over the construction period.

As discussed above, care is needed if there are fluctuations in exchange rates that cannot be attributed to interest rate differentials. In such cases, a practical approach is to limit exchange losses taken as borrowing costs such that the total borrowing costs capitalised do not exceed the amount of borrowing costs that would be incurred on functional currency equivalent borrowings, taking into consideration the corresponding market interest rates and other conditions that existed at inception of the borrowings. Applying this approach, an illustrative calculation of the amount of foreign exchange differences that might be capitalised under Method A and Method B is set out below.

	Year 1	Year 2	Total
	CU	CU	CU
Interest expense in foreign currency (A)	25,000	25,000	50,000
Hypothetical interest expense in functional currency (B)	30,000	30,000	60,000
Foreign exchange loss (C)	6,000	3,000	9,000
Method A - Discrete Approach			
Foreign exchange loss capitalised - lower of C and (B minus A)	5,000	3,000	8,000
Foreign exchange loss expensed	1,000	-	1,000
Method B - Cumulative Approach			
Foreign exchange loss capitalised	†5,000	*4,000	9,000
Foreign exchange loss expensed	1,000	(1,000)	-

† Lower of C and (B minus A) in Year 1.

* Lower of C and (B minus A) in total across the two years. In this Illustration this represents the sum of the foreign exchange loss of CU3,000 capitalised using the discrete approach plus the CU1,000 not capitalised in year 1.

In line with the agenda decision discussed above, IAS 1 *Presentation of Financial Statements* requires clear disclosure of significant accounting policies and judgements that are relevant to an understanding of the financial statements (see section 7.2 below).

5.5 Other finance costs as a borrowing cost

5.5.1 Derivative financial instruments

The most straightforward and commonly encountered derivative financial instrument used to manage interest rate risk is a floating to fixed interest rate swap, as explained in the following Illustration.

Illustration 5-4: Floating to fixed interest rate swap

Entity A has borrowed CU4 million for five years at a floating interest rate to fund the construction of a building. In order to hedge the cash flow interest rate risk arising from these borrowings, Entity A has entered into a matching pay-fixed receive-floating interest rate swap, based on the same underlying nominal sum and duration as the original borrowing, that effectively converts the interest on the borrowings to fixed rate. The net effect of the periodic cash settlements resulting from the hedged item and hedging instruments is as if Entity A had borrowed CU4 million at a fixed rate of interest.

These instruments are not addressed in IAS 23. IFRS 9 *Financial Instruments* sets out the basis on which such instruments are recognised and measured. See Chapter 49 regarding how to account for effective hedges and the conditions that these instruments must meet.

An entity might consider that a specific derivative financial instrument, such as an interest rate swap, is directly attributable to the acquisition, construction or production of a qualifying asset. If the instrument does not meet the conditions for hedge accounting, then the effects on profit or loss will be different from those if it does, and they will also be dissimilar from year to year. What is the impact of the derivative on borrowing costs eligible for capitalisation? In particular, does the accounting treatment of the derivative financial instrument affect the amount available for capitalisation? If hedge accounting is not adopted, does this affect the amount available for capitalisation?

The following Illustration highlights the potential implication of these questions.

Illustration 5-5: Cash flow hedge of variable-rate debt using an interest rate swap

Entity A is constructing a building and expects it to take 18 months to complete. To finance the construction, on 1 January 20X1 the entity issues an eighteen-month, CU20,000,000 variable-rate note payable, due on 30 June 20X2 at a floating rate of interest plus a margin of 1%. At that date the market rate of interest is 8%. Interest payment dates and interest rate reset dates occur on 1 January and 1 July until maturity. The principal is due at maturity. On 1 January 20X1, the entity also enters into an eighteen-month interest rate swap with a notional amount of CU10,000,000 from which it will receive periodic payments at the floating rate and make periodic payments at a fixed rate of 9%, with settlement and rate reset dates every 30 June and 31 December. The fair value of the swap is zero at inception.

On 1 January 20X1, the debt is recorded at CU20,000,000. No entry is required for the swap on that date because its fair value was zero at inception.

During the eighteen-month period, floating interest rates change as follows:

	Floating rate	Rate paid by Entity A on note payable
Period to 30 June 20X1	8%	9%
Period to 31 Dec 20X1	8.5%	9.5%
Period to 30 June 20X2	9.75%	10.75%

Under the interest rate swap, Entity A receives interest at the market floating rate as above and pays interest at 9% on the nominal amount of CU10,000,000 throughout the period. Note that this Illustration excludes the effect of issue costs and discounting. In addition, it is assumed that, if Entity A is entitled to, and applies, hedge accounting, there will be no ineffectiveness.

At 31 December 20X1, the swap has a fair value of CU37,500, reflecting the fact that it is now in the money as Entity A is expected to receive a net cash inflow of this amount in the period until the instrument is terminated. There are no further changes in interest rates prior to the maturity of the swap and the fair value of the swap declines to zero at 30 June 20X2.

The cash flows incurred by the entity on its borrowing and interest rate swap are as follows:

	Cash payments		
	Interest on principal	Interest rate swap (net)	Total
	CU	CU	CU
30 June 20X1	900,000	50,000	950,000
31 Dec 20X1	950,000	25,000	975,000
30 June 20X2	1,075,000	(37,500)	1,037,500
Total	2,925,000	37,500	2,962,500

There are a number of different ways in which Entity A could calculate the borrowing costs eligible for capitalisation, including the following:

- (i) The interest rate swap meets the conditions for, and entity A applies, hedge accounting. The finance costs eligible for capitalisation as borrowing costs will be CU1,925,000 in the year to 31 December 20X1 and CU1,037,500 in the period ended 30 June 20X2.
- (ii) Entity A does not apply hedge accounting. Therefore, it will reflect the fair value of the swap in profit or loss in the year ended 31 December 20X1, reducing the net finance costs by CU37,500 to CU1,887,500 and increasing the finance costs by an equivalent amount for the 6 months to 30 June 20X2 to CU1,075,000. Under this method, it will not be appropriate to reflect the cash payments received in 20X2 for the settlement of the fair value of the swap in the borrowing costs eligible for capitalisation in the period ended 30 June 20X2 because the fair value of the swap is recognised in the income statement and already reflected in the amount of borrowing costs capitalised in 20X1.

However, if Entity A considers that it is inappropriate to reflect the fair value of the swap in borrowing costs eligible for capitalisation, it capitalises costs based on the net cash cost on an accrual accounting basis. In this case this will give the same result as in (i) above.

- (iii) Entity A does not apply hedge accounting and considers only the costs incurred on the borrowing, not the interest rate swap, as eligible for capitalisation. The borrowing costs eligible for capitalisation would be CU1,850,000 in 20X1 and CU1,075,000 in 20X2.

How we see it

In our view, all the methods explained in the Illustration above are valid interpretations of IAS 23; however, the preparer will need to consider the most appropriate method in the particular circumstances after taking into consideration the discussion below. It is important to note that IAS 1 requires clear disclosure of significant accounting policies and judgements that are relevant to an understanding of the financial statements (see section 7.2 below).

If using method (ii), it is necessary to demonstrate that the gains or losses on the derivative financial instrument are directly attributable to the construction of a qualifying asset. In making this assessment it is necessary to consider the term of the derivative and this method might not be appropriate if the derivative has a different term to the underlying directly attributable borrowing. If the entity is not hedge accounting for the derivative financial instrument but considers its fair value movement to be directly attributable to the construction of a qualifying asset, then it will have to consider whether part of such fair value movement of the derivative relates to a period after the construction is completed and, therefore, excludes this part of the fair value movement when determining the borrowing costs eligible for capitalisation.

Based on the facts in the Illustration above, and assuming that entering into the derivative financial instrument is considered to be related to the borrowing activities of the entity, method (iii) might not be an appropriate method to use because it appears to be inconsistent with the underlying principle of IAS 23 that the costs eligible for capitalisation are those costs that would have been avoided if the expenditure on the qualifying asset had not been made. [IAS 23.10]. However, method (iii) could be an appropriate method to use in certain circumstances where it is not possible to demonstrate that the gains or losses on a specific derivative financial instrument are directly attributable to a particular qualifying asset, rather than being used by the entity to manage its interest rate exposure on a more general basis.

Note that the discussions above mainly relate to derivative financial instruments entered into to manage the interest rate risk on specific borrowings.

How we see it

In our view, the same methods and considerations can be applied when determining the borrowing costs eligible for capitalisation when derivative financial instruments were entered into to manage the interest rate risk in relation to general borrowings.

Note also that method (i) appears to be permitted under US GAAP for fair value hedges. IAS 23 makes reference in its Basis for Conclusions that, under US GAAP, derivative gains and losses (arising from the effective portion of a derivative instrument that qualifies as a fair value hedge) are considered to be part of the capitalised interest cost. IAS 23 does not address such derivative gains and losses. [IAS 23.BC21].

Whichever policy is chosen by an entity, it needs to be consistently applied in similar situations.

5.5.2 Gains and losses on derecognition of borrowings

If an entity repays borrowings early, in whole or in part, then it could recognise a gain or loss on the early settlement. Such gains or losses include amounts attributable to expected future interest rates; in other words, the settlement includes an estimated prepayment of the future cash flows under the instrument. The gain or loss is a function of relative interest rates and how the interest rate of the instrument differs from current and anticipated future interest rates. There might be circumstances in which a loan is repaid while the qualifying asset is still under construction. IAS 23 does not address this issue.

IFRS 9 requires that gains and losses on extinguishment of debt must be recognised in profit or loss (see Chapter 48).

How we see it

In our view, gains and losses on derecognition of borrowings are not eligible for capitalisation. It would be extremely difficult to determine an appropriate amount to capitalise and it would be inappropriate thereafter to capitalise any interest amounts (on specific or general borrowings) if doing so would amount to double counting. Decisions to repay borrowings early are not usually directly attributable to the qualifying asset but are attributable to other circumstances of the entity.

The same approach would be applied to gains and losses arising from a refinancing when there is a substantial modification of the terms of borrowings as this is accounted for as an extinguishment of the original financial liability and the recognition of a new financial liability (see Chapter 48).

5.5.3 Gains or losses on termination of derivative financial instruments

If an entity terminates a derivative financial instrument, for example, an interest rate swap, before the end of the term of the instrument, it will usually have to either make or receive a payment, depending on the fair value of the instrument at that time. This fair value is typically based on expected future interest rates; in other words, it is an estimated prepayment of the future cash flows under the instrument.

The treatment of the gain or loss for the purposes of capitalisation will depend on the following:

- The basis on which the entity capitalises the gains and losses associated with derivative financial instruments attributable to qualifying assets (see section 5.5.1 above)

And

- Whether the derivative is associated with a borrowing that has also been terminated

Entities must adopt a treatment that is consistent with their policy for capitalising the gains and losses from derivative financial instruments that are attributable to qualifying assets (see section 5.5.1 above).

The accounting under IFRS 9 will differ depending on whether the instrument has been designated as a hedge or not. Assuming the instrument has been designated as a cash flow hedge and that the borrowing has not also been repaid, the entity will usually maintain the cumulative gain or loss on the hedging instrument, subject to reclassification to profit or loss during the same period that the hedged cash flows affect profit or loss. In such a case, the amounts that are reclassified from other comprehensive income will be eligible for capitalisation for the remainder of the period of construction. On the other hand, if the borrowing has been repaid, the cumulative gain or loss in the cash flow hedge equity reserve will be reclassified immediately to profit or loss but will not be eligible for capitalisation. This aligns to the view that gains and losses on derecognition of borrowings are not eligible for capitalisation (see section 5.5.2 above).

Similarly, assuming the instrument has been designated as a fair value hedge and that the borrowing has not also been repaid, entities would continue to recognise the cumulative gain or loss on the hedging instrument in the carrying amount of the hedged item and this amount would form part of the ongoing determination of amortised cost of the financial liability using the effective interest rate method. Interest expense calculated using the effective interest method is eligible for capitalisation for the remainder of the period of construction (see section 4.1 above).

If the entity has not applied hedge accounting for the derivative financial instrument and the borrowing has not also been repaid, but the entity considers it to be directly attributable to the construction of the qualifying asset then it will have to consider whether part of the gain or loss relates to a period after construction is complete.

If the underlying borrowing is also terminated then the gain or loss will not be capitalised and the treatment will mirror that applied on derecognition of the borrowing, as described in section 5.5.2 above.

5.5.4 Dividends payable on shares classified as financial liabilities

An entity might finance its operations in whole or in part by the issue of preference or other types of shares and in some circumstances, these will be classified as financial liabilities (see Chapter 43). In some circumstances, the dividends payable on these instruments would meet the definition of borrowing costs. For example, an entity might have funded the development of a qualifying asset by issuing preference shares that are classified as financial liabilities under IAS 32 (see Chapter 43). In this case, the 'dividends' would be treated as interest and meet the definition of borrowing costs and so must be capitalised following the principles on specific borrowings discussed in section 5.2 above.

Companies with outstanding preference shares which are treated as liabilities under IAS 32 might subsequently obtain a qualifying asset. In such cases, these preference share liabilities would be considered to be part of the company's general borrowings. The related 'dividends' would meet the definition of borrowing costs and could be capitalised following the principles on general borrowings discussed in section 5.3 above - i.e., that they are directly attributable to a qualifying asset.

Capitalisation of dividends or other payments made in respect of any instruments that are classified as equity in accordance with IAS 32 is not appropriate as these instruments would not meet the definition of financial liabilities. In addition, the actual or imputed cost of equity, including preferred capital not classified as a liability is specifically scoped out of IAS 23 as described in section 2.2 above. [IAS 23.3].

5.6 Capitalisation of borrowing costs in hyperinflationary economies

In situations where IAS 29 *Financial Reporting in Hyperinflationary Economies* applies, an entity needs to distinguish between borrowing costs that compensate for inflation and those incurred in order to acquire or construct a qualifying asset. [IAS 29.21].

Extract from IAS 29

- | | |
|----|---|
| 21 | The impact of inflation is usually recognised in borrowing costs. It is not appropriate both to restate the capital expenditure financed by borrowing and to capitalise that part of the borrowing costs that compensates for the inflation during the same period. This part of the borrowing costs is recognised as an expense in the period in which the costs are incurred. |
|----|---|

Accordingly, IAS 23 specifies that when an entity applies IAS 29, the borrowing costs that can be capitalised must be restricted and the entity must expense the part of borrowing costs that compensates for inflation during the same period in accordance with IAS 29.21 (as described above). [IAS 23.9].

For detailed discussion and requirements of IAS 29, see Chapter 17.

5.7 Group considerations

5.7.1 Borrowings in one company and development in another

A question that can arise in practice is whether it is appropriate to capitalise interest in the group financial statements on borrowings that appear in the financial statements of a different group entity from that carrying out the development.

How we see it

Based on the underlying principle of IAS 23, capitalisation of interest in the group financial statements in circumstances described above would only be appropriate if the amount capitalised fairly reflected the interest cost of the group on borrowings from third parties that could have been avoided if the expenditure on the qualifying asset were not made.

Although it would be appropriate to capitalise interest in the group financial statements, the entity carrying out the development must not capitalise any interest if it has no borrowings in its own financial statements. If, however, the entity has intra-group borrowings or other external borrowings then interest on such borrowings would be capitalised in its own financial statements.

5.7.2 Qualifying assets held by joint arrangements

A number of sectors carry out developments through joint arrangements (see Chapter 13) - this is particularly common with property developments. In such cases, the joint arrangement might be financed principally by equity and the joint operators or joint venturers might have financed their participation in this equity through borrowings.

In situations where the joint arrangement is classified as a joint venture in accordance with IFRS 11 *Joint Arrangements*, it is not appropriate to capitalise interest in the joint venture on the borrowings of the venturers as the interest charge is not a cost of the joint venture. Neither would it be appropriate to capitalise interest in the financial statements of the venturers, whether separate or consolidated financial statements, because the qualifying asset does not belong to them. The investing entities have an investment in a financial asset (i.e., an equity accounted investment), which is excluded by IAS 23 from being a qualifying asset (see section 3.3 above).

In situations where loans and borrowings exist between the reporting entity and a joint venture, see discussion in Chapter 12.

In situations where the joint arrangement is classified as a joint operation in accordance with IFRS 11 and the operators are accounting for their own share of the assets, liabilities, revenue and expenses of the joint operation, then the operators must capitalise borrowing costs incurred that relate to their share of any qualifying asset. Borrowing costs eligible for capitalisation would be based on the operator's obligation for the loans of the joint operation together with any direct borrowings of the operator itself if the operator funds part of the acquisition of the joint operation's qualifying asset.

6 Commencement, suspension and cessation of capitalisation

6.1 Commencement of capitalisation

IAS 23 identifies several conditions that must be met before an entity can begin to capitalise eligible borrowing cost. These conditions are set out below: [IAS 23.17]

Extract from IAS 23

- 17** An entity shall begin capitalising borrowing costs as part of the cost of a qualifying asset on the commencement date. The commencement date for capitalisation is the date when the entity first meets all of the following conditions:
- (a) it incurs expenditures for the asset;
 - (b) it incurs borrowing costs; and
 - (c) it undertakes activities that are necessary to prepare the asset for its intended use or sale.

The standard is explicit that only the expenditure on a qualifying asset that has resulted in payments of cash, transfers of other assets or the assumption of interest-bearing liabilities, is included in determining borrowing costs (see section 5.3.3 above). Such expenditure must be reduced by any progress payments and grants received in connection with the asset (see section 5.3 above). [IAS 23.18].

The activities necessary to prepare an asset for its intended use or sale can include more than the physical construction of the asset. Necessary activities can start before the commencement of physical construction and include, for example, technical and administrative work such as the activities associated with obtaining permits prior to the commencement of the physical construction. [IAS 23.19]. However, this does not mean that borrowing costs can be capitalised if the permits that are necessary for the construction are not expected to be obtained. Consistent with the general principle in capitalisation and recognition of an asset, borrowing costs are capitalised as part of the cost of an asset when it is probable that they will result in future economic benefits to the entity and the costs can be measured reliably. [IAS 23.9].

How we see it

In assessing whether borrowing costs can be capitalised in advance of obtaining permits - assuming the borrowing costs otherwise meet the criteria - a judgement must be made, at the date the expenditure is incurred, as to whether it is sufficiently probable that the relevant permits will be granted.

In line with the discussion above, if during the application and approval process of such permits it is no longer expected that the necessary permits will be granted, capitalisation of borrowing costs must cease, and accordingly, the carrying amount of any related qualifying asset subject to development or redevelopment, including any related borrowing costs that were previously capitalised, (or, if appropriate, the cash generating unit where such an asset belongs) will be tested for impairment, where applicable (see section 6.2.1 below).

Borrowing costs cannot be capitalised during a period in which there are no activities that change the condition of the asset. For example, a house-builder or property developer would not capitalise borrowing costs on its 'land bank' i.e., that land which is held for future development. Borrowing costs incurred while land is under development are capitalised during the period in which activities related to the development are being undertaken. However, borrowing costs incurred while land acquired for building purposes is held without any associated development activity represent a holding cost of the land. Such costs do not qualify for capitalisation and hence would be considered a period cost (i.e., expensed as incurred). [IAS 23.19].

An entity might make a payment to a third-party contractor before that contractor commences construction activities. It is unlikely to be appropriate to capitalise borrowing costs in such a situation until the contractor commences activities that are necessary to prepare the asset for its intended use or sale. However, that would not preclude the payment being classified as a prepayment until such time as construction activities commence.

In its accounting policy, Fresnillo plc describes the period during which borrowing costs are capitalised, as well as noting that it uses either an actual rate or a weighted average cost of borrowings.

Practical example 6-1: Fresnillo plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial Statements [extract]

Notes to the consolidated financial statements [extract]

2. Significant accounting policies [extract]

(s) Borrowing costs

Borrowing costs directly attributable to the acquisition, construction or production of an asset that necessarily takes 12 or more months to get ready for its intended use or sale (a qualifying asset) are capitalised as part of the cost of the respective asset. Borrowing costs consist of interest and other costs that an entity incurs in connection with the borrowing of funds.

Where funds are borrowed specifically to finance a project, the amount capitalised represents the actual borrowing costs incurred. Where surplus funds are available for a short term from funds borrowed specifically to finance a project, the income generated from the temporary investment of such amounts is also capitalised and deducted from the total capitalised borrowing cost. Where the funds used to finance a project form part of general borrowings, the amount capitalised is calculated using a weighted average of rates applicable to relevant general borrowings of the Group during the period.

All other borrowing costs are recognised in the income statement in the period in which they are incurred.

6.1.1 Expenditures on a qualifying asset

In June 2018, the IFRS IC discussed a request it received about the amount of borrowing costs eligible for capitalisation when an entity uses general borrowings to obtain a qualifying asset. In the fact pattern described in the request:

- An entity constructs a qualifying asset
 - The entity has no borrowings at the start of the construction of the qualifying asset
 - Partway through construction, it borrows funds generally and uses them to finance the construction of the qualifying asset
- And
- The entity incurs expenditures on the qualifying asset both before and after it incurs borrowing costs on the general borrowings

The request asked whether an entity includes expenditures on a qualifying asset incurred before obtaining general borrowings in determining the amount of borrowing costs eligible for capitalisation.

The IFRS IC observed that an entity applies IAS 23.17 to determine the commencement date for capitalising borrowing costs. This paragraph requires an entity to begin capitalising borrowing costs when it meets all of the following conditions:

- It incurs expenditures for the asset
 - It incurs borrowing costs
- And
- It undertakes activities that are necessary to prepare the asset for its intended use or sale (see also section 6.1 above) [IAS 23.17]

Applying IAS 23.17 to the fact pattern described in the request, the entity would not begin capitalising borrowing costs until it incurs borrowing costs.¹⁰ [IAS 23.17].

Once the entity incurs borrowing costs and therefore satisfies all the three conditions in IAS 23.17 as described above, it then applies IAS 23.14 (see section 5.3 above) to determine the expenditures on the qualifying asset to which it applies the capitalisation rate. [IAS 23.17, IAS 23.14]. The IFRS IC observed that in doing so the entity does not disregard expenditures on the qualifying asset incurred before it obtains the general borrowings.

In September 2018, the IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for an entity to determine the amount of borrowing costs eligible for capitalisation in the fact pattern described in the request. Consequently, the IFRS IC decided not to add this matter to its standard-setting agenda.¹¹

¹⁰ [IFRIC Update](#), June 2018, available on the IFRS Foundation's website.

¹¹ [IFRIC Update](#), September 2018, available on the IFRS Foundation's website.

Illustration 6-1 sets out the application of the principles described above.

Illustration 6-1: Expenditures on a qualifying asset before general borrowings are obtained

Construction on Entity A's building begins on 1 January 20X1 and ends on 30 June 20X2. The building meets the definition of a qualifying asset. Entity A incurs the following expenditures on constructing the building:

	CU
1 January 20X1	250,000
30 June 20X1	450,000
31 December 20X1	480,000
	<u>1,180,000</u>
31 May 20X2	120,000
	<u>1,300,000</u>

On 1 July 20X1, Entity A issues three-years corporate bonds of CU1,500,000 with interest payable annually at 3.5% every 30 June. The bonds form part of Entity A's general borrowings. A portion of the proceeds is used to finance the construction of the qualifying asset. Entity A had no general or specific borrowings before 1 July 20X1 and did not incur any borrowing costs before that date.

Using the information above, Entity A incurred CU700,000 of expenditure before obtaining general borrowings on 1 July 20X1 and another CU600,000 of expenditure after that date.

Applying IAS 23.17, Entity A begins to capitalise borrowing costs only after it has obtained the general borrowings, i.e., only when it starts incurring borrowing costs (see section 6.1 above). Entity A does not capitalise borrowing costs before 1 July 20X1 (the day it issues the bonds) even though it has undertaken activities necessary to prepare the asset for its intended use or sale and has incurred expenditures for the asset before that date. This is because it did not incur any borrowing costs before 1 July 20X1.

Since Entity A has no other borrowings, the capitalisation rate is 3.5%. The capitalisation rate is applied to the expenditure on the qualifying asset, resulting in an amount eligible for capitalisation of CU12,250 for the year ending 31 December 20X1. This is computed as follows:

	CU
$\text{CU}250,000 \times 3.5\% \times 6/12$	4,375
$\text{CU}450,000 \times 3.5\% \times 6/12$	7,875
$\text{CU}480,000 \times 3.5\% \times 0/12$	-
	<u>12,250</u>

In the table above, Entity A does not disregard expenditures on the qualifying asset incurred before it obtained the general borrowings. However, since Entity A cannot capitalise borrowing costs before 1 July 20X1 (the day it started incurring borrowing costs), the eligible capitalisation period runs from 1 July 20X1 to 31 December 20X1 for the CU700,000 of expenditure incurred before 1 July 20X1.

The accumulated expenditure as at beginning of 20X2 is CU1,180,000 and the building construction is completed on 30 June 20X2. Accordingly, the amount eligible for capitalisation for the year ending 31 December 20X2 is computed as follows:

	CU
$\text{CU}1,180,000 \times 3.5\% \times 6/12$	20,650
$\text{CU}120,000 \times 3.5\% \times 1/12$	350
	<u>21,000</u>

6.2 Suspension of capitalisation

An entity might incur borrowing costs during an extended period in which it suspends the activities necessary to prepare an asset for its intended use or sale. In such a case, IAS 23 states that capitalisation of borrowing costs must be suspended during extended periods in which active development is interrupted. [IAS 23.20, IAS 23.21]. Such costs are costs of holding partially completed assets and do not qualify for capitalisation. However, the standard distinguishes between extended periods of interruption (when capitalisation would be suspended) and periods of temporary delay that are a necessary part of preparing the asset for its intended purpose (when capitalisation is not normally suspended). [IAS 23.21].

An entity does not normally suspend capitalising borrowing costs during a period when it carries out substantial technical and administrative work. Also, capitalising borrowing costs would not be suspended when a temporary delay is a necessary part of the process of getting an asset ready for its intended use or sale. For example, capitalisation would continue during the extended period in a situation where construction of a bridge is delayed by temporary adverse weather conditions or high water levels, if such conditions are common during the construction period in the geographical region involved. [IAS 23.21]. Similarly, capitalisation continues during periods when inventory is undergoing slow transformation - the example is given of inventories taking an extended time to mature (presumably such products as Scotch whisky or Cognac, although the relevance of this might be limited as these products are likely to meet the optional exemption for 'routinely manufactured' products - see section 3.1 above).

Borrowing costs incurred during extended periods of interruption caused, for example, by a lack of funding or a strategic decision to hold back project developments during a period of economic downturn are not considered a necessary part of preparing the asset for its intended purpose and must not be capitalised.

Other circumstances might not be as straightforward as the examples described above.

How we see it

Considering how the nature of the interruption, its length of duration, and the level of development activities during such period impact the determination as to whether the delay is a necessary part of the process of bringing the qualifying asset ready for its intended use or sale (and therefore, whether continuous capitalisation of eligible borrowing costs during such period is appropriate) would require judgement to be exercised based on particular facts and circumstances. Disclosure of this judgement is required if it is significant to the understanding of the financial statements (see section 7.2 below).

6.2.1 Impairment considerations

When it is determined that capitalisation is appropriate, an entity continues to capitalise borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset as part of the cost of the asset even if the capitalisation causes the expected ultimate cost of the asset to exceed its recoverable amount or net realisable value.

When the carrying amount of the qualifying asset exceeds its recoverable amount or net realisable value (depending on the type of asset), the carrying amount of the asset must be written down or written off in accordance with the relevant IFRS accounting standards. In certain circumstances, the amount of the write-down or write-off is written back in accordance with those relevant IFRS accounting standards. If the asset is incomplete, this assessment is performed by considering the expected ultimate cost of the asset.

[IAS 23.16]. The expected ultimate cost, which will be compared to recoverable amount or net realisable value, must include costs to complete and the estimated capitalised interest thereon.

IAS 36 *Impairment of Assets* will apply if the qualifying asset is property, plant and equipment accounted for in accordance with IAS 16 or if the asset is otherwise within the scope of IAS 36 (see Chapter 21). For inventories that are qualifying assets, the requirements of IAS 2 *Inventories* on net realisable value will apply (see Chapter 23).

6.3 Cessation of capitalisation

The standard requires capitalisation of borrowing costs to cease when substantially all the activities necessary to prepare the qualifying asset for its intended use or sale are complete. [IAS 23.22].

An asset is normally ready for its intended use or sale when the physical construction of the asset is complete, even though routine administrative work might still continue. If minor modifications, such as the decoration of a property to the purchaser's or user's specification, are all that are outstanding, this indicates that substantially all the activities are complete. [IAS 23.23].

How we see it

In some cases, there might be a requirement for inspection (e.g., to ensure that the asset meets safety requirements) before the asset can be used. Usually 'substantially all the activities' would have been completed before this point in order to be ready for inspection. In such a situation, capitalisation would cease prior to the inspection.

When the construction of a qualifying asset is completed in parts and each part is capable of being used while construction continues on other parts, capitalisation must cease for the borrowing costs on the portion of borrowings attributable to that part when substantially all the activities necessary to prepare that part for its intended use or sale are completed. [IAS 23.24]. An example of this might be a business park comprising several buildings, each of which is capable of being fully utilised individually while construction continues on other parts. [IAS 23.25]. This principle also applies to single buildings where one part is capable of being fully utilised even if the building as a whole is incomplete (for example, individual floors of a high-rise office building).

For a qualifying asset that needs to be complete in its entirety before any part can be used as intended, it would be appropriate to capitalise related borrowing costs until all the activities necessary to prepare the entire asset for its intended use or sale are substantially complete. An example of this is an industrial plant, such as a steel mill, involving several processes which are carried out in sequence at different parts of the plant within the same site. [IAS 23.25]. However, other circumstances might not be as straightforward.

How we see it

Because neither IAS 23 nor IAS 16 provide guidance on what constitutes a 'part', it will therefore depend on particular facts and circumstances and would require the exercise of judgement as to what constitutes a 'part'. Disclosure of this judgement is required if it is significant to the understanding of the financial statements (see section 7.2 below).

6.3.1 Borrowing costs on 'land expenditures'

In June 2018, the IFRS IC discussed a request it received about when an entity ceases capitalising borrowing costs on land. In the fact pattern described in the request:

- An entity acquires and develops land and thereafter constructs a building on that land - the land represents the area on which the building will be constructed.
 - Both the land and the building meet the definition of a qualifying asset.
- And
- The entity uses general borrowings to fund the expenditures on the land and construction of the building.

The request asked whether the entity ceases capitalising borrowing costs incurred in respect of expenditures on the land ('land expenditures') once it starts constructing the building or whether it continues to capitalise borrowing costs incurred in respect of land expenditures while it constructs the building.

The IFRS IC observed that in applying IAS 23 to determine when to cease capitalising borrowing costs incurred on land expenditures an entity considers:

- The intended use of the land
- And
- In applying IAS 23.24, whether the land is capable of being used for its intended purpose while the construction continues on the building [IAS 23.24]

Land and buildings are used for owner-occupation (and therefore recognised as property, plant and equipment applying IAS 16); rent or capital appreciation (and therefore recognised as investment property applying IAS 40 *Investment Property*); or for sale (and therefore recognised as inventory applying IAS 2). The intended use of the land is not simply for the construction of a building on the land, but rather to use it for one of these three purposes.

If the land is not capable of being used for its intended purpose while construction continues on the building, the entity considers the land and the building together to assess when to cease capitalising borrowing costs on the land expenditures. In this situation, the land would not be ready for its intended use or sale until substantially all the activities necessary to prepare both the land and building for that intended use or sale are complete (see section 6.3 above).¹²

In September 2018, the IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for an entity to determine when to cease capitalising borrowing costs on land expenditures. Consequently, the IFRS IC decided not to add this matter to its standard-setting agenda.¹³

1 Primarily consists of increases in rehabilitation provision of \$780 million and reclassifications within the various property, plant and equipment headings.

Plant and equipment includes expenditure for construction in progress of \$4,640 million (2022: \$3,731 million). Depreciation expenses included in cost of goods sold are \$5,805 million (2022: \$6,782 million) and in selling and administrative expenses, \$52 million (2022: \$46 million).

During 2023, \$51 million (2022: \$31 million) of interest was capitalised. With the exception of project-specific borrowings, the rate used to determine the amount of borrowing costs eligible for capitalisation was 6.1% (2022: 3.5%).

As at 31 December 2023, with the exception of leases, no property, plant or equipment was pledged as security for borrowings (2022: \$Nil).

...

7.2 Disclosure requirements in other IFRS accounting standards

In addition to the disclosure requirements in IAS 23, an entity needs to disclose additional information in relation to its borrowing costs in order to comply with requirements in other IFRS accounting standards. For example, disclosures required by IAS 1 include:

- The nature and amount of material items included in profit or loss. [IAS 1.97].
- The measurement bases used in preparing the financial statements and other accounting policies used that are relevant to an understanding of the financial statements (see Practical example 6-1 in section 6.1 above). [IAS 1.117].

And

- The significant judgements made in the process of applying an entity's accounting policies that have the most significant effect on the recognised amounts (e.g., criteria in determining a qualifying asset or a 'part' of a qualifying asset, including definition of 'substantial period of time'). [IAS 1.122].

As noted in section 5.4 above, the IFRS IC considered a request for guidance on the treatment of foreign exchange gains and losses and on the treatment of any derivatives used to hedge such foreign exchange exposures.

The IFRS IC decided not to add the issue to its agenda but concluded both that (i) how an entity applies IAS 23 to foreign currency borrowings is a matter of accounting policy requiring an entity to exercise judgement and (ii) IAS 1 requires disclosure of significant accounting policies and judgements that are relevant to an understanding of the financial statements.¹⁴ The requirements of IAS 1 are discussed in Chapter 3.

Overview

IAS 2 *Inventories* prescribes the accounting treatment for inventories. Inventories are assets held for sale in the ordinary course of business; in the process of production for such sale; or in the form of materials or supplies to be consumed in the production process or in the rendering of services. The term 'inventories' includes raw materials, work in progress, finished goods and goods for resale in the ordinary course of business.

Inventories can include all types of goods purchased and held for resale and may also include tangible and intangible assets held by an entity for sale in the ordinary course of business.

This chapter only deals with inventories within the scope of IAS 2, which applies to all inventories in financial statements except financial instruments and biological assets related to agricultural produce at the point of harvest.

IAS 2 does not apply to the measurement of inventories held by producers of agricultural and forest products, agricultural produce after harvest, and minerals and mineral products, to the extent that they are measured at net realisable value in accordance with well-established practices in those industries as well as inventories held by commodity broker-traders who measure their inventories at fair value less costs to sell.

The standard's basic rule is that inventories are measured at the lower of cost and net realisable value, except those inventories scoped out of its measurement requirements. The costs attributed to inventories under IAS 2 comprise all costs of purchase, costs of conversion and other costs incurred in bringing the inventories to their present location and condition.

IAS 2 specifically allows the use of techniques for the measurement of cost of inventories such as the standard cost method or the retail method, provided that the result approximates cost. Where it is necessary to use a cost-flow assumption (i.e., when there are large numbers of ordinarily interchangeable items), IAS 2 requires either a first-in, first-out (FIFO) or a weighted average cost formula to be used.

What you need to know

- In many industries, inventories are one of the more significant classes of assets and their accounting treatment may have a material impact on the statement of financial position and operating results.
- The use of significant judgements or assumptions may be required in classifying assets, determining costs to be included in inventory and determining the relevant net realisable value that meets the objectives of the standard.

1 Introduction

IAS 2 prescribes the accounting treatment for inventories. The term 'inventories' includes raw materials, work in progress, finished goods and goods for resale in the ordinary course of business. Biological assets related to agricultural activity and agricultural produce at the point of harvest are however dealt with in IAS 41 *Agriculture* (see Chapter 38). This chapter only deals with inventories within the scope of IAS 2.

Costs of inventories comprise expenditure which has been incurred in bringing the inventory to its present location and condition. All costs incurred in respect of inventories are charged as period costs, except for those which relate to those unconsumed inventories which are expected to be of future benefit to the entity. These are carried forward as an asset, until the entity transfers control to a third party, at which point revenue is recognised in accordance with IFRS 15 *Revenue from Contracts with Customers* (see Chapter 28).

IAS 2 was last revised in 2003 primarily to clarify its scope and prohibit the use of the last-in, first-out (LIFO) formula to measure the cost of inventories. When IAS 2 was revised, all references to matching and to the historical cost system were deleted, even though historical cost was retained as the primary measurement approach for IAS 2 inventories.

There are some differences between IFRS accounting standards and US GAAP accounting standards on inventories, which are not addressed in this chapter as the standards are not converged.

2 Objective, definitions and scope

2.1 Objective

The objective of IAS 2 is to prescribe the accounting treatment for inventories. The standard notes that a primary issue in accounting for inventories is the cost to be recognised as an asset and carried forward until the related revenues are recognised. The standard provides guidance on the determination of cost and its subsequent recognition as an expense, including any write-down to net realisable value. Further to this, it provides guidance on the cost formulas that are used to assign costs to inventories. [IAS 2.1].

2.2 Definitions

IAS 2 uses the following terms with the meanings specified below: [IAS 2.6]

Extract from IAS 2

- 6 The following terms are used in this Standard with the meanings specified:
- Inventories* are assets:
- (a) held for sale in the ordinary course of business;
 - (b) in the process of production for such sale; or
 - (c) in the form of materials or supplies to be consumed in the production process or in the rendering of services.
- Net realisable value* is the estimated selling price in the ordinary course of business less the estimated costs of completion and the estimated costs necessary to make the sale.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)

Fair value measurement is addressed in Chapter 15.

2.3 Scope

IAS 2 sets out its scope as follows: [IAS 2.2, IAS 2.3]

Extract from IAS 2

- 2 This Standard applies to all inventories, except:
- (a) [deleted]
 - (b) financial instruments (see IAS 32 *Financial Instruments: Presentation* and IFRS 9 *Financial Instruments*); and
 - (c) biological assets related to agricultural activity and agricultural produce at the point of harvest (see IAS 41 *Agriculture*).
- 3 This Standard does not apply to the measurement of inventories held by:
- (a) producers of agricultural and forest products, agricultural produce after harvest, and minerals and mineral products, to the extent that they are measured at net realisable value in accordance with well-established practices in those industries. When such inventories are measured at net realisable value, changes in that value are recognised in profit or loss in the period of the change.
 - (b) commodity broker-traders who measure their inventories at fair value less costs to sell. When such inventories are measured at fair value less costs to sell, changes in fair value less costs to sell are recognised in profit or loss in the period of the change.

The recognition, measurement, presentation and disclosure of financial instruments is addressed in Chapters 40 to 50.

The accounting treatment of biological assets related to agricultural activity and agricultural produce at the point of harvest is addressed in Chapter 38. IAS 41 defines 'harvest' as the detachment of produce from a biological asset or the cessation of a biological asset's life processes. [IAS 41.5]. IAS 2 applies to agricultural produce that has been harvested by the entity from its biological assets. Such produce is initially recognised at its fair value less costs to sell at the point of harvest, as set out in IAS 41 (see Chapter 38). This value becomes the cost of inventories at that date under IAS 2. [IAS 2.20].

The measurement provisions of IAS 2 do not apply to the measurement of inventories held by entities referred to in IAS 2.3. However, in both cases, the standard stresses that these inventories are excluded from only its measurement requirements. The standard's other requirements, such as disclosures, continue to apply. [IAS 2.4].

The inventories referred to in IAS 2.3(a) are measured at net realisable value at certain stages of production. This occurs, for example, when agricultural crops have been harvested or minerals have been extracted and sale is assured under a forward contract or a government guarantee, or when an active market exists and there is a negligible risk of failure to sell. [IAS 2.4]. However, in practice this approach is not common.

Commodity broker-traders referred to in IAS 2.3(b) are defined as those who buy or sell commodities for others or on their own account and these inventories are principally acquired with the purpose of selling in the near future and generating a profit from fluctuations in price or broker-traders' margin. [IAS 2.5]. Fair value and net realisable value are discussed in section 3 below.

Inventories can include all types of goods purchased and held for resale including, for example, merchandise purchased by a retailer and other tangible assets such as land and other property held for resale, although investment property accounted for under IAS 40 *Investment Property* is not treated as an inventory item. The term also encompasses finished goods produced, or work in progress being produced, by the entity and includes materials and supplies awaiting use in the production process, for example, unused office supplies. Costs incurred to fulfil a contract with a customer that do not give rise to inventories (or assets within the scope of another standard) are accounted for in accordance with IFRS 15. [IAS 2.8]. Inventories may also include items of property, plant and equipment initially held for rental and subsequently transferred to inventories when they cease to be rented, [IAS 16.68A], and intangible assets held by an entity for sale in the ordinary course of business. [IAS 38.3(a)].

There is a separate standard, IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*, that governs the accounting treatment of non-current assets held for sale, for example a group of assets held for sale as part of a business being disposed of. An entity would apply IFRS 5 to any inventories that form part of a disposal group. IFRS 5 is discussed in Chapter 5.

2.3.1 Practical application of the scope and recognition requirements of IAS 2

2.3.1.A Core inventories and spare parts

In certain industries, for example the non-ferrous metals, gas extraction and petrochemical sectors, certain processes or storage arrangements always require a minimum amount of material to be present in the system during the production process in order to permit plants to operate or for production to be maintained. For example, cushion gas is required to maintain minimum storage pressure in gas cavern storage facilities and, in order for a crude oil refining process to take place, the plant must contain a certain minimum quantity of oil which can only be taken out if the pipeline is interrupted. Such materials have been referred to as 'core inventories' or 'minimum fill'. The issue with such minimum amounts of material is whether they should be accounted for as inventory in accordance with IAS 2 or as property, plant and equipment in accordance with IAS 16 *Property, Plant and Equipment*.

The IFRS IC discussed the issue of 'core inventories' or 'minimum fill' at its March 2014 meeting and tentatively decided to develop an interpretation. The IFRS IC further directed the staff to define the scope of what is considered to be core inventories and to analyse the applicability of the concept to a range of industries.¹ At its July 2014 meeting, the IFRS IC discussed the feedback received from informal consultations with IASB members, the proposed scope of core inventories and the staff analysis of the applicability of the issue to a range of industries. In its redeliberations, the IFRS IC observed that what might constitute core inventories, and how they are accounted for, can vary between industries and that significant judgement might be needed in determining the appropriate accounting. The IFRS IC noted that it did not have clear evidence that the differences in accounting were caused by differences in how IAS 2 and IAS 16 were being applied and, in the absence of such evidence, the IFRS IC decided not to continue with the development of an interpretation and to remove this item from its agenda.²

1 [IFRIC Update](#), March 2014, available on the IFRS Foundation's website.

2 [IFRIC Update](#), November 2014, available on the IFRS Foundation's website.

How we see it

In our view, an item that is not held for sale in the ordinary course of business or to be consumed in a production process should be accounted for as an item of property, plant and equipment under IAS 16 if it is necessary to operate or benefit from an asset during more than one operating cycle and its cost either cannot be recouped through sale or it is significantly impaired after it has been used to operate the asset. This applies even if the part of inventory that is deemed to be an item of property, plant and equipment cannot physically be separated from other inventories.

Core inventories are discussed further in Chapter 39 in the context of extractive industries.

By contrast, spare parts are classified as inventories unless they meet the definition of property, plant and equipment. The recognition of spare parts as property, plant and equipment and the accounting treatment of core inventories are discussed further in Chapter 19.

2.3.1.B Broadcast rights

Broadcasters purchase programmes under a variety of arrangements. Often, they commit to purchasing programmes that are at a very early stage of development, perhaps merely being concepts. The broadcaster may have exclusive rights over the programme or perhaps only have the rights to broadcast for a set period of time or on a set number of occasions. IFRS accounting standards are not clear on how these rights should be classified and when they should be recognised.

Broadcast rights meet the definition of intangible assets because they are identifiable non-monetary assets without physical substance. [IAS 38.8]. IAS 38 *Intangible Assets* specifically includes within its scope rights under licensing agreements for items such as motion picture films and video recordings. [IAS 38.6]. Rights to programmes held for sale in the ordinary course business to other parties meet the definition of inventory and are therefore within the scope of IAS 2. [IAS 2.6, IAS 38.3]. It is possible to conclude that acquired rights to programmes held for a broadcaster's programming schedule are comparable to "materials or supplies to be consumed in the production process or in the rendering of services", which also meet the definition of inventory in the scope of IAS 2. [IAS 2.6].

Without specific guidance in IFRS accounting standards, there is diversity among broadcasters in practice when classifying broadcast rights as either inventories or intangible assets. Entities will have to consider the particular facts and circumstances when classifying such rights, for example, it may be more appropriate to classify a right acquired for a single broadcast of a movie or sporting event without a rerun as inventories. In contrast, it may be more appropriate to classify acquired rights to an episodic series with a high rerun value, for example children's cartoons, as an intangible asset.

How we see it

The appropriate classification of broadcast rights depends on the particular facts and circumstances applicable to each case. We believe that, depending on the facts and circumstances applicable to the entity, it may be appropriate to either treat these rights as inventory under IAS 2 or as intangible assets and classify them under IAS 38 (see Chapter 18).

When classified as inventory, the rights would be presented within current assets if the rights are expected to be sold, consumed or realised as part of the normal operating cycle, even if the intention is not to consume them within 12 months. [IAS 1.66, IAS 1.68].

Paragraph 68 of IAS 1 *Presentation of Financial Statements* defines the operating cycle of an entity as "the time between the acquisition of assets for processing and their realisation in cash or cash equivalents. When the entity's normal operating cycle is not clearly identifiable, it is assumed to be twelve months". [IAS 1.66]. The distinction between current and non-current assets is discussed in Chapter 3.

As with costs of other inventory the cash outflows from acquisition will be classified as operating cash flows as they are primarily derived from the principal revenue-producing activities and the expense will be presented within cost of sales when the right is consumed.

Given the typical significance of broadcast rights for broadcasters, presenting these assets as a separate line item in the statement of financial position is also an alternative presentation observed in practice in accordance with IAS 1.57(a).

There is also the issue of the timing of recognition of these rights. In accordance with paragraph 4.3 of the *Conceptual Framework for Financial Reporting* an asset is a present economic resource controlled by an entity as a result of past events. [CF 4.3].

Hence, it is necessary to determine when control is obtained. Under IFRS accounting standards, executory contracts where both parties are still to perform (such as purchase orders where neither payment nor delivery has taken place) do not generally result in the recognition of assets and liabilities. When a broadcaster initially contracts to purchase a programme, it will not usually result in immediate recognition of an asset relating to that programme. At this point there will not normally be an asset under the control of the broadcaster. A broadcaster may have to consider whether the underlying resource is sufficiently developed to be identifiable (for example, whether the manuscript or screenplay has been written, and whether directors and actors have been hired).

How we see it

In the absence of specific guidance in IAS 2 on how to determine the timing of obtaining control of broadcast rights, an entity should make reference to the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* (see Chapter 3) when deciding on an accounting policy and refer to guidance in other standards, for example IFRS 15, to determine the point in time when control of broadcast rights is obtained.

Where there is difficulty in determining when control of the asset is obtained it may be helpful to assess at what point any liability arises, since a liability will generally indicate that an asset has been acquired. In practice an entity might recognise an asset and a liability for a specific broadcast right, for example:

- When a screening certificate is obtained
 - When programming is available for exhibition
 - At the beginning of the season
 - At the beginning of the licence period
- Or
- At the date the event occurs (e.g., game-by-game basis)

The issue of when a licensor recognises revenue under IFRS 15 on the sale of such broadcast rights is covered in Chapter 28.

2.3.1.C Emission rights

In order to encourage entities to reduce emissions of pollutants, governments around the world have introduced schemes that comprise tradeable emissions allowances or permits. These schemes are discussed further in Chapter 18.

How we see it

It might be appropriate to recognise emission rights, whether granted by the government or purchased by an entity, as inventory in accordance with IAS 2 if they are held for sale in the ordinary course of business or to settle an emissions liability in the ordinary course of business.

Entities using emission rights for their own purposes might elect to record the rights as intangible assets, whether at cost, revalued amount or, under the so-called 'net liability' approach, as rights that are re-measured to fair value. See Chapter 18.

If the purchased emission rights are recognised as inventories, they are subsequently measured at the lower of cost or net realisable value in accordance with IAS 2, unless they are held by commodity broker-traders.

Broker-traders account for emission rights as inventory. A broker-trader may recognise emission rights either at the lower of cost and net realisable value, or at fair value less costs to sell as permitted by IAS 2. An integrated entity may hold emission rights both for own-use and for trading. An entity accounts for these emission rights separately.

2.3.1.D Accounting for green certificates or renewable energy certificates

Some governments have launched schemes to promote power production from renewable sources, based on green certificates, renewable energy certificates, green tags or tradable renewable certificates. There are similarities between green certificates and emission rights, except that whilst emission rights are granted to reflect a future limit on emissions, green certificates are awarded on the basis of the amount of green energy already produced. These schemes are discussed further in Chapter 18.

How we see it

It might be appropriate to recognise green certificates, whether granted by the government or purchased by an entity, as inventory in accordance with IAS 2 if they are held for sale in the ordinary course of business or to settle an emissions liability in the ordinary course of business.

Entities entitled to an award of green certificates might elect to recognise an intangible asset representing an entitlement to a government grant. The intangible asset is recognised at the point in time when the green electricity is produced and is initially measured at either fair value or a nominal amount. Entities that have the option to use or sell certificates granted to them may also apply the 'net liability' approach. See Chapter 18.

Green certificates recognised as inventories are subsequently measured at the lower of cost or net realisable value in accordance with IAS 2, unless they are held by commodity broker-traders.

Broker-traders may recognise green certificate inventories either at the lower of cost and net realisable value, or at fair value less costs to sell as permitted by IAS 2.

2.3.1.E Treatment of green feedstock purchased in order to label products as 'green'

An entity might be engaged in producing goods that use inputs sourced as either 'green' or 'grey' (sustainable or non-sustainable, respectively) in its production process. The entity might also produce under a certified production process that provides the right to label products as green, even if the actual production inputs used in the final product were grey.

The inputs might have the same physical characteristics and therefore be stored together. Sourcing green inputs is generally more expensive compared to grey inputs. Therefore, there are often questions about how to account for the additional costs involved.

How we see it

In our view, if the 'green' attributes grant only the right to label goods as 'green', and such right cannot be sold separately, then they do not result in a separable intangible asset for the entity to recognise. Therefore, the cost attached to the right to label products as 'green' should be included in the cost of the finished inventory.

2.3.1.F Crypto-assets

How we see it

Crypto-assets have diverse terms and conditions, and the purpose for holding them differs among holders. As a result, the holders of crypto-assets will need to evaluate their own facts and circumstances in determining which classification and measurement requirements in IFRS accounting standards should be applied. Depending on the relevant accounting standard, the holder may also need to assess its business model in order to determine the appropriate classification and measurement.³

³ The classification of crypto-assets is considered in detail in our publication *Applying IFRS: Accounting by holders of crypto assets*, Updated October 2021, available on [ey.com/IFRS](https://www.ey.com/IFRS).

Cryptocurrencies represent a subset of crypto-assets. In recent years, numerous cryptocurrencies (for example Bitcoin) and crypto-tokens have been launched. In June 2019, the IFRS IC discussed how IFRS accounting standards apply to holdings of a subset of crypto-assets with all the following characteristics:

- A digital or virtual currency recorded on a distributed ledger that uses cryptography for security
 - Not issued by a jurisdictional authority or other party
- And
- Does not give rise to a contract between the holder and another party

For the purpose of their discussion, the IFRS IC referred to crypto-assets with these characteristics as 'cryptocurrency'. The IFRS IC concluded that IAS 2 applies to cryptocurrencies when they are held for sale in the ordinary course of business. If IAS 2 is not applicable, an entity applies IAS 38 to holdings of cryptocurrencies.⁴

The IFRS IC observed that a holding of cryptocurrency would meet the definition of an intangible asset in IAS 38 on the grounds that: a) it is capable of being separated from the holder and sold or transferred individually; and b) it does not give the holder a right to receive a fixed or determinable number of units of currency.

Other crypto-assets that do not have the characteristics of cryptocurrency considered by the IFRS IC (and therefore not in scope of the agenda decision) may also meet the relatively wide definition of an intangible asset. The accounting for crypto-assets as intangible assets is discussed in Chapter 18.

However not all intangible assets are within the scope of IAS 38 as the standard is clear that it does not apply to items that are in the scope of another standard. For example, IAS 38 excludes from its scope intangible assets held by an entity for sale in the ordinary course of business, which are within scope of IAS 2, [IAS 38.3(a)], and financial assets as defined in IAS 32 *Financial Instruments: Presentation*. [IAS 38.3(e)].

The IFRS IC considered the definition of a financial asset in accordance with IAS 32 and concluded that a holding of cryptocurrency is not a financial asset. This is because a cryptocurrency is not cash. Nor is it an equity instrument of another entity. It does not give rise to a contractual right for the holder, and it is not a contract that will or may be settled in the holder's own equity instruments. The definition of a financial asset in accordance with IAS 32 is discussed in Chapter 41.

Although this is often assumed, IAS 2 does not require inventory to be tangible. The IFRS IC observed that cryptocurrencies could be held for sale in the ordinary course of business, for example, by a commodity broker-trader. In that circumstance, a holding of cryptocurrency is inventory for the entity, and IAS 2 applies to that holding.

Whether cryptocurrencies and other crypto-assets are held for sale in the ordinary course of business would depend on the specific facts and circumstances of the holder.

In practice, cryptocurrencies and other crypto-assets are generally not used in the production of inventory and, thus, would not be considered materials and supplies to be consumed in the production process.

How we see it

In limited circumstances, we believe that a crypto-asset could be held for consumption in the rendering of a service. For example, a crypto-asset, not readily convertible to cash, that only entitles the holder to a specific service (for example, server capacity) could be considered inventory if the holder uses the underlying service to deliver its own services in the ordinary course of its business.

The measurement of cryptocurrencies and other crypto-assets that meet the definition of inventory is addressed in section 3.4 below.

If an entity has made judgements regarding its accounting for holdings of cryptocurrencies, and those judgements have a significant effect on the amounts recognised in the financial statements, those judgements should be disclosed in accordance with the requirements of paragraph 122 of IAS 1 (see section 6.2 below).⁵ Such judgements may relate to the classification of cryptocurrency as inventory or intangible assets, and may also be relevant to holdings of other crypto-assets outside the scope of the IFRS IC's discussions.

⁵ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

2.3.1.G Transfers of rental assets to inventory

An entity may, in the course of its ordinary activities, routinely sell items that had previously been held for rental and classified as property, plant and equipment. For example, car rental companies may acquire vehicles with the intention of holding them as rental cars for a limited period and then selling them. IAS 16 requires that when such items become held for sale in the ordinary course of business rather than for rental, they should be transferred to inventory at their carrying value. [IAS 16.68A]. Revenue from the subsequent sale is then recognised gross rather than net, as discussed in Chapter 19.

2.3.1.H Consignment stock and sale and repurchase agreements

A manufacturer may enter into an arrangement with a distributor where the distributor sells inventory on behalf of the manufacturer. Under such arrangements, a manufacturer (consignor) may deliver inventory on a consignment basis to a distributor or dealer (consignee). The consignor retains the legal title to the inventory and consignee acts as a selling agent. Such consignment arrangements are common in certain industries, such as the automotive industry. Under IFRS 15, revenue will not be recognised for stock delivered to the consignee because control has not yet transferred (see Chapter 28), and the consignor would continue to account for the consignment inventory until control has passed.

Similarly, an entity may enter into sale and repurchase agreements with a customer where the entity agrees to repurchase inventory under particular circumstances. For example, the entity may agree to repurchase any inventory that the customer has not sold to a third party after six months. IFRS 15 contains complex guidance, explained in Chapter 28, which can result in the entity accounting for such arrangements as financing arrangements, as leases, or as a sale with a right of return.

When an arrangement is accounted for as a financing arrangement, the seller will continue to recognise the inventory on its balance sheet and will also recognise a financial liability for the consideration received. If IFRS 15 requires the arrangement to be accounted for as a lease, the arrangement must be accounted for in accordance with IFRS 16 *Leases*. In this case, if the seller is considered to be acting as the lessor in an operating lease, the seller will continue to recognise the inventory on balance sheet. For arrangements that are considered to be a sale with a right of return, inventory will be derecognised and the seller will instead recognise a right of return asset. Sales with a right of return are considered further in section 2.3.1.I below.

The entity will also have to consider appropriate disclosure for material amounts of inventories that are held on consignment or sale and return at a third party's premises.

Consignment stock may also be found in situations other than distribution agreements, for example, when an entity (consignor) outsources part of its production process and transfers the legal title of inventories to a third party (consignee) in a sale transaction to enable that consignee to perform an outsourced task, with the inventories subsequently repurchased by the consignor. This may arise, for example, in the pharmaceutical industry, where a pharmaceutical entity may legally sell large quantities of an active drug principle in bulk to enable repackaging into smaller quantities which are subsequently repurchased by the consignor. Although the transaction takes the legal form of a sale, the seller (consignor) does not transfer control of the goods and therefore, does not derecognise the inventories. IFRS 15 provides specific application guidance for a promise to deliver goods on a consignment basis to other parties and principal versus agent considerations (see Chapter 28).

2.3.1.I Sales with a right of return

An entity may provide its customers with a right to return goods that it has sold to them. The right may be contractual, or an implicit right that exists due to the entity's customary business practice, or a combination of both. Offering a right of return in a sales agreement obliges the selling entity to stand ready to accept any returned product. Under IFRS 15, the potential for customer returns needs to be considered when an entity estimates the transaction price because potential returns are a component of variable consideration. IFRS 15 also requires that the selling entity recognise the amount received or receivable that is expected to be returned to the customer as a refund liability and recognise a return asset for its right to recover goods returned by the customer.

How we see it

While IFRS 15 does not explicitly state this, we believe that the return asset would generally be presented separately from inventory.

Sales with a right of return are discussed further in Chapter 28.

2.3.1.J Collectibles

The accounting treatment of collectibles, for example paintings or sculptures, depends on the purpose for which the entity is holding the collectibles. The definition of inventories in IAS 2.6(a) encompasses assets held for sale in the ordinary course of business. Collectibles held for the purposes of sale in the ordinary course of business are therefore within the scope of IAS 2 and accordingly should be measured at the lower of cost and net realisable value in accordance with IAS 2.9. Items collected for administrative or aesthetic purposes and not traded in the ordinary course of business are within the scope of IAS 16 (see Chapter 19). Collectibles held for long-term investment purposes and not traded in the ordinary course of business are similar to investment property, therefore entities may apply the requirements of IAS 40 by analogy (see Chapter 20 for further discussions on the requirements of IAS 40).

How we see it

Our view is that an entity should apply judgement, considering the purpose for which collectibles are held and other relevant facts and circumstances, when deciding on an accounting policy for collectibles by reference to the hierarchy in IAS 8 (see Chapter 3).

3 Measurement

The standard's basic rule is that inventories are measured at the lower of cost and net realisable value, except those inventories scoped out of its measurement requirements as explained in section 2.3 above. [IAS 2.9]. Net realisable value is "the estimated selling price in the ordinary course of business less the estimated costs of completion and the estimated costs necessary to make the sale". [IAS 2.6]. This is different to fair value, which IAS 2 defines in accordance with IFRS 13 *Fair Value Measurement* as "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date". [IAS 2.6].

The standard points out that net realisable value is an entity-specific value, the amount that the entity actually expects to realise from selling that particular inventory in the ordinary course of business, while fair value is not. Fair value reflects the price at which an orderly transaction to sell the same inventory in the principal (or most advantageous) market for that inventory would take place between market participants at the measurement date. Therefore, net realisable value may not equal fair value less costs to sell. [IAS 2.7]. This is illustrated in the following Practical example in which AngloGold Ashanti Limited discloses that net realisable value is based on estimated future sales prices of the product.

Practical example 3-1:	AngloGold Ashanti Limited (2023)	South Africa
ANNUAL FINANCIAL STATEMENTS 2023 [extract]		
Group financial statements [extract]		
GROUP - NOTES TO THE FINANCIAL STATEMENTS [extract]		
17 INVENTORIES [extract]		
SIGNIFICANT ACCOUNTING JUDGEMENTS AND ESTIMATES [extract]		
STOCKPILES AND METALES IN PROCESS [extract]		
Costs that are incurred in or benefit the production process are accumulated in stockpiles and metals in process values. Net realisable value tests are performed at least annually and represent the estimated future sales price of the product, based on prevailing and long-term metals prices, less estimated costs to complete production and bring the product to sale.		
...		

If there has been a downturn in a cyclical business such as real estate, an entity may argue that net realisable value is higher than fair value because the entity intends to hold the asset until prices recover. This is rarely supportable as the decline in fair value usually indicates that the price that will be achieved in the ordinary course of business has declined and time taken to dispose of assets has increased. Net realisable value is discussed in section 3.3 below.

This basic measurement rule inevitably raises the question of what may be included in the cost of inventory.

3.1 What may be included in cost?

The costs attributed to inventories under IAS 2 comprise all costs of purchase, costs of conversion and other costs incurred in bringing the inventories to their present location and condition. [IAS 2.10]. This definition allows for significant judgement of the costs to be included in inventory.

3.1.1 Costs of purchase

IAS 2 states that: [IAS 2.11]

Extract from IAS 2	
Costs of purchase	
11	The costs of purchase of inventories comprise the purchase price, import duties and other taxes (other than those subsequently recoverable by the entity from the taxing authorities), and transport, handling and other costs directly attributable to the acquisition of finished goods, materials and services. Trade discounts, rebates and other similar items are deducted in determining the costs of purchase.

An example of an incentive deducted in determining the costs of purchase of inventories is where a supplier may pay cash upfront to its customer when entering into a contract. This form of incentive should be accounted for as a liability by the customer until it receives the related inventory, which is then shown at cost net of this incentive. Similarly, discounts for prompt settlement of invoices should be accounted for as a reduction of the cost of purchase and deducted from the costs of any unsold inventories.

There may be instances in which it is not clear whether payments received from suppliers are a discount, rebate or another similar item, nor whether they relate to inventories, another asset or something else. Unlike IFRS 15, which addresses the supplier's accounting for such payments, the accounting for the customer/purchaser receiving such a payment is not comprehensively addressed in IFRS accounting standards. IAS 2 does not provide guidance on accounting for such payments beyond noting that discounts, rebates and other similar items are deducted from the purchase price. In the absence of guidance, judgement might be needed. For further discussion on the considerations for payments received from suppliers refer to our publication *Applying IFRS: Accounting for Payments from Suppliers*.⁶

IAS 2 does not provide guidance on how to estimate trade discounts or rebates if they are variable. Discretionary rebates and rebates contingent on future purchases cannot be recognised because the resulting asset would not meet the recognition criteria in the IASB's Conceptual Framework. The IFRS IC discussed in November 2004 whether volume rebates should be recognised only when threshold volumes are achieved, or proportionately where achievement is assessed as probable. The IFRS IC tentatively agreed that there was insufficient evidence of diversity in practice and, therefore, decided not to add this issue to its agenda.⁷

How we see it

In our view, if it is probable that conditions to earn a trade discount or rebate will be met, and the amount can be estimated reliably, the discount or rebate should be recognised as a reduction in the cost of purchase. It follows that such trade discounts or rebates are recognised as an asset with a corresponding deduction from the cost of inventory. Estimating the amount of the rebate to be received often requires the use of judgement.

3.1.2 Costs of conversion

Costs of conversion include direct costs such as direct labour and materials, as well as an allocation of fixed and variable production overheads. It must be remembered that the inclusion of overheads is not optional. Overheads may comprise indirect labour and materials or other indirect costs of production. For the most part there are few problems over the inclusion of direct costs in inventories, although difficulties may arise over the inclusion of certain types of overheads and over the allocation of overheads into the cost of inventory. Overhead costs must be apportioned using a "systematic allocation of fixed and variable production overheads that are incurred in converting materials into finished goods". [IAS 2.12]. Overheads should be allocated to the cost of inventory on a consistent basis from year to year, regardless of whether this will result in costs being above net realisable value.

Variable production overheads are indirect costs of production that vary directly, or nearly directly, with the volume of production such as indirect material and indirect labour. [IAS 2.12]. Variable production overheads are allocated to each unit of production on the basis of the actual use of the production facilities. [IAS 2.13].

Fixed production overheads are indirect costs that remain relatively constant regardless of the volume of production, such as depreciation and maintenance of buildings, equipment and right-of-use assets used in the production process, and factory management expenses. [IAS 2.12].

The allocation of fixed production overheads is based on the normal capacity of the facilities. Normal capacity is defined as "the production expected to be achieved on average over a number of periods or seasons under normal circumstances, taking into account the loss of capacity resulting from planned maintenance". [IAS 2.13]. While actual capacity may be used if it approximates normal capacity, overheads may not be fully allocated to production as a result of low output or idle capacity. In these cases, the unallocated overheads must be expensed. Similarly, in periods of abnormally high production, the fixed overhead absorption rate must be reduced, otherwise inventories would be recorded at an amount in excess of cost. [IAS 2.13].

⁶ Available on ey.com/IFRS.

⁷ *IFRIC Update*, November 2004, available on the IFRS Foundation's website.

The occurrence of a disruptive event, such as a natural disaster, epidemic or war may often result in changes to an entity's operations, for example, by interrupting supply chains, restricting operations or increasing operating costs. If production volumes are lower than normal because of such events, the entity must not increase the amount of fixed overhead costs allocated to each unit of production. Rather, any unallocated overheads are recognised as an expense in the period in which they are incurred. Conversely, entities may have abnormally high production for certain products, for example due to panic-buying. In these circumstances, an entity needs to decrease the amount of fixed overhead allocated to each unit of production so that inventories are not measured above cost.

Entities need to assess whether wasted materials, labour, or other production costs are abnormal and, if so, they must be expensed as incurred. Entities may incur wasted materials, for example, to repackage goods that were originally destined for the wholesale market now redirected for retail sale to consumers (see section 3.1.3.A below).

In computing the costs to be allocated using the overhead recovery rate, costs such as distribution and selling must be excluded, together with the cost of storing raw materials and work in progress, unless it is necessary that storage costs be incurred prior to further processing, which may occasionally be the case (see section 3.1.3.A below).

How we see it

Although not specifically addressed in IAS 2, when the revaluation model in IAS 16 is applied, depreciation of property, plant and equipment is based on the revalued amount, less the residual value of the asset. Our view is that the depreciation based on the revalued amounts should be used in determining the costs of conversion for inventory measurement purposes.

IAS 2 mentions the treatment to be adopted when a production process results in the simultaneous production of more than one product, for example, when joint products are produced or when there is a main product and a by-product. If the costs of converting each product are not separately identifiable, they should be allocated between the products on a rational and consistent basis. For example, this might be the relative sales value of each of the products either at the stage in the production process when the products become separately identifiable, or at the completion of production. If the method of allocating costs to by-products subsequently changes, this is a change in an accounting estimate rather than a change in accounting policy, as changes in measurement techniques are considered to be changes in accounting estimates under IAS 8. [IAS 8.34A]. In contrast, a change in a cost formula would be a change in accounting policy, as discussed in section 3.2.2 below.

If the value of the by-product is immaterial, it may be measured at net realisable value and this value deducted from the cost of the main product. [IAS 2.14]. In the extractive industries, it is common for more than one product to be extracted from the same reserves therefore, joint and by-products are further discussed in Chapter 39 in the context of such industries.

3.1.3 Other costs

Other costs are to be included in inventories only to the extent that they are incurred to bring them to their present location and condition. Often judgement will be necessary to make this assessment. An example is given in IAS 2 of design costs for a special order for a particular customer and the standard notes that it may be appropriate to include such costs or other non-production overheads. [IAS 2.15]. However, a number of examples are given of costs that are specifically disallowed. The standard states the following: [IAS 2.16]

Extract from IAS 2

- | | |
|----|--|
| 16 | Examples of costs excluded from the cost of inventories and recognised as expenses in the period in which they are incurred are: |
| | (a) abnormal amounts of wasted materials, labour or other production costs; |
| | (b) storage costs, unless those costs are necessary in the production process before a further production stage; |
| | (c) administrative overheads that do not contribute to bringing inventories to their present location and condition; and |
| | (d) selling costs. |

The amount of inventories recognised as an expense during the period, which is often referred to as cost of sales, consists of those costs previously included in the measurement of inventory that have been sold as well as unallocated production overheads and abnormal amounts of production costs of inventories. [IAS 2.38].

3.1.3.A Storage and distribution costs

Storage costs are excluded from the cost of inventory unless they are necessary in the production process. [IAS 2.16(b)]. This prohibits, for example, including the overheads of a retail outlet as part of inventory.

However, where it is necessary to store raw materials or work in progress prior to a further processing or manufacturing stage (e.g., maturing stocks, such as cheese, wine or whisky), the costs of such storage should be included in production overheads.

Distribution costs are a cost of bringing an item to its present location, however, judgement may need to be applied in identifying which costs are necessarily incurred to bring the inventories to their present location and condition. For example, in the context of large retailers with distribution centres (e.g., supermarkets), the transport and logistics involved are essential to their ability to put goods on sale at a particular location in an appropriate condition. In these circumstances, costs to receive, repackage and transport goods from central or regional warehouses to retail outlets are considered a cost of bringing the asset to the point of sale and hence capitalised in the cost of inventories. Conversely:

- The cost of moving inventories from one retail outlet to another cannot be included in the carrying value of inventory.
- Entities may incur additional costs to store inventories due to lower than expected demand. Such costs need to be expensed when incurred as storage costs can only be capitalised when they are necessary to the production process before further processing.
- The cost of storing goods at central warehouses before they are shipped to customers upon receipt of an order (for example, for internet sales) or until they are moved to retail outlets for local storage, display or collection by customers cannot be included in the carrying value of inventory.
- Costs of distribution to the customer are excluded from the cost of inventory as they are not incurred to bring inventories to their point of sale.

The appropriate presentation of distribution costs in the income statement depends on whether the entity presents an analysis of expenses using a classification based on their nature or function in accordance with IAS 1 (see Chapter 3) and the particular facts and circumstances. For example:

- The cost of transportation from central or regional warehouses to retail outlets is capitalised in the cost of inventories in accordance with IAS 2 and included in cost of sales when inventories are sold.
- If an entity determines that shipping and handling activities are related to a promised good or service to a customer and the entity is acting as principal, we believe it is appropriate to present these as cost of sales, changes in contract costs, or similar, because the costs would be incurred to fulfil a revenue obligation (see Chapter 28).
- Shipping and handling costs that are not incurred to bring inventories to their point of sale and not related to a promised good or service to the customer are outside the scope of IAS 2 and IFRS 15. An entity might need to apply judgement to distinguish such costs from those within the scope of IAS 2 or IFRS 15, and where to present such costs (see Chapter 28).
- The presentation of shipping and handling costs is considered further in Chapter 28.

3.1.3.B General and administrative overheads

IAS 2 specifically disallows administrative overheads that do not contribute to bringing inventories to their present location and condition. [IAS 2.16(c)]. Other costs and overheads that do contribute are allowable as costs of production. There is a judgement to be made about such matters, as under a very broad interpretation any department could be considered to make a contribution. For example, the accounts department will normally support the following functions:

- (a) Production - by paying direct and indirect production wages and salaries, by controlling purchases and related payments, and by preparing periodic financial statements for the production units
 - (b) Marketing and distribution - by analysing sales and by controlling the sales ledger
- And
- (c) General administration - by preparing management accounts and annual financial statements and budgets, through controlling cash resources and planning investments

Only those costs of the accounts department that can be allocated to the production function can be included in the cost of conversion. Part of the management and overhead costs of a large retailer's logistical department may be included in cost if it can be related to bringing the inventory to its present location and condition. These types of costs are unlikely to be material in the context of the total inventory held by organisations. An entity determining that it needs to include a material amount of overhead of a borderline nature must ensure it can sensibly justify its inclusion under the provisions of IAS 2 by presenting an analysis of the function and its contribution to the production process similar to the above.

3.1.3.C Borrowing costs and purchases on deferred terms

IAS 2 states that IAS 23 *Borrowing Costs* identifies limited circumstances where borrowing costs are to be included in the cost of inventories. [IAS 2.17]. IAS 23 requires that borrowing costs be capitalised on qualifying assets but the standard provides an exemption for inventories that are manufactured in large quantities on a repetitive basis. [IAS 23.4, IAS 23.8]. In addition, IAS 23 clarifies that inventories manufactured, or otherwise produced, over a short period of time, are not qualifying assets. [IAS 23.7]. However, any manufacturer that is producing small quantities over a long time period (e.g., maturing stocks of wine or whisky) has to capitalise borrowing costs. This is further discussed in Chapter 22.

IAS 2 also states that, on some occasions, an entity might purchase inventories on deferred settlement terms, accompanied by a price increase that effectively makes the arrangement a combined purchase and financing arrangement. Under these circumstances the price difference is recognised as an interest expense over the period of the financing. [IAS 2.18].

Entities might also make prepayments for inventory, particularly raw materials in long-term supply contracts, raising the question of whether there is a financing component that should be accounted for separately.

If a purchaser accretes interest on long-term prepayments by recognising interest income, this will result in an increase in the cost of inventories and, ultimately, the cost of sales. The IFRS IC considered this in July 2015, noting that IAS 16 and IAS 38 include similar requirements to IAS 2 when payment for an asset is deferred (see Chapter 19 and Chapter 18).

Historically, there has been no explicit requirement in IFRS accounting standards to accrete interest income, but the IFRS IC noted that IFRS 15 includes the requirement that the financing component of a transaction should be recognised separately in circumstances of both prepayment and deferral of payment (see Chapter 28). They concluded, therefore, that when a financing component is identified in a long-term supply contract of raw materials, that financing component should be accounted for separately. They acknowledged that judgement is required to identify when individual arrangements contain a financing component.⁸

As stated in section 3.1.1 above, discounts for prompt settlement of suppliers' invoices should be deducted from the cost attributed to inventories.

3.1.3.D Service providers

Before IFRS 15 became effective, IAS 2 included the notion of work in progress (or 'inventory') of a service provider. However, this was consequentially removed from IAS 2 and replaced with the relevant requirements in IFRS 15. Costs to fulfil a contract, as defined in IFRS 15, are divided into two categories: (a) costs that give rise to an asset; and (b) costs that are expensed as incurred (see Chapter 28). [IFRS 15.95, IFRS 15.96]. When determining the appropriate accounting treatment for such costs, IAS 2 (or any other more specific IFRS accounting standard) is considered first and if costs incurred in fulfilling the contract are within the scope of this standard, those costs should be accounted for in accordance with IAS 2 (or other IFRS accounting standard). If costs incurred to fulfil a contract are not within the scope of IAS 2 or any other applicable standard, an entity would need to consider the criteria in IFRS 15 for capitalisation of such costs (see Chapter 28).

IFRS 15 does not specifically deal with the classification and presentation of contract costs. In the absence of a standard that specifically deals with the classification and presentation of these costs, entities would need to apply the requirements in IAS 8 to select an appropriate classification (see Chapter 3). As discussed in Chapter 28, we believe that costs to fulfil a contract must be presented as a separate asset in the statement of financial position. However, an entity needs to consider the aggregation requirements of IAS 1 when determining whether the separate classes of assets must be presented together with other assets (see Chapter 3).

Entities that are applying IFRS 18 *Presentation and Disclosure in Financial Statements* early need to consider the requirements in that IFRS accounting standard on whether items must be presented in the statement of financial position or disclosed in the notes. Specifically, paragraph B111 of IFRS 18 lists inventories as a class of assets that might have sufficiently dissimilar characteristics that disaggregating them into separate line items in the statement of financial position might be necessary. Examples of such line items could be "merchandise, production supplies, materials, work in progress and finished goods". [IFRS 18.B111]. Entities that apply IFRS 18 early also need to consider the consequential amendments to paragraph 39 of IAS 2. See Chapter 4 for further discussion of IFRS 18.

⁸ [IFRIC Update](#), July 2015, available on the IFRS Foundation's website.

3.1.3.E Forward contracts to purchase inventory

The standard scopes out commodity broker-traders that measure inventory at fair value less costs to sell from its measurement requirements (see section 2.3 above). If a broker-trader had a forward contract for purchase of inventory this contract would be accounted for as a derivative under IFRS 9 *Financial Instruments* since it would not meet the normal purchase or sale exemption (see Chapter 41) and when the contract is physically settled by taking delivery, the inventory would likewise be measured at fair value less costs to sell. [IAS 2.3(b)]. However, if such an entity were not measuring inventory at fair value less costs to sell it would be subject to the measurement requirements of IAS 2 and would therefore have to record the inventory at the lower of cost and net realisable value. This raises a question as to what cost is when such an entity takes delivery of inventory that has been purchased with a forward contract?

On delivery, the cash paid (i.e., the fixed price agreed in the forward contract) is in substance made up of two elements:

- (i) An amount that settles the forward contract

And

- (ii) An amount that represents the 'cost of purchase', being the market price at the date of purchase

This 'cost of purchase' represents the forward contract price adjusted for the derivative asset or liability. For example, assume that the broker-trader was purchasing oil and the forward contracted price was CU40 per barrel of oil, but at the time of delivery the spot price of oil was CU50 and the forward contract had a fair value of CU10 at that date. The oil would be recorded at the fair value on what is deemed to be the purchase date of CU50. The CU40 cash payment would in substance consist of CU50 payment for the inventory offset by a CU10 receipt on settlement of the derivative contract, which would be separately accounted for. This is exactly the same result as if the entity had been required to settle the derivative immediately prior to, and separate from, the physical delivery of the oil. The requirement to recognise inventory at the amount of cash paid (CU40) plus the fair value of the derivative at the settlement date (CU10), when the normal sale and purchase exemption does not apply and the derivative is not designated as part of a hedge relationship, was confirmed by the IFRS IC in the March 2019 agenda decision addressing physical settlement of contracts to buy or sell a non-financial item.⁹

If the entity purchasing the oil in the example above is not a broker-trader, and the acquisition meets the normal purchase or sale exemption given in IFRS 9, the purchase of oil would be recognised at the entity's cost thereof in terms of IAS 2, that is CU40 per barrel of oil.

3.1.3.F Drug production costs within the pharmaceutical industry

After the development stage, pharmaceutical companies often commence production of drugs prior to obtaining the necessary regulatory approval to sell them (so called 'pre-launch inventories'). These drugs are produced in advance so that the sales of the newly authorised drug may commence as soon as regulatory approval is obtained. It is unlikely that a pharmaceutical company can demonstrate that the sale of a drug will generate future cash flows with sufficient certainty before it files the request for the new drug approval. Therefore, drug production costs incurred before the filing are generally not recognised as an asset. After filing the request for regulatory approval, the various development phases are generally completed and the entity is likely to have an effective process for producing of the drug. Consequently, the product has the potential to contribute to the future cash flows of the entity.

How we see it

In our view, if the regulatory approval has been applied for and it is believed highly likely that this will be successfully obtained then it is appropriate for a pharmaceutical company to recognise an asset for the drug production costs and classify this as inventory. This would typically be the case if the drug manufacturer has already received regulatory approval to sell the same drug in a different jurisdiction and the criteria for approval are similar in both jurisdictions.

The capitalised drug production costs incurred are classified as inventory and measured at the lower of cost and net realisable value in accordance with the requirements of IAS 2. If the likelihood of obtaining the approval declines, these inventories are written-down with the write-down recognised in 'cost of sales'. If regulatory approval is subsequently obtained, the write-down is reversed to the extent that the original cost is realisable (see section 3.3.1.C below for further guidance on reversal of write-downs). [IAS 2.33].

⁹ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

Prior to this application for regulatory approval being made, any costs would usually be classified as research and development costs rather than inventory. However, such costs may be capitalised as an asset if the criteria in IAS 38 for recognising internally generated intangible assets have been satisfied, e.g., the entity can demonstrate the technological feasibility of completing the drug development prior to filing for regulatory approval and the likelihood of obtaining the approval is high. Similar to the above, this would typically be the case if the drug manufacturer has already received regulatory approval to sell the same drug in a different jurisdiction and the criteria for approval are similar in both jurisdictions (see Chapter 18).

Production costs of a new drug incurred before regulatory approval is obtained may be higher than the standard production costs expected after the approval, once the normal production process has started. In such a case, the full cost of inventory may not be recoverable and a write-down may be required.

3.2 Measurement of cost

3.2.1 Techniques for the measurement of cost

IAS 2 specifically allows the use of techniques for the measurement of cost of inventories such as the standard cost method or the retail method, provided that the result approximates cost. [IAS 2.21].

These techniques require an entity to use judgements or assumptions in developing an accounting estimate that meets the measurement objective, i.e., cost. The effects of a change in an input or in a measurement technique used to develop an accounting estimate is accounted for as a change in accounting estimate provided the change is not arising as a result of a correction of prior period errors. In this respect, a change in accounting estimate that results from new information or more experience is not the correction of an error.

3.2.1.A Standard cost

Standard costs should take into account normal levels of materials and supplies, labour, efficiency and capacity utilisation. They must be regularly reviewed and revised where necessary. [IAS 2.21]. Normal levels of activity are discussed in section 3.1.2 above.

3.2.1.B Retail method

The retail method is often used in the retail industry for measuring inventories with high volumes of rapidly changing items with similar margins for which it is impracticable to use other measurement techniques. [IAS 2.22]. In these circumstances, the cost of inventory is determined by converting selling prices to cost by adjusting for a normal margin.

This technique involves applying judgement regarding the granularity of inputs required in determining the appropriate margin rate adjustments which would result in an acceptable approximation of cost. Paragraph 22 of IAS 2 states that an average percentage for each retail department is often used when applying this technique. [IAS 2.22].

Inputs used in this technique must be consistent with how the entity determines appropriate write-downs. Using average margin rates and selling prices that are determined inconsistently may result in anomalies such as items of inventory being measured above their cost. For example, in the garment industry, any remaining items from a past seasonal collection will often be sold through alternative distribution channels (i.e., other than in the entity's retail outlets or distributors) such as discounters. In this case, applying an average margin rate from sales in the main distribution channels to the selling price in these points of sale would require the entity to also determine any required write-downs in a second step. Therefore, using average margin rates from all sales including sales to discounters and applying these rates to catalogue selling prices would result in measuring items above their cost because the margin rates used to convert selling prices to cost are inappropriately reduced.

3.2.2 Cost formulas

The standard states the following: [IAS 2.23, IAS 2.24]

Extract from IAS 2

- 23** The cost of inventories of items that are not ordinarily interchangeable and goods or services produced and segregated for specific projects shall be assigned by using specific identification of their individual costs.
- 24** Specific identification of cost means that specific costs are attributed to identified items of inventory. This is the appropriate treatment for items that are segregated for a specific project, regardless of whether they have been bought or produced. However, specific identification of costs is inappropriate when there are large numbers of items of inventory that are ordinarily interchangeable. In such circumstances, the method of selecting those items that remain in inventories could be used to obtain predetermined effects on profit or loss.

In practice, the specific identification method of valuation discussed in IAS 2.23 is relatively unusual, as the clerical effort required does not make it feasible unless there are relatively few high value items being bought or produced. Consequently, it would normally be used where the inventory comprised items such as antiques, jewellery and automobiles in the hands of dealers. The standard clarifies that this method is inappropriate where there are large numbers of items that are ordinarily interchangeable, as specific identification of costs could distort the profit or loss arising from these inventories through the method applied to selecting items that remain in inventories. [IAS 2.24].

Where it is necessary to use a cost-flow assumption (i.e., when there are large numbers of ordinarily interchangeable items), IAS 2 allows either a FIFO (first-in, first-out) or a weighted average cost formula to be used: [IAS 2.25]

Extract from IAS 2

- 25** The cost of inventories, other than those dealt with in paragraph 23, shall be assigned by using the first-in, first-out (FIFO) or weighted average cost formula. An entity shall use the same cost formula for all inventories having a similar nature and use to the entity. For inventories with a different nature or use, different cost formulas may be justified.

The standard makes it clear that the same cost formula should be used for all inventories having a similar nature and use to the entity, although items with a different nature and use may justify the use of a different cost formula. [IAS 2.25]. For example, the standard acknowledges that the use of inventories in one operating segment may differ from the same type of inventories used in another operating segment. However, differences in geographical location, and respective taxes rules, of inventories are not sufficient, on their own, to justify the use of different cost formulas. [IAS 2.26].

An entity may choose, as a result of particular facts and circumstances, to change its cost formula, for instance, from a FIFO-based cost formula to a weighted average cost formula. The change in a cost formula represents a change in the basis on which the value of the inventory has been determined, rather than a change in valuation of the inputs used to determine the cost of the inventory. An accounting policy is defined in IAS 8 as including specific bases applied by an entity in preparing and presenting financial statements. [IAS 8.5]. Therefore, a change in the cost formula represents a change in accounting policy which should only be made if it results in the financial statements providing reliable and more relevant information. [IAS 8.14]. If material, a change in accounting policy should be applied retrospectively, that is applied to transactions, other events and conditions as if it had always been applied in accordance with IAS 8 (see Chapter 3).

As stated in IAS 2.36(a) and confirmed by IAS 8.BC53, selecting a cost formula constitutes selecting an accounting policy. [IAS 8.BC53].

3.2.2.A First-in, first-out (FIFO)

In the vast majority of businesses, it will not be practicable to keep track of the cost of identical items of inventory on an individual unit basis; nevertheless, it is desirable to approximate to the actual physical flows as far as possible. The FIFO method probably gives the closest approximation to actual cost flows, since it is assumed that when inventories are sold or used in a production process, the oldest are sold or used first. Consequently, the balance of inventory on hand at any point represents the most recent purchases or production. [IAS 2.27]. This can best be illustrated in the context of a business which deals in perishable goods (for example food retailers) since clearly such a business will use the first goods received earliest. The FIFO method, by allocating the earliest costs incurred against revenue, matches actual cost flows with the physical flow of goods reasonably accurately. In any event, even in the case of businesses which do not deal in perishable goods, this would reflect what would probably be a sound management policy. In practice, the FIFO method is generally used where it is not possible to value inventory on an actual cost basis.

3.2.2.B Weighted average cost

The weighted average method, which like FIFO is suitable where inventory units are identical or nearly identical, involves the computation of an average unit cost by dividing the total cost of units by the number of units. The average unit cost then has to be revised with every receipt of inventory, or alternatively at the end of predetermined periods. [IAS 2.27]. In practice, weighted average systems are widely used in packaged inventory systems that are computer controlled, although its results are not very different from FIFO in times of relatively low inflation, or where inventory turnover is relatively quick.

3.2.2.C Last-in, first-out (LIFO)

LIFO, as its name suggests, is the opposite of FIFO and assumes that the most recent purchases or production are used first. In certain cases, this could represent the physical flow of inventory (e.g., if a store is filled and emptied from the top). However, IAS 2 prohibits the use of the LIFO method. [IAS 2.BC9]. LIFO is an attempt to match current costs with current revenues so that profit or loss excludes the effects of holding gains or losses. Essentially, therefore, LIFO is an attempt to achieve something closer to replacement cost accounting for the statement of profit or loss, whilst disregarding the statement of financial position. Consequently, the period-end balance of inventory on hand represents the earliest purchases of the item, resulting in inventories being stated in the statement of financial position at amounts which may bear little relationship to recent cost levels. Unlike IFRS accounting standards, US GAAP allows LIFO and it is popular in the United States of America as the Internal Revenue Service officially recognises LIFO as an acceptable method for the computation of tax provided that it is used consistently for tax and financial reporting purposes.

3.3 Net realisable value

IAS 2 requires an entity to measure its inventories at the lower of cost and net realisable value. [IAS 2.9]. The standard defines net realisable value as “the estimated selling price in the ordinary course of business less the estimated costs of completion and the estimated costs necessary to make the sale”. [IAS 2.6]. The difference between net realisable value and fair value is discussed in section 3 above. The standard contains substantial guidance on the estimation of net realisable value, particularly on how to determine the estimated selling price in the ordinary course of business. Estimated costs of completion and the estimated costs necessary to make the sale are discussed further in section 3.3.1.B below.

When net realisable value is below cost, inventory must be written down: [IAS 2.28]

Extract from IAS 2

- | | |
|----|---|
| 28 | The cost of inventories may not be recoverable if those inventories are damaged, if they have become wholly or partially obsolete, or if their selling prices have declined. The cost of inventories may also not be recoverable if the estimated costs of completion or the estimated costs to be incurred to make the sale have increased. The practice of writing inventories down below cost to net realisable value is consistent with the view that assets should not be carried in excess of amounts expected to be realised from their sale or use. |
|----|---|

Writing inventory down to net realisable value should normally be done on an item-by-item basis. IAS 2 specifically states that it may be appropriate to group similar or related items but it is not appropriate to write down an entire class of inventory, such as finished goods, or all the inventory of a particular segment. However, it may be necessary to write down an entire product line or group of inventories in a given geographical area if the items cannot be practicably evaluated separately. [IAS 2.29].

3.3.1 Determining net realisable value

Estimates of net realisable value must be based on the most reliable evidence available and take into account fluctuations of price or cost after the end of the period only to the extent that they confirm conditions existing at the end of the period. [IAS 2.30, IAS 10.9(b)(ii)]. A loss realised on a sale of a product after the end of the period may provide evidence of the net realisable value of that product at the end of the period. However, if the selling price of this product is, for example, correlated to an exchange-traded commodity, and the loss realised can be attributed to a fall in prices of that commodity after the period end date, then this loss would not provide evidence of the net realisable value at the period end date. The impact of post balance sheet events in determining the net realisable value of inventories is discussed further in Chapter 34.

Disruptive events, such as natural disasters, epidemics and wars may affect consumer behaviour. For example, some entities may encounter periods of high demand as customers panic-buy whilst other entities may have to offer discounts to attract customers. As a result of such events, estimates of net realisable value may be subject to increased estimation uncertainty, and determining the appropriate assumptions may require significant judgement. Entities with perishable goods, for example, may have to dispose of goods they are unable to store or sell during such periods. Other entities may have to determine whether to write-down their inventories to net realisable value if they become wholly or partially obsolete, or if their selling prices have declined. Also, estimates of net realisable value should take into account estimated costs of completion and the estimated costs necessary to make the sale, for example, additional future storage costs, which may reduce the net realisable value of inventories. Estimated costs of completion and the estimated costs necessary to make the sale are discussed further in section 3.3.1.B below.

Estimates of net realisable value must also take into account the purpose for which the inventory is held. Therefore, the net realisable value of inventory held for a particular contract should be determined based on the contract price, and only the net realisable value of any excess inventory held would be based on current market prices. If there is a firm contract to sell quantities in excess of inventory quantities that the entity holds or is able to obtain under a firm purchase contract, this may give rise to an onerous contract liability that should be provided for in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 27). [IAS 2.31]. For inventory such as unused office supplies that are held for internal use and not for sale to third parties, the replacement cost is the best available measure of their net realisable value.

3.3.1.A Materials and other supplies held for use in the production of inventories

IAS 2 explains that materials and other supplies held for use in the production of inventories are not written down below cost if the final product in which they are to be used is expected to be sold at or above cost. [IAS 2.32]. This is the case even if these materials in their present condition have a net realisable value that is below cost and would therefore otherwise require write-down. Thus, a whisky distiller would not write down an inventory of grain held for the production of whisky because of a fall in the grain price, so long as the cost of the whisky is not expected to exceed its net realisable value. If a decline in the price of materials indicates that the cost of the final product will exceed net realisable value, then a write-down is necessary and the replacement cost of those materials may be the best measure of their net realisable value. [IAS 2.32]. If an entity writes down any of its finished goods, the carrying value of any related raw materials should also be reviewed to determine if they too need to be written down.

Often raw materials are used to make a number of different products. In these cases, it is normally not possible to arrive at a particular net realisable value for each item of raw material based on the selling price of any one type of finished item. If the current replacement cost of those raw materials is less than their historical cost, a write-down is only required if the finished goods into which they will be made are expected to be sold at a loss. No write-down should be recognised just because the anticipated profit will be less than normal.

3.3.1.B Estimated costs of completion and the estimated costs necessary to make the sale

IAS 2 provides detailed guidance on determining net realisable value, however, the standard does not provide further guidance on how to determine “estimated costs necessary to make the sale”, a key component of the definition of net realisable value (see section 3.3 above). Without detailed guidance on which costs to include when estimating net realisable value, entities need to apply judgement, which may include considering the nature of their products, sales channel (for example, in-store or online sales) and industry. This has led to diversity in practice. Incremental costs are often the starting point before considering whether additional costs need to be included and, in some cases, entities may have only considered those costs that are incremental.

The IFRS IC received a request for clarification on how to determine which costs should be included as part of the costs necessary to make the sale when determining the net realisable value in accordance with IAS 2. In June 2021, the IFRS IC decided not to add the matter to its standard-setting agenda. The IFRS IC observed that IAS 2.28 describes the objective of writing inventories down to their net realisable value which is to avoid inventories being carried ‘in excess of amounts expected to be realised from their sale’. [IAS 2.28]. The IFRS IC further observed that the requirement in IAS 2.28 does not allow an entity to limit such costs to only those that are incremental, thereby potentially excluding costs the entity must incur to sell its inventories but that are not incremental to a particular sale. Including only incremental costs could fail to achieve the objective set out in that paragraph of the standard. Judgement will be needed to determine which costs are necessary to make the sale considering each entity’s specific facts and circumstances, including the nature of the inventories.¹⁰ There are a range of possibilities beyond the incremental cost approach: from direct costs at the point of sale (which might include, for example, a portion of the cost of internal sales staff or the cost of a special promotion campaign) to full costs (which might include costs such as depreciation or amortisation).

Furthermore, within that range, direct costs at the point of sale may be quite similar to incremental costs. Which costs are considered necessary to sell inventories may vary by entity, depending on the nature of the inventories, the applicable industry, sales channel and cost structure.

How we see it

The incremental cost approach is no longer permitted if it excludes non-incremental costs that must be incurred to sell inventories. We do not believe it would be possible to limit which other approaches might be considered appropriate, depending on the specific facts and circumstances. This is because IAS 2 does not specify which costs to consider.

Given the judgement involved and the diverse business models of entities, the agenda decision is unlikely to eliminate all diversity, but may help to reduce it.

3.3.1.C Reversal of net realisable value write-downs

When the circumstances that previously caused inventories to be written down below cost no longer exist, or when there is clear evidence of an increase in net realisable value because of changed economic circumstances, the amount of the write-down is reversed. The reversal cannot be greater than the amount of the original write-down, so that the new carrying amount will always be the lower of the cost and the revised net realisable value. [IAS 2.33].

Practical example 3-2 below shows how CRH plc describes its inventory valuation policies, including estimation of net realisable value.

¹⁰ [IFRIC Update](#), June 2021, Addendum. Available on the IFRS Foundation’s website.

2022 Annual Report and Form 20-F [extract]**Accounting Policies [extract]****Other Significant Accounting Policies [extract]****Inventories – Note 16**

Inventories are stated at the lower of cost and net realisable value. Cost is based on the first-in/first-out principle (and weighted average, where appropriate) and includes all expenditure incurred in acquiring the inventories and bringing them to their present location and condition. Raw materials are valued on the basis of purchase cost on a first-in/first-out basis. In the case of finished goods and work-in-progress, cost includes direct materials, direct labour and attributable overheads based on normal operating capacity and excludes borrowing costs.

Net realisable value is the estimated proceeds of sale less all further costs to completion, and less all costs to be incurred in marketing, selling and distribution. Estimates of net realisable value are based on the most reliable evidence available at the time the estimates are made, taking into consideration fluctuations of price or cost directly relating to events occurring after the end of the period, the likelihood of short-term changes in buyer preferences, product obsolescence or perishability (all of which are generally low given the nature of the Group's products) and the purpose for which the inventory is held.

Climate change and policy risks and uncertainties as set out on page 142 may also result in additional costs, changes to selling prices or product obsolescence impacting the valuation of inventories in future years. However, due to the short inventory turnover cycle there were no material write-downs of inventories required in this regard during the current financial year.

Materials and other supplies held for use in the production of inventories are not written down below cost if the finished goods, in which they will be incorporated, are expected to be sold at or above cost.

3.4 Measurement of crypto-assets within the scope of IAS 2

As discussed in section 2.3.1.F above, crypto-assets each have their own terms and conditions and, as a result, the holders of a crypto-asset will need to evaluate these terms and conditions to determine which IFRS accounting standard's recognition and measurement requirements should be applied. In some cases, crypto-assets may meet the definition of inventory.

The value of holdings of cryptocurrencies and other crypto-assets can fluctuate significantly. Where the fair value of a cryptocurrency or other crypto-asset holding has changed significantly after the end of the reporting period, the holder should consider whether the changes in fair value are of such significance that non-disclosure could influence the economic decisions of users of the financial statement. If so, the holder should consider whether the change in fair value should be disclosed as a non-adjusting post balance sheet event, in accordance with IAS 10 *Events after the Reporting Period*.¹¹ IAS 10 is discussed in Chapter 34.

3.4.1 Cost or lower net realisable value

The costs of purchased crypto-asset inventories would typically comprise the purchase price, irrecoverable taxes and other costs directly attributable to the acquisition of the inventory (for example blockchain processing fees). Other costs are included in the cost of inventories only to the extent that they are incurred in bringing the crypto-asset inventories to their present location and condition. The cost of inventory excludes anticipated selling costs as well as storage expenses *[IAS 2.16]* (for example costs of holding a wallet or other crypto-account), unless storage between production stages is necessary in the production process, which is unlikely to apply to crypto-assets.

¹¹ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

The cost of crypto-assets recorded as inventory may not be recoverable if those crypto-assets have become wholly or partially obsolete (due to declining interest in the crypto-asset or its application) or if their selling prices have declined. Similarly, the cost of crypto-asset inventory may not be fully recoverable if the estimated costs to sell them have increased.

An entity holding crypto-asset inventory will need to estimate the net realisable value at each reporting period. For crypto-assets quoted on a crypto-asset exchange, the net realisable value would typically comprise the current quoted price less the estimated selling costs. Estimating selling costs for crypto-assets classified as inventory may present challenges for a holder as these selling costs can fluctuate significantly depending on the current demand for processing on the particular blockchain.

Where the net realisable value is below cost, the inventory should be written down to its net realisable value with the write-down being recorded in profit or loss. A previous write-down of inventory is reversed when circumstances have improved, but the reversal is limited to the amount previously written down so that the carrying amount never exceeds the original cost.

3.4.2 Fair value less costs to sell

In June 2019, the IFRS IC observed that an entity may act as a broker-trader of cryptocurrencies.¹²

While there is no definition of a commodity under IFRS accounting standards, crypto-assets that are fungible and immediately marketable at quoted prices could potentially be considered commodities if they were held by broker-traders. However, judgement should be exercised in determining whether a particular crypto-asset can be regarded as a commodity.

The quoted prices of crypto-assets may vary considerably between exchanges. A broker-trader measuring crypto-assets at fair value less costs to sell will need to determine the principal (or most advantageous) market for those assets, and whether they could enter into a transaction for the crypto-asset at the price in that market at the measurement date. Measuring fair value without an active market could be challenging for a crypto-asset that does not entitle the holder to an underlying good or service from an identifiable counterparty. As the crypto-asset is only able to generate cash flows through a sale to a third party, an entity that is unable to use a market approach may need to use less observable inputs. The determination of the principal (or most advantageous) market is discussed in Chapter 15.

When a broker-trader measures its inventory at fair value less costs to sell, any changes in the recognised amount should be included in profit or loss for the period. [IAS 2.3(b)]. A broker-trader holder of a crypto-asset will need to estimate the costs to sell the crypto-asset at each reporting date, taking into consideration the transaction cost on the relevant blockchain and other fees required in order to convert the crypto-asset into cash. These fees could fluctuate significantly from period to period depending on the current demand for processing on the relevant blockchain.

¹² [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

4 Real estate inventory

4.1 Classification of real estate as inventory

Many real estate businesses develop and construct residential properties for sale, and these developments often consist of several units. The strategy is to make a profit from the development and construction of the property rather than to make a profit in the long term from general price increases in the property market. The intention is to sell the property units as soon as possible following their construction and the sale is therefore in the ordinary course of the entity's business. When construction is complete it is not uncommon for individual property units to be leased at market rates to earn revenue to partly cover expenses such as interest, management fees, and real estate taxes. Large-scale buyers of commercial property, such as insurance companies, are often reluctant to buy unless a property has been let, as this assures immediate cash flows from the investment.

How we see it

Our view is that if it is in the entity's ordinary course of business (supported by its strategy) to hold property for short-term sale rather than for long-term capital appreciation or rental income, the entire property (including the leased units) should be accounted for and presented as inventory. This will continue to be the case as long as it remains the intention to sell the property in the short term.

Rent received should be included in other income as it does not represent a reduction in the cost of inventory. The entity does not capitalise rental and related income generated by tenants against the cost of development as this is incidental to the development of the property and not a 'by-product' of the development process.

Investment property is defined in IAS 40 as "property ... held ... to earn rentals or for capital appreciation or both, rather than for ... use in the production or supply of goods or services or for administrative purposes; or ... sale in the ordinary course of business". [IAS 40.5]. Therefore, in the case outlined above, the property does not meet the definition of investment property. Properties intended for sale in the ordinary course of business, whether leased out or not, are outside the scope of IAS 40. However, if a property is not intended for sale, IAS 40 requires it to be transferred from inventory to investment property when there is a change in use. The change can be evidenced by the commencement of an operating lease to another party (see Chapter 20).

4.2 Costs of real estate inventory

4.2.1 Allocation of costs to individual units in multi-unit developments

A real estate developer of a multi-unit complex will be able to track and record various costs that are specific to individual units, such as individual fit out costs. However, there will also be various costs that are incurred which are not specific to any individual unit, such as the costs of land and any shared facilities, and a methodology will be required to allocate these costs to the individual units. This will of course impact the profit that is recognised on the sale of each individual unit.

There are two general approaches to this allocation:

- (i) The first approach is to allocate these non-unit specific costs based on some relative cost basis. A reasonable proxy of relative cost is likely to be the size of each unit and hence an appropriate methodology would be to allocate the non-unit specific cost per square metre to the individual units based upon the floor area of each unit. Another proxy of (total) relative cost may be the use of the specific cost of each unit. Marking up the specific cost that is attributable to each unit by a fixed percentage so as to cover and account for the non-unit specific costs would also seem reasonable. This relative cost approach is consistent with the guidance under IAS 2 in respect of allocation of overheads which requires a "systematic allocation of fixed and variable production overheads". [IAS 2.12].
- (ii) The second approach would be to allocate these non-unit specific costs based on the relative sales value of each unit. This methodology is specifically referred to by the standard in the context of a production process that results in more than one product being produced simultaneously. [IAS 2.14].

How we see it

In our view, both approaches discussed above are acceptable under IAS 2 when allocating non-unit specific costs to individual units in a multi-unit complex. Whichever approach is adopted it must be applied consistently. In addition, the developer must initially, as far as is practicable, segregate the non-unit specific costs between any commercial, retail and residential components before applying these methodologies.

These approaches are only appropriate when the entity constructs the units in the multi-unit real estate development simultaneously, as part of the same construction process, and allocates costs arising to the units on a rational and consistent basis.

4.2.2 Property demolition and lease costs

During the course of a property redevelopment project, an existing building may need to be demolished in order for the new development to take place. Should the cost of the building to be demolished be capitalised as part of the construction cost for the new building or should the cost be charged to profit or loss?

In all such cases an entity will need to exercise judgement in assessing the facts and circumstances. There are three distinct scenarios to consider:

- (a) The entity is the owner-occupier, in which case the matter falls under IAS 16 (see chapter 19)
- (b) The entity holds the property to earn rentals or for capital appreciation, in which case the matter falls under IAS 40 (see chapter 20)

Or

- (c) The entity sells such properties in its ordinary course of business

If it is the strategy of the developer to sell the developed property after construction, the new development falls within the scope of IAS 2, as it would be considered held for sale in the ordinary course of business by the developer. If the purchased property in question consists of land and an old building, the question of whether the land and building must be accounted for separately arises.

How we see it

In our view, the cost of the old building as well as demolition costs and costs of developing the new one would be treated as inventory if:

- At the time of purchase, it is the entity's intention to demolish the existing building
- And
- The building will not be used or leased out prior to its demolition

The cost of the new development will still be subject to the normal 'lower of cost and net realisable value' requirements.

If the property in question was purchased in a prior reporting period and subsequently occupied, the land and building would have been separately recognised in accordance with the requirements of IAS 16 in that period. If the existing building is demolished in subsequent periods in order for the new development to take place, the carrying amount of the old building will be derecognised in accordance with IAS 16 (see Chapter 19).

How we see it

When the building is demolished under the circumstances described above, our view is that the carrying amount of the old building which is derecognised in accordance with IAS 16 cannot be capitalised as part of the cost of the new building. In contrast, the carrying amount of the land will be transferred to inventory as part of the cost of the new building.

If a new development within the scope of IAS 2 is being constructed on land that is leased, the entity needs to determine whether the depreciation charge relating to the right-of-use asset represents a cost of conversion in bringing the inventories to their present location and condition as specified in IAS 2.12. If the entity concludes that this is the case, a systematic allocation of the depreciation of the right-of-use asset relating to that leased land used in the development process is included in the cost of the inventories.

[IAS 2.12].

5 Recognition in profit or loss

IAS 2 states the following: [IAS 2.34]

Extract from IAS 2

- 34 When inventories are sold, the carrying amount of those inventories shall be recognised as an expense in the period in which the related revenue is recognised. The amount of any write-down of inventories to net realisable value and all losses of inventories shall be recognised as an expense in the period the write-down or loss occurs. The amount of any reversal of any write-down of inventories, arising from an increase in net realisable value, shall be recognised as a reduction in the amount of inventories recognised as an expense in the period in which the reversal occurs.

The standard specifies that when inventory is sold, the carrying amount of the inventory must be recognised as an expense in the period in which the revenue is recognised. Judging when to recognise revenue, and therefore, when to recognise the related cost of sales, is one of the more complex accounting issues that can arise (see Chapter 28 for further discussions on this).

Consignment stock and sale and repurchase agreements are discussed in section 2.3.1.H above, and sales with a right of return are discussed in section 2.3.1.I above. In addition, revenue recognition in accordance with IFRS 15 is dealt with in Chapter 28, to which reference should be made in considering such issues.

Inventory used to create another asset, for instance into a self-constructed item of property, plant or equipment, would form part of the cost of that asset. Subsequently these costs are expensed through the depreciation of that item of property, plant and equipment during its useful life. [IAS 2.35].

Any write-downs or losses of inventory must be recognised as an expense when the write-down or loss occurs. Reversals of previous write-downs are recognised as a reduction in the inventory expense recognised in the period in which the reversal occurs. [IAS 2.34].

6 Disclosure requirements of IAS 2

6.1 General requirements

The following are the IAS 2 disclosure requirements: [IAS 2.36]

Extract from IAS 2

- 36** The financial statements shall disclose:
- (a) the accounting policies adopted in measuring inventories, including the cost formula used;
 - (b) the total carrying amount of inventories and the carrying amount in classifications appropriate to the entity;
 - (c) the carrying amount of inventories carried at fair value less costs to sell;
 - (d) the amount of inventories recognised as an expense during the period;
 - (e) the amount of any write-down of inventories recognised as an expense in the period in accordance with paragraph 34;
 - (f) the amount of any reversal of any write-down that is recognised as a reduction in the amount of inventories recognised as expense in the period in accordance with paragraph 34;
 - (g) the circumstances or events that led to the reversal of a write-down of inventories in accordance with paragraph 34; and
 - (h) the carrying amount of inventories pledged as security for liabilities.

IAS 2 does not specify the precise classifications that must be used to comply with the requirements in IAS 2.36(b) as shown above. However, it states that “information about the carrying amounts held in different classifications of inventories and the extent of the changes in these assets is useful to financial statement users”, and suggests suitable examples of common classifications such as merchandise, production supplies, materials, work in progress, and finished goods. [IAS 2.37].

Notes to the Consolidated Financial Statements Unilever Group [extract]

12. Inventories

Inventories are valued at the lower of weighted average cost and net realisable value. Cost comprises direct costs and, where appropriate, a proportion of attributable production overheads. Net realisable value is the estimated selling price less the estimated costs necessary to make the sale.

	€ million 2022	€ million 2021
Inventories		
Raw materials and consumables	2,062	1,598
Finished goods and goods for resale	4,248	3,393
Total inventories	6,310	4,991
Provision for inventories	(379)	(308)
	5,931	4,683

	€ million 2022	€ million 2021
Provision for inventories		
1 January	308	284
Charge to income statement	164	65
Reduction/(releases)	(66)	(56)
Currency translations	(12)	9
Others ^(a)	(15)	6
31 December	379	308

(a) Others include the amount relating to the acquisition/disposal of businesses and transfers.

Inventories with a value of €189 million (2021: €163 million) are carried at net realisable value, this being lower than cost. During 2022, a total expense of €407 million (2021: €281 million) was recognised in the income statement for inventory write-downs and losses.

The amount of inventory recognised as an expense in the period is normally included in cost of sales. This category includes unallocated production overheads and abnormal costs as well as the costs of inventories that have been sold. The circumstances of the entity may warrant the inclusion of distribution or other costs in cost of sales. [IAS 2.38]. Hence when a company presents its profit or loss based upon this IAS 1 'function of expense' or 'cost of sales' method it will normally be disclosing costs that are greater than those that have previously been classified as inventory.

Practical example 6-2 below shows how Stora Enso Oyj classified its inventories in its 2022 financial statements.

Practical example 6-2: Stora Enso Oyj (2022)

Republic of Finland

Annual Report 2022 [extract]

Notes to the consolidated financial statements [extract]

Note 16 Inventories

Accounting principles

Inventories are reported at lower of cost and net realisable value with the cost determined by the first-in first-out (FIFO) method or, alternatively, by the weighted average cost where it approximates FIFO. The same cost formula is used for all inventories having a similar nature and use to the Group. The cost of finished goods and work in progress comprises raw material, direct labour, depreciation, other direct costs and related production overheads, but excludes interest expenses. Net realisable value is the estimated selling price in the ordinary course of business, less the costs of completion and sale.

Where market conditions result in the manufacturing costs of a product exceeding its net realisable value, a valuation allowance is made. Valuation allowances are also made for old, slow moving and obsolete finished goods and spare parts when needed. Such valuation allowances are deducted from the carrying value of the inventories in the consolidated statement of financial position.

EUR million	As at 31 December	
	2022	2021
Materials and supplies	501	422
Work in progress	84	97
Finished goods	962	689
Spare parts and consumables	337	331
Other inventories	25	23
Advance payments and cutting rights	63	55
Obsolescence allowance - spare parts and consumables	-103	-125
Obsolescence allowance - finished goods	-19	-9
Net realisable value allowance	-40	-5
Total	1,810	1,478

EUR 6,576 (EUR 5,740) million of inventories in total have been expensed during the year. EUR 78 (EUR 29) million of inventory write-downs have been recognised as an expense. EUR 9 (EUR 16) million have been recognised as a reversal of previous write-downs.

Some entities adopt a format for profit or loss that results in amounts other than the cost of inventories being disclosed as an expense during the period. This will happen if an entity presents an analysis of expenses using a classification based on the nature of expenses. The entity then discloses the costs recognised as an expense for raw materials and consumables, labour costs and other costs together with the amount of the net change in inventories for the period. [IAS 2.39].

Formats for the presentation of profit or loss are discussed in Chapter 3.

The requirement to disclose the amount of any write-down of inventories recognised as an expense in the period in IAS 2.36(e) only relates to write-downs of inventory held at the end of the reporting period. The notion of 'write-down' is used in the context of the lower of cost and net realisable value test. An entity only performs this test at a reporting date.

6.2 Additional disclosure requirements for crypto-assets

In June 2019, the IFRS IC noted the following disclosure requirements in the context of holdings of cryptocurrencies in addition to the disclosures required by IAS 2 for cryptocurrencies held for sale in the ordinary course of business (see section 6 above):

- IAS 38 disclosures for holdings of cryptocurrencies to which it applies IAS 38 (see Chapter 18).
- IFRS 13 disclosures if an entity measures its holdings of cryptocurrencies at fair value less costs to sell (see Chapter 15).
- IAS 1 disclosures when an entity has made judgements regarding its accounting for holdings of cryptocurrencies, if they are part of the judgements that had the most significant effect on the amounts recognised in the financial statements (see chapter 3).¹³
- IAS 10 disclosures for any material non-adjusting events after the reporting period, including information about the nature of the event and an estimate of its financial effect (or a statement that such an estimate cannot be made) (see Chapter 34). For example, an entity holding cryptocurrencies would consider whether changes in the fair value of those holdings after the reporting period are of such significance that non-disclosure could influence the economic decisions that users of the financial statements make on the basis of the financial statements.¹⁴

13 IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

14 [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

Appendix A - Defined terms

Extract from IAS 2

- 6 The following terms are used in this Standard with the meanings specified:
- Inventories* are assets:
- (a) held for sale in the ordinary course of business;
 - (b) in the process of production for such sale; or
 - (c) in the form of materials or supplies to be consumed in the production process or in the rendering of services.
- Net realisable value* is the estimated selling price in the ordinary course of business less the estimated costs of completion and the estimated costs necessary to make the sale.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)

Overview

This chapter discusses the requirements of IFRS 16 *Leases* and how the standard is to be applied. IFRS 16 gives the accounting requirements for the recognition, measurement, presentation, and disclosure of leases and applies to both lessees and lessors. It has a single lessee accounting model and requires lessees to recognise assets and liabilities for most leases on their statements of financial position. Lessors, however, classify leases as operating or finance leases depending on whether the risks and rewards incidental to ownership of the underlying asset are transferred to the customer and account for the lease accordingly.

Under IFRS 16, leases are accounted for based on a 'right-of-use model'. The model reflects that, at the commencement date, a lessee has a financial obligation to make lease payments to the lessor for its right to use the underlying asset during the lease term. The lessor conveys that right to use the underlying asset at lease commencement, which is the time when it makes the underlying asset available for use by the lessee.

This chapter discusses how IFRS 16 is applied and is intended to help entities consider the effects of applying it.

What you need to know

- IFRS 16 requires lessees to put most leases on their statements of financial position.
- Lessees apply a single accounting model for all leases, with certain exemptions.
- Lessors classify leases as operating or finance leases depending on whether the risks and rewards incidental to ownership of the underlying asset are transferred to the customer and account for the lease accordingly.
- Entities need to focus on whether an arrangement contains a lease or a service agreement because there are significant differences in the accounting. Although we believe that the assessment of whether a contract contains a lease is straightforward in most arrangements, judgement may be required in applying the definition of a lease to certain arrangements, particularly those that include significant services.

1 Introduction

The International Accounting Standards Board (IASB or the Board) issued IFRS 16 after joint deliberations with the Financial Accounting Standards Board (FASB), which issued a similar standard (ASC 842 Leases). However, there are significant differences between the IASB and FASB standards (e.g., lessees classify leases as finance or operating leases under the FASB standard). These differences will result in certain transactions being accounted for differently under IFRS accounting standards and US GAAP. The key differences between IFRS 16 and ASC 842 are summarised in this chapter in the section in which they arise (see Appendix D for an overview).

2 Objective and scope of IFRS 16

2.1 Objective of IFRS 16

IFRS 16 sets out the principles for the recognition, measurement, presentation, and disclosure of leases. The objective is to ensure that lessees and lessors provide relevant information in a manner that faithfully represents those transactions. This information gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of an entity.

[IFRS 16.1].

IFRS 16 requires an entity to consider the terms and conditions of contracts and all relevant facts and circumstances, and to apply the standard consistently to contracts with similar characteristics and in similar circumstances. [IFRS 16.2].

2.2 Scope of IFRS 16

IFRS 16 paragraph 3 applies to all leases, including leases of right-of-use assets in a sublease, except for the following:

- (a) Leases to explore for, or use, minerals, oil, natural gas and similar non-regenerative resources (see Chapter 39)
- (b) Leases of biological assets within the scope of IAS 41 *Agriculture* held by a lessee (see Chapter 38)
- (c) Service concession arrangements within the scope of IFRIC 12 *Service Concession Arrangements* (see Chapter 26). Entities should evaluate the applicability of IFRIC 12 before evaluating whether an arrangement contains a lease.
- (d) Licences of intellectual property granted by a lessor within the scope of IFRS 15 *Revenue from Contracts with Customers* (see Chapter 28)
- (e) Rights held by a lessee under licensing agreements within the scope of IAS 38 *Intangible Assets* for such items as motion picture films, video recordings, plays, manuscripts, patents and copyrights (see Chapter 18) [IFRS 16.3]

A lessee may, but is not required to, apply IFRS 16 to leases of intangible assets not covered by the exceptions above. [IFRS 16.4]. Therefore, a lessee could choose to account for leases of such intangible assets under IFRS 16 (see Chapter 18).

There are differing views about whether other intangible assets (for example, a licence of software), not specifically referred to in IFRS 16.3(e) above are excluded from the scope of IFRS 16 based on interpretations of that paragraph. If an entity determines that an intangible asset is not excluded from the scope of IFRS 16, IFRS 16.4 permits, but does not require, an entity to account for the intangible asset as a lease.

If a cloud computing arrangement contains a lease of an asset other than a licence of software (or the entity has determined that a licence of software is not excluded from the scope of IFRS 16 and has elected to account for leases of intangible assets under IFRS 16), an entity should apply the provisions of IFRS 16 to the cloud computing arrangement. This includes identifying and separating lease and non-lease components and allocating contract consideration, which is discussed in section 3.2.2 below.

FASB differences

As discussed above, a lessee may, but is not required to, apply IFRS 16 to leases of intangible assets, other than rights held by a lessee under licensing agreements within the scope of IAS 38 for such items as motion picture films, video recordings, plays, manuscripts, patents and copyrights. Lessors are required to apply IFRS 16 to leases of intangible assets, except for licences of intellectual property that are in the scope of IFRS 15. All leases of intangible assets are excluded from the scope of ASC 842.

2.3 Recognition exemptions

IFRS 16 allows a lessee to elect not to apply the recognition requirements to:

- (a) Short-term leases

And

- (b) Leases for which the underlying asset is of low value [IFRS 16.5]

These recognition exemptions are discussed further in section 5.1 below.

3 What is a lease?

IFRS 16 defines a lease as a contract, or part of a contract, which conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration. [IFRS 16 Appendix A]. The determination of whether an arrangement contains a lease is performed at the inception of the contract. [IFRS 16.9].

The assessment of whether a contract is or contains a lease will be straightforward in most arrangements. However, judgement may be required in applying the definition of a lease to certain arrangements. For example, in contracts that include significant services, determining whether the contract conveys the right to direct the use of an identified asset may be challenging. We discuss this further below.

3.1 Determining whether an arrangement contains a lease

Extract from IFRS 16

Appendix A Defined terms

lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.
period of use	The total period of time that an asset is used to fulfil a contract with a customer (including any non-consecutive periods of time).

Terms defined in other Standards and used in this Standard with the same meaning

contract	An agreement between two or more parties that creates enforceable rights and obligations.
-----------------	---

[IFRS 16 Appendix A].

At inception of a contract, an entity assesses whether the contract is, or contains, a lease. A contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration. [IFRS 16.9]. See section 3.1.2 below for additional discussion on identified assets.

A period of time may be described in terms of the amount of use of an identified asset (for example, the number of production units that an item of equipment will be used to produce). [IFRS 16.10].

To assess whether a contract conveys the right to control the use of an identified asset for a period of time, an entity assesses whether, throughout the period of use, the customer has both of the following:

- (a) The right to obtain substantially all of the economic benefits from use of the identified asset (see section 3.1.4 below).

And

- (b) The right to direct the use of the identified asset (see section 3.1.5 below). [IFRS 16.B9].

If the customer has the right to control the use of an identified asset for only a portion of the term of the contract, the contract contains a lease for that portion of the term. [IFRS 16.B10].

An entity assesses whether a contract contains a lease for each potential separate lease component. [IFRS 16.B12]. See section 3.2 below.

FASB differences

In accordance with ASC 842, entities classify and account for related party leases (including sale and leaseback transactions) based on the legally enforceable terms and conditions of the lease. In addition, private companies and certain not-for-profit entities can elect a practical expedient to use the written terms and conditions of a common control arrangement to determine whether a lease exists and to classify and account for the lease. IFRS 16 does not include guidance on related party leases or a practical expedient for common control arrangements.

3.1.1 Joint arrangements

Entities often enter into joint arrangements with other entities for certain activities (e.g., exploration of oil and gas fields, development of pharmaceutical products).

A contract for the use of an asset by a joint arrangement might be entered into in a number of different ways, including:

- Directly by the joint arrangement, if the joint arrangement has its own legal identity.
- By each of the parties to the joint arrangement (i.e., the lead operator and the other parties, commonly referred to as the non-operators) individually signing the same arrangement.
- By one or more of the parties to the joint arrangement on behalf of the joint arrangement. Generally, this would be evidenced in the contract and the parties to the joint arrangement would have similar rights and obligations as they would if they individually signed the arrangement. In these situations, the facts and circumstances, as well as the legal position of each entity, need to be evaluated carefully.
- By the lead operator of the joint arrangement in its own name, i.e., as principal. This may occur when the lead operator leases equipment which it then uses in fulfilling its obligations as the lead operator of the joint arrangement and/or across a range of unrelated activities, including other joint arrangements with unrelated activities, such as with other joint operating parties.

A contract to receive goods or services may be entered into by a joint arrangement or on behalf of a joint arrangement, as defined by IFRS 11 *Joint Arrangements*. In this case, the joint arrangement is considered to be the customer in the contract. [IFRS 16.B11]. Accordingly, in determining whether such a contract contains a lease, an assessment needs to be made as to which party (e.g., the joint arrangement or the lead operator) has the right to control the use of an identified asset throughout the period of use.

If the parties to the joint arrangement collectively have the right to control the use of an identified asset throughout the period of use as a result of their collective control of the operation, the joint arrangement is the customer to the contract that may contain a lease. It would be inappropriate to conclude that the contract does not contain a lease on the grounds that each of the parties to the joint arrangement either has rights to a non-physically distinct portion of an underlying asset and, therefore, does not have the right to substantially all of the economic benefits from the use of that underlying asset or does not unilaterally direct its use. Determining if the parties to the joint arrangement collectively have the right to control the use of an identified asset throughout the period of use would require a careful analysis of the rights and obligations of each party.

In the first three scenarios above, if it has been determined that a contract is, or contains, a lease, each of the parties to the joint arrangement (i.e., the joint operators comprising the lead operator and the non-operators) will account for their respective interests in the joint arrangement (including any leases) under IFRS 11.20 to 23. Therefore, they will account for their individual share of any right-of-use assets and lease liabilities, and associated depreciation and interest.

In the fourth scenario (i.e., where the lead operator enters the arrangement in its own name), the lead operator will need to assess whether the arrangement is, or contains, a lease. If the lead operator controls the use of the identified asset, it would recognise the entire right-of-use asset and lease liability on its statement of financial position. This would be the case even if it is entitled to bill the non-operator parties their proportionate share of the costs under the joint operating agreement (JOA).

If the lead operator determines that it is the lessee, it would also evaluate whether it has entered into a sublease with the joint arrangement (as the customer to the sublease). For example, the lead operator may enter into a five-year equipment lease with a supplier but may then enter into a two-year arrangement with one of its joint arrangements, thereby yielding control of the right to use the equipment to the joint arrangement during the two-year period. In many cases, the lead operator will not meet the requirements to recognise a sublease because the arrangement does not create legally enforceable rights and obligations that convey the right to control the use of the asset to the joint arrangement. However, the conclusion as to whether the joint arrangement is a customer, i.e., the lessee in a contract with a lead operator, by virtue of the JOA, would be impacted by the individual facts and circumstances.

If the lead operator subleases an asset to the joint arrangement, IFRS 11 requires the non-operators to recognise their respective share of the joint arrangement's right-of-use asset and lease liability, and the lead operator accounts for its sublease to the joint arrangement separately. However, if there is no sublease, the non-operators recognise joint interest payables when incurred for their share of the costs incurred by the lead operator in respect of the leased asset.

In limited cases, the lead operator and non-operators will enter into a contract directly with the supplier, in which the lead operator and non-operators are proportionately liable for their share of the arrangement. In this case, the parties with interests in the joint operation would recognise their proportionate share of the leased asset, liability and lease expense in accordance with IFRS 11.

Frequently asked questions

Question 3-1: Should the lead operator in an unincorporated joint operation recognise in full the lease liability for a contract into which it alone has the primary obligation to make payments to the lessor?

In March 2019, the IFRS IC published an agenda decision regarding how a lead operator (the party responsible for undertaking the operations on behalf of the other joint operators) of a joint operation (JO), which is not structured through a separate vehicle, recognises a lease liability. The question specifically focused on situations where the lead operator, as the sole signatory, enters into a lease contract with a third-party supplier (lessor) for an item of property, plant and equipment that will be operated jointly as part of the JO's activities. The lead operator has the right to recover a share of the lease costs from the other joint operators in accordance with the contractual and other arrangements governing the JO.

The IFRS IC concluded, that in accordance with IFRS 11, a joint operator identifies and recognises both:

(a) Liabilities it incurs in relation to its interest in the JO

And

(b) Its share of any liabilities incurred jointly with other parties to the joint arrangement

The IFRS IC observed that identifying the liabilities that a joint operator incurs and those incurred jointly, requires an assessment of the terms and conditions in all contractual arrangements that relate to the JO, including consideration of the laws pertaining to those agreements. The IFRS IC further observed, in accordance with IFRS 11, the liabilities a joint operator recognises include those for which it has primary responsibility. Therefore, as sole signatory and where a lead operator has primary responsibility for a lease, the lead operator recognises 100% of the lease liability.

The IFRS IC also highlighted the importance of disclosing information about joint operations that is sufficient for a user of financial statements to understand the activities of the joint operation and a joint operator's interest in that operation. Therefore, the IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for the lead operator to identify and recognise its liabilities in relation to its interest in a JO and did not add this matter to its standard-setting agenda.

Joint arrangements are particularly common in extractive industries and the implications of this agenda decision are discussed further in Chapter 39.

3.1.2 Identified asset

An arrangement only contains a lease if there is an identified asset.

An asset is typically identified by being explicitly specified in a contract. However, an asset can also be identified by being implicitly specified at the time that the asset is made available for use by the customer.

[IFRS 16.B13].

Illustration 3-1: Implicitly specified asset

Customer X enters into a five-year contract with Supplier Y for the use of rolling stock specifically designed for Customer X. The rolling stock is designed to transport materials used in Customer X's production process and is not suitable for use by other customers. The rolling stock is not explicitly specified in the contract, but Supplier Y owns only one rolling stock that is suitable for Customer X's use. If the rolling stock does not operate properly, the contract requires Supplier Y to repair or replace the rolling stock. Assume that Supplier Y does not have a substantive substitution right. Refer to section 3.1.3.

Analysis: The rolling stock is an identified asset. While the rolling stock is not explicitly specified in the contract (e.g., by serial number), it is implicitly specified because Supplier Y must use it to fulfil the contract.

Illustration 3-2: Identified asset - implicitly specified at the time the asset is made available for use by the customer

Customer X enters into a five-year contract with Supplier Y for the use of a car. The specification of the car is specified in the contract (brand, type, colour, options etc.). At inception of the contract the car is not yet built.

Analysis: The car is an identified asset. Although the car cannot be identified at inception of the contract, it is apparent that it will be identifiable at the commencement of the lease. The car is identified by being implicitly specified at the time that it is made available for use by the customer (i.e., at the commencement date).

A capacity portion of an asset is an identified asset if it is physically distinct (e.g., a floor of a building). A capacity or other portion of an asset that is not physically distinct (e.g., a capacity portion of a fibre optic cable) is not an identified asset unless it represents substantially all of the capacity of the asset and thereby provides the customer with the right to obtain substantially all of the economic benefits from use of the asset. [IFRS 16.B20].

Some contracts allow the use of an identified asset for specified non-consecutive periods. This is discussed further at section 4.4.1.A below.

Some contracts involve a dedicated cable that is part of the larger network infrastructure (e.g., unbundled network element arrangements for the 'last mile' to a customer location, 'special access' arrangements for a dedicated connection between two locations). IFRS 16 does not specify or provide examples that clarify that these arrangements are identified assets. However, the FASB's standard ASC 842 includes an additional example that is similar to a dedicated cable (i.e., a segment of a pipeline that connects a single customer to a larger pipeline). The example clarifies that such segments of a larger pipeline are identified assets.

How we see it

As the IASB has stated that both it and the FASB have reached the same conclusions on the definition of a lease, we believe that, under IFRS 16, the last mile of a network that connects a single customer to a larger network may be an identified asset. However, such arrangements may, or may not, meet the definition of a lease. Entities will need to consider the facts and circumstances of each arrangement to determine whether there is an identified asset and whether the arrangement meets the definition of a lease.

Illustration 3-3: Identified asset - physically distinct portion of a larger asset

Customer X enters into a 12-year contract with Supplier Y for the right to use three fibres within a fibre optic cable between New York and London. The contract identifies three of the cable's 20 fibres for use by Customer X. The three fibres are dedicated solely to Customer X's data for the duration of the contract term. Assume that Supplier Y does not have a substantive substitution right (refer to section 3.1.3).

Analysis: The three fibres are identified assets because they are physically distinct and explicitly specified in the contract.

Illustration 3-4: Identified asset - capacity portion of an asset

Scenario A

Customer X enters into a five-year contract with Supplier Y for the right to transport oil from Country A to Country B through Supplier Y's pipeline. The contract provides that Customer X will have the right to use of 95% of the pipeline's capacity throughout the term of the arrangement.

Analysis: The capacity portion of the pipeline is an identified asset. While 95% of the pipeline's capacity is not physically distinct from the remaining capacity of the pipeline, it represents substantially all of the capacity of the entire pipeline and thereby provides Customer X with the right to obtain substantially all of the economic benefits from use of the pipeline.

Scenario B

Assume the same facts as in Scenario A, except that Customer X has the right to use 60% of the pipeline's capacity throughout the term of the arrangement.

Analysis: The capacity portion of the pipeline is not an identified asset because 60% of the pipeline's capacity is less than substantially all of the capacity of the pipeline. Customer X does not have the right to obtain substantially all of the economic benefits from use of the pipeline.

Land easements or rights of way are rights to use, access or cross another entity's land for a specified purpose. For example, a land easement might be obtained for the right to construct and operate a pipeline or other assets (e.g., railway line, utility pipes or telecommunication lines) over, under or through an existing area of land or body of water while allowing the landowner continued use of the land for other purposes (e.g., farming), as long as the landowner does not interfere with the rights conveyed in the land easement. A land easement may be perpetual or for a specified term. It may provide for exclusive or non-exclusive use of the land and may be prepaid or paid over a defined term.

Perpetual easements are outside the scope of IFRS 16, as the definition of a lease requires the contract to be for a period of time. Therefore, entities must carefully evaluate easement contracts to determine whether the contract is perpetual or for a period of time. Examples of contracts that may appear perpetual but are term-based include:

- Very long-term contracts (e.g., the FASB indicated in the Basis for Conclusions (BC113) to ASC 842 that very long-term leases of land (e.g., 999 years) are in the scope of ASC 842).
- Contracts with a stated non-cancellable lease term that 'automatically renews' if the lessee pays a periodic renewal fee. This is an in-substance fixed term contract with optional renewal periods.
- Contracts that define the period of use as the period over which the assets are used (e.g., as long as natural gas flows through a gathering system) are a fixed term contract (i.e., terminated when production ceases) rather than a perpetual contract because the gas reserves will ultimately be depleted.

When determining whether a contract for a land easement or right of way is a lease, entities will need to assess whether there is an identified asset and whether the customer obtains substantially all of the economic benefits of the identified asset and has the right to direct the use of that asset throughout the period of use.

Frequently asked questions

Question 3-2: Does IFRS 16 apply to the right to place an oil pipeline in underground space for a period of time in exchange for consideration?

In June 2019, the IFRS IC discussed a contract for subsurface rights. In the contract described, a pipeline operator obtains the right to place an oil pipeline in underground space for 20 years in exchange for consideration. The contract specifies the exact location and dimensions (path, width and depth) of the underground space within which the pipeline will be placed. The landowner retains the right to use the surface of the land above the pipeline, but it has no right to access or otherwise change the use of the specified underground space throughout the 20-year period of use. The customer has the right to perform inspection, repairs and maintenance work (including replacing damaged sections of the pipeline when necessary).

The IFRS IC noted the following in the agenda decision:

- Paragraph 3 of IFRS 16 requires an entity to apply IFRS 16 to all leases, with limited exceptions. In the contract described in the request, none of the exceptions in IFRS 16.3 and 4 apply (see section 2.2 above). In particular, the IFRS IC noted that the underground space is tangible. Accordingly, if the contract contains a lease, IFRS 16 applies to that lease. If the contract does not contain a lease, the entity would then consider which other IFRS accounting standard applies.
- Applying IFRS 16.B9, to meet the definition of a lease, the customer must have both:
- The right to obtain substantially all the economic benefits from use of an identified asset throughout the period of use
And
- The right to direct the use of the identified asset throughout the period of use
- The specified underground space is physically distinct from the remainder of the land. The contract's specifications include the path, width and depth of the pipeline, thereby defining a physically distinct underground space. The space being underground does not in itself affect whether it is an identified asset - the specified underground space is physically distinct in the same way that a specified area of space on the land's surface would be physically distinct. As the landowner does not have the right to substitute the underground space throughout the period of use, the IFRS IC concluded that the specified underground space is an identified asset as described in IFRS 16.B13 to B20.
- The customer has the right to obtain substantially all the economic benefits from use of the specified underground space throughout the 20-year period of use. The customer has exclusive use of the specified underground space throughout that period of use.
- The customer has the right to direct the use of the specified underground space throughout the 20-year period of use because the customer has the right to operate the asset throughout the period of use without the supplier having the right to change those operating instructions. How and for what purpose the specified underground space will be used (i.e., to locate the pipeline with specified dimensions through which oil will be transported) is predetermined in the contract. The customer has the right to operate the specified underground space by having the right to perform inspection, repairs and maintenance work. The customer makes all the decisions about the use of the specified underground space that can be made during the 20-year period of use.

Consequently, the IFRS IC concluded that the contract described in the request contains a lease as defined in IFRS 16. The customer would therefore apply IFRS 16 in accounting for that lease.

3.1.3 Substantive substitution rights

Even if an asset is specified, a customer does not have the right to use an identified asset if, at inception of the contract, a supplier has the substantive right to substitute the asset throughout the period of use (i.e., the total period of time that an asset is used to fulfil a contract with a customer, including the sum of any non-consecutive periods of time). [IFRS 16 Appendix A]. A supplier's right to substitute an asset is substantive when both of the following conditions are met:

- The supplier has the practical ability to substitute alternative assets throughout the period of use (e.g., the customer cannot prevent the supplier from substituting an asset and alternative assets are readily available to the supplier or could be sourced by the supplier within a reasonable period of time).
- The supplier would benefit economically from the exercise of its right to substitute the asset (i.e., the economic benefits associated with substituting the asset are expected to exceed the costs associated with substituting the asset). [IFRS 16.B14].

The IASB indicated in the Basis for Conclusions to IFRS 16 that the conditions above are intended to differentiate between substitution rights that result in a supplier controlling the use of an asset, rather than the customer, and rights that do not change the substance or character of the contract. [IFRS 16.BC113].

If the supplier has a right or an obligation to substitute the asset only on or after either a particular date, or the occurrence of a specified event, the supplier's substitution right is not substantive because the supplier does not have the practical ability to substitute alternative assets throughout the period of use.

[IFRS 16.B15].

An entity's evaluation of whether a supplier's substitution right is substantive is based on facts and circumstances at inception of the contract. At inception of the contract, an entity should not consider future events that are not likely to occur. IFRS 16 provides the following examples of circumstances that, at inception of the contract, are not likely to occur and, thus, are excluded from the evaluation of whether a supplier's substitution right is substantive throughout the period of use:

- An agreement by a future customer to pay an above market rate for use of the asset
- The introduction of new technology that is not substantially developed at inception of the contract
- A substantial difference between the customer's use of the asset, or the performance of the asset, and the use or performance considered likely at inception of the contract
- A substantial difference between the market price of the asset during the period of use, and the market price considered likely at inception of the contract [IFRS 16.B16]

In many cases, it will be clear that the supplier will not benefit from the exercise of a substitution right because of the costs associated with substituting an asset. [IFRS 16.BC113]. The physical location of the asset may affect the costs associated with substituting the asset. For example, if an asset is located at the customer's premises, the cost associated with substituting it is generally higher than the cost of substituting a similar asset located at the supplier's premises. [IFRS 16.B17]. However, simply because a supplier concludes that the cost of substitution is not significant does not automatically mean that it would economically benefit from the right of substitution.

IFRS 16 further clarifies that a customer should presume that a supplier's substitution right is not substantive when the customer cannot readily determine whether the supplier has a substantive substitution right. [IFRS 16.B19]. This requirement is intended to clarify that a customer is not expected to exert undue effort to provide evidence that a substitution right is not substantive.

How we see it

We believe that suppliers cannot presume that their substitution rights are non-substantive because suppliers should have sufficient information to make such a determination.

Contract terms that allow or require a supplier to substitute alternative assets only when the underlying asset is not operating properly (e.g., a normal warranty provision) or when a technical upgrade becomes available do not create a substantive substitution right. [IFRS 16.B18].

Illustration 3-5: Substitution rights

Scenario A

Assume that an electronic data storage provider (supplier) provides services through a centralised data centre, that involve the use of a specified server (Server No. 9). The supplier maintains many identical servers in a single accessible location and determines, at inception of the contract, that it is permitted to and can easily substitute another server without the customer's consent throughout the period of use. Further, the supplier would benefit economically from substituting an alternative asset, because doing this would allow the supplier to optimise the performance of its network at only a nominal cost. In addition, the supplier has made clear that it has negotiated this right of substitution as an important right in the arrangement, and the substitution right affected the pricing of the arrangement.

Analysis: The customer does not have the right to use an identified asset because, at the inception of the contract, the supplier has the practical ability to substitute the server and would benefit economically from such a substitution. However, if the customer could not readily determine whether the supplier had a substantive substitution right (e.g., there is insufficient transparency into the supplier's operations), the customer would presume the substitution right is not substantive and conclude that there is an identified asset.

Scenario B

Assume the same facts as in Scenario A except that Server No. 9 is customised, and the supplier does not have the practical ability to substitute the customised asset throughout the period of use. Additionally, it is unclear whether the supplier would benefit economically from sourcing a similar alternative asset.

Analysis: Because the supplier does not have the practical ability to substitute the asset and there is no evidence of economic benefit to the supplier for substituting the asset, the substitution right is non-substantive, and Server No. 9 would be an identified asset. In this case, neither of the conditions of a substitution right is met. As a reminder, both conditions must be met for the supplier to have a substantive substitution right.

Frequently asked questions**Question 3-3: Does a contract contain a lease when the supplier has substitution rights that are not substantive throughout the period of use?**

In March 2023, the IFRS IC discussed a fact pattern in which a customer enters into a 10-year contract with a supplier for 100 similar batteries used in electric buses. The supplier has the practical ability to substitute alternative assets throughout the contract term and would be required to compensate the customer for any revenue lost or costs incurred while the substitution takes place. At inception of the contract, it is expected that the supplier would benefit economically from substituting the battery once it has been used for three years or more but not before.

The IFRS IC noted that the customer is able to benefit from the use of each battery together with a bus that is readily available to it, and each battery is neither highly dependent on, or highly interrelated with the other batteries in the contract. The supplier has the practical ability to substitute alternative batteries throughout the period of use. However, because the supplier is not expected to benefit economically from substituting a battery for at least the first three years of the contract, the supplier does not have a substantive substitution right throughout the period of use.

Therefore, in the fact pattern presented, the IFRS IC concluded that each battery is an identified asset. It follows that, in evaluating whether the contract contains a lease, the requirements in IFRS 16 need to be applied to assess whether, throughout the period of use, the customer has the right to obtain substantially all the economic benefits from use, and direct the use, of each battery.

3.1.4 Right to obtain substantially all of the economic benefits from use of the identified asset

To control the use of an identified asset, a customer is required to have the right to obtain substantially all of the economic benefits from use of the identified asset throughout the period of use (e.g., by having exclusive use of the asset throughout that period). A customer can obtain economic benefits either directly or indirectly (e.g., by using, holding or subleasing the asset). Economic benefits include the asset's primary outputs (i.e., goods or services) and any by-products (e.g., renewable energy credits that are generated through the use of the asset), including potential cash flows derived from these items. Economic benefits also include benefits from using the asset that could be realised from a commercial transaction with a third party (e.g., subleasing the asset). [IFRS 16.B21].

However, economic benefits arising from construction or ownership of the identified asset (e.g., tax benefits related to excess tax depreciation and investment tax credits) are not considered economic benefits derived from the use of the asset. Therefore, they are not considered when assessing whether a customer has the right to obtain substantially all of the economic benefits.

When assessing the right to obtain substantially all of the economic benefits from use of an asset, an entity considers the economic benefits that result from use of the asset within the defined scope of a customer's right to use the asset. For example:

- (a) If a contract limits the use of a motor vehicle to only one particular territory during the period of use, an entity considers only the economic benefits from use of the motor vehicle within that territory, and not beyond.
Or
- (b) If a contract specifies that a customer can drive a motor vehicle only up to a particular number of miles during the period of use, an entity considers only the economic benefits from use of the motor vehicle for the permitted mileage, and not beyond. [IFRS 16.B22].

If a contract requires a customer to pay the supplier or another party a portion of the cash flows derived from use of an asset as consideration, those cash flows paid as consideration are considered to be part of the economic benefits that the customer obtains from use of the asset. For example, if the customer is required to pay the supplier a percentage of sales from use of retail space as consideration for that use, that requirement does not prevent the customer from having the right to obtain substantially all of the economic benefits from use of the retail space. This is because the cash flows arising from those sales are considered to be economic benefits that the customer obtains from use of the retail space, a portion of which it then pays to the supplier as consideration for the right to use that space. [IFRS 16.B23].

Frequently asked questions

Question 3-4: Does an electricity retailer, applying IFRS 16.B9(a), have the right to obtain substantially all the economic benefits from use of a windfarm throughout the term of an agreement with a windfarm generator?

In December 2021, the IFRS IC discussed a fact pattern in which, an electricity retailer (customer) and a windfarm generator (supplier) are registered participants in an electricity market, in which customers and suppliers are unable to enter into contracts directly with each other for the purchase and sale of electricity. Instead, customers and suppliers transact directly with the market's electricity grid to make purchases and sales at the spot price which is set by the market operator. In a separate agreement the customer and supplier swap the spot price per megawatt of electricity the windfarm supplies to the grid during the 20-year term of the agreement for a fixed price per megawatt, which is settled net in cash. The separate agreement also transfers to the customer all renewable energy credits that accrue from use of the windfarm.

The IFRS IC observed that, in the fact pattern described in the request, the economic benefits from use of the windfarm include the electricity it produces (as its primary output) and the renewable energy credits (as a by-product or other economic benefit from use of the windfarm). The agreement results in the customer settling with the supplier the difference between the fixed price and the spot prices per megawatt of electricity the windfarm supplies to the grid throughout the 20-year term of the agreement. That agreement, however, gives rise to neither the right nor the obligation for the customer to obtain any of the electricity the windfarm produces and supplies to the grid. Although the customer has the right to obtain the renewable energy credits (which represent a portion of the economic benefits from use of the windfarm), the customer does not have the right to obtain substantially all the economic benefits from use of the windfarm because it has no right to obtain any of the electricity the windfarm produces throughout the period of the agreement. The IFRS IC therefore concluded that, in the fact pattern described in the request, the customer does not have the right to obtain substantially all the economic benefits from use of the windfarm. Consequently, the contract does not contain a lease.

3.1.5 Right to direct the use of the identified asset

A customer has the right to direct the use of an identified asset throughout the period of use when either:

- The customer has the right to direct how and for what purpose the asset is used throughout the period of use.
- The relevant decisions about how and for what purpose an asset is used are predetermined and the customer either: (1) has the right to operate the asset, or to direct others to operate the asset in a manner that it determines, throughout the period of use, without the supplier having the right to change those operating instructions; or (2) designed the asset, or specific aspects of the asset, in a way that predetermines how and for what purpose the asset will be used throughout the period of use.

[IFRS 16.B24].

3.1.5.A The right to direct how and for what purpose an asset is used throughout the period of use

Extract from IFRS 16

B25 A customer has the right to direct how and for what purpose the asset is used if, within the scope of its right of use defined in the contract, it can change how and for what purpose the asset is used throughout the period of use. In making this assessment, an entity considers the decision-making rights that are most relevant to changing how and for what purpose the asset is used throughout the period of use. Decision-making rights are relevant when they affect the economic benefits to be derived from use. The decision-making rights that are most relevant are likely to be different for different contracts, depending on the nature of the asset and the terms and conditions of the contract.

A customer has the right to direct the use of an identified asset whenever it has the right to direct how and for what purpose the asset is used throughout the period of use (i.e., it can change how and for what purpose the asset is used throughout the period of use). [IFRS 16.B25]. How and for what purpose an asset is used is a single concept (i.e., ‘how’ an asset is used is not assessed separately from ‘for what purpose’ an asset is used). [IFRS 16.BC120].

When evaluating whether a customer has the right to change how and for what purpose the asset is used throughout the period of use, the focus should be on whether the customer has the decision-making rights that will most affect the economic benefits that will be derived from the use of the asset. The decision-making rights that are most relevant are likely to depend on the nature of the asset and the terms and conditions of the contract.

The IASB has indicated that decisions about how and for what purpose an asset is used can be viewed as similar to the decisions made by a board of directors. Decisions made by a board of directors about the operating and financing activities of an entity are generally the most relevant decisions rather than the actions of individuals in implementing those decisions. [IFRS 16.BC120].

IFRS 16 provides the following examples of decision-making rights that grant the right to change how and for what purpose an asset is used:

- The right to change the type of output that is produced by the asset (e.g., deciding whether to use a shipping container to transport goods or for storage, deciding on the mix of products sold from a retail unit)
- The right to change when the output is produced (e.g., deciding when an item of machinery or a power plant will be used)
- The right to change where the output is produced (e.g., deciding on the destination of a truck or a ship, deciding where a piece of equipment is used or deployed)
- The right to change whether the output is produced and the quantity of that output (e.g., deciding whether to produce energy from a power plant and how much energy to produce from that power plant). [IFRS 16.B26].

IFRS 16 also provides the following examples of decision-making rights that do not grant the right to change how and for what purpose an asset is used:

- Maintaining the asset
- Operating the asset

Although the decisions about maintaining and operating the asset are often essential to the efficient use of that asset, the right to make those decisions, in and of itself, does not result in the right to change how and for what purpose the asset is used throughout the period of use. [IFRS 16.B27].

The customer does not need the right to operate the underlying asset to have the right to direct its use. That is, the customer may direct the use of an asset that is operated by the supplier’s personnel. However, as discussed in section 3.1.5.B below, the right to operate an asset will often provide the customer the right to direct the use of the asset if the relevant decisions about how and for what purpose the asset is used are predetermined.

How we see it

We believe that the assessment of whether a contract is or contains a lease will be straightforward in most arrangements. However, judgement may be required in applying the definition of a lease to certain arrangements. For example, in contracts that include significant services, we believe that determining whether the contract conveys the right to direct the use of an identified asset may be challenging.

3.1.5.B The relevant decisions about how and for what purpose an asset is used are predetermined

In some cases, it will not be clear whether the customer has the right to direct the use of the identified asset. This could be the case when the most relevant decisions about how and for what purpose an asset is used are predetermined by contractual restrictions on the use of the asset (e.g., the decisions about the use of the asset are agreed to by the customer and the supplier in negotiating the contract, and those decisions cannot be changed). This could also be the case when the most relevant decisions about how and for what purpose an asset is used are, in effect, predetermined by the design of the asset. The IASB indicated that it would expect decisions about how and for what purpose an asset is used to be predetermined in relatively few cases. [IFRS 16.BC121]. In such cases, a customer has the right to direct the use of an identified asset throughout the period of use when the customer either:

- Has the right to operate the asset, or direct others to operate the asset in a manner it determines, throughout the period of use without the supplier having the right to change those operating instructions
- Designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use [IFRS 16.B24]

Significant judgement may be required to assess whether a customer designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use. Example 9 in IFRS 16 illustrates the evaluation of whether a customer designed the asset in a way that predetermines how and for what purpose the asset will be used throughout the period of use.

Frequently asked questions

Question 3-5: Does a customer have the right to direct the use of a ship in accordance with IFRS 16?

In January 2020, the IFRS IC issued an agenda decision about whether the customer has the right to direct the use of a ship throughout the five-year term of a contract. In the fact pattern described in the request:

- (a) There is an identified asset (the ship) applying IFRS 16.B13 to B20.
- (b) The customer has the right to obtain substantially all of the economic benefits from use of the ship throughout the five-year period of use applying IFRS 16.B21 to B23.
- (c) Many, but not all, decisions about how, and for what purpose, the ship is used are predetermined in the contract. The customer has the right to make the remaining decisions about how, and for what purpose, the ship is used throughout the period of use (i.e., the order of the voyages to the designated ports during the contract term). In the fact pattern described in the request, the customer has determined that this decision-making right is relevant because it affects the economic benefits to be derived from use of the ship.
- (d) The supplier operates and maintains the ship throughout the period of use.

The IFRS IC observed that, in the fact pattern described in the request, because not all relevant decisions about how and for what purpose the ship is used are predetermined, the customer considers IFRS 16.B24(a) in assessing whether it has the right to direct the use of the ship.

Paragraph B24(a) specifies that a customer has the right to direct the use of an identified asset throughout the period of use if it has “the right to direct how and for what purpose the asset is used throughout the period of use (as described in IFRS 16.B25 to B30)”. To have the right to direct how and for what purpose the asset is used, within the scope of its right of use defined in the contract, the customer must be able to change how and for what purpose the asset is used throughout the period of use (IFRS 16.B25). In assessing whether that is the case, an entity considers rights to make decisions during the period of use that are most relevant to changing how and for what purpose the asset is used throughout that period. Decision-making rights are relevant when they affect the economic benefits to be derived from use (IFRS 16.B25). An entity does not consider decisions that are predetermined before the period of use unless the conditions in IFRS 16.B24(b)(ii) exist (IFRS 16.B29).

The IFRS IC observed that, in the fact pattern described in the request, the customer has the right to direct how and for what purpose the ship is used throughout the period of use. Within the scope of its right of use defined in the contract, the customer can change how and for what purpose the ship is used (i.e., the customer can change the order of the voyages to the designated ports during the contract term). Despite many decisions about how and for what purpose the ship is used being predetermined, such decisions define the scope of the customer's right of use. Therefore, in this fact pattern, the customer has the right to make the decisions that are most relevant to changing how and for what purpose the ship is used.

The IFRS IC also observed that, although the operation and maintenance of the ship are essential to its efficient use, the supplier's decisions in this regard do not give it the right to direct how and for what purpose the ship is used.

The IFRS IC concluded that, in the fact pattern described in the request, the customer has the right to direct the use of the ship throughout the period of use. Consequently, the contract contains a lease.

3.1.5.C Specifying the output of an asset before the period of use

Extract from IFRS 16

Decisions determined during and before the period of use

- B28 The relevant decisions about how and for what purpose the asset is used can be predetermined in a number of ways. For example, the relevant decisions can be predetermined by the design of the asset or by contractual restrictions on the use of the asset.
- B29 In assessing whether a customer has the right to direct the use of an asset, an entity shall consider only rights to make decisions about the use of the asset during the period of use, unless the customer designed the asset (or specific aspects of the asset) as described in paragraph B24(b)(ii). Consequently, unless the conditions in paragraph B24(b)(ii) exist, an entity shall not consider decisions that are predetermined before the period of use. For example, if a customer is able only to specify the output of an asset before the period of use, the customer does not have the right to direct the use of that asset. The ability to specify the output in a contract before the period of use, without any other decision-making rights relating to the use of the asset, gives a customer the same rights as any customer that purchases goods or services.

[IFRS 16.B28, IFRS 16.B29].

If a customer can only specify the output from an asset before the beginning of the period of use and cannot change that output throughout the period of use, the customer does not have the right to direct the use of that asset unless it designed the asset, or specific aspects of the asset, as contemplated in IFRS 16.B24(b)(ii). If the customer did not design the asset or aspects of it, the customer's ability to specify the output in a contract that does not give it any other relevant decision-making rights relating to the use of the asset (e.g., the ability to change when, whether and what output is produced) gives the customer the same rights as any customer that purchases goods or services in an arrangement (i.e., a contract that does not contain a lease).

3.1.5.D Protective rights

A contract may include terms and conditions designed to protect the supplier's interest in the asset or other assets, to protect its personnel, or to ensure the supplier's compliance with laws or regulations. These are examples of protective rights. For example, a contract may (i) specify the maximum amount of use of an asset or limit where or when the customer can use the asset, (ii) require a customer to follow particular operating practices, or (iii) require a customer to inform the supplier of changes in how an asset will be used. Protective rights typically define the scope of the customer's right of use but do not, in isolation, prevent the customer from having the right to direct the use of an asset. [IFRS 16.B30].

Illustration 3-6: Right to direct the use of an asset

Customer X enters into a contract with Supplier Y to use a vehicle for a three-year period. The vehicle is identified in the contract. Supplier Y cannot substitute another vehicle unless the specified vehicle is not operational (e.g., it breaks down).

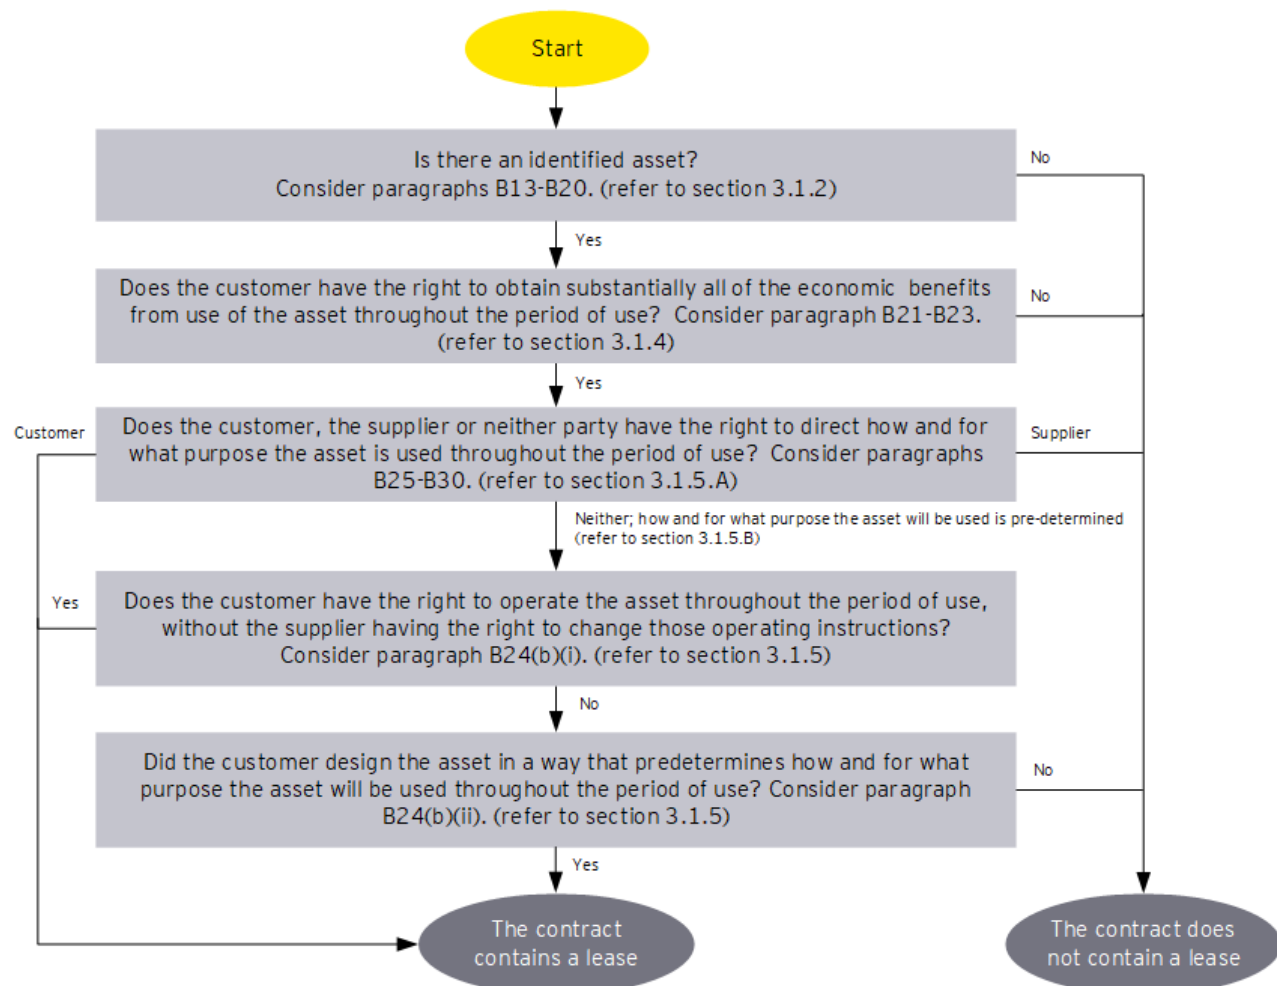

Under the contract:

- Customer X operates the vehicle (i.e., drives the vehicle) or directs others to operate the vehicle (e.g., hires a driver).
- Customer X decides how to use the vehicle (within contractual limitations, discussed below). For example, throughout the period of use, Customer X decides where the vehicle goes, as well as when or whether it is used and what it is used for. Customer X can also change these decisions throughout the period of use.
- Supplier Y prohibits certain uses of the vehicle (e.g., moving it overseas) and modifications to the vehicle to protect its interest in the asset.

Analysis: Customer X has the right to direct the use of the identified vehicle throughout the period of use. Customer X has the right to direct the use of the vehicle because it has the right to change how the vehicle is used, when or whether the vehicle is used, where the vehicle goes and what the vehicle is used for. Supplier Y's limits on certain uses for the vehicle and modifications to it are considered protective rights that define the scope of Customer X's use of the asset, but do not affect the assessment of whether Customer X directs the use of the asset.

3.1.6 Flowchart

The following flowchart is based on the one included in IFRS 16's application guidance, [IFRS 16.B31], and depicts the decision-making process for determining whether an arrangement is or contains a lease:

**3.1.7 Reassessment of the contract**

Under IFRS 16, an entity reassesses whether a contract is or contains a lease only if the terms and conditions of the contract are changed. [IFRS 16.11]. A change in the terms and conditions of a contract does not include the exercise of an option (e.g., renewal option) or failure to exercise an option that is included in the contract.

3.2 Identifying and separating lease and non-lease components of a contract and allocating contract consideration

3.2.1 Identifying and separating lease components of a contract

Extract from IFRS 16

- 12 For a contract that is, or contains, a lease, an entity shall account for each lease component within the contract as a lease separately from non-lease components of the contract, unless the entity applies the practical expedient in paragraph 15. Paragraphs B32-B33 set out guidance on separating components of a contract.

For contracts that contain the rights to use multiple assets (e.g., a building and equipment, multiple pieces of equipment), the right to use each asset is considered a separate lease component if both of the following criteria are met:

- The lessee can benefit from the use of the asset either on its own or together with other resources that are readily available to the lessee (i.e., goods or services that are sold or leased separately, by the lessor or other suppliers, or that the lessee has already obtained from the lessor or in other transactions or events).

And

- The underlying asset is neither highly dependent on, nor highly interrelated with, the other underlying assets in the contract. [IFRS 16.12, IFRS 16.B32].

If one or both of these criteria are not met, the right to use multiple assets is considered a single lease component.

A contract may include an amount payable by the lessee for activities and costs that do not transfer a good or service to the lessee. For example, a lessor may include in the total amount payable a charge for administrative tasks, or other costs it incurs associated with the lease, that do not transfer a good or service to the lessee. Such amounts payable does not give rise to a separate component of the contract but are considered to be part of the total consideration that is allocated to the separately identified components of the contract. [IFRS 16.B33].

Illustration 3-7: Identifying and separating lease components

Scenario A

Assume that a lessee enters into a lease of an excavator and the related accessories (e.g., excavator attachments) that are used for mining purposes. The lessee is a local mining company that intends to use the excavator at a copper mine.

Analysis: From the perspective of the lessee, the contract contains one lease component. The lessee would be unable to benefit from the use of the excavator without also using the accessories. Therefore, the excavator is dependent upon the accessories.

Scenario B

Assume the same facts as in Scenario A, except that the contract also conveys the right to use an additional loading truck. This loading truck could be deployed by the lessee for other uses (e.g., to transport iron ores at another mine).

Analysis: From the perspective of the lessee, the contract contains two lease components: a lease of the excavator (together with the accessories) and a lease of the loading truck. Because the loading truck could be deployed for other uses independent of the excavator, the lessee can benefit from the loading truck on its own or together with other readily available resources. The lessee can also benefit from the use of the excavator on its own or together with other readily available resources.

For contracts that involve the right to use land and land improvements (e.g., buildings), IFRS 16 requires a lessor to classify (see section 6.1 below) and account for the right to use land as a separate lease component, unless the accounting effect of doing so is immaterial to the lease. [IFRS 16.B57]. For example, separation of the land may not be necessary when the amount that would be recognised for the land lease component is immaterial to the lease. If the lease payments cannot be allocated reliably between the land and the buildings, the entire lease is classified as a finance lease, unless it is clear that both elements are operating leases (i.e., the entire lease is classified as an operating lease). [IFRS 16.B56].

How we see it

An entity that leases an entire building (i.e., 100% of the building) is inherently leasing the land underneath the building and would potentially account for the land and the building as separate lease components. However, when an entity only leases part of the building (e.g., one floor of a multi-storey building) the land may not be a separate lease component as the lessee does not control substantially all the benefits of the shared land.

3.2.2 Identifying and separating lease from non-lease components of a contract

Many contracts contain a lease coupled with an agreement to purchase or sell other goods or services (non-lease components). The non-lease components are identified and accounted for separately from the lease component in accordance with other standards (except when a lessee applies the practical expedient as discussed in section 3.2.2.B below). [IFRS 16.16]. For example, the non-lease components may be accounted for as executory arrangements by lessees (customers) or as contracts subject to IFRS 15 by lessors (suppliers). Non-lease components are also within the scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*, as discussed in Chapter 27. Some contracts contain items that do not relate to the transfer of goods or services by the lessor to the lessee (e.g., fees or other administrative costs a lessor charges a lessee). These items are not considered separate lease or non-lease components, and lessees and lessors do not allocate consideration in the contract to these items. [IFRS 16.B33]. Refer to sections 3.2.3.B and 3.2.4.B below.

However, if the lessor provides services (e.g., maintenance, supply of utilities) or operates the underlying asset (e.g., vessel charter, aircraft wet lease), the contract would generally contain non-lease components.

3.2.2.A Lessee reimbursements

Under IFRS 16, payments for maintenance activities, including common area maintenance (e.g., cleaning the common areas of a building, removing snow from a car park for employees and customers) and other goods or services transferred to the tenant (e.g., providing utilities or rubbish removal) are considered non-lease components because they provide the lessee with a service.

In some leases, a lessee also may reimburse (or make certain payments on behalf of) the lessor for costs that relate to the leased asset for activities and costs that do not transfer a good or service to the lessee (e.g., payments made for real estate taxes that would be owed by the lessor regardless of whether it leased the building and regardless of who the lessee is, payments made for insurance that protects the lessor's investment in the asset and the landlord will receive the proceeds from any claim). Under IFRS 16, such costs are not separate components of the contract because they do not represent payments for goods or services and are considered to be part of the total consideration that is allocated to the separately identified components of the contract (i.e., the lease and non-lease components). Entities also need to evaluate whether such payments are fixed (or in-substance fixed) lease payments or variable lease payments. Refer to section 4.5 below.

Illustration 3-8: Activities that are not components of a lease contract

Scenario A

A lessee enters into a three-year lease of equipment, with fixed annual payments of CU12,000. The contract itemises the fixed annual payments as follows: CU9,000 for rent, CU2,500 for maintenance and CU500 of administrative tasks.

Analysis: The contract contains two components - a lease component (lease of equipment) and a non-lease component (maintenance). The amount paid for administrative tasks does not transfer a good or service to the lessee. Therefore, the total consideration in the contract of CU36,000 will be allocated to the lease component (equipment) and the non-lease component (maintenance).

Scenario B

Assume the fact pattern as in scenario A except that, in addition, the contract requires the lessee to pay for the restoration of the equipment to its original condition.

Analysis: The contract still contains two components - a lease component (lease of equipment) and a non-lease component (maintenance). Similar to the amount paid for administrative tasks, the restoration does not transfer a good or service to the lessee as it is only performed at the end of the lease term. Therefore, the total consideration in the contract will be allocated to the lease component (equipment) and the non-lease component (maintenance). See section 5.2.1 below for further discussion on the inclusion of restoration costs to the initial measurement of the right-of-use asset.

3.2.2.B Practical expedient - lessees

IFRS 16 provides a practical expedient that permits lessees to make an accounting policy election, by class of underlying asset, to account for each separate lease component of a contract and any associated non-lease components as a single lease component. [IFRS 16.15]. IFRS 16 provides this expedient to alleviate concerns that the costs and administrative burden of allocating consideration to separate lease and non-lease components may not be justified by the benefit of more precisely reflecting the right-of-use asset and the lease liability. Furthermore, the Board expects the practical expedient to most often be used when the non-lease components of a contract are not significant when compared with the lease components of a contract. [IFRS 16.BC135(b)]. The practical expedient does not allow lessees to account for multiple lease components of a contract (refer to section 3.2.1 above) as a single lease component. Refer to section 5 below for a discussion of measurement of right-of-use assets and lease liabilities.

How we see it

Although it is not explicitly stated, we believe that non-lease components relate to services contained within the lease contract. Paragraphs BC133 and BC135 of the Basis for Conclusions to IFRS 16 refer to non-lease components being service components. Therefore, when a lease includes a component related to the purchase of inventory or another asset such as property, plant and equipment or an intangible asset, we believe an entity should separate asset purchases from the lease components and other non-lease components.

The separate asset purchases would not be combined with lease and other non-lease components, even if the entity has elected to apply the practical expedient to combine lease and non-lease components to the class of underlying asset to which the lease relates. For example, if a contract contains a lease as well as non-lease components related to a service and the purchase of sheet metal to be used in the construction of inventory, we believe the purchase of the sheet metal should be accounted for as a component of inventory rather than together with the lease component as the purchase of a physical good is not a 'non-lease component associated with that lease component'.

Lessees that make the policy election to account for each separate lease component of a contract and any associated non-lease components as a single lease component allocate all of the contract consideration to the lease component. Therefore, the initial and subsequent measurement of the lease liability and right-of-use asset is higher than if the policy election was not applied.

FASB differences

IFRS 16 does not include a practical expedient for lessors. Under ASC 842, a lessor can elect, by class of underlying asset, not to separate lease and related non-lease components if certain criteria are met. Additionally, if the non-lease component is the predominant component of the combined component, the combined component is accounted for in accordance with ASC 606 *Revenue from Contracts with Customers*.

3.2.3 Determining and allocating the consideration in the contract - lessees

3.2.3.A Determining the consideration in the contract

IFRS 16 does not define 'consideration' in a lease contract, nor is 'consideration' defined in the IFRS Glossary.

How we see it

We believe that the consideration in a contract for a lessee includes the lease payments as defined in Appendix A to IFRS 16 (described in section 4.5 below) as well as variable payments that do not depend on an index or a rate and any other amounts in the contract that are not included in lease payments. Only those amounts that meet the definition of lease payments are included in the lease liability at their present value (see section 5.2.2 below).

3.2.3.B Allocating the consideration in the contract - lessees

Lessees that do not make an accounting policy election (by class of underlying asset) to use the practical expedient (discussed in section 3.2.2.B above) to account for each separate lease component of a contract and any associated non-lease components as a single lease component are required to allocate the consideration in the contract to the lease and non-lease components on a relative stand-alone price basis. Lessees are required to use observable stand-alone prices (i.e., prices at which a customer would purchase a component of a contract separately) when available. If observable stand-alone prices are not readily available, lessees estimate stand-alone prices, maximising the use of observable information. Although a contractually stated price may be the stand-alone price for a good or service, it is not presumed to be for accounting purposes. [IFRS 16.13, IFRS 16.14].

Illustration 3-9: Allocating contract consideration to lease and non-lease components - lessees

A lessee enters into a lease of equipment. The contract stipulates the lessor will perform maintenance of the leased equipment and receive consideration for that maintenance service. The contract includes the following fixed prices for the lease and non-lease component:

Lease	CU80,000
Maintenance	CU10,000
Total	CU90,000

Assume the stand-alone prices cannot be readily observed, so the lessee makes estimates, maximising the use of observable information, of the lease and non-lease components, as follows:

Lease	CU85,000
Maintenance	CU15,000
Total	CU100,000

Analysis: The stand-alone price for the lease component represents 85% of total estimated stand-alone prices. The lessee allocates the consideration in the contract (CU90,000), as follows:

Lease	CU76,500 ⁽¹⁾
Maintenance	CU13,500 ⁽²⁾
Total	CU90,000

(1) $85\% \times \text{CU}90,000$

(2) $15\% \times \text{CU}90,000$

3.2.4 Determining and allocating the consideration in the contract - lessors

3.2.4.A Determining the consideration in the contract - lessors

As discussed in section 3.2.3.A above, IFRS 16 does not define 'consideration' in a lease contract, nor is 'consideration' defined in the IFRS Glossary.

How we see it

We believe that the consideration in a lease contract for a lessor would include the following:

- Lease payments (refer to section 4.5)
- Any other fixed payments (e.g., monthly service charges, non-lease components such as maintenance) or in-substance fixed payments made during the lease term, less any incentives paid or payable to the lessee
- Any other variable payments that depend on an index or a rate made during the lease term and initially measured using the index or rate at the commencement date (refer to section 4.2)
- Any other variable payment amounts that would be included in the transaction price in accordance with the requirements on variable consideration in IFRS 15

Variable consideration is described broadly in IFRS 15 and can take many forms. Consideration can vary because of discounts, rebates, refunds, credits, price concessions, incentives, performance bonuses, penalties or other similar items. It is important for lessors to appropriately identify the different types of variable consideration included in the contract because estimating variable consideration requires lessors to apply a constraint to each type of variable consideration. See Chapter 28 for further discussion on variable consideration under IFRS 15.

3.2.4.B Allocating the consideration in the contract - lessors

When applying IFRS 16, lessors are required to apply IFRS 15.73 to 86 to allocate the consideration in the contract between the lease and non-lease components on a relative stand-alone selling price basis. In addition, lessors are required to apply IFRS 15.87 to 90 to allocate any subsequent changes in the consideration of the contract between the lease and non-lease components. The stand-alone selling price is the price at which an entity would sell a promised good or service separately to a customer. When stand-alone selling prices are not directly observable, the lessor must estimate the stand-alone selling price. Paragraph 79 of IFRS 15 provides suitable methods for estimating the stand-alone selling price. [IFRS 16.17]. See Chapter 28 for further discussion on determining stand-alone selling prices under IFRS 15.

How we see it

Personnel responsible for an entity's revenue recognition policies (including revenue recognition policies associated with arrangements that include a lease) may need to obtain information from personnel beyond those in the accounting or finance departments to estimate stand-alone selling prices. That is, they may need to gain information and an understanding of an entity's pricing decisions in order to determine estimated stand-alone selling prices, especially when there are limited or no observable inputs.

FASB differences

IFRS 16 does not give guidance on allocating variable consideration related to the lease component. Under US GAAP, if the terms of a variable payment that is not dependent on an index or rate relate, even partially, to the lease component, the lessor will recognise those payments (allocated to the lease component) as income in profit or loss in the period when the changes in facts and circumstances on which the variable payment is based occur (e.g., when the lessee's sales on which the amount of the variable payment depends occur). When the changes in facts and circumstances on which the variable payment is based occur, the lessor will allocate those payments to the lease and non-lease components of the contract. The allocation is on the same basis as the initial allocation of the consideration in the contract or the most recent modification not accounted for as a separate contract unless the variable payment meets the criteria in ASC 606-10-32-40 to be allocated only to the lease component(s).

3.2.5 Examples - Identifying and separating components of a contract and determining and allocating the consideration in the contract

IFRS 16 provides the following example to illustrate how lessees identify and separate lease and non-lease components of a contract and determine and allocate the consideration in the contract. [IFRS 16.IE4, IFRS 16.IE Example 12].

Extract from IFRS 16 Illustrative Examples

Example 12-Lessee allocation of consideration to lease and non-lease components of a contract

Lessor leases a bulldozer, a truck and a long-reach excavator to Lessee to be used in Lessee's mining operations for four years. Lessor also agrees to maintain each item of equipment throughout the lease term. The total consideration in the contract is CU600,000(a), payable in annual instalments of CU150,000, and a variable amount that depends on the hours of work performed in maintaining the long-reach excavator. The variable payment is capped at 2 per cent of the replacement cost of the long-reach excavator. The consideration includes the cost of maintenance services for each item of equipment.

Lessee accounts for the non-lease components (maintenance services) separately from each lease of equipment applying paragraph 12 of IFRS 16. Lessee does not elect the practical expedient in paragraph 15 of IFRS 16. Lessee considers the requirements in paragraph B32 of IFRS 16 and concludes that the lease of the bulldozer, the lease of the truck and the lease of the long-reach excavator are each separate lease components. This is because:

- (a) Lessee can benefit from use of each of the three items of equipment on its own or together with other readily available resources (for example, Lessee could readily lease or purchase an alternative truck or excavator to use in its operations); and
- (b) although Lessee is leasing all three items of equipment for one purpose (ie to engage in mining operations), the machines are neither highly dependent on, nor highly interrelated with, each other. Lessee's ability to derive benefit from the lease of each item of equipment is not significantly affected by its decision to lease, or not lease, the other equipment from Lessor.

Consequently, Lessee concludes that there are three lease components and three non-lease components (maintenance services) in the contract. Lessee applies the guidance in paragraphs 13-14 of IFRS 16 to allocate the consideration in the contract to the three lease components and the non-lease components.

Several suppliers provide maintenance services for a similar bulldozer and a similar truck. Accordingly, there are observable standalone prices for the maintenance services for those two items of leased equipment. Lessee is able to establish observable stand-alone prices for the maintenance of the bulldozer and the truck of CU32,000 and CU16,000, respectively, assuming similar payment terms to those in the contract with Lessor. The long-reach excavator is highly specialised and, accordingly, other suppliers do not lease or provide maintenance services for similar excavators. Nonetheless, Lessor provides four-year maintenance service contracts to customers that purchase similar long-reach excavators from Lessor. The observable consideration for those four-year maintenance service contracts is a fixed amount of CU56,000, payable over four years, and a variable amount that depends on the hours of work performed in maintaining the long-reach excavator. That variable payment is capped at 2 per cent of the replacement cost of the long-reach excavator. Consequently, Lessee estimates the stand-alone price of the maintenance services for the long-reach excavator to be CU56,000 plus any variable amounts. Lessee is able to establish observable stand-alone prices for the leases of the bulldozer, the truck and the long-reach excavator of CU170,000, CU102,000 and CU224,000, respectively.

Lessee allocates the fixed consideration in the contract (CU600,000) to the lease and non-lease components as follows:

CU	Bulldozer	Truck	Long-reach excavator	Total
Lease	170,000	102,000	224,000	496,000
Non-lease				104,000
Total fixed consideration				600,000

Lessee allocates all of the variable consideration to the maintenance of the long-reach excavator, and, thus, to the non-lease components of the contract. Lessee then accounts for each lease component applying the guidance in IFRS 16, treating the allocated consideration as the lease payments for each lease component.

(a) In these Illustrative Examples, currency amounts are denominated in 'currency units' (CU).

FASB differences

In Example 12 in IFRS 16, as shown above, the variable consideration is allocated entirely to the non-lease component of the contract. Under ASC 842, a lessee must allocate variable consideration not dependent on an index or rate to the lease and non-lease components of a contract on a relative stand-alone price basis.

3.3 Contract combinations

IFRS 16 requires that two or more contracts entered into at or near the same time with the same counterparty (or related parties of the counterparty) be considered a single contract if any one of the following criteria is met:

- The contracts are negotiated as a package with an overall commercial objective that cannot be understood without considering the contracts together
- The amount of consideration to be paid in one contract depends on the price or performance of the other contract
- The rights to use the underlying assets conveyed in the contracts (or some of the rights to use underlying assets conveyed in each of the contracts) are a single lease component (refer to section 3.2.1 above) [IFRS 16.B2]

The IASB developed these criteria to address concerns that separately accounting for multiple contracts may not result in a faithful representation of the combined transaction. [IFRS 16.BC130, IFRS 16.BC131, IFRS 16.BC132].

A lease-leaseback transaction, also referred to as a lease-in lease-out (LILO) transaction, in which the owner of an asset leases the asset to a third party and then leases it back, often for tax-driven purposes, is an example of when the contract combination guidance should be assessed. When the contract combination guidance is met in a lease-leaseback transaction, it is often determined that a lease does not exist, as the right to control the use of the asset is not conveyed from the owner to the third party when both the original lease out and the leaseback are considered a single arrangement. For example, an entity leases its medical equipment with a 10-year useful life to a third party and then leases the equipment back for the first seven years. In this case, the right to control the use of the equipment is not transferred to the third party until the completion of the leaseback period (i.e., the first seven years). Therefore, the entity would record the transaction as a financing during the leaseback period and then account for the lease to the third party at the end of the leaseback period (and allocate the consideration in the contract accordingly).

4 Key concepts

Lessees and lessors generally apply the same key concepts for the purposes of identifying, recognising and measuring lease contracts.

4.1 Inception of a contract

At the inception of a contract, an entity assesses whether the contract is, or contains, a lease. A contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration. Paragraphs B9-B31 set out guidance on the assessment of whether a contract is, or contains, a lease. [IFRS 16.9].

IFRS 16 requires customers and suppliers to determine whether a contract is or contains a lease at the inception of the contract. The inception date of a lease is the earlier of the date of a lease agreement and the date of commitment by the parties to the principal terms and conditions of the lease. [IFRS 16 Appendix A].

After the inception of the lease, but before the commencement date (refer to section 4.2), the requirements in IAS 37 apply to any contract (and, hence, any lease contract) that becomes onerous as defined in that standard. [IFRS 16.BC72].

4.2 Commencement date of the lease

Extract from IFRS 16

Appendix A

Defined terms

commencement date of the lease (commencement date)	The date on which a lessor makes an underlying asset available for use by a lessee .
underlying asset	An asset that is the subject of a lease , for which the right to use that asset has been provided by a lessor to a lessee .

The commencement date is the date on which the lessor makes an underlying asset (i.e., the asset that is subject to the lease) available for use by the lessee. [IFRS 16 Appendix A]. In some cases, the commencement date of the lease may be before the date stipulated in the lease agreement (e.g., the date on which rents become due and payable). This often occurs when the leased space is modified by the lessee prior to commencing operations in the leased space (e.g., during the period a lessee uses the leased space to construct its own leasehold improvements). If a lessee takes possession of, or is given control over, the use of the underlying asset before it begins operations or making lease payments under the terms of the lease, the lease term has commenced even if the lessee is not required to pay rent or the lease arrangement states the lease commencement date is a later date. The timing of when lease payments begin under the contract does not affect the commencement date of the lease. For example, a lessee (except for a lessee applying the short-term lease or low-value asset exemption discussed in section 5.1.1 and section 5.1.2 below) initially recognises a lease liability and related right-of-use asset on the commencement date and a lessor (for finance leases) initially recognises its net investment in the lease on the commencement date.

4.3 Lessee involvement with the underlying asset before the commencement date

An entity may negotiate a lease before the underlying asset is available for use by the lessee. For some leases, the underlying asset may need to be constructed or redesigned for use by the lessee. Depending on the terms and conditions of the contract, a lessee may be required to make payments relating to the construction or design of the asset. [IFRS 16.B43].

If the lessee incurs costs relating to the construction or design of an underlying asset, the lessee accounts for those costs applying other IFRS accounting standards, such as IAS 16 *Property, Plant and Equipment*. Costs relating to the construction or design of an underlying asset do not include payments made by the lessee for the right to use the underlying asset. Payments for the right to use an underlying asset are payments for a lease, regardless of the timing of those payments. [IFRS 16.B44].

The lessee may obtain legal title to an underlying asset before that legal title is transferred to the lessor and the asset is leased to the lessee. Obtaining legal title does not in itself determine how to account for the transaction. [IFRS 16.B45].

If the lessee controls (or obtains control of) the underlying asset before that asset is transferred to the lessor, the transaction is a sale and leaseback transaction that is accounted for as described in section 8 below. [IFRS 16.B46].

However, if the lessee does not obtain control of the underlying asset before the asset is transferred to the lessor, the transaction is not a sale and leaseback transaction. For example, this may be the case if a manufacturer, a lessor and a lessee negotiate a transaction for the purchase of an asset from the manufacturer by the lessor, which is in turn leased to the lessee. The lessee may obtain legal title to the underlying asset before legal title transfers to the lessor. In this case, if the lessee obtains legal title to the underlying asset but does not obtain control of the asset before it is transferred to the lessor, the transaction is not accounted for as a sale and leaseback transaction, but as a lease. [IFRS 16.B47].

4.4 Lease term and purchase options

4.4.1 Lease term

The lease term begins at the lease commencement date and is determined on that date based on the non-cancellable term of the lease, together with both of the following:

- The periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option
- The periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option [IFRS 16.18]

Purchase options should be assessed in the same way as options to extend the lease term or terminate the lease. The IASB indicated that an option to purchase an underlying asset is economically similar to an option to extend the lease term for the remaining economic life of the underlying asset. [IFRS 16.BC173].

The lease term begins at the commencement date and includes any rent-free periods provided to the lessee by the lessor. [IFRS 16.B36].

At the commencement date, an entity assesses whether the lessee is reasonably certain to exercise an option to extend the lease or to purchase the underlying asset, or not to exercise an option to terminate the lease. [IFRS 16.19, IFRS 16.B37]. The entity considers all relevant facts and circumstances that create an economic incentive for the lessee to exercise, or not to exercise, the option, including any expected changes in facts and circumstances from the commencement date until the exercise date of the option. Examples of factors to consider include, but are not limited to:

- (a) Contractual terms and conditions for the optional periods compared with market rates, such as:
 - (i) The amount of payments for the lease in any optional period
 - (ii) The amount of any variable payments for the lease or other contingent payments, such as payments resulting from termination penalties and residual value guarantees

And

 - (iii) The terms and conditions of any options that are exercisable after initial optional periods (for example, a purchase option that is exercisable at the end of an extension period at a rate that is currently below market rates)
 - (b) Significant leasehold improvements undertaken (or expected to be undertaken) over the term of the contract that are expected to have significant economic benefit for the lessee when the option to extend or terminate the lease, or to purchase the underlying asset, becomes exercisable
 - (c) Costs relating to the termination of the lease, such as negotiation costs, relocation costs, costs of identifying another underlying asset suitable for the lessee's needs, costs of integrating a new asset into the lessee's operations, or termination penalties and similar costs, including costs associated with returning the underlying asset in a contractually specified condition or to a contractually specified location
 - (d) The importance of that underlying asset to the lessee's operations, considering, for example, whether the underlying asset is a specialised asset, the location of the underlying asset and the availability of suitable alternatives
- And
- (e) Conditionality associated with exercising the option (i.e., when the option can be exercised only if one or more conditions are met), and the likelihood that those conditions will exist. [IFRS 16.B37].

4.4.1.A Evaluating lease term and purchase options

When evaluating whether a lessee is reasonably certain to exercise an option to renew the lease, not terminate the lease or to purchase the underlying asset, lessees and lessors are required to assess all relevant factors that create an economic incentive for the lessee to exercise lease renewal, termination or purchase options. The phrase reasonably certain is generally interpreted as a high threshold.

The longer the period from commencement of the lease (refer to section 4.2 above) to the exercise date of an option, the more difficult it will be, in certain cases, to determine whether the exercise of the option is reasonably certain. The difficulty arises from several factors. For example, a lessee's estimates of its future needs for the leased asset become less precise the further into the future the forecast goes. Also, the future fair value of certain assets such as those involving technology is more difficult to predict than the future fair value of a relatively stable asset, such as a fully leased commercial office building located in a prime area.

The further into the future that the option date is, the lower the option price must be in relation to the estimated future fair value to conclude that the lessee is reasonably certain to exercise the option. The difference between the option price and the estimated future fair value of an asset that is subject to significant changes in value also should be greater than would be the case for an asset with a relatively stable value.

An artificially short lease term (e.g., a lease of a corporate headquarters, distribution facility, manufacturing plant or other key property with a four- year lease term), may effectively create a significant economic incentive for the lessee to exercise a purchase or renewal option. This may be evidenced by the significance of the underlying asset to the lessee's continuing operations and whether, absent the option, the lessee would have entered into such a lease.

Similarly, the significance of the underlying asset to the lessee's operations may affect a lessee's decisions about whether it is reasonably certain to exercise a purchase or renewal option. For example, an entity that leases a specialised facility (e.g., manufacturing plant, distribution facility, corporate headquarters) and does not exercise a purchase or renewal option would face a significant economic penalty if an alternative facility is not readily available. This would potentially have an adverse effect on the entity while it searched for a replacement asset.

An option to extend or terminate a lease may be combined with one or more other contractual features (for example, a residual value guarantee) such that the lessee guarantees the lessor a minimum or fixed cash return that is substantially the same regardless of whether the option is exercised. In such cases, and notwithstanding the guidance on in-substance fixed payments (see section 4.5.1 below), an entity assumes that the lessee is reasonably certain to exercise the option to extend the lease, or not to exercise the option to terminate the lease. [IFRS 16.B38].

The shorter the non-cancellable period of a lease, the more likely a lessee is to exercise an option to extend the lease or not to exercise an option to terminate the lease. This is because the costs associated with obtaining a replacement asset are likely to be proportionately higher the shorter the non-cancellable period. [IFRS 16.B39].

A lessee's past practice regarding the period over which it has typically used particular types of assets (whether leased or owned), and its economic reasons for doing so, may provide information that is helpful in assessing whether the lessee is reasonably certain to exercise, or not to exercise, an option. For example, if a lessee has typically used particular types of assets for a particular period of time or if the lessee has a practice of frequently exercising options on leases of particular types of underlying assets, the lessee considers the economic reasons for that past practice in assessing whether it is reasonably certain to exercise an option on leases of those assets. [IFRS 16.B40].

A lessee may enter into a lease contract for non-consecutive periods. This is seen in the retail industry when retailers enter into contracts with shopping centres to lease the same retail space for certain non-consecutive months of the year (e.g., during an annual holiday period). Similar arrangements also exist when sports teams lease a sports stadium for particular non-consecutive days of the year. These arrangements will usually meet the definition of a lease because during the agreed period of use, the customer controls the right to use the underlying asset. In these arrangements, the lease term is the aggregate of the non-consecutive periods, as shown in Illustration 4-1, Scenario C below.

Illustration 4-1: Determining the lease term

Scenario A

Entity P enters into a lease for equipment that includes a non-cancellable term of four years and a two-year fixed-priced renewal option with future lease payments that are intended to approximate market rates at lease inception. There are no termination penalties or other factors indicating that Entity P is reasonably certain to exercise the renewal option.

Analysis: At the lease commencement date, the lease term is four years.

Scenario B

Entity Q enters into a lease for a building that includes a non-cancellable term of four years and a two-year, market-priced renewal option. Before it takes possession of the building, Entity Q pays for leasehold improvements. The leasehold improvements are expected to have significant value at the end of four years, and that value can only be realised through continued occupancy of the leased property.

Analysis: At lease commencement, Entity Q determines that it is reasonably certain to exercise the renewal option because it would suffer a significant economic penalty if it abandoned the leasehold improvements at the end of the initial non-cancellable period. At lease commencement, Entity Q concludes that the lease term is six years.

Scenario C

Entity R enters into a lease for an identified retail space in a shopping centre. The retail space will be available to Entity R for only the months of October, November and December during a non-cancellable term of five years. The lessor agrees to provide the same retail space for each of the five years.

Analysis: At the lease commencement date, the lease term is 15 months (three months per year over the five annual periods specified in the contract).

4.4.1.B Cancellable leases

Extract from IFRS 16

- | | |
|-----|---|
| B34 | In determining the lease term and assessing the length of the non-cancellable period of a lease, an entity shall apply the definition of a contract and determine the period for which the contract is enforceable. A lease is no longer enforceable when the lessee and the lessor each has the right to terminate the lease without permission from the other party with no more than an insignificant penalty. |
| B35 | If only a lessee has the right to terminate a lease, that right is considered to be an option to terminate the lease available to the lessee that an entity considers when determining the lease term. If only a lessor has the right to terminate a lease, the non-cancellable period of the lease includes the period covered by the option to terminate the lease. |

Any non-cancellable periods (by the lessee and the lessor) in contracts that meet the definition of a lease are considered part of the lease term. If only the lessor has the right to terminate a lease, the period covered by the option to terminate the lease is included in the non-cancellable period of the lease. If only the lessee has the right to terminate a lease, that right is a termination option that is considered when determining the lease term. Refer to section 4.4.1.A. [IFRS 16.B34, IFRS 16.B35].

An arrangement is not enforceable if both the lessor and lessee each have the right to terminate the lease without permission from the other party and with no more than an insignificant penalty. The question arises as to whether penalty should be interpreted to include only the contractual amount payable by one party to the other if the termination option is exercised (i.e., the narrow interpretation) or whether significant economic disincentives should also be considered a penalty (i.e., the wide interpretation). With respect to the determination of the lease term, IFRS 16 requires an entity to consider all relevant facts and circumstances that create an economic incentive for the lessee to exercise, or not to exercise, the option and thus suggests that all aspects of termination penalties, whether contractual or financial in nature, should be considered.

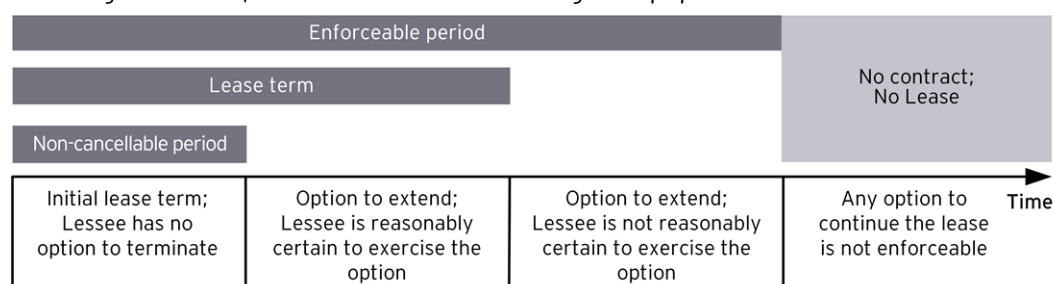

Frequently asked questions

Question 4-1: How is the lease term determined in a cancellable lease? Specifically, when applying IFRS 16.B34 and assessing 'no more than an insignificant penalty', does an entity consider the broader economics of the contract, and not only contractual termination payments?

In November 2019, the IFRS IC issued an agenda decision about how to determine the lease term of a cancellable lease. Specifically, when applying IFRS 16.B34 and assessing 'no more than an insignificant penalty' the question considered how an entity determines penalties. That is, does the entity consider only the termination payments identified in the contract or does it consider the broader economics of the contract when evaluating whether a more than insignificant penalty exists. Such broader economic considerations might include the cost of abandoning or dismantling leasehold improvements. Another example may be the importance of the asset to the lessee's operations.

Paragraph B34 states that in determining the lease term and assessing the length of the non-cancellable period of a lease, an entity applies the definition of a contract and determines the period for which it is enforceable. A lease is no longer enforceable when the lessee and lessor each have the right to terminate the lease without permission from the other party and with no more than an insignificant penalty.

To determine the lease term, an entity determines the non-cancellable period and the enforceable period. It then determines where the lease term falls, depending on the likelihood of exercising the options to extend or terminate using the reasonably certain threshold. The impact of extension options is shown in the diagram below, taken from the IFRS IC's agenda paper:

The IFRS IC noted that in applying IFRS 16.B34 and determining the enforceable period of the lease, an entity considers:

- The broader economics of the contract (i.e., not only the contractual termination payments). For example, if either party has an economic incentive not to terminate the lease such that it would incur a more than insignificant penalty on termination, the contract is enforceable beyond the date on which the contract can be terminated.
- Whether each of the parties has the right to terminate the lease without permission from the other party with no more than an insignificant penalty. Applying IFRS 16.B34, a lease is no longer enforceable only when both parties have such a right. Consequently, if only one party has the right to terminate the lease without permission from the other party with no more than an insignificant penalty, the contract is enforceable beyond the date on which the contract can be terminated by that party.

If an entity concludes that the contract is enforceable beyond the notice period of a cancellable lease, it then applies IFRS 16.19 and IFRS 16.B37 to B40 to assess whether the lessee is reasonably certain not to exercise the option to terminate the lease.

Interaction between useful life and the lease term

The IFRS IC noted that in assessing whether a lessee is reasonably certain to extend (or not to terminate) a lease, IFRS 16.B37 requires an entity to consider all relevant facts and circumstances that create an economic incentive for the lessee. This includes significant leasehold improvements undertaken (or expected to be undertaken) over the term of the contract that are expected to have significant economic benefit for the lessee when an option to extend or terminate the lease becomes exercisable (IFRS 16.B37(b)). In addition, as noted above, an entity considers the broader economics of the contract when determining the enforceable period of a lease. This includes, for example, the costs of abandoning or dismantling non-removable leasehold improvements. If an entity expects to use non-removable leasehold improvements beyond the date on which the contract can be terminated, the existence of those leasehold improvements indicates that the entity might incur a more than insignificant penalty if it terminates the lease. Consequently, applying IFRS 16.B34, an entity considers whether the contract is enforceable for at least the period of expected utility of the leasehold improvements.

The agenda decision discussed above also considered the question of whether the useful life of leasehold improvements is limited to the lease term. This is discussed further in Chapter 19.

In many jurisdictions, property leases are subject to local property laws in addition to the contractual terms of the lease arrangement. That is, local laws and regulations may give the lessee legal renewal options not stated in the lease contract. Examples of where the local law may provide lessees such rights include airport terminal and retail shopping space. When assessing the lease term, entities need to consider whether local laws and regulations create enforceable rights and obligations that need to be included in the evaluation of the lease term.

IFRS 16 applies to contracts that are referred to as 'cancellable', 'month-to-month', 'at will', 'evergreen', 'perpetual' or 'rolling' if they create enforceable rights and obligations. These types of lease generally allow for the contract to continue beyond a non-cancellable period until one party gives notice to terminate the contract (e.g., the contract will roll monthly until the lessee or the lessor elect to terminate the contract). If both the lessee and the lessor can terminate the contract without more than an insignificant penalty at any time at or after the end of the non-cancellable term, then there are no enforceable rights and obligations beyond the non-cancellable term (i.e., the lease term is limited to the non-cancellable term). However, if only the lessee holds a renewal option, there may be other factors to consider in order to determine whether the lessee is reasonably certain to extend the lease, including economic disincentives discussed above.

Illustration 4-2: Cancellable leases

A lease contract has an initial non-cancellable period of one year and an extension for an additional year if both the lessee and the lessor agree. There is no penalty if the lessee and the lessor do not agree to extend for the additional year. The initial one-year non-cancellable period meets the definition of a contract because it creates enforceable rights and obligations. However, the one-year extension period does not meet the definition of a contract because both the lessee and the lessor could unilaterally elect to not extend the arrangement without a more than insignificant penalty. That is, at lease commencement, neither party has enforceable rights and obligations beyond the initial non-cancellable period.

4.4.2 Reassessment of the lease term and purchase options

4.4.2.A Reassessment of the lease term and purchase options- lessees

After lease commencement (refer to section 4.2), IFRS 16 requires lessees to monitor leases for significant changes that could trigger a change in the lease term. Lessees are required to reassess the lease term upon the occurrence of either a significant event or a significant change in circumstances that:

- Is within the control of the lessee
- Affects whether the lessee is reasonably certain to exercise an option not previously included in its determination of the lease term, or not to exercise an option previously included in its determination of the lease term [IFRS 16.20]

Examples of significant events or significant changes in circumstances within the lessee's control include:

- Constructing significant leasehold improvements that are expected to have significant economic value for the lessee when the option becomes exercisable
- Making significant modifications or customisations to the underlying asset
- Making a business decision that is directly relevant to the lessee's ability to exercise, or not to exercise, an option (e.g., extending the lease of a complementary asset or disposing of an alternative asset) [IFRS 16.B41]
- Subleasing the underlying asset for a period beyond the exercise date of the option

Changes in market-based factors (e.g., a change in market rates to lease or purchase a comparable asset) are not within the lessee's control, and they therefore do not trigger a reassessment by themselves.

IFRS 16 also requires lessees to revise the lease term when the lessee either exercises an option that it previously deemed it was not reasonably certain to exercise or does not exercise an option that it previously deemed it was reasonably certain to exercise. Furthermore, the lease term is revised if an event occurs that contractually obliges the lessee to exercise an option not previously included in the entity's determination of the lease term or an event occurs that contractually prohibits the lessee from exercising an option previously included in the entity's determination of the lease term. [IFRS 16.21].

As the lessee is required to reassess the lease term upon the occurrence of either a significant event or a significant change in circumstances that is within the control of the lessee, the revision of the lease term often happens before the actual exercise of the option in these circumstances. Additionally, if the reassessment of lease term or the exercise of a purchase option results in a change, the lessee would remeasure the lease liability, using revised inputs (e.g., discount rate,) at the reassessment date, and would adjust the right-of-use asset. However, if the right-of-use asset is reduced to zero, the lessee would recognise any remaining amount in profit or loss. Refer to section 4.5.12.

4.4.2.B Reassessment of the lease term and purchase options - lessors

IFRS 16 requires the lessor to revise the lease term to account for the lessee's exercise of an option to extend or terminate the lease or purchase the underlying asset, when exercise of such options was not already included in the lease term.

4.5 Lease payments

Lease payments are payments, made by a lessee to a lessor, relating to the right to use an underlying asset during the lease term and include the following amounts:

- Fixed (including in-substance fixed) payments, less any lease incentives receivable from the lessor (refer to section 4.5.1 and section 4.5.2)
- Variable lease payments that depend on an index or a rate (refer to section 4.5.3)
- The exercise price of a purchase option if the lessee is reasonably certain to exercise that purchase option (refer to section 4.5.4)
- Payments for penalties for terminating a lease, if the lease term reflects the lessee exercising an option to terminate the lease (refer to section 4.5.5)
- Amounts expected to be payable by the lessee under residual value guarantees (lessee only) (refer to section 4.5.6)
- Residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee (lessor only) (refer to section 4.5.7) [IFRS 16 Appendix A]

Lease payments generally also include payments made by a lessee to a third party on behalf of the lessor. Lease payments do not include payments allocated to non-lease components of a contract, unless the lessee elects to combine non-lease components with a lease component and to account for them as a single lease component.

IFRS 16 does not specifically address non-cash consideration that may be part of the consideration provided to the lessor. For example, a lessee may lease land to construct its own building and agree to transfer, at the end of the construction period, certain equipment used in construction. The transfer of such equipment supplements the cash consideration for use of the underlying land.

How we see it

We believe that non-cash consideration provided to the lessor is included in total consideration for purposes of initially recognising and measuring lease related assets and liabilities. This is because the total cost to the lessee, negotiated by the lessee and lessor, includes all forms of consideration, including any non-cash consideration. Applying this to the example above, the non-cash consideration is treated as a fixed payment, as the contract requires delivery of the equipment at the end of the construction period. Therefore, the consideration is measured at lease commencement at the fair value of the promise to deliver, at the end of the lease term, the equipment as stipulated in the contract.

4.5.1 In-substance fixed lease payments

Extract from IFRS 16

In-substance fixed lease payments (paragraphs 27(a), 36(c) and 70(a))

- B42 Lease payments include any in-substance fixed lease payments. In-substance fixed lease payments are payments that may, in form, contain variability but that, in substance, are unavoidable. In-substance fixed lease payments exist, for example, if:
- (a) payments are structured as variable lease payments, but there is no genuine variability in those payments. Those payments contain variable clauses that do not have real economic substance. Examples of those types of payments include:
 - (i) payments that must be made only if an asset is proven to be capable of operating during the lease, or only if an event occurs that has no genuine possibility of not occurring; or
 - (ii) payments that are initially structured as variable lease payments linked to the use of the underlying asset but for which the variability will be resolved at some point after the commencement date so that the payments become fixed for the remainder of the lease term. Those payments become in-substance fixed payments when the variability is resolved.
 - (b) there is more than one set of payments that a lessee could make, but only one of those sets of payments is realistic. In this case, an entity shall consider the realistic set of payments to be lease payments.
 - (c) there is more than one realistic set of payments that a lessee could make, but it must make at least one of those sets of payments. In this case, an entity shall consider the set of payments that aggregates to the lowest amount (on a discounted basis) to be lease payments.

Some lease agreements include payments that are described as variable, or may appear to contain variability, but are in-substance fixed payments because the contract terms ensure that the payment of a fixed amount is unavoidable. Such payments are included in the lease payments at lease commencement and thus used to measure entities' lease assets and lease liabilities. [IFRS 16.B42].

4.5.2 Lease incentives

Extract from IFRS 16

Appendix A **Defined terms**

lease incentives

Payments made by a **lessor** to a **lessee** associated with a **lease**, or the reimbursement or assumption by a lessor of costs of a lessee.

[IFRS 16 Appendix A].

A lease agreement with a lessor might include incentives for the lessee to sign the lease, such as an upfront cash payment to the lessee, payment of costs for the lessee (such as moving expenses) or the assumption by the lessor of the lessee's pre-existing lease with a third party.

For lessees, lease incentives that are received by the lessee at or before the lease commencement date reduce the initial measurement of a lessee's right-of-use asset. [IFRS 16.24(b)].

In some circumstances, a lease incentive may reduce the initial measurement of the right-of-use asset below zero. For example, this may occur if all the consideration is variable lease payments that do not depend on an index or rate, such as payments based on usage of the asset, and the lessee receives a lease incentive upfront, such as a cash payment from the lessor.

How we see it

We believe that when, as a result of the lease incentive, the initial measurement of the right-of-use asset is reduced to less than zero, the excess amount of the lease incentive is deferred and allocated over the lease term.

Section 5.4 below discusses IFRS 16.39, which relates to the remeasurement of a lease liability and the related adjustment to the previously recognised right-of-use asset. However, this paragraph applies to remeasurements after the commencement date, not to lease incentives at lease commencement.

Lease incentives that are receivable by the lessee at lease commencement date reduce a lessee's lease liability (and therefore, the right-of-use asset as well). [IFRS 16.27(a)].

How we see it

We believe that lease incentives received or receivable at the date of a lease modification would also reduce the measurement of the right-of-use asset and the lease liability (if receivable) at the effective date of the modification.

For lessors, lease incentives that are paid or payable to the lessee are also deducted from lease payments and affect the lease classification test. For finance leases, lease incentives that are payable to the lessee reduce the expected lease receivables at the commencement date and, thereby, the initial measurement of the lessor's net investment in the lease. [IFRS 16.70(a)]. For operating leases, lessors should defer the cost of any lease incentives paid or payable to the lessee and recognise that cost as a reduction to lease income over the lease term. Refer to section 5 and section 6, for lessees and lessors respectively.

In May 2020, the IASB issued *Annual Improvements to IFRS Standards 2018 - 2020*, which includes an amendment to Example 13 in IFRS 16 to remove the illustration of the reimbursement of leasehold improvements by the lessor. This was removed because of concerns that the example did not explain clearly enough the conclusion as to whether the reimbursement would meet the definition of a lease incentive in IFRS 16.

4.5.3 Variable lease payments that depend on an index or rate

A lessee remeasures the lease liability by discounting the revised lease payments if there is a change in future lease payments resulting from a change in an index or a rate used to determine those payments, including for example a change to reflect changes in market rental rates following a market rent review. The lessee remeasures the lease liability to reflect those revised lease payments only when there is a change in the cash flows (i.e., when the adjustment to the lease payments takes effect). A lessee determines the revised lease payments for the remainder of the lease term based on the revised contractual payments. [IFRS 16.42(b)].

In applying IFRS 16.42, a lessee uses an unchanged discount rate, unless the change in lease payments results from a change in floating interest rates. In that case, the lessee uses a revised discount rate that reflects changes in the interest rate. [IFRS 16.43].

Variable lease payments that depend on an index or a rate include, for example, payments linked to a consumer price index (CPI), payments linked to a benchmark interest rate (such as a nearly risk-free interest rate) or payments that vary to reflect changes in market rental rates. [IFRS 16.28]. The payments are included in the lease payments and are measured using the prevailing index or rate at the measurement date (e.g., lease commencement date for initial measurement). The IASB indicated in the Basis for Conclusions that, despite the measurement uncertainty associated with changes to index- or rate-based payments, the payments meet the definition of an asset (lessor) and a liability (lessee) because they are unavoidable and do not depend on any future activity of the lessee. [IFRS 16.BC165]. Lessees subsequently remeasure the lease liability if there is a change in the cash flows (i.e., when the adjustment to the lease payments takes effect) for future payments resulting from a change in index or rate used to determine lease payments. [IFRS 16.42(b)]. Refer to section 5.4.

FASB differences

Applying ASC 842, changes in variable lease payments based on an index or rate result in a remeasurement of the lease liability when the lease liability is remeasured for another reason (e.g., a change in the lease term). Under US GAAP, when lease payments are based on an index or rate and there is a change to the index or rate, an entity does not remeasure its lease payments and instead recognises the effect of the change in index or rate in expense. However, under IFRS 16, such change will result in the remeasurement of the lease liability.

Illustration 4-3: Variable lease payments that depend on an index or rate

Entity A enters into a 10-year lease of property. The lease payment for the first year is CU1,000. The lease payments are linked to the consumer price index (CPI), i.e., not a floating interest rate. The CPI at the beginning of the first year is 100. Lease payments are updated at the end of every second year. At the end of year one, the CPI is 105. At the end of year two, the CPI is 108.

Analysis: At the lease commencement date, the lease payments are CU1,000 per year for 10 years. Entity A does not take into consideration the potential future changes in the index. At the end of year one the payments have not changed, so the liability is not updated. At the end of year two, when the lease payments change, Entity A updates the remaining eight lease payments to CU1,080 per year ($CU1,000 \div 100 \times 108$) and does not change its discount rate to remeasure the lease liability (and right-of-use asset).

Lease contracts, particularly those relating to property, may include market rent reviews at future dates. The following Illustration shows how these clauses may be treated.

Illustration 4-4: Property leases with market rent reviews

Entity A enters into a 5-year lease of property. The lease payment for the first year is CU1,000. In years 2 and 3, there is a fixed escalation of 4%. At the beginning of year 4, there is a market rent review that will determine the lease payment in years 4 and 5.

Analysis: The lease payments included in the lease liability and right-of-use asset at the lease commencement date are determined, as follows:

- Year 1 - CU1,000
- Year 2 - CU1,000 + 4% fixed escalation = CU1,040
- Year 3 - CU1,040 + 4% fixed escalation = CU1,082

The market rent review applicable to years 4 and 5 is a variable lease payment that depends on an index or a rate (as described in IFRS 16.28). Entity A assesses the market rent at commencement date for the lease of the property for a period of two years, which is the length of the remaining lease term. This is determined to be CU1,035 per annum for years 4 and 5.

4.5.4 The exercise price of a purchase option

If the lessee is reasonably certain to exercise a purchase option, the exercise price is included as a lease payment. That is, entities consider the exercise price of asset purchase options included in lease contracts consistently with the evaluation of lease renewal and termination options (refer to section 4.4).

4.5.5 Payments for penalties for terminating a lease

If it is reasonably certain that the lessee will not terminate a lease, the lease term is determined assuming that the termination option would not be exercised, and any termination penalty is excluded from the lease payments. Otherwise, the lease termination penalty is included as a lease payment. The determination of whether to include lease termination penalties as lease payments is similar to the evaluation of lease renewal options.

4.5.6 Amounts expected to be payable under residual value guarantees - lessees only

IFRS 16 requires lessees to include amounts expected to be payable to the lessor under residual value guarantees as lease payments.

A lessee may provide a guarantee to the lessor that the value of the underlying asset it returns to the lessor at the end of the lease will be at least a specified amount. Such guarantees are enforceable obligations that the lessee has assumed by entering into the lease. Uncertainty related to a lessee's guarantee of a lessor's residual value affects the measurement of the obligation rather than the existence of an obligation.

[IFRS 16.BC170].

A lessee is required to remeasure the lease liability if there is a change in the amounts expected to be payable under a residual value guarantee. [IFRS 16.42(a)]. Refer to section 4.5.12.

Illustration 4-5: Residual value guarantee included in lease payments

Entity R (lessee) enters into a lease and guarantees that the lessor will realise CU15,000 from selling the asset to another party at the end of the lease. At lease commencement, based on Entity R's estimate of the residual value of the underlying asset, Entity R determines that it expects that it will owe CU6,000 at the end of the lease.

Analysis: Because it is expected that it will owe the lessor CU6,000 under the residual value guarantee, Entity R includes that amount as a lease payment.

How we see it

IFRS 16 does not state how frequently reassessment should occur for expected changes under residual value guarantees. We would expect entities to apply judgement to determine the frequency of reassessment based on the relevant facts and circumstances.

4.5.7 Residual value guarantees - lessors only

IFRS 16 requires lessors to include in the lease payments, any residual value guarantees provided to the lessor by the lessee, a party related to the lessee, or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee. [IFRS 16.70(c)]. This amount included in the lease payments is different from that for a lessee which only includes the amount expected to be payable (refer to section 4.5.6).

4.5.8 Variable lease payments that do not depend on an index or rate

Variable lease payments that do not depend on an index or rate and are not, in substance, fixed (refer to section 4.5.1 above), such as those based on performance (e.g., a percentage of sales) or usage of the underlying asset (e.g., the number of hours flown, the number of units produced), are not included as lease payments. Instead, they are recognised in profit or loss (unless they are included in the carrying amount of another asset in accordance with other IFRS accounting standards) in the period in which the event that triggers the payment occurs. [IFRS 16.38(b)].

In some cases, the variability may be resolved during the lease term, so that payments become fixed for the remainder of the lease term. The new fixed payments are then used to remeasure the lease liability (with an offset to the right-of-use asset).

How we see it

In some cases, a contract specifies that when a contingency is resolved, the lessee is required to make an immediate catch-up payment. The catch-up payment relates specifically to the lessee's prior use of the asset. In this case, we believe, when the contingency is resolved, the catch-up obligation is recognised as part of the lease liability and is expensed immediately (rather than adjusting the right-of-use asset).

Illustration 4-6: Variable lease payments that do not depend on an index or rate

Entity A is a medical equipment manufacturer and a supplier of the related consumables. Customer B operates a medical centre. Under the agreement entered into by both parties, Entity A grants Customer B the right to use a medical laboratory machine at no cost and Customer B purchases consumables for use in the equipment from Entity A at CU100 each. The consumables can only be used for that equipment and Customer B cannot use other consumables as substitutes. There is no minimum purchase amount required in the contract.

Based on its historical experience, Customer B estimates that it is highly likely to purchase at least 8,000 units of consumables annually. Customer B has appropriately assessed that the arrangement contains a lease of medical equipment. There are no residual value guarantees or other forms of consideration included in the contract.

Analysis: There are two components in the arrangement, a lease of equipment and the purchase of consumables.

Even though Customer B may believe that it is highly unlikely to purchase fewer than 8,000 units of consumables every year, in this example, there are no lease payments for purposes of initial measurement (Entity A and Customer B) and lease classification (Entity A).

Entity A and Customer B would allocate the payments associated with the future payments to the lease and consumables component of the contract.

Lease payments do not include payments allocated to the non-lease components of a contract. However, lease payments include amounts that would otherwise be allocable to the non-lease components (other than the purchase of goods) of a contract when the lessee makes an accounting policy election to account for the lease and non-lease components as a single lease component. Refer to section 3.2.2 above.

4.5.9 Security deposits

At the commencement of a lease, a lessee may be required to pay a security deposit to the lessor. As long as the deposit is a true deposit and not a prepaid lease payment, the deposit gives the lessee a right to receive the money back in cash from the lessor and is, therefore, a financial asset for the lessee and a financial liability for the lessor and is within the scope of IFRS 9 *Financial Instruments*. The deposit must initially be accounted for at fair value. The fair value of the deposit is determined based on the prevailing market rate of interest for a similar loan to the lessor, considering the lessor's credit-worthiness and, depending on facts and circumstances, any additional security available to the lessee, in accordance with IFRS 9.B5.1.1.

When the deposit earns interest below the market rate, the excess of the principal amount of the deposit over its fair value is accounted for by both the lessee and lessor as a prepaid lease payment. It is therefore considered by the lessor in determining whether the lease is an operating or finance lease. The lessee includes this amount in the cost of its right-of-use asset at the lease commencement date. For the lessor, if the lease is classified as an operating lease, the prepaid lease payment is included in the total lease payments that are recognised as income on either a straight-line basis or another systematic basis, if that basis is more representative of the pattern in which benefit from the use of the underlying asset is diminished. If the lease is classified as a finance lease, the lessor includes the prepaid lease payment in the consideration for the lease (i.e., lease payments) and, therefore, in the determination of the gain or loss on derecognition of the underlying asset, if any.

Interest on the deposit is accounted for using the effective interest method by both the lessee and the lessor.

Illustration 4-7: Accounting for deposits paid by a lessee to a lessor

A lessee is required to pay a deposit of CU100 to the lessor at lease commencement, for which no interest accrues to the lessee. The fixed lease term is 10 years. The market interest rate is 5% per annum (i.e., that is the interest rate the lessor would have to pay each year if it borrowed CU100 for a 10-year term from a third party).

Analysis:

Lessee accounting

At lease commencement:

Dr	Deposit receivable*	CU61	
Dr	Right-of-use asset	CU39	
	Cr Cash		CU100

To record the deposit receivable at fair value on initial recognition and to record the prepaid lease payment as part of the right-of-use asset. There is no impact on profit or loss at lease commencement.

* Deposit of CU100 discounted at the market rate of interest (5% per annum) for the lease term of 10 years)

Year 1:

Dr	Deposit receivable#	CU3	
	Cr Interest income		CU3

To recognise interest income on the deposit using the effective interest method

Dr	Depreciation expenses	CU4	
	Cr	Right-of-use asset	CU4

To depreciate over the ten-year lease term the additional rent included in the right-of-use asset

Estimated based on a 5% per annum effective interest rate

	Cr	Deferred lease income	CU39
	Cr	Deposit payable	CU61

To record the deposit payable at fair value on initial recognition and to record the prepaid lease payment as part of deferred lease income. There is no impact on profit or loss at lease commencement.

Year 1:

Dr	Interest expense	CU3	
	Cr	Deposit payable	CU3

To recognise interest expense on the deposit using the effective interest method.

Dr	Deferred lease income	CU4	
	Cr	Rental income	C4

To recognise the additional rent on a straight-line basis over the lease term

Lessor accounting in a finance lease

Assume the carrying amount of the underlying asset is CU600; the initial carrying amount of the net investment in the lease (i.e., the present value of the lease payments not yet received at the commencement date) is CU700; total lease payments including the effect of discounting the deposit is CU739, and the present value of the unguaranteed residual value is CU60.

At lease commencement:

Dr	Cash	CU100	
Dr	Net investment in the lease	CU760	
	Cr	Underlying asset	CU600
	Cr	Deposit payable	CU61
	Cr	Gain on disposal	CU199

To recognise the lease transaction at commencement of the lease.

Year 1:

Dr	Interest expense	CU3	
	Cr	Deposit payable	CU3

To recognise interest expense on the deposit using the effective interest method. The additional journals to adjust the net investment in the lease for accrued interest and cash receipts have been excluded for simplicity.

4.5.10 Non-recoverable value added tax and property taxes

When a lessee enters into a lease contract the lessor may be required to charge the lessee VAT in accordance with the local tax regulations. In many jurisdictions, the lessor charges VAT on behalf of the tax authority and payment is remitted to the tax authority. In circumstances when the VAT is the obligation of the lessee (i.e., not the lessor's obligation) the VAT charged is not a lease payment. From a lessee's perspective, typically the lessee only incurs a liability for the VAT when the lessor invoices the lease payment. Therefore, the payments do not meet the definition of an initial direct cost as they are incurred as a consequence of using the asset during the lease term, not obligations that arise to obtain the lease.

In some cases, VAT is not fully recoverable by the lessee, usually because either the activities of the lessee prohibit the recovery of VAT or recovery is prohibited due to the nature of the leased asset. The IFRS IC discussed this in March 2021. However, the IFRS IC did not obtain evidence that the matter had widespread effect or a material effect on entities and so decided not to add a standard-setting project to the work plan.

How we see it

Generally, we expect that lessees will not include non-recoverable VAT in lease payments. Non-recoverable VAT payments are in the scope of IFRIC 21 *Levies*. See Chapter 27.

In some circumstances, a lessee may enter into a contract to lease property and the lessor is required to pay property taxes levied by a local government authority. For example, the lease contract may specify that the lessee pays an additional amount to cover the lessor's property tax costs. Property tax that is reimbursable by the lessee to the lessor as the owner of the office building, according to the contract, does not transfer any goods or services to the lessee and, as such, it is not a separate component of the contract. Rather, it is part of the total consideration and should be allocated to the separately identified components of the contract. If any portion of the reimbursable amount meets the definition of a lease payment (for example, the first-year tax reimbursement may be known at lease commencement) it is included in the lease liability. If the reimbursable amount is variable and does not depend on an index or rate (for example, because it depends on the actual tax owed by the lessor as determined by the taxing authority each period) it is accounted for as a variable payment that does not depend on an index or rate as described in section 4.5.8 above. Unlike the non-recoverable VAT payments discussed above, the property tax reimbursable by the lessee to the lessor is not a collection of tax by the lessor on behalf of the tax authority. The obligation to pay the property tax rests with the lessor as the owner (regardless of whether the lessee ends up making any payments to the lessor). That is, the property tax is a cost of ownership and the lessee's payment to the lessor simply compensates the lessor for the use of the office building.

4.5.11 Co-tenancy clauses

A co-tenancy clause is a clause in a lease contract that could result in changes in a lessee's lease payments if certain events involving other tenants occur (e.g., if key tenants, or a certain number of tenants, leave a retail shopping centre). A co-tenancy clause, if triggered, may temporarily reduce a lessee's lease payments or contractually change the lease payments from fixed lease payments to variable lease payments (e.g., payments that were previously fixed are changed to a percentage of sales). Generally, when the co-tenancy clause is resolved (e.g., the anchor tenant is replaced or occupancy levels return to a stated percentage), the lease payments will revert back to the previous amounts.

IFRS 16 requires a lessee to remeasure lease payments when a contingency, upon which some or all of the variable lease payments that will be paid over the remainder of the lease term are based, is resolved and those payments now meet the definition of lease payments. A co-tenancy clause would typically result in the inverse scenario because it would temporarily lower the lease payment or temporarily cause fixed payments to become variable.

How we see it

If after lease commencement, a co-tenancy clause is triggered, we believe a lessee generally would not remeasure the lease payments. We believe any temporary change in lease payments that results from a co-tenancy clause being triggered should be recognised in profit or loss similar to variable lease payments.

However, in certain circumstances, when it is likely the co-tenancy clause will not be resolved (e.g., the lease space is an aging shopping centre with a low likelihood of locating replacement tenants that comply with the clause), we believe a lessee may reasonably conclude it should remeasure the lease payments.

In the example where the lease space is an ageing shopping centre with a low likelihood of locating replacement tenants that comply with the clause and the lessee concludes it should remeasure the lease payments, the lessee would reduce the existing lease liability with an adjustment to the right-of-use asset. The effect of a co-tenancy clause when reassessing lease payments will depend on facts and circumstances.

4.5.12 Reassessment of the lease liability

IFRS 16 contains specific requirements about how to remeasure the lease liability to reflect changes to the lease payments (see section 5.4 below). A lessee recognises the amount of the remeasurement of the lease liability as an adjustment to the right-of-use asset. However, if the carrying amount of the right-of-use asset is reduced to zero and there is a further reduction in the measurement of the lease liability, a lessee recognises any remaining amount of the remeasurement in profit or loss. [IFRS 16.39].

4.5.13 Remeasurement by lessors

Lessors remeasure the lease payments upon a modification (i.e., a change in the scope of a lease, or the consideration for a lease that was not part of its original terms and conditions) that is not accounted for as a separate contract. Refer to section 6.5.

4.6 Discount rates

Extract from IFRS 16

Appendix A

Defined terms

interest rate implicit in the lease

The rate of interest that causes the present value of (a) the **lease payments** and (b) the **unguaranteed residual value** to equal the sum of (i) the **fair value** of the **underlying asset** and (ii) any **initial direct costs** of the lessor.

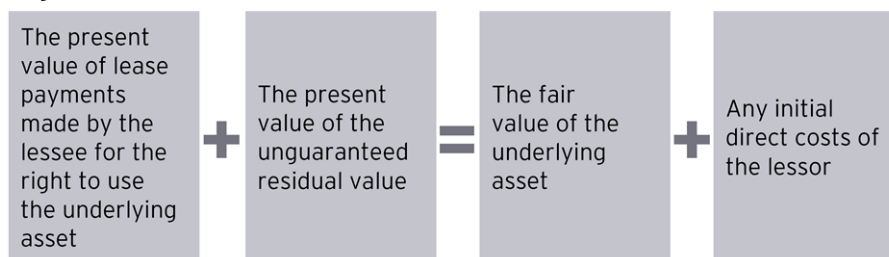

lessee's incremental borrowing rate

The rate of interest that a **lessee** would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the **right-of-use asset** in a similar economic environment.

[IFRS 16 Appendix A].

Discount rates are used to determine the present value of the lease payments, which are used to determine lease classification (refer to section 6.1 below) and to measure a lessor's net investment in the lease and a lessee's lease liability.

For a lessor, the discount rate for the lease is the interest rate implicit in the lease, which is the rate that causes the following:

Initial direct costs, other than those incurred by manufacturer or dealer lessors, are included in the initial measurement of the net investment in the lease and reduce the amount of income recognised over the lease term. Refer to section 6 and section 4.7 below.

For lessees, lease payments are discounted using the interest rate implicit in the lease as described above if that rate can be readily determined. If that rate cannot be readily determined, the lessee uses the incremental borrowing rate. [IFRS 16.26].

How we see it

The interest rate implicit in the lease is not necessarily the rate stated in the contract and reflects, among other things, the lessor's initial direct costs and estimates of residual value. Therefore, lessees may find it difficult to determine the interest rate implicit in the lease, in which case, they will need to determine the incremental borrowing rate.

The term readily determinable is not equivalent to estimable. Therefore, when the interest rate implicit in the lease can only be determined by using estimates and/or assumptions, then the interest rate implicit in the lease is not readily determinable.

The lessee's incremental borrowing rate is the rate of interest that the lessee would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment. [IFRS 16 Appendix A].

In determining the incremental borrowing rate, the lessee considers borrowings with a similar term and security to the right-of-use asset, not the underlying asset. For example, in the case of a five-year property lease, the lessee considers borrowings with a similar term to the five year right-of-use asset, not the property itself, which may have a significantly longer life. Observable rates, such as a property yield can be used as a starting point to determine the incremental borrowing rate, but adjustments need to be considered for an asset with a value similar to the right-of-use asset. Other potential sources of adjustment may include the credit profile of the lessee, the borrowing currency, or the length of the lease term. It is likely that in some cases significant judgement will be needed to determine the incremental borrowing rate.

How we see it

Market interest rates, particularly risk-free rates, can be negative. IFRS 16 does not contain a floor of zero for the discount rate and therefore it is possible that a lessee's incremental borrowing rate could be below zero. However, as stated above, observable borrowings with negative nominal interest rates may be a starting point and entities will need to consider all potential sources of adjustment (e.g., its own credit rating, lease term, currency) to determine its own incremental borrowing rate.

In certain cases, particularly for high value assets, the incremental borrowing rate may be lower than the lessee would expect the lessor's interest rate implicit in the lease to be, because the lessor is exposed to the residual value risk of the asset at the end of the lease term. This asset risk premium is not adjusted for as it does not meet the definition of the incremental borrowing rate in IFRS 16.

As explained above, the lessee's incremental borrowing rate reflects the rate of interest that a lessee would have to pay, among others, in a similar economic environment. This is generally a nominal discount rate. If the contract requires lease payments to be made in a currency other than the functional currency of the lessee, the incremental borrowing rate of the lessee should be determined based on a borrowing of a similar amount in that foreign currency. Leases denominated in a foreign currency are discussed further in section 5.6.2 below.

In June and September 2019, the IFRS IC discussed whether a lessee's incremental borrowing rate is required to reflect the interest rate on a loan with both a similar maturity to the lease and a similar payment profile to the lease. Specifically, whether an entity should use the interest rate for an amortising loan (whereby the principal and interest are paid down over time) or the interest rate for a bullet repayment loan, (whereby the interest is paid over time with a single bullet payment of the principal at the end of the loan). Interest rates for bullet repayment loans are often higher than those for amortising loans.

The IFRS IC noted that the lessee's incremental borrowing rate is a lease-specific rate that the Board defined "to take into account the terms and conditions of the lease". [IFRS 16.BC162]. The definition of a lessee's incremental borrowing rate in IFRS 16 does not explicitly require a lessee to determine its incremental borrowing rate to reflect the interest rate on a loan with a similar payment profile to the lease payments. Nonetheless, the IFRS IC observed that it would be consistent with the Board's objective (when developing the definition of incremental borrowing rate) for a lessee to refer, as a starting point, to a readily observable rate for a loan with a similar payment profile to that of the lease.

How we see it

Given the lack of prescriptive guidance, we believe that the use of an amortising loan rate that has a similar payment profile to the lease is always acceptable. The use of other rates (e.g., bullet loan rates) may also be acceptable depending on the facts and circumstances (e.g., when the use of such rates aligns with the lessee's normal borrowing practices).

FASB differences

IFRS 16 does not address whether the lessee considers the effect of lease term options (e.g., purchase and renewal options) that are not included in the lease term, in the determination of the incremental borrowing rate. Under ASC 842, a lessee may consider the effect of lease term options (e.g., purchase and renewal options) that are not included in the lease term.

Entities that are not public business entities may, under ASC 842, elect to use a risk-free rate by class of underlying asset for initial and subsequent measurement of the lease liability. However, a lessee is required to use the rate implicit in the lease when it is readily determinable, even if they make the risk-free rate election.

4.6.1 Determination of the incremental borrowing rate by a subsidiary with centralised treasury functions

Some groups maintain centralised treasury functions and all funding requirements for the group are managed by the parent entity. Under IFRS 16, subsidiaries participating in a centralised treasury function cannot default to their parent's incremental borrowing rate. Rather, all facts and circumstances should be considered to determine the subsidiary/lessee's incremental borrowing rate. The existence of guarantees of the subsidiary's obligations may result in a rate that is similar to the parent's rate as if the parent had entered into the lease directly.

4.6.2 Reassessment of the discount rate

The discount rate for a lessee is reassessed in the following situations:

- A change in the lease term
- A change in the assessment of an option to purchase the underlying asset
- A modification that is not accounted for as a separate lease
- A change in lease payments resulting from a change in floating interest rates

Refer to section 4.5.12 and section 5.5.

IFRS 16 does not include specific requirements on the reassessment of the discount rate for lessors.

4.7 Initial direct costs

Extract from IFRS 16

Appendix A Defined terms

initial direct costs

Incremental costs of obtaining a **lease** that would not have been incurred if the lease had not been obtained, except for such costs incurred by a manufacturer or dealer **lessor** in connection with a **finance lease**.

[IFRS 16 Appendix A].

Under IFRS 16, initial direct costs are incremental costs that would not have been incurred if the lease had not been obtained (e.g., commissions, certain payments made to an existing lessee to incentivise that lessee to terminate its lease). Lessees and lessors apply the same definition of initial direct costs. The requirements under IFRS 16 for initial direct costs are consistent with the concept of incremental costs in IFRS 15.

4.7.1 Lessor accounting for initial direct costs

IFRS 16 requires lessors, other than manufacturer or dealer lessors, to include initial direct costs in the initial measurement of their net investments in finance leases and reduce the amount of income recognised over the lease term. The interest rate implicit in the lease is defined in such a way that the initial direct costs are included automatically in the net investment in the lease and they are not added separately. Initial direct costs related to finance leases incurred by manufacturer or dealer lessors are expensed at lease commencement. [IFRS 16.69].

IFRS 16 requires lessors to include initial direct costs in the carrying amount of the underlying asset in an operating lease. These initial direct costs are recognised as an expense over the lease term on the same basis as lease income.

4.7.2 Lessee accounting for initial direct costs

IFRS 16 requires lessees to include their initial direct costs in their initial measurement of the right-of-use asset.

Certain costs associated with acquiring an asset within the scope of IAS 16 are required to be capitalised upon initial recognition. See Chapter 19. However, IFRS 16 does not address the accounting for lessees' costs incurred directly attributable to bringing a right-of-use asset to the location and condition necessary for it to be capable of operating in the manner intended by management.

How we see it

To the extent that costs related to acquiring a right-of-use asset are not subject to capitalisation under other IFRS accounting standards (e.g., IAS 16), it remains to be seen in practice whether they are charged to profit or loss when incurred or capitalised by analogy to IAS 16. For example, a lessee may incur costs when leasing an asset, by paying a third party to ship the asset, prepare the site and install the underlying asset. We believe lessees may analogise to IAS 16 to determine if such costs can be capitalised.

4.8 Economic life

Extract from IFRS 16

Appendix A Defined terms

economic life

Either the period over which an asset is expected to be economically usable by one or more users or the number of production or similar units expected to be obtained from an asset by one or more users.

[IFRS 16 Appendix A].

4.9 Fair value

Extract from IFRS 16

Appendix A Defined terms

fair value

For the purpose of applying the **lessor** accounting requirements in this Standard, the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction.

[IFRS 16 Appendix A].

5 Lessee accounting

5.1 Initial recognition

At the commencement date, a lessee recognises a right-of-use asset and a lease liability. [IFRS 16.22].

IFRS 16 requires lessees to recognise a liability to make lease payments and an asset representing the right to use the underlying asset (i.e., the right-of-use asset) during the lease term for all leases, except for short-term leases (refer to section 5.1.1 below) and leases of low-value assets (refer to section 5.1.2 below) if they choose to apply such exemptions.

FASB differences

Under IFRS 16, all leases are accounted for using the right-of-use model (unless a recognition exemption is applied). ASC 842 similarly requires recognition of a right-of-use asset and lease liability at commencement date. However, under ASC 842 recognised leases are classified as either finance or operating at the lease commencement date, which will affect the subsequent measurement of the right-of-use asset.

5.1.1 Short-term leases

A short-term lease is defined as a lease that, at the commencement date, has a lease term of 12 months or less. A lease that contains a purchase option is not a short-term lease. [IFRS 16 Appendix A].

The short-term lease exemption can be made by class of underlying asset to which the right of use relates. A class of underlying asset is a grouping of underlying assets of a similar nature and use in an entity's operations. [IFRS 16.8].

A lessee that makes this accounting policy election does not recognise a lease liability or right-of-use asset on its statement of financial position. Instead, the lessee recognises the lease payments associated with those leases as an expense on either a straight-line basis over the lease term or another systematic basis. The lessee is required to apply another systematic basis if that basis is more representative of the pattern of the lessee's benefit. [IFRS 16.6].

When determining whether a lease qualifies as a short-term lease, a lessee evaluates the lease term in the same manner as all other leases. Refer to section 4.4 above. That is, the lease term includes the non-cancellable term of the lease, periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option, and periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option. As the determination is made at commencement date, a lease cannot be classified as short-term if the lease term is subsequently reduced to less than 12 months. In addition, to qualify as a short-term lease, the lease cannot include an option to purchase the underlying asset.

FASB differences

Under IFRS 16, a lease does not qualify as a short-term lease if it includes an option to purchase the underlying asset. Under ASC 842, a lease does not qualify as a short-term lease if it includes a purchase option that is reasonably certain to be exercised.

A lease that at commencement qualified as a short-term lease is considered to be a new lease if there is a lease modification or a change in a lessee's assessment of the lease term (e.g., the lessee exercises an option not previously included in the determination of the lease term). [IFRS 16.7]. The new lease is evaluated to determine whether it qualifies for the short-term exemption, similar to any other new lease.

FASB differences

Under ASC 842, a lease no longer qualifies as a short-term lease when there is a change in a lessee's assessment of either of the following:

- The lease term so that, after the change, the remaining lease term extends more than 12 months from the end of the previously determined lease term
- Whether the lessee is reasonably certain to exercise an option to purchase the underlying asset

The short-term lease accounting policy election is intended to reduce the cost and complexity of applying IFRS 16. However, a lessee that makes the election must make certain quantitative and qualitative disclosures about short-term leases. Refer to section 5.8 below.

Once a lessee establishes a policy for a class of underlying assets, all future short-term leases for that class are required to be accounted for in accordance with the lessee's policy. A lessee evaluates any potential change in its accounting policy in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*.

Illustration 5-1: Short-term lease

Scenario A

A lessee enters into a lease with a nine-month non-cancellable term with an option to extend the lease for four months. The lease does not have a purchase option. At the lease commencement date, the lessee concludes that it is reasonably certain to exercise the extension option because the monthly lease payments during the extension period are significantly below market rates.

Analysis: The lease term is greater than 12 months (i.e., 13 months). Therefore, the lessee may not account for the lease as a short-term lease.

Scenario B

Assume the same facts as Scenario A except, at the lease commencement date, the lessee concludes that it is not reasonably certain to exercise the extension option because the monthly lease payments during the optional extension period are at what the lessee expects to be market rates and there are no other factors that would make exercise of the renewal option reasonably certain.

Analysis: The lease term is 12 months or less, i.e., nine months. Therefore, the lessee may (subject to its accounting policy, by class of underlying asset) account for the lease under the short-term lease exemption, i.e., it recognises lease payments as an expense on either a straight-line basis over the lease term or another systematic basis and does not recognise a lease liability or right-of-use asset on its statement of financial position.

5.1.2 Leases of low-value assets

Lessees can also make an election for leases for which the underlying asset is of low value (i.e., low-value assets). This election can be made on a lease-by-lease basis. [IFRS 16.B]. A lessee that makes this election does not recognise a lease liability or right-of-use asset on its statement of financial position. Instead, the lessee recognises the lease payments associated with those leases as an expense on either a straight-line basis over the lease term or another systematic basis, if that basis is more representative of the pattern of the lessee's benefit. [IFRS 16.6].

A lessee assesses the value of an underlying asset based on the value of the asset when it is new, regardless of the age of the asset being leased. [IFRS 16.B3]. The assessment of whether an underlying asset is of low value is performed on an absolute basis. Leases of low-value assets qualify for the exemption regardless of whether those leases are material to the lessee. The assessment is not affected by the size, nature or circumstances of the lessee. Accordingly, different lessees are expected to reach the same conclusion about whether a particular underlying asset is of low-value. [IFRS 16.B4]. At the time of reaching its decisions about the exemption, the IASB had in mind leases of underlying assets with a value, when new, of US\$5,000 or less. [IFRS 16.BC100]. Examples of low-value assets include desktop and laptop computers, small items of office furniture, telephones and other low-value equipment and excludes cars because a new car would typically not be of low value. [IFRS 16.B6].

An underlying asset can only be of low-value if both:

- The lessee can benefit from use of the assets on their own, or together with, other resources that are readily available to the lessee
- The underlying asset is not dependent on, or highly interrelated with, other assets [IFRS 16.B5]

For example, an entity may lease a truck for use in its business and the lease includes the use of the tyres attached to the truck. To use the tyres for their intended purpose, they can only be used with the truck and as such, they are dependent on, or highly interrelated with the truck. Therefore, the tyres would not qualify for the low-value asset exemption.

An intermediate lessor who subleases, or expects to sublease an asset, cannot account for the head lease as a lease of a low-value asset. [IFRS 16.B7]. Refer to section 7.2 below.

FASB differences

Under ASC 842, there is no recognition exemption for leases based on the value of the underlying asset.

5.2 Initial measurement

5.2.1 Right-of-use assets

A lessee initially measures the right-of-use asset at cost, which consists of all of the following:

- The amount of the initial measurement of the lease liability (refer to section 5.2.2 below)
- Any lease payments made to the lessor at or before the commencement date, less any lease incentives received from the lessor (refer to section 4.5.2 above)
- Any initial direct costs incurred by the lessee (refer to section 4.7 above)
- An estimate of the costs to be incurred by the lessee in dismantling and removing the underlying asset, restoring the site on which the underlying asset is located or restoring the underlying asset to the condition required by the terms and conditions of the lease, unless those costs are incurred to produce inventories. [IFRS 16.23, IFRS 16.24].

On initial measurement, a lessee is required to recognise dismantling, removal and restoration costs as part of the right-of-use asset. Costs may be incurred at lease commencement or during a particular period as a consequence of having used an underlying asset. Costs that are incurred during a particular period as a consequence of having used the right-of-use asset to produce inventories are accounted for under IAS 2 *Inventories*. The liability associated with dismantling, removal and restoration costs is recognised and measured in accordance with IAS 37. [IFRS 16.25].

In certain retail property leases, a lessee may sign a lease contract with a lessor and also make a payment to the existing lessee in return for vacating the property. This is sometimes referred to as key money. The existing lessee is released from all obligations under the lease contract with the lessor (i.e., this is not a sublease arrangement). The new lessee also has the right to transfer its rights and obligations in the lease contract to another party in exchange for payment, which would also release the new lessee from all obligations with the lessor. On initial recognition of the lease contract, the payment to the previous lessee is accounted for as an initial direct cost and is included in the measurement of the right-of-use asset. The payment is not in the scope of IAS 38. The new lessee applies the requirements described in section 5.3.1 below to the subsequent measurement of the right-of-use asset.

5.2.2 Lease liabilities

Extract from IFRS 16

- | | |
|----|--|
| 26 | At the commencement date, a lessee shall measure the lease liability at the present value of the lease payments that are not paid at that date. The lease payments shall be discounted using the interest rate implicit in the lease, if that rate can be readily determined. If that rate cannot be readily determined, the lessee shall use the lessee's incremental borrowing rate. |
| 27 | At the commencement date, the lease payments included in the measurement of the lease liability comprise the following payments for the right to use the underlying asset during the lease term that are not paid at the commencement date: <ul style="list-style-type: none"> (a) fixed payments (including in-substance fixed payments as described in paragraph B42), less any lease incentives receivable; (b) variable lease payments that depend on an index or a rate, initially measured using the index or rate as at the commencement date (as described in paragraph 28); (c) amounts expected to be payable by the lessee under residual value guarantees; (d) the exercise price of a purchase option if the lessee is reasonably certain to exercise that option (assessed considering the factors described in paragraphs B37-B40); and (e) payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease |

At the commencement date, a lessee initially measures the lease liability at the present value of the lease payments to be made over the lease term. Lessees apply the concepts previously described in section 3 and section 4 above to identify the lease components and to determine the lease term, lease payments and discount rate as of the commencement date of the lease. [IFRS 16.26, IFRS 16.27].

5.3 Subsequent measurement

5.3.1 Right-of-use assets

A lessee subsequently measures the right-of-use asset using a cost model, unless it applies one of the other measurement models discussed below. [IFRS 16.29].

5.3.1.A Cost model

To apply the cost model, a lessee measures the right-of-use asset at cost:

- Less any accumulated depreciation and any accumulated impairment losses
- And
- Adjusted for any remeasurement of the lease liability described in section 5.4 below

When a lessee applies the cost model, the right-of-use asset is subsequently measured at cost less accumulated depreciation and accumulated impairment losses.

A lessee applies the depreciation requirements in IAS 16 in depreciating the right-of-use asset, subject to the following requirements:

If the lease transfers ownership of the underlying asset to the lessee by the end of the lease term, or if the cost of the right-of-use asset reflects that the lessee will exercise a purchase option, the lessee depreciates the right-of-use asset from the commencement date to the end of the useful life of the underlying asset. [IFRS 16.31]. Otherwise, the lessee depreciates the right-of-use asset from the commencement date to the earlier of the end of the useful life of the right-of-use asset or the end of the lease term. [IFRS 16.32]. The leased asset is depreciated from the commencement date of the lease even if the lessee chooses not to use the asset from the commencement date, for example, because leasehold improvements are being constructed.

Depreciation of the right-of-use asset is recognised in a manner consistent with existing standards for property, plant and equipment. IAS 16 is not prescriptive about the methods of depreciation, mentioning straight line, diminishing balance and units of production as possibilities. The overriding requirement of IAS 16 is that the depreciation charge reflects the pattern of consumption of the benefits the asset brings over its useful life and is applied consistently from period to period.

IAS 16 also requires that each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item is depreciated separately. An entity allocates the amount initially recognised with respect to an item of property, plant and equipment to its significant parts and separately depreciates each such part. For example, as noted in IAS 16, it may be appropriate to depreciate separately the airframe and engines of an aircraft. In many cases, the right-of-use asset will relate to one underlying asset or significant part and so a component approach may not be necessary. However, entities will need to assess whether it should be applied for right-of-use assets that have significant parts with different useful economic lives.

FASB differences

Under ASC 842, component depreciation is also permitted but is not common.

A lessee applies IAS 36 *Impairment of Assets* to determine whether the right-of-use asset is impaired and to account for any impairment loss identified. [IFRS 16.33].

5.3.1.B Other measurement models

If a lessee applies the fair value model in IAS 40 *Investment Property* to its investment property, the lessee also applies the fair value model to right-of-use assets that meet the definition of investment property in IAS 40. [IFRS 16.34].

If right-of-use assets relate to a class of property, plant and equipment to which the lessee applies the revaluation model in IAS 16, the lessee may elect to apply that revaluation model to all the right-of-use assets that relate to that class of property, plant and equipment. [IFRS 16.35].

5.3.2 Lease liabilities

Extract from IFRS 16

- 36 After the commencement date, a lessee shall measure the lease liability by:
- (a) increasing the carrying amount to reflect interest on the lease liability;
 - (b) reducing the carrying amount to reflect the lease payments made; and
 - (c) remeasuring the carrying amount to reflect any reassessment or lease modifications specified in paragraphs 39-46, or to reflect revised in-substance fixed lease payments (see paragraph B42).

Interest on the lease liability in each period during the lease term, is the amount that produces a constant periodic rate of interest on the remaining balance of the lease liability. The periodic rate of interest is the discount rate determined at commencement unless a reassessment requiring a change in the discount rate has been triggered. [IFRS 16.36, IFRS 16.37]. Lease payments reduce the lease liability when paid. Refer to section 5.4 and section 5.5, respectively.

5.3.3 Expense recognition

After the commencement date, the lessee recognises depreciation and impairment of the right-of-use asset in profit or loss, unless depreciation is permitted to be capitalised (e.g., to inventory) under other IFRS accounting standards (or the lessee applies the fair value model described in section 5.3.1.B above).

A lessee also recognises in profit or loss, unless the costs are included in the carrying amount of another asset applying other IFRS accounting standards, both:

- (a) Interest on the lease liability

And

- (b) Variable lease payments not included in the measurement of the lease liability in the period in which the event or condition that triggers those payments occurs. [IFRS 16.38].

When a lessee depreciates the right-of-use asset on a straight-line basis, the total periodic expense (i.e., the sum of interest and depreciation expense) is generally higher in the early periods and lower in the later periods. Because a constant interest rate is applied to the lease liability, interest expense decreases as cash payments are made during the lease term and the lease liability decreases. Therefore, more interest expense is incurred in the early periods and less in the later periods. This trend in the interest expense, combined with straight-line depreciation of the right-of-use asset, results in a front-loaded expense recognition pattern.

If a lessee determines that a right-of-use asset is impaired, it recognises an impairment loss and measures the right-of-use asset at its carrying amount immediately after the impairment. A lessee subsequently depreciates, generally on a straight-line basis, the right-of-use asset from the date of the impairment to the earlier of the end of the useful life of the right-of-use asset or the end of the lease term. However, the depreciation period is the remaining useful life of the underlying asset if the lessee is reasonably certain to exercise an option to purchase the underlying asset or if the lease transfers ownership of the underlying asset to the lessee by the end of the lease term. Refer to section 5.6.1 below, for additional discussion of impairment of right-of-use assets.

5.3.4 Example - lessee accounting

Illustration 5-2: Lessee accounting

Entity H (lessee) enters into a three-year lease of equipment. Entity H agrees to make the following annual payments at the end of each year: CU10,000 in year one, CU12,000 in year two and CU14,000 in year three. For simplicity, there are no other elements to the lease payments (e.g., purchase options, lease incentives from the lessor or initial direct costs). The initial measurement of the right-of-use asset and lease liability is CU33,000 (present value of lease payments using a discount rate of approximately 4.235%). Entity H uses its incremental borrowing rate because the interest rate implicit in the lease cannot be readily determined. Entity H depreciates the right-of-use asset on a straight-line basis over the lease term.

Analysis:

At lease commencement, Entity H would recognise the lease-related asset and liability:

Dr	Right-of-use asset	CU33,000	
	Cr	Lease liability	CU33,000

To initially recognise the lease-related asset and liability

The following journal entries would be recorded in the first year:

Dr	Interest expense	CU1,398	
	Cr	Lease liability	CU1,398

To record interest expense and accrete the lease liability using the interest method
(CU33,000 × 4.235%)

Dr	Depreciation expense	CU11,000	
	Cr	Right-of-use asset	CU11,000

To record depreciation expense on the right-of-use asset (CU33,000 ÷ 3 years)

Dr	Lease liability	CU10,000	
	Cr	Cash	CU10,000

To record lease payment

A summary of the lease contract's accounting (assuming no changes due to reassessment) is, as follows:

	Initial	Year 1	Year 2	Year 3
Cash lease payments		CU10,000	CU12,000	CU14,000
Lease expense recognised				
Interest expense		CU1,398	CU1,033	CU569
Depreciation expense		11,000	11,000	11,000
Total periodic expense		CU12,398	CU12,033	CU11,569
Statement of financial position				
Right-of-use asset	CU33,000	CU22,000	CU11,000	-
Lease liability	(CU33,000)	(CU24,398)	(CU13,431)	-

5.4 Remeasurement of lease liabilities

Extract from IFRS 16

- 39 After the commencement date, a lessee shall apply paragraphs 40-43 to remeasure the lease liability to reflect changes to the lease payments. A lessee shall recognise the amount of the remeasurement of the lease liability as an adjustment to the right-of-use asset. However, if the carrying amount of the right-of-use asset is reduced to zero and there is a further reduction in the measurement of the lease liability, a lessee shall recognise any remaining amount of the remeasurement in profit or loss.
- 40 A lessee shall remeasure the lease liability by discounting the revised lease payments using a revised discount rate, if either:
- (a) there is a change in the lease term, as described in paragraphs 20-21. A lessee shall determine the revised lease payments on the basis of the revised lease term; or
 - (b) there is a change in the assessment of an option to purchase the underlying asset, assessed considering the events and circumstances described in paragraphs 20-21 in the context of a purchase option. A lessee shall determine the revised lease payments to reflect the change in amounts payable under the purchase option.
- 41 In applying paragraph 40, a lessee shall determine the revised discount rate as the interest rate implicit in the lease for the remainder of the lease term, if that rate can be readily determined, or the lessee's incremental borrowing rate at the date of reassessment, if the interest rate implicit in the lease cannot be readily determined.

- 42 A lessee shall remeasure the lease liability by discounting the revised lease payments, if either:
- (a) there is a change in the amounts expected to be payable under a residual value guarantee. A lessee shall determine the revised lease payments to reflect the change in amounts expected to be payable under the residual value guarantee.
 - (b) there is a change in future lease payments resulting from a change in an index or a rate used to determine those payments, including for example a change to reflect changes in market rental rates following a market rent review. The lessee shall remeasure the lease liability to reflect those revised lease payments only when there is a change in the cash flows (ie when the adjustment to the lease payments takes effect). A lessee shall determine the revised lease payments for the remainder of the lease term based on the revised contractual payments.
- 43 In applying paragraph 42, a lessee shall use an unchanged discount rate, unless the change in lease payments results from a change in floating interest rates. In that case, the lessee shall use a revised discount rate that reflects changes in the interest rate.

[IFRS 16.39-43].

IFRS 16 requires lessees to remeasure lease liabilities when there is a lease modification (i.e., a change in the scope of a lease, or the consideration for a lease that was not part of the original terms and conditions of the lease) that is not accounted for as a separate contract. Refer to section 5.5 below. Lessees are also required to remeasure lease payments upon a change in any of the following:

- The lease term (refer to section 4.4.1 above)
- The assessment of whether the lessee is reasonably certain to exercise an option to purchase the underlying asset (refer to section 4.4.1.A above)
- The amounts expected to be payable under residual value guarantees (refer to section 4.5.6 above)
- Future lease payments resulting from a change in an index or rate (refer to section 4.5.3 above)
- In-substance fixed lease payments (refer to section 4.5.1 above)

Lessees use a revised discount rate when lease payments are updated for a change in the lease term or a revised assessment of a purchase option. [IFRS 16.40]. The revised discount rate is based on the interest rate implicit in the lease for the remainder of the lease term. If that rate cannot be readily determined, the lessee uses its incremental borrowing rate. [IFRS 16.41]. Lessees use the original discount rate when lease payments are updated for a change in expected amounts for residual value guarantees, payments dependent on an index or rate and changes to in-substance fixed lease payments, unless the rate is a floating interest rate. [IFRS 16.42, IFRS 16.43].

How we see it

When a lease includes a market rate adjustment (a market rent review), the negotiations between the lessee and the lessor may take some time to complete (the negotiation period). We believe any adjustment is recognised as an adjustment to lease payments when the market rent review is finalised and the change in contractual cash flows takes effect.

For example, consider a 10-year lease that has a market rate adjustment that applies from the end of year 5. The market rent review negotiations begin during year 5, but are not completed until September in year 6. During year 6, while the negotiation is ongoing, the lessee is required to pay the original contractual lease payments. At the conclusion of the negotiation period in September of year 6 (i.e., upon a final determination of the lease payments for year 6 until year 10), the new lease payments apply retrospectively from the beginning of year 6. Under this view, the lessee does not adjust the lease payments at the beginning of year 6 for the expected increase in rent. Instead, the lease payments are adjusted in September of year 6 when they are finalised. The lease liability is remeasured at this date and the additional cost is recognised as an adjustment to the right-of-use asset for the future lease payments.

How we see it

We believe the difference between the original lease payments and the new lease payments for the period when the new lease payments are applied retrospectively (from the beginning of year 6 to September of year 6 in the example above) may be recognised in profit or loss at the date the negotiations are finalised. Alternatively, the difference may be recognised as an adjustment to the right-of-use asset. In this case, it may also be necessary to consider the recoverability of the right-of-use asset.

How we see it

Under IFRS 16.45(a), the consideration in the contract is reallocated when a lease is modified. IFRS 16 is silent on reallocation when a lease liability is remeasured for other reasons (e.g., a change in lease term). However, we believe, when a lease liability is remeasured for other reasons, the allocation of the revised consideration in the contract is not updated at the remeasurement date (i.e., the revised consideration in the contract is allocated using the relative stand-alone prices previously determined at lease commencement or the most recent modification date). Allocation of the consideration in the contract is discussed at section 3.2.3.B above.

FASB differences

Under ASC 842, the consideration in the contract is reallocated when a lease is modified or a lease liability is remeasured. Therefore, the revised lease payments are generally allocated based on the standalone price of the lease and non-lease components at the date of remeasurement (or effective date of the modification). However, standalone prices are not required to be updated under US GAAP when the remeasurement is due to (1) a change in the amount that is probable the lessee will owe under a residual value guarantee or (2) a resolution of a contingency that results in some or all of the payments allocated to the lease component that were previously determined to be variable meeting the definition of lease payments, unless these events are combined with one of the other remeasurement and reallocation events (e.g., change in lease term).

5.5 Lease modifications

Extract from IFRS 16

Appendix A

Defined terms

lease modification

A change in the scope of a **lease**, or the consideration for a lease, that was not part of the original terms and conditions of the lease (for example, adding or terminating the right to use one or more **underlying assets**, or extending or shortening the contractual **lease term**).

[IFRS 16 Appendix A].

If a lease is modified (i.e., a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease), the modified contract is evaluated to determine whether it is or contains a lease. Refer to section 3.1.7 above. If a lease continues to exist, lease modification can result in:

- A separate lease. Refer to section 5.5.1 below.
- A change in the accounting for the existing lease (i.e., not a separate lease). Refer to section 5.5.2 below.

The exercise of an existing purchase or renewal option or a change in the assessment of whether such options are reasonably certain to be exercised are not lease modifications but can result in the remeasurement of lease liabilities and right-of-use assets. Refer to section 4.5.12 above.

5.5.1 Determining whether a lease modification results in a separate lease

A lessee accounts for a lease modification (i.e., a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease) as a separate lease (i.e., separate from the original lease) when both of the following conditions are met:

- The modification increases the scope of the lease by adding the right to use one or more underlying assets.
- The consideration for the lease increases commensurate with the stand-alone price for the increase in scope and any adjustments to that stand-alone price reflect the circumstances of the particular contract. [IFRS 16.44].

If both of these conditions are met, the lease modification results in two separate leases, the unmodified original lease and a separate new lease. Lessees account for the separate contract that contains a lease in the same manner as other new leases. The accounting for the unmodified lease is not changed. Refer to IFRS 16's Example 15 that illustrates this concept in section 5.5.3 below.

If either of the conditions are not met, the modified lease is not accounted for as a separate lease. Refer to section 5.5.2 below.

The first condition above, is met if there is an additional right of use that was not included in the original lease. For example, if an existing lease for one floor of a building is modified to add a second floor, the right to use the second floor would meet the first condition as this adds a right of use that was not included in the original contract. Conversely, a modification that grants the lessee the right to use only the existing floor for an additional period of time does not meet the first condition above.

A lessee that terminates an existing lease and at the same time enters into a new lease arrangement with the same landlord evaluates the contract combination guidance discussed in section 3.3 above.

Illustration 5-3: Lessee accounting for an immediate termination and new lease with the same landlord

On 1 January 20X0, Retailer entered into a 10-year lease with Landlord for retail store A in a shopping mall. Retail store A is 10,000 square feet. The lease requires Retailer to make fixed monthly payments at the beginning of each month, but the amount increases each year. There are no initial direct costs or incentives associated with the lease, and there are no non-lease components in the contract.

On 1 January 20X2, Retailer and Landlord negotiate a new contract to immediately terminate the lease for retail store A and at the same time enter into a new lease for retail store B (i.e., the termination of retail store A lease is dependent on obtaining retail store B). Retail store B is 5,000 square feet and is located in a more desirable location. The term of the new lease is eight years, consistent with the remaining term of the retail store A lease. There are no lease termination payments for retail store A, and no lease prepayments, initial direct costs or lease incentives associated with the retail store B lease. There are no non-lease components in the contract for the retail store B lease. Retailer determines that the contract combination guidance is met.

On 1 January 20X2, immediately before the parties signed the new lease agreement, Retailer has a remaining right-of-use asset of CU115,000 and a lease liability of CU120,000. The lease for retail store A is not impaired.

Based on the terms of the retail store B lease agreement, the initial measurement of the lease liability is CU70,000, which represents the lease payments in the new lease, discounted using Retailer's incremental borrowing rate at the commencement date of the new lease.

Analysis: Under IFRS 16, Retailer accounts for the change as a termination of the existing lease of retail store A by removing the right-of-use asset and the lease liability from the balance sheet and including any difference between the right-of-use asset and the lease liability as part of the right-of-use asset it recognises for the new lease of retail store B (which in this case is similar to a lease incentive received to enter into the retail store B lease). Retailer records the following entries:

Dr	Lease liability (existing lease)	CU120,000	
	Cr	Right-of-use asset (existing lease)	CU115,000
Dr	Right-of-use asset (new lease)	CU65,000 ^(a)	
	Cr	Lease liability (new lease)	CU70,000

- (a) Recognition of the right-of-use asset associated with the new lease of retail store B at the initial measurement of the lease liability of CU70,000 less the difference between the lease liability and right-of-use asset from retail store A lease of CU5,000 (i.e., which in this case is similar to a lease incentive received to enter into the retail store B lease).

5.5.2 Lessee accounting for a modification that does not result in a separate lease

For those lease modifications that do not result in a separate lease, lessees allocate the consideration in the contract (refer to section 3.2.3.B) and remeasure the lease liability (using the lease term of the modified lease and the discount rate (i.e., the interest rate implicit in the lease for the remainder of the lease term if that rate can be readily determined or if not the lessee's incremental borrowing rate) as determined at the effective date of the modification). [IFRS 16.45, IFRS 16.46].

For a modification that fully or partially decreases the scope of the lease (e.g., reduces the square footage of leased space), IFRS 16 requires a lessee to decrease the carrying amount of the right-of-use asset to reflect partial or full termination of the lease. Any difference between those adjustments is recognised in profit or loss at the effective date of the modification. Refer to IFRS 16's Examples 17 and 18 in section 5.5.3 below.

How we see it

In some circumstances, a lessee may purchase the underlying asset from the lessor during the lease term but the contract did not include a purchase option. In such circumstances, we believe, consistent with IAS 16, the lessee recognises the purchase price plus the difference between carrying amounts of the lease liability and the right-of-use asset immediately before the purchase, to initially measure the purchased asset. That is, there is no P&L impact as a result of the transaction.

For all other lease modifications which are not accounted for as a separate lease, IFRS 16 requires the lessee to recognise the amount of the remeasurement of the lease liability as an adjustment to the corresponding right-of-use asset without affecting profit or loss. Refer to IFRS 16's Examples 16, 18 and 19 that illustrate this concept in section 5.5.3 below.

In the IASB's view, this approach results in accounting outcomes that faithfully represent the substance of a lease modification and closely aligns gain or loss recognition with a corresponding change in the lessee's rights and obligations under the lease. This is because a lease gives rise to both a right-of-use asset and a lease liability. Accordingly, a lease modification can result in a change to the lessee's rights (i.e., a change to the right-of-use asset), a change to the lease liability, or both. [IFRS 16.BC204].

In some cases, the lessee and lessor may agree to a modification to the lease contract that starts at a later date (i.e., the terms of the modification take effect at a date later than the date when both parties agreed to the modification). For example, a lessee enters into a lease arrangement with a lessor to lease an asset for 10 years. At the beginning of year 8, the lessee and lessor agree to a modification to the contract that will take effect from the beginning of year 9.

- If the modification is an increase in the scope that does not result in a separate lease, the lessee will re-allocate the consideration in the modified contract to each of the existing lease and non-lease components and remeasure the lease liability at the date both parties agreed to the modification (the beginning of year 8).
- If the modification results in a separate lease component, the lessee will allocate the consideration in the modified contract to each of the existing and new lease and non-lease components at the date both parties agreed to the modification (the beginning of year 8). The lessee will remeasure the lease liability for the existing lease components at that date as well. However, recognition of the lease liability and right-of-use asset for any new lease component occurs at the commencement date of the new lease component (the beginning of year 9).
- If the modification is a decrease in the scope, the lessee will re-allocate the consideration in the modified contract to each existing lease and non-lease component and remeasure the lease liability and right-of-use asset at the effective date of the modification (the beginning of year 8).

5.5.3 Examples - lessees' accounting for lease modifications

IFRS 16 provides the following examples to illustrate how lessees account for lease modifications.

[IFRS 16.IE7, IFRS 16.IE Example 15, IFRS 16.IE Example 16, IFRS 16.IE Example 17, IFRS 16.IE Example 18, IFRS 16.IE Example 19].

Extract from IFRS 16 Illustrative Examples

Example 15-Modification that is a separate lease

Lessee enters into a 10-year lease for 2,000 square metres of office space. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease for the remaining five years to include an additional 3,000 square metres of office space in the same building. The additional space is made available for use by Lessee at the end of the second quarter of Year 6. The increase in total consideration for the lease is commensurate with the current market rate for the new 3,000 square metres of office space, adjusted for the discount that Lessee receives reflecting that Lessor does not incur costs that it would otherwise have incurred if leasing the same space to a new tenant (for example, marketing costs).

Lessee accounts for the modification as a separate lease, separate from the original 10-year lease. This is because the modification grants Lessee an additional right to use an underlying asset, and the increase in consideration for the lease is commensurate with the stand-alone price of the additional right-of-use adjusted to reflect the circumstances of the contract. In this example, the additional underlying asset is the new 3,000 square metres of office space. Accordingly, at the commencement date of the new lease (at the end of the second quarter of Year 6), Lessee recognises a right-of-use asset and a lease liability relating to the lease of the additional 3,000 square metres of office space. Lessee does not make any adjustments to the accounting for the original lease of 2,000 square metres of office space as a result of this modification.

Example 16-Modification that increases the scope of the lease by extending the contractual lease term

Lessee enters into a 10-year lease for 5,000 square metres of office space. The annual lease payments are CU100,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. At the beginning of Year 7, Lessee and Lessor agree to amend the original lease by extending the contractual lease term by four years. The annual lease payments are unchanged (ie CU100,000 payable at the end of each year from Year 7 to Year 14). Lessee's incremental borrowing rate at the beginning of Year 7 is 7 per cent per annum.

At the effective date of the modification (at the beginning of Year 7), Lessee remeasures the lease liability based on: (a) an eight-year remaining lease term, (b) annual payments of CU100,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. The modified lease liability equals CU597,130. The lease liability immediately before the modification (including the recognition of the interest expense until the end of Year 6) is CU346,511. Lessee recognises the difference between the carrying amount of the modified lease liability and the carrying amount of the lease liability immediately before the modification (CU250,619) as an adjustment to the right-of-use asset.

Example 17-Modification that decreases the scope of the lease

Lessee enters into a 10-year lease for 5,000 square metres of office space. The annual lease payments are CU50,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease to reduce the space to only 2,500 square metres of the original space starting from the end of the first quarter of Year 6. The annual fixed lease payments (from Year 6 to Year 10) are CU30,000. Lessee's incremental borrowing rate at the beginning of Year 6 is 5 per cent per annum.

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability based on: (a) a five-year remaining lease term, (b) annual payments of CU30,000 and (c) Lessee's incremental borrowing rate of 5 per cent per annum. This equals CU129,884.

Lessee determines the proportionate decrease in the carrying amount of the right-of-use asset on the basis of the remaining right-of-use asset (ie 2,500 square metres corresponding to 50 per cent of the original right-of-use asset).

50 per cent of the pre-modification right-of-use asset (CU184,002) is CU92,001. Fifty per cent of the pre-modification lease liability (CU210,618) is CU105,309. Consequently, Lessee reduces the carrying amount of the right-of-use asset by CU92,001 and the carrying amount of the lease liability by CU105,309. Lessee recognises the difference between the decrease in the lease liability and the decrease in the right-of-use asset (CU105,309 - CU92,001 = CU13,308) as a gain in profit or loss at the effective date of the modification (at the beginning of Year 6).

Lessee recognises the difference between the remaining lease liability of CU105,309 and the modified lease liability of CU129,884 (which equals CU24,575) as an adjustment to the right-of-use asset reflecting the change in the consideration paid for the lease and the revised discount rate.

Example 18-Modification that both increases and decreases the scope of the lease

Lessee enters into a 10-year lease for 2,000 square metres of office space. The annual lease payments are CU100,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease to (a) include an additional 1,500 square metres of space in the same building starting from the beginning of Year 6 and (b) reduce the lease term from 10 years to eight years. The annual fixed payment for the 3,500 square metres is CU150,000 payable at the end of each year (from Year 6 to Year 8). Lessee's incremental borrowing rate at the beginning of Year 6 is 7 per cent per annum.

The consideration for the increase in scope of 1,500 square metres of space is not commensurate with the stand-alone price for that increase adjusted to reflect the circumstances of the contract.

Consequently, Lessee does not account for the increase in scope that adds the right to use an additional 1,500 square metres of space as a separate lease.

The pre-modification right-of-use asset and the pre-modification lease liability in relation to the lease are as follows.

Year	Lease liability				Right-of-use asset		
	Beginning balance	6% interest expense	Lease payment	Ending balance	Beginning balance	Depreciation charge	Ending balance
	CU	CU	CU	CU	CU	CU	CU
1	736,009	44,160	(100,000)	680,169	736,009	(73,601)	662,408
2	680,169	40,810	(100,000)	620,979	662,408	(73,601)	588,807
3	620,979	37,259	(100,000)	558,238	588,807	(73,601)	515,206
4	558,238	33,494	(100,000)	491,732	515,206	(73,601)	441,605
5	491,732	29,504	(100,000)	421,236	441,605	(73,601)	368,004
6	421,236				368,004		

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability on the basis of: (a) a three-year remaining lease term, (b) annual payments of CU150,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. The modified liability equals CU393,647, of which (a) CU131,216 relates to the increase of CU50,000 in the annual lease payments from Year 6 to Year 8 and (b) CU262,431 relates to the remaining three annual lease payments of CU100,000 from Year 6 to Year 8.

Decrease in the lease term

At the effective date of the modification (at the beginning of Year 6), the pre-modification right-of-use asset is CU368,004. Lessee determines the proportionate decrease in the carrying amount of the right-of-use asset based on the remaining right-of-use asset for the original 2,000 square metres of office space (ie a remaining three-year lease term rather than the original five-year lease term). The remaining right-of-use asset for the original 2,000 square metres of office space is CU220,802 (ie CU368,004 ÷ 5 × 3 years).

At the effective date of the modification (at the beginning of Year 6), the pre-modification lease liability is CU421,236. The remaining lease liability for the original 2,000 square metres of office space is CU267,301 (ie present value of three annual lease payments of CU100,000, discounted at the original discount rate of 6 per cent per annum).

Consequently, Lessee reduces the carrying amount of the right-of-use asset by CU147,202 (CU368,004 - CU220,802), and the carrying amount of the lease liability by CU153,935 (CU421,236 - CU267,301). Lessee recognises the difference between the decrease in the lease liability and the decrease in the right-of-use asset (CU153,935 - CU147,202 = CU6,733) as a gain in profit or loss at the effective date of the modification (at the beginning of Year 6).

Lease liability	CU153,935
Right-of-use asset	CU147,202
Gain	CU6,733

At the effective date of the modification (at the beginning of Year 6), Lessee recognises the effect of the remeasurement of the remaining lease liability reflecting the revised discount rate of 7 per cent per annum, which is CU4,870 (CU267,301 - CU262,431), as an adjustment to the right-of-use asset.

Lease liability	CU4,870
Right-of-use asset	CU4,870

Increase in the leased space

At the commencement date of the lease for the additional 1,500 square metres of space (at the beginning of Year 6), Lessee recognises the increase in the lease liability related to the increase in scope of CU131,216 (ie present value of three annual lease payments of CU50,000, discounted at the revised interest rate of 7 per cent per annum) as an adjustment to the right-of-use asset

Right-of-use asset	CU131,216
Lease liability	CU131,216

The modified right-of-use asset and the modified lease liability in relation to the modified lease are as follows.

Year	Lease liability				Right-of-use asset		
	Beginning balance	7% interest expense	Lease payment	Ending balance	Beginning balance	Depreciation charge	Ending balance
	CU	CU	CU	CU	CU	CU	CU
6	393,647	27,556	(150,000)	271,203	347,148	(115,716)	231,432
7	271,203	18,984	(150,000)	140,187	231,432	(115,716)	115,716
8	140,187	9,813	(150,000)	-	115,716	(115,716)	-

Example 19-Modification that is a change in consideration only

Lessee enters into a 10-year lease for 5,000 square metres of office space. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease for the remaining five years to reduce the lease payments from CU100,000 per year to CU95,000 per year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. Lessee's incremental borrowing rate at the beginning of Year 6 is 7 per cent per annum. The annual lease payments are payable at the end of each year.

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability based on: (a) a five-year remaining lease term, (b) annual payments of CU95,000, and (c) Lessee's incremental borrowing rate of 7 per cent per annum. Lessee recognises the difference between the carrying amount of the modified liability (CU389,519) and the lease liability immediately before the modification (CU421,236) of CU31,717 as an adjustment to the right-of-use asset.

FASB differences

As shown in Example 18 in IFRS 16 above, lease modifications that do not result in a separate contract and shorten the contractual lease term result in the recognition of a gain or loss for the difference between the decrease in the lease liability and the proportionate decrease in the right-of-use asset. Under ASC 842, lease modifications that do not result in a separate contract and shorten the contractual lease term do not result in the recognition of a gain or loss. A lessee recognises the amount of the remeasurement of the lease liability as an adjustment to the corresponding right-of-use asset without affecting profit or loss. However, if the right-of-use asset is reduced to zero, a lessee would recognise any remaining amount in profit or loss.

5.5.4 Assessing whether a rent concession is a lease modification

As discussed above, a lease modification is defined in IFRS 16 as a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease.

In April 2020, the IASB issued a non-authoritative educational document, *IFRS 16 and covid-19: Accounting for covid-19-related rent concessions applying IFRS 16 Leases*, to support the consistent application of requirements of IFRS 16 upon changes in lease payments that occur, or are expected to occur, as a result of the covid-19 pandemic. Although the educational document was issued in response to the covid-19 pandemic, it includes perspectives that may be helpful when evaluating certain rent concessions that arise in circumstances unrelated to covid-19 including certain circumstances discussed below.

In many cases, rent concessions will meet the definition of a lease modification, in which case, the lease modification requirements are applied from the effective date of the modification, as discussed in section 5.5.4.B below.

A change in the scope of a lease

In assessing whether there has been a change in the scope of a lease, an entity considers whether there has been a change in the right of use conveyed to the lessee by the contract. A change in the scope of a lease includes adding or terminating the right to use one or more underlying assets or extending or shortening the contractual lease term. A lease payment deferral, lease payment holiday or lease payment reduction alone is not, in isolation, a change in the scope of a lease.

A change in the consideration for a lease

In assessing whether there has been a change in the consideration for a lease, an entity considers the overall effect of any change in the lease payments. For example, a lessor-granted concession may allow a lessee not to make lease payments for a three-month period, but the lease payments for periods thereafter are increased proportionally in a way that means that the consideration for the lease is unchanged. Such a lease payment deferral, with no change in the total consideration for the lease, or the scope of the lease, would not, based on the IASB's April 2020 non-authoritative educational document, be a lease modification. We believe that increases to subsequent lease payments to take account solely of the time value of money would not be a substantive change in the consideration for the lease. For example, if a lessor deferred a lease payment for June 2022 and required it to be paid in January 2023 plus an interest charge at a rate to reasonably compensate the lessor for the time value of money, that would not be a substantive change in the consideration for the lease. However, if there are other substantive changes in the consideration (e.g., forgiveness of rents payable/receivable) and/or a change in the scope of a lease (e.g., adding an additional floor to a leased office space), the lease modification guidance in IFRS 16 applies to the entire change. That is, an entity cannot bifurcate and account for a lease payment deferral separately from other contemporaneous changes to the contract.

FASB differences

Applying ASC 842, a substantive change in the timing of lease payments is a lease modification because there is a substantive change in the terms and conditions of the contract. This may be interpreted differently under IFRS 16 because there is no change to the total amount of consideration for the lease.

Illustration 5-4: Deferral of lease payments - considering the IASB's April 2020 non-authoritative educational document

Restaurant A leases space in a shopping mall from Lessor B. Under the terms of the lease, Restaurant A makes fixed lease payments of CU100 to Lessor B at the beginning of each month. The non-cancellable lease term ends on 28 February 2024. The contract does not include any extension, termination or purchase options. For simplicity, the discount rate is assumed to be 0% at the commencement date and thus the lease liability at 30 June 2022 for the remaining 20 monthly lease payments is CU2,000.

Assume that Restaurant A's right-of-use asset is not impaired before or during the periods described.

On 1 July 2022, Lessor B agrees to defer the three months of lease payments originally due in July, August and September 2022 to 1 January 2023. There are no non-lease components to the contract and there are no other changes to the terms and conditions of the lease.

Analysis: Under IFRS 16, a lease modification is defined as a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease. Given that the only change is the timing of the cash outflows, there is no change in the scope of the lease. Restaurant A next considers whether there is a change in the consideration for the lease by reference to the overall effect of any change in the lease payments. In this fact pattern, Restaurant A does not make lease payments for a period of three months from July 2022 and will increase the lease payment due on 1 January 2023 by the same amount as the deferral. Therefore, the consideration for the lease remains substantively unchanged and the rent concession does not constitute a lease modification.

A change that is, or is not, part of the original terms and conditions of the lease

When evaluating if there has been a change in either the scope of, or the consideration for, the lease, an entity is required to consider the terms and conditions of contracts and all relevant facts and circumstances, including the applicable law governing such contracts. When a lessee and lessor agree to a change to a lease that is not contemplated by the original terms and conditions of the lease, the change is accounted for as a lease modification. In this case, lessees would follow IFRS 16.44 to 46 and lessors would consider the guidance in IFRS 16.79 and 80 (for finance leases) or IFRS 16.87 (for operating leases).

However, if a change is limited solely to the changes contemplated in the existing terms and conditions of the lease, there is no lease modification for the purposes of IFRS 16.

Entities should carefully consider terms in their contracts as they may contain clauses (e.g., a force majeure clause) that result in changes to lease payments if particular events occur or circumstances arise. For example, a contract may include a clause providing the lessee with a right to reduced lease payments upon government action requiring the closure of retail stores for a period of time. Changes in lease payments that result from clauses in the original contract (or in applicable law) would not be lease modifications for the purposes of IFRS 16.

Existing contracts may not specifically contemplate particular circumstances (for example the effect of a global pandemic) and, as such, there could be legal ambiguities when evaluating lease contracts. Therefore, to determine the appropriate accounting for a lease concession, it is important to carefully identify and consider the rights and obligations of the lessee and lessor, taking into account the terms and conditions of the contract and the applicable legal framework.

Questions have been asked as to whether lease concessions mandated by changes to applicable law constitute a lease modification. For example, when a government introduces new laws mandating certain rent concessions. Some stakeholders believe that, in these cases, there is a change in the consideration for the lease which was not part of the original terms and conditions of the lease and, thus, modification accounting is required. However, other stakeholders believe that when the lessee and lessor agree to a lease contract, subject to the law of a jurisdiction, the parties have also agreed to be bound by any future changes in the applicable law. Thus, any changes made to comply with a change in law are contemplated in the contract and should not be considered to constitute a lease modification.

How we see it

Given that IFRS 16 does not specifically address whether changes to the law constitute a lease modification, we believe there is likely to be diversity in practice and both approaches explained above are acceptable. However, entities should consider the disclosure objectives in IFRS 16 and disclose their policies and the effect of such policies related to lease concessions.

5.5.4.A Rent concessions that change the consideration in the contract

Some forms of rent concessions may change the consideration of the lease beyond what was contemplated in the original terms and conditions of the lease and, thus, require lease modification accounting to be applied.

Illustration 5-5: Change of lease payments from fixed to partially variable

Restaurant A leases space in a shopping mall from Lessor B. Under the terms of the lease, Restaurant A makes fixed lease payments of CU100 to Lessor B at the beginning of each month. The non-cancellable lease term ends on 28 February 2024. The contract does not include any extension, termination or purchase options. For simplicity, the discount rate is assumed to be 0% at the commencement date and thus the lease liability at 30 June 2022 for the remaining 20 monthly lease payments is CU2,000.

Assume that Restaurant A's right-of-use asset is not impaired before or during the periods described.

On 1 July 2022, Lessor B agrees to change the terms and conditions of the lease contract with Restaurant A, such that fixed lease payments are reduced to CU25 per month, plus an additional variable lease payment based on 3% of the monthly turnover of Restaurant A at that shopping mall.

Analysis: In this fact pattern, the consideration for the lease has changed from solely fixed lease payments to a combination of fixed and variable lease payments, which were not part of the original terms and conditions of the contract. Therefore, the change constitutes a lease modification.

5.5.4.B Lessee accounting for rent concessions that are lease modifications

As discussed in section 5.5.2 above, for a lease modification that is not accounted for as a separate lease, a lessee applies modification accounting at the effective date of the lease modification. In such a case, a lessee allocates the consideration in the modified contract to the lease and non-lease components (where applicable), determines the lease term of the modified lease and remeasures the lease liability by discounting the revised lease payments using a revised discount rate determined on that date. The revised discount rate is the rate of interest implicit in the lease for the remainder of the lease term, or if that rate cannot be readily determined, the lessee's incremental borrowing rate.

If the modification decreases the scope of the lease (e.g., a change that reduces total leased space or shortens the lease term), the lessee remeasures the lease liability and reduces the right-of-use asset to reflect the partial or full termination of the lease (e.g., a 50% reduction in leased space would reduce the right-of-use asset by 50%). Any difference between those two adjustments is recognised in profit or loss at the effective date of the modification. For all other modifications, the lessee recognises the amount of the remeasurement of the lease liability as an adjustment to the right-of-use asset, without affecting profit or loss.

Illustration 5-6: Lessee accounting for rent concessions that are a lease modification

Scenario 1 - Forgiveness of lease payments and extension of the lease term

Restaurant A leases space in a shopping mall from Lessor B.

Under the terms of the lease, Restaurant A makes fixed lease payments of CU100 to Lessor B at the beginning of each month. The non-cancellable lease term ends on 28 February 2024. The contract does not include any extension, termination or purchase options. For simplicity, the discount rate is assumed to be 0% at the commencement date and thus the lease liability at 30 June 2022 for the remaining 20 monthly lease payments is CU2,000.

Assume that Restaurant A's right-of-use asset is not impaired before or during the periods described.

On 1 July 2022, Lessor B agrees to forgive the three months of lease payments originally due in July, August and September 2022. There are no non-lease components to the contract and there are no other changes to the terms and conditions of the lease.

Assume the parties agree to extend the lease term by three months at the same monthly lease payment of CU100 per month. The lease term will now end on 31 May 2024.

Analysis: There is no overall effect of any change in the lease payments in this scenario. Thus, there is no change in the consideration for the lease. However, the scope of the lease has changed as the lease term has been extended by three months, which was not part of the original terms and conditions of the lease. Therefore, the rent concession in this scenario constitutes a lease modification.

On the effective date of modification (i.e., 1 July 2022), Restaurant A applies lease modification accounting and remeasures the lease liability by discounting the revised lease payments using a revised discount rate, determined at the effective date of the modification. A corresponding adjustment is made to the right-of-use asset.

Depreciation of the right-of-use asset continues over the revised remaining lease term.

Scenario 2 - Forgiveness of lease payments

Assume the same fact pattern as above, except for the following:

On 1 July 2022, Lessor B agrees to waive the three months of lease payments originally due in July, August and September 2022. There are no other changes to the terms and conditions of the lease.

Analysis: In this fact pattern, there is a reduction in the consideration for the lease which was not part of the original terms and conditions of the lease. Therefore, there is a lease modification.

On the effective date of the modification (i.e., 1 July 2022), Restaurant A applies lease modification accounting and remeasures the lease liability by discounting the revised lease payments using a revised discount rate, determined at the effective date of the modification. Restaurant A accounts for the remeasurement of the lease liability by adjusting the carrying amount of the right-of-use asset, as follows (assuming the revised discount rate is 0%):

Dr	Lease liability (100 × 3)	CU300	
	Cr	Right-of-use asset	CU300

Depreciation of the revised right-of-use asset continues over the remaining lease term.

How we see it

The modification of a lease often requires the remeasurement of the lease liability using a revised discount rate. Given that the interest rate implicit in the lease is generally not readily determinable by the lessee, it is usually necessary for the lessee to determine a revised incremental borrowing rate.

5.5.4.C Application of IFRS 9 to rent concessions

In 2022, the IFRS IC discussed a submission on lessee accounting when the lessee is legally released by the lessor from its obligation to make specifically identified lease payments with no other changes being made to the lease. The submission asked whether the lessee applies the derecognition requirements in IFRS 9, or the lease modification requirements in IFRS 16 in accounting for the rent concession. The IFRS IC observed that there is more than one way for a lessee to read the principles and requirements in IFRS in accounting for the rent concession in the submitted fact pattern. The IFRS IC therefore referred the issue to the IASB. The IASB considered the issue, and in July 2024, as part of the *Annual Improvements to IFRS Accounting Standards - Volume 11*, the IASB amended paragraph 2.1(b)(ii) of IFRS 9 to include a cross reference to paragraph 3.3.3 of IFRS 9. This amendment clarifies that when a lessee has determined that a lease liability has been extinguished applying IFRS 9, the lessee is required to recognise any resulting gain or loss in profit or loss in accordance with paragraph 3.3.3 of IFRS 9. The amendment does not address how a lessee distinguishes between a lease modification as defined in IFRS 16 and an extinguishment of a lease liability in accordance with IFRS 9. The amendment applies to annual reporting periods beginning on or after 1 January 2026, with earlier application permitted.

How we see it

As discussed in section 5.5.4 above, in many cases, rent concessions will meet the definition of a lease modification, in which case, the lease modification requirements are applied from the effective date of the modification, as discussed in section 5.5.4.B. We believe that when a lease modification includes both a reduction in the lessee's obligation to make specifically identified lease payments and other changes to the lease contract (for example, changing the lease term, adding a right to use additional underlying assets), the entirety of modification is accounted for in accordance with IFRS 16 (rather than IFRS 9).

5.5.5 Temporary exception arising from interest rate benchmark reform

In August 2020, the IASB published *Interest Rate Benchmark Reform - Phase 2, Amendments to IFRS 9, IAS 39, IFRS 7, IFRS 4 and IFRS 16*. The amendments provide temporary reliefs which address the financial reporting effects when an interbank offered rate (IBOR) is replaced with an alternative nearly risk-free interest rate (RFR).

The amendments to IFRS 16 provide relief from the need to apply modification accounting. As a practical expedient, a lessee applies IFRS 16.42 to account for a lease modification required by interest rate benchmark reform. This practical expedient applies only to such modifications. For this purpose, a lease modification is required by interest rate benchmark reform if, and only if, both of these conditions are met

- The modification is necessary as a direct consequence of interest rate benchmark reform, and
- The new basis for determining lease payments is 'economically equivalent' to the previous basis (i.e., the basis immediately preceding the modification). [IFRS 16.105].

If the modifications to the contract includes changes beyond those required by interest rate benchmark reform, a lessee applies the requirements in IFRS 16 to account for all lease modifications made at the same time, including those required by interest rate benchmark reform. [IFRS 16.106]. Interest rate benchmark reform is further discussed in Supplement: IBOR Reform.

5.6 Other lessee matters

5.6.1 Impairment of right-of-use assets

Extract from IFRS 16

- 33 A lessee shall apply IAS 36 *Impairment of Assets* to determine whether the right-of-use asset is impaired and to account for any impairment loss identified.

Lessees' right-of-use assets are subject to existing impairment requirements in IAS 36. [IFRS 16.33].

IAS 36 requires an impairment indicator analysis at each reporting period. If any indicators are present, the entity is required to estimate the recoverable amount of the asset (or the cash-generating unit (CGU) of which the asset is a part). The entity has to recognise an impairment loss if the recoverable amount of the CGU is less than the carrying amount of the CGU. After an impairment loss is recognised, the adjusted carrying amount of the right-of-use asset would be its new basis for depreciation.

Subsequent reversal of a previously recognised impairment loss needs to be assessed if there is any indication that an impairment loss recognised in prior periods may no longer exist or may have decreased. In recognising any reversal, the increased carrying amount of the asset must not exceed the carrying amount that would have been determined after depreciation, had there been no impairment.

5.6.2 Leases denominated in a foreign currency

Lessees apply IAS 21 *The Effects of Changes in Foreign Exchange Rates*, to leases denominated in a foreign currency. As they do for other monetary liabilities, lessees remeasure the foreign currency-denominated lease liability using the exchange rate at each reporting date. Any changes to the lease liability due to exchange rate changes are recognised in profit or loss. Because the right-of-use asset is a non-monetary asset measured at historical cost, it is not affected by changes in the exchange rate.

The IASB acknowledged that this approach could result in volatility in profit or loss from the recognition of foreign currency exchange gains or losses, but it will be clear to users of financial statements that the gains or losses result solely from changes in exchange rates. [IFRS 16.BC199].

5.6.3 Portfolio application

IFRS 16 applies to individual leases. However, entities that have a large number of leases of similar assets (e.g., leases of a fleet of similar rolling stock) may face practical challenges in applying the leases model on a lease-by-lease basis. The IASB acknowledged the concerns and included a practical expedient that allows entities to use a portfolio approach for leases with similar characteristics if the entity reasonably expects that the effects on the financial statements would not differ materially from the application of the standard to the individual leases in that portfolio. [IFRS 16.B1, IFRS 16.BC83].

How we see it

The IASB included the portfolio approach to be consistent with IFRS 15. A decision to use the portfolio approach is similar to a decision to expense, rather than capitalise, certain assets when the accounting difference is, and would continue to be, immaterial to the financial statements.

5.6.4 Income tax accounting

IFRS 16 can affect lessees' accounting for income taxes. For lessees, IFRS 16 requires recognition of lease-related assets and liabilities and can change the measurement of other lease-related assets and liabilities. These changes affect certain aspects of accounting for income taxes such as the following:

- Recognition and measurement of deferred tax assets and liabilities
- Assessment of the recoverability of deferred tax assets

Deferred tax assets and liabilities are further discussed in Chapter 29.

5.7 Presentation

Extract from IFRS 16

Presentation

- 47 A lessee shall either present in the statement of financial position, or disclose in the notes:
- (a) right-of-use assets separately from other assets. If a lessee does not present right-of-use assets separately in the statement of financial position, the lessee shall:
 - (i) include right-of-use assets within the same line item as that within which the corresponding underlying assets would be presented if they were owned; and
 - (ii) disclose which line items in the statement of financial position include those right-of-use assets.
 - (b) lease liabilities separately from other liabilities. If the lessee does not present lease liabilities separately in the statement of financial position, the lessee shall disclose which line items in the statement of financial position include those liabilities.
- 48 The requirement in paragraph 47(a) does not apply to right-of-use assets that meet the definition of investment property, which shall be presented in the statement of financial position as investment property.
- 49 In the statement of profit or loss and other comprehensive income, a lessee shall present interest expense on the lease liability separately from the depreciation charge for the right-of-use asset. Interest expense on the lease liability is a component of finance costs, which paragraph 82(b) of IAS 1 *Presentation of Financial Statements* requires to be presented separately in the statement of profit or loss and other comprehensive income.
- 50 In the statement of cash flows, a lessee shall classify:
- (a) cash payments for the principal portion of the lease liability within financing activities;
 - (b) cash payments for the interest portion of the lease liability applying the requirements in IAS 7 *Statement of Cash Flows* for interest paid; and
 - (c) short-term lease payments, payments for leases of low-value assets and variable lease payments not included in the measurement of the lease liability within operating activities.

[IFRS 16.47, IFRS 16.48, IFRS 16.49, IFRS 16.50].

Right-of-use assets and lease liabilities are subject to the same considerations as other assets and liabilities in classifying them as current and non-current in the statement of financial position.

The following table summarises how lease-related amounts and activities are presented in lessees' financial statements:

Financial statement	Lessee presentation
Statement of financial position	<ul style="list-style-type: none"> ▪ Right-of-use assets presented either: <ul style="list-style-type: none"> ▪ Separately from other assets (e.g., owned assets) ▪ Together with other assets as if they were owned, with disclosures of the statement of financial position line items that include right-of-use assets and their amounts ▪ Right-of-use assets that meet the definition of investment property are presented as investment property ▪ Lease liabilities presented either: <ul style="list-style-type: none"> ▪ Separately from other liabilities ▪ Together with other liabilities with disclosure of the statement of financial position line items that include lease liabilities and their amounts
Statement of profit or loss	Lease-related depreciation and lease-related interest expense are presented separately (i.e., lease-related depreciation and lease-related interest expense cannot be combined). Interest expense on the lease liability is a component of finance costs.

Financial statement	Lessee presentation
Statement of cash flows	<ul style="list-style-type: none"> ▪ Cash payments for the principal portion of the lease liability are presented within financing activities ▪ Cash payments for the interest portion of the lease liability are presented based on an accounting policy election in accordance with IAS 7 <i>Statement of Cash Flows</i> ▪ Lease payments for short-term leases and leases of low-value assets not recognised on the statement of financial position and variable lease payments not included in the lease liability are presented within operating activities ▪ Non-cash activity (e.g., the initial recognition of the lease at commencement) is disclosed as a supplemental non-cash item

5.8 Disclosure

5.8.1 Disclosure objective

The objective of lessee disclosures is to enable financial statement users to assess the effect that leases have on a lessee's financial statements (e.g., the amount, timing and uncertainty of cash flows arising from leases). The IASB believes that if a lessee is required to assess whether the overall quality and informational value of its lease disclosures are sufficient to meet the stated objective, the lessees' interpretation and implementation of the disclosure requirements will be improved. [IFRS 16.51, IFRS 16.BC215].

IFRS 16 requires lessees to present all disclosures in a single note or separate section in the financial statements. The IASB believes this will often be the most effective way to present information about leases in the manner required by IAS 1.113. [IFRS 16.BC228].

5.8.2 Disclosures of assets, liabilities, expenses and cash flows

Lessees are required to disclose the following information, which users of financial statements identified as being most useful to their analyses:

- Carrying amount of right-of-use assets and depreciation charge for those assets, split by class of underlying asset
- Interest expense on lease liabilities
- Short-term lease expense for such leases with a lease term greater than one month
- Low-value asset lease expense (except for portions related to short-term leases)
- Variable lease expense (i.e., for variable lease payments not included in the lease liability)
- Income from subleasing right-of-use assets
- Total cash outflow for leases
- Additions to right-of-use assets
- Gains and losses arising from sale and leaseback transactions
- Carrying amount of right-of-use assets at the end of the reporting period by class of underlying asset [IFRS 16.53]

All of the above disclosures are required to be presented in tabular format, unless another format is more appropriate. The amounts disclosed include costs that a lessee has included in the carrying amount of another asset during the reporting period. [IFRS 16.54].

In Practical example 5-1 below, Deutsche Post AG presents disclosures of right-of-use assets in the notes to the accounts.

Practical example 5-1: Deutsche Post AG (2024)

Germany

2024 Annual Report [extract]

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements of Deutsche Post AG [extract]

Lease disclosures

42 Lease disclosures

Currency translation income on lease liabilities totaled €26 million (previous year: €58 million), while the related expenses amounted to €119 million (previous year: €38 million). Gains from sale-and-leaseback transactions came in at €51 million (previous year: €47 million) and were fully attributable to real estate development projects (previous year: €38 million). The right-of-use assets carried as noncurrent assets resulting from leases are presented separately in the following table:

RIGHT-OF-USE ASSETS

€m	Land and buildings	Technical equipment and machinery	IT equipment, operating and office equipment	Aircraft	Transport equipment	Advance payments and assets under development	Total
December 31, 2023							
Accumulated cost	15,406	239	11	4,674	1,671	158	22,159
of which additions	2,036	40	1	608	591	63	3,339
Accumulated depreciation and impairment losses	6,458	135	7	1,427	701	0	8,728
Carrying amount	8,948	104	4	3,247	970	158	13,431
December 31, 2024							
Accumulated cost	16,653	240	10	4,937	2,042	225	24,107
of which additions	2,060	48	0	418	586	83	3,195
Accumulated depreciation and impairment losses	7,535	133	7	1,540	850	0	10,065
Carrying amount	9,118	107	3	3,397	1,192	225	14,042

In the real estate area, the Group primarily leases warehouses, office buildings and mail and parcel centers. The leased aircraft are predominantly deployed in the air network of the Express segment. The additions also relate to the renewal of the aircraft fleet. Leased transport equipment also includes the leased vehicle fleet. The real estate leases in particular are long-term leases. The Group had 69 real estate leases with remaining lease terms of more than 20 years as of December 31, 2024 (previous year: 84 leases). Aircraft leases have remaining lease terms of up to 14 years (previous year: 15 years). Leases may include extension and termination options, **note 7**. The leases are negotiated individually and include a wide range of different conditions.

Future cash outflows amounted to €18 billion (previous year: €17 billion) as of the reporting date, **note 44**. Possible future cash outflows amounting to €4.4 billion (previous year: €4.2 billion) were not included in lease liabilities because it is not reasonably certain that the leases will be extended (or not terminated). Leases that the Group has entered into as a lessee but that have not yet commenced result in possible future payment outflows totaling €2.4 billion (previous year: €2.3 billion), which primarily result from the renewal of the aircraft fleet. Additional information on the lessee required under IFRS 16 can be found in **notes 12, 14, 18, 39 and 43**.

Lessees also are required to disclose a maturity analysis of lease liabilities in accordance with paragraphs 39 and B11 of IFRS 7 *Financial Instruments: Disclosures*. Lessees are required to disclose this maturity analysis separately from the maturity analyses of other financial liabilities. [IFRS 16.58]. The IASB believes that because the lessee accounting model is based on the premise that a lease liability is a financial liability, it is appropriate for lessees to apply the same maturity analysis disclosure requirements to lease liabilities as to those applied to other financial liabilities. [IFRS 16.BC222].

A lessee is required to disclose the amount of its lease commitments for short-term leases when short-term lease commitments at the end of the reporting period are dissimilar to same period's short-term lease expense (that is otherwise required to be disclosed). [IFRS 16.55].

A lessee is not required to provide the disclosures required in IFRS 16.53(a), (f), (h) or (j) for right-of-use assets that meet the definition of investment property. Instead, a lessee applies the disclosure requirements in IAS 40. [IFRS 16.56].

If a lessee measures right-of-use assets at revalued amounts when applying IAS 16, the lessee is required to disclose the information required by IAS 16.77 for those right-of-use assets. [IFRS 16.57].

How we see it

IFRS 16 requires disclosure of the total cash outflow for leases. It does not explicitly state that leases of low-value assets and short-term leases are excluded. Therefore, we believe the cash outflows related to those leases should be included in the disclosure.

5.8.3 Additional disclosures

Extract from IFRS 16

- 59 In addition to the disclosures required in paragraphs 53-58, a lessee shall disclose additional qualitative and quantitative information about its leasing activities necessary to meet the disclosure objective in paragraph 51 (as described in paragraph B48). This additional information may include, but is not limited to, information that helps users of financial statements to assess:
- (a) the nature of the lessee's leasing activities;
 - (b) future cash outflows to which the lessee is potentially exposed that are not reflected in the measurement of lease liabilities. This includes exposure arising from:
 - (i) variable lease payments (as described in paragraph B49);
 - (ii) extension options and termination options (as described in paragraph B50);
 - (iii) residual value guarantees (as described in paragraph B51); and
 - (iv) leases not yet commenced to which the lessee is committed.
 - (c) restrictions or covenants imposed by leases; and
 - (d) sale and leaseback transactions (as described in paragraph B52).
- 60 A lessee that accounts for short-term leases or leases of low-value assets applying paragraph 6 shall disclose that fact.

[IFRS 16.59, IFRS 16.60].

In Practical example 5-2 below, Nestle S.A. describes the nature of its leasing activities.

Practical example 5-2: Nestlé S.A. (2023)

Switzerland

Financial Statements 2023 [extract]**Consolidated Financial Statements of the Nestlé Group 2023 [extract]****Notes [extract]****8. Property, plant and equipment [extract]****8.2 Leases - Group as a lessee [extract]****8.2a Description of lease activities****Real estate leases**

The Group leases land and buildings for its office and warehouse space and retail stores. Lease terms are negotiated on an individual basis and contain a wide range of different terms and conditions. Leases are typically made for a fixed period of 5–15 years and may include extension options which provide operational flexibility. If the Group exercised all extension options not currently included in the lease liability, the additional payments would amount to CHF 0.9 billion (undiscounted) as at December 31, 2023.

Vehicle leases

The Group leases trucks for distribution in specific businesses and cars for management and sales functions. The average contract duration is 6 years for trucks and 3 years for cars.

Other leases

The Group also leases machinery and equipment, and tools, furniture and other equipment that are each insignificant to the total leased asset portfolio.

In providing additional information, lessees are required to consider:

- (a) Whether that information is relevant to users of financial statements. The additional information specified above is included only if that information is expected to be relevant to users of financial statements. In this context, this is likely to be the case if it helps those users to understand:
 - (i) The flexibility provided by leases. Leases may provide flexibility if, for example, a lessee can reduce its exposure by exercising termination options or renewing leases with favourable terms and conditions
 - (ii) Restrictions imposed by leases. Leases may impose restrictions, for example, by requiring the lessee to maintain particular financial ratios
 - (iii) Sensitivity of reported information to key variables. Reported information may be sensitive to, for example, future variable lease payments
 - (iv) Exposure to other risks arising from leases
 - (v) Deviations from industry practice. Such deviations may include, for example, unusual or unique lease terms and conditions that affect a lessee's lease portfolio
- (b) Whether that information is apparent from information either presented in the primary financial statements or disclosed in the notes. A lessee need not duplicate information that is already presented elsewhere in the financial statements [IFRS 16.B48]

Additional information relating to variable lease payments that, depending on the circumstances, may be needed to satisfy the disclosure objective could include information that helps users of financial statements to assess, for example:

- (a) The lessee's reasons for using variable lease payments and the prevalence of those payments
- (b) The relative magnitude of variable lease payments to fixed payments
- (c) Key variables upon which variable lease payments depend and how payments are expected to vary in response to changes in those key variables
- (d) Other operational and financial effects of variable lease payments [IFRS 16.B49]

Additional information relating to extension options or termination options that, depending on the circumstances, may be needed to satisfy the disclosure objective could include information that helps users of financial statements to assess, for example:

- (a) The lessee's reasons for using extension options or termination options and the prevalence of those options
- (b) The relative magnitude of optional lease payments to lease payments
- (c) The prevalence of the exercise of options that were not included in the measurement of lease liabilities
- (d) Other operational and financial effects of those options *[IFRS 16.B50]*

Optional lease payments are payments made by a lessee to a lessor for the right to use an underlying asset during periods covered by an option to extend or terminate a lease that are not included in the lease term.

[IFRS 16 Appendix A].

Additional information relating to residual value guarantees that, depending on the circumstances, may be needed to satisfy the disclosure objective could include information that helps users of financial statements to assess, for example:

- (a) The lessee's reasons for providing residual value guarantees and the prevalence of those guarantees
- (b) The magnitude of a lessee's exposure to residual value risk
- (c) The nature of underlying assets for which those guarantees are provided
- (d) Other operational and financial effects of those guarantees *[IFRS 16.B51]*

5.8.4 Disclosures required by IAS 1

In addition to the disclosure requirements under IFRS 16 described above, an entity is required to make disclosures in accordance with IAS 1.

An entity is required to disclose its significant accounting policies comprising:

- (a) The measurement basis (or bases) used in preparing the financial statements
- And
- (b) The other accounting policies used that are relevant to an understanding of the financial statements *[IAS 1.117]*

An entity discloses, along with its significant accounting policies or other notes, the judgements that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements. *[IAS 1.122]*. An entity also discloses information about the assumptions it makes about the future, and other major sources of estimation uncertainty at the end of the reporting period, that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year. In respect of those assets and liabilities, the notes include details of:

- (a) Their nature
- And
- (b) Their carrying amount as at the end of the reporting period *[IAS 1.125]*

There are a number of judgements and estimates that entities may make in applying IFRS 16, which may require disclosure in accordance with IAS 1. These include, but are not limited to, application of the definition of a lease, determination of the lease term and determination of the incremental borrowing rate.

6 Lessor accounting

6.1 Lease classification

Extract from IFRS 16

61	A lessor shall classify each of its leases as either an <i>operating lease</i> or a <i>finance lease</i> .
62	A lease is classified as a finance lease if it transfers substantially all the risks and rewards incidental to ownership of an underlying asset. A lease is classified as an operating lease if it does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset.
B53	The classification of leases for lessors in this Standard is based on the extent to which the lease transfers the risks and rewards incidental to ownership of an underlying asset. Risks include the possibilities of losses from idle capacity or technological obsolescence and of variations in return because of changing economic conditions. Rewards may be represented by the expectation of profitable operation over the underlying asset's economic life and of gain from appreciation in value or realisation of a residual value.
B54	A lease contract may include terms and conditions to adjust the lease payments for particular changes that occur between the inception date and the commencement date (such as a change in the lessor's cost of the underlying asset or a change in the lessor's cost of financing the lease). In that case, for the purposes of classifying the lease, the effect of any such changes shall be deemed to have taken place at the inception date.

[IFRS 16.61, IFRS 16.62, IFRS 16.B53, IFRS 16.B54].

At inception, lessors classify all leases as finance leases or operating leases. Lease classification determines how and when a lessor recognises lease income and what assets are recorded. The criteria used for lease classification are discussed in detail below.

As classification is assessed at lease inception, lessors must also determine the interest rate implicit in the lease at lease inception.

FASB differences

In accordance with ASC 842, leases are classified by a lessor as operating, direct financing or sales-type leases at the lease commencement date. As a consequence, under ASC 842, lessors also determine the discount rate at the lease commencement date.

6.1.1 Criteria for lease classification

The classification of leases in IFRS 16 is based on the extent to which the risks and rewards incidental to ownership of the underlying asset lie with the lessor or the lessee. It depends on the substance of the transaction rather than the form of the contract. IFRS 16 lists a number of examples that individually, or in combination, would normally lead to a lease being classified as a finance lease:

- The lease transfers ownership of the asset to the lessee by the end of the lease term
- The lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair value at the date the option becomes exercisable for it to be reasonably certain, at the inception date, that the option will be exercised
- The lease term is for the major part of the economic life of the asset even if title is not transferred
- At the inception date, the present value of the lease payments amounts to at least substantially all of the fair value of the asset
- The asset is of such a specialised nature that only the lessee can use it without major modifications [IFRS 16.63]

IFRS 16 does not provide quantitative indicators or thresholds for the assessment of the terms 'major part' and 'substantially all' to determine that a lease should be classified as a finance lease rather than as an operating lease. Under IFRS 16, entities apply qualitative, rather than quantitative, assessments to determine whether the risks and rewards incident to ownership of a leased asset lie with the lessor or the lessee. Accordingly, assessing whether a lease term is for the major part of the economic life of an asset or whether the present value of the lease payments amounts to at least substantially all of the fair value of a leased asset is a matter of judgement.

Similarly, determining whether the exercise price in a lessee's option to purchase the underlying asset is expected to be 'sufficiently lower' than the fair value of the underlying asset at the date the option becomes exercisable, is a matter of judgement and depends on the facts and circumstances of the particular lease.

Paragraph 63 of IFRS 16 is clear that these are "examples of situations that individually or in combination would normally lead to a lease being classified as a finance lease". Consequently, it is possible that the existence of certain of the situations, on their own, may determine the classification of a lease, whereas other leases may need to be evaluated in combination with other situations or indicators. The overriding consideration is whether the lease transfers from the lessor to the lessee substantially all the risks and rewards incidental to ownership of an underlying asset.

FASB differences

Unlike IFRS 16, under ASC 842, each classification criteria is determinative. After the adoption of Accounting Standards Update 2021-05 Leases (Topic 842): Lessors - Certain Leases with Variable Lease Payments, lessors are also required to classify a lease, under ASC 842, as an operating lease if the lease has variable lease payments that do not depend on an index or rate and would result in selling losses if the lease were to be classified as a sales-type or direct financing lease otherwise. IFRS 16 does not include additional guidance for a lessor's classification of a lease that results in a loss at lease commencement.

IFRS 16 also lists the following indicators of situations that, individually or in combination, could also lead to a lease being classified as a finance lease:

- If the lessee can cancel the lease, the lessor's losses associated with the cancellation are borne by the lessee
- Gains or losses from the fluctuation in the fair value of the residual accrue to the lessee (e.g., in the form of a rent rebate that is equal to most of the sale proceeds at the end of the lease)
- The lessee has the ability to continue the lease for a secondary period at a rent that is substantially lower than market rent [IFRS 16.64]

Assessing the substance of the transaction involves considering all relevant factors. This includes considering the probability of different gain and loss outcomes relating to the residual accruing to the lessee and is not limited to the maximum possible amount at risk.

Illustration 6-1: Gains and losses from the fluctuation in the fair value of the residual

At the end of a lease, the underlying asset (the item of equipment) of a lease will be disposed of. The lessee is entitled to a rent rebate equalling 100% of the sales proceeds with a cap of CU1,000. The distribution of the probability of the sales proceeds is as follows:

Sales proceeds	Probability %
Up to CU1,000	95
CU1,000 to CU2,000	5
Over CU2,000	0

Analysis: The sales proceeds could be as high as CU2,000 and the rent rebate is capped at CU1,000. However, the probability assessment suggests that it would be unlikely for the sales proceeds to exceed the capped amount. Therefore, it would be appropriate to conclude the gains or losses from the fluctuation in the fair value of the residual generally accrue to the lessee.

How we see it

In our view, other considerations that could be made in determining the economic substance of the lease arrangement include the following:

- Are the lease rentals based on a market rate for use of the asset (which would indicate an operating lease) or a financing rate for use of the funds, which would be indicative of a finance lease?
- Is the existence of put and call options a feature of the lease? If so, are they exercisable at a predetermined price or formula (indicating a finance lease) or are they exercisable at the market price at the time the option is exercised (indicating an operating lease).

**FASB differences**

ASC 842 states that collectability of lease payments is considered when determining if a lease is classified as a direct financing or an operating lease. IFRS 16 does not include explicit guidance for considering collectability of lease payments.

6.1.2 Lease classification test for land and buildings

For a lease that includes both land and buildings elements, the lessor separately assesses the classification of each element as a finance lease or an operating lease, noting that land normally has an indefinite economic life. [IFRS 16.B55]. The lessor allocates lease payments between the land and the buildings elements in proportion to the relative fair values of the leasehold interests in the land element and buildings element of the lease at the inception date. If the lease payments cannot be allocated reliably between these two elements, the entire lease is classified as a finance lease, unless it is clear that both elements are operating leases, in which case, the entire lease is classified as an operating lease. [IFRS 16.B56].

For a lease of land and buildings in which the amount for the land element is immaterial to the lease, the lessor may treat the land and buildings as a single unit for the purpose of lease classification and classify it as a finance lease or an operating lease. In such a case, the lessor regards the economic life of the buildings as the economic life of the entire underlying asset. [IFRS 16.B57].

6.1.3 Residual value guarantees included in the lease classification test

In evaluating IFRS 16's lease classification criteria, lessors are required to include in the 'substantially all' test any (i.e., the maximum obligation) residual value guarantees provided by both lessees and any other third party unrelated to the lessor.

6.1.4 Reassessment of lease classification

Lessors are required to reassess the lease classification only if there is a lease modification (i.e., a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease). Lessors reassess lease classification as at the effective date of the modification using the modified conditions at that date. If a lease modification results in a separate new lease, that new lease would be classified in the same manner as any new lease. [IFRS 16.66].

**FASB differences**

ASC 842 requires lessors to reassess lease classification if lessees exercise an existing option to renew the lease (i.e., change in assessment of lease term) or to purchase the underlying asset when it was previously determined it was not reasonably certain to do so. Under IFRS 16, lease classification is reassessed only if there is a lease modification that is not accounted for as a separate contract.

6.2 Key concepts applied by lessor**Extract from IFRS 16****Appendix A****Defined terms**

gross investment in the lease	The sum of: (a) the lease payments receivable by a lessor under a finance lease ; and (b) any unguaranteed residual value accruing to the lessor.
net investment in the lease	The gross investment in the lease discounted at the interest rate implicit in the lease .
unguaranteed residual value	That portion of the residual value of the underlying asset , the realisation of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.

[IFRS 16 Appendix A].

At lease commencement, lessors apply the key concepts described in section 4 above such as determining the initial direct costs, lease term, lease payments, fair value of the underlying asset and the interest rate implicit in the lease. Lessors also apply the following lessor accounting concepts to recognise and measure their leases.

Gross investment in the lease

The lessor's gross investment in a finance lease consists of the following undiscounted amounts:

- Lease payments receivable by the lessor under a finance lease. Refer to section 4.5 above.
- Any unguaranteed residual value accruing to the lessor - the unguaranteed residual value is the portion of the residual value of the underlying asset, the realisation of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.

Net investment in the lease

A lessor's net investment in a finance lease consists of the gross investment in the lease discounted at the interest rate implicit in the lease.

6.3 Finance leases

6.3.1 Initial recognition and measurement

Extract from IFRS 16

- 67 **At the commencement date, a lessor shall recognise assets held under a finance lease in its statement of financial position and present them as a receivable at an amount equal to the net investment in the lease.**
Initial measurement
- 68 The lessor shall use the interest rate implicit in the lease to measure the net investment in the lease. In the case of a sublease, if the interest rate implicit in the sublease cannot be readily determined, an intermediate lessor may use the discount rate used for the head lease (adjusted for any initial direct costs associated with the sublease) to measure the net investment in the sublease.
- 69 Initial direct costs, other than those incurred by manufacturer or dealer lessors, are included in the initial measurement of the net investment in the lease and reduce the amount of income recognised over the lease term. The interest rate implicit in the lease is defined in such a way that the initial direct costs are included automatically in the net investment in the lease; there is no need to add them separately.
- Initial measurement of the lease payments included in the net investment in the lease**
- 70 At the commencement date, the lease payments included in the measurement of the net investment in the lease comprise the following payments for the right to use the underlying asset during the lease term that are not received at the commencement date:
- (a) fixed payments (including in-substance fixed payments as described in paragraph B42), less any lease incentives payable;
 - (b) variable lease payments that depend on an index or a rate, initially measured using the index or rate as at the commencement date;
 - (c) any residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee;
 - (d) the exercise price of a purchase option if the lessee is reasonably certain to exercise that option (assessed considering the factors described in paragraph B37); and
 - (e) payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease.

[IFRS 16.67, IFRS 16.68, IFRS 16.69, IFRS 16.70].

Illustration 6-2: The lessor's gross and net investment in the lease

Details of a non-cancellable lease are, as follows:

- The asset has a fair value of CU10,000
- The lessee is required to make five annual rentals payable in advance of CU2,100
- The unguaranteed estimated residual value at the end of five years is CU1,000
- There is no guaranteed residual value

The lessor's direct costs have been excluded for simplicity.

The interest rate implicit in the lease is that which gives a present value of CU10,000 for the five rentals plus the total estimated residual value at the end of year 5. This rate is 6.62%.

Year	Net investment in the lease at start of period	Rental received	Finance income (6.62% per annum)	Gross investment at end of period	Gross earnings allocated to future periods	Net investment in the lease at end of period
	CU	CU	CU	CU	CU	CU
1	10,000	2,100	523	9,400	977	8,423
2	8,423	2,100	419	7,300	558	6,742
3	6,742	2,100	307	5,200	251	4,949
4	4,949	2,100	189	3,100	62	3,038
5	3,038	2,100	62	1,000	-	1,000
		10,500	1,500			

The lessor's gross investment in the lease is the total rents receivable of CU10,500 and the unguaranteed residual value of CU1,000. The gross earnings are therefore CU1,500.

The gross investment in the lease at any point in time comprises the aggregate of the rentals receivable in future periods and the unguaranteed residual value, e.g., at the end of year 2, the gross investment of CU7,300 is three years' rental of CU2,100 plus the unguaranteed residual of CU1,000. The net investment, which is the amount at which the debtor will be recorded in the statement of financial position, is CU7,300 less the earnings allocated to future periods of CU558 = CU6,742.

At lease commencement, a lessor accounts for a finance lease, as follows:

- Derecognises the carrying amount of the underlying asset
- Recognises the net investment in the lease
- Recognises, in profit or loss, any selling profit or selling loss

**FASB differences**

IFRS 16 does not distinguish between sales-type and direct financing leases. Under IFRS 16, selling profit on finance leases is recognised at lease commencement. In accordance with ASC 842, selling profit on direct financing leases is deferred at lease commencement and amortised into income over the lease term.

For finance leases (other than those involving manufacturer and dealer lessors), initial direct costs are included in the initial measurement of the finance lease receivable. Initial direct costs are included in the interest rate implicit in the lease and are not added separately. [IFRS 16.69].

**FASB differences**

In accordance with ASC 842, lessors expense initial direct costs for sales-type leases if the fair value of the underlying asset is different from the carrying amount of the underlying asset at lease commencement.

The net investment in the lease is initially measured as the sum of: (1) the present value of both the lease payments (section 4.5); and (2) the present value of the unguaranteed residual asset, both discounted using the interest rate implicit in the lease (section 4.6). Any selling profit or loss is measured as the difference between the fair value of the underlying asset or the lease receivable, if lower, and the carrying amount of the underlying asset, net of any unguaranteed residual asset.

FASB differences

IFRS 16 does not include explicit guidance for considering collectability of lease payments. In accordance with ASC 842, collectability of lease payments is assessed for purposes of initial recognition and measurement of sales-type leases.

6.3.2 Manufacturer or dealer lessors

Extract from IFRS 16

- 71 At the commencement date, a manufacturer or dealer lessor shall recognise the following for each of its finance leases:
- (a) revenue being the fair value of the underlying asset, or, if lower, the present value of the lease payments accruing to the lessor, discounted using a market rate of interest;
 - (b) the cost of sale being the cost, or carrying amount if different, of the underlying asset less the present value of the unguaranteed residual value; and
 - (c) selling profit or loss (being the difference between revenue and the cost of sale) in accordance with its policy for outright sales to which IFRS 15 applies. A manufacturer or dealer lessor shall recognise selling profit or loss on a finance lease at the commencement date, regardless of whether the lessor transfers the underlying asset as described in IFRS 15.

[IFRS 16.71].

Manufacturers or dealers often offer to customers the choice of either buying or leasing an asset. A finance lease of an asset by a manufacturer or dealer lessor gives rise to profit or loss equivalent to the profit or loss resulting from an outright sale of the underlying asset, at normal selling prices, reflecting any applicable volume or trade discounts. [IFRS 16.72].

Manufacturer or dealer lessors sometimes quote artificially low rates of interest to attract customers. The use of such a rate would result in a lessor recognising an excessive portion of the total income from the transaction at the commencement date. If artificially low rates of interest are quoted, a manufacturer or dealer lessor shall restrict selling profit to that which would apply if a market rate of interest were charged. [IFRS 16.73].

A manufacturer or dealer lessor recognises as an expense, costs incurred in connection with obtaining a finance lease at the commencement date because they are mainly related to earning the manufacturer or dealer's selling profit. Costs incurred by manufacturer or dealer lessors in connection with obtaining a finance lease are excluded from the definition of initial direct costs and, thus, are excluded from the net investment in the lease. [IFRS 16.74].

As discussed at section 4.1 above, after inception of a lease, but before the commencement date, the requirements in IAS 37 apply to a contract that becomes onerous.

Illustration 6-3: Manufacturer or dealer lessors

A company manufactures specialised machinery. The company offers customers the choice of either buying or leasing the machinery. A customer chooses to lease the machinery. Details of the arrangement are, as follows:

- (i) The lease commences on 1 January 20X1 and lasts for three years.
- (ii) The lessee is required to make three annual rentals payable in arrears of CU57,500.
- (iii) The leased machinery is returned to the lessor at the end of the lease.
- (iv) The fair value of the machinery is CU150,000, which is equivalent to the selling price of the machinery.
- (v) The machinery cost CU100,000 to manufacture. The lessor incurred costs of CU2,500 to negotiate and arrange the lease.
- (vi) The expected useful life of the machinery is 3 years. The machinery has an expected residual value of CU10,000 at the end of year three.
- (vii) The interest rate implicit in the lease is 10.19%.

The lessor classifies the lease as a finance lease.

The cost to the lessor of providing the machinery for lease consists of the book value of the machinery (CU100,000), plus the initial direct costs associated with entering into the lease (CU2,500), less the future income expected from disposing of the machinery at the end of the lease (the present value of the unguaranteed residual value of CU10,000, being CU7,475). This gives a cost of sale of CU95,025.

The lessor records the following entries at the commencement of the lease:

Dr	Net investment in the lease	CU150,000	
Dr	Cost of sales	CU95,025	
	Cr Inventory		CU100,000
	Cr Revenue		CU142,525
	Cr Creditors/cash (initial direct costs)		CU2,500

The sales profit recognised by the lessor at the commencement of the lease is therefore CU47,500 (CU142,525 - CU95,025). This is equal to the fair value of the machinery of CU150,000, less the book value of the machinery (CU100,000) and the initial direct costs of entering into the lease (CU2,500). Revenue is equal to the net investment in the lease (CU150,000), less the present value of the unguaranteed residual value (CU7,475).

Lease payments received from the lessee will then be allocated over the lease term, as follows:

Year	Net investment in the lease at the start of the year (CU)	Lease payments (CU)	Interest income (10.19% per annum) (CU)	Decrease in net investment in the lease (CU)	Net investment in the lease at the end of the year (CU)
	(a)	(b)	(c)	(d)=(b)-(c)	(e)=(a)-(d)
1	150,000	57,500	15,280	42,220	107,780
2	107,780	57,500	10,980	46,520	61,260
3	61,260	57,500	6,240	51,260	10,000

The lessor will record the following entries:

Year 1

Dr	Cash	CU57,500	
	Cr Lease receivable		CU42,220
	Cr Interest income		CU15,280

Year 2

Dr	Cash	CU57,500	
	Cr Lease receivable		CU46,520
	Cr Interest income		CU10,980

Year 3

Dr	Cash	CU57,500	
	Cr Lease receivable		CU51,260
	Cr Interest income		CU6,240

At the end of the three-year lease term, the leased machinery will be returned to the lessor, who will record the following entries:

Dr	Inventory	CU10,000	
	Cr Lease receivable		CU10,000

6.3.3 Subsequent measurement

Extract from IFRS 16

- 75** A lessor shall recognise finance income over the lease term, based on a pattern reflecting a constant periodic rate of return on the lessor's net investment in the lease.
- 76** A lessor aims to allocate finance income over the lease term on a systematic and rational basis. A lessor shall apply the lease payments relating to the period against the *gross investment in the lease* to reduce both the principal and the *unearned finance income*.

[IFRS 16.75, IFRS 16.76].

After lease commencement, a lessor accounts for a finance lease, as follows:

- Recognises finance income (in profit or loss) over the lease term in an amount that produces a constant periodic rate of return on the remaining balance of the net investment in the lease (i.e., using the interest rate implicit in the lease). Income is recognised on the components of the net investment in the lease, including:
 - Interest on the lease receivable
 - Interest via accretion of the unguaranteed residual asset to its expected value at the end of the lease
 - Reduces the net investment in the lease for lease payments received (net of finance income calculated above)
- Separately recognises income from variable lease payments that are not included in the net investment in the lease (e.g., performance- or usage-based variable payments) in the period in which that income is earned
- Recognises any impairment of the net investment in the lease

The question as to whether the finance income should be calculated based on the gross lease receivable or the net amount of the lease receivable less any expected credit loss is not explicitly addressed.

How we see it

We believe the staging approach in IFRS 9 (see Chapter 47) can be applied to determine how finance income recognised over the lease term is calculated:

- On a gross basis (excluding the effect of expected credit losses) for lease receivables in stages 1 or 2 of the expected credit loss model in IFRS 9
- And
- On a net basis (based on the net investment in the lease less expected credit losses) for lease receivables in stage 3 of the expected credit loss model in IFRS 9

The election (or non-election) of the simplified approach allowed by IFRS 9 does not affect this conclusion.

In the absence of prescriptive guidance in IFRS accounting standards, we believe entities may apply the above accounting as an accounting policy choice. However, alternative approaches may also be acceptable.

Credit losses should be presented separately in the income statement in accordance with IAS 1.82.

The net investment in the lease should generally be presented net of the loss allowance. However, a separate presentation of the net investment in the lease, gross of the lease allowance and the loss allowance itself may be appropriate when the presentation is relevant to understanding the entity's financial position. For example, where the loss allowance has significantly reduced an otherwise material net investment in the lease.

The following Illustration shows how a lessor accounts for a finance lease that gives rise to selling profit:

Illustration 6-4: Lessor accounting for a finance lease (dealer-lessor case)

Assume Lessor enters into a 10-year lease of equipment with Lessee. The equipment is not specialised in nature and is expected to have alternative use to Lessor at the end of the 10-year lease term. Under the lease:

- Lessor receives annual lease payments of CU15,000, payable at the end of the year
- Lessor expects the residual value of the equipment to be CU20,000 at the end of the 10-year lease term
- Lessee provides a residual value guarantee that protects Lessor from the first CU10,000 of loss for a sale at a price below the estimated residual value at the end of the lease term (i.e., CU20,000)

The equipment has an estimated remaining economic life of 12 years, a carrying amount of CU100,000 and a fair value of CU111,000

The lease does not transfer ownership of the underlying asset to Lessee at the end of the lease term or contain an option to purchase the underlying asset

The interest rate implicit in the lease is 7.8%.

Also, assume the lessor determined it should classify the lease as a finance lease.

At lease commencement, Lessor accounts for the finance lease, as follows:

To record the net investment in the finance lease and derecognise the underlying asset:

Dr	Net investment in the lease	CU111,000 ^(a)	
Dr	Cost of goods sold	CU95,281 ^(b)	
	Cr Revenue		CU106,281 ^(c)
	Cr Property held for lease		CU100,000 ^(d)

(a) The net investment in the lease consists of (1) the present value of the 10 annual payments of CU15,000 plus the guaranteed residual value of CU10,000, both discounted at the interest rate implicit in the lease, which equals CU106,281 (i.e., the lease payment) and (2) the present value of unguaranteed residual asset of CU10,000, which equals CU4,719. Note that the net investment in the lease is subject to the same considerations as other assets in classification as current or non-current assets in a classified statement of financial position (refer to section 6.7)

(b) Cost of goods sold is the carrying amount of the equipment of CU100,000 less the present value of the unguaranteed residual asset of CU4,719

(c) Revenue equals the net investment in the lease of CU111,000 less the present value of the unguaranteed residual value of CU4,719

(d) The carrying amount of the underlying asset

At lease commencement, Lessor recognises selling profit of CU11,000 which is calculated as the lease payment of CU106,281 less the carrying amount of the asset (CU100,000), net of any unguaranteed residual asset (CU4,719), which equals CU95,281.

Year 1 journal entries for a finance lease:

Dr	Cash	CU15,000 ^(e)	
	Cr Net investment in the lease		CU6,341 ^(f)
	Cr Interest income		CU8,659 ^(g)

(e) Receipt of annual lease payments at the end of the year

(f) Reduction of the net investment in the lease for lease payments received of (CU15,000), net of interest income of CU8,659

(g) Interest income is the amount that produces a constant periodic discount rate on the remaining balance of the net investment in the lease. See computation below

The following table summarises the interest income from this lease and the related amortisation of the net investment over the lease term:

Year	Annual rental payment CU	Annual interest income(h) CU	Net investment at end of year CU
Initial net investment	-	-	111,000
1	15,000	8,659	104,659
2	15,000	8,164	97,822
3	15,000	7,631	90,453
4	15,000	7,056	82,509
5	15,000	6,436	73,945
6	15,000	5,768	64,713
7	15,000	5,048	54,761
8	15,000	4,272	44,033
9	15,000	3,435	32,467
10	15,000	2,533	20,000 (i)

(h) Interest income equals 7.8% of the net investment in the lease at the beginning of each year. For example, Year 1 annual interest income is calculated as CU111,000 (initial net investment) × 7.8%.

(i) The estimated residual value of the equipment at the end of the lease term.

6.3.4 Unguaranteed residual values

Income recognition by lessors can be extremely sensitive to the amount recognised as the asset's residual value. This is because the amount of the residual value directly affects the computation of the amount of finance income earned over the lease term - this is shown in Illustration 6-5 below. The standard gives no guidance regarding the estimation of unguaranteed residual values, but it does require them to be reviewed regularly. If there has been a reduction in the estimated value, the income allocation over the lease term is revised and any reduction in respect of amounts accrued is recognised immediately. [IFRS 16.77].

Illustration 6-5: Reduction in residual value

At lease commencement, the lessor accounts for the finance lease, as follows:

Details of a non-cancellable lease are:

- The asset has a fair value of CU10,000
- The lessee is required to make five annual rentals payable in advance of CU2,100
- The unguaranteed estimated residual value at the end of five years is CU1,000.

The lessor's direct costs have been excluded for simplicity.

Year	Net investment in lease at start of period	Rental received	Finance income (6.62% per annum)	Gross investment at end of period	Gross earnings allocated to future periods	Net investment in lease at end of period
	CU	CU	CU	CU	CU	CU
1	10,000	2,100	523	9,400	977	8,423
2	8,423	2,100	419	7,300	558	6,742
3	6,742	2,100	307	5,200	251	4,949
4	4,949	2,100	189	3,100	62	3,038
5	3,038	2,100	62	1,000	-	1,000
		10,500	1,500			

The gross investment in the lease at any point in time comprises the aggregate of the rentals receivable in future periods and the unguaranteed residual value, e.g., at the end of year 2, the gross investment of CU7,300 is three years' rental of CU2,100 plus the unguaranteed residual of CU1,000. The net investment, which is the amount that will be recorded in the statement of financial position, is CU7,300 less the earnings allocated to future periods of CU558 = CU6,742. The gross earnings allocated to future periods is the total finance income of CU1,500 less the finance income already recognised.

The lessor concludes at the end of year 2 that the residual value of the asset is only CU500 and revises the income allocation over the lease term accordingly at the original discount rate of 6.62%.

Year	Net investment in lease at start of period	Rental received	Finance income (6.62% per annum)	Gross investment at end of period*	Gross earnings allocated to future periods	Net investment in lease at end of period
	CU	CU	CU	CU	CU	CU
2	8,423	2,100	419	6,800	471	6,329
3	6,329	2,100	280	4,700	191	4,509
4	4,509	2,100	160	2,600	31	2,569
5	2,569	2,100	31	500	-	500

* The gross investment in the lease now takes account of the revised unguaranteed residual of CU500, rather than the original CU1,000.

The lessor will have to write off CU413, being the difference between the carrying amount of the receivable and the revised balance above (CU6,742 - CU6,329). This is the present value as at the end of year 2 of CU500 and represents the part of the unguaranteed residual written off.

6.3.5 Remeasurement of the net investment in the lease

After lease commencement, the net investment in a lease is remeasured when the following occurs:

- The lease is modified (i.e., a change in the scope of the lease, or the consideration for the lease, that was not part of its original terms and conditions) and the modified lease is not accounted for as a separate contract. Refer to section 6.5.
- The lease term is revised when there is a change in the non-cancellable period of the lease. Refer to section 4.4.2.B.
- There is a change in the estimated unguaranteed residual value. Refer to section 6.3.4.

A lessor includes in its initial measurement of the net investment in the lease, variable lease payments that depend on an index or rate.

How we see it

IFRS 16 is silent on the accounting for any subsequent changes in future cash flows resulting from a change in an index or rate or variable lease payments becoming in-substance fixed. In the absence of further guidance, we believe lessors have an accounting policy choice regarding whether variable lease payments that depend on an index or rate are remeasured.

6.4 Operating leases

Under IFRS 16, lessors continue to recognise the underlying asset and do not recognise a net investment in the lease on the statement of financial position or initial profit (if any) on the income statement. The underlying asset continues to be accounted for in accordance with applicable accounting standards (e.g., IAS 16).

Lessors subsequently recognise lease payments over the lease term on either a straight-line basis or another systematic and rational basis if that basis better represents the pattern in which benefit is expected to be derived from the use of the underlying asset. If the lessor pays the lessee an incentive to enter the lease, this is accounted for as described in section 4.5.2 above. [IFRS 16.81]. After lease commencement, lessors recognise variable lease payments that do not depend on an index or rate (e.g., performance- or usage- based payments) as they are earned.

A lessor recognises costs, including depreciation, incurred in earning the lease income as an expense. IFRS 16 also requires lessors of operating leases to defer initial direct costs at lease commencement and recognise them over the lease term on the same basis as lease income. [IFRS 16.82, IFRS 16.83].

The depreciation policy for depreciable underlying assets subject to operating leases must be consistent with the lessor's normal depreciation policy for similar assets. A lessor calculates depreciation in accordance with IAS 16 and IAS 38. [IFRS 16.84]. A lessor applies IAS 36 to determine whether an underlying asset subject to an operating lease is impaired and to account for any impairment loss identified. [IFRS 16.85].

A manufacturer or dealer lessor does not recognise any selling profit on entering into an operating lease because it is not the equivalent of a sale. [IFRS 16.86].

6.4.1 Operating lease income

Unlike other standards such as IFRS 15, IFRS 16 does not refer to collectability to determine whether (and when) lease income should be recognised.

How we see it

We believe that a lessor may continue to recognise operating lease income even when collectability is not probable. However, other approaches may also be appropriate when there is significant doubt about collectability. Therefore, there could be diversity in practice, and it is important to consider the views of local regulators.

Regardless of the approach followed, IFRS 9's guidance on credit losses continues to be applicable to recognised lease receivables (see Chapter 47).

FASB differences

In accordance with ASC 842, collectability of lease payments is evaluated to determine the income recognition pattern of operating leases.

Illustration 6-6: Operating lease income not expected to be fully collectible

Restaurant A leases space in a shopping mall from Lessor B. Lessor B classifies the lease as an operating lease.

Under the terms of the lease, Restaurant A makes fixed lease payments of CU100 to Lessor B at the beginning of each month. The non-cancellable lease term ends on 28 February 2022. The contract does not include any non-lease components, extension, termination or purchase options.

Due to significant financial difficulties, at the end of June, Restaurant A has indicated that it will only pay 25% of the lease receivable due for the month of July 2020. Up to 31 July 2020, CU25 has been collected and Lessor B does not expect the remaining amount of CU75 due in respect of July to be recovered considering Restaurant A's financial condition.

Analysis

Approach 1 - Recognising the full operating lease income

Lessor B recognises the full operating lease income on a straight-line basis of CU100 per month in accordance with IFRS 16.81.

Lessor B recognises a lease receivable and an impairment loss of CU75 reflecting the remote likelihood of collection in accordance with IFRS 9.

Under this approach, Lessor B records the following entries:

Dr	Lease receivable	CU100	
	Cr	Operating lease income	CU100

To record the operating lease income and lease receivable for July 2020

Dr	Impairment loss on lease receivable	CU75	
	Cr	Impairment allowance on lease receivable	CU75

To record an impairment loss against the lease receivable

Dr	Cash	CU25	
	Cr	Lease receivable	CU25

To record receipt of CU25 from the lessee

Approach 2 - Recognition of operating lease income to the extent collectible

Under this approach, Lessor B accounts for the monthly lease income to the extent collectible. This approach reflects the high uncertainty related to the collectability of the full lease payments and Lessor B's concerns about the appropriateness of reporting income when the likelihood of collecting the full amount is considered to be remote.

Under this approach, Lessor B records the following entries:

Dr	Lease receivable	CU25	
	Cr	Operating lease income	CU25

To record the operating lease income for July 2020

Dr	Cash	CU25	
	Cr	Lease receivable	CU25

To record receipt of CU25 from the lessee

6.5 Lease modifications

If a finance lease is modified (i.e., there is a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and condition of the lease), the modified lease is evaluated to determine whether it is or contains a lease. [IFRS 16 Appendix A]. Refer to section 3.1. If a lease continues to exist, a modification to a finance lease may result in:

- A separate lease (refer to section 6.5.1.A)
- A change in the accounting for the existing lease (i.e., not a separate lease) (refer to section 6.5.1.B)

If an operating lease is modified, it is treated as a new lease from the effective date of the modification. Refer to section 6.5.2.

6.5.1 Modifications to a finance lease

6.5.1.A Determining whether a lease modification results in a separate lease

Extract from IFRS 16

- 79 A lessor shall account for a modification to a finance lease as a separate lease if both:
- (a) the modification increases the scope of the lease by adding the right to use one or more underlying assets; and
 - (b) the consideration for the lease increases by an amount commensurate with the stand-alone price for the increase in scope and any appropriate adjustments to that stand-alone price to reflect the circumstances of the particular contract.

[IFRS 16.79].

If both of these conditions are met, the lease modification results in two separate leases, the unmodified original finance lease and a separate lease. Lessors account for the separate lease in the same manner as other new leases. If either of the conditions is not met, the lease modification does not result in a separate lease. The accounting for a modification that does not result in a separate lease is discussed further in section 6.5.1.B below.

6.5.1.B Lessor accounting for a modification that does not result in a separate lease

If a finance lease is modified and does not result in a separate lease, lessors account for the modification depending on the classification of the modified lease. If the lease would have been classified as an operating lease had the modification been in effect at the inception date, lessors account for such modifications as the creation of a new lease that commences on the effective date of the modification. The carrying amount of the underlying asset is measured as the net investment in the original lease immediately before the effective date of the modification. Otherwise, the net investment in the lease is accounted for in accordance with IFRS 9. [IFRS 16.80].

FASB differences

In accordance with ASC 842, if the modification of a sales-type or direct financing lease is not accounted for as a separate contract, the entity reassesses the classification of the lease as of the effective date of the modification based on the modified terms and conditions, and the facts and circumstances as of that date. ASC 842 then specifies how to account for the modified lease based on the classification of the modified lease.

6.5.2 Modification to an operating lease

If an operating lease is modified and the arrangement continues to be or contains a lease, it is treated as a new lease from the effective date of the modification. [IFRS 16.87]. Accounting for the new lease includes identifying and separating the lease and non-lease components of the contract as discussed in section 3.2 above.

Upon modification, the classification criteria are reassessed (refer to section 6.1 above). As a result, the new lease may be an operating lease or a finance lease. Any remaining prepaid or accrued lease payments relating to the original lease are included as part of the lease payments for the new lease.

Illustration 6-7 shows how the modification guidance is applied for a concession that involves the forgiveness of future lease payments.

Illustration 6-7: Forgiveness of future lease payments on an operating lease

Restaurant A leases space in a shopping mall from Lessor B. Lessor B classifies the lease as an operating lease.

Under the terms of the lease, Restaurant A makes fixed lease payments of CU100 to Lessor B at the beginning of each month. The non-cancellable lease term ends on 28 February 2025. The contract does not include any non-lease components, extension, termination or purchase options.

All lease payments due up to 30 June 2023 have been received in a timely manner. On 30 June 2023, in compensation for the closure of the shopping mall, Lessor B agrees to forgive Restaurant A's future lease payments for the months of July, August and September 2023.

Analysis:

The rent concession results in a decrease in the total lease payments. Thus, there has been a change in the consideration for a lease that was not part of the original terms and conditions of the contract. Therefore, the rent concession constitutes a lease modification. The modification does not change the classification of the lease as an operating lease.

On the effective date of the modification (i.e., 30 June 2023), Lessor B accounts for the modification as a new lease, as follows:

- The remaining lease payments under the modified lease comprise CU1,700 (lease payments of CU100 per month from October 2023 to February 2025).
- The remaining lease term is 20 months.
- The monthly operating lease income to be recognised over the remaining lease term is therefore $\text{CU1,700} \div 20 \text{ months} = \text{CU85}$.

Frequently asked questions

Question 6-1: How does a lessor apply the expected credit loss model in IFRS 9 to an operating lease receivable before a rent concession is granted, if it expects to forgive payments due from the lessee under the lease contract? Does a lessor apply the derecognition requirements in IFRS 9 or the lease modification requirements in IFRS 16 in accounting for a rent concession?

In September 2022, the IFRS IC discussed a fact pattern in which a rent concession is agreed by a lessor and a lessee, which changes the original terms and conditions of a lease contract that is classified by the lessor as an operating lease. The lessor legally releases the lessee from its obligation to make specifically identified lease payments. Some of these lease payments are amounts contractually due but not paid and are recognised as operating lease receivables. Some of these lease payments are not yet contractually due. No other changes are made to the lease contract, nor are there any other negotiations between the lessor and the lessee that might affect the accounting for the rent concession.

Applying the expected credit loss model in IFRS 9 to the operating lease receivable

The IFRS IC noted that in the fact pattern described, the lessor applies the impairment requirements in IFRS 9 to the operating lease receivable. The lessor estimates expected credit losses on the operating lease receivable by measuring 'all cash shortfalls', which are the difference between:

- (a) All contractual cash flows due to the lessor in accordance with the lease contract, and included in the gross carrying amount of the operating lease receivable; and
- (b) All the cash flows the lessor expects to receive, determined using 'reasonable and supportable information' about 'past events, current conditions and forecasts of future economic conditions'.

Therefore, the IFRS IC concluded that before the rent concession is granted, the lessor measures expected credit losses on the operating lease receivable in a way that reflects 'an unbiased and probability-weighted amount', 'the time value of money', and 'reasonable and supportable information' (as required by IFRS 9.5.5.17).

Accounting for the rent concession - IFRS 9 and IFRS 16

The agenda decision published in October 2022 also addresses the issue of whether the lessor applies the derecognition requirements in IFRS 9, or the lease modification requirements in IFRS 16, in accounting for the rent concession when operating lease payments are forgiven.

In the rent concession described in the request, the lessor legally releases the lessee from its obligation to make specifically identified lease payments, some of which the lessor has recognised as an operating lease receivable. Accordingly, on granting the rent concession, the lessor concludes that the requirements in paragraph 3.2.3(a) of IFRS 9 have been met (i.e., its contractual rights to the cash flows from the operating lease receivable expire) because it has agreed to legally release the lessee from its obligation and thus has given up its contractual rights to those specifically identified cash flows. Therefore, on the date the rent concession is granted, the lessor remeasures expected credit losses on the remaining operating lease receivable (and recognises any change to the expected credit loss allowance in profit or loss) and derecognises the operating lease receivable (and associated expected credit loss allowance).

The rent concession also meets the definition of a lease modification in IFRS 16. Therefore, the lessor applies IFRS 16.87 and accounts for the modified lease as a new lease from the date the rent concession is granted. The IFRS IC observed that lease payments contractually due from the lessee that the lessor has recognised as an operating lease receivable (to which the derecognition and impairment requirements in IFRS 9 apply) are not accrued lease payments. Consequently, neither those lease payments nor their forgiveness are considered, applying IFRS 16.87, as part of the lease payments for the new lease. In accounting for the modified lease as a new lease, a lessor applies IFRS 16.81 and recognises the lease payments (including any prepaid or accrued lease payments relating to the original lease) as income on either a straight-line basis or another systematic basis.

Therefore, the IFRS IC concluded that the lessor accounts for the rent concession described in the fact pattern, on the date it is granted, by applying:

- (a) The derecognition requirements in IFRS 9 to forgiven lease payments that the lessor has recognised as an operating lease receivable, and
- (b) The lease modification requirements in IFRS 16 to forgiven lease payments that the lessor has not recognised as an operating lease receivable.

Expected credit losses (ECL) are discussed further in Chapter 47.

6.6 Other lessor matters

6.6.1 Impairment of the net investment in the lease

Extract from IFRS 16

- | | |
|----|---|
| 77 | A lessor shall apply the derecognition and impairment requirements in IFRS 9 to the net investment in the lease. A lessor shall review regularly estimated unguaranteed residual values used in computing the gross investment in the lease. If there has been a reduction in the estimated unguaranteed residual value, the lessor shall revise the income allocation over the lease term and recognise immediately any reduction in respect of amounts accrued. |
|----|---|

Lessors evaluate their net investment in the lease for impairment by applying the derecognition and impairment requirements in IFRS 9. [IFRS 16.77].

6.6.2 Portfolio application

IFRS 16 specifies the accounting for an individual lease. However, as a practical expedient, an entity may apply it to a portfolio of leases with similar characteristics if the entity reasonably expects that the effects on the financial statements of applying IFRS 16 to the portfolio would not differ materially from applying it to the individual leases within that portfolio. If accounting for a portfolio, an entity shall use estimates and assumptions that reflect the size and composition of the portfolio. *[IFRS 16.B1]*.

Entities that have a large number of leases of similar assets (e.g., leases of a fleet of similar rolling stock) may face practical challenges in applying the leases model on a lease-by-lease basis. The IASB in the Basis for Conclusions acknowledged the concerns and included a practical expedient that allows entities to use a portfolio approach to leases with similar characteristics if the entity reasonably expects that the effects on the financial statements would not differ materially from the application of the standard to the individual leases in that portfolio. *[IFRS 16.BC83]*.

A decision to use the portfolio approach would be similar to a decision some entities already make to expense, rather than capitalise, certain assets when the accounting difference is, and would continue to be, immaterial to the financial statements.

6.7 Presentation

Lessors recognise assets held under a finance lease in the statements of financial position and present them as a receivable at an amount equal to the net investment in the lease under IFRS 16. *[IFRS 16.67]*. In addition, lessors are required under IFRS 16 to present underlying assets subject to operating leases according to the nature of that asset in the statement of financial position. *[IFRS 16.88]*.

The net investment in the lease is subject to the same considerations as other assets in classification as current or non-current assets in the statement of financial position.

6.8 Disclosure

Extract from IFRS 16

Disclosure

- 89 The objective of the disclosures is for lessors to disclose information in the notes that, together with the information provided in the statement of financial position, statement of profit or loss and statement of cash flows, gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of the lessor. Paragraphs 90-97 specify requirements on how to meet this objective.
- 90 A lessor shall disclose the following amounts for the reporting period:
- (a) for finance leases:
 - (i) selling profit or loss;
 - (ii) finance income on the net investment in the lease; and
 - (iii) income relating to variable lease payments not included in the measurement of the net investment in the lease.
 - (b) for operating leases, lease income, separately disclosing income relating to variable lease payments that do not depend on an index or a rate.
- 91 A lessor shall provide the disclosures specified in paragraph 90 in a tabular format, unless another format is more appropriate.
- 92 A lessor shall disclose additional qualitative and quantitative information about its leasing activities necessary to meet the disclosure objective in paragraph 89. This additional information includes, but is not limited to, information that helps users of financial statements to assess:
- (a) the nature of the lessor's leasing activities; and
 - (b) how the lessor manages the risk associated with any rights it retains in underlying assets. In particular, a lessor shall disclose its risk management strategy for the rights it retains in underlying assets, including any means by which the lessor reduces that risk. Such means may include, for example, buy-back agreements, residual value guarantees or variable lease payments for use in excess of specified limits.

Finance leases

- 93 A lessor shall provide a qualitative and quantitative explanation of the significant changes in the carrying amount of the net investment in finance leases.
- 94 A lessor shall disclose a maturity analysis of the lease payments receivable, showing the undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years. A lessor shall reconcile the undiscounted lease payments to the net investment in the lease. The reconciliation shall identify the unearned finance income relating to the lease payments receivable and any discounted unguaranteed residual value.

Operating leases

- 95 For items of property, plant and equipment subject to an operating lease, a lessor shall apply the disclosure requirements of IAS 16. In applying the disclosure requirements in IAS 16, a lessor shall disaggregate each class of property, plant and equipment into assets subject to operating leases and assets not subject to operating leases. Accordingly, a lessor shall provide the disclosures required by IAS 16 for assets subject to an operating lease (by class of underlying asset) separately from owned assets held and used by the lessor.
- 96 A lessor shall apply the disclosure requirements in IAS 36, IAS 38, IAS 40 and IAS 41 for assets subject to operating leases.
- 97 A lessor shall disclose a maturity analysis of lease payments, showing the undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years.

[IFRS 16.89-97].

The objective of the disclosures is for lessors to disclose information that gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of the lessor. [IFRS 16.89].

IFRS 16 requires a lessor to disclose quantitative and qualitative information about its leases, the significant judgements made in applying IFRS 16 and the amounts recognised in the financial statements related to the leases.

Lessors may need to exercise judgement to determine the appropriate level at which to aggregate, or disaggregate, disclosures so that meaningful information is not obscured by insignificant details or by grouping items with different characteristics.

7 Subleases

7.1 Definition

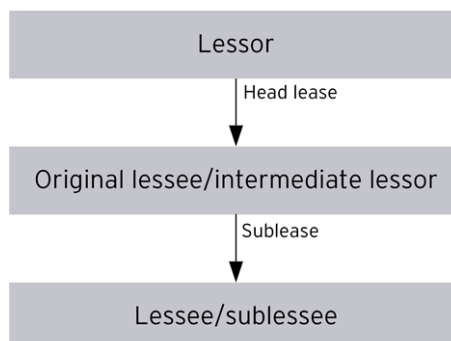

Extract from IFRS 16

Appendix A Defined terms

sublease	A transaction for which an underlying asset is re-leased by a lessee ('intermediate lessor') to a third party, and the lease ('head lease') between the head lessor and lessee remains in effect.
----------	--

[IFRS 16 Appendix A].

Lessees often enter into arrangements to sublease a leased asset to a third party while the original lease contract is in effect. In these arrangements, one party acts as both the lessee and lessor of the same underlying asset. The original lease is often referred to as a head lease, the original lessee is often referred to as an intermediate lessor or sublessor and the ultimate lessee is often referred to as the sublessee.

In some cases, the sublease is a separate lease agreement. In other cases, a third party assumes the original lease, but the original lessee remains the primary obligor under the original lease.

7.2 Intermediate lessor accounting

Extract from IFRS 16

B7	If a lessee subleases an asset, or expects to sublease an asset, the head lease does not qualify as a lease of a low-value asset.
	Sublease classification
B58	In classifying a sublease, an intermediate lessor shall classify the sublease as a finance lease or an operating lease as follows: <ul style="list-style-type: none"> (a) if the head lease is a short-term lease that the entity, as a lessee, has accounted for applying paragraph 6, the sublease shall be classified as an operating lease. (b) otherwise, the sublease shall be classified by reference to the right-of-use asset arising from the head lease, rather than by reference to the underlying asset (for example, the item of property, plant, or equipment that is the subject of the lease).

If an underlying asset is re-leased by a lessee to a third party and the original lessee retains the primary obligation under the original lease, the transaction is a sublease. That is, the original lessee generally continues to account for the original lease (the head lease) as a lessee and accounts for the sublease as the lessor (intermediate lessor).

When the head lease is a short-term lease, the sublease is classified as an operating lease. Otherwise, the sublease is classified using the classification criteria in section 6 above by reference to the right-of-use asset in the head lease (and not the underlying asset of the head lease). [IFRS 16.B7, IFRS 16.B58].

FASB differences

In accordance with ASC 842, the sublessor classifies the sublease based on the underlying asset rather than the right-of-use asset arising on the head lease.

Illustration 7-1: Classification of a sublease

Entity F (original lessee/intermediate lessor) leases a building for five years. The building has an economic life of 30 years. Entity F subleases the building for four years. The sublease is classified with reference to the right-of-use asset in the head lease (and not the underlying building). For example, when assessing the useful life criterion, the sublease term of four years is compared with five year right-of-use asset in the head lease and not with 30-year economic life of the building which may result in the sublease being classified as a finance lease.

The intermediate lessor accounts for the sublease as follows:

- If the sublease is classified as an operating lease, the original lessee continues to account for the lease liability and right-of-use asset on the head lease like any other lease. Refer to section 5. If the total remaining carrying amount of the right-of-use asset on the head lease exceeds the anticipated sublease income, this may indicate that the right-of-use asset associated with the head lease is impaired. A right-of-use asset is assessed for impairment under IAS 36.
- If the sublease is classified as a finance lease, the original lessee derecognises the right-of-use asset on the head lease at the sublease commencement date and continues to account for the original lease liability in accordance with the lessee accounting model. Refer to section 5. The original lessee, as the sublessor, recognises a net investment in the sublease and evaluates it for impairment. Refer to section 6.6.1 above.

In a sublease, an intermediate lessor may use the discount rate for the head lease (adjusted for any initial direct costs associated with the sublease) to measure the net investment in the sublease, if the interest rate implicit in the lease cannot be readily determined. [IFRS 16.68].

When contracts are entered into at or near the same time, an intermediate lessor is required to consider the criteria for combining contracts (e.g., when the contracts are negotiated as a package with a single commercial objective, or when the consideration to be paid in one contract depends on the price or performance of the other contract). If the contracts are required to be combined, the intermediate lessor accounts for the head lease and sublease as a single combined transaction. Refer to section 3.3 above.

An intermediate lessor who subleases, or expects to sublease an asset, cannot account for the head lease as a lease of a low-value asset even when the criteria, as discussed in section 5.1.2 above, are satisfied.

IFRS 16 gives the following two examples of applying the requirements to an intermediate lessor that enters into a head lease and a sublease of the same underlying asset. [IFRS 16.IE8, IFRS 16.IE Example 20, IFRS 16.IE Example 21].

Extract from IFRS 16 Illustrative Examples

Example 20- Sublease classified as a finance lease

Head lease - An intermediate lessor enters into a five-year lease for 5,000 square metres of office space (the head lease) with Entity A (the head lessor).

Sublease - At the beginning of Year 3, the intermediate lessor subleases the 5,000 square metres of office space for the remaining three years of the head lease to a sublessee.

The intermediate lessor classifies the sublease by reference to the right-of-use asset arising from the head lease. The intermediate lessor classifies the sublease as a finance lease, having considered the requirements in paragraphs 61-66 of IFRS 16.

When the intermediate lessor enters into the sublease, the intermediate lessor:

- (a) derecognises the right-of-use asset relating to the head lease that it transfers to the sublessee and recognises the net investment in the sublease;
- (b) recognises any difference between the right-of-use asset and the net investment in the sublease in profit or loss; and
- (c) retains the lease liability relating to the head lease in its statement of financial position, which represents the lease payments owed to the head lessor.

During the term of the sublease, the intermediate lessor recognises both finance income on the sublease and interest expense on the head lease.

Example 21- Sublease classified as an operating lease

Head lease-An intermediate lessor enters into a five-year lease for 5,000 square metres of office space (the head lease) with Entity A (the head lessor).

Sublease-At commencement of the head lease, the intermediate lessor subleases the 5,000 square metres of office space for two years to a sublessee.

The intermediate lessor classifies the sublease by reference to the right-of-use asset arising from the head lease. The intermediate lessor classifies the sublease as an operating lease, having considered the requirements in paragraphs 61-66 of IFRS 16.

When the intermediate lessor enters into the sublease, the intermediate lessor retains the lease liability and the right-of-use asset relating to the head lease in its statement of financial position.

During the term of the sublease, the intermediate lessor:

- (a) recognises a depreciation charge for the right-of-use asset and interest on the lease liability; and
- (b) recognises lease income from the sublease.

7.3 Sublessee accounting

A sublessee accounts for its lease in the same manner as any other lease (i.e., as a new lease subject to IFRS 16's recognition and measurement provisions). Refer to section 5.

7.4 Presentation

According to IAS 1.32, an entity cannot offset assets and liabilities or income and expenses, unless required or permitted by an IFRS accounting standard. [IAS 1.32]. Therefore, intermediate lessors are not permitted to offset lease liabilities and lease assets that arise from a head lease and a sublease, respectively, unless those liabilities and assets meet the requirements in IAS 1 for offsetting. [IFRS 16.BC235]. Similarly, intermediate lessors are not permitted to offset depreciation and interest expenses and lease income relating to a head lease and a sublease of the same underlying asset, respectively, unless the requirements for offsetting in IAS 1 are met. [IFRS 16.BC236]. For example, intermediate lessors apply the principal-versus-agent application guidance in IFRS 15 to determine whether sublease revenue needs to be presented on a gross or net basis (i.e., reduced for head lease expenses).

How we see it

We believe that intermediate lessors generally will not meet the principal-versus-agent application guidance in IFRS 15 to present sublease income on a net basis and therefore, will generally present sublease revenue on a gross basis. See Chapter 28.

7.5 Disclosure

Under IFRS 16, entities including intermediate lessors are required to disclose qualitative and quantitative information which gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of the lessor. Refer to section 5.8 for lessees and section 6.8 for lessors, respectively.

8 Sale and leaseback transactions

Extract from IFRS 16

- 98 If an entity (the seller-lessee) transfers an asset to another entity (the buyer-lessor) and leases that asset back from the buyer-lessor, both the seller-lessee and the buyer-lessor shall account for the transfer contract and the lease applying paragraphs 99-103.

[IFRS 16.98].

A sale and leaseback transaction involves the transfer of an asset by an entity (the seller-lessee) to another entity (the buyer-lessor) and the leaseback of the same asset by the seller-lessee. Because IFRS 16 requires lessees to recognise most leases on the statement of financial position, sale and leaseback transactions may no longer provide lessees with a source of off-balance sheet financing. Both the seller-lessee and the buyer-lessor are required to apply IFRS 15 to determine whether to account for a sale and leaseback transaction as a sale and purchase of an asset.

The presentation in the statement of cash flows of sale and leaseback transactions is discussed in Chapter 36.

The IFRS IC discussed a question about the applicability of the sale and leaseback requirements in IFRS 16 to a transaction in which an entity sells its equity interest in a subsidiary that holds only a real estate asset and then leases that real estate back. The question asked was whether the entity applies the sale and leaseback requirements in IFRS 16 and accordingly recognises only the amount of the gain that relates to the rights transferred to the buyer-lessor, rather than recognising the full gain on the sale. In September 2020, the IFRS IC published a tentative agenda decision that concluded that in the fact pattern described, the entity would apply IFRS 10 *Consolidated Financial Statements* to account for the loss of control of the subsidiary. The tentative agenda decision also noted that the transfer of the building satisfies the requirements in IFRS 15 to be accounted for as a sale of the building and the entity therefore applies the sale and leaseback requirements of IFRS 16 and recognises only the amount of the gain that relates to the rights transferred to the buyer-lessor. The IFRS IC received a number of comment letters on the tentative agenda decision that raised concerns about the accounting requirements. Therefore, in February 2021, the IFRS IC decided to refer the matter to the Board for further consideration of narrow scope standard setting. At the time of writing, the Board has not yet discussed the issue.

How we see it

In the absence of further guidance, we believe entities should consider the views of local regulators before establishing an initial accounting policy for transactions involving the transfer or acquisition of a controlling interest in an entity that holds an underlying asset that will be leased back to the transferor. Entities also need to carefully consider the disclosure of these transactions to ensure that users of the financial statements can assess the impact. The disclosure requirements for sale and leaseback transactions are discussed at section 8.4 below.

8.1 Determining whether the transfer of an asset is a sale

When determining whether the transfer of an asset should be accounted for as a sale or purchase, both the seller-lessee and the buyer-lessor apply the requirements in IFRS 15 on when an entity satisfies a performance obligation by transferring control of an asset. [IFRS 16.99]. If control of an underlying asset passes to the buyer-lessor, the transaction is accounted for as a sale or purchase of the asset and a lease. If not, both the seller-lessee and the buyer-lessor account for the transaction as a financing transaction. See Chapter 28 for determining when a performance obligation is satisfied under requirements of IFRS 15.

IFRS 15 includes the following to help entities determine whether control of the asset has been transferred. [IFRS 15.31-34, IFRS 15.38].

Extract from IFRS 15

- 31 An entity shall recognise revenue when (or as) the entity satisfies a performance obligation by transferring a promised good or service (ie an asset) to a customer. An asset is transferred when (or as) the customer obtains control of that asset.**
- 32** For each performance obligation identified in accordance with paragraphs 22-30, an entity shall determine at contract inception whether it satisfies the performance obligation over time (in accordance with paragraphs 35-37) or satisfies the performance obligation at a point in time (in accordance with paragraph 38). If an entity does not satisfy a performance obligation over time, the performance obligation is satisfied at a point in time.
- 33** Goods and services are assets, even if only momentarily, when they are received and used (as in the case of many services). Control of an asset refers to the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. Control includes the ability to prevent other entities from directing the use of, and obtaining the benefits from, an asset. The benefits of an asset are the potential cash flows (inflows or savings in outflows) that can be obtained directly or indirectly in many ways, such as by:
- (a) using the asset to produce goods or provide services (including public services);
 - (b) using the asset to enhance the value of other assets;
 - (c) using the asset to settle liabilities or reduce expenses;
 - (d) selling or exchanging the asset;
 - (e) pledging the asset to secure a loan; and
 - (f) holding the asset.
- 34** When evaluating whether a customer obtains control of an asset, an entity shall consider any agreement to repurchase the asset (see paragraphs B64-B76).
- Performance obligations satisfied at a point in time**
- 38** If a performance obligation is not satisfied over time in accordance with paragraphs 35-37, an entity satisfies the performance obligation at a point in time. To determine the point in time at which a customer obtains control of a promised asset and the entity satisfies a performance obligation, the entity shall consider the requirements for control in paragraphs 31-34. In addition, an entity shall consider indicators of the transfer of control, which include, but are not limited to, the following:
- (a) The entity has a present right to payment for the asset-if a customer is presently obliged to pay for an asset, then that may indicate that the customer has obtained the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset in exchange.
 - (b) The customer has legal title to the asset-legal title may indicate which party to a contract has the ability to direct the use of, and obtain substantially all of the remaining benefits from, an asset or to restrict the access of other entities to those benefits. Therefore, the transfer of legal title of an asset may indicate that the customer has obtained control of the asset. If an entity retains legal title solely as protection against the customer's failure to pay, those rights of the entity would not preclude the customer from obtaining control of an asset.
 - (c) The entity has transferred physical possession of the asset - the customer's physical possession of an asset may indicate that the customer has the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset or to restrict the access of other entities to those benefits. However, physical possession may not coincide with control of an asset. For example, in some repurchase agreements and in some consignment arrangements, a customer or consignee may have physical possession of an asset that the entity controls. Conversely, in some bill-and-hold arrangements, the entity may have physical possession of an asset that the customer controls. Paragraphs B64-B76, B77-B78 and B79-B82 provide guidance on accounting for repurchase agreements, consignment arrangements and bill-and-hold arrangements, respectively.

- (d) The customer has the significant risks and rewards of ownership of the asset-the transfer of the significant risks and rewards of ownership of an asset to the customer may indicate that the customer has obtained the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. However, when evaluating the risks and rewards of ownership of a promised asset, an entity shall exclude any risks that give rise to a separate performance obligation in addition to the performance obligation to transfer the asset. For example, an entity may have transferred control of an asset to a customer but not yet satisfied an additional performance obligation to provide maintenance services related to the transferred asset.
- (e) The customer has accepted the asset-the customer's acceptance of an asset may indicate that it has obtained the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. To evaluate the effect of a contractual customer acceptance clause on when control of an asset is transferred, an entity shall consider the guidance in paragraphs B83-B86.

None of the indicators above individually determine whether the buyer-lessor has obtained control of the underlying asset. Both the seller-lessee and the buyer-lessor must consider all relevant facts and circumstances to determine whether control has transferred. Furthermore, not all of the indicators must be present to determine that the buyer-lessor has gained control. Rather, the indicators are factors that are often present when a customer has obtained control of an asset and the list is meant to help entities apply the principle of control. See Chapter 28.

The IASB noted that, in considering whether a transaction should be accounted for as a sale and leaseback transaction, an entity should consider not only those transactions structured in the form of a legal sale and leaseback, but should also consider other forms of transactions for which the economic effect is the same as a legal sale and leaseback. [IFRS 16.BC261].

FASB differences

Under US GAAP, to determine whether an asset transfer is a sale and purchase, a seller-lessee and a buyer-lessor consider the following:

- Whether the transfer meets the sale criteria under ASC 606 (however, certain fair value repurchase options would not result in a failed sale)
- Whether the leaseback would be classified as a sales-type lease by the buyer-lessor or a finance lease by the seller-lessee (i.e., a sale and purchase does not occur when the leaseback is classified as a sales-type lease by the buyer-lessor or as a finance lease by the seller-lessee)

The IASB noted that the existence of a leaseback, in isolation, does not preclude a sale. This is because a lease is different from the sale or purchase of an underlying asset, as a lease does not transfer control of the underlying asset. Instead, it transfers the right to control the use of the underlying asset for the period of the lease. However, if the seller-lessee has a substantive repurchase option for the underlying asset (i.e., a right to repurchase the asset), no sale has occurred because the buyer-lessor has not obtained control of the asset. [IFRS 16.BC262].

How we see it

IFRS 16 does not address whether a lessee's renewal options (e.g., fixed price, fair value at the date of exercise) permitting the seller-lessee to extend the lease for substantially all of the remaining economic life of the underlying asset precludes sale accounting. We believe one acceptable view is that when the exercise price of a renewal option(s) is not at fair value, determined at the time the renewal option is exercised, the existence of the renewal option(s) would prohibit sale accounting in the same way a seller's repurchase agreement (i.e., a forward or call option) would preclude sale accounting under IFRS 15. However, there may be other reasonable approaches to evaluate whether control is transferred to the buyer under IFRS 15 when a renewal option that extends a lease for substantially all of the remaining economic life of the underlying asset is present.

8.2 Transactions in which the transfer of an asset is a sale

Extract from IFRS 16

Transfer of the asset is a sale

- 100 If the transfer of an asset by the seller-lessee satisfies the requirements of IFRS 15 to be accounted for as a sale of the asset:
- (a) the seller-lessee shall measure the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee shall recognise only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor.
 - (b) the buyer-lessor shall account for the purchase of the asset applying applicable Standards, and for the lease applying the lessor accounting requirements in this Standard.
- 101 If the fair value of the consideration for the sale of an asset does not equal the fair value of the asset, or if the payments for the lease are not at market rates, an entity shall make the following adjustments to measure the sale proceeds at fair value:
- (a) any below-market terms shall be accounted for as a prepayment of lease payments; and
 - (b) any above-market terms shall be accounted for as additional financing provided by the buyer-lessor to the seller-lessee.
- 102 The entity shall measure any potential adjustment required by paragraph 101 on the basis of the more readily determinable of:
- (a) the difference between the fair value of the consideration for the sale and the fair value of the asset; and
 - (b) the difference between the present value of the contractual payments for the lease and the present value of payments for the lease at market rates.

[IFRS 16.100, IFRS 16.101, IFRS 16.102].

8.2.1 Accounting for the sale

If the transfer of the asset is a sale, the seller-lessee will:

- Derecognise the underlying asset
- Recognise the gain or loss, if any, that relates to the rights transferred to the buyer-lessor and adjusted for off-market terms

A buyer-lessor accounts for the purchase of the asset in accordance with other standards based on the nature of the asset (e.g., IAS 16 for property, plant and equipment).

How we see it

IFRS 16 requires a seller-lessee to measure the right-of-use asset from the leaseback at the portion of the previous carrying amount of the asset that relates to the right of use retained but does not prescribe how the portion retained should be measured. Therefore, judgement may be required to measure the portion retained. Examples 24 and 25 in IFRS 16 (shown at section 8.2.4 below) show methodologies for determining the gain on sale.

Frequently asked questions

Question 8-1: When the lease payments relating to a leaseback are totally variable and not based on an index or rate, how is 'the proportion of the previous carrying amount of the asset that relates to right-of-use retained by the lessee' determined?

The IFRS IC issued an agenda decision in June 2020 related to a sale and leaseback transaction with variable payments. In the transaction described in the request, an entity (seller-lessee) enters into a sale and leaseback transaction whereby it transfers an item of property to another entity (buyer-lessor) and leases the asset back for five years. The transfer of the property satisfies the requirements in IFRS 15 to be accounted for as a sale of the property. The amount paid by the buyer-lessor to the seller-lessee in exchange for the property equals the property's fair value at the date of the transaction. Payments for the lease (which are at market rates) include variable payments (not based on an index or rate), calculated as a percentage of the seller-lessee's revenue generated using the property during the five-year lease term. The seller-lessee has determined that the variable payments are not in-substance fixed payments as described in IFRS 16. The request asked how, in the transaction described, the seller-lessee measures the right-of-use asset arising from the leaseback and determines the amount of any gain or loss recognised at the date of the transaction.

The IFRS IC observed that the requirements applicable to the transaction described in the request are in IFRS 16.100. Paragraph 100 states that, "... if the transfer of an asset by the seller-lessee satisfies the requirements of IFRS 15 to be accounted for as a sale of the asset: (a) the seller-lessee measures the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee recognises only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor."

Consequently, to measure the right-of-use asset arising from the leaseback, the seller-lessee determines the proportion of the property transferred to the buyer-lessor that relates to the right of use retained. It does so by comparing, at the date of the transaction, the right of use it retains via the leaseback to the rights comprising the entire property. IFRS 16 does not prescribe a method for determining that proportion. In the transaction described in the request, the seller-lessee could determine the proportion by comparing, for example: (a) the present value of expected lease payments (including those that are variable and not based on an index or rate); with (b) the fair value of the property at the date of the transaction.

The gain or loss the seller-lessee recognises at the date of the transaction is a consequence of its measurement of the right-of-use asset arising from the leaseback. Because the right of use the seller-lessee retains is not remeasured as a result of the transaction (it is measured as a proportion of the property's previous carrying amount), the amount of the gain or loss recognised relates only to the rights transferred to the buyer-lessor. Applying IFRS 16.53(i), the seller-lessee discloses gains or losses arising from sale and leaseback transactions.

The seller-lessee also recognises a liability at the date of the transaction, even if all the payments for the lease are variable and do not depend on an index or rate. The initial measurement of the liability is a consequence of how the right-of-use asset is measured - and the gain or loss on the sale and leaseback transaction determined - applying IFRS 16.100(a).

Illustration 8-1: Sale and leaseback with variable payments - extract from June 2020 IFRIC update

Seller-lessee enters into a sale and leaseback transaction whereby it transfers an asset (PPE) to Buyer-lessor, and leases that PPE back for five years. The transfer of the PPE satisfies the requirements in IFRS 15 to be accounted for as a sale of the PPE.

The carrying amount of the PPE in Seller-lessee's financial statements at the date of the transaction is CU1,000,000, and the amount paid by Buyer-lessor for the PPE is CU1,800,000 (the fair value of the PPE at that date). All the payments for the lease (which are at market rates) are variable, calculated as a percentage of Seller-lessee's revenue generated using the PPE during the five-year lease term. At the date of the transaction, the present value of the expected payments for the lease is CU450,000. There are no initial direct costs.

Seller-lessee determines that it is appropriate to calculate the proportion of the PPE that relates to the right of use retained using the present value of expected payments for the lease. On this basis, the proportion of the PPE that relates to the right of use retained is 25%, calculated as CU450,000 (present value of expected payments for the lease) ÷ CU1,800,000 (fair value of the PPE). Consequently, the proportion of the PPE that relates to the rights transferred to Buyer-lessor is 75%, calculated as (CU1,800,000 – CU450,000) ÷ CU1,800,000.

Applying IFRS 16.100(a), Seller-lessee:

- (a) Measures the right-of-use asset at CU250,000, calculated as CU1,000,000 (previous carrying amount of the PPE) × 25% (proportion of the PPE that relates to the right of use it retains).
- (b) Recognises a gain of CU600,000 at the date of the transaction, which is the gain that relates to the rights transferred to Buyer-lessor. This gain is calculated as CU800,000 (total gain on sale of the PPE (CU1,800,000 - CU1,000,000)) × 75% (proportion of the PPE that relates to rights transferred to Buyer-lessor).

Applying IFRS 16.100(a), the right-of-use asset would not be measured at zero at the date of the transaction because zero would not reflect the proportion of the previous carrying amount of the PPE (CU1,000,000) that relates to the right of use retained by Seller-lessee.

At the date of the transaction, Seller-lessee accounts for the transaction as follows:

Dr	Cash	CU1,800,000	
Dr	Right-of-use asset	CU250,000	
	Cr	PPE	CU1,000,000
	Cr	Liability	CU450,000
	Cr	Gain on rights transferred	CU600,000

The IFRS IC concluded that the principles and requirements in IFRS 16 provide an adequate basis for an entity to determine, at the date of the transaction, the accounting for the sale and leaseback transaction described in the request and, therefore, decided not to add the matter to its standard-setting agenda.

How we see it

Although not explicitly stated in IFRS 16, we believe that if the sale and leaseback transaction is expected to result in a loss to the seller-lessee, that loss will not be deferred. In addition, the seller-lessee may also need to consider whether the underlying asset may have been impaired prior to the sale and leaseback and the transaction would require the asset to have been classified as held-for-sale under IFRS 5 (see Chapter 5) and, hence, subject to potential impairment prior to the transaction.

The IFRS IC's discussions above highlighted that IFRS 16 does not specify the measurement of the liability that arises in such a sale and leaseback transaction. To address this, the IASB issued *Lease Liability in a Sale and Leaseback (Amendments to IFRS 16)* (the amendment) in September 2022. The amendment to IFRS 16 specifies that a seller-lessee applies IFRS 16.36 to IFRS 16.46 to subsequently measure the lease liability arising from the leaseback. The amendment does not change the accounting for leases unrelated to sale and leaseback transactions. [IFRS 16.102A].

Extract from IFRS 16

- 102A After the commencement date, the seller-lessee shall apply paragraphs 29-35 to the right-of-use asset arising from the leaseback and paragraphs 36-46 to the lease liability arising from the leaseback. In applying paragraphs 36-46, the seller-lessee shall determine 'lease payments' or 'revised lease payments' in a way that the seller-lessee would not recognise any amount of the gain or loss that relates to the right of use retained by the seller-lessee. Applying the requirements in this paragraph does not prevent the seller-lessee from recognising in profit or loss any gain or loss relating to the partial or full termination of a lease as required by paragraph 46(a).

The amendment clarifies that the seller-lessee subsequently measures the right-of-use asset and lease liability arising from the leaseback in accordance with the existing requirements in IFRS 16.

Effective date and transition

A seller-lessee applies the amendment above to annual reporting periods beginning on or after 1 January 2024. Earlier application is permitted. If an entity applies the amendment for an earlier period, it discloses that fact. A seller-lessee applies the amendment retrospectively in accordance with IAS 8 to sale and leaseback transactions entered into after the date of initial application. The date of initial application is the beginning of the annual reporting period in which an entity first applies IFRS 16.

The Illustrative Examples accompanying IFRS 16 have also been updated to amend Example 24 and include a new Example 25. These examples are reproduced in section 8.2.4 below. [IFRS 16.IE11, IFRS 16.IE Example 24] [IFRS 16.IE12, IFRS 16.IE Example 25]

**FASB differences**

In accordance with ASC 842, the seller-lessee recognises any gain or loss, adjusted for off-market terms, immediately.

8.2.2 Accounting for the leaseback

When a sale occurs, both the seller-lessee and the buyer-lessor account for the leaseback in the same manner as any other lease (refer to section 5 and section 6, respectively), with adjustments for any off-market terms. Specifically, a seller-lessee recognises a lease liability and right-of-use asset for the leaseback.

8.2.3 Adjustment for off-market terms

The sale transaction and the ensuing lease are generally interdependent and negotiated as a package. Consequently, some transactions could be structured with a negotiated sales price that is above or below the asset's fair value and with lease payments for the ensuing lease that are above or below the market rates. These off-market terms could distort the gain or loss on the sale and the recognition of lease expense and lease income for the lease. To ensure that the gain or loss on the sale and the lease-related assets and liabilities associated with such transactions are neither understated nor overstated, IFRS 16 requires adjustments for any off-market terms of sale and leaseback transactions, on the more readily determinable basis of the difference between the fair value of the consideration for the sale and the fair value of the asset and the difference between the present value of the contractual payments for the lease and the present value of payments for the lease at market rates. [IFRS 16.102].

When the sale price is less than the underlying asset's fair value or the present value of the lease payments is less than the present value of the market lease payments, using the more readily determinable basis, a seller-lessee recognises the difference as an increase to the sales price and the initial measurement of the right-of-use asset as a lease prepayment. When the sale price is greater than the underlying asset's fair value or the present value of the lease payments is greater than the present value of the market lease payments, using the more readily determinable basis, a seller-lessee recognises the difference as a reduction in the sales price and an additional financing received from the buyer-lessor.

Buyer-lessors are also required to adjust the purchase price of the underlying asset for any off-market terms. Such adjustments are recognised as lease prepayments made by the seller-lessee or as additional financing provided to the seller-lessee.

8.2.4 Illustrative Examples

IFRS 16 provides the following two examples of the accounting for a sale and leaseback transaction:
[IFRS 16.IE11, IFRS 16.IE Example 24, IFRS 16.IE12, IFRS 16.IE Example 25]

Extract from IFRS 16 Illustrative Examples

Example 24 - Sale and leaseback transaction with fixed payments and above-market terms

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of CU2,000,000. Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of CU120,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of IFRS 15 Revenue from Contracts with Customers to be accounted for as a sale of the building. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback.

The fair value of the building at the date of sale is CU1,800,000. Because the consideration for the sale of the building is not at fair value, Seller-lessee and Buyer-lessor make adjustments to measure the sale proceeds at fair value. Applying paragraph 101(b) of IFRS 16, the amount of the excess sale price of CU200,000 (CU2,000,000 - CU1,800,000) is recognised as additional financing provided by Buyer-lessor to Seller-lessee.

The interest rate implicit in the lease is 4.5 per cent per annum, which is readily determinable by Seller-lessee. The present value of the annual payments (18 payments of CU120,000, discounted at 4.5 per cent per annum) is CU1,459,200, of which CU200,000 relates to the additional financing and CU1,259,200 relates to the lease-corresponding to 18 annual payments of CU16,447 and CU103,553, respectively.

Buyer-lessor classifies the lease of the building as an operating lease.

Seller-lessee

Applying paragraph 100(a) of IFRS 16, at the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee, which is CU699,555. Seller-lessee calculates this amount as: CU1,000,000 (the carrying amount of the building) × CU1,259,200 (the discounted lease payments for the 18-year right-of-use asset) ÷ CU1,800,000 (the fair value of the building).

Seller-lessee recognises only the amount of the gain that relates to the rights transferred to Buyer-lessor of CU240,355 calculated as follows. The gain on sale of the building amounts to CU800,000 (CU1,800,000 - CU1,000,000), of which:

- (a) CU559,645 (CU800,000 × CU1,259,200 ÷ CU1,800,000) relates to the right to use the building retained by Seller-lessee; and
- (b) CU240,355 (CU800,000 × (CU1,800,000 - CU1,259,200) ÷ CU1,800,000) relates to the rights transferred to Buyer-lessor.

At the commencement date, Seller-lessee accounts for the transaction, as follows:

Cash	CU2,000,000
Right-of-use asset	CU699,555
Building	CU1,000,000
Lease liability	CU1,259,200
Financial liability	CU200,000
Gain on rights transferred	CU240,355

Buyer-lessor

At the commencement date, Buyer-lessor accounts for the transaction, as follows:

Building	CU1,800,000
Financial asset	CU200,000 (18 payments of CU16,447, discounted at 4.5 per cent per annum)
Cash	CU2,000,000

After the commencement date, Buyer-lessor accounts for the lease by treating CU103,553 of the annual payments of CU120,000 as lease payments. The remaining CU16,447 of annual payments received from Seller-lessee are accounted for as (a) payments received to settle the financial asset of CU200,000 and (b) interest revenue.

Example 25 - Subsequent measurement of a right-of-use asset and lease liability in a sale and leaseback transaction with variable lease payments that do not depend on an index or rate

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of CU1,800,000 (the fair value of the building at the date of sale). Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for five years. Lease payments - payable annually - comprise fixed payments and variable payments that do not depend on an index or rate.

The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of IFRS 15 Revenue from Contracts with Customers to be accounted for as a sale of the building. Accordingly, Seller-lessee accounts for the transaction as a sale and leaseback.

The interest rate implicit in the lease cannot be readily determined. Seller-lessee's incremental borrowing rate is 3 per cent per annum.

Applying paragraph 100(a) of IFRS 16, Seller-lessee determines the proportion of the building transferred to Buyer-lessor that relates to the right of use it retains as 25 per cent.^(a) Consequently, at the commencement date Seller-lessee accounts for the transaction as follows.

Cash	CU1,800,000
Right-of-use asset (CU1,000,000 x 25 per cent)	CU250,000
Building	CU1,000,000
Lease liability	CU450,000
Gain on rights transferred ((CU1,800,000 - CU1,000,000) x 75 per cent)	CU600,000

Seller-lessee expects to consume the right-of-use asset's future economic benefits evenly over the lease term and, thus, depreciates the right-of-use asset on a straight-line basis.

In measuring the lease liability applying paragraphs 36-46 of IFRS 16, Seller-lessee develops an accounting policy for determining 'lease payments' in a way that it would not recognise any amount of the gain that relates to the right of use it retains. Depending on the circumstances (including the method Seller-lessee used - applying paragraph 100(a) of IFRS 16 - for determining the measurement of the right-of-use asset and the gain recognised on the transaction at the commencement date), either Approach 1 or Approach 2 could meet the requirements in paragraph 102A.

Approach 1 - Expected lease payments at the commencement date

Applying paragraph 102A of IFRS 16, Seller-lessee determines 'lease payments' to reflect the expected lease payments at the commencement date that, when discounted using its incremental borrowing rate, result in the carrying amount of the lease liability at that date of CU450,000.

The lease liability and the right-of-use asset arising from the leaseback are:

Year	Lease liability				Right-of-use asset		
	Beginning balance	Lease payments ^(b)	3 per cent interest expense ^(c)	Ending balance	Beginning balance	Depreciation charge	Ending balance
	CU	CU	CU	CU	CU	CU	CU
1	450,000	(95,902)	13,500	367,598	250,000	(50,000)	200,000
2	367,598	(98,124)	11,028	280,502	200,000	(50,000)	150,000
3	280,502	(99,243)	8,415	189,674	150,000	(50,000)	100,000
4	189,674	(100,101)	5,690	95,263	100,000	(50,000)	50,000
5	95,263	(98,121)	2,858	0	50,000	(50,000)	0

In applying paragraph 102A and paragraph 38(b) of IFRS 16, Seller-lessee recognises in profit or loss the difference between the payments made for the lease and the lease payments that reduce the carrying amount of the lease liability. For example, if Seller-lessee pays CU99,321 for the use of the building in Year 2, it recognises CU1,197 (CU99,321 - CU98,124) in profit or loss.

Approach 2 - Equal lease payments over the lease term

Applying paragraph 102A of IFRS 16, Seller-lessee determines 'lease payments' to reflect equal periodic payments over the lease term that, when discounted using its incremental borrowing rate, result in the carrying amount of the lease liability at the commencement date of CU450,000.

The lease liability and the right-of-use asset arising from the leaseback are:

Year	Lease liability				Right-of-use asset		
	Beginning balance	Lease payments ^(d)	3 per cent interest expense ^(c)	Ending balance	Beginning balance	Depreciation charge	Ending balance
	CU	CU	CU	CU	CU	CU	CU
1	450,000	(98,260)	13,500	365,240	250,000	(50,000)	200,000
2	365,240	(98,260)	10,957	277,937	200,000	(50,000)	150,000
3	277,937	(98,260)	8,338	188,015	150,000	(50,000)	100,000
4	188,015	(98,260)	5,640	95,395	100,000	(50,000)	50,000
5	95,395	(98,260)	2,865	0	50,000	(50,000)	0

In applying paragraph 102A and paragraph 38(b) of IFRS 16, Seller-lessee recognises in profit or loss the difference between the payments made for the lease and the lease payments that reduce the carrying amount of the lease liability. For example, if Seller-lessee pays CU99,321 for the use of the building in Year 2, it recognises CU1,061 (CU99,321 - CU98,260) in profit or loss.

- (a) Applying paragraph 100(a) of IFRS 16, Seller-lessee determines the proportion of the building transferred to Buyer-lessor that relates to the right of use retained by comparing, at the commencement date, the right of use it retains via the leaseback to the rights comprising the entire building. Paragraph 100(a) does not prescribe a particular method for determining that proportion.
- (b) Applying paragraph 102A and paragraph 36(b) of IFRS 16, Seller-lessee reduces the carrying amount of the lease liability with 'lease payments' that reflect the expected lease payments estimated at the commencement date and, when discounted, result in the carrying amount of the lease liability at that date of CU450,000.
- (c) Applying paragraph 102A and paragraph 36(a) of IFRS 16, Seller-lessee increases the carrying amount of the lease liability to reflect interest on the lease liability using its incremental borrowing rate.
- (d) Applying paragraph 102A and paragraph 36(b) of IFRS 16, Seller-lessee reduces the carrying amount of the lease liability with 'lease payments' that reflect equal periodic payments over the lease term that, when discounted, result in the carrying amount of the lease liability at the commencement date of CU450,000.

8.3 Transactions in which the transfer of an asset is not a sale

If the transfer of an asset is not a sale, the seller-lessee accounts for the transaction as a financing transaction. The seller-lessee keeps the transferred asset subject to the sale and leaseback transaction on its statement of financial position and accounts for amounts received as a financial liability in accordance with IFRS 9. The seller-lessee decreases the financial liability by the payments made less the portion considered interest expense.

If the transfer of an asset is not a sale, the buyer-lessor does not recognise the transferred asset and accounts for the amounts paid as a receivable in accordance with IFRS 9. [IFRS 16.103].

How we see it

A sale and leaseback transaction that includes a repurchase option does not qualify as a sale under IFRS 15 and therefore is not accounted for as a sale and leaseback under IFRS 16. However, IFRS 16 does not explicitly specify whether a buyer and seller would reassess a failed sale when a repurchase option expires unexercised. We believe it is acceptable to reassess whether there is a sale (or purchase) in accordance with IFRS 15 in this scenario and if so, apply the sale and leaseback guidance in IFRS 16 at the time the control transfers to the buyer.

In developing an accounting policy in accordance with IAS 8, entities may look to ASC 842's *Implementation Guidance and Illustrations* (ASC 842-40-55-31 to 38) which provides an illustration of the accounting for a failed sale transaction. In the example, the existence of a repurchase option is the only reason the transfer of an asset in a sale and leaseback transaction is not accounted for as a sale. However, when the repurchase option expires unexercised, the seller recognises the sale and the buyer recognises the purchase and both apply sale and leaseback accounting.

FASB differences

Asset transfers that do not qualify as sales should be treated as financings by the lessor and lessee. ASC 842 provides additional guidance for seller-lessees on adjusting the interest rate in certain circumstances (e.g., to ensure there is not a built-in loss).

8.4 Disclosure

Extract from IFRS 16

- B52 Additional information relating to sale and leaseback transactions that, depending on the circumstances, may be needed to satisfy the disclosure objective in paragraph 51 could include information that helps users of financial statements to assess, for example:
- (a) the lessee's reasons for sale and leaseback transactions and the prevalence of those transactions;
 - (b) key terms and conditions of individual sale and leaseback transactions;
 - (c) payments not included in the measurement of lease liabilities; and
 - (d) the cash flow effect of sale and leaseback transactions in the reporting period.

[IFRS 16.B52].

A seller-lessee may be required to provide additional qualitative and quantitative information about its leasing activities that is necessary to meet the disclosure objective in IFRS 16. Refer to section 5.8 on lessee disclosure requirements.

A seller-lessee is also required to disclose any gains and losses arising from sale and leaseback transactions separately from gains and losses on disposals of other assets under IFRS 16.53(i).

9 Business combinations

9.1 Acquiree in a business combination is a lessee

Extract from IFRS 3

Leases in which the acquiree is the lessee

- 28A The acquirer shall recognise right-of-use assets and lease liabilities for leases identified in accordance with IFRS 16 in which the acquiree is the lessee. The acquirer is not required to recognise right-of-use assets and lease liabilities for:
- (a) leases for which the lease term (as defined in IFRS 16) ends within 12 months of the acquisition date; or
 - (b) leases for which the underlying asset is of low value (as described in paragraphs B3-B8 of IFRS 16).
- 28B The acquirer shall measure the lease liability at the present value of the remaining lease payments (as defined in IFRS 16) as if the acquired lease were a new lease at the acquisition date. The acquirer shall measure the right-of-use asset at the same amount as the lease liability, adjusted to reflect favourable or unfavourable terms of the lease when compared with market terms.

[IFRS 3.28A, IFRS 3.28B].

9.1.1 Initial measurement of a lease

IFRS 3 *Business Combinations* specifies the initial measurement requirements for leases that are acquired in a business combination.

The acquirer measures the acquired lease liability as if the lease contract were a new lease at the acquisition date. That is, the acquirer applies IFRS 16's initial measurement provisions, using the present value of the remaining lease payments at the acquisition date. The acquirer follows the requirements for determining the lease term, lease payments and discount rate as discussed in section 4 above. The discount rate is determined from the perspective of the acquiree, as the acquiree is the customer in the lease contract. However, the determination of the lessee's incremental borrowing rate will take into account that the acquiree is now part of the new group. This is discussed further in section 4.6.1 above.

The right-of-use asset is measured at an amount equal to the recognised liability, adjusted to reflect the favourable or unfavourable terms of the lease, relative to market terms. Because the off-market nature of the lease is captured in the right-of-use asset, the acquirer does not separately recognise an intangible asset or liability for favourable or unfavourable lease terms relative to market. [IFRS 16.BC298].

The acquirer is not required to recognise right-of-use assets and lease liabilities for leases with lease terms which end within 12 months of the acquisition date and leases for low-value assets. The IASB considered whether to require an acquirer to recognise assets and liabilities relating to off-market terms for short-term leases and leases of low-value assets. However, the IASB indicated that the effect of off-market terms would rarely be material for short-term leases and leases of low-value assets and so decided not to require this. [IFRS 16.BC298].

9.1.2 Subsequent measurement of a lease

The subsequent measurement requirements for an acquired lease liability and right-of-use asset are the same as the requirements for any other existing lease arrangement.

9.2 Acquiree in a business combination is a lessor

Extract from IFRS 3

- 17 This IFRS provides two exceptions to the principle in paragraph 15:
- (a) classification of a lease contract in which the acquiree is the lessor as either an operating lease or a finance lease in accordance with IFRS 16 *Leases*.
 - (b) [deleted]
- The acquirer shall classify those contracts on the basis of the contractual terms and other factors at the inception of the contract (or, if the terms of the contract have been modified in a manner that would change its classification, at the date of that modification, which might be the acquisition date).
- Assets subject to operating leases in which the acquiree is the lessor**
- B42 In measuring the acquisition-date fair value of an asset such as a building or a patent that is subject to an operating lease in which the acquiree is the lessor, the acquirer shall take into account the terms of the lease. The acquirer does not recognise a separate asset or liability if the terms of an operating lease are either favourable or unfavourable when compared with market terms.

[IFRS 3.17, IFRS 3.B42].

IFRS 16 requires an acquirer to classify acquired lessor leases as either finance or operating leases using the contractual terms and conditions at the inception of the lease, or, if the terms of the contract have been modified in a manner that would change its classification, at the date of that modification. Therefore, the classification is not changed as a result of a business combination unless a lease is modified. Refer to section 6.5.

10 Effective date and transition

10.1 Effective date

IFRS 16 was effective for annual periods beginning on or after 1 January 2019. Early application was permitted for entities that applied IFRS 15 as at or before the date of initial application of IFRS 16.

[IFRS 16.C1].

10.2 Transition

IFRS 16 contained a number of transition provisions, some optional and some required that were applied at the beginning of the annual reporting period in which the entity first applied the standard.

The transition provisions most significantly impacted the prior operating leases of a lessee. IFRS 16 required retrospective application for lessees. However, it allowed either a 'full retrospective' adoption (in which the standard was applied retrospectively to all periods presented in accordance with IAS 8 or a 'modified retrospective' adoption (in which the standard was applied retrospectively to only the most current period presented in the financial statements). Under both transition methods, the IASB granted transition practical expedients to provide relief. *[IFRS 16.C5-C10].*

With the exception of subleases, on transition, a lessor was not required to make any adjustments for leases in which it is a lessor. From the date of initial application, the lessor accounted for those leases applying IFRS 16.

11 Future developments

In June 2025, the IASB published a Request for Information¹ as part of the Post-implementation Review (PIR) of IFRS 16, seeking feedback on the application of the standard. A PIR is part of the IASB's due process to assess the effect of the requirements of a standard on users and preparers of financial statements. It is undertaken some time after the standard has become effective.

The Request for Information targeted a number of topics including the views stakeholders had on IFRS 16 as a whole, such as whether it meets its overall objective, whether the core principles of the standard are clear, and how stakeholders perceive the ongoing costs and benefits of applying IFRS 16, as well as asking more targeted questions about the application of IFRS 16.

The comment period closed on 15 October 2025 and based on the comments received, the IASB will summarise the findings and decide what steps, if any, to take as a result of the process.

¹ Request for Information Post-implementation Review of IFRS 16 Leases

Appendix A - Index of Illustrations

Illustration 3-1:	Implicitly specified asset	1733
Illustration 3-2:	Identified asset - implicitly specified at the time the asset is made available for use by the customer	1734
Illustration 3-3:	Identified asset - physically distinct portion of a larger asset	1734
Illustration 3-4:	Identified asset - capacity portion of an asset	1734
Illustration 3-5:	Substitution rights	1737
Illustration 3-6:	Right to direct the use of an asset	1743
Illustration 3-7:	Identifying and separating lease components	1744
Illustration 3-8:	Activities that are not components of a lease contract	1745
Illustration 3-9:	Allocating contract consideration to lease and non-lease components - lessees	1747
Illustration 4-1:	Determining the lease term	1754
Illustration 4-2:	Cancellable leases	1756
Illustration 4-3:	Variable lease payments that depend on an index or rate	1760
Illustration 4-4:	Property leases with market rent reviews	1760
Illustration 4-5:	Residual value guarantee included in lease payments	1761
Illustration 4-6:	Variable lease payments that do not depend on an index or rate	1761
Illustration 4-7:	Accounting for deposits paid by a lessee to a lessor	1762
Illustration 5-1:	Short-term lease	1770
Illustration 5-2:	Lessee accounting	1773
Illustration 5-3:	Lessee accounting for an immediate termination and new lease with the same landlord	1777
Illustration 5-4:	Deferral of lease payments - considering the IASB's April 2020 non-authoritative educational document	1782
Illustration 5-5:	Change of lease payments from fixed to partially variable	1783
Illustration 5-6:	Lessee accounting for rent concessions that are a lease modification	1784
Illustration 6-1:	Gains and losses from the fluctuation in the fair value of the residual	1794
Illustration 6-2:	The lessor's gross and net investment in the lease	1797
Illustration 6-3:	Manufacturer or dealer lessors	1798
Illustration 6-4:	Lessor accounting for a finance lease (dealer-lessor case)	1800
Illustration 6-5:	Reduction in residual value	1802
Illustration 6-6:	Operating lease income not expected to be fully collectible	1804
Illustration 6-7:	Forgiveness of future lease payments on an operating lease	1806
Illustration 7-1:	Classification of a sublease	1812
Illustration 8-1:	Sale and leaseback with variable payments - extract from June 2020 IFRIC update	1818

Appendix B - Index of Frequently asked questions

Question 3-1:	Should the lead operator in an unincorporated joint operation recognise in full the lease liability for a contract into which it alone has the primary obligation to make payments to the lessor?	1733
Question 3-2:	Does IFRS 16 apply to the right to place an oil pipeline in underground space for a period of time in exchange for consideration?	1736
Question 3-3:	Does a contract contain a lease when the supplier has substitution rights that are not substantive throughout the period of use?	1738
Question 3-4:	Does an electricity retailer, applying IFRS 16.B9(a), have the right to obtain substantially all the economic benefits from use of a windfarm throughout the term of an agreement with a windfarm generator?	1739
Question 3-5:	Does a customer have the right to direct the use of a ship in accordance with IFRS 16?	1741
Question 4-1:	How is the lease term determined in a cancellable lease? Specifically, when applying IFRS 16.B34 and assessing 'no more than an insignificant penalty', does an entity consider the broader economics of the contract, and not only contractual termination payments?	1755
Question 6-1:	How does a lessor apply the expected credit loss model in IFRS 9 to an operating lease receivable before a rent concession is granted, if it expects to forgive payments due from the lessee under the lease contract? Does a lessor apply the derecognition requirements in IFRS 9 or the lease modification requirements in IFRS 16 in accounting for a rent concession?	1806
Question 8-1:	When the lease payments relating to a leaseback are totally variable and not based on an index or rate, how is 'the proportion of the previous carrying amount of the asset that relates to right-of-use retained by the lessee' determined?	1818

Appendix C - IFRS 16 Defined terms

The following table summarises the terms that are defined in Appendix A of IFRS 16.

Extract from IFRS 16

Appendix A Defined terms

This appendix is an integral part of the Standard.

commencement date of the lease (commencement date)	The date on which a lessor makes an underlying asset available for use by a lessee .
economic life	Either the period over which an asset is expected to be economically usable by one or more users, or the number of production or similar units expected to be obtained from an asset by one or more users.
effective date of the modification	The date when both parties agree to a lease modification .
fair value	For the purpose of applying the lessor accounting requirements in this Standard, the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction.
finance lease	A lease that transfers substantially all the risks and rewards incidental to ownership of an underlying asset .
fixed payments	Payments made by a lessee to a lessor for the right to use an underlying asset during the lease term , excluding variable lease payments .
gross investment in the lease	The sum of: (a) the lease payments receivable by a lessor under a finance lease ; and (b) any unguaranteed residual value accruing to the lessor.
inception date of the lease (inception date)	The earlier of the date of a lease agreement and the date of commitment by the parties to the principal terms and conditions of the lease.
initial direct costs	Incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained, except for such costs incurred by a manufacturer or dealer lessor in connection with a finance lease .
interest rate implicit in the lease	The rate of interest that causes the present value of (a) the lease payments and (b) the unguaranteed residual value to equal the sum of (i) the fair value of the underlying asset and (ii) any initial direct costs of the lessor.
lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.
lease incentives	Payments made by a lessor to a lessee associated with a lease , or the reimbursement or assumption by a lessor of costs of a lessee.
lease modification	A change in the scope of a lease , or the consideration for a lease, that was not part of the original terms and conditions of the lease (for example, adding or terminating the right to use one or more underlying assets , or extending or shortening the contractual lease term).
lease payments	Payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term , comprising the following: (a) fixed payments (including in-substance fixed payments), less any lease incentives ; (b) variable lease payments that depend on an index or a rate;

	<p>(c) the exercise price of a purchase option if the lessee is reasonably certain to exercise that option; and</p> <p>(d) payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease.</p> <p>For the lessee, lease payments also include amounts expected to be payable by the lessee under residual value guarantees. Lease payments do not include payments allocated to non-lease components of a contract, unless the lessee elects to combine non-lease components with a lease component and to account for them as a single lease component.</p> <p>For the lessor, lease payments also include any residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee. Lease payments do not include payments allocated to non-lease components.</p>
lease term	<p>The non-cancellable period for which a lessee has the right to use an underlying asset, together with both:</p> <p>(a) periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option; and</p> <p>(b) periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option.</p>
lessee	An entity that obtains the right to use an underlying asset for a period of time in exchange for consideration.
lessee's incremental borrowing rate	The rate of interest that a lessee would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment.
lessor	An entity that provides the right to use an underlying asset for a period of time in exchange for consideration.
net investment in the lease	The gross investment in the lease discounted at the interest rate implicit in the lease .
operating lease	A lease that does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset .
optional lease payments	Payments to be made by a lessee to a lessor for the right to use an underlying asset during periods covered by an option to extend or terminate a lease that are not included in the lease term .
period of use	The total period of time that an asset is used to fulfil a contract with a customer (including any non-consecutive periods of time).
residual value guarantee	A guarantee made to a lessor by a party unrelated to the lessor that the value (or part of the value) of an underlying asset at the end of a lease will be at least a specified amount.
right-of-use asset	An asset that represents a lessee's right to use an underlying asset for the lease term .
short-term lease	A lease that, at the commencement date , has a lease term of 12 months or less. A lease that contains a purchase option is not a short-term lease.
sublease	A transaction for which an underlying asset is re-leased by a lessee ('intermediate lessor') to a third party, and the lease ('head lease') between the head lessor and lessee remains in effect.
underlying asset	An asset that is the subject of a lease , for which the right to use that asset has been provided by a lessor to a lessee .
unearned finance income	<p>The difference between:</p> <p>(a) the gross investment in the lease; and</p> <p>(b) the net investment in the lease.</p>

unguaranteed residual value	That portion of the residual value of the underlying asset , the realisation of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.
variable lease payments	The portion of payments made by a lessee to a lessor for the right to use an underlying asset during the lease term that varies because of changes in facts or circumstances occurring after the commencement date , other than the passage of time.

Terms defined in other Standards and used in this Standard with the same meaning

contract	An agreement between two or more parties that creates enforceable rights and obligations.
useful life	The period over which an asset is expected to be available for use by an entity; or the number of production or similar units expected to be obtained from an asset by an entity.

Appendix D - Key differences between IFRS 16 and ASC 842

The IASB issued IFRS 16 after joint deliberations with the US FASB, which issued a similar standard, ASC 842 *Leases*. While IFRS 16 and ASC 842 both require lessees to put most leases on their statements of financial position, there are a number of differences between the standards. The following table summarises the key differences and includes references to the IASB's and FASB's discussion of the differences in the Basis for Conclusions for each standard (i.e., IFRS 16 and ASU 2016-2).

	IFRS 16	US GAAP ASC 842
Scope and measurement exceptions		
<i>Low-value asset exemption</i> ² Section 5.1.2	Lessees may elect, on a lease-by-lease basis, not to recognise leases when the value of the underlying asset is low (e.g., US\$5,000 or less when new).	There is no recognition exemption for leases based on the value of the underlying asset.
<i>Scope exemption for intangible assets</i> ³ Section 2.2	Lessees may apply IFRS 16 to leases of intangible assets other than rights held by a lessee under licensing agreements within the scope of IAS 38, for items such as motion picture films, video recordings, plays, manuscripts, patents and copyrights. Lessors are required to apply IFRS 16 to leases of intangible assets, except for licences of intellectual property that are in the scope of IFRS 15 <i>Revenue from Contracts with Customers</i> .	All leases of intangible assets are excluded from the scope of ASC 842.
Key concepts		
<i>Lease liability - reassessment of variable lease payments</i> ⁴ Section 4.5.3	Changes in variable lease payments based on an index or rate result in a remeasurement of the lease liability whenever there is a change in the cash flows (i.e., when the adjustment to the lease payments take effect).	Changes in variable lease payments based on an index or rate result in a remeasurement of the lease liability when the lease liability is remeasured for another reason (e.g., a change in the lease term).
<i>Determination of the discount rate</i> Section 6.1	Lessees determine the discount rate at lease commencement but lessors determine the rate implicit in the lease at the lease inception date. That is because a lessor determines lease classification at the lease inception date.	Lessees and lessors determine the discount rate at the lease commencement date.
<i>Determination of a lessee's incremental borrowing rate</i> Section 4.6	IFRS 16 does not address whether a lessee may consider the effect of lease term options (e.g., purchase and renewal options) that are not included in the lease term. IFRS 16 does not provide accounting alternatives for private companies.	A lessee may consider the effect of lease term options (e.g., purchase and renewal options) that are not included in the lease term. Entities that are not public business entities (PBEs) may elect to use a risk-free rate by class of underlying asset for initial and subsequent measurements of the lease liability. However, a lessee is required to use the rate implicit in the lease when it is readily determinable, even if they make the risk-free rate election.

² IFRS 16 BC308 and ASC 842 BC421.

³ ASC 842 BC431.

⁴ IFRS 16 BC309 and ASC 842 BC425.

<i>Initial direct costs (IDCs)</i> Section 6.3.1	IDCs are incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained. However, costs incurred by a manufacturer or dealer lessor in connection with a finance lease are expensed as incurred.	IDCs are incremental costs that would not have been incurred if the lease had not been obtained. Lessors expense IDCs for sales-type leases if the fair value of the underlying asset is different from the carrying amount of the underlying asset at lease commencement.
Lease classification		
<i>Lessee lease classification</i> ⁵ Section 5.1	All recognised leases are accounted for based on a right-of-use model (similar to finance leases under ASC 842).	Recognised leases are classified as either finance or operating. Lessees classify leases at the lease commencement date.
<i>Lessor lease classification</i> Section 6.1	Leases are classified as operating or finance leases at the inception date of the lease.	Leases are classified as operating, direct financing or sales-type leases at the lease commencement date.
<i>Lessor - lease classification criteria</i> Section 6.1.1	All classification criteria can be considered individually or in combination. IFRS 16 provides examples and indicators of situations that can be considered individually, or in combination, and would result in a lease being classified as a finance lease. Meeting a single criterion would not automatically result in the lease being classified as a finance lease. IFRS 16 does not include additional guidance for a lessor's classification of a lease that results in a selling loss.	Each classification criterion is determinative. After the adoption of Accounting Standards Update 2021-05, <i>Leases (Topic 842): Lessors - Certain Leases with Variable Lease Payments</i> , lessors are also required to classify a lease as an operating lease if the lease has variable lease payments that do not depend on an index or rate and would result in a selling loss if the lease were to be classified as a sales-type or direct financing lease otherwise.
<i>Lessor - reassessment of lease classification</i> Section 6.1.4	As long as the existing option is part of the original terms and conditions of the lease (i.e., not a lease modification), lessors do not reassess lease classification if lessees exercise an existing option to renew the lease (i.e., change in assessment of lease term) or to purchase the underlying asset when it was previously determined it was not reasonably certain to do so. Lease classification is determined at lease inception and reassessed only if there is a lease modification that is not accounted for as a separate contract.	Lessors are required to reassess lease classification if lessees exercise an existing option to renew the lease (i.e., change in assessment of lease term) or to purchase the underlying asset when it was previously determined it was not reasonably certain to do so.
<i>Lessor - collectability</i> Section 6.1.1	IFRS 16 does not include explicit guidance for considering collectability of lease payments.	Collectability of lease payments is considered when determining if a lease is classified as a direct financing or an operating lease.
<i>Subleases</i> Section 7.2	When classifying a sublease, a sublessor classifies the sublease based on the right-of-use asset recognised as part of the head lease rather than the underlying asset subject to the sublease.	When classifying a sublease, the sublessor classifies the sublease based on the underlying asset rather than the right-of-use asset on the head lease.

5 IFRS 16 BC304 and ASC 842 BC420.

Lessee accounting		
<i>Short-term leases - existence of a purchase option</i> Section 5.1.1	A lease does not qualify as a short-term lease if it includes a purchase option, regardless of whether the lessee is reasonably certain to exercise the option.	A lease does not qualify as a short-term lease if it includes a purchase option that is reasonably certain to be exercised.
<i>Short-term leases - change in lease term</i> Section 5.1.1	A change in the terms of a short-term lease creates a new lease. If that new lease has a lease term greater than 12 months, it cannot qualify as a short-term lease.	A lease no longer qualifies as a short-term lease when there is a change in a lessee's assessment of either of the following: <ul style="list-style-type: none"> ▪ The lease term so that, after the change, the remaining lease term extends more than 12 months from the end of the previously determined lease term ▪ Whether the lessee is reasonably certain to exercise an option to purchase the underlying asset.
<i>Allocating variable consideration not dependent on an index or rate between lease and non-lease components of a contract</i> Section 3.2.5	Under IFRS 16 lessees may allocate variable consideration not dependent on an index or rate entirely to a non-lease component of a contract. Refer to Example 12 in IFRS 16	Lessees allocate variable consideration not dependent on an index or rate to the lease and non-lease components of a contract on a relative stand-alone price basis.
<i>Lease modifications that do not result in a separate contract and shorten the contractual lease term</i> Section 5.5.3	Lease modifications that do not result in a separate contract and shorten the contractual lease term result in the recognition of a gain or loss for the difference between the decrease in the lease liability and the proportionate decrease in the right-of-use asset. Refer to Example 18 in IFRS 16.	Lease modifications that do not result in a separate contract and shorten the contractual lease term do not result in the recognition of a gain or loss. A lessee recognises the amount of the remeasurement of the lease liability as an adjustment to the corresponding right-of-use asset without affecting profit or loss. However, if the right-of-use asset is reduced to zero, a lessee would generally recognise any remaining amount in profit or loss.
<i>Componentisation</i> Section 5.3.1.A	A lessee applies the depreciation requirements in IAS 16 in depreciating right-of-use assets, which requires that each item of property, plant and equipment with a cost that is significant in relation to the total cost of the item be separately depreciated (i.e., a component approach).	Component depreciation is permitted but not common.

<p><i>Reallocation of consideration in the contract upon a change in the lease term, the assessment of whether a purchase option is reasonably certain to be exercised, or the amounts probable of being owed under a residual value guarantee</i></p> <p>Section 5.4</p>	<p>The consideration in the contract is reallocated only when a lease is modified. Therefore, when a lease liability is remeasured for other reasons (e.g., a change in lease term), the revised lease payments are allocated based on the standalone price of the lease and non-lease components at lease commencement.</p>	<p>The consideration in the contract is reallocated when a lease is modified or a lease liability is remeasured. Therefore, the revised lease payments are generally allocated based on the standalone price of the lease and non-lease components at the date of remeasurement (or effective date of the modification). However, standalone prices are not required to be updated under US GAAP when the remeasurement is due to (1) a change in the amount that is probable the lessee will owe under a residual value guarantee or (2) a resolution of a contingency that results in some or all of the payments allocated to the lease component that were previously determined to be variable meeting the definition of lease payments, unless these events are combined with one of the other remeasurement and reallocation events (e.g., change in lease term).</p>
<p><i>Capitalisation of lease costs during the construction of a lessee asset</i></p>	<p>IFRS 16 does not provide guidance on the capitalisation of lease costs during the construction of a lessee asset.</p>	<p>ASC 842-10-55-21 prohibits an entity from capitalising lease costs during the construction of a lessee asset, unless an entity is able to capitalise those costs under ASC 970 on real estate projects for sale or rental.</p>
<p><i>Amortisation of leasehold improvements associated with a lease between entities under common control</i></p>	<p>IFRS 16 does not provide specific guidance on amortisation of leasehold improvements associated with a lease between entities under common control.</p>	<p>A lessee is required to amortise leasehold improvements associated with common control leases over their useful life to the common control group, as long as the lessee controls the use of the underlying asset through a lease.</p>
<p>Lessor accounting</p>		
<p><i>Practical expedient to not separate lease and non-lease components</i></p> <p>Section 3.2.2.B</p>	<p>IFRS 16 does not include a practical expedient for lessors.</p>	<p>A lessor can elect, by class of underlying asset, not to separate lease and related non-lease components if certain criteria are met. Additionally, if the non-lease component is the predominant component of the combined component, the combined component is accounted for in accordance with ASC 606 <i>Revenue from Contracts with Customers</i>.</p>
<p><i>Recognition of selling profit for direct financing leases⁶</i></p> <p>Section 6.3.1</p>	<p>IFRS 16 does not distinguish between sales-type and direct financing leases. Selling profit on finance leases is recognised at lease commencement.</p>	<p>Selling profit on direct financing leases is deferred at lease commencement and amortised into income over the lease term.</p>

⁶ ASC 842 BC427.

<p><i>Collectability - sales-type leases and operating leases</i> Section 6.3.1 and section 6.4.1</p>	<p>IFRS 16 does not include explicit guidance for considering collectability of lease payments.</p>	<p>Collectability of lease payments is assessed for purposes of initial recognition and measurement of sales-type leases. It is also evaluated to determine the income recognition pattern of operating leases.</p>
<p><i>Modification of a sales-type or direct financing lease⁷ (under US GAAP) or a finance lease (under IFRS accounting standards) that does not result in a separate contract</i> Section 6.5.1.B</p>	<p>If the modification of a finance lease is not accounted for as a separate contract, the accounting for the modification depends on whether the finance lease would have been classified as an operating lease had the modification been in effect at lease inception. IFRS 16 then specifies how to account for the modified lease based on that classification.</p>	<p>If the modification of a sales-type or direct financing lease is not accounted for as a separate contract, the entity reassesses the classification of the lease as of the effective date of the modification based on the modified terms and conditions, and the facts and circumstances as of that date. ASC 842 then specifies how to account for the modified lease based on the classification of the modified lease.</p>
<p><i>Allocating variable consideration not dependent on an index or rate between lease and non-lease components of a contract</i> Section 3.2.4.B</p>	<p>IFRS 16 does not give guidance for variable consideration related to the lease component. Lessors would allocate the consideration in the contract based on the guidance in IFRS 15.73 to 90, which is to allocate the transaction price to each performance obligation (or distinct good or service) in an amount that depicts the amount of consideration to which the entity expects to be entitled in exchange for transferring the promised goods or services to the customer.</p>	<p>If the terms of a variable payment that is not dependent on an index or rate relate, even partially, to the lease component, the lessor will recognise those payments (allocated to the lease component) as income in profit or loss in the period when the changes in facts and circumstances on which the variable payment is based occur (e.g., when the lessee's sales on which the amount of the variable payment depends occur). When the changes in facts and circumstances on which the variable payment is based occur, the lessor will allocate those payments to the lease and non-lease components of the contract. The allocation is on the same basis as the initial allocation of the consideration in the contract or the most recent modification not accounted for as a separate contract unless the variable payment meets the criteria in ASC 606-10-32-40 to be allocated only to the lease component(s).</p>
<p><i>Sale of lease receivables when the lessor retains an interest in the unguaranteed residual asset</i></p>	<p>IFRS 16 does not include similar guidance. The lessor's net investment in the lease, which includes any unguaranteed residual value, is subject to the derecognition and impairment requirements in IFRS 9.</p>	<p>If a lessor sells substantially all of the lease receivable associated with a sales-type lease or a direct financing lease and retains an interest in the unguaranteed residual asset, the lessor no longer accretes the unguaranteed residual asset to its estimated value over the remaining lease term under ASC 842. Instead, the lessor reports any remaining unguaranteed residual asset at its carrying amount at the date of the sale of the lease receivable and applies ASC 360 to determine whether the unguaranteed residual asset is impaired.</p>

⁷ IFRS 16.80 and ASC 842 BC429.

Sale and leaseback transactions		
<p><i>Assessing if a transfer of an asset is a sale in a sale/purchase and leaseback transaction</i></p> <p>Section 8.1</p>	<p>To determine whether the transfer of an asset is accounted for as a sale, a seller-lessee and a buyer-lessor apply the requirements in IFRS 15 (including those for repurchase agreements) to assess whether the buyer-lessor has obtained control of the asset.</p> <p>IFRS 16 does not contain the same lease classification criteria included in US GAAP, which precludes sale accounting if the leaseback would be classified as a sales-type lease by the buyer-lessor or a finance lease by the seller-lessee. However, entities should carefully consider the requirements in IFRS 15 (i.e., whether the buyer-lessor obtains control of the asset) to determine whether the transfer of an asset is accounted for as a sale and purchase. Entities may often reach similar conclusions on whether a sale and purchase have occurred under both standards.</p>	<p>To determine whether an asset transfer is a sale and purchase, a seller-lessee and a buyer-lessor consider the following:</p> <ul style="list-style-type: none"> ▪ Whether the transfer meets the sale criteria under ASC 606 (however, certain fair value repurchase options would not result in a failed sale) ▪ Whether the leaseback would be classified as a sales-type lease by the buyer-lessor or a finance lease by the seller-lessee (i.e., a sale and purchase does not occur when the leaseback is classified as a sales-type lease by the buyer-lessor or as a finance lease by the seller-lessee)
<p><i>Gain or loss recognition in sale and leaseback transactions⁸</i></p> <p>Section 8.2.1</p>	<p>The seller-lessee recognises only the amount of any gain or loss, adjusted for off-market terms, that relates to the rights transferred to the buyer-lessor.</p>	<p>The seller-lessee recognises any gain or loss, adjusted for off-market terms, immediately.</p>
<p><i>Failed sales - seller/lessee</i></p> <p>Section 8.3</p>	<p>Asset transfers that do not qualify as sales should be accounted for as financings in accordance with IFRS 9 <i>Financial Instruments</i> by the lessor and lessee. IFRS 16 does not provide additional guidance on interest rate adjustments.</p>	<p>Asset transfers that do not qualify as sales should be accounted for as financings by the lessor and lessee. ASC 842 provides additional guidance on adjusting the interest rate in certain circumstances (e.g., to ensure there is not a built-in loss).</p>
<p><i>Reassessment of a failed sale when a repurchase option expires</i></p>	<p>IFRS 16 does not include guidance for the reassessment of a failed sale when a repurchase option expires in a sale and leaseback transaction.</p>	<p>If a repurchase option is the only reason the transfer of an asset in a sale and leaseback transaction is not accounted for as a sale, a seller would recognise the sale of the asset and a leaseback upon expiration of the repurchase option.</p>

⁸ IFRS 16 BC306 and ASC 842 BC430.

Other considerations		
<i>Related party transactions</i>	IFRS 16 does not address related party lease transactions. IAS 24 <i>Related Party Disclosures</i> contains guidance on related party disclosures.	Entities classify and account for related party leases (including sale and leaseback transactions) based on the legally enforceable terms and conditions of the lease. Disclosure of related party transactions is required.
<i>Practical expedient to use the written terms and conditions of common control arrangement</i>	IFRS 16 does not include a practical expedient for common control arrangements.	Private companies and certain not-for-profit entities can elect a practical expedient to use the written terms and conditions of a common control arrangement to determine whether a lease exists and to classify and account for the lease.
<i>Lessee involvement in asset construction ('build-to-suit' transactions)</i>	IFRS 16 does not include guidance for lessee involvement in asset construction.	ASC 842 includes guidance for evaluating whether a lessee controls an underlying asset being constructed before the commencement date. When a lessee controls the underlying asset during construction, it recognises the asset on its balance sheet and accounts for the transaction using the sale and leaseback guidance in ASC 842-40 at the end of the construction period to determine whether it has sold the asset. When a lessee controls the underlying asset during construction, the lessor accounts for its costs to construct the asset as a loan to the lessee to construct the lessee's asset. At the end of the construction period, the lessor applies the sale and leaseback guidance to determine whether it has purchased the asset.
<i>Leveraged leases</i>	Leveraged lease accounting is not permitted under IFRS 16.	Leveraged lease accounting is eliminated for leases that commence on or after the effective date of ASC 842. However, leveraged leases that commenced before the effective date are grandfathered. If an existing leveraged lease is modified on or after the effective date, the lease would no longer be accounted for as a leveraged lease but would instead be accounted for under ASC 842.

Overview

IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* applies to the accounting for, and the disclosure of, government grants and to the disclosure of other forms of government assistance. [IAS 20.1]. The distinction between government grants and other forms of government assistance is important because the standard's accounting requirements only apply to the former.

Government grants are a specific form of government assistance and relate to the transfers of resources to an entity in return for past or future compliance with certain conditions relating to the entity's operating activities. [IAS 20.3]. The purpose of government grants, which may be called subsidies, subventions or premiums, [IAS 20.6], and other forms of government assistance is often to encourage a private sector entity to take a course of action that it would not normally have taken if the assistance had not been provided. [IAS 20.4]. Government grants are also used to provide financial support as was abundantly illustrated during the coronavirus pandemic when governments all over the world introduced measures to provide financial assistance to businesses in an effort to mitigate the significant impact of the pandemic on their economies.

The main accounting issue that arises from government grants is how to deal with the benefit that the grant represents. IAS 20 adopts an income approach, whereby grants are recognised in profit or loss in the same periods as the entity recognises as expenses the costs that the grants are intended to compensate. [IAS 20.12].

This chapter covers the requirements of IAS 20 regarding recognition, measurement and presentation of government grants and looks at specific examples of government grants including low interest and forgivable loans. It also covers disclosure requirements for grants and other forms of government assistance.

What you need to know

- Grants are not recognised until there is reasonable assurance that the entity is eligible as a result of a past event.
- IAS 20 adopts an income approach to the recognition of government grants, regardless of whether the grant is received in cash, as a reduction in a liability to the government or in the form of a transfer of a non-monetary asset.
- Grants relating to specific expenses are recognised in profit or loss in the same periods as those expenses, and grants relating to depreciable assets are recognised in profit or loss in the same periods as the related depreciation expense.
- Grants relating to assets must be presented in the statement of financial position either by setting up the grant as deferred income or by deducting the grant in arriving at the carrying amount of the asset.
- Grants relating to income must be presented in the income statement either separately or by deduction in reporting the related expense.
- A grant received in the form of a non-monetary asset can be recognised at fair value or, alternatively, at a nominal amount.
- The nature of significant other forms of government assistance that do not meet the definition of a government grant must be disclosed.

1 Introduction

IAS 20 was applicable for the first time in 1984. [IAS 20.41]. The only substantive amendment since issue was in 2008, requiring entities to quantify the benefit of a government loan at a below-market rate of interest. [IAS 20.10A, IAS 20.43].

IAS 20 defines government grants in terms of "transfers of resources to an entity in return for meeting certain conditions relating to the operating activities of the entity". [IAS 20.3]. SIC-10 *Government Assistance - No Specific Relation to Operating Activities* was issued in 1998 to clarify that IAS 20 applies even if the only condition is a requirement to operate in certain regions or industry sectors (see section 2.2.2 below).

Government grants related to biological assets are excluded from the scope of IAS 20 and are dealt with in IAS 41 *Agriculture*, which has different accounting requirements (see section 5 below and Chapter 38). [IAS 20.2(d)].

The standard pre-dates the IASB's *Conceptual Framework* and, as the IASB itself has noted, is inconsistent with it,¹ resulting in the recognition in the statement of financial position of deferred credits that do not meet the *Framework*'s definitions of liabilities and allowing alternatives to initial measurement that could result in an asset being understated by reference to the *Framework*. IAS 20 is the only standard left that takes an income approach instead of the balance sheet approach for the recognition of income and expense applied in the rest of the IFRS accounting standards.

The standard recognises that an entity may receive other forms of government assistance which cannot reasonably have a value placed upon them. Rather than prescribe how these must be accounted for, it requires disclosure about such assistance. [IAS 20.34, IAS 20.36]. However, since the issuance of IFRS 13 *Fair Value Measurement*, the challenge of placing a value on forms of assistance has reduced (see section 3.8 below). For example, IAS 20 cites free technical or marketing advice and the provision of guarantees as examples of government assistance that cannot reasonably have a value placed on them and hence are excluded from the definition of grants. [IAS 20.35]. Nevertheless, where it can be demonstrated that a fair value can be determined for these items, then they must be accounted as a government grant (see section 3.5 below for further discussion about guarantees).

1 [IASB Update](#), February 2006, available on the IFRS Foundation's website.

1.1 Terms used in this chapter

The following terms from IAS 20 and IAS 41 are used in this chapter with the meanings specified: [IAS 20.3, IAS 41.5]

Extract from IAS 20

- 3 The following terms are used in this Standard with the meanings specified:
- Government* refers to government, government agencies and similar bodies whether local, national or international.
- Government assistance* is action by government designed to provide an economic benefit specific to an entity or range of entities qualifying under certain criteria. Government assistance for the purpose of this Standard does not include benefits provided only indirectly through action affecting general trading conditions, such as the provision of infrastructure in development areas or the imposition of trading constraints on competitors.
- Government grants* are assistance by government in the form of transfers of resources to an entity in return for past or future compliance with certain conditions relating to the operating activities of the entity. They exclude those forms of government assistance which cannot reasonably have a value placed upon them and transactions with government which cannot be distinguished from the normal trading transactions of the entity.²
- Grants related to assets* are government grants whose primary condition is that an entity qualifying for them should purchase, construct or otherwise acquire long-term assets. Subsidiary conditions may also be attached restricting the type or location of the assets or the periods during which they are to be acquired or held.
- Grants related to income* are government grants other than those related to assets.
- Forgivable loans* are loans which the lender undertakes to waive repayment of under certain prescribed conditions.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)

2 See also SIC-10 *Government Assistance-No Specific Relation to Operating Activities*.

Extract from IAS 41

- 5 The following terms are used in this Standard with the meanings specified:
- ...
- A *bearer plant* is a living plant that:
- (a) is used in the production or supply of agricultural produce;
 - (b) is expected to bear produce for more than one period; and
 - (c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales.
- A *biological asset* is a living animal or plant.
- ...
- Costs to sell* are the incremental costs directly attributable to the disposal of an asset, excluding finance costs and income taxes.
- ...

Government grants are sometimes called by other names such as subsidies, subventions, or premiums. [IAS 20.6]. In addition, a non-monetary government grant is a government grant that takes the form of a transfer of a non-monetary asset, such as land or other resources, for the use of the entity. [IAS 20.23].

2 Scope of IAS 20

IAS 20 applies in accounting for, and in the disclosure of, government grants and in the disclosure of other forms of government assistance. [IAS 20.1]. The distinction between government grants and other forms of government assistance is important because the standard's accounting requirements only apply to the former. The standard regards the term 'government' to include government agencies and similar bodies whether local, national or international. [IAS 20.3]. However, IAS 20 gives no further guidance on what is meant by 'similar bodies', therefore the assessment of whether a body providing support to an entity is regarded as a 'similar body' under IAS 20 is a judgemental area dependent on the specific facts and circumstances.

2.1 Government assistance

Government assistance is defined as action by government designed to provide an economic benefit to an entity or range of entities qualifying under certain criteria. [IAS 20.3]. Government assistance takes many forms "varying both in the nature of the assistance given and in the conditions which are usually attached to it". [IAS 20.4].

However, such assistance does not include benefits provided indirectly through action affecting general trading conditions, such as the provision of infrastructure (e.g., transport, communications networks or utilities) in development areas or that are available for the benefit of an entire local community or the imposition of trading constraints on competitors (see section 3.8 below). [IAS 20.3, IAS 20.38].

2.2 Government grants

2.2.1 Definitions

Government grants are a specific form of government assistance. Under IAS 20, government grants represent assistance by government in the form of transfers of resources to an entity in return for past or future compliance with certain conditions relating to the operating activities of the entity. [IAS 20.3]. The standard identifies grants related to assets and grants related to income, as follows:

Extract from IAS 20

3 The following terms are used in this Standard with the meanings specified:

...

Grants related to assets are government grants whose primary condition is that an entity qualifying for them should purchase, construct or otherwise acquire long-term assets. Subsidiary conditions may also be attached restricting the type or location of the assets or the periods during which they are to be acquired or held.

Grants related to income are government grants other than those related to assets.

...

Government grants exclude:

- (a) Assistance to which no value can reasonably be assigned
And
- (b) Transactions with government that cannot be distinguished from the normal trading transactions of the entity, e.g., where the entity is being favoured by a government's procurement policy [IAS 20.3, IAS 20.34, IAS 20.35]

Such excluded items are to be treated as falling only within the standard's disclosure requirements for government assistance (see section 3.8 below).

The benefit of loans at below-market interest rates is also deemed to be a form of government grant. The standard requires entities to measure and record the loan in accordance with IFRS 9 *Financial Instruments* (i.e., at fair value) and account for the benefit of the below-market rate of interest as a grant. [IAS 20.10A]. The accounting consequences are discussed in section 3.4 below.

Grants of emission rights may meet the definition of government grants under IAS 20. Grants of renewable energy certificates can also meet the definition of government grants, in some cases. The rights and certificates themselves might be classified as intangible assets under IAS 38 *Intangible Assets* or, if they meet the definition of inventory under IAS 2 *Inventories*, it might be appropriate to classify them as inventory rather than intangible assets. Accounting for emission rights and renewable energy certificates is discussed in Chapter 18 and in Chapter 23.

There are other emerging schemes in a number of regions, for example schemes relating to carbon credit projects. It is important that the specific facts and circumstances of a scheme are determined to be able to assess whether the scheme involves a government grant or not. Factors to consider include the primary reason for the scheme, whether there is a transfer of economic benefit from the government and, if so, what conditions are attached and what type of expense the government support may be compensating for.

2.2.2 Grants with no specific relation to operating activities (SIC-10)

SIC-10 addresses the situation in some countries where government assistance is provided to entities, but without there being any conditions specifically relating to their operating activities, other than to operate in certain regions or industry sectors. It determined that such forms of government assistance are to be treated as government grants. [SIC-10.3]. This ruling was made to avoid any suggestion that such forms of assistance were not governed by IAS 20 and could be credited directly to equity.

2.2.3 Determining the recipient of a government grant

It may not always be clear who the recipient of a government grant is due to the involvement of multiple parties. In certain cases, an entity might receive cash from the government but is merely acting as a 'facilitator' to ensure the benefit of the cash is passed on to the intended beneficiary of the government support. In cases where there are multiple parties, it is important to have a full understanding of the terms of the relevant government support scheme to determine which party should be recognising a government grant.

Illustration 2-1: Recipient of a government grant

A government has a scheme in place whereby they will provide CU1,000 of financial support to commercial electricity users over 12 months. This support will be provided by way of part settlement of their energy bills. The government provides cash to energy suppliers, and this must be used only for the partial settlement of customer bills. The terms of the scheme state that it does not reduce the amount the energy supplier is able to charge its electricity customers. Any cash remaining after the 12 months must be returned to the government.

In this case, who is the recipient of the government grant, is it the supplier or the electricity users?

Although the energy supplier receives a resource (cash) from the government, it is required to pass that resource on to its customer. The energy supplier still has a right to supply energy at the price in the customer contract, so the provision of support does not affect the supplier's contract with its customer. It is merely, the settlement party that has changed, i.e., the energy bill is now part settled by the customer and part settled by the government. This is consistent with the discussion in the Basis for Conclusions on paragraph BC187 in IFRS 15 *Revenue from Contracts with Customers* which clarifies that the amounts to which the entity has rights under the present contract can be paid by any party. It is therefore appropriate, in this case, to consider the customer (not the supplier) as the grant recipient. The supplier is merely facilitating the provision of support to the customer and recognises a liability upon receiving cash from the government that it must use for the partial settlement of customer bills.

2.3 Scope exclusions

2.3.1 General considerations

IAS 20 does not deal with:

- (a) Accounting for government grants if the entity prepares financial information that reflects the effects of changing prices, whether as financial statements or in supplementary information of a similar nature
- (b) Government assistance in the form of benefits that are available in determining taxable profit or loss or are determined or limited on the basis of income tax liability, e.g., income tax holidays, investment tax credits, accelerated depreciation allowances and reduced income tax rates

- (c) Government participation in the ownership of the entity

And

- (d) Government grants covered by IAS 41 [IAS 20.2]

The accounting treatment of government assistance either provided by way of a reduction in taxable profit or loss, or determined or limited according to an entity's income tax liability, is discussed in the context of investment tax credits in section 2.3.2 below and in Chapter 29.

In the case of exclusion (c) above, for an entity in which the government is a shareholder, it will be necessary to determine whether any assistance being provided to the entity is being given by the government acting in its capacity as a shareholder. If so, such assistance will not be within the scope of IAS 20 and will be accounted for in equity, in common with other shareholder transactions (see Chapter 3).

The reason for exclusion (d) above is that the presentation permitted by IAS 20 of deducting government grants from the carrying amount of the asset (see section 4.1 below) was considered inconsistent with a fair value model, which must be used in the measurement of biological assets. [IAS 41.B66]. The IASB decided to deal with government grants related to agricultural activity in IAS 41 rather than initiate a wider review of IAS 20. [IAS 41.B67]. The requirements of IAS 41 in relation to government grants are set out in section 5 below and in Chapter 38.

There are no similar exclusions for government grants in IAS 40 *Investment Property* which includes a similar fair value model (see Chapter 20), nor was IAS 20 revised to deal with the matter. This is probably because government grants in the investment property sector are relatively rare compared to the agricultural sector. However, governments do on occasion provide grants and subsidised loans to finance the acquisition of social housing that meets the definition of investment property. The discount on these subsidised loans is considered to be a government grant, as described in section 3.4 below.

2.3.2 Investment tax credits

IAS 20 excludes from its scope government assistance either provided by way of a reduction in taxable profit or determined or limited according to an entity's income tax liability, citing income tax holidays, investment tax credits, accelerated depreciation allowances and reduced income tax rates as examples. [IAS 20.2(b)]. IAS 12 *Income Taxes* states that it does not deal with the methods of accounting for government grants or investment tax credits, although any temporary differences that arise from them are in the scope of the standard. [IAS 12.4]. Accordingly, if government assistance is described as an investment tax credit, but it is neither determined or limited by reference to the entity's income tax liability nor provided in the form of an income tax deduction, the requirements of IAS 20 apply.

This raises the question as to how an entity should account for those forms of government incentives for specific kinds of investment that are delivered through the tax system. The fact that both IAS 20 and IAS 12 use the term 'investment tax credits' to describe items excluded from their scope requires entities to carefully consider the nature of such incentives and the conditions attached to them to determine which standard the particular tax credit is excluded from and, therefore, whether they fall in the scope of IAS 20 or IAS 12.

How we see it

In our view, the determination of which framework to apply to a particular investment tax credit (IAS 12 or IAS 20) is a matter of judgement and all facts and circumstances relating to the specific incentive need to be considered in assessing the substance of the arrangement.

The following factors will often be relevant, but this list of factors must not be considered exhaustive, and entities may identify other factors which they consider to be more important than those listed below.

Feature of credit	Indicator of IAS 20 treatment	Indicator of IAS 12 treatment
Method of realisation	Directly settled in cash where there are insufficient taxable profits to allow credit to be fully recovered, or available for set off against non-income taxes, such as payroll taxes, sales taxes or other amounts owed to government.	Only available as a reduction in income taxes payable (i.e., benefit is forfeited if there are insufficient income taxes payable). However, a lengthy period allowed for carrying forward unused credits may make this indicator less relevant.
Number of non-income tax conditions attached to initial receipt of grant (e.g., minimum employment, ongoing use of purchased assets)	Many	None or few
Restrictions as to nature of expenditure required to receive the grant	Highly specific	Broad criteria encompassing many different types of qualifying expenditure
Income tax status of grant income	Taxable	Not taxable

In group accounts, in which entities from several different jurisdictions may be consolidated, it may be desirable that all 'investment tax credits' are consistently accounted for, either as an IAS 20 government grant or as an income tax under IAS 12. However, the judgement as to which standard applies is made by reference to the nature of each type of investment tax credit and the conditions attached to it. This may mean that the predominant practice in a particular jurisdiction for a specific type of investment tax credit has evolved differently from the consensus in another jurisdiction for what could appear to be a substantially similar credit. We believe that, in determining whether the arrangement is of a type that falls within the scope of IAS 20 or IAS 12, an entity must consider the following factors in the order listed below:

- If there is a predominant local treatment for a specific investment tax credit as to whether a specific credit in the relevant tax jurisdiction falls within the scope of IAS 20 or IAS 12, this must take precedence.
- If there is no predominant local treatment, the group-wide approach to determining the standard that applies to such a credit must be applied.
- In the absence of a predominant local consensus or a group-wide approach to making the determination, the indicators listed in the table above provide guidance.

This may mean that an entity operating in several territories adopts different accounting treatments for apparently similar arrangements in different countries, but it at least ensures a measure of comparability between different entities operating in the same tax jurisdiction.

How we see it

It is important to note that this is not an accounting policy choice. Accordingly, an entity operating in several territories could be required to adopt different accounting treatments for apparently similar arrangements in different countries if predominant local practice for a specific type of investment tax credit has evolved differently from the consensus in another jurisdiction.

For investment tax credits subject to IAS 20 and therefore treated as government grants, if the related expenditure is charged directly to the income statement under IFRS accounting standards, the tax credit/grant must be reflected in the income statement, either separately or under a general heading such as 'other income'; or as a deduction against the related expenditure. If the related expenditure is capitalised and amortised, the grant must be presented either by setting up the credit as deferred income or by deducting it from the carrying amount of the asset in accordance with IAS 20. It must not be included within deferred tax. The income statement will reflect the grant as 'other income' or as a reduction in the amortisation expense of the asset concerned on a systematic basis over the life of the asset. If the credit will be received in future periods without compensation for the time value of money, the notional amount of the asset must be reduced through application of an appropriate discount rate.

An example of the accounting policy disclosure of a company accounting for a type of investment tax credit as a government grant is shown below.

Practical example 2-1:	Aston Martin Lagonda Global Holdings plc (2023)	United Kingdom
ANNUAL REPORT AND ACCOUNTS 2023 [extract] NOTES TO THE FINANCIAL STATEMENTS [extract] 2. ACCOUNTING POLICIES [extract] Government Grants [extract]		
<p>Research and development tax relief in the form of the Research and Development Expenditure Credit ("RDEC") is recognised in the Income Statement over the periods in which the qualifying expenditure giving rise to the RDEC claim is recognised, as the Group's assessment of the conditions of receipt of the RDEC concludes that it meets the definition of a Government grant. Certain expenses within the scope of RDEC are capitalised as part of the Groups development costs. Where this is the case, the Group defers the income associated with the claim to deferred income and releases it to the Income Statement in line with the amortisation profile of the associated asset. Claims are submitted annually based on the qualifying expenditure for a given accounting period. The cash benefit from the claim is received in the year of the claim and presented in operating cash flows.</p>		

The treatment of investment tax credits accounted for under IAS 12 is discussed in Chapter 29.

2.4 Interaction of IAS 20 with IFRS 15

The situation can arise whereby a contract with a customer, accounted for under IFRS 15, also includes a government grant that falls within the scope of IAS 20, for example as illustrated below:

Illustration 2-2: Contract with a customer contains a government grant

A pharmaceutical entity has a contract with the government of the jurisdiction within which it operates. The contract includes a grant relating to the development of a vaccine and an obligation to deliver a specific quantity of vaccines, with an option to purchase additional vaccines at a discount.

How does the entity allocate the contract between IFRS 15 and IAS 20?

IFRS 15 applies to all contracts with customers, except when certain other standards apply. [IFRS 15.5]. When these other standards apply, entities are required to consider firstly the other standard before applying IFRS 15. [IFRS 15.7]. IAS 20 is not included in this list of other standards and accordingly the requirements of IFRS 15.7 do not apply for such contracts (this is discussed in detail in Chapter 28). IAS 20 does provide initial measurement and/or separation requirements in respect of three scenarios (low-interest loans, [IAS 20.10A], non-monetary grants, [IAS 20.23], and forgivable loans, [IAS 20.10]) which are discussed in section 3 below but does not specify how to separate the components of a contract between IFRS 15 and IAS 20 as in the scenario in Illustration 2-2 above. An entity would therefore need to apply the requirements in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* to develop an accounting policy to determine how to separate the parts of such a contract between IFRS 15 and IAS 20. When developing its policy, an entity is required to refer to, and consider the applicability of requirements in IFRS accounting standards that deal with similar and related issues. [IAS 8.11].

How we see it

In developing an accounting policy under IAS 8, in this case to separate a contract into IFRS 15 and IAS 20 components, we believe it would be appropriate to refer to IAS 20.10A by analogy. Hence, the benefit of the government grant must be measured as the difference between the total contract value and the consideration for the portion of the contract that is within the scope of IFRS 15, measured in accordance with IFRS 15 (at stand-alone selling price).

3 Recognition and measurement

3.1 General requirements of IAS 20

IAS 20 requires that: [IAS 20.7]

Extract from IAS 20

- 7** Government grants, including non-monetary grants at fair value, shall not be recognised until there is reasonable assurance that:
- (a) the entity will comply with the conditions attaching to them; and
 - (b) the grants will be received.

The standard does not define 'reasonable assurance', which raises the question of whether or not it means the same as 'probable' (or 'more likely than not'). [IAS 37.15]. The phrase 'reasonable assurance' is generally interpreted as being a high threshold which implies a significantly higher probability than 'more likely than not'. Therefore, an entity cannot recognise government grants before it is significantly more likely than probable that the entity will comply with the conditions attached to them and that the grants will be received. In assessing the likelihood of compliance with conditions attached to the grant, it is acknowledged the conditions may relate to future performance and other future events.

For a grant related to an asset, a grant cannot be recognised before the asset is acquired, regardless of how likely the acquisition of the asset is. If the grant is also conditional on maintaining a number of jobs to operate the asset, the grant must be recognised as soon as the asset is acquired as long as there is (and continues to be throughout the period during which the grant can be claimed back by government) reasonable assurance that the jobs will be maintained as required.

The standard notes that receiving a grant does not of itself provide conclusive evidence that the conditions attaching to the grant have been or will be fulfilled. [IAS 20.8]. This is particularly true since there sometimes exists a supranational legal framework to comply with in addition to the eligibility criteria in local jurisdictions. For example, in the EU, Member State aids also need to comply with EU laws, e.g., in the context of the coronavirus pandemic. A grant may need to be recognised before it is received (in cash or otherwise) or even before the entity formally files a request to receive the grant (i.e., as soon as it becomes eligible to receive the grant). The grant receivable would not generally be a financial asset as it does not arise from contractual rights but rather arises due to government legislation.

The assessment about the existence of a 'reasonable assurance' must be made before the initial recognition of any grant income as well as subsequently, on a continuous basis, until the end of the period during which any grant received could be claimed back by the government. Such assessment requires the entity to understand fully the exact conditions that apply before it can make a valid judgement on whether it is entitled to the grant, and to what extent.

The Illustration below considers two examples.

Illustration 3-1: Recognition of a government grant

- (a) A government has announced that, as a result of the coronavirus pandemic, it is introducing a scheme whereby entities will receive financial support for their employee costs. This support is available to all companies, there are no performance conditions and once the entity submits details of all their employees, there is a routine verification process to confirm the identity of the applicant and the grant is automatically paid.

In this Illustration, there are no conditions attached and the scheme is very simple by design so that the outcome is known by the entity with certainty. Hence, assessing whether there is 'reasonable assurance' is relatively straight-forward.

- (b) A government, with the aim of driving investment in artificial intelligence, has announced a scheme whereby they will provide entities in this industry financial support for the next two years but only for very specific cost types. The application process is complex and requires applicants to submit detailed cost information and forecasts alongside the specific amount of funding they will require to cover both past and future costs. Once the submission is made, there is an extensive approval process by an independent reviewer, which may require further information to be submitted by the entity as the approval process progresses. As this is a new scheme, there is no past experience of approvals that the industry can consider.

In this Illustration, once due care has been applied by the entity to identify eligible projects and costs as set out in the scheme rules, and provide appropriate documentation, it will normally be reasonably assured that the entity will **comply with the conditions attaching to the grant**. However, caution may need to be exercised when measuring the amount expected to be received.

When the terms and conditions of a grant have been communicated before the end of a reporting period, then in determining whether it is reasonably assured that the entity will comply with the conditions attached to a grant and that the grant will be received as per IAS 20.7, information obtained after the reporting period, (e.g., confirmation of the entity receiving the grant), may provide evidence of an adjusting subsequent event.

Conversely, no 'reasonable assurance' can exist if the terms and conditions of a grant have not been communicated before the end of a reporting period.

How we see it

In our view, entitlement to a grant does not exist before the terms of the grant have been established by the government and clearly communicated publicly, or confirmed to the entity for entity-specific grants.

If a new law or regulation introduces a government grant after the end of the reporting period, it will represent a non-adjusting subsequent event.

Illustration 3-2: Date of entitlement to a government grant

An entity has a 31 March year end and on 20 March 20X1 there is an earthquake in the jurisdiction in which it operates. There is severe damage to the company's facilities. The government of that jurisdiction announces on 21 March that it will introduce assistance, but the exact nature and terms of such assistance are not communicated until 4 April 20X1. Hence, the criteria in IAS 20.7 cannot be met on 31 March 20X1. The announcement on 4 April 20X1 confirming the conditions related to the grant is a non-adjusting post balance sheet event.

If the facts and circumstances supporting the recognition of the government grant change and it is no longer 'reasonably assured' that the entity will retain the grant it has initially recognised, then the entity needs to derecognise any grant income and reverse any related asset or, to the extent the grant has already been received in cash, recognise a refund liability. This may be before it becomes 'more likely than not' that the entity may need to refund the grant (i.e., before the recognition threshold for a provision is met under IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*).

When a grant is derecognised, consideration must be given as to whether there has been a change in facts and circumstances or whether there was an error in the initial application of the recognition criteria. In the case of the latter, please refer to IAS 8 guidance as discussed in Chapter 3.

After an entity has recognised a government grant, any related contingent liability or contingent asset must be accounted for under IAS 37. [IAS 20.11].

Illustration 3-3: Derecognition of a government grant

A pharmaceutical company recognised a government grant two years ago based on meeting future conditions on their performance. It has reassessed their future performance and no longer believes it is reasonable assured they will comply with the conditions attached to the government grant. This is due to a decline in performance that could not be foreseen when making the initial judgement on recognising the government grant. Any grant funding already received is required to be repaid.

The government grant the company was initially entitled to was CU500 to be recognised in the income statement on a straight-line basis over 5 years. Currently, the company has deferred income of CU300 and as CU250 had already been received in cash, the remaining CU250 is held as a receivable on the balance sheet.

On derecognition, the accounting entries would be;

Dr	Grant income (income statement)	CU200	
Dr	Deferred income (balance sheet)	CU300	
	Cr Government grant receivable (balance sheet)		CU250
	Cr Payable to Government (balance sheet)		CU250

Government grants are accounted for similarly regardless of whether they are received in cash or as a reduction of a liability to the government. [IAS 20.9]. When a grant is received in the form of a transfer of a non-monetary asset, the standard allows an alternative accounting treatment, which is detailed in section 3.2 below.

3.2 Non-monetary grants

A government grant in the form of a transfer of a non-monetary asset, such as land or other resources, which is intended for use by the entity, is usually recognised at the fair value of that asset. [IAS 20.23]. Fair value is defined in IFRS 13 and applies when another IFRS accounting standard requires or permits fair value measurement, including IAS 20. [IFRS 13.5, IAS 20.45]. “Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date”. [IAS 20.3, IFRS 13.9]. The requirements of IFRS 13 are discussed in Chapter 15.

An alternative of recognising such assets, and the related grant, at a nominal amount is permitted, effectively leading to no recognition and a pure disclosure approach. [IAS 20.23]. This alternative is available even if the fair value of the asset differs materially from the nominal amount. Under IAS 8 an entity must select an accounting policy and apply it consistently to all non-monetary government grants. [IAS 8.13]. Despite IAS 20 permitting two approaches to measuring non-monetary grants, it is acknowledged that regulators in some jurisdictions may have a preference for one approach over the other.

3.3 Forgivable loans

A forgivable loan from government, the repayment of which will be waived under certain prescribed conditions, [IAS 20.3], is to be treated as a government grant when there is reasonable assurance that the entity will meet the terms for forgiveness of the loan. [IAS 20.10].

Illustration 3-4: Government grant by way of forgivable loan

An entity participates in a government-sponsored research and development programme under which it is entitled to receive a government grant of up to 50% of the costs incurred for a particular project. The government grant is interest-bearing and fully repayable based on a percentage ('royalty') of the sales revenue of any products developed. Although the repayment period is not limited, no repayment is required if there are no sales of the products.

The entity must account for this type of government grant as a forgivable loan, as follows:

- Initially recognise the cash received as a liability.
- Apply the principles underlying the effective interest rate method in subsequent periods, which would involve estimating the amount and timing of future cash flows.
- Review at each reporting date whether there is reasonable assurance that the entity will meet the terms for forgiveness of part, or all of the loan based on expected future royalty repayments. If this is the case, then IAS 20.10 would require derecognition of part or all of the liability initially recorded with a corresponding profit in the income statement.

And

- If the entity subsequently revises its estimates of future sales upwards, it adjusts the amount of the liability and recognises a corresponding loss in the income statement for any amounts previously included in profit.

However, an arrangement only meets the definition of a forgivable loan if its terms provide for circumstances where repayment would be waived (i.e., forgiven), without any other form of settlement. In Illustration 3-4 above, the entity either repays some or all of the loan if the project generates any sales, or, if no sales are made, its liability is waived in full, with no further recourse to the government. In May 2016, the IFRS IC concluded that if any other consideration is required to be given in settlement of the obligation, then the arrangement is not a forgivable loan.

Frequently asked questions

Question 3-1: How does an entity account for cash received from a government to help finance a research and development project, when nothing is repayable in cash if the project is unsuccessful and instead the entity is required only to transfer to the government the rights to the research?

The IFRS IC was asked to clarify whether the cash received would be treated as a forgivable loan in the following specific circumstances:²

- The loan was repayable only if the entity decided to exploit and commercialise the results of the research phase of the project.
- Otherwise, the loan was not repayable in cash but instead the entity was required to transfer to the government the rights to the research.

The IFRS IC noted that, in this arrangement, the cash received did not meet the definition of a forgivable loan under IAS 20, because the government did not undertake to waive repayment of the loan but instead required settlement in cash or by the transfer of rights to the research. In other words, the entity could only avoid repayment by settling a non-financial obligation (to hand over the rights to the research). This requirement confirms the status of the cash receipt as a financial liability under IAS 32 *Financial Instruments: Presentation*. [IAS 32.20(a)]. The IFRS IC also noted that the financial liability must be measured under IFRS 9. Any difference between the cash receipt and the fair value of the liability would need to be accounted for under IAS 20 as discussed in section 3.4 below. The IFRS IC decided not to add this issue to its agenda on the basis that existing standards provide an adequate basis of accounting.³

Where an entity receives a loan to finance a research and development project and the loan will be forgiven if the project is not successful, then the existence of the forgivable loan has no bearing on assessing the project for capitalisation under the criteria in IAS 38 (see Chapter 18). One of the criteria for capitalisation of development costs is that the entity must demonstrate that the intangible asset will generate probable economic benefits. [IAS 38.57(d)]. The existence of the forgivable loan does not mean that this requirement is always met. The criteria in IAS 38 must be assessed on their own merits.

3.4 Loans at lower than market rates of interest

IAS 20 requires government loans that have a below-market rate of interest to be recognised and measured in accordance with IFRS 9. [IAS 20.10A, IFRS 9.5.1.1]. The loans could be interest-free. The difference between the initial carrying value of the loan (its fair value) and the proceeds received is treated as a government grant. [IAS 20.10A, IFRS 9.B5.1.1].

Illustration 3-5: Interest-free loan from a government agency

Company A secures an interest-free loan of CU1,000 from a local government agency to ensure that the company invests in new equipment at its manufacturing facility. The loan is repayable at the end of five years and carries no interest. Company A can draw down the loan on demonstrating that it has incurred qualifying expenditure on property, plant and equipment.

On initial recognition, the market rate of interest for a similar five-year loan for Company A is 10% per year. The initial fair value of the loan is the present value of the future payment of CU1,000, discounted using the market rate of interest for a similar loan of 10% for five years. This equates to CU621.

The value of the government incentive to Company A to invest in its factory is CU379, which is the difference between the total consideration received of CU1,000 and the loan's initial fair value of CU621. This difference is treated as a government grant.

Subsequently, interest will be imputed to the loan using the effective interest method, taking account of any transaction costs (see Chapter 45). IAS 20 requires that the grant is recognised in profit or loss on a systematic basis that matches it with the related costs it is intended to compensate. [IAS 20.12]. The standard stresses that the entity must consider the conditions and obligations that have been, or must be, met when "identifying the costs for which the benefit of the loan is intended to compensate". [IAS 20.10A]. In this example, the benefit of the loan is to help fund the purchase of new equipment. Therefore, it would be appropriate to recognise the grant as the new equipment is depreciated, rather than as the interest on the loan is recognised. Recognition in the income statement of the benefit of loans at below-market interest rates is discussed further in section 3.6.2 below.

² [IFRIC Update](#), May 2016, available on the IFRS Foundation's website.

³ [IFRIC Update](#), May 2016, available on the IFRS Foundation's website.

As well as subsidised lending to meet specific objectives such as investment in new equipment, loans made as part of government rescue plans are generally within the scope of IAS 20 if they are at a lower than market rate of interest. In 2009, PSA Peugeot Citroën received assistance from the European Investment Bank as described in Practical example 3-1 below.

Practical example 3-1: PSA Peugeot Citroën (2009)	France
Half-Year Financial Report [extract] NOTES TO THE INTERIM CONSOLIDATED FINANCIAL STATEMENTS Six months ended June 30, 2009 [extract] NOTE 17 - CURRENT AND NON-CURRENT FINANCIAL LIABILITIES MANUFACTURING AND SALES COMPANIES [extract] 17.2. REFINANCING TRANSACTIONS [extract] - EIB loan <p>In April 2009, Peugeot Citroën Automobiles S.A. obtained a €400 million 4-year bullet loan from the European Investment Bank (EIB). Interest on the loan is based on the 3-month Euribor plus 179 bps. At June 30, 2009 the government bonds (OATs) given by Peugeot S.A. as collateral for all EIB loans to Group companies had a market value of €160 million. In addition, 4,695,000 Faurecia shares held by Peugeot S.A. were pledged to the EIB as security for the loans. The interest rate risk on the new EIB loan has not been specifically hedged.</p> <p>This new loan is at a reduced rate of interest. The difference between the market rate of interest for an equivalent loan at the inception date and the rate granted by the EIB has been recognised as a government grant in accordance with IAS 20. The grant was originally valued at €38 million and was recorded as a deduction from the capitalized development costs financed by the loan. It is being amortised on a straight-line basis over the life of the underlying projects. The loan is measured at amortised cost, in the amount of €362 million at June 30, 2009. The effective interest rate is estimated at 5.90%.</p>	

Governments sometimes provide assistance in arrangements that are similar in substance to loans by allowing entities to retain sums that they collect on behalf of the government (e.g., value added taxes) until a future event, as in the following Illustration:

Illustration 3-6: Entity allowed to retain amounts owed to government
<p>The local government of an underdeveloped region is trying to stimulate investment in fixed assets by allowing local companies to delay payment of the value added tax (VAT) on their sales. An entity participating in this scheme is entitled to retain an amount up to 40% of its investment in fixed assets. The retained VAT must be paid to the local government after 5 years and does not bear interest.</p> <p>The fact that amounts retained by the entity are required to be repaid after 5 years makes this arrangement similar in nature to an interest-free loan. Accordingly, the entity would determine a value for the government assistance by comparing the amounts retained to the fair value of a 5-year loan at market rates of interest, as illustrated in Illustration 3-5 in section 3.4 above. In determining an appropriate basis for recognising the benefit of the grant in profit or loss, the entity must consider the conditions and obligations that have been, or must be, met when "identifying the costs for which the benefit of the loan is intended to compensate". [IAS 20.10A].</p>

In Illustration 3-6 above, because the grant is intended to stimulate investment in fixed assets, it would be appropriate to recognise the grant in income in line with depreciation of the relevant assets. The judgement involved in matching the benefit to costs is discussed in section 3.6.1 below.

3.5 Government guarantees

Governments sometimes provide support to an entity indirectly in the form of guarantees to lenders to the entity.

For example, a government may offer to guarantee loans taken out by entities that meet certain conditions. The government does not charge the lender a fee for this guarantee and consequently with the credit enhancement provided by the guarantee, the lender is able to reduce the interest rate charged to the borrower.

How we see it

IAS 20 cites guarantees as an example of government assistance that cannot reasonably have a value placed on them and hence are excluded from the definition of government grants. Nevertheless, where it can be demonstrated that a fair value can be determined for the guarantee, and the guarantee is not integral to the loan then it could be accounted for separately as a government grant.

This determination will depend on the facts and circumstances of the guarantee. Assessing whether the guarantee is integral to the loan is a matter of judgement (see Chapter 47). This may include consideration as to whether the loan together with the guarantee is capable of being transferred.

If it is determined that grant accounting is appropriate, then the approach for below-market rate loans would apply (see sections 3.4 above and 3.6.2 below). In this case, the fair value of the loan reflects the present value of cash flows discounted using the market rate as if no guarantee were in place. The difference between the proceeds received and the fair value of the loan is accounted for as a government grant. If it is determined that the guarantee is government assistance, then the nature of that government assistance must be disclosed. [IAS 20.39(b)].

3.6 Recognition in the income statement

IAS 20 notes that: [IAS 20.12]

Extract from IAS 20

12 Government grants shall be recognised in profit or loss on a systematic basis over the periods in which the entity recognises as expenses the related costs for which the grants are intended to compensate.

Grants must not be credited directly to equity. [IAS 20.15]. Income recognition on a receipts basis, which is not in accordance with the accruals accounting assumption, is only acceptable if there is no basis for allocating a grant to periods other than the one in which it is received. [IAS 20.16].

IAS 20 rejects a 'capital approach', under which a grant is recognised outside profit or loss (typically credited directly to equity), [IAS 20.13], in favour of the 'income approach', under which grants are taken to income over one or more periods, because:

- (a) Government grants are receipts from a source other than shareholders. As such, they are not credited directly to equity but must be recognised in profit or loss in appropriate periods.
- (b) Government grants are rarely gratuitous. An entity earns them through compliance with their conditions and meeting the envisaged obligations. They must therefore be recognised in profit or loss over the periods in which the entity recognises the associated costs which the grant is intended to compensate.
- (c) As income and other taxes are expenses, it is logical to deal also with government grants, which are an extension of fiscal policies, in profit or loss. [IAS 20.15].

IAS 20 envisages that in most cases, the periods over which an entity recognises the costs or expenses related to the government grant are readily ascertainable and thus grants in recognition of specific expenses are recognised as income in the same period as the relevant expense. [IAS 20.17].

Grants related to depreciable assets are recognised as income over the periods in which, and in proportion to, depreciation on those assets is charged. [IAS 20.17]. Grants related to non-depreciable assets may also require the fulfilment of certain obligations, in which case they would be recognised as income over the periods in which the costs of meeting the obligations are incurred. For example, a grant of land may be conditional upon the erection of a building on the site, and it may be appropriate to recognise it as income over the life of the building. [IAS 20.18].

IAS 20 acknowledges that grants may be received as part of a package of financial or fiscal aids to which a number of conditions are attached. In such cases, the standard indicates that care is needed in identifying the conditions giving rise to the costs and expenses which determine the periods over which the grant will be recognised as income. It may also be appropriate to allocate part of the grant on one basis and part on another. [IAS 20.19].

Where a grant relates to expenses or losses already incurred or becomes receivable for the purpose of giving immediate financial support to the entity with no future related costs, the grant must be recognised in income when it becomes receivable, and the entity must disclose its effects to ensure that these are clearly understood. [IAS 20.20, IAS 20.21, IAS 20.22]. The reference to 'expenses or losses already incurred' relates to expenses already recognised in the income statement. Where an entity has already incurred costs but they have been capitalised, then the grant received will be recognised in profit or loss as the depreciation expense on the asset is recognised. [IAS 20.17].

Many of the problems in accounting for government grants relate to that of interpreting the requirement to match the grant with the related costs, particularly because of the international context in which IAS 20 is written. It does not address specific questions that relate to particular types of grants that are available in individual countries.

3.6.1 Achieving the most appropriate matching

The requirement to match the grant against the costs that it is intended to compensate can be difficult to apply in practice, because grants are sometimes given for a particular kind of expenditure that forms a component of a larger project. For example, in trying to determine an appropriate accounting policy for government assistance that is in the form of a grant against training costs incurred as part of a larger project, an entity might consider recognition in income in one of the following ways:

(a) Matching against direct training costs

Or

(b) Matching rateably against total project costs

How we see it

Determining a reasonable approach is dependent on the specific facts and circumstances, including not only the terms of the arrangement but also other facts that might highlight the purpose of the grant, including those relating to the context in which the grant was offered, the conditions attached to it and the consequences of failing to meet those conditions.

Recognition of a grant in income when received in cash is unlikely to be an appropriate method because it is not obviously linked to the recognition of the related expenditure and would be acceptable only in the rare circumstances where no basis exists for allocating a grant to periods other than the one in which it is received.

In some jurisdictions, grants are taxed as income on receipt; consequently, this is often the argument advanced for taking grants to income when received in cash. However, it is clear that the treatment of an item for tax purposes does not necessarily determine its treatment for accounting purposes, and recognition in the income statement on receipt may result in an unacceptable departure from the principle that government grants must be matched with the costs that they are intended to compensate. [IAS 20.16]. The recognition of a grant in the income statement in a different period from that in which it is taxed, gives rise to a temporary difference that must be accounted for in accordance with IAS 12 (see Chapter 29). The Illustration below illustrates that the determination of a systematic basis for recognition under the standard is not always straightforward.

Illustration 3-7: Grant associated with investment property

The government provides a grant to an entity that owns an investment property on the condition that it is let for social housing for 10 years. The grant is intended to compensate the entity for the lower rent it will receive when the property is let as social housing at below-market rates. That means that future rental income will be lower over the period of the lease which, at the same time, reduces the fair value of the investment property. The property cost CU1,000 and its fair value with the condition that it must be let for social housing is CU900, while the fair value of the property without that condition is CU1,000. The grant is for CU100, and the useful life of the property is 20 years.

If the entity accounts for the investment property under the cost model in IAS 40, then it could be argued that the government grant must be recognised on a straight-line basis (or another systematic basis) over the 10-year term of the lease to offset the lower than market rental income as social housing.

Alternatively, if the entity applies the fair value model in IAS 40.33, the cost being compensated is effectively the present value of the foregone future rentals (which affects the fair value change recognised). In that case, it is more appropriate to recognise the benefit of the government grant immediately, to match the reduction in the fair value of the investment property which, in this example is CU100.

How we see it

In the face of the issues described above of attributing a grant to related costs, entities will have to make their own determination as to how the matching principle must be applied in light of the specific facts and circumstances of the case. The only overriding considerations are that the determination must be consistently applied to similar grants and the policy adopted in respect of both grants related to assets and grants related to income, if material, must be adequately disclosed along with any significant judgements relevant to the application of IAS 20.

3.6.2 Loans at lower than market rates of interest

As discussed in section 3.4 above, IAS 20 requires that the difference between the initial fair value of a government loan that has a below-market rate of interest and the proceeds received is treated as a government grant. [IAS 20.10A].

The issue that then arises is how to recognise the grant in profit or loss. As noted in section 3.6 above, IAS 20 requires that the grant is recognised in profit or loss on a systematic basis that matches it with the related costs it is intended to compensate, [IAS 20.12], i.e., the emphasis in IAS 20 is on matching the benefit of a grant with the related costs as they are recognised in the income statement, rather than on the recognition of liquidity or cash flows.

The assessment of an appropriate method of allocation requires the entity to identify the costs intended to be compensated by the grant and is driven by a careful analysis of the facts and circumstances. The final determination as to which treatment is appropriate must reflect not only the terms of the arrangement but also other facts that might highlight the purpose of the loan, e.g.:

- Where it is determined that the grant is a grant related to an asset, as in Illustration 3-5 in section 3.4 above, recognition as the asset is depreciated would be appropriate.
- Where the grant is a grant related to income and is intended to compensate for a specific expense, then recognition at the same time as that expense is recognised in profit or loss would be appropriate. [IAS 20.17]. This could include immediate recognition for expenses or losses that had already been incurred. [IAS 20.20]. Where the grant is intended to compensate for the cost of funding, then recognition on the same basis as the interest is charged (i.e., over the term of the loan) would be appropriate. This is shown in the following Illustration.

Illustration 3-8: Below-market interest rate loan from the government

Company A secures a low interest loan of CU1,000 from the government as part of its support measures for the coronavirus pandemic. The loan is repayable at the end of five years and carries an interest rate of 5%, demonstrably below the market rate. There are no conditions attached regarding the expenditure that the loan must be used for. Also, the grant benefit of the below-market rate loan cannot be attributed to any specific costs, past or future, neither based on the terms of the arrangement nor on other facts and circumstances, other than the cost of funding. The purpose of the grant is to provide the entity with immediate liquidity support by allowing it to borrow more money than it could have based on the market rate.

On initial recognition, the market rate of interest for a similar five-year loan is 10% per year. The initial fair value of the loan is the present value of the future payments for the loan, discounted using the market rate of interest for a similar loan of 10% for five years. This equates to CU811.

The value of the government incentive to Company A is CU189 being the difference between the total consideration received of CU1,000 and the loan's initial fair value of CU811. This difference is treated as a government grant.

In this Illustration, the grant is compensating Company A for the higher market rate of interest that would otherwise have been charged as an expense on the loan. Company A recognises the grant benefit on the same basis as the interest is charged, over the term of the loan, thereby matching the benefit with the interest cost.

3.6.3 The period to be benefited by the grant

IAS 20 cautions that care is needed in identifying the conditions giving rise to the costs and expenses which determine the periods over which the grant will be earned. [IAS 20.19]. The qualifying conditions that must be satisfied are not necessarily conclusive evidence of the period to be benefited by the grant. For example, certain grants may become repayable if assets cease to be used for a qualifying purpose within a certain period; notwithstanding this condition, the grant may need to be recognised over the whole life of the asset, not over the qualifying period.

3.6.4 Separating grants into components

The grant received may relate to a package of activities, the components of which have different costs and conditions. In such cases, it is common that the components for which the grant is given are not specifically identified or quantified. It might be appropriate to treat these different components on different bases rather than accounting for the entire grant in one way, [IAS 20.19], however, this will not always be practicable. For example, a grant may be given on the basis that an entity makes approved capital expenditure in a particular area and employs a specified number of local people for an agreed period of time. In general, the most straightforward way of recognising such a grant is by linking it to long-term assets where this is a possible interpretation, particularly where the receipt of the grant depends on the cost of acquisition of long-term assets. However, this approach can only be taken if there is no clear indication to the contrary.

How we see it

The assessment of an appropriate method of allocation requires the entity to identify the costs intended to be compensated by the grant and is driven by a careful analysis of the facts and circumstances. The final determination as to which treatment is appropriate must reflect not only the terms of the arrangement but also other facts that might highlight the purpose of the loan.

Allocation of a grant between the components will often involve judgement and entities may place more emphasis on some features than on others. In these cases, and where the effect is material, the financial statements must explicitly state what judgement has been made when applying the standard and disclose the corresponding financial effect.

3.7 Repayment of government grants

A government grant that becomes repayable after recognition must be accounted for as a revision of an accounting estimate. An entity must carefully assess the existence of a 'reasonable assurance' required to account for the grant initially so that if the grant subsequently becomes repayable, this is not the correction of a prior period error but the consequence of a change in circumstances or new information. [IAS 8.34].

Repayment of a grant related to income must be charged first against the related unamortised deferred credit and any excess must be recognised as an expense immediately. [IAS 20.32].

Repayment of a grant related to an asset must be recognised by increasing the carrying amount of the related asset or reducing the related unamortised deferred credit. The cumulative additional depreciation that would have been recognised to date as an expense in the absence of the grant must be charged immediately to profit or loss. [IAS 20.32].

IAS 20 emphasises that the circumstances giving rise to the repayment of a grant related to an asset may require that consideration be given to the possible impairment of the asset. [IAS 20.33].

3.8 Government assistance

Extract from IAS 20

- 34 Excluded from the definition of government grants in paragraph 3 are certain forms of government assistance which cannot reasonably have a value placed upon them and transactions with government which cannot be distinguished from the normal trading transactions of the entity.

[IAS 20.34].

In the period since 1984, when IAS 20 first became effective, [IAS 20.41], the use of fair values in financial reporting and the range of techniques used to determine reliable measures of fair value have increased. IFRS 13, issued in 2011, defines fair value, provides a principles-based framework for measuring fair value under IFRS accounting standards and requires information about those fair value measurements to be disclosed. [IFRS 13.1]. IFRS 13 provides guidance for selecting appropriate valuation techniques and therefore one might now expect the occurrence of government assistance that cannot reasonably have a value placed on it to be a relatively rare occurrence (see Chapter 15).

IAS 20 cites a government procurement policy as an example of assistance that cannot be distinguished from the normal trading transactions of the entity. In this case, the "existence of the benefit might be unquestioned but any attempt to segregate the trading activities from government assistance could well be arbitrary". [IAS 20.35]. The standard therefore requires disclosure of significant government assistance.

[IAS 20.36, IAS 20.39(b)].

The following Illustration describes two different forms of government assistance:

Illustration 3-9: Government assistance

(a) Assistance in the form of priority bidding status

A government specifies that entities below a certain size are to be given priority in bidding for a particular type of government contract by mandating a minimum number of such entities to obtain bidding status. Although the entities will benefit from the quota, the value cannot be identified, and the effects of the assistance cannot be segregated from the trading activities of the qualifying entities.

(b) Assistance in the form of credit facilities at market rates

Three governments that between themselves own just over 50% of the shares in an airline participate in granting it a revolving credit facility at a market rate of interest. This is not a government grant as it is on terms that a private market participant might have accepted but it is government assistance as the benefit cannot be distinguished from normal trading activities of the airline.

IAS 20 notes that: [IAS 20.38]

Extract from IAS 20

38 In this Standard, government assistance does not include the provision of infrastructure by improvement to the general transport and communication network and the supply of improved facilities such as irrigation or water reticulation which is available on an ongoing indeterminate basis for the benefit of an entire local community.

3.9 Particular issues arising when grants related to assets are accounted for as deferred income

When grants related to assets are accounted for as deferred income, any unamortised balance carried in the statement of financial position needs to be included in the accounting treatment of an impairment loss, a gain on disposal or a reassessment of the useful life of the asset to which it relates so that the impact on profit or loss is the same as if the grant had been deducted from the initial carrying amount of the related asset.

3.9.1 Impairment testing of assets that qualified for government grants

When an asset is tested for impairment under IAS 36 *Impairment of Assets*, the value of any government grants received in relation to those assets is taken into account regardless of whether the entity elected to deduct the grants in arriving at the carrying amount of the related assets or decided to set up the grant as deferred income.

Where grants have been deducted from the initial carrying amount of the related assets, no further adjustment is required before commencing the impairment test. However, when grants relating to assets are classified as deferred income, the unamortised balance carried in the statement of financial position must be deducted from the carrying amount of the assets or cash generating unit (CGU) being tested.

Illustration 3-10: Impairment test of an asset that qualified for a government grant

An entity, which is operating in a development area, purchased a machine for CU1,000 to use for the production of goods. The investment in the machine is eligible for a government grant amounting to 50% of the purchase price. The machine is measured according to the cost model in IAS 16 *Property, Plant and Equipment*.

In accordance with IAS 20.24 and 26, the entity presented the grant, which it received in cash, as deferred income in the statement of financial position. The entity subsequently recognised this deferred income as income on a straight-line basis over the useful life of the machine.

The entity has to perform an impairment test of the asset. What impact does the grant have on this test?

The entity deducts the grant recognised as deferred income that relates to the machine from the carrying amount of the asset for an impairment test for that asset.

If the entity cannot test the asset for impairment individually and the impairment test is carried out at a CGU level, the grant is deducted from the carrying amount of the CGU.

If the impairment test requires the carrying value of the asset or related CGU to be reduced (because it exceeds the recoverable amount determined under IAS 36), the amount of the impairment is deducted from the carrying amount of the asset. However, an entity must not adjust the balance presented as deferred income, which continues to be recognised as income over the useful life of the asset. This is illustrated as follows:

Illustration 3-11: The effect of impairment of asset on the related government grant

On 1 January 20X1, an entity purchased a machine costing CU1,000 to use for the production of goods. The investment in the machine is eligible for a government grant amounting to 50% of the purchase price. The machine has a useful economic life of 10 years, and the entity determines that the benefit of the grant will be amortised over the useful life of the asset. However, due to adverse trading conditions, at the end of 20X1 it is determined that the carrying value of the asset (net of grant) is not recoverable, and is fully impaired

Immediately before the impairment, the respective carrying values are:

- Asset CU900 (cost of CU1,000 less depreciation to date of CU100)
- Grant CU450 (after amounts released to income statement to date of CU50)

Applying the principles noted in Illustration 3-10 above, if the asset, net of the grant, is fully impaired that means an impairment loss of CU450 (CU900-CU450) arises and is charged to the income statement.

Immediately after this impairment, the carrying values are as follows:

- Asset CU450 (after impairment of CU450)
- Grant CU450

The grant continues to be recognised as income over the useful life of the asset.

Likewise, any future reversal of the impairment would not affect the carrying value of the grant.

When the asset that is tested for impairment has been financed partly or fully by forgivable loans, the recognition of an impairment loss would generally be a trigger for the reassessment of whether there is reasonable assurance that the entity will meet the terms for forgiveness of part or all the related forgivable loan (see section 3.3 above).

The requirements of IAS 36 are discussed in Chapter 21.

3.9.2 Disposal of assets that qualified for government grants

Where grants have been deducted from the initial carrying amount of the related assets, the gain on disposal is based on the carrying amount of the assets and no further adjustment is needed.

Where an asset is disposed of and the grant related to the asset is classified as deferred income, any remaining deferred income at the time of disposal must be recognised immediately in the income statement. It would also be necessary to assess whether the disposal of such an asset triggers any payment obligations to the government, such as full or partial repayment of the grant or sharing of the gain on disposal, if applicable. These obligations may give rise to the recognition of a liability.

3.9.3 Changes to the useful life of assets that qualified for government grants

Where the useful life of an asset has changed then in respect of depreciation of that asset, the change is accounted for as a change in an accounting estimate in accordance with IAS 8. [IAS 16.51, IAS 8.36].

Where grants have been deducted from the initial carrying amount of the related assets, no further adjustment is needed to reflect the change in estimate prospectively over the remaining useful life of the assets.

Where a grant related to the asset is classified as deferred income, the change to the release of any remaining deferred income to the income statement is also reflected prospectively over the new remaining useful life of the associated asset.

4 Presentation of grants

4.1 Presentation of grants related to assets in the statement of financial position

Grants that are related to assets (i.e., those whose primary condition is that an entity qualifying for them must purchase, construct or otherwise acquire long-term assets) must be presented in the statement of financial position either: [IAS 20.24]

- (a) By setting up the grant as deferred income, which is recognised as income on a systematic basis over the useful life of the asset [IAS 20.26]

Or

- (b) By deducting the grant in arriving at the carrying amount of the asset, in which case the grant is recognised in profit or loss as a reduction of depreciation [IAS 20.27]

IAS 20 regards both these methods of presenting grants in financial statements as acceptable alternatives. [IAS 20.25]. The presentation approach must be applied consistently to all similar grants and appropriately disclosed.

Greencore Group plc adopted the former treatment, as shown below:

Practical example 4-1: Greencore Group plc (2021)	United Kingdom
Annual Report and Financial Statements 2021 [extract] Notes to the Group Financial Statements [extract] 1. Group statement of accounting policies [extract] Government grants Government grants for the acquisition of assets are recognised at their fair value when there is reasonable assurance that the grant will be received and any conditions attached to them have been fulfilled. The grant is held on the Statement of Financial Position as a deferred credit and released to the Group Income Statement over the periods necessary to match the related depreciation charges, or other expenses of the asset, as they are incurred. ...	

If an entity chooses to set up the grant as deferred income, which is then recognised as income on a systematic basis over the useful life of the asset, IAS 20 is not explicit about where in the income statement this must be presented.

How we see it

Where a grant related to an asset is recognised as deferred income, we believe that when it is subsequently recognised in profit or loss, there is an accounting policy choice as to whether it is recognised gross or deducted from the depreciation expense.

Under the 'gross' accounting policy, the income statement presentation reflects the balance sheet treatment. However, the 'net' approach is also an acceptable accounting policy as this is analogous to the accounting policy choice available under IAS 20.29 (see section 4.2 below). IAS 1 *Presentation of Financial Statements*⁴ also suggests offsetting may be appropriate where it 'reflects the substance of the transaction' [IAS 1.33], which will be subject to some degree of judgement.

⁴ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

An example of a company adopting a policy of deducting grants related to assets from the cost of the assets is shown below:

Practical example 4-2: Akzo Nobel N.V. (2023)	The Netherlands
AkzoNobel Report 2023 [extract] FINANCIAL INFORMATION [extract] NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract] Note 1 SUMMARY OF MATERIAL ACCOUNTING POLICIES [extract]	
<p>Government grants</p> <p>Government grants related to costs are deducted from the relevant costs to be compensated in the same period. Government grants to compensate for the cost of an asset are deducted from the cost of the related asset. Emission rights granted by the government are recorded at cost. A provision is recorded if the actual emission is higher than the emission rights granted.</p>	

4.2 Presentation of grants related to income in the statement of profit or loss

Grants related to income must be presented either as:

- (a) A credit in the income statement, either separately or under a general heading such as 'other income'
- Or
- (b) A deduction in reporting the related expense [IAS 20.29]

The standard points out that supporters of method (a) above consider it inappropriate to present income and expense items on a net basis and that "separation of the grant from the expense facilitates comparison with other expenses not affected by a grant". [IAS 20.30]. Furthermore, method (a) is consistent with the general prohibition of offsetting in IAS 1 *Presentation of Financial Statements*. [IAS 1.32, IAS 1.33]. However, supporters of method (b) above would argue that "the expenses might well not have been incurred by the entity if the grant had not been available and presentation of the expense without offsetting the grant may therefore be misleading". [IAS 20.30]. The standard regards both methods as acceptable for the presentation of grants related to income. [IAS 20.31]. When offsetting is permitted by another standard, the general prohibition in IAS 1 does not apply. [IAS 1.32]. In any case, IAS 20 considers that disclosure of the grant is necessary when material for a proper understanding of the financial statements. Furthermore, disclosure of the effect of grants on any item of income or expense, which must be disclosed separately, is usually appropriate. [IAS 20.31].

As illustrated below, Anheuser-Busch InBev NV/SA has adopted a policy of presenting grants within other operating income, which is shown separately on the face of the income statement as a component of profit from operations, rather than as a deduction from the related expense.

Practical example 4-3: Anheuser-Busch InBev NV/SA (2023)	Belgium
2023 Annual Report [extract] Financial report [extract] Consolidated financial statements [extract] Notes to the consolidated financial statements [extract] 3. Summary of significant accounting policies [extract] (W) INCOME RECOGNITION [extract]	
<p>Government grants</p> <p>A government grant is recognized in the statement of financial position initially as deferred income when there is reasonable assurance that it will be received and that the company will comply with the conditions attached to it. Grants that compensate the company for expenses incurred are recognized as other operating income on a systematic basis in the same periods in which the expenses are incurred. Grants that compensate the company for the acquisition of an asset are presented by deducting them from the acquisition cost of the related asset.</p>	

Refer to Practical example 4-2 in section 4.1 above for an example of a company presenting the grant as a deduction from the related expense in the income statement.

Frequently asked questions

Question 4-1: Assuming an entity elects not to deduct the government grant from the related expense, can an entity present government grants related to income as revenue?

When grants related to income are not deducted from the related expense, IAS 20 is not prescriptive, stating that such grants are presented "... **either** separately, **or** under a general heading such as 'Other income'". [IAS 20.29].

A question, therefore, arises as to whether it may be appropriate to present income from grants as revenue on the face of the income statement either within one revenue line item with appropriate disaggregation in the notes to the financial statements or shown as a separate line item on the face of the income statement (i.e., Revenue from grants) with inclusion in a revenue subtotal.

How we see it

IFRS 15 defines revenue as income arising in the course of an entity's ordinary activities. Determining whether a government grant is income arising in the course of an entity's ordinary activities is a matter of judgement after considering all the facts and circumstances relevant to an entity. Facts to consider relevant to this judgement include consideration of the business model of the entity as well as the frequency and purpose of grants received.

Accordingly, some grants may be presented as revenue while others, that are determined not to arise in the course of an entity's ordinary activities, cannot be presented as revenue.

However, any grant revenue recognised that is outside the scope of IFRS 15 will need to be presented either separately from revenue from contracts with customers within the income statement or disclosed separately within the notes. This is because entities are required to present in the statement of comprehensive income, or disclose within the notes, the amount of revenue recognised from contracts with customers separately from other sources of revenue.

This view is consistent with the Basis for Conclusions on IFRS 15, which says that an entity can present interest income as revenue only when interest income represents income from an entity's ordinary activities (discussed in Chapter 28). [IFRS 15.BC247].

It is important to distinguish between those transactions which arise in the course of an entity's ordinary activities, and therefore may be presented as revenue, and transactions that are incidental to the main revenue-generating activities, but do not generate revenue themselves.

The presentation approach must be applied consistently to all similar grants and appropriately disclosed. Grants that have the same characteristics must follow the same presentational approach on a consistent basis.

Illustration 4-1: Presentation of grants with different characteristics

Company A has been receiving government grants to fund research activities for a number of years that it presents as 'other operating income'. In its current financial year, it has also received government support to compensate for the salaries of furloughed employees due to the coronavirus pandemic. Company A judges the R&D credits and the furlough grant to have different characteristics. It continues to present the grants to fund research activities separately in other operating income and recognises the furlough grant as a deduction from employment costs.

4.3 Statement of cash flows

The receipt of grants can cause major movements in the cash flows of an entity.

However, neither IAS 20 nor IAS 7 *Statement of Cash Flows* (see Chapter 36) provide unambiguous guidance on where in the statement of cash flows to present the cash inflows from the receipt of government grants.

The IFRS IC discussed the presentation of cash flows for several fact patterns including government grants related to assets in July 2012.⁵ The issue was further discussed in March 2013. The IFRS IC observed that the primary principle behind the classification of cash flows in IAS 7 is that cash flows are classified on the basis of the nature of the activity in a manner that is most appropriate to the business of the entity in accordance with IAS 7.11 and with the definitions of operating, investing and financing activities in IAS 7.6. In the course of the discussions held, staff initially suggested that grants were providing a source of financing to the entity, and consequently cash received would be part of the entity's financing activities. In a later meeting, however, it reached a different conclusion that cash received from a government grant is presented as an operating cash flow instead, on the basis that although cash inflows from a grant provide the entity with financing for the designated asset/activity, a grant does not represent a borrowing activity because there is no expectation that the resource will be returned to the provider of finance; or that the provider of finance will be appropriately compensated. Eventually, the IFRS IC concluded that clarifying the application of the primary classification principle in IAS 7 was a matter too broad for it to address and discontinued its work.⁶

Consequently, until and unless the IASB addresses this issue as part of its upcoming project on the cash flow statement, there is likely to be diversity in practice for the presentation of all grants in the statement of cash flows, whether related to assets or to income. Cash flows received from grants could be considered to be financing by nature because they provide a source of financing to the entity. Alternatively, cash flows received from grants (or only those from grants related to income) could be presented as operating cash flows by default since they do not seem to meet the definition of financing activities and cash flows received from grants related to assets could be presented as investing cash flows as they relate to an investing activity. Further discussion on cash flow classification can be found in Chapter 36.

How we see it

Selecting the most appropriate presentation will be a matter of judgement. Once adopted, the presentation principles must be applied consistently and clear disclosure of the principles and the impact thereof on the cash flow statement must be provided in accordance with IAS 1.

IAS 20 does make clear, however, that cash flows from government grants must be disclosed as separate items in the cash flow statement, even as regards grants related to assets, when such grants are deducted from the related assets for the purpose of presentation in the statement of financial position. [IAS 20.28].

Lastly, cash flows from refundable advances must be presented as financing cash flows, whereas their transformation into a grant, if and when the entity meets the conditions for forgiveness of the loan, is a non-cash transaction.

⁶ [IFRIC Update](#), March 2013, available on the IFRS Foundation's website.

5 Government grants related to biological assets in the scope of IAS 41

A different accounting treatment to that prescribed in IAS 20 is required if a government grant relates to a biological asset measured at its fair value less costs to sell, in accordance with IAS 41, or a government grant requires an entity not to engage in specified agricultural activity. [IAS 41.38]. In this context, the term 'biological asset' excludes bearer plants as defined in IAS 41 (see section 1.1 above). [IAS 41.1(a), IAS 41.5]. Government grants involving biological assets are only accounted for under IAS 20 if the biological asset is "measured at its cost less any accumulated depreciation and any accumulated impairment losses" (see Chapter 38). [IAS 41.37, IAS 41.38]. For government grants relating to biological assets measured at fair value less costs to sell, the requirements of IAS 41 apply as discussed below.

An unconditional government grant related to a biological asset measured at its fair value less costs to sell is recognised in profit or loss when, and only when, the grant becomes receivable. [IAS 41.34]. An entity is therefore not permitted under IAS 41 to deduct a government grant from the carrying amount of the related asset. The IASB determined that any adjustment to the carrying value of the asset would be inconsistent with a fair value model and would give rise to no difference in the treatment of unconditional and conditional government grants, with both effectively recognised in income immediately. [IAS 41.B66].

A conditional government grant related to a biological asset measured at its fair value less costs to sell is recognised only when the conditions attaching to the grant are met. [IAS 41.35]. IAS 41 permits an entity to recognise a government grant as income only to the extent that it (i) has met the terms and conditions of the grant and (ii) has no obligation to return the grant. [IAS 41.36]. This could be later than the point of recognition in IAS 20, where reasonable assurance that these criteria will be met is sufficient. [IAS 20.7]. The following Illustration, which is taken from IAS 41, illustrates how an entity applies these requirements. [IAS 41.36].

Illustration 5-1: Grant relating to biological assets carried at fair value

Entity A receives a government grant under terms that require it to farm in a particular location for five years. The entire government grant must be returned if it farms for less than five years. In this case the government grant is not recognised as income until the five years have passed.

Entity B receives a government grant on a similar basis, except the terms of the grant allow part of it to be retained based on the passage of time. Entity B recognises that part of the government grant as income as time passes.

6 Disclosures

IAS 20 requires, whenever material, that entities must disclose the following information regarding government grants:

- (a) The accounting policy, including the methods of presentation adopted in the statement of financial position, the statement of profit or loss and the cash flow statement
- (b) A description of the nature and extent of the grants recognised in the financial statements and an indication of other forms of government assistance from which the entity has directly benefited
And
- (c) Unfulfilled conditions or other contingencies attaching to government assistance that has been recognised [IAS 20.39]

The Practical examples below illustrate how companies typically satisfy the disclosure requirements of IAS 20. It should be noted that disclosures concerning the nature and conditions of government grants are sometimes relatively minimal, possibly because the amounts involved are immaterial. Marks and Spencer Group plc disclose both government grants received and the effect of other government assistance.

Practical example 6-1: Marks and Spencer Group plc (2021)	United Kingdom
Annual Report & Financial Statements & Notice of Annual General Meeting 2021 [extract] NOTES TO THE FINANCIAL STATEMENTS [extract] 1 ACCOUNTING POLICIES [extract]	
<p>Government grants</p> <p>Government grants are recognised where there is reasonable assurance that the grants will be received and that the Group will comply with the conditions attached to them.</p> <p>Government grants that compensate the Group for expenses incurred are recognised in profit or loss, as a deduction against the related expense, over the periods necessary to match them with the related costs.</p> <p>Government grant income is disclosed in note 30.</p>	
<p>30 GOVERNMENT SUPPORT</p> <p>During the year, the Group has received support from governments in connection with its response to the Covid-19 pandemic. This support included furlough and job retention scheme reliefs, tax payment deferral schemes and business rates relief.</p> <p>The Group has recognised government grant income of £131.5m in relation to furlough programmes, such as the Coronavirus Job Retention Scheme (CJRS) in the UK, and its equivalents in other countries. The salary expense relating to those colleagues on furlough during the period was £181.8m.</p> <p>The Group also benefited from the business rates holiday for the retail, hospitality and leisure sector of £174.6m.</p> <p>There are no unfulfilled conditions or contingencies attached to these grants.</p>	

Additional examples of accounting policies for government grants can be found in Practical examples 4-1 and 4-2 in section 4.1 above and Practical example 4-3 in section 4.2 above.

In Practical example 6-2 below, Stagecoach Group plc also provides an indication of other forms of government assistance from which the entity has directly benefited, [IAS 20.39(b)], in this case in the form of additional support from government bodies and local authorities to whom the Group provides concessionary travel and other tendered transport services.

Practical example 6-2: Stagecoach Group plc (2021)

United Kingdom

Annual Report and Financial Statements 2021 [extract]**Notes to the consolidated financial statements [extract]****Note 3 Operating costs and other operating income [extract]**

COVID-19 related grants receivable reflects the amounts receivable in respect of government grants provided to organisations in light of the ongoing COVID-19 situation. The amounts reflect grants receivable in respect of the year ended 1 May 2021 under the Coronavirus Job Retention Scheme ("CJRS"), the COVID-19 Bus Services Support Grant ("CBSSG") scheme, the COVID-19 Support Grant ("CSG") scheme for bus services in Scotland, the Bus Emergency Scheme ("BES") in Wales and the Light Rail Revenue Grant ("LRRRG") scheme.

Under the CJRS, grant income may be claimed in respect of certain costs to the Group of furloughed employees. The CJRS income included above reflects the costs incurred on or prior to 1 May 2021 that are eligible to be included in CJRS grant claims to the extent the Group considers there to be reasonable certainty that the grant will be received.

Under the CBSSG, CSG and BES schemes, grant income may be claimed by operators of certain bus services to close the shortfall of revenue earned by them during the period affected by COVID-19 and the costs incurred by them in that period. The estimation of the grant income involves significant uncertainty, as explained in note 1(e)(ii) to these consolidated financial statements. The amount of income recognised in the year ended 1 May 2021 reflects the amount in respect of which the Group considers there to be reasonable certainty that: (a) the Group will comply with the conditions attaching to the grant and (b) the grant will be received and retained by the Group, taking account of the potential adjustments to grant payments as a result of any reconciliation process.

In addition to the COVID-19 related grants receivable shown above, some government bodies have agreed to continue certain levels of payments of concessionary revenue, tender revenue and Bus Service Operators Grant ("BSOG") to help support the continuing operation of bus services. The payment rates of these items during the period affected by COVID-19 are higher than they would ordinarily be for the relevant levels of patronage, mileage and fuel consumption. Consistent with previous years, all amounts of concessionary revenue and tender revenue are reported within revenue and an analysis of revenue for the year ended 1 May 2021 is provided in note 2(a) to these consolidated financial statements. Also consistent with previous years, all amounts of BSOG receivable, essentially rebates of fuel duty, are included net within materials and consumables costs shown above.

Had the average rate of concessionary revenue per journey for the year ended 1 May 2021 as a whole been consistent with the rate for the period from 28 April 2019 to 29 February 2020, the concessionary revenue for the year would have been £89.1m, £153.9m lower than £243.0m reported in note 2(a) (2020: £234.3m, £22.3m lower than £256.6m reported in note 2(a)). While not all concessionary revenue is ordinarily determined on a "per journey" basis, that illustrates the extent to which concessionary payments were maintained notwithstanding the COVID-19 related reductions in journey numbers.

Question 3-1:	How does an entity account for cash received from a government to help finance a research and development project, when nothing is repayable in cash if the project is unsuccessful and instead the entity is required only to transfer to the government the rights to the research?	1854
Question 4-1:	Assuming an entity elects not to deduct the government grant from the related expense, can an entity present government grants related to income as revenue?	1864

Appendix C - Defined terms

Extract from IFRS accounting standards - Definitions

bearer plant	<p>A <i>bearer plant</i> is a living plant that:</p> <ul style="list-style-type: none"> (a) is used in the production or supply of agricultural produce; (b) is expected to bear produce for more than one period; and (c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales. [IAS 41.5].
biological asset	A <i>biological asset</i> is a living animal or plant. [IAS 41.5].
costs to sell	<p><i>Costs to sell</i> are the incremental costs directly attributable to the disposal of an asset, excluding finance costs and income taxes. [IAS 41.5].</p>
government	<i>Government</i> refers to government, government agencies and similar bodies whether local, national or international. [IAS 20.3].
government assistance	<i>Government assistance</i> is action by government designed to provide an economic benefit specific to an entity or range of entities qualifying under certain criteria. Government assistance for the purpose of this Standard does not include benefits provided only indirectly through action affecting general trading conditions, such as the provision of infrastructure in development areas or the imposition of trading constraints on competitors. [IAS 20.3].
government grants	<i>Government grants</i> are assistance by government in the form of transfers of resources to an entity in return for past or future compliance with certain conditions relating to the operating activities of the entity. They exclude those forms of government assistance which cannot reasonably have a value placed upon them and transactions with government which cannot be distinguished from the normal trading transactions of the entity. ² [IAS 20.3].
grants related to assets	<i>Grants related to assets</i> are government grants whose primary condition is that an entity qualifying for them should purchase, construct or otherwise acquire long-term assets. Subsidiary conditions may also be attached restricting the type or location of the assets or the periods during which they are to be acquired or held. [IAS 20.3].
grants related to income	<i>Grants related to income</i> are government grants other than those related to assets. [IAS 20.3].
forgivable loans	<i>Forgivable loans</i> are loans which the lender undertakes to waive repayment of under certain prescribed conditions. [IAS 20.3].
fair value	<i>Fair value</i> is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 Fair Value Measurement.) [IAS 20.3].

Overview

In some countries, governments have introduced contractual service arrangements to attract private sector participation in the development, financing, operation and maintenance of public service infrastructure. IFRIC 12 *Service Concession Arrangements* was developed to provide guidance on the accounting by private sector operators for public-to-private service concession arrangements. The interpretation applies to public-to-private service concession arrangements (SCAs) in which the public sector grantor controls or regulates what services the operator must provide with the infrastructure, to whom it must provide them, and at which price, and the grantor controls- through ownership, beneficial entitlement or otherwise- any significant residual interest in the infrastructure at the end of the term of the arrangement. It does not specify the accounting by grantors.

Infrastructure within the scope of IFRIC 12 is not recognised as property, plant and equipment of the operator as the operator does not have the right to control the use of the infrastructure. Instead, the operator acts as service provider, and recognises revenue in accordance with IFRS 15 *Revenue from Contracts with Customers* for the services it performs. The nature of the consideration receivable determines its subsequent accounting treatment.

This chapter addresses the scope of IFRIC 12, and the accounting for service concession arrangements within the scope of IFRIC 12. It also covers disclosures required by SIC-29 *Service Concession Arrangements: Disclosures*. Revenue recognition in accordance with IFRS 15 is addressed in Chapter 28.

What you need to know

- IFRIC 12 applies to public-to-private service concession arrangements in which:
 - The public sector grantor controls or regulates:
 - What services the operator must provide with the infrastructure
 - To whom it must provide them
 - And
 - At what price
 - And
 - The grantor controls any significant residual interest in the infrastructure at the end of the term of the arrangement.
- IFRIC 12 does not specify the accounting by grantors.
- The assessment of whether an arrangement is a service concession in scope of IFRIC 12, or an outsourcing arrangement, could give rise to differences in accounting for the private sector entity.
 - It is important to consider whether the infrastructure is being used by the operator to provide services for the benefit of the public, rather than to the grantor for its own benefit.
- Infrastructure within the scope of IFRIC 12 is not recognised as property, plant and equipment of the operator. Instead, the operator recognises a financial asset, an intangible asset, or both, as consideration for construction or upgrade services provided.
- IFRIC 12 requires the operator to account for construction or upgrade services, and operation services, in accordance with IFRS 15.
- Under the financial asset model, total revenue recognised over the concession term will be the same as the total cash inflows under the contract. Total revenue recognised under the intangible asset model will also include the fair value of the intangible asset, and so will be higher by that amount.
- Disclosure requirements for service concession arrangements are set out in SIC-29.

1 Introduction

Service concession arrangements have been developed as a mechanism for governments to procure public services using private capital and management expertise. The rights and obligations of the public sector body procuring the services and the private sector entity providing the services are set out in a contract, the terms of which can be complex depending upon the nature of the SCA. The most common forms of arrangement are as follows:

- **'Build-operate-transfer'** SCA - where a private sector entity takes responsibility for building and operating infrastructure assets such as roads, bridges, railways, hospitals, prisons, power stations and schools, in consideration for a long-term contract from the public sector body giving the entity the right to charge for services to the public using that infrastructure.
- **'Rehabilitate-operate-transfer'** SCA - where the private sector entity restores or improves an existing facility or public service up to an agreed standard and continues to maintain and operate the related infrastructure for a contracted period. This type of arrangement includes a range of projects from the refurbishment of social housing and street lighting to major civil engineering projects to restore a city's underground rail system.
- **'Operate-only'** SCA - where a private sector entity becomes responsible for the operational management and maintenance of an existing infrastructure asset that is used to provide services to the public. This last variant, together with the development of similar arrangements between private sector bodies, has at times obscured the boundary between service concessions and outsourcing arrangements (see section 2.2.1 below).

The accounting challenge is to reflect the substance of these arrangements fairly in the financial statements of both of the contracting parties, because the various transactions between the parties to a SCA range across a number of accounting standards and interpretations, including:

- Accounting for the rights of the parties over the infrastructure assets (IAS 16 *Property, Plant and Equipment*, and IFRS 16 *Leases*)
- Construction or refurbishment of the infrastructure assets (IFRS 15)
- Accounting for the various obligations under the contract during the operations period of the concession (IFRS 15 and IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*)
- Recognition and measurement of the amounts payable or receivable under the arrangement (IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance*, IAS 23 *Borrowing Costs*, IAS 32 *Financial Instruments: Presentation*, IAS 37, IAS 38 *Intangible Assets* and IFRS 9 *Financial Instruments*)

This makes it difficult to develop a coherent accounting model that deals with all the features of service concessions simultaneously, and from the position of both the private sector (i.e., the 'operator') and public sector (i.e., the 'grantor'). Moreover, prior to the issue of IFRIC 12, entrenched national positions had developed and differing accounting treatments had been widely adopted in various jurisdictions, with or without a basis in specific local accounting standards. Also, some jurisdictions accepted more than one accounting treatment for broadly similar arrangements, some of which are influenced by a taxation basis that has been agreed with the jurisdictional taxation authorities. All this resulted in considerable diversity in the accounting by IFRS reporters of seemingly similar arrangements.

In 2001, SIC-29 was issued. This did not attempt to address the accounting issues but considered the information that must be disclosed in the notes to the financial statements of an 'operator' and 'grantor' under a service concession arrangement. [SIC-29.4]. Its requirements are described further in section 7 below.

IFRIC 12 addresses the accounting issues from the perspective of the operator and was approved by the IASB in November 2006. The fact that the Interpretation took more than three years to develop indicates the complexity of the issues and the difficulty that the IFRS IC encountered in fitting a solution into the existing accounting framework.

IFRIC 12 is not a converged standard and there are differences of methodology between the IFRS accounting standards and US GAAP guidance on this topic that are not discussed in this chapter.

1.1 The IFRS IC's approach to accounting for service concessions

The IFRS IC views the primary accounting determination for the operator as being whether control over the infrastructure assets rests with the operator or whether any new or existing assets under the concession arrangement are controlled by the grantor. [IFRIC 12.BC11].

The IFRS IC decided that arrangements where control does not rest with the grantor, and the asset is either derecognised by the grantor or is an asset constructed for the concession that the grantor never controls, can be dealt with adequately by other accounting standards or interpretations. [IFRIC 12.BC12, IFRIC 12.BC13]. The interrelationship with other accounting standards is discussed further in section 2.2 below.

Infrastructure assets controlled by the grantor are the subject of IFRIC 12. This applies whether the assets are constructed or acquired by the operator for the concession, that become those of the grantor because it controls them, or existing assets that remain under the grantor's control and to which the operator is granted access. [IFRIC 12.7].

'Control' is therefore a central concept in IFRIC 12. Control is not determined by attributing risks and benefits to identify the 'owner' of the infrastructure. Instead, IFRIC 12 regards control in terms of the operator's ability (or lack thereof) to decide how to use the asset during the concession term and how it will be deployed thereafter. Its definition and consequences are discussed further in section 3 below.

Thus, an operator will account for any infrastructure that is under the control of the grantor using IFRIC 12. In doing so, the IFRS IC establishes the following principles for accounting by the operator of a concession falling within its scope:

- The infrastructure is not recognised as property, plant and equipment by the operator. [IFRIC 12.11].
- The operator recognises revenue from construction services when assets are built or upgraded during the concession term. [IFRIC 12.14].
- A financial asset or an intangible asset is recognised as consideration for these construction services, depending upon the way in which the operator is paid for services under the contract. [IFRIC 12.15].
- However, both types of consideration are classified as a contract asset during the construction or upgrade period in accordance with IFRS 15. [IFRIC 12.19].
- Revenue and costs for the provision of operating services are recognised over the term of the concession arrangement. [IFRIC 12.20].

The requirement to recognise an asset as consideration for construction services gives rise to three service concession models- the 'financial asset' model, the 'intangible asset' model and a hybrid model. These are considered further in section 4 below. However, under all models the operator is required to recognise a contract asset during the construction or upgrade period in accordance with IFRS 15. The recognition of revenue and costs in the operations phase is discussed in section 5 below.

1.2 Terms used in this chapter

The following terms are used in this chapter with the meanings specified:

Term	Definition
Grantor	A public sector body (including a governmental body, or a private sector entity to which responsibility for a public service has been devolved) that grants the service arrangement. <i>[IFRIC 12.3].</i>
Operator	A private sector entity that is contractually obliged to construct and/or upgrade, operate and maintain infrastructure used to provide services to the public on behalf of the public sector entity. The operator is responsible for at least some of the management of the infrastructure and related services and does not merely act as an agent on behalf of the grantor. <i>[IFRIC 12.2, IFRIC 12.3].</i>
Service concession arrangement	A contract that obliges the operator to construct and/or upgrade, operate and maintain infrastructure used to provide the services to the public on behalf of the grantor. The contract sets the initial prices to be levied by the operator and regulates price revisions over the period of the service arrangement. <i>[IFRIC 12.3].</i>
Infrastructure	Assets used in the provision of services to the public. Examples include roads, bridges, tunnels, prisons, hospitals, airports, water distribution facilities, energy supply and telecommunications networks. <i>[IFRIC 12.1].</i> Infrastructure can be constructed or acquired by the operator for the purpose of the service arrangement; or can be existing assets to which the grantor gives the operator access for the purpose of the service arrangement. <i>[IFRIC 12.7].</i>
Control criteria	<p>(a) The grantor controls or regulates what services the operator must provide with the infrastructure, to whom it must provide them, and at what price.</p> <p>And</p> <p>(b) The grantor controls any significant residual interest in the infrastructure at the end of the term of the arrangement, through ownership, beneficial entitlement or otherwise. <i>[IFRIC 12.5].</i></p>
Residual interest in the infrastructure	The estimated current value of the infrastructure as if it were already of the age and in the condition expected at the end of the period of the arrangement. <i>[IFRIC 12.AG4].</i>
Government	Refers to government, government agencies and similar bodies whether local, national, or international. <i>[IAS 20.3].</i>

2 Scope of IFRIC 12

The scope of IFRIC 12 is specific and relatively narrow. [IFRIC 12.5].

Extract from IFRIC 12

- 5 This Interpretation applies to public-to-private service concession arrangements if:
- (a) the grantor controls or regulates what services the operator must provide with the infrastructure, to whom it must provide them, and at what price; and
 - (b) the grantor controls - through ownership, beneficial entitlement or otherwise - any significant residual interest in the infrastructure at the end of the term of the arrangement.

Infrastructure used in a service concession for its entire useful life is deemed to meet the second condition above (grantor control of significant residual interest) because there is no significant residual interest. [IFRIC 12.6].

The IFRS IC also decided to restrict its guidance to the accounting by operators in public-to-private service concession arrangements. [IFRIC 12.4]. Accordingly, the Interpretation does not specify the accounting by grantors. [IFRIC 12.9].

The IFRS IC acknowledged that these restrictions would exclude many arrangements that are found in practice for private sector participation in the provision of public services. However, it concluded that the above conditions were likely to be met in most of the public-to-private service concession arrangements for which guidance had been sought and that other accounting standards apply when these conditions are not a feature of the arrangement. [IFRIC 12.BC11, IFRIC 12.BC13]. The accounting standards that might apply for arrangements outside the scope of IFRIC 12 are set out in section 2.2 below.

2.1 Public service nature of the obligation

Initially, as described in the exposure draft D12,¹ the interpretation was intended to apply only to arrangements that involved a 'public service obligation', i.e., a contractual obligation for the operator to keep the infrastructure available for public use.

Having agreed that "...the concept of a public service obligation was not in itself robust enough to form the basis for the scope...",² the IFRS IC did not retain this condition. This is understandable, since different governments will have a range of political or ideological views of what activities should be provided by the state and the definition of a 'public service obligation' may vary across jurisdictions and, sometimes, over time within the same jurisdiction.

As a result, the reference to "...the public service nature of the obligation undertaken by the operator..." now only appears as a common feature of a service concession in the background section of the interpretation, without defining what is meant by the term. [IFRIC 12.3]. Instead, the IFRS IC refers to examples of service concession arrangements. IFRIC 12 identifies roads, bridges, tunnels, prisons, hospitals, airports, water distribution facilities, energy supply and telecommunications networks as examples of infrastructure used for public services. [IFRIC 12.1]. SIC-29 refers to water treatment and supply facilities, motorways, car parks, tunnels, bridges, airports and telecommunications networks. [SIC-29.1]. It also states that a service concession arrangement generally involves the grantor conveying to the concession operator the right to provide services that give the public access to major economic and social facilities for the period of the concession. [SIC-29.2(a)].

It is at least clear that it is not necessary for the operator to have direct involvement with the public as evidenced by the example in the Application Guidance of the interpretation of a hospital used by the grantor to treat public patients. [IFRIC 12.AG7].

1 Exposure Draft D12 *Service Concession Arrangements - Determining the Accounting Model*.

2 [IFRIC Update](#), September 2005, available on the IFRS Foundation's website.

2.2 Arrangements that are not in the scope of IFRIC 12

The IFRS IC acknowledged that in practice there are arrangements between the public sector and the private sector that will not fall in the scope of IFRIC 12. However, it was satisfied that the Interpretation would apply to most of the public-to-private service concession arrangements for which guidance had been sought. Nevertheless, the IFRS IC did consider a range of typical arrangements and decided that it could provide references to the accounting standards that apply to those that fall outside the scope of IFRIC 12 without giving any guidance as to their application. [IFRIC 12.BC13].

These references are presented in Information note 2 to IFRIC 12 which shows a range of arrangements between the public and private sectors. The IFRS IC's view is that IFRIC 12 is interpreting IFRS accounting standards for the transactions in the middle of this range, where the application of accounting standards was previously unclear. These are described in Information note 2 below as 'Rehabilitate-operate-transfer' and 'Build-operate-transfer' arrangements. The Information note also demonstrates how other accounting standards, namely IFRS 16, IFRS 15 and IAS 16, apply to arrangements that do not meet the control criteria of a public-to-private service concession as defined in the Interpretation.

Extract from IFRIC 12

Information note 2

References to IFRSs that apply to typical types of public-to-private arrangements

This note accompanies, but is not part of, IFRIC 12.

The table sets out the typical types of arrangements for private sector participation in the provision of public sector services and provides references to IFRSs that apply to those arrangements. The list of arrangements types is not exhaustive. The purpose of the table is to highlight the continuum of arrangements. It is not the IFRIC's intention to convey the impression that bright lines exist between the accounting requirements for public-to-private arrangements.

Category	Lessee	Service Provider			Owner	
Typical arrangement types	Lease (eg Operator leases assets from grantor)	Service and/or maintenance contract (specific tasks eg debt collection)	Rehabilitate-operate-transfer	Build-operate-transfer	Build-own-operate	100% Divestment/Privatisation/Corporation
Asset ownership	Grantor				Operator	
Capital investment	Grantor		Operator			
Demand risk	Shared	Grantor	Operator and/or Grantor		Operator	
Typical duration	8-20 years	1-5 years	25-30 years			Indefinite (or may be limited by licence)
Residual interest	Grantor				Operator	
Relevant IFRSs	IFRS 16	IFRS 15	IFRIC 12		IAS 16	

[IFRIC 12.IG Information note 2]

2.2.1 Outsourcing arrangements

Service concessions are not the only contractual arrangements between public sector bodies and private sector providers of services. Public sector bodies lease buildings or other property, plant and equipment from private sector entities for their own use. The private sector entity might also be engaged to construct the buildings or other property before it is occupied by the public sector body. The public sector also engages independent subcontractors to perform procurement services or to outsource the operation of its internal activities and functions.

It is important to consider whether the infrastructure is being used by the operator to provide services for the benefit of the public (such as in the case of a water treatment facility, for example), rather than to the grantor for its own benefit.

SIC-29 identifies examples of activities that are not service concession arrangements, citing an entity outsourcing the operation of its internal services, such as employee cafeteria, building maintenance, and accounting or information technology functions. [SIC-29.1].

The IFRS IC noted in September 2005 that it would not expect an information technology outsourcing arrangement for a government department to be dealt with under IFRIC 12 because the infrastructure is not available for the public to use.³

The assessment of whether an arrangement is a service concession within scope of IFRIC 12 or an outsourcing arrangement could give rise to differences in accounting for the private sector entity. Treating an arrangement as an outsourcing arrangement could result in the private sector entity recognising property, plant and equipment in its financial statements in respect of the assets subject to the arrangement. This would be the case, if the arrangement was accounted for as the provision of goods and services under IFRS 15. When the private sector entity is considered to be the lessor, given the length of typical service concession arrangements, it is likely that a finance lease receivable would be recognised under IFRS 16. [IFRS 16.63, IFRS 16.67]. Although for an arrangement accounted for under IFRIC 12, the private sector entity (operator) would in this case normally recognise a financial asset, an important distinction is that in an IFRIC 12 service concession, the private sector entity would recognise revenue in the period during which any infrastructure asset was being constructed. [IFRIC 12.14]. A lessor would record an IAS 16 asset under construction and only recognise a gain or loss on derecognition of the constructed asset at lease commencement if the terms of the lease required that asset to be derecognised.

2.2.2 Rate-regulated activities

In many countries, the provision of utilities (e.g., water, natural gas or electricity) to consumers is regulated by a government agency (regulator). Regulations differ between countries but often regulators operate a cost-plus system under which a utility provider is allowed to make a fixed return on investment. When there is a rate-adjustment mechanism to adjust the future price, a utility provider is allowed to charge its customers for variances between estimated and actual inputs to the rate calculation. Hence, this adjustment creates timing differences as the future price for services may be influenced by past cost levels and investment levels. For some time, the Board has been working on its rate-regulated activities project to address the accounting and disclosure of rate-regulated activities. Currently, IFRS 14 *Regulatory Deferral Accounts*, an interim standard on the accounting for regulatory deferral accounts, applies for first-time adopters of IFRS accounting standards who conduct rate-regulated activities (as defined in that standard) and recognised amounts that qualify as regulatory deferral account balances in their financial statements under their previous GAAP. [IFRS 14.5]. This standard does not apply to other IFRS reporters and in some jurisdictions (e.g., Europe) it has not been endorsed in local regulations.

³ [IFRIC Update](#), September 2005, available on the IFRS Foundation's website.

In January 2021, the Board published the Exposure Draft *Regulatory Assets and Regulatory Liabilities*. Under its proposals, when an entity has an enforceable right, created by a regulatory agreement, to add an amount in determining the regulated rate to be charged to customers in future periods, it must recognise this as regulatory income together with a related regulatory asset. Conversely, a regulatory expense and a related regulatory liability must be recognised when an entity has an enforceable present obligation, created by a regulatory agreement, to deduct an amount in determining the regulated rate to be charged to customers in future periods.⁴ The Exposure Draft gives a service concession arrangement as an example of a regulatory agreement.⁵ Accordingly, the forthcoming IFRS accounting standard may have an impact on the accounting for service concession arrangements. At the time of writing, the IASB has finalised redeliberating the proposals in the Exposure Draft, with the expectation of an IFRS accounting standard during the first half of 2026.⁶

The rate-regulated activities project is discussed further in Chapter 28.

2.3 Interaction of IFRS 16 and IFRIC 12

IFRS 16 clearly excludes from its scope service concession arrangements falling within scope of IFRIC 12. [IFRS 16.3(c)].

IFRS 16 defines an arrangement as containing a lease “...if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration”. [IFRS 16.9]. A right to control the use of an identified asset is then described in terms of the right to direct the use of the asset. [IFRS 16.B9]. Since IFRS 16 clearly applies a control model, like IFRIC 12, any arrangement that meets the control criteria in IFRIC 12.5 cannot meet the definition of a lease in IFRS 16, [IFRS 16.BC69], as a conclusion that the grantor controls or regulates what services the operator must provide with the infrastructure, to whom, and at what price, [IFRIC 12.5], is not compatible with the assertion that the private sector entity has a leasehold interest in the same assets under IFRS 16. The control criteria in IFRIC 12 are discussed in section 3 below.

In light of this, the IASB had considered whether it was necessary to explicitly exclude from the scope of IFRS 16 service concession arrangements within the scope of IFRIC 12. However, stakeholders informed the IASB that including a scope exclusion for service concession arrangements in IFRS 16 would provide clarity in this respect. [IFRS 16.BC69].

2.4 Private-to-private arrangements

While the IFRS IC expects IFRIC 12 to be applied primarily to public-to-private arrangements, its application to private-to-private arrangements is neither required nor prohibited. The Basis for Conclusions notes that application by analogy could be appropriate under the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* if the arrangement met the control criteria quoted in section 2 above. [IFRIC 12.BC14]. Accordingly, the application of IFRIC 12 to other arrangements would be regarded as an accounting policy choice, rather than a treatment that could be determined on a case-by-case basis. However, this choice would not be possible if it was determined that the arrangement falls within the scope of other accounting standards, such as IFRS 15 and IFRS 16. In practice, it is not common to see IFRIC 12 applied to private-to-private arrangements.

2.5 Accounting by grantors

The Interpretation applies only to accounting by the operator, not the grantor. [IFRIC 12.4, IFRIC 12.9]. Grantor accounting was determined not to be a priority for the IFRS IC, who noted that grantors are government bodies that do not necessarily apply IFRS accounting standards. [IFRIC 12.BC15]. IPSAS 32 *Service Concession Arrangements: Grantor*, issued by the International Public Sector Accounting Standards Board (IPSASB), addresses the grantor's accounting in such arrangements. Its approach is consistent with that used for the operator's accounting in IFRIC 12, in that an infrastructure asset is recognised by the grantor, together with an obligation comprising either a financial liability to the operator or, where an unconditional obligation to pay cash to the operator is not a feature of the arrangement, a deferred revenue balance.⁷ This chapter does not address accounting by grantors.

3 The control model

A contractual arrangement that is within the scope of IFRIC 12 includes both of the following features, commonly referred to as the 'control criteria':

- (a) The grantor controls or regulates the services that the operator must provide using the infrastructure, to whom it must provide them, and at what price.

And

- (b) The grantor controls any significant residual interest in the infrastructure at the end of the concession term through ownership, beneficial entitlement or otherwise. [IFRIC 12.5].

The IFRS IC considers that, taken together, these conditions identify when the infrastructure is controlled by the grantor for the whole of its economic life, [IFRIC 12.AG6], in which case an operator is only managing the infrastructure on the grantor's behalf. Crucially, it has concluded from this that an infrastructure asset controlled by the grantor cannot be the property, plant and equipment of the operator. [IFRIC 12.11, IFRIC 12.BC21, IFRIC 12.BC22]. Control must be distinguished from management. If the grantor retains both the degree of control described in (a) above and any significant residual interest in the infrastructure, the operator is only managing the infrastructure on the grantor's behalf- even though, in many cases, it may have wide managerial discretion. [IFRIC 12.AG5].

3.1 Regulation of services

The control or regulation of services does not have to be governed by contract as it could include control via an industry regulator. Control also extends to circumstances in which the grantor buys all the output as well as those in which it is bought by other users.

The grantor and relevant related parties must be considered together. If the grantor is a public sector entity, the public sector as a whole, together with any independent regulators acting in the public interest, are to be regarded as related to the grantor. [IFRIC 12.AG2]. 'Price' can mean the amount at which the grantor buys the service or the amount that the operator charges members of the public or a combination of both.

This means that many regulated public utilities (water, sewage, electricity supply etc.) will fall within (a) in section 3 above. Other arrangements that fall within (a) include public health facilities that are free to users and subsidised transport facilities (some rail, toll roads and bridges) that are partly paid by public sector grant and partly by passenger fares. Of course, all of these will only be within scope of IFRIC 12 if there is also a contract between grantor and operator for the arrangement and any significant residual interest is also 'controlled' by the grantor under (b) above.

The IFRS IC stresses that the grantor does not need to have complete control of the price. It is sufficient for the price to be regulated, which could be by way of a capping mechanism (regulated utilities are usually free to charge lower prices). Other 'caps' may not be so apparent. A contract may give the operator freedom to set its prices, but any excess is clawed back by the grantor, e.g., through setting a maximum return on an agreed investment in the infrastructure. In such a case, the operator's return is capped, and the price element of the control test is substantively met. [IFRIC 12.AG3].

Care must be taken to look to the substance of the agreements, so a cap that only applies in remote circumstances will be ignored. [IFRIC 12.AG3].

A requirement in the agreement for the grantor to review or approve prices would also generally be sufficient to determine that the grantor controls the price. It would not be appropriate to assume that such approvals are insubstantial or 'rubber stamps' that could be disregarded by the operator.⁸ See section 2.2.2 above for discussion of the forthcoming IFRS accounting standard on rate-regulated activities.

⁸ [IFRIC Update](#), July 2009, available on the IFRS Foundation's website.

3.1.1 Partial regulation of services

Some arrangements only allow the grantor to control prices for part of the life of the infrastructure. For example, an operator may construct clinical facilities that are used by a government health care provider (the grantor) for a five-year contract term (i.e., for a period less than the remaining useful life of the infrastructure). At the end of the term, the health care provider may request (but not require) the operator to extend the contract by renegotiation. If it does not do so, the operator can run the facilities for private health care. Although the prices are controlled for the first five years, this arrangement is unlikely to meet the control condition in (a) in section 3 above.

Alternatively, the contract might allow regulation of the prices of some but not all the services provided with the infrastructure. Judgement is required in determining whether arrangements involving partially regulated assets fall within the scope of IFRIC 12 (see section 3.4 below).

Where arrangements involving partially regulated assets do not fall within the scope of IFRIC 12, the operator would need to assess how other accounting standards, namely IFRS 16, IFRS 15 and IAS 16 apply to the arrangement. See section 2.2 above for further discussion of arrangements that are not in scope of IFRIC 12.

3.2 Control of the residual interest

In order for an arrangement to be within scope of IFRIC 12, the grantor must control not only the services provided with the infrastructure but also any significant residual interest in the infrastructure at the end of the concession term through ownership, beneficial entitlement or otherwise. [IFRIC 12.5(b)]. For this to be the case, the grantor's control over any significant residual interest should restrict the operator's ability to sell or pledge the infrastructure. [IFRIC 12.AG4]. IFRIC 12 provides only this limited guidance on assessing whether the grantor controls any significant residual interest in the infrastructure. It may be relevant also to consider that IFRS 15 states that "...Control of an asset refers to the ability to direct the use of, and obtain substantially all of the remaining economic benefits from, the asset. Control includes the ability to prevent other entities from directing the use of, and obtaining the benefits from, an asset. The benefits of an asset are the potential cash flows (inflows or savings in outflows) that can be obtained directly or indirectly in many ways...". [IFRS 15.33]. As discussed below, control over the residual interest does not require the infrastructure to be returned to the grantor. It is sufficient that the grantor controls how access to the infrastructure is awarded after the concession term.

The control approach requires consideration of the infrastructure as a whole, thereby avoiding the piecemeal accounting for the different components of the infrastructure as required by IAS 16. If the operator has to replace part of an item of infrastructure during the life of the concession, e.g., the top layer of a road or the roof of a building, the item of infrastructure is to be considered as a whole, so that condition (b) will be met for the whole of the infrastructure, including the part that is replaced, if the grantor has the residual interest in the final replacement of that part. [IFRIC 12.AG6].

The Interpretation does not expand on what is regarded as 'significant'. Some infrastructure assets such as toll roads and bridges generate cash flows directly and it may be possible to use estimated future cash flows to calculate the significance of the residual value, whether or not the grantor will charge tolls after reversion of the asset. It may not be possible to base the assessment of 'significance' on the cash flows received by the operator on handing back the asset to the grantor as these may be nominal amounts; indeed, the grantor may pay nothing. The remaining useful life of the asset when it reverts may give a good indication, e.g., if a hospital is handed back to the public sector with a remaining useful life of twenty years, this residual interest is likely to be significant.

There are a number of features that indicate whether the grantor controls the residual interest. There are usually several contractual alternatives: the operator is granted a second concession term, a new operator is allowed to acquire the assets or the grantor acquires the assets and brings the arrangement 'in house'. The grantor still controls the residual as it will determine which of these alternatives applies and the option exercise price (if it or a new operator acquires the infrastructure) is irrelevant.

In some arrangements, the grantor only has an option to reacquire the asset at the end of the concession term. The operator cannot control the infrastructure until the grantor decides what to do with the option. An option at fair value at the date of exercise may by itself be enough to give the grantor control over the residual under IFRIC 12 if it is sufficient to restrict the operator's ability to sell or pledge the infrastructure. This is a clear difference between a 'risks and rewards' and a 'control' model as under the former, the operator would be seen as keeping the risks and rewards of ownership if another party had the right to acquire the asset at fair value.

Illustration 3-1: Residual arrangements

A gas transmission system is being operated under a concession arrangement with the State Gas Authority. At the end of the term, the grantor will either acquire the infrastructure assets at their net book value, determined on the basis of the contract, or it may decide to grant a new SCA on the basis of a competitive tender, which will exclude the current operator. If the grantor elects to do the latter, the operator will be entitled to the lower of the following two amounts:

(a) The net book value of the infrastructure, determined on the basis of the contract
And

(b) The proceeds of a new competitive bidding process to acquire a new contract

Although the operator cannot enter the competitive tender, it also has the right to enter into a new concession term but, in order to do so, it must match the best tender offer made. It has to pay to the grantor the excess of the best offer (b) above the amount in (a); should the tender offer be lower than (a), it will receive an equivalent refund.

In this arrangement, the grantor will control the residual. It can choose to take over the activities of the concession itself or it can allow potential operators, including the incumbent, to bid for a second term. The price that might be received by the operator, or paid by the grantor, is not relevant.

What if the arrangement is for the whole life of the infrastructure? Assets in service concession arrangements may revert to the grantor at the end of the concession term but they may not have much, if any, remaining useful life. Many modern buildings, for example, only have a useful life of thirty years or so and this is a common concession term. Consequently, infrastructure used in a service concession arrangement for its entire useful life ('whole of life infrastructure') is included within the scope of IFRIC 12 if the grantor controls or regulates the services that the operator must provide using the infrastructure, to whom it must provide them, and at what price. [IFRIC 12.6].

The IFRS IC noted that one reason for including the 'significant residual interest' requirement was to differentiate between privatised, but still regulated, industries and service concession arrangements, thereby seeming to confirm that it had not intended regulated industries to be in scope.⁹ The IFRS IC considers that privatised regulated industries are generally out of scope, because they are divestitures or privatisations where it is more appropriate to treat the infrastructure as the property, plant and equipment of the operator. This is indicated in the table included as Information note 2 to IFRIC 12 (reproduced in section 2.2 above). It is usually the case in a privatisation that the infrastructure only reverts to the grantor in the event of a major breach of the conditions of the regulatory framework as otherwise the right of the operator to provide the regulated services may roll over indefinitely into a new term. In other cases, it may require legislative change to bring the assets back into the control of the public sector. This means that the grantor does not control the residual interest in the property as required by IFRIC 12.

ENGIE SA discloses that some of its concessions are not considered to be within scope of IFRIC 12 as the grantor has no rights over the infrastructure at the end of the contract. These assets (for gas distribution) are likely to have an economic life significantly in excess of the contract term.

⁹ [IFRIC Update](#), September 2005, available on the IFRS Foundation's website.

Practical example 3-1: ENGIE SA (2023)

France

2023 MANAGEMENT REPORT AND ANNUAL CONSOLIDATED FINANCIAL STATEMENTS [extract]**03 NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****NOTE 13 FIXED ASSETS [extract]****13.2 Intangible assets [extract]****Accounting standards [extract]****Intangible rights arising on concession contracts**

IFRIC 12 – *Service Concession Arrangements* deals with the treatment to be applied by the concession operator in respect of certain concession arrangements.

For a concession arrangement to fall within the scope of IFRIC 12, usage of the infrastructure must be controlled by the concession grantor. This requirement is satisfied when the following two conditions are met:

- the grantor controls or regulates what services the operator must provide with the infrastructure, to whom it must provide them, and at what price; and
- the grantor controls any residual interest in the infrastructure at the end of the term of the arrangement, for example it retains the right to take back the infrastructure at the end of the concession.

The intangible asset model according to paragraph 17 of IFRIC 12 applies if the operator receives a right (a license) to charge the users, or the grantor, depending on the use made of the public service. There is no unconditional right to receive cash, as the amounts depend on the extent to which the public uses the service.

Concession infrastructures that do not meet the requirements of IFRIC 12 are presented as property, plant and equipment. This is the case of gas distribution infrastructures in France. The related assets are recognized in accordance with IAS 16, given that GRDF operates its network under long-term concession arrangements, most of which are mandatorily renewed upon expiration pursuant to French law No. 46-628 of April 8, 1946.

3.3 Assets within scope

Extract from IFRIC 12

7 This Interpretation applies to both:

- (a) infrastructure that the operator constructs or acquires from a third party for the purpose of the service arrangement; and
- (b) existing infrastructure to which the grantor gives the operator access for the purpose of the service arrangement.

[IFRIC 12.7].

How we see it

Generally, 'infrastructure' is interpreted broadly, and it is accepted that 'the infrastructure' used to provide services can include moveable assets.

Although IFRIC 12 uses the word 'infrastructure' and includes examples traditionally regarded as such, including roads, bridges, hospitals, and airports, [IFRIC 12.1], the Interpretation is based on the definition of an asset under IFRS accounting standards. "An asset is a present economic resource controlled by the entity as a result of past events" [CF 4.3] and is therefore considered to apply to all assets, including items such as buses or railway rolling stock that are made available by the grantor to the operator of the public service.

It is usually relatively straightforward to apply (a) above to infrastructure that the operator constructs or acquires from a third party for the purpose of the concession. The accounting for service concession arrangements in which infrastructure is leased from a party other than the grantor is discussed in section 3.3.1 below.

However, there are some issues of interpretation relating to infrastructure to which the grantor has given access to the operator for the purpose of the SCA. 'Existing infrastructure' under (b) above could include other arrangements in the form of leases from the grantor over assets. As part of a SCA, in addition to receiving payments for the construction and/or operation of the infrastructure, an operator may make payments to a grantor, e.g., in respect of the land on which a facility is to be built. These issues are discussed in section 3.3.2 below.

A third group of assets comprises property, plant and equipment previously held by the operator and then used in connection with the provision of services under the SCA. The IFRS IC's view is that accounting for these types of assets is already covered by existing IFRS accounting standards, principally IAS 16, and therefore, it does not specify how the operator accounts for its previously existing assets that now form part of the infrastructure. [IFRIC 12.8]. The treatment of existing assets is discussed further in section 3.3.3 below.

3.3.1 Accounting for service concession arrangements for which the infrastructure is leased from a party other than the grantor

As noted in section 3.3 above, assets within the scope of IFRIC 12 include infrastructure that the operator constructs or acquires from a third party for the purpose of the service arrangement and existing infrastructure to which the grantor gives the operator access for the purpose of the service arrangement. [IFRIC 12.7]. In some cases, an operator may enter into an arrangement with the grantor to provide a public service using infrastructure that is leased. For example, an operator may lease trains in order to provide rail transportation services to the public. The accounting for arrangements in which infrastructure is leased from the grantor are addressed in section 3.3.2 below. Where the lessor and grantor are controlled by the same governmental body and are related parties, lease payments made by the operator to the lessor are, in substance, payments made to a grantor in a service concession arrangement¹⁰ which are covered in section 3.3.2 below.

In September 2016, the IFRS IC considered this issue.

¹⁰ [IASB Staff Paper 06](#), Project: IFRIC 12 Service Concession Arrangements, Paper topic: *Service concession arrangements with leased infrastructure*, IFRS IC Meeting, March 2016, p.11. Available on the IFRS Foundation's website.

Frequently asked questions

Question 3-1: How does an operator account for a service concession arrangement in which the infrastructure is leased from a third party?

Is the arrangement (including the leased infrastructure) in scope of IFRIC 12?

If so, how does the operator account for any assets and liabilities arising from the arrangement with the lessor?

The IFRS IC was asked these questions in respect of an arrangement where infrastructure is leased from a third-party lessor, unrelated to the grantor, and the operator is not required to provide any construction or upgrade services with respect to the infrastructure. In the fact pattern discussed, the operator is contractually required to pay the lessor for the lease of the infrastructure, and has an unconditional contractual right to receive cash from the grantor to reimburse those payments. The grantor provides the lessor with a guarantee of the lease payments to be made during the lease terms and of any residual value at the end of the lease term. The IFRS IC observed that:

- (a) Assessing whether an arrangement (including the leased infrastructure) is in scope of IFRIC 12 requires consideration of all facts and circumstances, in particular whether the control conditions in IFRIC 12.5 are met (see section 3 above), and whether the infrastructure falls within one of the groups of assets set out in IFRIC 12.7 as in scope of IFRIC 12 (see section 3.3 above). However, an operator is not required to provide construction or upgrade services with respect to the infrastructure for the arrangement to be in scope of IFRIC 12.
- (b) If the arrangement is in scope of IFRIC 12, then it is the grantor, not the operator, that controls the right to use the infrastructure. Accordingly, the operator assesses whether it has the obligation to make payments to the lessor for the lease, or whether the grantor has this obligation.
 - (i) If the grantor has the obligation to make payments to the lessor, the operator is collecting cash from the grantor that it remits to the lessor on behalf of the grantor.
 - (ii) If the operator has the obligation to make payments to the lessor as part of the service concession arrangement, the operator recognises a liability for this obligation when it is committed to the service concession arrangement and the infrastructure is made available by the lessor. At the time the operator recognises the liability, it also recognises a financial asset because the operator has a contractual right to receive cash from the grantor to reimburse those payments. The operator offsets the liability to make payments to the lessor against the corresponding receivable from the grantor only when the criteria for offsetting a financial asset and financial liability in IAS 32 are met.¹¹ The offsetting criteria in IAS 32 are discussed in Chapter 50.

In contrast to the fact pattern discussed by the IFRS IC, if the operator is contractually required to pay the lessor for the lease of the infrastructure, but does not have an unconditional contractual right to receive cash from the grantor to reimburse those payments, then in effect it is paying the lease payments on behalf of the grantor. Therefore, the operator recognises a liability for this obligation and treats this obligation either as an additional cost of the concession right asset under the intangible asset model or as a reduction to the overall consideration the financial asset model applies (see section 3.3.2 below).

3.3.2 Periodic payments to the grantor for the right to use assets

Assets within the scope of IFRIC 12 include infrastructure that the operator constructs or acquires from a third party for the purpose of the service arrangement and existing infrastructure to which the grantor gives the operator access for the purpose of the service arrangement. [IFRIC 12.7]. IFRIC 12 contains no explicit guidance regarding periodic payments made to the grantor in connection with the right to use assets. The issue is whether these costs are treated as lease costs in accordance with IFRS 16, treated as executory in nature with costs expensed as incurred or otherwise recognised as a liability. If they are considered to be within scope of IFRIC 12, what are the accounting consequences? Are they part of the overall consideration paid by the grantor or recognised as an asset and, if an asset, did they form part of the 'concession asset' at the start of the concession, with an obligation to make the related payments?

¹¹ [IFRIC Update](#), September 2016, available on the IFRS Foundation's website.

This has been discussed by the IFRS IC in the context of a question about payments to the grantor in general (see section 4.7 below). The IFRS IC decided in March 2016 that the treatment of variable payments for asset purchases, including payments that vary in relation to future activity by the purchaser, was too broad an issue for it to address, and consequently decided not to add the issue to its agenda.¹²

For fixed payments made by the operator to the grantor, the IFRS IC observed in July 2016 that IFRIC 12 would apply, unless:

- (a) They are payments for the right to a good or service that is separate from the service concession arrangement, which are accounted for under other applicable IFRS accounting standards.

Or

- (b) They are payments for the right to use an asset that is separate from the infrastructure within the scope of IFRIC 12, in which case the operator assesses whether the arrangement contains a lease. If the arrangement contains a lease, the operator accounts for those payments by applying IFRS 16.¹³

This approach is consistent with the requirements in IFRS 15 to determine whether consideration payable to a customer gives rise to goods or services distinct from the customer contract (see Chapter 28).

[IFRS 15.70, IFRS 15.71]. Payments that are part of the overall concession agreement but do not fall within these two exceptions will be accounted for as part of the SCA. In this case, the accounting treatment will depend on whether the SCA falls within the financial asset model, the intangible asset model or is a hybrid. If the financial asset model applies, payments to the grantor would be treated as reductions to the overall consideration received and therefore be offset against the financial asset receivable under the SCA. In contrast, under the intangible asset model the payments to the grantor are recognised as a liability that increases the cost of the concession right asset. If the hybrid model applies, then the entity assesses the extent to which the concession payment represents an adjustment to the overall consideration receivable or whether it is consideration for the intangible asset element. This is discussed further in section 4.7 below.

3.3.3 Previously held assets used for the concession

IFRIC 12 does not apply to infrastructure held and recognised as property, plant and equipment by the operator before entering into the SCA. If such assets of the operator become part of the infrastructure in the SCA, the operator applies the derecognition requirements of IAS 16 to determine whether it derecognises those previously held assets. [IFRIC 12.8]. The IFRS IC's view is that accounting for assets is already covered by existing accounting standards, principally IAS 16, and therefore, it is not necessary to specify how the operator accounts for its previously existing assets that now form part of the infrastructure. [IFRIC 12.BC16, IFRIC 12.BC18].

How we see it

The implication of the guidance above is that losing control of a previously held asset by contractually giving control of its use to the grantor would give rise to a disposal of the asset under IAS 16.

The existing asset would be derecognised and any consideration on the disposal established in accordance with the requirements for determining the transaction price in IFRS 15. [IAS 16.72]. This means that the total consideration received under the contract would be allocated between an amount receivable for construction and upgrade services and an amount to reflect the transfer of the existing asset to the control of the grantor. What was previously recorded by the operator as property, plant and equipment would be replaced by an element of either an intangible asset or a financial asset, depending on the accounting model determined to be appropriate to the particular SCA (see section 4.1.2 below). Gains and losses must be calculated as the difference between any net disposal proceeds and the carrying value of the item of property, plant and equipment, [IAS 16.71], and recognised in profit or loss. Derecognition of assets within scope of IAS 16 in general is discussed in Chapter 19.

¹² [IFRIC Update](#), March 2016, available on the IFRS Foundation's website.

¹³ [IFRIC Update](#), July 2016, available on the IFRS Foundation's website.

The operator may use some of its existing assets for the purpose of the concession without transferring control to the grantor. Unless the contract transfers the residual interest in these pre-existing assets to the grantor (and thereby both of the control criteria laid out in section 3 above are met), these assets are out of scope of IFRIC 12. If an infrastructure asset is itself out of scope, the SCA might include, for example, extensions to that asset, upgrades to it and a contractual period of using the infrastructure asset to provide services. In this case, the total consideration payable under the concession will be allocated between the extension, upgrade and operating services within scope of IFRIC 12. Accordingly, construction revenue would be recognised at the time of the extension or upgrade work, with an additional financial asset or intangible asset recognised as appropriate.

3.4 Partially regulated assets

IFRIC 12 notes that it is not uncommon for the use of infrastructure to be partly regulated and partly unregulated. [IFRIC 12.AG7].

Extract from IFRIC 12

- AG7 Sometimes the use of infrastructure is partly regulated in the manner described in paragraph 5(a) and partly unregulated. However, these arrangements take a variety of forms:
- (a) any infrastructure that is physically separable and capable of being operated independently and meets the definition of a cash-generating unit as defined in IAS 36 shall be analysed separately if it is used wholly for unregulated purposes. For example, this might apply to a private wing of a hospital, where the remainder of the hospital is used by the grantor to treat public patients.
 - (b) when purely ancillary activities (such as a hospital shop) are unregulated, the control tests shall be applied as if those services did not exist, because in cases in which the grantor controls the services in the manner described in paragraph 5, the existence of ancillary activities does not detract from the grantor's control of the infrastructure.

In both cases set out in IFRIC 12.AG7, the grantor may have given to the operator a right to use the unregulated asset in question. This right may be in substance a lease from the grantor to the operator; if so, this is to be accounted for in accordance with IFRS 16. [IFRIC 12.AG8]. Determining whether the right is, in substance, a lease would involve using the principles in IFRS 16 (see Chapter 24). The interaction of IFRIC 12 and IFRS 16 is discussed in section 2.3 above.

The Interpretation gives no further guidance on how an entity might interpret the term 'purely ancillary' in evaluating whether an unregulated activity is ignored for the purposes of determining if the control criteria are met or considered to detract from the grantor's control of the asset. The hospital shop is clearly insignificant by virtue of its size relative to the whole hospital, the proportion of cash flows attributable to it and the fact that the existence of a shop has no direct impact on the function of the infrastructure in the provision of regulated services. However, it is not clear at what point a secondary activity would become or cease to be 'purely ancillary'. This will be a matter of judgement, as demonstrated in Illustration 3-2 below.

Illustration 3-2: Partially regulated assets - Airport

Entity A has been contracted by the government department of transport to construct a regional airport and operate it for a period of 25 years.

Entity A will have the right to charge airlines using the airport fees for 'aeronautical services' provided by Entity A, such as landing fees, passenger fees, terminal fees and fees for gate and ground services. These aeronautical services and fees will be subject to regulation by the department of transport. Entity A expects 55% of its income from the airport over the contract period to come from aeronautical fees and expects the remainder of its income over the term of the contract to arise from unregulated non-aeronautical activities within the airport, such as rent for concessions, retail and parking.

Whilst some of the areas of the airport used to provide concession, retail and parking services are physically separable, Entity A concludes that they do not meet the definition of a cash-generating unit as defined in IAS 36 *Impairment of Assets* [IFRIC 12.AG7(a)] because the cash inflows from these areas are not largely independent of the cash inflows from other parts of the airport infrastructure, because the users of those services are also passengers of the airlines to whom Entity A provides aeronautical services. [IAS 36.6].

As the use of the airport infrastructure is partially regulated and partially unregulated, Entity A will need to apply judgement to assess whether the non-aeronautical activities are purely ancillary.

Entity A could base this judgement on a qualitative assessment. Entity A could take the view that, although the non-aeronautical services are outside the primary purpose of the airport infrastructure, they are important to managing the flow of passengers through the airport, and do not significantly impact the function of the infrastructure in the provision of the regulated aeronautical services. Entity A could therefore conclude that the non-aeronautical services are purely ancillary and apply the control test in paragraph 5(a) of IFRIC 12 as if those services did not exist. [IFRIC 12.AG7(b)].

Alternatively, Entity A could base its judgement on a quantitative assessment, comparing total estimated revenues from regulated services over the life of the arrangement to estimated revenues from unregulated services. Under this approach, Entity A could conclude that the unregulated non-aeronautical services are not ancillary as the proportion of cash flows attributable to those services is not clearly insignificant. Entity A could conclude that the extent of unregulated services provided using the airport infrastructure is such that the grantor is not considered to control the infrastructure.

Regardless of which approach is used or the emphasis placed by the entity on qualitative or quantitative factors, there may be judgement involved in making the determination of whether non-aeronautical services are ancillary. Entity A must apply a consistent approach and determine its judgements consistently to all similar contractual arrangements.

In addition, there are many concession agreements that include unregulated services that are neither purely ancillary nor delivered by using a physically separable portion of the total infrastructure, a situation not addressed by IFRIC 12.AG7. For example, a grantor may control prices charged to children, pensioners and the unemployed who use a sports facility, but the amounts charged to other adults are not controlled. The same facility is being used by all, regardless of the amount that they pay. Alternatively, price regulation could apply only to services provided at certain times of the day rather than to different classes of user.

Illustration 3-3: Partially regulated assets - Rail transportation

Entity B has been contracted by the government department of transport to build and operate a regional rail network for 10 years.

Entity B will operate the trains across the regional network, employ the required staff, and manage the railway stations and depots across the regional network. The department of transport will specify the level of train services to be provided, set certain specifications of trains to be used, and establish overall performance targets. Train fares charged by Entity B to rail passengers will consist of regulated fares (for peak-time rail tickets), and unregulated fares (for off-peak time rail tickets). Entity B expects 60% of rail fare revenue over the term of the contract to come from regulated fares, and 40% from unregulated fares.

The same rail infrastructure will be used to provide both peak-time and off-peak services. Entity B will therefore need to apply judgement in assessing the control criteria in paragraph 5(a) of IFRIC 12 ('The grantor controls or regulates the services that the operator must provide using the infrastructure, to whom it must provide them, and at what price'). [IFRIC 12.5(a)].

In this case, Entity B could base its judgement on a quantitative assessment, comparing total estimated revenues from regulated fares over the life of the arrangement to estimated revenues from unregulated fares. As Entity B expects 40% of its revenue over the term of the contract to come from unregulated fares, Entity B could conclude that although the department of transport may control the services that the operator must provide with the rail infrastructure, they do not control the price given that a significant portion of non-regulated rail fare revenue is expected to be generated by Entity B. In this case, the arrangement is not in scope of IFRIC 12. Entity B could reach a different conclusion if the proportion of non-regulated rail fare income was expected to be clearly insignificant.

In practice, there may be judgement involved in making the determination of whether enough of the service or process for the service is unregulated in order to demonstrate that the grantor is not considered to control the infrastructure. Whilst we do not believe that there are any clear cut-off points or bright lines in making this judgement, entities must apply a consistent approach and determine its judgements consistently to all similar contractual arrangements.

How we see it

When a concession agreement includes unregulated services that are neither purely ancillary, nor delivered by using a physically separable portion of the total infrastructure, it will be a matter of judgement whether enough of the service is unregulated in order to demonstrate that the grantor is not considered to control the asset, which would lead to the arrangement as a whole falling out of the scope of IFRIC 12. We would expect entities to apply these judgements consistently to similar arrangements.

The assessment of whether enough of the service is unregulated in order to demonstrate that the grantor is not considered to control the asset will be made at the beginning of the contract and will not be revisited unless errors were made in the original assessment, i.e., it will not be revisited simply because there are significantly more or fewer unregulated users than originally anticipated. In practice, partial price regulation is often a reason for an arrangement to fall outside the scope of IFRIC 12.

However, if it transpires that there are significantly fewer unregulated users than anticipated then it is likely that the contract will be renegotiated. This is because of the public service obligation, which means that the grantor will want the service to continue to be provided to the public albeit under new terms. Whilst IFRIC 12 does not address changes to concession arrangements, it would be necessary to look to the requirements of other standards that IFRIC 12 interprets (such as IFRS 15, IFRS 9 and IAS 38) in order to determine the impact on the accounting for the concession, including the impact on any assets and liabilities recognised in respect of the concession. Similar considerations apply where there is a change in regulation that impacts whether the grantor controls or regulates the services that the operator must provide using the infrastructure, to whom it must provide them, and at what price, and/or whether grantor controls any significant residual interest in the infrastructure at the end of the concession term.

4 Accounting by the concession operator: the financial asset and intangible asset models

The IFRS IC's accounting framework for public-to-private arrangements is summarised in the following diagram from Information note 1 in IFRIC 12.

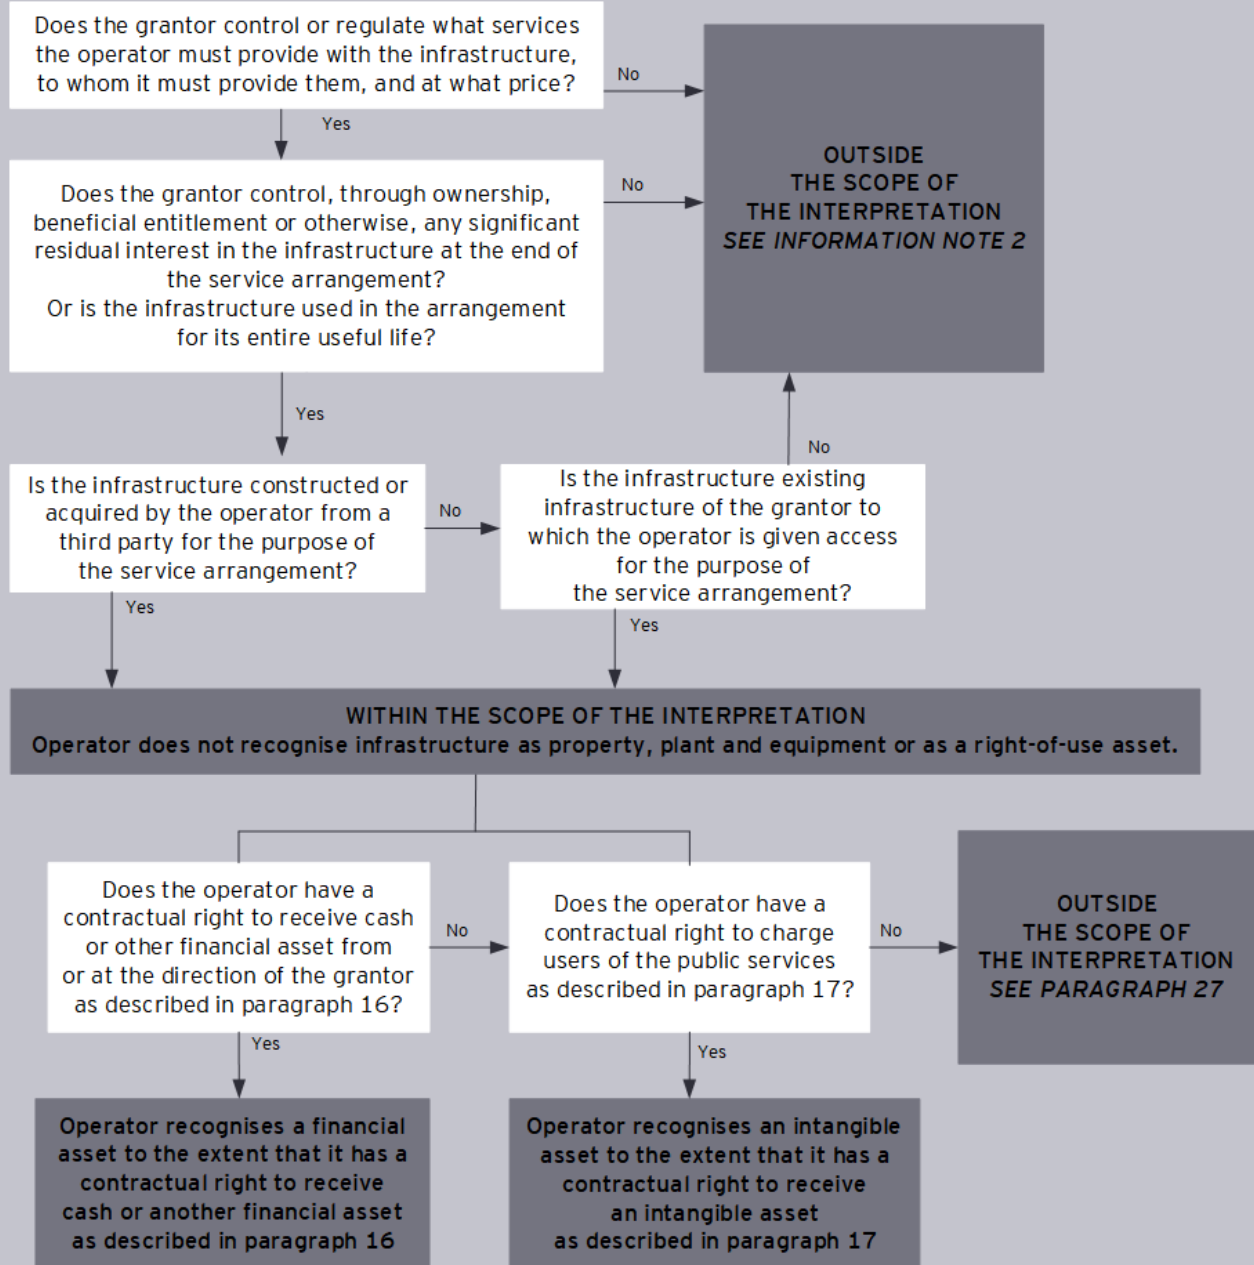

Extract from IFRIC 12

Information note 1

Accounting framework for public-to-private service arrangements

This note accompanies, but is not part of, IFRIC 12.

The diagram below summarises the accounting for service arrangements established by IFRIC 12.

[IFRIC 12.IG Information note 1].

The two accounting models in IFRIC 12 apply several decisions of principle:

- The control model applies as described in section 3 above, which means that the operator will not recognise infrastructure assets as its property, plant and equipment. [IFRIC 12.11].

And

- The operator is providing 'construction services' and not, for example, constructing an item of property, plant and equipment for sale. Construction services are to be accounted for separately from 'operation services' in the operations phase of the contract. [IFRIC 12.14, IFRIC 12.20, IFRIC 12.BC31].

There is a third important point of principle: although the nature of the consideration determines the subsequent accounting (as discussed in section 4.1.2 below), both types of consideration give rise to a contract asset during the construction or upgrade period. [IFRIC 12.19]. The point at which the consideration is subsequently classified as a receivable or intangible asset is discussed in sections 4.2 and 4.3 below, respectively.

4.1 Consideration for services provided and the determination of the appropriate model

Most service concession agreements are for both construction (or upgrade) services and operations services. Operators almost always negotiate a single contract with the grantor and, although the Interpretation does not refer to this, this will usually include a single payment mechanism throughout the concession term, sometimes called a 'unitary payment'. The operator is unlikely to be remunerated separately for its different activities. The payment mechanism often falls into one or other of the following models:

Illustration 4-1: Payment mechanisms for service concessions

(a) A hospital where the payment is based on the availability of the whole hospital

The unitary payment is based on the full provision of an overall accommodation requirement which is divided into different units, such as hospital wards, consulting rooms, operating theatres, common parts and reception. Availability is defined in terms of being usable and accessible and, includes some associated core services such as heating, power and cleaning services. There is a payment deduction for failure to provide an available unit according to a contractual scale. There are no separate payment streams for any of the non-core services but substandard performance can result in payment deductions.

$$P = (F \times I) - (D + E)$$

P = unitary payment per day

F = price per day for overall accommodation requirement

I = Indexation increase based on the retail prices index

D = deductions for unavailability

E = performance deductions

b) A prison where payment is made based on the number of occupied places

The unitary payment is based on the number of occupied places. Occupied means not only that a prisoner is allocated a physical space but the associated core services and minimum requirements must be met in relation to services such as heating, mail delivery and food. No payment is made for unoccupied places. There are no separate payment streams for any of the non-core services (i.e., not associated with the definition of an occupied place) but deductions from the unitary payment can be made for substandard performance of these services.

The unitary payment is based on the following formula:

$$P = (F \times I) - Z$$

P = unitary payment per place

F = Fixed amount per occupied place per day

I = Indexation increase based on the retail prices index

Z = Performance deductions

The payments for both models are not immediately separable between amounts attributable to the construction or other services.

The operator acts as a service provider. It constructs or upgrades infrastructure used to provide a public service and operates and maintains that infrastructure for a specified period of time. [IFRIC 12.12]. IFRIC 12 clarifies that the operator recognises and measures revenue in accordance with IFRS 15 for the services it performs. [IFRIC 12.13]. This requires the operator to allocate the consideration receivable to each performance obligation in proportion to their relative stand-alone selling prices. The exercise to separate the consideration receivable for the distinct services (i.e., construction, upgrade or operating services) provided by the operator is explained in section 4.1.1 below. The nature of the consideration determines the accounting model, [IFRIC 12.13], as described in section 4.1.2 below.

Payments often start only when the infrastructure asset has been completed and accepted as suitable for purpose by the grantor. Operators usually seek payment during the construction phase but whether or not they receive any is inevitably a result of negotiation between the parties. Payments that are received are normally for services provided and not directly to meet construction costs; any amounts received will be allocated to the relevant service activity as described below.

4.1.1 Allocating the consideration

The Interpretation argues that the separate services within a service concession arrangement, i.e., 'construction services', 'upgrade services' or 'operations services', must be disaggregated "...because each separate phase or element has its own distinct skills, requirements and risks...". [IFRIC 12.BC31].

The allocation of revenue for the provision of these separate services is determined in accordance with IFRS 15. [IFRIC 12.14, IFRIC 12.20]. This involves identifying who is (are) the customer(s) of the service concession arrangement (see section 4.1.1.A below), identifying the performance obligations under the contract with the customer (see section 4.1.1.B below), determining the transaction price under the contract(s) (see section 4.1.1.C below), and allocating that transaction price to the performance obligations in the contract (see section 4.1.1.D below).

4.1.1.A Identifying the contract(s) with a customer

The first step in allocating consideration in accordance with IFRS 15 is to identify the contract with the customer. Under IFRS 15, a contract is defined as an agreement between two parties that creates enforceable rights and obligations. [IFRS 15 Appendix A]. Whether the customer in a service concession arrangement is the grantor and/or the user of the infrastructure will depend on the terms and conditions of the service concession arrangement. Because the grantor of the concession retains control over the infrastructure asset, [IFRIC 12.5], it is likely that the grantor will be identified as the customer for any construction or upgrade services.

Because of the public service nature of the obligation undertaken by the operator, the operating services are provided to the public. This suggests that the public may be the customer for the operating services. A customer is defined in IFRS 15 as a party that has contracted with an entity to obtain goods or services that are an output of an entity's ordinary activities in exchange for consideration. [IFRS 15 Appendix A]. IFRS 15 does not require the existence of a written contract; a contract may be oral or implied, although it must be legally enforceable. [IFRS 15.10].

How we see it

We believe that the users of the infrastructure may be identified as the customers for the operation services where:

- A written or implied contract exists between the operator and users of the infrastructure
- The operator receives consideration from those users of the infrastructure
- And
- The operator is collecting that consideration as principal (rather than as agent for the grantor)

Identification of the contract with the customer under IFRS 15 is discussed in Chapter 28.

4.1.1.B Identifying the performance obligations in the contract

Most service concession agreements are for both construction (or upgrade) services and operations services. Many service concessions also require the operator to perform some level of maintenance of the infrastructure asset over the term of the service concession arrangement. IFRS 15 provides guidance on the types of items that may be goods or services promised in the contract. Examples given by the standard include performing a contractually agreed-upon task (or tasks) for a customer, and providing a service of standing ready to provide goods or services. [IFRS 15.26].

A promised good or service is a performance obligation if it is either:

- (a) A good or service that is distinct
Or
- (b) A series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer [IFRS 15.22]

In order to be distinct, a promised good or service must be:

- (a) Capable of being distinct- i.e., provide a benefit to the customer either on its own or together with other resources that are readily available to the customer
And
- (b) Distinct within the context of the contract- i.e., the entity's promise to transfer the good or service to the customer is separately identifiable from other promises in the contract [IFRS 15.27]

If a promised good or service is not distinct, IFRS 15 requires that the entity must combine that good or service with other promised goods or services until it identifies a bundle of goods or services that is distinct. [IFRS 15.30].

How we see it

Where an operator has identified only one contract with the grantor, the operator would typically identify, at least, construction services, upgrade services and operation services as separate performance obligations. Whether the operator has identified a contract with the users of the infrastructure as the customer for the operating services will impact the identification of performance obligations within the contract(s) with customers.

It could be argued that because major maintenance enhances an asset that the grantor owns, then it is providing a benefit to the grantor. In addition, contractual terms often require an operator to repay an element advanced by the grantor for maintenance services if the operator does not incur contracted levels of maintenance spend. This may also support the argument that maintenance is a separate performance obligation. In practice, there is likely to be some judgement involved in determining whether maintenance is a separate performance obligation, based on how it is defined in the contractual arrangement. To the extent that the contract requires the operator to provide major maintenance, similar in nature to an upgrade, that enhances the infrastructure asset, maintenance could be a separate performance obligation. However, minor maintenance necessary to preserve the infrastructure in a condition required for the operator to operate the infrastructure safely and to return it to the grantor in a certain condition at the end of the arrangement could be argued as not transferring a distinct good or service to the grantor. In other cases, it may be less clear whether a contractual obligation represents a performance obligation under IFRS 15 or an obligation that is accounted for under IAS 37. For example, a water supply operator may be contractually required to replace all lead pipes for environmental and health reasons; similarly, a gas supply operator may be required to replace all cast-iron pipes for safety reasons.

As discussed at section 6 below, some respondents to the post-implementation review of IFRS 15 raised questions related to the interaction between IFRS 15 and IFRIC 12 on accounting for contractual obligations to maintain or restore infrastructure. This is because, while paragraph 21 of IFRIC 12 requires such contractual obligations to be recognised and measured in accordance with IAS 37, the Illustrative Examples to IFRIC 12 show the obligation to maintain or restore infrastructure as a distinct performance obligation applying IFRS 15 in Example 1 ('financial asset model' example), and a provision applying IAS 37 in Example 2 ('intangible asset model' example), with the reasons for the different approaches not explained in IFRIC 12.¹⁴ However, the IASB decided to classify the matter as low priority, and will consider applying IFRS 15 with IFRIC 12 in the next agenda consultation, including accounting for contractual obligations to maintain or restore service concession infrastructure.¹⁵

¹⁴ [IASB Staff Paper 6E](#), Project: Post-implementation Review of IFRS 15, Paper topic: Applying IFRS 15 with other IFRS Accounting Standards, IASB meeting, April 2024. Available on the IFRS Foundation's website.

¹⁵ *IFRS - IASB Update July 2024*. Available on the IFRS Foundation's website.

Significant judgement may be needed to determine whether major maintenance is a separate performance obligation and consideration must be given to the disclosure requirements in paragraph 122 of IAS 1 *Presentation of Financial Statements*. See Chapter 3.

In practice, operators may often sub-contract some or all the construction activities under a service concession arrangement. In such cases, the operator applies the guidance in IFRS 15 to determine whether it is acting as principal or agent for the provision of construction services. This determination will impact whether the operator's performance obligation under the contract is to provide construction services, or to arrange for another party to provide construction services. Principal versus agent considerations under IFRS 15 are discussed in Chapter 28.

4.1.1.C Determining the transaction price under the contract

Transaction price is defined in IFRS 15 as the amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties. [IFRS 15.47].

The determination of transaction price must take into account any elements of variable consideration. It is often the case within service concession arrangements that the operator will be required to pay penalties if its performance under the contract does not meet specified standards. The element of revenue that is subject to such penalties would be considered a form of variable consideration under IFRS 15. [IFRS 15.51]. IFRS 15 requires that, if the consideration promised in a contract includes a variable amount, an entity must estimate the amount of consideration to which they will be entitled. [IFRS 15.50]. IFRS 15 requires that variable consideration must be estimated using either an expected value or most likely amount basis, depending on which method the entity expects to better predict the amount of consideration to which it will be entitled. [IFRS 15.53]. The assessment of which approach is most appropriate will depend upon the facts and circumstances of the service concession arrangement and the penalty regime. In practice, it may be that the expected value approach better predicts the amount of consideration to which the operator expects to be entitled in many service concession arrangements. Estimates of variable consideration are then included in the transaction price only to the extent that it is highly probable that a significant reversal of revenue will not occur when the uncertainty associated with the variable consideration is subsequently resolved. [IFRS 15.56].

Payments often start under a service concession arrangement only when the infrastructure asset has been completed and accepted as suitable for purpose by the grantor. In these cases, the delay between the timing of payments from the grantor compared to the provision of construction services by the operator may require a significant financing component to be taken into account in determining the transaction price. However, where the reason for the difference between the cash selling price of the construction services and the promised consideration arises for reasons other than the provision of finance, and the difference between those amounts is proportional to the reason given for the difference, the contract does not contain a significant financing component. [IFRS 15.62]. This may be the case where the form of the consideration for the construction services necessitates a delay between the provision of the services and the receipt of the consideration, such as where the operator receives an intangible asset in return for construction services.

When it is determined that the contract contains a significant financing component, the amount of promised consideration is discounted at a rate that the operator would use if it were to enter into a separate financing transaction with the grantor at contract inception. The discount rate reflects the credit characteristics of the grantor, as well as any collateral or security provided, including assets transferred in the contract, [IFRS 15.64], i.e., the discount rate is a rate specific to the contract. IFRS 15 also notes that the discount rate could be derived by discounting the contractual cash flows to a cash selling price for the promised good or service. [IFRS 15.64]. In Illustrative Example 1 to IFRIC 12 (which is reproduced in Illustration 4-2 in section 4.2 below), the implied interest rate in the contract is assumed to be the rate that would be reflected in a financing transaction between the operator and the grantor, although this may not always be the case in a service concession arrangement.

How we see it

In determining the discount rate to be used when a service concession contract contains a significant financing component, we believe that IFRS 15 requires primacy to be given to the rate that the operator would use if it were to enter into a separate financing transaction with the grantor at contract inception. Whilst the rate implicit in the contract may be used in determining that rate, the use of the rate implicit in the contract may not always be consistent with the objective of IFRS 15.64. However, because most operators in a service concession are not in the business of entering into free-standing financing arrangements with grantors, they may find it difficult to identify an appropriate rate, and judgement may be required.

When determining the discount rate to use, the factors that the operator might take into account include, but are not limited to:

- The expected duration and repayment pattern of the service payments, noting that SCA payments may extend significantly longer than the duration of government bonds
- The credit profile of the government entity
- Borrowing rates that may be offered by the central treasury function of the government
- Credit risks specific to the terms of the SCA, including security or guarantees provided by the government, whether express or implied by statute or legislation, and to the extent it impacts the rate that would be negotiated between the parties

Determination of the discount rate when an entity concludes that a financing component is significant to a customer contract is discussed in Chapter 28.

The effect of financing is excluded from the transaction price prior to the allocation of the transaction price to the performance obligations in the contract.

IFRS 15 is clear that an entity does not update the interest rate for changes in circumstances or market interest rates after contract inception. [IFRS 15.64]. However, the standard does not discuss situations in which expectations change after contract inception regarding the timing difference between the receipt of consideration and the transfer of goods and services to the customer (e.g., a change in the timing of delivery). If an entity has accounted for a significant financing component at contract inception and the expected timing of the transfer of goods or services then changes, it may be important to understand the reason for the expectation change. This is discussed further in Chapter 28.

Where consideration for construction services comprises or includes a license to charge end users of the concession infrastructure, the license will be non-cash consideration. IFRS 15 requires non-cash consideration to be included in the transaction price, measured at fair value. [IFRS 15.66]. If the fair value of the non-cash consideration cannot be reasonably estimated, the non-cash consideration is measured indirectly by reference to the stand-alone selling price of the goods or services promised to the customer. [IFRS 15.67]. In practice, it may often be the case that the fair value of the licence received from the grantor to charge users cannot be estimated reasonably and will therefore be measured indirectly by reference to the stand-alone selling price of the construction services provided by the operator in exchange for the license. This is consistent with the approach shown in Illustrative Example 2 and Illustrative Example 3 to IFRIC 12. [IFRIC 12.IE14, IFRIC 12.IE24].

Determination of the transaction price under IFRS 15 is discussed in Chapter 28.

An operator may also be contractually required to make payments to the grantor. These may take the form of payments for the right of access to infrastructure or other assets, for the construction of assets or additional fees for the right to operate the concession. If the SCA falls within the financial asset model, the payments made may reduce the consideration received from the grantor. This is considered further in section 4.7 below.

4.1.1.D Allocating the transaction price to the performance obligations in the contract

IFRS 15 generally requires the transaction price to be allocated to each performance obligation in proportion to their relative stand-alone selling prices. [IFRS 15.74].

If stand-alone selling prices are not readily observable, they must be estimated, considering all information that is reasonably available to the entity. [IFRS 15.78]. The operator may choose to estimate stand-alone selling prices using an expected cost-plus margin approach, [IFRS 15.79], although other approaches are permitted.

How we see it

Although most service concessions apply a single payment mechanism, it is often straightforward in practice to identify the underlying cash flows that relate to different activities within the arrangement. This may be based on the original contract negotiations or because the contract contains terms allowing for subsequent price adjustments by 'market testing' or 'benchmarking'. However, the cash flows may not reflect the stand-alone prices of the underlying services so care will have to be taken. There may be practical problems when it comes to apportioning the total contract consideration between the elements of the contract and the allocation will be a matter of judgement.

With respect to variable consideration, IFRS 15 provides an exception to the relative selling price method of allocating the transaction price if certain criteria are met. This means that variable consideration may be attributable to a specific part of the contract. [IFRS 15.84]. In the context of service concession arrangements, for example, penalties incurred due to substandard service may sometimes meet the criteria in IFRS 15 to be entirely allocated to a single performance obligation (e.g., operation services).

Allocation of the transaction price to performance obligations under IFRS 15 is discussed in Chapter 28.

4.1.2 Determining the accounting model after the construction phase

IFRIC 12 states that the operator may receive a financial asset or an intangible asset as consideration for its construction services and the asset that it receives determines the subsequent treatment. [IFRIC 12.15, IFRIC 12.19]. The nature of the consideration given by the grantor to the operator must be determined by reference to the contract terms and, when it exists, relevant contract law. However, the Interpretation is clear that both types of consideration give rise to a contract asset during the construction or upgrade period. [IFRIC 12.19].

The IFRS IC decided that the boundary between the financial and the intangible asset models is based on the operator's unconditional contractual right to receive cash from, or at the direction of, the grantor. [IFRIC 12.16]. The grantor does not need to pay the cash to the operator directly. Fees or tolls received from users are viewed as essentially no more than collections on behalf of the grantor if they are part of an overall arrangement under which the grantor bears ultimate responsibility. If the grantor pays but the amounts are wholly based on usage of the infrastructure and there is no minimum guaranteed payment, the entity has no unconditional contractual right to receive cash, as the amounts receivable are contingent on the extent to which the public uses the service. In this case, the intangible asset model will apply.

The operator will recognise a financial asset to the extent that it has a contractual right to receive cash or other financial assets from the grantor for the construction services, where the grantor has little, if any, discretion to avoid payment. This is usually because the agreement is legally enforceable. [IFRIC 12.16]. The recognition of a financial asset is not affected by the fact that the operator's contractual right to receive cash may be contingent on performance standards, as in the example of a unitary charge for a hospital in Illustration 4-1 in section 4.1 above. The IFRS IC points out that this is no different from other circumstances and other financial assets where the payment for goods and services depends on the subsequent performance of the asset. [IFRIC 12.BC44].

The operator will recognise an intangible asset to the extent that it receives a licence to charge users of the public service. [IFRIC 12.17].

Sometimes it is necessary to 'bifurcate' the operator's right to cash flows for construction services into a financial asset and an intangible asset and account separately for each component of the operator's consideration. This, the IFRS IC argues, is because the operator is paid for its services partly by a financial asset and partly by an intangible asset. [IFRIC 12.18].

The analysis between the different models can be seen in the following table:

Arrangement		Applicable model
1	Operator receives fixed payments from grantor	Financial asset
2	Operator receives payments from grantor which vary with demand	Intangible asset
3	Operator receives payments from users which vary with demand, and from grantor for any difference with guaranteed amounts	Financial asset or bifurcated (part financial, part intangible)
4	Operator receives payments from users which vary with demand until it achieves specified return	Intangible asset
5	Operator receives payment from users which vary with demand - no grantor guarantees	Intangible asset

Of the two arrangements in Illustration 4-1 above, the hospital is an example of (1) above: the payments are contractually fixed if all obligations and services are provided. The prison, as described in Illustration 4-1 above, would fall within (2) and be accounted for as an intangible asset. However, the prison operator might be paid on a different basis, e.g., it might be paid for 1,000 'available places' and receive this as long as heating and food were capable of being provided. In this case, it would be no different to the hospital and be a financial asset. There are, of course, many potential variations and a combination of fixed and variable demand could lead to bifurcation.

Common examples of arrangements that fall within (3) above are transport concessions where the operator collects revenue from users but is entitled to an agreed return on capital invested in the infrastructure. The fees or tolls up to this amount are considered to be collections on behalf of the grantor. There will be a financial asset to the extent of the guaranteed return. There may also be an intangible asset if the value of the financial asset is less than the fair value of the construction services.

However, arrangements of the type in (4) above remain to be treated as intangible assets even if the overall risk to the operator of not obtaining a specified result is very low.

How we see it

An arrangement that effectively caps revenue collected from users once an agreed level of return is reached, is not a contractual right to cash but a right to collect revenues from users and it is not relevant that the risk is low or that the operator will, in effect, get a fixed return.

The extent to which demand risk is borne by the operator does not determine whether the operator should recognise a financial asset or an intangible asset. This is because IAS 32 defines financial assets solely by reference to the existence of a contractual right to receive cash, not by reference to the likelihood of future cash flows. [IAS 32.11]. Note that even if the operator bears little or no demand risk, the intangible asset model must be applied if there is no contractual right to receive cash from, or at the direction of, the grantor. While demand risk is borne by the grantor under the financial asset model, this is not the deciding factor for the determination of the appropriate model to use.

The following are examples of arrangements that will be accounted for using the intangible asset model:

- (a) A municipality grants the operator a contract to construct a waste treatment plant and treat all its waste collections for which it will be paid per unit processed. The arrangement does not provide for any guaranteed volume of waste to be provided by the grantor and treated by the operator (so it does not contain a take-or-pay arrangement) or any form of guarantee by the grantor. Historically, however, the annual volume of waste has never been less than 40,000 tonnes and the average annual volume over the last 20 years has been 75,000 tonnes. Although the operator has a contractual right to receive cash for all waste treated, there is no guarantee that any waste will be treated, and therefore no contractual right to receive cash.
- (b) An operator enters into a toll bridge concession. The operator is permitted to collect revenues from users or the grantor until it achieves a 6% return on its agreed infrastructure spend, at which point the arrangement comes to an end.

In commercial terms, the toll bridge concession may be virtually identical to a transaction that falls within (3) above, e.g., where the users pay tolls but the grantor guarantees a minimum 6% return. The crucial difference is the grantor's guarantee. The arrangement with the guarantee, which will contain a financial asset, is likely to leave more of the rewards of ownership with the operator than the intangible arrangement in (b) as the operator will be entitled to benefits in excess of the 6% return. This demonstrates that the distinction between the financial asset and intangible asset models is linked less to the transfer of commercial risk, but more to the existence (or not) of an unconditional contractual right to cash flows.

If the terms of the arrangement in (a) above contained a clause whereby the municipality must either provide, or pay for, a minimum guaranteed volume of waste to be treated by the operator (i.e., the arrangement contained a take-or-pay element), there would be a financial asset to the extent of the guaranteed minimum to be provided or paid for. There may also be an intangible asset if the value of the financial asset is less than the fair value of the construction services.

There are jurisdictions where public-to-private contract laws or the concession arrangements themselves allow an operator to ask the grantor for a revision of the tariffs for the public service when the operator's actual return is below initial expectations. Although this feature in the concession arrangement is included to reduce the operator's risk, it only gives the operator a right to re-negotiate and the outcome of that is not certain. As a result, the operator does not have an unconditional right to receive cash and, therefore, the existence of these features would not allow the operator to apply the financial asset model.

Many payment mechanisms include deductions for substandard performance of services. These do not affect the analysis of the contract as a financial asset or intangible asset and are discussed further below.

4.2 The financial asset model

Under the financial asset model, the service element that relates to the construction of the infrastructure asset ('construction services') is accounted for in accordance with IFRS 15. [IFRIC 12.14]. For the avoidance of doubt, an asset is not recognised for the discounted present value of all amounts payable by the grantor under the service concession arrangement. The entity recognises an asset for construction services performed up to the reporting date; subsequently it may recognise an asset on the same basis for upgrade services; the carrying value of the asset does not include future services yet to be performed or maintenance services that are accounted for as expenses. The consideration received by the operator for other services is addressed in section 5 below.

During the construction period, regardless of which model applies, consideration for the construction activity is classified as a contract asset. [IFRIC 12.19]. The operator recognises a financial asset [IAS 32.11] only when, and to the extent, it has an unconditional contractual right to receive cash or another financial asset from or at the direction of the grantor for the construction services. This is the case even if payment is contingent on the operator ensuring that the infrastructure meets specified quality or efficiency requirements. [IFRIC 12.16].

Contractual penalties imposed in service concession arrangements for failing specified quality or efficiency requirements during the operating phase may sometimes be recovered against consideration from construction services. This raises the question of the appropriate timing for recognising a receivable.

How we see it

A careful assessment of all facts and circumstances is required to identify, based on the contractual terms and applicable laws governing the service concession arrangement, the point at which the operator has an unconditional right to receive consideration and would therefore recognise a receivable. In some circumstances, the amount due to the operator in exchange for construction services only unwinds from a contract asset to a receivable over the period in which other performance obligations in the contract are satisfied by the operator. In other cases, the operator recognises a receivable as soon as the construction performance obligation is satisfied when offsetting penalties for failure to achieve operating services quality or efficiency requirements subsequently during the operating phase of the concession arrangement against consideration due for the construction services is only a settlement mechanism under the contractual terms and applicable laws governing the arrangement.

IFRS 15 does not require entities to use the terms 'contract asset' or 'contract liability', but entities must disclose sufficient information so that users of the financial statements can clearly distinguish between unconditional rights to consideration (receivables) and conditional rights to receive consideration (contract assets). [IFRS 15.109]. See Chapter 28 for further discussion on the distinction between contract assets and receivables.

Once the operator has an unconditional right to receive consideration, we believe that different approaches may be acceptable regarding measurement of the receivable at initial recognition.

On initial recognition, IFRS 9 generally requires a financial asset to be measured at its fair value (plus transaction costs, for a financial asset not at fair value through profit or loss). [IFRS 9.5.1.1]. See Chapter 15 for further discussion of fair value measurement. IFRS 15 requires any difference between the initial measurement of a financial asset in accordance with IFRS 9 and the corresponding amount of revenue recognised under IFRS 15 to be presented as an expense. [IFRS 15.108]. Applying this approach, movements in market interest rates between the date of commencement of construction services and the point at which the receivable is initially recognised that impact the fair value of the financial asset would result in the operator recognising an expense on initial recognition of the financial asset.

An alternative approach is based on the view that when an operator enters into a service concession contract accounted for under the financial asset model, it agrees to provide extended payments terms to the grantor for the construction services it provides. All terms and conditions are negotiated between the parties at the time of entering into the contract. The contract asset recognised during the construction phase is therefore a right to consideration at those pre-specified terms and conditions, subject to performance risk. The receivable recognised subsequently is based on the same terms and conditions and is a continuation of the contract asset (without any performance risk). A firm commitment to provide credit under pre-specified terms and conditions is a 'loan commitment' as defined in IFRS 9. [IFRS 9.BC22.2]. Under IFRS 9, specific requirements apply to loan commitments. Financial assets recognised following a draw down on a loan commitment are generally treated as a continuation of the related commitments instead of as a new financial instrument. [IFRS 9.BC22.3, IFRS 9.B5.5.47]. See Chapter 45 for further discussion on assets arising from loan commitments. Accordingly:

- When a receivable is recognised after a contract asset for the same right to consideration (but subject to performance risk) has been recognised, the resulting receivable is treated as a continuation of the contract asset considering the terms and conditions contracted at inception of the contract, rather than as a new financial asset.
And
- The entity does not measure the receivable at its fair value at the date of initial recognition and does not recognise changes in fair value of the contract asset that result from changes in market interest rates or credit spreads between the inception date of the customer contract and the initial recognition of the receivable. [IFRS 9.BC22.3]

Applying this approach, the operator would not recognise an expense on initial recognition of the financial asset as a result of any movements in market interest rates between the date of commencement of construction services and the point at which the receivable is initially recognised. Assets and liabilities arising from loan commitments are discussed in Chapter 44.

How we see it

Once the operator has an unconditional right to receive consideration, we believe that different approaches may be acceptable regarding measurement of the receivable at initial recognition.

If the receivable is recognised at fair value, any movements in market interest rates between the date of commencement of construction services and the point at which the receivable is initially recognised that impact the fair value of the financial asset would result in the operator recognising an expense on initial recognition of the financial asset.

If the receivable is instead treated as a continuation of the contract asset, the operator would not recognise an expense on initial recognition of the financial asset as a result of any movements in market interest rates between the date of commencement of construction services and the point at which the receivable is initially recognised.

We would expect entities to apply either approach consistently to similar arrangements.

As required by IFRS 9, the receivable would subsequently be recognised at amortised cost, at fair value through other comprehensive income, or at fair value through profit or loss, depending upon how it is classified under IFRS 9. [IFRIC 12.24]. Measurement at amortised cost requires the receivable to be held in a business model whose objective is to hold financial assets in order to collect contractual cash flows, and requires that those contractual cash flows represent solely payments of principal and interest. [IFRS 9.4.1.2]. Any features that introduce a more than *de minimis* exposure to risks or volatility in the contractual cash flows that is unrelated to a basic lending arrangement would mean that the receivable would not be measured at amortised cost. [IFRS 9.B4.1.7A, IFRS 9.B4.1.18]. If the amount due from the grantor is measured at amortised cost or fair value through other comprehensive income, interest income will be recognised, calculated using the effective interest method. [IFRIC 12.25]. Classification of financial assets under IFRS 9 is discussed in Chapter 44.

The financial asset recognised by the operator will be subject to the impairment requirements of IFRS 9. IFRS 15 also requires that contract assets are assessed for impairment in accordance with IFRS 9. [IFRS 15.107]. The impairment requirements of IFRS 9 are discussed in Chapter 47.

Borrowing costs incurred by the operator during the construction phase cannot be capitalised under the financial asset model. [IFRIC 12.22].

Illustration 4-2 below is based on Illustrative Example 1 in IFRIC 12 and illustrates how the financial asset model may be applied. It must, however, be noted that this example deals with only one of many possible types of arrangements seen in practice and is based on an uncomplicated fact pattern. It is important that entities understand and assess all the facts and circumstances of their own service concession arrangements in order to determine the appropriate accounting.

In the Illustration below, the operator recognises a receivable once construction services are complete. As discussed above, a receivable is recognised only when the operator has an unconditional right to receive consideration. The Illustration below contains an unstated assumption that this is the case at completion of construction services. However, this may not always be the case in practice.

Illustration 4-2: The Financial Asset Model**Table 1 Concession terms**

The terms of the arrangement require an operator to construct a road- completing construction within two years- and maintain and operate the road to a specified standard for eight years (i.e., years 3-10). The terms of the concession also require the operator to resurface the road at the end of year 8. At the end of year 10, the arrangement will end. Assume that the operator identified three performance obligations for construction services, operation services and road resurfacing. The operator estimates that the costs it will incur to fulfil its obligations will be:

	Year	CU
Construction services (per year)	1-2	500
Operation services (per year)	3-10	10
Road resurfacing	8	100

The terms of the concession require the grantor to pay the operator CU200 per year in years 3-10 for making the road available to the public.

For the purpose of this Illustration, it is assumed that all cash flows take place at the end of the year.

Table 2 Contract revenue

The operator recognises contract revenue in accordance with IFRS 15. Revenue- the amount of consideration to which the operator expects to be entitled from the grantor for the services provided- is recognised when (or as) the performance obligations are satisfied.

The total consideration (CU200 in each of years 3-8) is allocated to the performance obligations based on the relative stand-alone selling prices of the construction services, operating services and road resurfacing, taking into the significant financing component, as follows:

Transaction price allocation (including effect of the significant financing component)	
	CU
Construction services (a)	1,050
Operation services (b)	96
Road resurfacing services (c)	110
Total	1,256
Implied interest rate (d)	6.18% per year
(a) The operator estimates the relative stand-alone selling price by reference to the forecast cost plus 5%.	
(b) The operator estimates the relative stand-alone selling price by reference to the forecast cost plus 20%.	
(c) The operator estimates the relative stand-alone selling price by reference to the forecast cost plus 10%.	
(d) The implied interest rate is assumed to be the rate that would be reflected in a financing transaction between the operator and the grantor.	

Financial asset

During the first two years, the entity recognises a contract asset and accounts for the significant financing component in the arrangement in accordance with IFRS 15. Once the construction is complete, the amounts due from the grantor are accounted for in accordance with IFRS 9 as receivables.

Table 3 Measurement of contract asset/receivable

	CU
Amount due for construction in year 1	525
Contract asset at end of year 1*	525
Effective interest in year 2 on contract asset at the end of year 1 (6.18% × CU525)	32
Amount due for construction in year 2	525
Receivable at end of year 2	1,082
Effective interest in year 3 on receivable at the end of year 2 (6.18% × CU1,082)	67
Amount due for operation in year 3 (CU10 × (1 + 20%))	12
Cash receipts in year 3	(200)
Receivable at end of year 3	961

* No effective interest arises in year 1 because the cash flows are assumed to take place at the end of the year.

Overview of cash flows, statement of comprehensive income and statement of financial position

For the purposes of this example, it is assumed that the operator finances the arrangement wholly with debt and retained profits. It pays interest at 6.7% per year on outstanding debt. If the cash flows and fair values remain the same as those forecast, the operator's cash flows, statement of comprehensive income and statement of financial position over the duration of the arrangement will be as follows.

Table 4 Cash flows (CU)

Year	1	2	3	4	5	6	7	8	9	10	Total
Receipts	-	-	200	200	200	200	200	200	200	200	1,600
Contract costs (a)	(500)	(500)	(10)	(10)	(10)	(10)	(10)	(110)	(10)	(10)	(1,180)
Borrowing costs (b)	-	(34)	(69)	(61)	(53)	(43)	(33)	(23)	(19)	(7)	(342)

Table 5 Statement of comprehensive income (CU)

Year	1	2	3	4	5	6	7	8	9	10	Total
Revenue	525	525	12	12	12	12	12	122	12	12	1,256
Contract costs	(500)	(500)	(10)	(10)	(10)	(10)	(10)	(110)	(10)	(10)	(1,180)
Finance income (a)	-	32	67	59	51	43	34	25	22	11	344
Borrowing costs (b)	-	(34)	(69)	(61)	(53)	(43)	(33)	(23)	(19)	(7)	(342)
Net profit	25	23	-	-	-	2	3	14	5	6	78

(a) Amount due from grantor at start of year (table 6) × 6.18%
(b) Cash/(debt) (table 6) × 6.7%

Table 6 Statement of financial position (CU)

End of year	1	2	3	4	5	6	7	8	9	10
Amount due from grantor (a)	525	1,082	961	832	695	550	396	343	177	-
Cash/(debt) (b)	(500)	(1,034)	(913)	(784)	(647)	(500)	(343)	(276)	(105)	78
Net assets	25	48	48	48	48	50	53	67	72	78

(a) Amount due from grantor at start of year, plus revenue and finance income earned in year (table 5), less receipts in year (table 4).
(b) Debt at start of year plus net cash flows in year (table 4).

4.3 The intangible asset model

If the financial asset model does not apply (i.e., there is no unconditional contractual right to cash or other financial assets), the operator's consideration for its construction services will be an intangible asset.

[IFRIC 12.15]. As with the financial asset model, the operator cannot have an item of property, plant and equipment because the physical infrastructure is controlled by the grantor (see section 3 above).

[IFRIC 12.11]. Therefore, the IFRS IC has concluded that the right of an operator to charge users of the public service, for example, the right to collect tolls from a road or a bridge, meets the definition of an intangible asset, that is accounted for in accordance with IAS 38. It is, in effect, a licence 'bought' in exchange for construction services. [IFRIC 12.17].

Consideration is classified as a contract asset during the construction or upgrade period, [IFRIC 12.19], and revenue for construction or upgrade services will be recorded in accordance with IFRS 15. [IFRIC 12.14].

Under the intangible asset model, borrowing costs must be capitalised during the period of construction. [IFRIC 12.22]. However, as noted above, IFRIC 12 requires consideration to be classified as a contract asset, rather than an intangible asset, during the construction period. [IFRIC 12.19]. In March 2019, the IFRS IC issued an agenda decision relating to the capitalisation of borrowing costs on a constructed good for which revenue was recognised over time. In that agenda decision, the IFRS IC noted that, in the particular fact pattern considered, a contract asset is not a qualifying asset as the intended use of the contract asset is not a use for which it necessarily takes a substantial period of time to get ready.¹⁶ IAS 23 requires capitalisation of borrowing costs that are directly attributable to the acquisition, construction or production of an asset that necessarily takes a substantial period of time to get ready for its intended use or sale. [IAS 23.8, IAS 23.5]. Some may argue that there is a tension between the requirement in IFRIC 12 to capitalise interest during the construction phase under the intangible asset model and this agenda decision.

How we see it

We believe that the March 2019 agenda decision discussed above does not override the requirement in IFRIC 12.22 that, under the intangible asset model, borrowing costs must be capitalised during the period of construction.

Whilst IFRIC 12 requires consideration to be classified as a contract asset during the construction or upgrade period, Illustrative Example 2 to IFRIC 12 (which is reproduced in Illustration 4-3 below and Illustration 5-2 in section 5.2 below) shows that the contract asset is presented as an intangible asset during the construction phase. [IFRIC 12.IE15].

It is argued that an inevitable consequence of applying the intangible asset model is that there must be an exchange transaction in which the operator receives the intangible right in exchange for its construction services. [IFRIC 12.BC32]. As this is an exchange of dissimilar assets, revenue must be recognised in accordance with IFRS 15, which requires the recognition of revenue based on the fair value of the assets received, unless the fair value of the assets received cannot be reasonably estimated. [IFRIC 12.BC33, IFRS 15.66, IFRS 15.67]. This means that the operator must establish the fair value of either the intangible asset it receives or the stand-alone selling price of the construction services. [IFRS 15.67].

Under IAS 38, amortisation of an intangible asset begins when the asset is available for use, i.e., when it is in the location and condition necessary for it to be capable of operating in the manner intended by management. [IAS 38.97].

How we see it

We believe that amortisation of the intangible asset recognised by the operator in exchange for construction services would likely commence once construction is complete, and the operator can begin using the licence received in exchange for construction services in order to generate revenues.

In the following Illustration, based on Illustrative Example 2 in IFRIC 12, the operator determines the fair value of the intangible asset indirectly by reference to the stand-alone selling price of the construction services delivered. As with Illustration 4-2 above, it must be noted that this relatively simple example deals with only one of many possible types of arrangements seen in practice and it is important that entities understand and assess the facts and circumstances of their own service concession arrangements in order to determine the appropriate accounting.

¹⁶ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

Illustration 4-3: The Intangible Asset Model - recording the construction asset**Arrangement terms**

The terms of a service arrangement require an operator to construct a road- completing construction within two years- and maintain and operate the road to a specified standard for eight years (i.e., years 3-10). The terms of the arrangement also require the operator to resurface the road when the original surface has deteriorated below a specified condition. The operator estimates that it will have to undertake the resurfacing at the end of year 8. At the end of year 10, the service arrangement will end. The operator estimates that the costs it will incur to fulfil its obligations will be:

Table 1 Contract costs

	Year	CU
Construction services (per year)	1-2	500
Operation services (per year)	3-10	10
Road resurfacing	8	100

The terms of the arrangement allow the operator to collect tolls from drivers using the road. The operator forecasts that vehicle numbers will remain constant over the duration of the contract and that it will receive tolls of CU200 in each of years 3-10.

For the purpose of this Illustration, it is assumed that all cash flows take place at the end of the year.

Intangible asset

The operator provides construction services to the grantor in exchange for an intangible asset, i.e., a right to collect tolls from road users in years 3-10. In accordance with IFRS 15, the operator measures this non-cash consideration at fair value. In this case the operator determines the fair value indirectly by reference to the stand-alone selling price of the construction services delivered.

During the construction phase of the arrangement the operator's contract asset (representing its accumulating right to be paid for providing construction services) is presented as an intangible asset (licence to charge users of the infrastructure). The operator estimates the stand-alone selling price of the construction services to be equal to the forecast construction costs plus 5% margin, which the operator concludes is consistent with the rate a market participant would require as compensation for providing the construction services and for assuming the risk associated with the construction costs. The operator also capitalises borrowing costs during the construction phase as required by IAS 23, at an estimated rate of 6.7%:

Table 2 Initial measurement of intangible asset

	CU
Construction services in year 1 ($\text{CU}500 \times (1 + 5\%)$)	525
Capitalisation of borrowing costs	34
Construction services in year 2 ($\text{CU}500 \times (1 + 5\%)$)	525
Intangible asset at end of year 2	1,084

The intangible asset is amortised over the period in which it is expected to be available for use by the operator, i.e., years 3-10. In this case, the directors determine that it is appropriate to amortise using a straight-line method. The annual amortisation charge is therefore CU1,084 divided by 8 years, i.e., CU135 per year.

Construction costs and revenue

The operator accounts for the construction services in accordance with IFRS 15. It measures revenue at the fair value of the non-cash consideration received or receivable. Thus, in each of years 1 and 2 it recognises in its income statement construction costs of CU500, construction revenue of CU525 (cost plus 5%) and, hence, construction profit of CU25.

Toll revenue

The road users pay for the public services at the same time as they receive them, i.e., when they use the road. The operator therefore recognises toll revenue when it collects the tolls.

The accounting for the operations phase of this example service concession arrangement is discussed in Illustration 5-2 in section 5.2 below.

4.3.1 Amortisation of the intangible asset

The intangible asset will subsequently be accounted for in accordance with IAS 38, [IFRIC 12.26], and the amount at which it is measured initially, i.e., after the exchange transaction, is its cost. [IAS 38.45]. It will be amortised on a systematic basis over its useful life, using a method that reflects "...the pattern in which the asset's future economic benefits are expected to be consumed by the entity...". [IAS 38.97]. This means that the methods permitted by IAS 38 are available (straight line, diminishing balance or units-of-production). [IAS 38.98]. The requirements of IAS 38 are discussed in detail in Chapter 18. Interest methods of amortisation are forbidden. [IFRIC 12.BC65].

The IFRS IC expressly considered units-of-production methods to be appropriate in some circumstances; in March 2006, it was noted in the *IFRIC Update* that the Basis for Conclusions to Exposure Draft D14 *Service Concession Arrangements - The Intangible Asset Model* would be redrafted to avoid the impression that these methods were not allowed.¹⁷ There were still concerns that a units-of-production method could result in lower amortisation in the early years of the asset's operation so IAS 38 itself was amended to remove a statement discouraging methods that might have such a result.¹⁸ This clarifies that there is no prohibition when the method is the most appropriate, whatever the resulting profile of amortisation.

Units-of-production methods are typically considered in the context of toll roads and bridges. Obviously, the method might apply if there is a right to charge a specified number of users. It might also be applied using the estimated number of users, e.g., the number of vehicles that might use a particular road during the concession term, as a basis.

The remaining issue regarding amortisation methods has been whether they could be based on revenue generated by the asset; this depends on the meaning of 'consumption of economic benefits' in the context of intangible assets with finite lives. IAS 38 includes a rebuttable presumption that a method of amortisation based on the revenue expected to be generated from an activity that includes the use of an intangible asset is not appropriate. This is because this method typically reflects factors that are not directly linked to the consumption of the economic benefits embodied in the asset. [IAS 38.98A]. See Chapter 18.

Illustration 4-4 below demonstrates the potentially distorting effects for a SCA of basing amortisation on revenue.

However, the Board did acknowledge certain 'limited circumstances' that would give rise to an exception to this presumption. Revenue generated can be used to amortise an intangible asset when: [IAS 38.98A]

- The rights embodied in that intangible asset are expressed as a measure of revenue
- Or
- It can be demonstrated that revenue and the consumption of economic benefits are 'highly correlated'

The Board did not define what is meant by 'highly correlated', but it describes situations where the asset is 'expressed as a measure of revenue'. A 'highly correlated' outcome would only be achieved where a revenue-based method of amortisation is expected to give a similar answer to one of the other methods permitted by IAS 38. For example, if revenue is earned evenly over the expected life of the asset, the pattern of amortisation would be similar to a straight-line basis.

How we see it

In situations where unit prices are fixed and all production is sold, a revenue-based pattern of amortisation would replicate the use of the units-of-production method. However, when unit prices are not fixed, a revenue-based pattern of amortisation would not provide a similar answer and its use would therefore be inappropriate.

¹⁷ [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

¹⁸ IAS 38 (2007), *Intangible Assets*, IASB, 2007 Bound Volume, para. 98 stated that "there is rarely, if ever, persuasive evidence to support an amortisation method for intangible assets with finite useful lives that results in a lower amount of accumulated amortisation than under the straight-line method." This was removed by Improvements to IFRSs, May 2008.

The following Illustration shows how a revenue-based method of amortisation diverges from the units-of-production method when the price per unit is not fixed.

Illustration 4-4: Output-based versus revenue-based amortisation when prices change

Entity Z enters into a twenty-five year SCA over a toll bridge. It recognises an intangible asset of CU20 million and expects the bridge to be used at its full capacity of 100,000 vehicles per year. Tolls will commence at CU10 per vehicle and, under the terms of the SCA, it is allowed to raise prices by 10% every five years. On this basis, the profile of amortisation on a units-of-production method (UoP) and on a revenue-based method would be as follows:

	Units	Charge UoP basis	Revenue	Charge Revenue basis
		CU	CU	CU
Years 1-5	500,000	4,000,000	5,000,000	3,276,000
Years 6-10	500,000	4,000,000	5,500,000	3,604,000
Years 11-15	500,000	4,000,000	6,050,000	3,964,000
Years 16-20	500,000	4,000,000	6,655,000	4,360,000
Years 21-25	500,000	4,000,000	7,320,500	4,796,000
Total	2,500,000	20,000,000	30,525,500	20,000,000

Despite an expected constant level of consumption of the asset in the Illustration above, the revenue-based method results in amortisation being delayed until the later periods of the asset's use. This distortion is caused by the increase in price rather than any factor related to the use of the intangible asset.

The Board permits revenue-based amortisation to be used when revenue is "...the predominant limiting factor that is inherent in an intangible asset...". [IAS 38.98C]. In other words, revenue determines the useful life of the asset, rather than, for example, a number of years or the number of units produced.

The IASB provided two examples of this circumstance in which revenue earned can be regarded as a measure of consumption of an intangible asset: [IAS 38.98C]

(a) A contract may allow the extraction of gold from a mine until total cumulative revenue from the sale of gold reaches CU2 billion.

Or

(b) The right to operate a toll road could be based on a fixed total amount of revenue generated, based on cumulative tolls that have been charged.

An example of (b) is a SCA, described in section 4.1.2 above, in which an operator enters into a toll bridge concession under which it is permitted to collect revenues from users or the grantor until it achieves a 6% return on its agreed infrastructure spend, at which point the arrangement comes to an end. As explained in section 4.1.2 above, this will be accounted for as an intangible asset because the operator may never achieve the revenue target. In this case, the operator could calculate amortisation based on cumulative revenue as a percentage of total revenue.

The choice of amortisation method is a matter of judgement. In the following extract from its accounting policies, ENGIE SA indicates that it amortises its intangible assets mainly on a straight-line basis.

Practical example 4-1: ENGIE SA (2023)

France

2023 MANAGEMENT REPORT AND ANNUAL CONSOLIDATED FINANCIAL STATEMENTS [extract]**03 NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****NOTE 13 FIXED ASSETS [extract]****13.2 Intangible assets [extract]****Accounting standards [extract]****Amortization**

Intangible assets are amortized on the basis of the expected pattern of consumption of the estimated future economic benefits embodied in the asset. Amortization is calculated mainly on a straight-line basis over the following useful lives:

Main depreciation periods (years)	Useful life	
	Minimum	Maximum
Concession rights	10	30
Customer portfolio	3	20
Other intangible assets	1	50

Intangible assets with an indefinite useful life are not amortized but are tested for impairment annually.

4.3.2 Impairment testing during the construction phase

As noted in section 4.3 above, IFRS 15 requires the operator to classify the consideration given by the grantor as a contract asset during the construction phase. [IFRIC 12.19]. Contract assets are subject to the impairment requirements of IFRS 9. [IFRS 15.107].

How we see it

Operators may need to apply judgement in determining how to test the contract asset for impairment, given that the contract asset is expected to be realised in the form of an intangible asset, rather than as a receivable or cash. This will include consideration of whether and how they can use the value of the underlying asset to which they are entitled as a proxy for cash flows in order to determine expected credit losses on the contract asset.

The impairment requirements of IFRS 9 are discussed in Chapter 47, and impairment of non-cash consideration contract assets is discussed in Chapter 28.

4.4 Revenue recognition implications of the two models

Extract from IFRIC 12

- 12 Under the terms of contractual arrangements within the scope of this Interpretation, the operator acts as a service provider. The operator constructs or upgrades infrastructure (construction or upgrade services) used to provide a public service and operates and maintains that infrastructure (operation services) for a specified period of time.

[IFRIC 12.12].

IFRIC 12 requires the operator to recognise and measure revenue in accordance with IFRS 15 for the services it performs. [IFRIC 12.13].

While the nature of the consideration (i.e., a financial asset, an intangible asset, or a mixture of the two) determines how revenue is recognised during the operating phase, [IFRIC 12.13], under both models, the revenue that is recognised by the operator for the construction or upgrade services is the same and equals the fair value of these construction services.

There is nonetheless a major difference in the way in which revenue is measured under the two models during the operating phase of the arrangement. Under the financial asset model, total revenue over the concession term will be the same as the total cash inflows under the contract. By contrast, the fair value of the intangible asset is recognised as revenue under the intangible asset model, so total revenue measured using this model will be higher by this amount. The consequences of the two models can be demonstrated by the following simple example:

Illustration 4-5: Revenue under the financial asset and intangible models

An operator builds a road at a cost of CU100. The construction profit is CU10 and total cash inflows over the life of the concession are CU200. Assume that there is no significant financing component in the arrangement. Under the financial asset model, the operator will recognise construction revenue of CU110 and a receivable of CU110. Of the future cash inflows of CU200, CU110 will be treated as repaying the receivable, with the remaining CU90 being recognised as revenue over the life of the concession. Total revenue will be CU200. Under the intangible asset model, the operator will recognise construction revenue of CU110, an intangible asset of CU110, and a construction profit of CU10. Over the life of the concession, the intangible asset of CU110 would be amortised against revenues (which in this case would be from users) of CU200. The net position is the same as in the financial asset case, but total revenues will be CU310 rather than CU200.

It is fair to say that this proved highly controversial. In fact, the September 2004 *IFRIC Update* stated that "...The majority of the IFRIC strongly disliked this outcome...".¹⁹ However, the IFRS IC maintained that this is the appropriate application of accounting standards to the arrangements and is consistent with the treatment generally accorded to barter transactions, [IFRIC 12.BC35], although, of course, there are no other sectors where barter transactions are fundamental to the arrangement.

4.5 'Bifurcation' - single arrangements that contain both financial and intangible assets

The IFRS IC concluded that it may be necessary in certain circumstances to divide the operator's right to cash flows into a financial asset and an intangible asset. [IFRIC 12.18]. The March 2006 *IFRIC Update* reported that "...With this change, the proposed amendment would better reflect the economic reality of concession arrangements: to the extent that the operator is remunerated for its construction services by obtaining a contractual right to receive cash from, or at the direction of, the grantor, the operator would recognise a financial asset and, to the extent that the operator receives only a licence to charge users, it would recognise an intangible asset...".²⁰

The Basis for Conclusions on IFRIC 12 explains more of the reasoning and potential impact. In some arrangements, both parties to the contract share the risk (demand risk) that the cash flows generated by the project will not be sufficient to recover the operator's capital investment. A common mechanism for achieving this is where the grantor pays partly by a financial asset (i.e., the grantor will pay cash for the services provided) but gives the operator the right to charge for services (i.e., the operator has an intangible asset). The operator's infrastructure asset is to be split into a financial asset component for any guaranteed amount of cash and an intangible asset for the remainder. [IFRIC 12.18, IFRIC 12.BC53].

This is common in transport concessions, e.g., a rail system paid for partly by grantor subsidy and partly by the payment of fares. This gives rise to difficult matters of judgement. It may not be clear how much of the arrangement is a financial asset and, therefore, where to draw the boundary between the two assets.

The following Illustration, based on Illustrative Example 3 in IFRIC 12, illustrates how an entity may account for a service concession arrangement under the bifurcated model. As with Illustration 4-2 and Illustration 4-3 above, it must be noted that this example deals with only one of many possible types of arrangements seen in practice and it is important that entities understand and assess the facts and circumstances of their own service concession arrangements in order to determine the appropriate accounting. In the Illustration below, the operator recognises a receivable and an intangible asset once construction services are complete. As discussed in section 4.2 above, IFRS 15 requires that a receivable is recognised only when the operator has an unconditional right to receive consideration, which will be the case only when nothing other than the passage of time is required before payment of the consideration is due. [IFRS 15.108]. We therefore assume that the example below contains an unstated assumption that this is the case at completion of construction services. However, this may not always be the situation in practice.

¹⁹ [IFRIC Update](#), September 2004, available on the IFRS Foundation's website.

²⁰ [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

Illustration 4-6: The bifurcated model**Arrangement terms**

The terms of a service arrangement require an operator to construct a road- completing construction within two years- and maintain and operate the road to a specified standard for eight years (i.e., years 3-10). The terms of the arrangement also require the operator to resurface the road when the original surface has deteriorated below a specified condition. The operator estimates that it will have to undertake the resurfacing at the end of the year 8. At the end of year 10, the service arrangement will end. The operator estimates that the costs it will incur to fulfil its obligations will be:

Table 1 Contract costs

	Year	CU
Construction services (per year)	1-2	500
Operation services (per year)	3-10	10
Road resurfacing	8	100

The operator estimates the consideration in respect of construction services to be CU1,050 by reference to the stand-alone selling price of those services, which it estimates at forecast cost plus 5%. The terms of the arrangement allow the operator to collect tolls from drivers using the road. In addition, the grantor guarantees the operator a minimum amount of CU700 and interest at a specified rate of 6.18% to reflect the timing of cash receipts. The operator forecasts that vehicle numbers will remain constant over the duration of the contract and that it will receive tolls of CU200 in each of years 3 to 10. All cash flows occur at the end of the year.

Dividing the arrangement

The contractual right to receive cash from the grantor for the services and the right to charge users for the public services are regarded as two separate assets under IFRS accounting standards. Therefore, in this arrangement it is necessary to divide the operator's contract asset during the construction phase into two components- a financial asset component based on the guaranteed amount and an intangible asset for the remainder. When the construction services are complete, the two components of the contract asset would be classified and measured as a financial asset and an intangible asset accordingly.

Table 2 Dividing the operator's consideration

Year	Total	Financial asset	Intangible asset
Construction services in year 1	525	350	175
Construction services in year 2	525	350	175
Total construction services	1,050	700	350
	100%	67% (a)	33%
Finance income, at specified rate of 6.18% (see table 3)	22	22	-
Borrowing costs capitalised (interest paid in years 1 and 2 × 33%) (see table 7)	11	-	11
Total fair value of the operator's consideration	1,083	722	361

(a) Amount guaranteed by the grantor as a proportion of the construction services.

Financial asset

During the first two years, the entity recognises a contract asset and accounts for the significant financing component in the arrangement in accordance with IFRS 15. Once the construction is complete, the amount due from, or at the direction of, the grantor in exchange for the construction services is accounted for in accordance with IFRS 9 as a receivable.

Table 3 Measurement of the contract asset/receivable

	CU
Construction services in year 1 allocated to the contract asset	350
Contract asset at end of year 1	350
Construction services in year 2 allocated to the contract asset	350
Interest in year 2 on contract asset at end of year 1 (6.18% × CU350)	22
Receivable at end of year 2	722
Interest in year 3 on receivable at end of year 2 (6.18% × CU722)	45
Cash receipts in year 3 (see table 5)	(117)
Receivable at end of year 3	650

Intangible asset

In accordance with IAS 38, the operator recognises the intangible asset at cost, i.e., the fair value of the consideration received or receivable. During the construction phase of the arrangement, the portion of the operator's contract asset that represents its accumulating right to be paid amounts in excess of the guaranteed amount for providing construction services is presented as a right to receive a licence to charge users of the infrastructure. The operator estimates the stand-alone selling price of the construction services as equal to the forecast construction costs plus 5%, which the operator concludes is consistent with the rate that a market participant would require as compensation for providing the construction services and for assuming the risk associated with the construction costs. It is also assumed that, in accordance with IAS 23, the operator capitalises the borrowing costs, estimated at 6.7%, during the construction phase.

Table 4 Initial measurement of the intangible asset

	CU
Construction services in year 1	175
Borrowing costs (interest paid in years 1 and 2 × 33%) (see table 7)	11
Construction services in year 2	175
Intangible asset at the end of year 2	361

In accordance with IAS 38, the intangible asset is amortised over the period in which it is expected to be available for use by the operator, i.e., years 3-10. The depreciable amount of the intangible asset (CU361 including borrowing costs) is allocated using a straight-line method. The annual amortisation charge is therefore CU361 divided by 8 years, i.e., CU45 per year.

Revenue and costs

The operator provides construction services to the grantor in exchange for a financial asset and an intangible asset. Under both the financial asset model and intangible asset model, the operator accounts for the construction services in accordance with IFRS 15. Thus, in each of years 1 and 2 it recognises in profit or loss construction costs of CU500 and construction revenue of CU525.

Toll revenue

The road users pay for the public services at the same time as they receive them, i.e., when they use the road. Under the terms of this arrangement the cash flows are allocated to the financial asset and intangible asset in proportion, so the operator allocates the receipts from tolls between repayment of the financial asset and revenue earned from the intangible asset.

Table 5 Allocation of toll receipts

Year	CU
Guaranteed receipt from grantor	700
Finance income (see table 8)	237
Total	937
Cash allocated to realisation of the financial asset per year (CU937 ÷ 8 years)	117
Receipts attributable to intangible asset (CU200 × 8 years - CU937)	663
Annual receipt from intangible asset (CU663 ÷ 8 years)	83

Resurfacing obligations

The operator's resurfacing obligation arises as a consequence of use of the road during the operation phase. It is recognised and measured in accordance with IAS 37, i.e., at the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. It is assumed that the terms of the operator's contractual obligation are such that the best estimate of the expenditure required to settle the obligation at any date is proportionate to the number of vehicles that have used the road by that date and increases by CU17 each year. The operator discounts the provision to its present value in accordance with IAS 37. The charge recognised each period in profit or loss is:

Table 6 Resurfacing obligation (CU)

Year	3	4	5	6	7	8	Total
Obligation arising in year (CU17 discounted at 6%)	12	13	14	15	16	17	87
Increase in earlier years' provision arising from passage of time	0	1	1	2	4	5	13
Total expense recognised in profit or loss	12	14	15	17	20	22	100

Overview of cash flows, statement of comprehensive income and statement of financial position

For the purposes of this example, it is assumed that the operator finances the arrangement wholly with debt and retained profits. It pays interest at 6.7% per year on outstanding debt. If the cash flows are fair values remain the same as those forecast, the operator's cash flows, statement of comprehensive income and statement of financial position over the duration of the arrangement will be as follows:

Table 7 Cash flows (CU)

Year	1	2	3	4	5	6	7	8	9	10	Total
Receipts	-	-	200	200	200	200	200	200	200	200	1,600
Contract costs (a)	(500)	(500)	(10)	(10)	(10)	(10)	(10)	(110)	(10)	(10)	(1,180)

Cash/(debt) (b)	(500)	(1,034)	(913)	(784)	(647)	(500)	(343)	(276)	(105)	78
Resurfacing obligation	-	-	(12)	(26)	(41)	(58)	(78)	-	-	-
Net assets	25	49	41	34	29	27	27	29	51	78

(a) Asset is a contract asset in years 1 and 2 until construction is completed

(b) Debt at start of year plus net cash flow in year (table 7)

The example above shows the operator's contractual obligation to resurface the road being recognised and measured in accordance with IAS 37. The accounting for maintenance costs during the operations phase is discussed in section 5.2 below.

4.6 Accounting for residual interests

Unless the infrastructure in a service concession arrangement is used for the whole of its useful life (within scope of IFRIC 12 - see section 3.2 above), there will be a residual interest at the end of the contract that will be controlled by the grantor. The way in which the grantor controls the residual interest will affect the way in which the operator accounts for it. If the operator has an unconditional contractual right to cash (or another financial asset) for the residual interest in the infrastructure, this right will be a financial asset. This is unaffected by the basis on which the consideration is calculated.

There are many different arrangements over residual interests in the infrastructure at the end of the concession term. The grantor may control the residual via:

- (a) An obligation to purchase the infrastructure from the operator regardless of the pricing terms (fair value, net book value, a notional amount or zero)
- (b) Other rights, e.g., deciding who will operate the residual interests at the end of the initial service concession arrangement either by granting the operator a new term or selecting a new party to take on the assets, regardless of whether payments are made by the grantor or by the new operator at the direction of the grantor

Or

- (c) The grantor has an option to acquire the assets on similar bases to (a) but if this is not exercised then the operator may retain them

The implications of grantor options and control of the residual interest are discussed in section 3.2 above.

If the terminal arrangements fall within (a) above the operator will have an unconditional contractual right to cash (unless the infrastructure must be returned for no consideration). It will recognise a financial asset, initially at fair value, which will then be accounted for according to the relevant classification under IFRS 9 (see section 4.2 above). If the financial asset is measured at amortised cost or fair value through other comprehensive income under IFRS 9, then interest will be calculated using the effective interest method. At the end of the contract the financial asset in respect of the residual interest will be stated at the operator's best estimate of the amount receivable.

Where the grantor has a right to put in place other arrangements, as in (b) above, the operator would only have an unconditional right to cash (i.e., a financial asset) after the grantor terminates the operator's involvement in the concession (by letting the contract lapse or by selecting a new party to take on the assets) if such termination will result in a payment to the operator. To the extent that the grantor can avoid any obligation to pay cash by allowing the concession term to continue, the operator has an intangible asset. In this scenario, the operator has a right to receive economic benefits either in the form of cash or continuing use of the infrastructure at the end of the concession. The existence of such extension rights would have to be considered when determining the term of the concession arrangement.

If the arrangement is of the type described in (c), then the operator's residual interest is not a financial asset. Nor does it have a residual interest in the underlying property, plant and equipment because this is an arrangement within the scope of IFRIC 12 and the entity cannot recognise the underlying assets, in whole or in part. [IFRIC 12.11]. The only option is to recognise an intangible asset.

How we see it

The operator must account for its residual interests as a financial asset or an intangible asset based on the contractual rights, whatever model is being applied to its construction services. This is similar to the explicit requirements for upgrade services set out in IFRIC 12.15 and described in section 5.1 below.

As described in section 5.1 below, IFRIC 12 recognises that entities account for upgrade services in accordance with IFRS accounting standards, meaning that revenue must be recognised on the basis of the contract terms related to the provision of those upgrade services regardless of what determinations were made in relation to the construction services, including the accounting model applied. [IFRIC 12.14]. We believe that the same principle applies to the operator's accounting for its residual interest. The result is that an entity that has recognised an intangible asset for the major part of its construction services might have to recognise a financial asset for the residual interests - or *vice versa* if its construction services have been accounted for as a financial asset. This treatment is a variation of the bifurcation described in section 4.5 above except that the financial asset relates only to the residual interest in the infrastructure rather than to a portion of the consideration receivable for the infrastructure as a whole. The residual rights will be taken into account in calculating the revenue receivable under the contract.

As the termination arrangements can be complex, care will have to be taken to ensure that the effects are fully analysed.

Illustration 4-7: Contractual rights to cash in termination arrangements

The facts of the SCA are as in Illustration 3-1 above. At the end of the term, the grantor will either pay for the infrastructure assets at their net book value, determined on the basis of the contract, or it may decide to grant a new SCA on the basis of a competitive tender, which will exclude the current operator. If the grantor elects to do the latter, the operator will be entitled to the lower of the following two amounts:

(a) The net book value of the infrastructure, determined on the basis of the contract

And

(b) The proceeds of a new competitive bidding process to acquire a new contract

Although the operator cannot enter the competitive tender, it also has the right to enter into a new concession term but in order to do so, it must match the best tender offer made. It has to pay to the grantor the excess of the best offer (b) above the amount in (a); should the tender offer be lower than (a), it will receive an equivalent refund.

In this arrangement, the operator has a contractual right to cash that is recognised as a financial asset. It has a right to receive the lower of (a) and (b). It may choose to use its right to cash to settle part or all of the price of a new concession agreement but this does not affect the fact that it has a right to cash. The financial asset will be initially measured at its fair value, and subsequently at fair value through profit or loss because the contractual cash flows of the financial asset do not represent solely payments of principal and interest.

[IFRS 9.4.1.2]. Classification of financial assets under IFRS 9 is discussed in Chapter 44.

The example above also illustrates that calculating the fair value of the contractual right to cash may be complex as it must take account of a number of different estimates, including the net book value of the infrastructure at the end of the contract, as well as the options available to the parties to the contract.

4.7 Accounting for contractual payments to be made by an operator to a grantor

Many arrangements require an entity to make payments to the grantor during the course of the SCA. These payments take two main forms:

(a) Payments related to the use of tangible assets, including:

- (i) Payments to the grantor or third parties for making assets available (such as trains and buses) in order to provide the services required by the concession contract
- (ii) Payments to a third party for the construction and making available of assets (such as rolling stock) that pass to the grantor at the end of the concession term
- (iii) Payments to the grantor for making available land on which the infrastructure assets are constructed or situated

Or

(b) Fees payable to the grantor for the right to operate the concession, which can be described as concession fees, development fees or access charges

It is possible that some of these payments could be for the right to use assets controlled by the operator itself or the concession payment could relate to a distinct good or service that is separate from the concession arrangement.

In July 2016, the IFRS IC was asked to consider how such payments are accounted for, as follows:

Frequently asked questions

Question 4-1: How does an operator account for payments it makes to a grantor in a service concession arrangement within the scope of IFRIC 12?

The IFRS IC observed the following in circumstances other than those in which the operator is collecting amounts (for example, sales taxes) on behalf of, and remitting them to, the grantor:

- (a) If payments made by an operator to a grantor are for a right to a good or service that is separate from the service concession arrangement, the operator accounts for those payments by applying the applicable IFRS accounting standards.
- (b) If payments are for the right to use an asset that is separate from the infrastructure within the scope of IFRIC 12, the operator assesses whether the arrangement contains a lease. If the arrangement contains a lease, the operator accounts for those payments by applying IFRS 16.
- (c) If payments are neither for the right to a separate good or service nor a separate right to use an asset that is a lease, then accounting for those payments should depend on whether the SCA falls within the financial asset model, the intangible asset model or is a hybrid. This means that the payments will be reflected in the carrying value of the appropriate concession asset, as follows:
 - (i) If the SCA is accounted for under the financial asset model, then the concession payment is a reduction to of the transaction price, applying the requirements in IFRS 15.70 to 72 (as illustrated in section 4.7.2 below).
 - (ii) If the intangible asset model applies, then the concession payment is part of the cost of acquiring the intangible asset recognised for the right to charge users of the service.
 - (iii) If the operator has both a right to charge users of the public service and a contractual right to receive cash from the grantor, then the entity assesses the extent to which the concession payment represents an adjustment to the overall consideration receivable or whether it is consideration for the intangible asset element.²¹

The application guidance in AG7 and AG8 of IFRIC 12 may be relevant to an operator in assessing whether an asset is separate from the infrastructure within scope of IFRIC 12. This application guidance is considered in section 3.4 above, in the context of partially regulated assets.

The recommended treatment under the financial asset model is predicated on the fact that the operator has a contractual right to receive cash from the grantor and that payments between the parties are all part of this single relationship, however described. In this regard, payments to the grantor will include amounts paid to a related private sector entity to which responsibility for the service has been devolved. [IFRIC 12.3].

Under the IFRS IC's approach for the intangible asset model, payments to the grantor that are not for a right to a good or service that is separate from the SCA, and are not an embedded lease, represent consideration for the concession, i.e., part of the cost of the intangible asset recognised.

4.7.1 Accounting for variable payments in a service concession

Some contracted payments, particularly concession fees, vary with a measure of usage of the concession asset or with another feature of the arrangement. Whilst the IFRS IC was able to reach a consensus on the treatment of concession fees that do not depend on future activity, as noted in section 4.7 above, it has found the issue of variable payments more challenging.

The topic of variable payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The IFRS IC's discussions considered both the accounting at the date of purchasing the asset and subsequently, and distinguished between those variable payments that depend on the purchaser's future activity and those that do not. The IFRS IC determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively. In May 2016, the IASB tentatively agreed that this issue would be included in the research pipeline between 2017 and 2021. At the time of writing this is not listed as an active research project on the IASB's work plan.

²¹ [IFRIC Update](#), July 2016, available on the IFRS Foundation's website.

How we see it

In light of the discussions held by the IFRS IC; and in the absence of clear guidance in the final agenda decision, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments should be recognised as a liability. In doing so, entities will need to apply the hierarchy in IAS 8. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

The IFRS IC's deliberations on the treatment of variable payments for the separate acquisition of intangible assets is also discussed in Chapter 18. Operators in a service concession often treat contingent payments that vary in relation to future activity as executory and expense them as incurred.

4.7.2 Accounting for contractual payments under the financial asset model

If the financial asset model applies then the IFRS IC agreed that unless the contractual payments relate to the right to use assets controlled by the operator itself or relate to a distinct good or service that is distinct from the service concession arrangement, the contractual payment is accounted for as a reduction in the overall consideration received, i.e., it is an adjustment to the fair value of the consideration given by the grantor²² (see section 4.7 above). Another way of expressing this is that payments from the grantor reduce the financial asset while payments to the grantor increase that asset; both will also affect the amount of interest accrued on the outstanding balance. This applies whether the payment is for the right of access to an asset or described as a concession fee.

Illustration 4-8: Contractual payments made to a grantor under the financial asset model

Entity A enters into a 10-year concession agreement requiring it to construct a school and be responsible for operations services (including maintenance, utilities, cleaning and catering). After a 2-year construction period, the entity will receive CU300 per year during years 3-10, to operate the asset, after which the concession will cease. The entity must pay CU30 per year for the use of the land on which the school is built. Entity A concludes that the land use charge does not relate to a distinct good or service that is distinct from the service concession itself and does not give the entity a right to use an asset that is separate from the infrastructure.

The entity's estimated contract costs and contractual payments are as follows:

		Annual charge	Total
	Year	CU	CU
Construction services	1-2	500	1,000
Operation services	3-10	100	800
Land use charge	1-10	30	300
Total cash paid	1-10		2,100

The operating cash flows under the contract are as follows:

Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Concession consideration	-	-	300	300	300	300	300	300	300	300
Construction and operation costs	(500)	(500)	(100)	(100)	(100)	(100)	(100)	(100)	(100)	(100)
Land use charge	(30)	(30)	(30)	(30)	(30)	(30)	(30)	(30)	(30)	(30)
Net cash flows	(530)	(530)	170	170	170	170	170	170	170	170

22 [IFRIC Update](#), July 2016, available on the IFRS Foundation's website.

The entity recognises revenue in accordance with IFRS 15 and estimates that the stand-alone selling price of its services and total revenue from those services is as follows:

Estimated stand-alone selling price				Total
				CU
Construction	Forecast cost	+	5%	1,050
Operation and maintenance	Forecast cost	+	15%	920
Total revenue				1,970
Lending rate to grantor		2.25% per year		

Under the financial asset model, the land use charge is treated as an adjustment to the transaction price and is not treated as an expense. Accordingly, the gross concession profit is calculated as follows:

Year	1	2	3	4	5	6	7	8	9	10	Total
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Concession revenue*	525	525	115	115	115	115	115	115	115	115	1,970
Construction costs	(500)	(500)	(100)	(100)	(100)	(100)	(100)	(100)	(100)	(100)	(1,800)
Finance income	6	19	24	21	18	15	12	8	5	3	130
Concession profit**	31	44	39	36	33	30	27	23	20	18	300

* Concession revenue comprises revenue from construction and operation and maintenance services, less the land use charge.

** Concession profit totals CU300, which represents the total consideration received for services (CU2,400), less the land use charge of CU300, and construction costs of CU1,800. In the income statement this is analysed as:

	CU
Concession revenue	1,970
Construction costs	(1,800)
Finance income	130
Total	300

The contract asset/financial asset is computed as follows, applying an effective interest rate of 2.25%.

Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Opening balance	0	561	1,135	1,004	870	733	592	449	302	152
Additions	525	525	115	115	115	115	115	115	115	115
Net cash	30	30	(270)	(270)	(270)	(270)	(270)	(270)	(270)	(270)
Finance income*	6	19	24	21	18	15	12	8	5	3
Closing balance	561	1,135	1,004	870	733	592	449	302	152	-

* Finance income is calculated on the average debtor balance outstanding and assumes that the same interest rate is applied to both the contract asset and receivable.

4.7.3 Accounting for contractual payments under the intangible asset model

Under the intangible asset model, concession payments would be treated in accordance with IAS 38 as part of the consideration for the intangible asset.

While lease-type costs and land use charges can be part of any concession arrangement, concession fees (however called) are much more commonly a feature of arrangements which follow the intangible asset model. This is unsurprising as they are in substance payments made by the operator for the right to charge users of the concession infrastructure.

The IFRS IC have noted that unless the contractual payments relate to the right to use assets controlled by the operator itself or relate to a distinct good or service that is distinct from the service concession arrangement, the concession payment represents additional consideration for the concession right (i.e., part of the cost of the intangible asset recognised) - see section 4.7 above.

4.8 Contract acquisition and mobilisation costs

Given the scale of many service concession arrangements, operators often incur significant bid costs, pre-contract costs and mobilisation costs.

IFRS 15 specifies the accounting treatment for costs that an entity incurs to obtain and fulfil a contract to provide goods or services to customers, if those costs are not within the scope of another IFRS accounting standard. [IFRS 15.8].

4.8.1 Costs to obtain a contract

IFRS 15 requires that incremental costs of obtaining a contract with a customer are recognised as an asset if the entity expects to recover them, either directly (i.e., reimbursement under the contract), or indirectly (i.e., through the margin inherent under the contract). [IFRS 15.91]. Incremental costs of obtaining a contract are those that the entity would not have incurred if the contract had not been obtained, such as sales commission. [IFRS 15.92]. Costs incurred to obtain a contract that are not incremental costs must be expensed as incurred, unless they are explicitly chargeable to the customer regardless of whether the contract is obtained. [IFRS 15.93]. Many of the costs that an operator incurs in bidding for a service concession contract, such as the fixed salaries of employees involved in drafting the tender document, and legal due diligence fees, may not meet the definition of incremental costs under IFRS 15 and therefore must be expensed as incurred, even if the operator expects to be successful in bidding for the service concession and expects to be able to indirectly recover those costs through the margin in the service concession contract over the term of the arrangement.

In determining the appropriate accounting treatment for costs to obtain a service concession that are not explicitly chargeable regardless of obtaining the contract, the key judgements are made in the following order:

- Are the costs within the scope of another IFRS accounting standard? If so, apply that standard.
- Are the costs incremental (i.e., would not have occurred if the contract had not been obtained)? Costs that are not incremental are expensed.
- Are the incremental costs expected to be recovered? To the extent that incremental costs are not expected to be recoverable, they are expensed as incurred.

Costs to obtain a contract with a customer are discussed in Chapter 28.

4.8.2 Pre-contract costs

Pre-contract costs incurred by the operator of a service concession may include costs incurred in designing financial models and planning infrastructure improvements for tender purposes, costs incurred in undertaking site surveys, and similar expenses. Such costs will often result in no future economic benefit for the operator unless the contract is obtained. As discussed in Chapter 28, pre-contract costs that are incurred in anticipation of a specific contract are first be evaluated for capitalisation under other accounting standards (e.g., IAS 2 *Inventories*, IAS 16, or IAS 38). Costs not addressed under other IFRS accounting standards are capitalised under IFRS 15 only if they meet all of the following criteria of a cost incurred to fulfil a contract:

- (a) The costs relate directly to a contract or to an anticipated contract that the entity can specifically identify (e.g., costs relating to services to be provided under renewal of an existing contract or costs of designing an asset to be transferred under a specific contract that has not yet been approved).
- (b) The costs generate or enhance resources of the entity that will be used in satisfying performance obligations in the future.

And

- (c) The costs are expected to be recovered. [IFRS 15.95].

The need to consider first the requirement of other relevant IFRS accounting standards is significant, for example, where another standard requires costs of a similar nature to be expensed. As noted in section 4.8.3 below, these requirements are not overridden on the basis that the costs were incurred in the context of a service concession arrangement.

Criteria (b) and (c) above are to ensure that only those costs that meet the definition of an asset are recognised as such. [IFRS 15.BC308]. In the context of service concessions, costs for pre-designing a bespoke piece of equipment or infrastructure for the concession (e.g., a tramway or a depot for electrical buses) are an example of such costs.

4.8.3 Mobilisation costs

An operator may also incur significant mobilisation costs in moving personnel, equipment and supplies as it takes on the service concession. These costs are incurred to ensure that the entity is able to fulfil its promise to the customer in a contract, rather than transferring a good or service to the customer. That is, they do not represent a promised good or service in its own right. The assessment of whether mobilisation costs can be capitalised will depend on the specific facts and circumstances and may require significant judgement. Entities need to ensure that the costs to be capitalised are within the scope of IFRS 15; and meet all of the criteria of a cost incurred to fulfil a contract set out in section 4.8.2 above.

Particular care must be taken where costs of a similar nature to those being considered in the service concession arrangement fall under the scope of another IFRS accounting standard. For example, IAS 38 cites training costs, expenditure on advertising and promotional activities, and expenditure on start-up activities not themselves qualifying for inclusion in the cost of property, plant and equipment in accordance with IAS 16 as examples of expenditure that is recognised as an expense when it is incurred. [IAS 38.69]. In March 2020, the IFRS IC considered a question about the interaction of the above requirements in relation to staff training to deliver outsourced services for a customer. The IFRS IC concluded that, in the fact pattern described in the request, the entity recognises the training costs to fulfil the contract with the customer as an expense when incurred. The IFRS IC noted that the entity's ability to charge to the customer the costs of training does not affect that conclusion.²³

Mobilisation costs are discussed in Chapter 28.

4.8.3.A Mobilisation costs are excluded from input measures of contract progress

Where an operator determines that a performance obligation is satisfied over time, IFRS 15 requires selection of a revenue recognition method to measure progress. [IFRS 15.39]. If the operator selects a method based on costs incurred, they must exclude from their measure of progress those costs that do not depict the entity's performance in transferring a good or service to the customer. [IFRS 15.B19]. An example may be costs incurred in mobilisation activities that do not transfer a good or service to the grantor and from which the grantor receives little or no benefit. Measurement of revenue recognised over time is discussed in Chapter 28.

4.9 Onerous performance obligations within a contract

As discussed in section 4.1.1.D above, IFRS 15 generally requires the transaction price in a contract with a customer to be allocated to each performance obligation in proportion to their relative stand-alone selling prices. [IFRS 15.74]. This allocation is done at contract inception and is generally not updated unless there is a change to the transaction price after contract inception. If an operator were to incur unexpected costs during the construction phase of a service concession arrangement and could not pass those additional costs on to the grantor, the operator may expect to incur a loss on the construction services performance obligation, whilst still expecting to make a profit on the operation services performance obligation. IFRIC 12 requires operators to account for construction, upgrade and operation services in accordance with IFRS 15. [IFRIC 12.14, IFRIC 12.20]. As IFRS 15 contains no specific requirements to address contracts with customers that have become onerous, IAS 37 applies to such contracts. [IAS 37.5(g)].

How we see it

Since the definition of an onerous contract in IAS 37 refers only to a contract, the unit of account to determine whether an onerous contract exists is the contract itself, rather than the performance obligations identified in accordance with IFRS 15. As a result, the operator would not recognise an onerous contract provision unless the entire remaining contract was onerous.

Contracts with customers that are, or have become, onerous are discussed further in Chapter 27.

²³ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

5 Revenue and expenditure during the operations phase of the concession agreement

So far, we have described the recognition and measurement of the infrastructure asset in the accounts of the operator under the two models. A significant issue in practice is that service concession arrangements are composite transactions. They usually have a long duration (twenty-five to thirty years is not uncommon) during which time the operator has a variety of obligations. These may be in connection with the infrastructure asset itself and include:

- Enhancement of the infrastructure or construction of new infrastructure
- Infrastructure components that must be replaced in their entirety
- Infrastructure subject to major cyclical repairs
- Regular repairs and maintenance

In addition, many service concession arrangements involve the provision of services. In the case of a hospital, for example, this could include utilities (such as water and electricity) and a wide range of 'soft' services such as cleaning, laundry, meals, portering, security and grounds maintenance, amongst others. All of these might be paid for as a single unitary charge that would probably be adjusted according to performance as in Illustration 4-1 above. The accounting models for service concessions must be able to deal with all of these issues.

IFRIC 12 identifies two principal revenue-generating activities in a service concession arrangement, construction or upgrade services and operation services, requiring that both are accounted for in accordance with IFRS 15. [IFRIC 12.14, IFRIC 12.20]. The Interpretation also states that, during the construction phase, both accounting models (intangible asset and financial asset) give rise to a contract asset in accordance with IFRS 15. [IFRIC 12.19]. The point at which the consideration is subsequently classified as a receivable, or an intangible asset, is discussed in sections 4.2 and 4.3 above, respectively. Whilst the Interpretation includes examples to illustrate how these requirements might be applied to a relatively simple set of facts and circumstances, it does not set out any special treatments in relation to how IFRS 15 is applied for an SCA. Any questions about how IFRS 15 is applied in accounting for revenue from construction, upgrade or operation services or for the contract assets and liabilities arising during the construction phase of an SCA will be answered by reference to that standard (see Chapter 28), rather than to IFRIC 12.

5.1 Additional construction and upgrade services

The concession may include obligations to construct new infrastructure (construction services) or to enhance either new or existing infrastructure to a condition better than at the start of the concession (upgrade services). IFRIC 12 does not deal in detail with the treatment to be adopted other than to say that revenue and costs relating to construction or upgrade services are recognised in accordance with IFRS 15. [IFRIC 12.14]. This means that all construction or upgrade services are accounted for in accordance with the appropriate model, regardless of when they take place. Contractual obligations to maintain or restore infrastructure may also include an upgrade element. [IFRIC 12.21].

Upgrade or construction services are separate performance obligations. This means that the contract has to require the particular service to be carried out at a specified time. This is not the same as a general requirement to maintain the asset in a specified condition.

It would be unusual for a toll road concession, for example, to require resurfacing to take place according to a predetermined schedule as road surfaces degrade with usage (based on both the number of vehicles and weight per axle) as well as weather conditions. However, the contract might require a new bridge or access road after a specified period of time and either of these would be separate upgrade services.

Upgrade services must be recognised in accordance with IFRS 15. [IFRIC 12.14]. IFRS 15 is discussed in Chapter 28.

The entity must determine the consideration receivable for the upgrade services. This may be part of the allocation at inception of the contract, as shown in Illustration 4-2 above where part of the contract revenue is attributed to road resurfacing, or the contract may specify a separate payment when the upgrade is performed. In either case, the entity would allocate the transaction price for the arrangement as a whole to each of the performance obligations in proportion to their stand-alone selling prices in accordance with IFRS 15. [IFRIC 12.14]. The entity would recognise revenue for the upgrade service only as the obligation to provide those services is fulfilled.

5.1.1 Subsequent construction or upgrade services that are part of the initial intangible asset

In some circumstances, the 'enhancement' spend is a component of the original intangible asset and is recognised as part of the exchange transaction to secure the right to charge users described in section 4.3 above. An example of this is the construction of an additional water treatment facility for an existing water distribution network to which the operator is given immediate access to charge users for water supply.

Assuming that the intangible asset model is the relevant one, the intangible asset received in exchange for such construction or upgrade services is recognised in accordance with the general principles applicable to contracts for the exchange of goods or services. [IFRIC 12.BC66]. Therefore, service concession contracts are not recognised to the extent that they remain executory, which is generally the case when they are signed. [IFRIC 12.BC68]. The contract is no longer executory if:

- The operator has started to fulfil its contractual obligations by constructing the infrastructure concerned or enhancing an existing infrastructure before being entitled to derive benefits from its right to charge for the public service.

Or

- The operator starts deriving benefits from its right to charge for the public service before fulfilling its obligations (e.g., when the contract provides for a new item to be constructed some time ahead in the concession period).

Therefore, if the operator starts charging users before the upgrade services are performed, the carrying amount of the intangible asset includes the fair value of the upgrade services, which is recognised as a contract liability.

5.1.2 Subsequent construction services that are additional to the initial intangible asset

An operator may be contractually required to add to the infrastructure to which it is given a licence and from this generate additional revenues. For example, it is common in developing countries that the operator of a water distribution network incurs an obligation to extend the distribution network. The operator will obtain revenues from newly connected users under its right to charge for the services.

Revenues generated by the licence to operate the new infrastructure will be determined under the terms of the original licence granted to the operator. However, the operator cannot start charging users of the extension to the distribution network until it has completed constructing the extension. Any obligation to extend the network is not recognised whilst it remains executory and is not an additional component of the cost of the original intangible asset. Instead, the completion of the extension will create a new intangible asset (representing the right to charge users of the extended network), giving rise to new construction revenues and recognised using the same principles as the original as described in section 4.3 above.

5.2 Accounting for the operations phase

Both the financial and intangible asset models apply the same accounting in the operations phase of the SCA. According to the September 2006 *IFRIC Update*, "...the nature of the asset recognised by the operator as consideration for providing construction services (a financial asset or an intangible asset) does not determine the accounting for the operation phase of the arrangement..."²⁴

Revenue and costs for the operation services will be recognised in accordance with IFRS 15. [IFRIC 12.20]. This means that most operating costs are likely to be executory and will be accounted for as incurred. Contractual obligations, including obligations to maintain, replace or restore infrastructure to a specified level of serviceability during its operation or to a specified condition at the end of the concession, are to be recognised and measured in accordance with IAS 37, [IFRIC 12.21], as shown in Illustration 5-1 below, when such obligations do not include any upgrade element (which is treated as an additional construction service, see section 5.1 above).

²⁴ [IFRIC Update](#), September 2006, available on the IFRS Foundation's website.

How we see it

Distinguishing between executory maintenance expenditure and contractual obligations is not always straightforward. In such circumstances, judgement is required in deciding whether expenditure on renewals is an obligation requiring recognition or an executory contract.

A concession arrangement may provide for a specified total amount of expenditure to be incurred by the operator throughout the contract. Sometimes, the contract provides for mechanisms whereby at the end of the contract, any shortfall in the agreed amount is paid in cash to the grantor by the operator. Particularly in the case of older contracts, it is common for the maintenance and repair obligation to be expressed in very general terms such as keeping the infrastructure in 'good working condition' or 'state of the art' working condition. The obligation may include the requirement that the asset be handed over with a certain number of years' useful life remaining.

Local regulations or laws also change over time. Some operators are obliged to report annually to the grantor on the level of maintenance and renewal expenditure incurred during the year and on a cumulative basis from inception of the contract. Sometimes, the operator must report on expected expenditures over some future period of time (e.g., over the next 12 months or two years) as well. In these situations, more often than not, the grantor compares the cumulative expenditure at any point in time with either the operator's prior estimates of expenditures or with the level of expenditure that had been anticipated at the outset of the arrangement and was factored into the level of usage charges.

Illustration 5-1: Executory and contractual obligations to maintain and restore the infrastructure

The operator under a water supply service concession is required as part of the overall contractual arrangement to replace four water pumps as soon as their performance drops below certain quality levels. The operator expects this to be the case after 15 years of service. The expected cost of replacing the pumps is CU1,000. The operator's best estimate is that the service potential of the pumps is consumed evenly over time and provision for the costs is made on this basis from inception of the service concession arrangement until the date of expected replacement. The provision is measured at the net present value of the amounts expected to be paid, using the operator's discount rate of 5%. The amount provided in the first year can be calculated as CU33.67. Assuming no changes to estimates, in 15 years CU1,000 would have been provided and would be utilised in replacing the pumps. The provision would be adjusted on a cumulative basis to take account of changes in estimates to the cost of replacement pumps, the manner in which they are wearing out or changes to the operator's discount rate.

The IFRS IC has also provided an example in Illustrative Example 2, the intangible asset model, of how operational expenditure might be accounted for in accordance with IAS 37. Although this Illustration is in the context of an intangible asset, IAS 37 can apply to maintenance and other obligations whichever model applies. Major maintenance, in this case, the requirement to resurface the road, will be recognised as the best estimate of the expenditure required to settle the present obligation at the reporting date and it is suggested that this might arise "...as a consequence of use of the road..." [IFRIC 12.IE19], therefore increasing in measurable annual increments. [IFRIC 12.IE20]. The basis for accounting for such obligations is discussed further in Chapter 27.

Illustration 5-2: The Intangible Asset Model - recording the operations phase

The terms of the arrangement are the same as in Illustration 4-3 above. The contract costs and initial measurement of the intangible asset are set out in Table 1 and Table 2 in that example.

Resurfacing obligations

The operator's resurfacing obligation arises as a consequence of use of the road during the operating phase. It is recognised and measured in accordance with IAS 37, i.e., at the best estimate of the expenditure required to settle the present obligation at the end of the reporting period.

For the purpose of this Illustration, it is assumed that the terms of the operator's contractual obligation are such that the best estimate of the expenditure required to settle the obligation at any date is proportional to the number of vehicles that have used the road by that date and increases by CU17 (discounted to a current value) each year. The operator discounts the provision to its present value in accordance with IAS 37. The income statement charge each period is:

Table 3 Resurfacing obligation

Year	3	4	5	6	7	8	Total
	CU	CU	CU	CU	CU	CU	CU
Obligation arising in year (CU17 discounted at 6%)	12	13	14	15	16	17	87
Increase in earlier years' provision arising from passage of time	-	1	1	2	4	5	13
Total expense recognised in income statement	12	14	15	17	20	22	100

Overview of cash flows, income statement and statement of financial position

For the purpose of this Illustration, it is assumed that the operator finances the arrangement wholly with debt and retained profits. It pays interest at 6.7% a year on outstanding debt. If the cash flows and fair values remain the same as those forecast, the operator's cash flows, income statement and statement of financial position over the duration of the arrangement will be:

Table 4 Cash flows

Year	1	2	3	4	5	6	7	8	9	10	Total
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Receipts	-	-	200	200	200	200	200	200	200	200	1,600

* Borrowing costs are capitalised during the construction phase

† Table 1

Table 6 Statement of financial position

End of Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Intangible asset	525	1,084	949	814	678	542	406	270	135	-
Cash/(debt)*	(500)	(1,034)	(913)	(784)	(647)	(500)	(343)	(276)	(105)	78
Resurfacing obligation	-	-	(12)	(26)	(41)	(58)	(78)	-	-	-
Net assets	25	50	24	4	(10)	(16)	(15)	(6)	30	78

* Debt at start of year plus net cash flow in year (table 4)

To make this Illustration as clear as possible, it has been assumed that the arrangement period is only ten years and that the operator's annual receipts are constant over the period. In practice, arrangement periods may be much longer and annual revenue may increase with time. In such circumstances, the changes in net profit from year to year could be greater.

In the following Practical example, VINCI explains how provisions are recognised for contractual obligations to maintain the condition of concession assets.

Practical example 5-1: VINCI (2023)	France
Consolidated financial statements at 31 December 2023 [extract] Notes to the consolidated financial statements [extract] H. Other balance sheet items and business-related commitments [extract] 19. Working capital requirement and current provisions [extract] 19.3 Breakdown of current provisions [extract]	
<p>...</p> <p>Provisions are taken for contractual obligations to maintain the condition of concession assets. They concern the motorway concession companies and cover the expense of major repairs of roads, bridges, tunnels and hydraulic infrastructure. They also include expenses to be incurred by airport concession companies (repairs to runways, traffic lanes and other paved surfaces) and are calculated on the basis of maintenance plans spanning several years, which are updated annually. These expenses are reassessed on the basis of appropriate indices (mainly the TP01, TP02 and TP09 indices in France). Provisions are also taken whenever signs of defects are encountered on certain infrastructure.</p> <p>...</p> <p>At 31 December 2023, contractual obligations to maintain the condition of concession assets mainly comprised €600 million for the ASF group (€534 million at 31 December 2022), €279 million for Cofiroute (€264 million at 31 December 2022), and €393 million for VINCI Airports (€333 million at 31 December 2022) including €148 million for ANA (€125 million at 31 December 2022) and €119 million for OMA (€94 million at 31 December 2022).</p> <p>...</p>	

5.3 Items provided to the operator by the grantor

Following the basic principles underlying the accounting treatment under both models, infrastructure items to which the operator is given access by the grantor for the purpose of the service concession are not recognised as its property, plant and equipment. [IFRIC 12.27]. This is because they remain under the control of the grantor.

There is a different treatment for assets that are given to the operator as part of the consideration for the concession that can be kept or dealt with as the operator wishes. These assets are not to be treated as government grants as defined in IAS 20. Instead, an operator accounts for these assets as part of the transaction price and in accordance with IFRS 15. [IFRIC 12.27]. See Chapter 28.

What this means is that an operator that has, for example, been given a licence or similar arrangement over a piece of land on which a hospital is to be built does not recognise the land as an asset. If, on the other hand, the operator has been given a piece of surplus land on which it can build private housing for sale, it will recognise an asset. The consideration, which is the fair value of that land, will be aggregated with the remainder of the consideration for the transaction and accounted for according to the model being used.

6 Further examples illustrating the application of IFRIC 12 and interactions with IFRS 15 and IFRS 9

IFRIC 12 was not significantly amended upon issue of IFRS 15 and IFRS 9 and the Illustrative Examples to IFRIC 12 were largely unchanged. However, it must be noted that the Illustrative Examples in IFRIC 12 are intended simply to demonstrate the principal features of the financial asset and intangible asset models. In doing so, they reflect some aspects of service concession arrangements that are commonly seen in practice, but the examples are not intended to be exhaustive.

In June 2022, a post-implementation review of IFRS 15 was added to the IASB agenda. In June 2023, the IASB issued its request for stakeholder feedback to inform its post-implementation review of IFRS 15.²⁵ Although the post-implementation review did not ask stakeholders about the interaction between IFRS 15 and IFRIC 12 (as outreach indicated that IFRIC 12 affects a relatively narrow population of entities and relatively little feedback was received on its interaction with IFRS 15²⁶), a few respondents to the post-implementation review did provide comments relating to the application of IFRS 15 with IFRIC 12. The most common matter raised related to IFRIC 12 requirements on accounting for contractual obligations to maintain or restore infrastructure. Whilst there was some acknowledgement that the clarity and suitability of the requirements in IFRIC 12 on applying IAS 37 to account for obligations to maintain or restore service concession infrastructure could be improved,²⁷ the issue was decided to be low priority. The IASB also decided to consider the application of IFRS 15 with IFRIC 12, including accounting for contractual obligations to maintain or restore service concession infrastructure, in the next agenda consultation.²⁸ The post-implementation review of IFRS 15 is discussed further in Chapter 28.

How we see it

It is important that entities understand and assess the facts and circumstances of their own arrangements in order to determine whether their service concession accounting is supported under the 5-step model within IFRS 15 and the requirements of IFRS 9 as appropriate.

In the Illustrations below, we have considered the fact patterns set out in Illustrative Examples 1 and 2 from IFRIC 12 (which are reproduced in Illustration 4-2 in section 4.2 above, Illustration 4-3 in section 4.3 above and Illustration 5-2 in section 5.2 above), in the context of the 5-step model in IFRS 15, and suggested how the accounting for the same basic fact pattern may be impacted by certain changes to the terms within the concession arrangement, the operator's assessment of those terms, and the introduction of other facts and circumstances.

Illustration 6-1: Financial asset model - Receivable recognised once construction is complete

Arrangement terms

The terms of the arrangement are the same as in Illustration 4-2 in section 4.2 above.

The operator's annual receipts do not vary over the concession period, cash flows and fair values remain the same as forecast, no contract modifications occur over the concession period, and there is no change to the timing of delivery from that anticipated at contract inception. In addition, for the purposes of this example, we assume that the operator may be subject to penalties for substandard performance, with any penalties being deducted from the CU200 per annum to which the operator is entitled in years 3 to 10 of the arrangement. However, in this case, the operator has not deducted any potential penalties when determining the transaction price under the contract on the basis that it is highly probable that significant penalties will not be incurred (see Step 3 below- Determining the transaction price).

Any changes in these assumptions or facts and circumstances would need to be assessed by reference to the requirements of IFRIC 12 and IFRS 15 and could result in a change to the accounting discussed below.

28 IFRS - IASB Update July 2024. Available on the IFRS Foundation's website.

Step 1 - Identify the contract with the customer

Under IFRS 15, a contract is defined as an agreement between two parties that creates enforceable rights and obligations. [IFRS 15 Appendix A].

Because the public-sector grantor of the concession retains control over the infrastructure asset, construction and upgrade (resurfacing) services are provided to the grantor. The grantor pays cash consideration to the operator in exchange for those services. The grantor is the only party with which the operator has a contract.

Because of the public service nature of the obligation undertaken by the operator, the operating services (operation of the road) are provided to the public. However, a customer is defined in IFRS 15 as a party that has contracted with an entity to obtain goods or services that are an output of an entity's ordinary activities in exchange for consideration. [IFRS 15 Appendix A]. Under the terms of the arrangement, the operator does not collect any tolls so the end user of the road is not passing consideration to the operator and therefore is not considered a customer. The grantor is therefore considered to be the only customer of the operator in this arrangement.

Identification of the contract(s) with the customer under IFRS 15 is discussed in Chapter 28.

Step 2 - Identify the performance obligations in the contract

Illustration 4-2 in section 4.2 above identifies construction services, operation services and road resurfacing as performance obligations within the contract with the grantor.

IFRS 15 provides guidance on the types of items that may be goods or services promised in the contract. Examples given by the standard include performing a contractually agreed-upon task (or tasks) for a customer, and providing a service of standing ready to provide goods or services. [IFRS 15.26]. This introduces the possibility that maintenance may also be a performance obligation within the contract with the grantor.

A promised good or service is a performance obligation if it is either:

- (a) A good or service that is distinct
Or
- (b) A series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer [IFRS 15.22]

In order to be distinct, a promised good or service must be:

- (a) Capable of being distinct- i.e., provide a benefit to the customer either on its own or together with other resources that are readily available to the customer
And
- (b) Distinct within the context of the contract- i.e., the entity's promise to transfer the good or service to the customer is separately identifiable from other promises in the contract [IFRS 15.27]

If a promised good or service is not distinct, IFRS 15 requires that the entity combines those goods or services with other promised goods or services until it identifies a bundle of goods or services that is distinct. [IFRS 15.30].

It could be argued that because major maintenance enhances an asset that the grantor owns, then it is providing a benefit to the grantor. In addition, contractual terms often require an operator to repay an element advanced by the grantor for maintenance services if the operator does not incur contracted levels of maintenance spend. This may also support the argument that maintenance is a separate performance obligation. In practice, there is likely to be some judgement involved in determining whether maintenance is a separate performance obligation, based on how it is defined in the contractual arrangement. To the extent that the contract requires the operator to provide major maintenance, similar in nature to an upgrade, that enhances the infrastructure asset, maintenance could be a separate performance obligation. However, minor maintenance necessary to preserve the road in a condition required for the operator to operate the road safely and to return the road to the grantor in a certain condition at the end of the arrangement could be argued as not transferring a distinct good or service to the grantor.

Maintenance has not been identified as a separate performance obligation in Illustration 4-2 in section 4.2 above. This may be on the basis that the operator is required to return the road to the grantor in a specified condition at the end of the concession arrangement. IFRIC 12 requires contractual obligations to maintain infrastructure to a specified level of serviceability or to return infrastructure to the grantor in a specified condition at the end of the service concession arrangement to be recognised and measured in accordance with IAS 37. [IFRIC 12.21]. This treatment is akin to that required for assurance-type warranties under IFRS 15. An assurance-type warranty provides the customer with assurance that the product complies with agreed-upon specifications and is not a separate performance obligation. [IFRS 15.B30]. IFRS 15 requires the estimated cost of satisfying assurance warranty obligations to be accrued in accordance with the requirements in IAS 37. [IFRS 15.B30]. In many arrangements other than service concessions, the 8-year term of the maintenance promise would likely indicate that treatment as an assurance-type warranty may not be appropriate. However, common warranty practices within the industry and the entity's business practices relating to warranties must be considered when identifying assurance-type warranties under IFRS 15. The accounting for warranties under IFRS 15 is discussed in Chapter 28.

Alternatively, it may be, that in Illustration 4-2 in section 4.2 above, maintenance is considered to be a promised service that is not distinct in the context of the contract, as the operator would not be able to fulfil its promise to operate the road without maintaining the road in a safe condition. As such, maintenance may have been bundled with operation services into a single performance obligation.

Identification of performance obligations in a contract under IFRS 15 is discussed in Chapter 28.

Step 3 - Determine the transaction price

Transaction price is defined in IFRS 15 as "...the amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties...". [IFRS 15.47].

The determination of transaction price must also take into account any elements of variable consideration. The element of revenue that is subject to penalties would be considered a form of variable consideration under IFRS 15. [IFRS 15.51]. IFRS 15 requires that, if the consideration promised in a contract includes a variable amount, an entity must estimate the amount of consideration to which they will be entitled. [IFRS 15.50]. Estimates of variable consideration are then included in the transaction price only to the extent that it is highly probable that a significant reversal of revenue will not occur when the uncertainty associated with the variable consideration is subsequently resolved. [IFRS 15.56]. As noted in the arrangement terms section above, for the purposes of this example we assume that the operator is subject to penalties for substandard performance, with any penalties being deducted from the CU200 per annum to which the operator is entitled in years 3 to 10 of the service concession arrangement. IFRS 15 requires that variable consideration must be estimated using either an expected value or most likely amount basis, depending on which method the entity expects to better predict the amount of consideration to which it will be entitled. [IFRS 15.53]. The assessment of which approach is most appropriate will depend upon the facts and circumstances of the service concession arrangement and the penalty regime. In practice, it may be that the expected value approach better predicts the amount of consideration to which the operator expects to be entitled in many service concession arrangements. In this example, the operator concludes that the most-likely amount is the most appropriate approach due to the nature of the penalties. Based on their previous experience in the sector, the operator concludes that they are most likely to receive the full amount of CU200 per annum (i.e., CU1600 in total, and not incur any penalties) and that it is highly probable that they will not incur significant penalties. The operator concludes that if they include the full CU200 per annum in the transaction price for the contract, it is highly probable that a significant revenue reversal will not occur when the uncertainty is resolved. The operator therefore does not deduct any potential penalties when determining the transaction price under the contract. The assessment of the impact of penalties on the IFRS 15 transaction price will depend on facts and circumstances. Whilst an experienced concession operator may be able to meet the requirements for not constraining revenue in some concessions, this will not hold true in all cases, for example if they were to enter into a concession involving an infrastructure asset with which they had little experience.

The difference between the timing of payments from the grantor compared to the provision of construction services by the operator is likely to require a significant financing component to be taken into account in determining the transaction price. The gross amount of consideration is discounted at a rate that the operator would use if it were to enter into a separate financing transaction with the grantor at contract inception. The discount rate reflects the credit characteristics of the grantor, as well as any collateral or security provided, including assets transferred in the contract, [IFRS 15.64], i.e., the discount rate is a rate specific to the contract. IFRS 15 also notes that an entity may be able to determine that rate by identifying the rate that discounts the nominal amount of the promised consideration to the price that the customer would pay in cash for the goods or services when (or as) they transfer to the customer. [IFRS 15.64]. In Illustration 4-2 in section 4.2 above, the implied interest rate in the contract is assumed to be the rate that would be reflected in a financing transaction between the operator and the grantor, although this may not always be the case in a service concession arrangement.

How we see it

In determining the discount rate to be used when a service concession contract contains a significant financing component, we believe that IFRS 15 requires primacy to be given to the rate that the operator would use if it were to enter into a separate financing transaction with the grantor at contract inception. Whilst the rate implicit in the contract may be used in determining that rate, the use of the rate implicit in the contract may not always be consistent with the objective of IFRS 15.64. However, because most operators in service concessions are not in the business of entering into free-standing financing arrangements with grantors, they may find it difficult to identify an appropriate rate, and judgement may be required.

The effect of financing is excluded from the transaction price prior to the allocation of transaction price to performance obligations.

Based on the arrangement terms in this example, the total amount of consideration to which the operator expects to be entitled in exchange for transferring promised construction, operating, maintenance and upgrade services to the grantor is CU200 per year for 8 years, i.e., CU1600. The financing component is CU344, based on a rate of 6.18% per year. This gives a net transaction price of CU1256 (being CU1600 - CU344). This is consistent with the transaction price in Illustration 4-2 in section 4.2 above.

Step 4 - Allocate the transaction price to the performance obligations in the contract

IFRS 15 generally requires the transaction price to be allocated to each performance obligation in proportion to their relative stand-alone selling prices. [IFRS 15.74].

If stand-alone selling prices are not readily observable, they must be estimated, considering all information that is reasonably available to the entity. [IFRS 15.78]. The operator may choose to estimate stand-alone selling prices using an expected cost-plus margin approach, [IFRS 15.79], although other approaches are permitted. Illustration 4-2 in section 4.2 above shows the operator estimating stand-alone selling prices for each performance obligation using an expected cost-plus margin approach.

In Illustration 4-2 in section 4.2 above, the transaction price allocated to each performance obligation is equal to the estimated stand-alone selling price for each distinct service (i.e., construction, operations, upgrade), and as such, there is no discount in the contract to allocate between the performance obligations.

Allocation of the transaction price to performance obligations under IFRS 15 is discussed in Chapter 28.

Step 5 - Recognise revenue when (or as) the entity satisfies a performance obligation

IFRS 15 requires that revenue is recognised when an identified performance obligation is satisfied, by transferring a promised good or service to a customer, i.e., when the customer obtains control. [IFRS 15.31]. Performance obligations will be satisfied either over time or at a point in time. [IFRS 15.32].

In Illustration 4-2 in section 4.2 above, revenue is recognised over time for construction, resurfacing and operating services. As discussed at Step 2 above, maintenance is assumed not to be a separate performance obligation within this example and therefore no revenue is recognised in respect of maintenance.

One of the criteria in IFRS 15 for recognising revenue over time is that an entity's performance creates or enhances an asset that the customer controls. [IFRS 15.35(b)]. In order to be in scope of IFRIC 12, the grantor to a service concession arrangement must control the infrastructure asset, including any significant residual interest. It therefore appears reasonable to conclude that this criteria for recognising revenue over time is met for construction and resurfacing services because they create and then enhance the grantor's asset.

In some circumstances, an entity may be unable to reasonably measure the outcome of the construction performance obligation. They may be able to determine that a loss will not be incurred, but may not be able to reasonably estimate the amount of profit. Until the entity can reasonably measure the outcome, IFRS 15 requires the entity to recognise revenue, but only up to the amount of costs incurred. [IFRS 15.45]. This could result in an operator recognising no margin on construction services until they are able to reasonably estimate the amount of profit.

An alternative criterion in IFRS 15 for recognising revenue over time is that the customer simultaneously receives and consumes the benefit as the entity performs. [IFRS 15.35(a)]. i.e., a performance obligation is satisfied over time if an entity determines that another entity would not need to substantially re-perform the work that the entity has completed to date if that other entity were to fulfil the remaining performance obligation to the customer. [IFRS 15.B4]. It would seem reasonable to conclude that this criterion is met for operating services in Illustrative Illustration 4-2 in section 4.2 above.

Progress over time may be measured using an input method to recognise revenue on the basis of the operator's inputs to the satisfaction of the performance obligation (e.g., costs incurred or time elapsed) relative to the total expected efforts to the satisfaction of that performance obligation. [IFRS 15.B18]. Other methods are also permitted, although the entity must determine the best method that faithfully depicts the entity's performance.

In Illustration 4-2 in section 4.2 above, construction revenue appears to be recognised over time by reference to costs incurred relative to total expected costs required to satisfy the construction services performance obligation. Revenue from operation services is also recognised using an input method. In Illustration 4-2 above, operating costs are incurred evenly over the operating phase of the service concession arrangement and so the recognition pattern shown in the example may have been derived using either a time elapsed input method or by reference to costs incurred relative to total expected costs required to satisfy the performance obligation. Entities do not have a free choice in determining how to measure progress over time. IFRS 15 requires that, in measuring progress over time, an entity must select a revenue recognition method that faithfully depicts its performance in satisfying the performance obligation. Although upgrade revenue appears to meet the criteria to be recognised over time as it enhances an asset owned and controlled by the grantor, all upgrade services occur in year 8 and hence the revenue allocated to this performance obligation is all recognised in year 8.

With regards the recognition of finance income, IFRIC 12 requires consideration given by the grantor to be classified as a contract asset during the construction activity. [IFRIC 12.19]. The operator would recognise a receivable, rather than a contract asset, only once the operator has an unconditional right to receive consideration from the customer.

In this example, the operator receives payment of CU200 per annum in years 3 to 10 of the service concession arrangement, i.e., once construction is complete and the operator starts providing operating services. As noted in the arrangement terms section above, for the purposes of this example we assume that the operator is subject to penalties for substandard performance, with any penalties being deducted from the CU200 per annum to which the operator is entitled in years 3 to 10 of the service concession arrangement. Although the amounts the operator will receive may be reduced by penalties in the event of substandard performance, or failure to meet specified quality or efficiency requirements, for the purposes of this example, we assume that the operator, based on its careful assessment of facts and circumstances, concludes that they have an unconditional right to consideration from the grantor for construction services as soon as construction activity is complete. The operator therefore recognises a receivable in respect of the construction performance obligation once construction is complete. This is consistent with the treatment in Illustration 4-2 in section 4.2 above.

Until a receivable is recognised, the operator accounts for the significant financing component in the arrangement in accordance with IFRS 15. Under IFRS 15 a significant financing component would be recorded if the consideration was paid more than a year after construction is complete, which is the case in Illustration 4-2 above, and this example, as noted at step 3 above. Illustration 4-2 does not identify any significant financing component in respect of upgrade services delivered in year 8. Based on the entity's chosen approach to allocating the consideration receivable under the arrangement to the various performance obligations, at contract inception, the entity may expect the period between delivery of the upgrade services and the date on which payment will be received to be one year or less. [IFRS 15.63].

Once a receivable is recognised, the amounts due from the grantor are accounted for in accordance with IFRS 9. As discussed in section 4.2 above, we believe that different approaches may be acceptable regarding measurement of the receivable at initial recognition. In this example, the value of the receivable at initial recognition is equal to the carrying value of the contract asset at completion of construction, and interest is recognised on the financial asset at 6.18%. This is consistent with Illustration 4-2 in section 4.2 above.

How we see it

Once the operator has an unconditional right to receive consideration, we believe that different approaches may be acceptable regarding measurement of the receivable at initial recognition.

If the receivable is recognised at fair value, any movements in market interest rates between the date of commencement of construction services and the point at which the receivable is initially recognised that impact the fair value of the financial asset would result in the operator recognising an expense on initial recognition of the financial asset.

If the receivable is instead treated as a continuation of the contract asset, the operator would not recognise an expense on initial recognition of the financial asset as a result of any movements in market interest rates between the date of commencement of construction services and the point at which the receivable is initially recognised.

We would expect entities to apply either approach consistently to similar arrangements.

IFRS 9 requires the receivable to be subsequently measured at amortised cost, fair value through other comprehensive income or fair value through profit or loss, depending on the operator's business model for managing the receivable, and the contractual cash flow characteristics of the receivable. We assume for the purpose of this example that the operator has a business model whose objective is to collect the contractual cash flows of the receivable. As noted above, the operator has determined that recoverability of the receivable recognised for construction services is not dependent upon their future performance of the service concession arrangement. The operator has not identified any other features that would cause the receivable to fail the SPPI test (that confirms that the cash flows are 'solely payments of principal and interest on the principal amount outstanding'). Therefore, the receivable is subsequently measured at amortised cost. This is consistent with Illustration 4-2 in section 4.2 above. Subsequent measurement of financial assets under IFRS 9 is discussed in Chapter 46.

Under the arrangement terms in this example, as set out above, the overview of the operator's statement of cash flows, statement of comprehensive income and statement of financial position will be consistent with those in Illustrative Example 1 to IFRIC 12, which are shown in Illustration 4-2 in section 4.2 above. Although the operator in this arrangement may be subject to penalties for substandard performance, the contractual terms of the penalties do not impact the accounting in the operator's primary statements, for reasons explained above.

Both the contract asset recognised during the construction phase, and the receivable recognised once construction is complete will be subject to the impairment requirements of IFRS 9. [IFRS 15.107]. Impairment of financial assets under IFRS 9 is discussed in Chapter 47.

Illustration 6-2: Intangible Asset Model

Arrangement terms

The terms of the arrangement are the same as in Illustration 4-3 in section 4.3 above and Illustration 5-2 in section 5.2 above. Illustration 4-3 and Illustration 5-2 are based on Illustrative Example 2 in IFRIC 12 and assume that the operator's annual receipts are constant over the concession period, that cash flows and fair values remain the same as forecast, that no contract modifications occur over the concession period, and that there is no change to the timing of delivery from that anticipated at contract inception. Any changes in these assumptions or facts and circumstances would need to be assessed by reference to the requirements of IFRIC 12 and IFRS 15 and could result in a change to the accounting illustrated in Illustration 4-3 and Illustration 5-2 above.

Step 1 - Identify the contract(s) with a customer

Under IFRS 15, a contract is defined as an agreement between two parties that creates enforceable rights and obligations. [IFRS 15 Appendix A]. A customer is defined in IFRS 15 as a party that has contracted with an entity to obtain goods or services that are an output of an entity's ordinary activities in exchange for consideration. [IFRS 15 Appendix A].

Because the public sector grantor of the concession retains control over the infrastructure asset, construction and upgrade (resurfacing) services are provided to the grantor. The grantor pays consideration, in the form of an intangible asset, to the operator in exchange for those services.

Because of the public service nature of the obligation undertaken by the operator, the operating services are provided to the public users the road. There could be a written contract between the operator and each road user, if, for example, the road user takes a ticket from the toll booth on entering the road. Even in the absence of a written contract, the public users of the road transfer consideration to the operator in exchange for using the road, and therefore could be considered to have an implied contract with the operator. IFRS 15 does not require the existence of a written contract; a contract may be oral or implied, although it must be legally enforceable. [IFRS 15.10]. The specified good or service in the contract between the operator and the road user is the provision of access to the toll road. Access is physically controlled by the operator through the operating services that they provide.

Illustration 4-3 and Illustration 5-2 above reflect two contractual customer relationships within the arrangement, being (1) a contract with the grantor for the provision of construction services to build toll road; and (2) many contracts with individual public road users to provide access to the toll road by way of a service fulfilled by the operator, and reflect the operator acting as principal in both contractual customer relationships.

Identification of the contract(s) with the customer under IFRS 15 is discussed in Chapter 28.

Step 2 - Identify the performance obligations in the contract

In Illustration 4-3 and Illustration 5-2 above, the operator recognises revenue in respect of the following performance obligations:

- Contract with the grantor- a distinct performance obligation, being construction services
- And
- Many contracts with road users- a distinct performance obligation for operation services

The contract with the grantor requires the operator to resurface the road when the original surface has deteriorated below a specified condition. Resurfacing is not identified as a separate performance obligation. Because the resurfacing is required when the original surface has deteriorated below a specific condition, rather than being required at a specified point in time, the operator treats this as a contractual obligation to maintain or restore the infrastructure, with the contractual obligation to restore the road recognised and measured in accordance with IAS 37. [IFRIC 12.21]. This is similar to the treatment required for assurance-type warranties under IFRS 15. An assurance-type warranty is a warranty that provides the customer (the public users of the road in this example) with assurance that the product complies with agreed-upon specifications and is not a separate performance obligation. [IFRS 15.B30].

Identification of performance obligations in a contract under IFRS 15 is discussed in Chapter 28.

Step 3 - Determine the transaction price

The consideration in the contract with the grantor is the amount that the operator expects to be entitled to in exchange for construction services. The consideration is a right to charge toll road users, i.e., non-cash consideration which would be measured at fair value, unless the entity cannot reasonably estimate the fair value of the non-cash consideration, in which case it is measured indirectly by reference to the stand-alone selling price of the promised goods or services. [IFRS 15.66, IFRS 15.67]. In Illustration 4-3 and Illustration 5-2 above, the fair value of the intangible asset has been measured indirectly by reference to the stand-alone selling price of the promised construction services.

Illustration 4-3 and Illustration 5-2 above do not identify a significant financing component related to the provision of construction services by the operator, despite the timing difference between the operator providing construction services in years 1 and 2, and delivery of the intangible asset once construction is complete at the end of year 2. This may be because the operator has concluded that the reason for the difference between the cash selling price of the construction services and the promised consideration arises for reasons other than the provision of finance, and the difference between those amounts is proportional to the reason for the difference. [IFRS 15.62]. The operator may have reached this conclusion because the promised consideration in this example is an intangible asset, representing a right to charge users of the toll road, and that right cannot be exercised until the toll road is constructed. Therefore, in this example, the nature of the consideration necessitates a delay between provision of the construction services by the operator, and receipt of the promised consideration, being the intangible asset.

The operator will receive cash consideration from each toll road user in exchange for operating services. The total amount of consideration for operating services will vary depending upon how many vehicles use the toll road. However, as each contract is with a separate road user (customer), it would seem appropriate to consider each contract in isolation. The transaction price for each contract is the cash toll paid by each road user.

Determination of the transaction price under IFRS 15 is discussed in Chapter 28.

Step 4 - Allocate the transaction price to the performance obligations in the contract

IFRS 15 generally requires the transaction price to be allocated to each performance obligation in proportion to their relative stand-alone selling prices. [IFRS 15.74]. If stand-alone selling prices are not readily observable, they must be estimated, considering all information that is reasonably available to the entity. [IFRS 15.78]. The operator may choose to estimate stand-alone selling prices using an expected cost-plus margin approach, [IFRS 15.79], although other approaches are permitted.

As discussed at Step 2 above, there is only one distinct performance obligation in the contract with the grantor, being construction services. The transaction price is therefore allocated to construction services. Similarly, each contract with individual road users has one distinct performance obligation, being the provision of operating services.

Allocation of the transaction price to performance obligations under IFRS 15 is discussed in Chapter 28.

Step 5 - Recognise revenue when (or as) the entity satisfies a performance obligation

Illustration 4-3 and Illustration 5-2 above show revenue being recognised over time for construction and operating services.

One criterion within IFRS 15 for recognising revenue over time is that an entity's performance creates or enhances an asset that the customer controls. [IFRS 15.35(b)]. To be in scope of IFRIC 12, the grantor to a service concession arrangement must control the infrastructure asset, including any significant residual interest. It therefore appears reasonable to conclude that this criteria for recognising revenue over time is met for construction services. Progress over time may be measured using an input method to recognise revenue based on the operator's inputs to the satisfaction of the performance obligation (e.g., costs incurred or time elapsed) relative to the total expected efforts to the satisfaction of that performance obligation. [IFRS 15.B18]. Other methods are also permitted, although the entity must determine the best method that faithfully depicts the entity's performance. In Illustration 4-3 and Illustration 5-2 above, construction revenue appears to be recognised over time by reference to costs incurred relative to total expected costs required to satisfy the construction services performance obligation.

An alternative criterion in IFRS 15 for recognising revenue over time is that the customer simultaneously receives and consumes the benefit as the entity performs. [IFRS 15.35(a)]. Each road-user simultaneously receives and consumes the benefits provided by the operator as the operator provides the road operating services and therefore the operator recognises revenue over time. However, given the short time period over which the operator provides road operating services to each road user in this fact pattern (i.e., the duration of the time it takes the road user to travel the length of the toll road), the operator recognises toll revenue when it collects the tolls.

Under the arrangement terms in this example, as set out above, the overview of the operator's statement of cash flows, statement of comprehensive income and statement of financial position will be consistent with those in Illustrative Example 2 to IFRIC 12, which are shown in Illustration 4-3 in section 4.3 above and Illustration 5-2 in section 5.2 above.

Satisfaction of performance obligations under IFRS 15 is discussed in Chapter 28.

Classification as contract asset or intangible asset, and impairment testing

IFRIC 12 requires that, during the construction or upgrade period, consideration is classified as a contract asset by the operator. [IFRIC 12.19].

Whilst IFRIC 12 requires consideration to be classified as a contract asset during the construction or upgrade period, Illustrative Example 2 to IFRIC 12 shows that the contract asset may still be presented as an intangible asset during the construction phase. [IFRIC 12.IE15].

Under IAS 38, amortisation of an intangible asset begins when the asset is available for use, i.e., when it is in the location and condition necessary for it to be capable of operating in the manner intended by management. This would likely be the case once construction of the road is complete and the operator can begin using their right to operate the road to generate revenue.

As noted above, IFRIC 12 requires that during the construction or upgrade period, consideration is classified as a contract asset by the operator. Contract assets are subject to the impairment requirements of IFRS 9. [IFRS 15.107]. Operators may need to apply judgement in determining how to test the contract asset for impairment, given that the contract asset is expected to be realised in the form of an intangible asset, rather than as a receivable or cash. Operators may consider whether and how they can use the value of the underlying intangible asset to which they are entitled as a proxy for cash flows in order to determine expected credit losses on the contract asset.

Capitalisation of borrowing costs

Under the intangible asset model, borrowing costs must be capitalised during the period of construction. [IFRIC 12.22]. However, as noted above IFRIC 12 requires consideration to be classified as a contract asset, rather than an intangible asset, during the construction period. [IFRIC 12.19]. In March 2019, the IFRS IC issued an agenda decision relating to the capitalisation of borrowing costs on a constructed good for which revenue was recognised over time. In that agenda decision, the IFRS IC noted that, in the particular fact pattern considered, a contract asset is not a qualifying asset as the intended use of the contract asset is not a use for which it necessarily takes a substantial period of time to get ready. IAS 23 requires capitalisation of borrowing costs that are directly attributable to the acquisition, construction or production of an asset that necessarily takes a substantial period of time to get ready for its intended use or sale. [IAS 23.8, IAS 23.5]. Some may argue that there is a tension between the requirement in IFRIC 12 to capitalise interest during the construction phase under the intangible asset model and this agenda decision.

How we see it

We believe that the March 2019 agenda decision noted above does not override the requirement in IFRIC 12.22 that, under the intangible asset model, borrowing costs must be capitalised during the period of construction.

7 Disclosure requirements: SIC-29

IFRIC 12 has no specific disclosure requirements, although the disclosure requirements of the various applicable accounting standards (such as IFRS 9, IFRS 7 *Financial Instruments: Disclosures*, [IFRIC 12.23], IFRS 15, and IAS 38) will have to be applied as appropriate. SIC-29, which pre-dates IFRIC 12 by several years, includes additional disclosure requirements. [IFRIC 12.10]. It is important to note that the scope of SIC-29 is not defined in terms of IFRIC 12 and is potentially broader in scope than IFRIC 12. It applies to a type of transaction that is described although not really defined and which does not depend on the control criteria described in section 3 above. It also applies to both sides of the transaction, whereas IFRIC 12 applies only to the operator under the concession agreement.

SIC-29 describes service concessions as arrangements in which an entity (the operator) provides services on behalf of another entity (the grantor, which may be a public or private sector entity, including a governmental body) that give the public access to major economic and social facilities. The examples of service concession arrangements given by SIC-29 include water treatment and supply facilities, motorways, car parks, tunnels, bridges, airports and telecommunications networks. [SIC-29.1].

SIC-29 states that the common characteristic of all service concession arrangements is that the operator both receives a right and incurs an obligation to provide public services. [SIC-29.3]. It excludes from its scope an entity outsourcing the operation of its internal services (e.g., employee cafeteria, building maintenance, and accounting or information technology functions). [SIC-29.1].

How we see it

Some of the arrangements that do not include the construction of a major capital asset, as discussed above, may not be caught by the disclosure requirements of the SIC, although there is no hard-and-fast dividing line between service concessions and outsourcing arrangements. For example, a contract between a government department and an operator to maintain the existing computer system, including replacement of hardware and software as appropriate, may be outside the scope of SIC-29 if it is concluded that the government department has outsourced the operation of its internal services to the operator for its own benefit.

However, arrangements where an entity provides services on behalf of another entity that give the public access to major economic and social facilities will be in scope of the disclosure requirements of SIC-29 even if they do not meet the control criteria in IFRIC 12.5.

SIC-29 summarises the rights and obligations as follows:

For the period of the concession, the operator has received from the grantor:

- (a) The right to provide services that give the public access to major economic and social facilities

And

- (b) In some cases, the right to use specified tangible assets, intangible assets, and/or financial assets

In exchange for the operator:

- (a) Committing to provide the services according to certain terms and conditions during the concession period

And

- (b) When applicable, committing to return at the end of the concession period the rights received at the beginning of the concession period and/or acquired during the concession period [SIC-29.2]

SIC-29 requires disclosure in addition to that required by other accounting standards that may cover part of the transaction, such as IAS 16 (see Chapter 19), IFRS 16 (see Chapter 24) and IAS 38 (see Chapter 18). [SIC-29.5]. The disclosure requirements are set out below:

Extract from SIC-29

- | | |
|----|--|
| 6 | <p>All aspects of a service concession arrangement shall be considered in determining the appropriate disclosures in the notes. An operator and a grantor shall disclose the following in each period:</p> <ul style="list-style-type: none"> (a) a description of the arrangement; (b) significant terms of the arrangement that may affect the amount, timing and certainty of future cash flows (eg the period of the concession, re-pricing dates and the basis upon which re-pricing or re-negotiation is determined); (c) the nature and extent (eg quantity, time period or amount as appropriate) of: <ul style="list-style-type: none"> (i) rights to use specified assets; (ii) obligations to provide or rights to expect provision of services; (iii) obligations to acquire or build items of property, plant and equipment; (iv) obligations to deliver or rights to receive specified assets at the end of the concession period; (v) renewal and termination options; and (vi) other rights and obligations (eg major overhauls); (d) changes in the arrangement occurring during the period; and (e) how the service arrangement has been classified. |
| 6A | <p>An operator shall disclose the amount of revenue and profits or losses recognised in the period on exchanging construction services for a financial asset or an intangible asset.</p> |

[SIC-29.6, SIC-29.6A].

The disclosures required in SIC-29.6 above are provided individually for each service concession arrangement or in aggregate for each class of service concession arrangements. A class is a grouping of service concession arrangements involving services of a similar nature (e.g., toll collections, telecommunications and water treatment services). [SIC-29.7].

VINCI has made aggregate disclosures for the principal terms of its arrangements. The following extract is part of the disclosures that address concession arrangements.

Practical example 7-1: VINCI (2023)

France

Consolidated financial statements at 31 December 2023 [extract]

Notes to the consolidated financial statements [extract]

F. Concessions: PPP contracts, concession contracts and other infrastructure [extract]

12. Details of the main contracts in Concessions [extract]

Details of the main contracts in the Concessions business are set out by business line in the table below.

	Country	End of contract	Accounting model	Consolidation method
VINCI Autoroutes ⁽¹⁾				
ASF group				
ASF 2,730 km of toll motorways	France	2036	Intangible asset	FC
Escota 471 km of toll motorways	France	2032	Intangible asset	FC
...				
VINCI Airports ⁽²⁾				
Société Concessionnaire Aéroports du Grand Ouest Nantes Atlantique and Saint-Nazaire Montoir airports	France	⁽³⁾	Intangible asset	FC
Aéroports de Lyon Lyon-Saint Exupéry and Lyon-Bron airports	France	2047	Intangible asset	FC
ANA group 10 airports	Portugal	2063	Intangible asset	FC
Belfast International airport	United Kingdom	2993	Intangible asset	FC

(1) Remuneration is based on the pricing law as defined in the concession contract, and price increases must be validated by the grantor.

(2) Remuneration comes from both users and from airlines. Airport fees are generally regulated.

(3) The concession contract was terminated on 24 October 2019 on the grounds of public interest. The termination is due to take effect no later than the signing date of the new concession contract.

FC: Full consolidation; EM: Equity method.

	Country	End of contract	Accounting model	Consolidation method
VINCI Highways				
Vía Sumapaz (ex Vía 40 Express) Toll motorway connecting Bogotá and Girardot (141 km including construction of a third lane over 65 km)	Colombia	2046	Intangible asset	FC
Gefyra Toll bridge between Rio and Antirrio	Greece	2039	Intangible asset	FC
Lima Expresa Línea Amarilla: 25 km toll expressway in Lima	Peru	2049	Intangible asset	FC
Strait Crossing Development Inc. Confederation Bridge connecting the Canadian provinces of Prince Edward Island and New Brunswick	Canada	2032	Intangible asset	FC
A4 Hürselberg A-Modell 45 km	Germany	2037	Intangible asset	EM
...				

Certain contracts may benefit from investment grants from the grantor. This relates mainly to contracts under the financial asset model, but also certain contracts with traffic level risk (Arcour (A19), LISEA and Consortium Stade de France).

As a general rule, when the contracts end, the concession infrastructure is returned to the grantor for no consideration. In the event that the contract is terminated or the asset under concession is bought out early by the grantor, compensation is payable to the concession holders. Its amount is determined in accordance with contractual or statutory provisions.

15. Off-balance sheet commitments in Concessions [extract]

15.1 Companies controlled by the Group

Contractual investment and renewal obligations

(in € millions)	31/12/2023	31/12/2022
Aerodom	1,036	-
ASF group	963	1,039
OMA (Grupo Aeroportuario del Centro Norte – Mexico)	342	488
Cobra IS	321	143
Cofiroute	279	370
ANA group (Portugal)	269	199
Via Sumapaz (ex Via 40 Express)	239	-
Concessionária dos Aeroportos da Amazônia	153	176
Cabo Verde Airports	114	-
VINCI Highways (Entrevias in Brazil)	-	286
Other	241	221
Total	3,958	2,922

Contractual investment obligations of motorway concession companies consist mainly of undertakings made under concession contracts, multi-year master contracts as part of the 2015 motorway stimulus plan and the motorway investment plan approved in 2018. VINCI Autoroutes' investment undertakings amounted to €1,242 million at 31 December 2023 (€1,409 million at 31 December 2022). The decrease in these undertakings during the period was due to progress with works.

...

The above amounts do not include obligations relating to maintenance expenditure on infrastructure under concession, in respect of which specific provisions based on maintenance plans are set aside (see Note H.19.3, "Breakdown of current provisions").

In addition to the disclosures required by SIC-29, the disclosure requirements of IFRS 15 will need to be considered. See Chapter 28. VINCI also disclosed the revenue and profit earned from its concession arrangements. The following Practical example discloses revenue from concessions as a component of revenue by business line. The Practical example is not intended to illustrate the disclosures requirements of IFRS 15.

Overview

IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* prescribes the recognition criteria and measurement bases to be applied to provisions, contingent liabilities and contingent assets. IAS 37 also prescribes the disclosures required in the notes to financial statements to enable users to understand the nature, timing and amount of provisions, contingent liabilities and contingent assets.

IAS 37 requires a provision to be recognised when an entity has a present obligation (legal or constructive) as a result of a past event, it is probable that an outflow of resources embodying economic benefits will be required to settle the obligation, and a reliable estimate can be made of the obligation. The amount required to be recognised as a provision is the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. Provisions are not recognised for executory contracts, except where the contract is onerous.

Contingent liabilities and contingent assets are not recognised. Instead, IAS 37 requires contingent liabilities to be disclosed, unless the possibility of any outflow is remote, and disclosure of contingent assets where an inflow of economic benefits is probable.

This chapter addresses the accounting for, and disclosure of, provisions, contingent liabilities and contingent assets in scope of IAS 37. It also covers IFRIC Interpretations related to the application of IAS 37. It does not address the accounting for provisions, contingent liabilities and contingent assets covered by another IFRS accounting standard. When another IFRS accounting standard deals with a specific type of provision, contingent liability or contingent asset, an entity applies that standard instead of IAS 37. For example, some types of provisions are addressed in standards on income taxes (see Chapter 29), leases (see Chapter 24), employee benefits (see Chapter 31), insurance contracts and other contracts within the scope of IFRS 17 *Insurance Contracts* (see Chapter 51), contingent consideration of an acquirer in a business combination (see Chapter 10) or revenue from contracts with customers (see Chapter 28).

What you need to know

- A provision is recognised if, and only if, an entity has a present obligation (legal or constructive) as a result of a past event, it is probable that an outflow of economic resources embodying economic benefits will be required to settle the obligation, and a reliable estimate can be made of the obligation.
- The amount recognised as a provision is required to be the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. Where the effect of the time value of money is material, the amount of a provision is the present value of the expenditures expected to be required to settle the obligation.
- IAS 37 prohibits the recognition of provisions for future operating losses, repairs and maintenance of owned assets, and staff training costs.
- Contingent liabilities and contingent assets are not recognised.
- IAS 37 requires contingent liabilities to be disclosed unless the possibility of any outflow in settlement is remote.
- Contingent assets are disclosed if an inflow of economic benefits is probable.
- Disclosures of provisions, contingent liabilities and contingent assets must be sufficient to enable users to understand their nature, timing and amount.

1 Introduction

1.1 Background

IAS 37 applies to all provisions, contingent liabilities and contingent assets, except those relating to executory contracts that are not onerous and those provisions covered by another IFRS accounting standard. [IAS 37.1].

For some time, the IASB has considered amending IAS 37 and an exposure draft was issued in June 2005. Subsequent deliberation, including round-table meetings held with constituents to discuss their views, resulted in the Board revising its proposals and issuing a second exposure draft in January 2010. However, IAS 37 was not revised. Instead, in 2010, the Board suspended the project to allow it to focus on higher priority projects, and pending completion of its project to revise the *Conceptual Framework for Financial Reporting (Conceptual Framework)*. The IASB again began discussions on a *Provisions, Contingent Liabilities and Contingent Assets* research project in 2015. Whilst stakeholders have told the Board that IAS 37 generally works well in practice, problems have been identified with some aspects of the standard. It is often difficult to determine whether an entity has a liability if an entity has an obligation that has arisen from its past actions but is also dependent on a future action of the entity. Some stakeholders have argued that the principles underlying IFRIC 21 *Levies*, an interpretation of IAS 37, are inconsistent with other requirements in IAS 37, and have argued that IFRIC 21 results in information that is not useful to investors. In addition, the measurement requirements in IAS 37 for provisions are not clear on which costs are included as part of 'the expenditure required to settle' an obligation, and do not specify whether the rate used to discount provisions should reflect the risk that the entity may fail to fulfil its liability (i.e., the entity's own credit risk). This leads to diversity in practice in the measurement of provisions. In November 2024, the Board issued the Exposure Draft *Provisions - Targeted Improvements*¹ which proposes targeted improvements to three aspects of IAS 37; (i) the present obligation recognition criteria; (ii) the measurement of costs to include in a provision; and (iii) the discount rate requirements. The comment period for the Exposure Draft closed in March 2025. See section 8 below.

FASB differences

Differences between IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter as the accounting standards are not converged.

1.2 Interpretations related to the application of IAS 37

The IFRS IC has issued a number of pronouncements relating to the application of IAS 37 (although one of them was subsequently withdrawn).

1.2.1 IFRIC 1

IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* provides guidance on how to account for the effect of changes in the measurement of existing provisions for obligations to dismantle, remove or restore items of property, plant and equipment or right-of-use assets. This is discussed in section 6.3.1 below.

1.2.2 IFRIC 3

Another issue considered by the IFRS IC was how to account for a 'cap and trade' emission rights scheme. In December 2004, the IFRS IC issued IFRIC 3 *Emission Rights*, but this was later withdrawn in June 2005. This interpretation, *inter alia*, required that as emissions are made, a liability was to be recognised for the obligation to deliver allowances equal to the emissions that had been made by the entity. Such a liability was a provision within the scope of IAS 37 and was to be measured at the present market value of the number of allowances required to cover emissions made up to the end of the reporting period. Accounting for liabilities associated with emissions trading schemes is discussed in section 6.5 below.

¹ Exposure Draft [ED/2024/8: Provisions-Targeted Improvements](#), IASB, November 2024. Available on the IFRS Foundation's website.

1.2.3 IFRIC 5

IFRIC 5 *Rights to Interests arising from Decommissioning, Restoration and Environmental Rehabilitation Funds* deals with the accounting by an entity when it participates in a 'decommissioning fund', the purpose of which is to segregate assets to fund some or all of the costs of its decommissioning or environmental liabilities for which it has to make a provision under IAS 37. This is discussed in section 6.3.3 below.

1.2.4 IFRIC 6

IFRIC 6 *Liabilities arising from Participating in a Specific Market - Waste Electrical and Electronic Equipment* provides guidance on the accounting for liabilities for waste management costs. This clarifies when certain producers of electrical goods will need to recognise a liability for the cost of waste management relating to the decommissioning of waste electrical and electronic equipment (historical waste) supplied to private households. This is discussed in section 6.7 below.

1.2.5 IFRIC 21

IFRIC 21 addresses the recognition of a liability to pay a levy imposed by government if that liability is within the scope of IAS 37. It also addresses the accounting for a liability to pay a levy whose timing and amount is certain (see section 6.8 below).

Although they are not interpretations of the standard as such, the IAS 37 guidance on non-financial liabilities is also referred to in IFRIC 12 *Service Concession Arrangements* (see Chapter 26); and IFRIC 14 *IAS 19 - The Limit on a Defined Benefit Asset, Minimum Funding Requirements and their Interaction* (see Chapter 31).

1.3 Terms used in this chapter

The following terms are used in this chapter with the meanings specified in the respective IFRS accounting standard:

Extract from IAS 37

- 3 Executory contracts are contracts under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent. This Standard does not apply to executory contracts unless they are onerous.

Definitions

- 10 The following terms are used in this Standard with the meanings specified:
- A provision* is a liability of uncertain timing or amount.
- A liability* is a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits.¹
- An obligating event* is an event that creates a legal or constructive obligation that results in an entity having no realistic alternative to settling that obligation.
- A legal obligation* is an obligation that derives from:
- (a) a contract (through its explicit or implicit terms);
 - (b) legislation; or
 - (c) other operation of law.
- A constructive obligation* is an obligation that derives from an entity's actions where:
- (a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and
 - (b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities.
- A contingent liability* is:
- (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity; or
 - (b) a present obligation that arises from past events but is not recognised because:
 - (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or
 - (ii) the amount of the obligation cannot be measured with sufficient reliability.
- A contingent asset* is a possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity.
- An onerous contract* is a contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it.
- A restructuring* is a programme that is planned and controlled by management, and materially changes either:
- (a) the scope of a business undertaken by an entity; or
 - (b) the manner in which that business is conducted.

¹ The definition of a liability in this Standard was not revised following the revision of the definition of a liability in the *Conceptual Framework for Financial Reporting* issued in 2018.

[IAS 37.3, IAS 37.10].

Extract from IFRIC 21

- 4 For the purposes of this Interpretation, a levy is an outflow of resources embodying economic benefits that is imposed by governments on entities in accordance with legislation (ie laws and/or regulations), other than:
- (a) those outflows of resources that are within the scope of other Standards (such as income taxes that are within the scope of IAS 12 *Income Taxes*); and
 - (b) fines or other penalties that are imposed for breaches of the legislation.
- 'Government' refers to government, government agencies and similar bodies whether local, national or international.

[IFRIC 21.4].

As discussed in section 8 below, in November 2024, the IASB issued the Exposure Draft *Provisions - Targeted Improvements* which includes three targeted improvements to the standard.² One of the proposed improvements would involve aligning the definition of a liability in IAS 37 and the requirements for identifying liabilities with the *Conceptual Framework*. The *Conceptual Framework* defines a liability as a present obligation of the entity to transfer an economic resource as a result of past events, [CF 4.26], and requires that for a liability to exist, three criteria must be satisfied:

- (a) The entity has an obligation
 - (b) The obligation is to transfer an economic resource
- And
- (c) The obligation is a present obligation that exists as a result of past events [CF 4.27]

² Exposure Draft [ED/2024/8: Provisions-Targeted Improvements](#), IASB, November 2024. Available on the IFRS Foundation's website.

2 Objective and scope of IAS 37

2.1 Objective

Extract from IAS 37

Objective

The objective of this Standard is to ensure that appropriate recognition criteria and measurement bases are applied to provisions, contingent liabilities and contingent assets and that sufficient information is disclosed in the notes to enable users to understand their nature, timing and amount.

[IAS 37 Objective].

2.2 Scope of IAS 37

Extract from IAS 37

- 1** This Standard shall be applied by all entities in accounting for provisions, contingent liabilities and contingent assets, except:
- (a) those resulting from executory contracts, except where the contract is onerous; and
 - (b) [deleted]
 - (c) those covered by another Standard.

[IAS 37.1].

The following table lists the specific types of transaction or circumstances referred to in the standard that might give rise to a provision, contingent liability or contingent asset. In some cases, the transaction is identified in IAS 37 only to prohibit recognition of any liability, such as for future operating losses and repairs and maintenance of owned assets (see section 5 below). This chapter does not address those items identified below as falling outside the scope of the standard.

Types of transaction or circumstances referred to	In scope	Out of scope	Covered by
Restructuring costs	Yes		
Environmental penalties or clean-up costs	Yes		
Decommissioning costs	Yes		
Product warranties/refunds	Yes		
Legal claims	Yes		
Reimbursement rights	Yes		
Insurance recoveries	Yes		
Future operating costs (training, relocation, etc.)	Yes		
Future operating losses	Yes		
Onerous contracts (including onerous contracts under IFRS 15)	Yes		
Repairs and maintenance costs	Yes		
Provisions for depreciation, impairment or doubtful debts		Yes	IAS 16 / IAS 38 / IAS 36 / IFRS 9
Executory contracts (unless onerous)		Yes	
Income taxes		Yes	IAS 12
Leases (other than leases becoming onerous before commencement date, short-term leases, and leases of low-value assets)		Yes	IFRS 16

Types of transaction or circumstances referred to	In scope	Out of scope	Covered by
Employee benefits		Yes	IAS 19
Insurance contracts issued		Yes	IFRS 17
Contingent liabilities acquired in a business combination		Yes	IFRS 3
Contingent consideration of an acquirer in a business combination		Yes	IFRS 3
Financial instruments and financial guarantees within the scope of IFRS 9		Yes	IFRS 9
Trade payables		Yes	IFRS 9
Accruals		Yes	

2.2.1 Items outside the scope of IAS 37

2.2.1.A Executory contracts, except where the contract is onerous

The standard uses the term executory contracts to mean "...contracts under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent...". [IAS 37.3]. This means that contracts such as supplier purchase contracts and capital commitments, which would otherwise fall within the scope of the standard, are exempt.

This exemption prevents the statement of financial position from being grossed up for all manner of commitments that an entity has entered into, and in respect of which it is debatable whether (or at what point) such contracts give rise to items that meet the definition of a liability or an asset. In particular, the need for this exemption arises because the liability framework on which this standard is based includes the concept of a constructive obligation (see section 3.1.1 below) which, when applied to executory contracts would otherwise give rise to an inordinate number of contingent promises requiring recognition or disclosure.

An executory contract will still require recognition as a provision if the contract becomes onerous. [IAS 37.3]. Onerous contracts are dealt with in section 6.2 below.

2.2.1.B Items covered by another IFRS accounting standard

Where another IFRS accounting standard deals with a specific type of provision, contingent liability or contingent asset, it must be applied instead of IAS 37. Examples given in the standard are:

- Income taxes (dealt with in IAS 12 *Income Taxes* - see Chapter 29).
- Leases (dealt with in IFRS 16 *Leases* - see Chapter 24). However, IAS 37 applies to any lease that becomes onerous before the commencement date of the lease, as defined in IFRS 16. IAS 37 also applies to onerous short-term leases and onerous leases of low value assets that are accounted for under IFRS 16.6. [IAS 37.5(c)].
- Employee benefits (dealt with in IAS 19 *Employee Benefits* - see Chapter 31).
- Insurance and other contracts in scope of IFRS 17 (see Chapter 51).
- Contingent consideration of an acquirer in a business combination (dealt with in IFRS 3 *Business Combinations* - see Chapter 10).
- Revenue from contracts with customers (dealt with in IFRS 15 *Revenue from Contracts with Customers* - see Chapter 28). However, as IFRS 15 contains no specific requirements to address contracts with customers that are, or have become, onerous, IAS 37 applies to such cases. [IAS 37.5(g)].

Contingent consideration of an acquirer in a business combination is excluded from the scope of IAS 37. See Chapter 10.

As noted above, the scope of IAS 37 excludes income taxes that fall in the scope of IAS 12. The IFRS IC confirmed in July 2014 that the recognition of tax-related contingent liabilities and contingent assets are assessed using the guidance in IAS 12 rather than IAS 37.³ In addition, IFRIC 23 *Uncertainty over Income Tax Treatments* clarifies how to apply the recognition and measurement requirements in IAS 12 when there is uncertainty over tax treatments. [IFRIC 23.4]. IAS 37 remains relevant to the disclosure of tax-related contingent liabilities and contingent assets. [IAS 12.88]. However, as discussed in section 6.8.1 below, IAS 37 in general and IFRIC 21 in particular, apply to taxes or levies outside the scope of IAS 12. As regards interest and penalties imposed by taxation authorities, the position is unclear. Neither IAS 12 nor IFRIC 23 contain a specific reference to interest and penalties, the IFRS IC decided not to add a project on interest and penalties to its agenda.⁴ However, notwithstanding their decision to exclude interest and penalties from the scope of IFRIC 23 and their decision not to add a project on interest and penalties to its agenda, the IFRS IC observed that if an entity determines that amounts payable or receivable for interest and penalties are income taxes, then the entity applies IAS 12 to those amounts. If an entity does not apply IAS 12 to interest and penalties, then it applies IAS 37 to those amounts. Uncertain tax treatments are discussed further in Chapter 29. The circumstances in which interest and penalties might fall within the scope of IAS 12 are considered in Chapter 29. Levies imposed by governments are examined in section 6.8 below.

Whilst IAS 37 contains no reference to it, IFRS 3 is clear that the requirements in IAS 37 do not apply in determining which contingent liabilities to recognise as of the acquisition date (see section 4.10 below and Chapter 10). [IFRS 3.23].

In addition, the standard does not apply to financial instruments (including guarantees) that are within the scope of IFRS 9 *Financial Instruments*. [IAS 37.2]. This means that guarantees of third-party borrowings (including those of subsidiaries, associates and joint arrangements) are not covered by IAS 37. See Chapter 41.

The standard applies to provisions for restructurings, including discontinued operations. However, it emphasises that when a restructuring meets the definition of a discontinued operation under IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*, additional disclosures may be required under that standard (see Chapter 5). [IAS 37.9].

As noted above, IAS 37 applies to contracts in scope of IFRS 15 that are, or have become, onerous. [IAS 37.5(g)]. IFRS 15 adds that IAS 37 applies to other obligations under a contract with a customer that do not give rise to a performance obligation. For example, a law that requires an entity to pay compensation if its products cause harm or damage does not give rise to a performance obligation and IAS 37 would apply. Similarly, an entity would account for customer indemnities arising from claims of patent, copyright, trademark or other infringement in relation to its products in accordance with IAS 37. [IFRS 15.B33]. Furthermore, whilst an entity would apply IFRS 15 to separately purchased warranties, if a customer does not have the option to purchase a warranty separately, an entity would consider IAS 37 (see section 6.10 below), unless the promised warranty, or a part of the promised warranty, provides the customer with a service in addition to the assurance that the product complies with agreed-upon specifications. [IFRS 15.B30]. The standard defines a provision as “...a liability of uncertain timing or amount”. [IAS 37.10]. Thus, it only deals with provisions that are shown as liabilities in a statement of financial position. The term ‘provision’ is also used widely in the context of items such as depreciation, impairment of assets and doubtful debts. Such ‘provisions’ are not addressed in IAS 37, since these are adjustments to the carrying amounts of assets. [IAS 37.7].

2.2.2 Provisions compared to other liabilities

IAS 37 states that the feature distinguishing provisions from other liabilities, such as trade payables and accruals, is the existence of “...uncertainty about the timing or amount of the future expenditure required in settlement...”. [IAS 37.11]. The standard compares provisions to:

- (a) Trade payables - liabilities to pay for goods or services that have been received or supplied and have been invoiced or formally agreed with the supplier.
- (b) Accruals - liabilities to pay for goods or services that have been received or supplied but have not been paid, invoiced or formally agreed with the supplier, including amounts due to employees (for example, amounts relating to accrued vacation pay). Although it is sometimes necessary to estimate the amount or timing of accruals, the uncertainty is generally much less than for provisions.

³ [IFRIC Update](#), July 2014, p.7. Available on the IFRS Foundation’s website.

⁴ [IFRIC Update](#), September 2017, available on the IFRS Foundation’s website.

IAS 37 also notes that accruals are often reported as part of trade and other payables whereas provisions are reported separately. [IAS 37.11].

For trade payables and their associated accruals, there is little uncertainty regarding either the amount of the obligation (which would be determined by the contracted price for the goods and services being provided) or of the timing of settlement (which would normally occur within an agreed period following transfer of the goods and services in question and the issue of an invoice). In practice, however, contracts can be more complex and give rise to a wide range of possible outcomes in terms of the amount or timing of payment. In these circumstances, the difference between provisions and other liabilities is less obvious and judgement may be required to determine where the requirement to make an estimate of an obligation indicates a level of uncertainty about timing or amount that is more indicative of a provision. Such judgements, if significant to the amounts recognised in the financial statements, would merit disclosure (see Chapter 3). [IAS 1.122].

Some liabilities may initially be classified as provisions due to uncertainty regarding the timing or amount of payment. Subsequently, after negotiation with a counterparty or a decision by a court of law, the exact amount and timing of settlement may be agreed. As the entity now has an obligation to pay a fixed sum at an agreed point in time, the liability no longer meets the definition of a provision and instead is a financial liability in scope of IFRS 9.

One reason why the distinction between provisions and other liabilities matters is that provisions are subject to narrative disclosure requirements regarding the nature of the obligation and the uncertainties over timing and amount; and to quantitative disclosures of movements arising from their use, remeasurement or release that do not apply to other payables (see section 7.1 below). In fact, although questions of recognition and measurement are important, transparency of disclosure is also a very significant matter in relation to accounting for provisions and ensuring that their effect is properly understood by users of the financial statements.

2.2.3 Distinction between provisions and contingent liabilities

There is an area of overlap between provisions and contingent liabilities. Although contingent liabilities are clearly not as likely to give rise to outflows, similar judgements are made in assessing the nature of the uncertainties, the need for disclosures and ultimately the recognition of a liability in the financial statements. The standard notes that in a general sense, all provisions are contingent because they are uncertain in timing or amount. However, in IAS 37 the term 'contingent' is used for liabilities and assets that are not recognised because their existence will be confirmed only by the occurrence of one or more uncertain future events not wholly within the entity's control. In addition, the term 'contingent liability' is used for liabilities that do not meet the recognition criteria for provisions. [IAS 37.12].

Accordingly, the standard distinguishes between:

- (a) Provisions - which are recognised as liabilities (assuming that a reliable estimate can be made) because they are present obligations and it is probable that an outflow of resources embodying economic benefits will be required to settle the obligations.
 - (b) Contingent liabilities - which are not recognised as liabilities because they are either:
 - (i) Possible obligations, as it has yet to be confirmed whether the entity has a present obligation that could lead to an outflow of resources embodying economic benefits.
 - Or
 - (ii) Present obligations that do not meet the recognition criteria in the standard because either it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation, or a sufficiently reliable estimate of the amount of the obligation cannot be made.
- [IAS 37.13].

3 Recognition

3.1 Determining when a provision must be recognised

Extract from IAS 37

- 14 A provision shall be recognised when:
- (a) an entity has a present obligation (legal or constructive) as a result of a past event;
 - (b) it is probable that an outflow of resources embodying economic benefits will be required to settle the obligation; and
 - (c) a reliable estimate can be made of the amount of the obligation.
- If these conditions are not met, no provision shall be recognised.

[IAS 37.14].

Each of these three conditions is discussed separately below.

3.1.1 'An entity has a present obligation (legal or constructive) as a result of a past event'

The standard defines both legal and constructive obligations. The definition of a legal obligation is fairly straightforward and uncontroversial; it refers to an obligation that derives from a contract (through its explicit or implicit terms), legislation or other operation of law. [IAS 37.10].

The definition of a constructive obligation, on the other hand, may give rise to more problems of interpretation. A constructive obligation is defined as "...an obligation that derives from an entity's actions where:

- (a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and
- (b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities." [IAS 37.10].

The following Illustration, based on the examples in IAS 37, shows how a constructive obligation is created.

Illustration 3-1: Recognising a provision because of a constructive obligation

Scenario 1: Environmental policy - contaminated land

An entity in the oil industry operates in a country with no environmental legislation. However, it has a widely published environmental policy in which it undertakes to clean up all contamination that it causes and it has a record of honouring this published policy. During the period, the entity causes contamination to some land in this country.

In these circumstances, the contamination of the land gives rise to a constructive obligation because the entity (through its published policy and record of honouring it) has created a valid expectation on the part of those affected by it that the entity will clean up the site. [IAS 37.IE Example 2B].

Scenario 2: Refunds policy - product returns

A retail store has a generally known policy of refunding purchases by dissatisfied customers, even though it is under no legal obligation to do so.

In these circumstances, the sale of its products gives rise to a constructive obligation because the entity (through its reputation for providing refunds) has created a valid expectation on the part of customers that a refund will be given if they are dissatisfied with their purchase. [IAS 37.IE Example 4].

Scenario 2 above addresses refunds policy for product returns. As noted in section 6.12 below, the accounting treatment of refunds impinges into the area of revenue recognition. Other than contracts with customers that are, or have become onerous, contracts in scope of IFRS 15 are outside the scope of IAS 37.

The examples in Illustration 3-1 above demonstrate that the essence of a constructive obligation is the creation of a valid expectation that the entity is irrevocably committed to accepting and discharging its responsibilities.

The standard states that in almost all cases it will be clear whether a past event has given rise to a present obligation. However, it acknowledges that there will be some rare cases, such as a lawsuit against an entity, where this will not be so because the occurrence of certain events or the consequences of those events are disputed. [IAS 37.16]. When it is not clear whether there is a present obligation, a 'more likely than not' evaluation (taking into account all available evidence) is deemed to be sufficient to require recognition of a provision at the end of the reporting period. [IAS 37.15].

The evidence to be considered includes, for example, the opinion of experts together with any additional evidence provided by events after the reporting period. If, on the basis of such evidence, it is concluded that a present obligation is 'more likely than not' to exist at the end of the reporting period, a provision will be required (assuming that the other recognition criteria are met). [IAS 37.16]. This is an apparent relaxation of the standard's first criterion for the recognition of a provision as set out in section 3.1 above, which requires there to be a definite obligation, not just a probable one. It also confuses slightly the question of the existence of an obligation with the probability criterion, which strictly speaking relates to whether it is more likely than not that there will be an outflow of resources (see section 3.1.2 below). However, this interpretation is confirmed in IAS 10 *Events after the Reporting Period*, which includes "...the settlement after the reporting period of a court case that confirms that the entity had a present obligation at the end of the reporting period..." as an example of an adjusting event. [IAS 10.9].

The second half of this condition uses the phrase 'as a result of a past event'. This is based on the concept of an obligating event, which the standard defines as "...an event that creates a legal or constructive obligation that results in an entity having no realistic alternative to settling that obligation". [IAS 37.10]. The standard says that this will be the case only:

(a) Where the settlement of the obligation can be enforced by law

Or

(b) In the case of a constructive obligation, where the event (which may be an action of the entity) creates valid expectations in other parties that the entity will discharge the obligation [IAS 37.17]

This concept of obligating event is used in the standard when discussing specific examples of recognition, which we consider further in section 6 below. However, it is worth mentioning here that this concept, like that of a constructive obligation, is open to interpretation and requires the exercise of judgement, as the obligating event is not always easy to identify.

The standard emphasises that the financial statements deal with the financial position of an entity at the end of its reporting period, not its possible position in the future. Accordingly, no provision is recognised for costs that need to be incurred to operate in the future. The only liabilities to be recognised are those that exist at the end of the reporting period. [IAS 37.18]. It is not always easy to distinguish between the current state at the reporting date and the entity's future possible position, especially where IAS 37 requires an assessment to be made based on the probability of obligations and expectations as to their outcome. However, when considering these questions, it is important to ensure that provisions are not recognised for liabilities that arise from events after the reporting period (see Chapter 34).

Illustration 3-2: No provision without a past obligating event

The government introduces a number of changes to the income tax system. As a result of these changes, an entity in the financial services sector will need to retrain a large proportion of its administrative and sales staff in order to ensure continued compliance with financial services regulation. At the end of the reporting period, no training has taken place.

In these circumstances, no event has taken place at the reporting date to create an obligation. Only once the training has taken place, will there be a present obligation as a result of a past event. [IAS 37.IE Example 7].

IAS 37 prohibits certain provisions that might otherwise qualify to be recognised by stating that "It is only those obligations arising from past events existing independently of an entity's future actions (ie the future conduct of its business) that are recognised as provisions...". [IAS 37.19]. In contrast to situations where the entity's past conduct has created an obligation to incur expenditure (such as to rectify environmental damage already caused), a commercial or legal requirement to incur expenditure in order to operate in a particular way in the future, will not of itself justify the recognition of a provision. It argues that because the entity can avoid the expenditure by its future actions, for example, by changing its method of operation, there is no present obligation for the future expenditure. [IAS 37.19].

Illustration 3-3: Obligations must exist independently of an entity's future actions

Under legislation passed in 20X1, an entity is required to fit smoke filters in its factories by 30 June 20X3. The entity has not fitted the smoke filters.

At 31 December 20X2, the end of the reporting period, no event has taken place to create an obligation. Only once the smoke filters are fitted or the legislation takes effect, will there be a present obligation as a result of a past event, either for the cost of fitting smoke filters or for fines under the legislation.

At 31 December 20X3, there is still no obligating event to justify provision for the cost of fitting the smoke filters required under the legislation because the filters have not been fitted. However, an obligation may exist as at the reporting date to pay fines or penalties under the legislation because the entity is operating its factory in a non-compliant way. However, a provision would only be recognised for the best estimate of any fines and penalties if, as at 31 December 20X3, it is determined to be more likely than not that such fines and penalties will be imposed. [IAS 37.IE Example 6].

The standard expects strict application of the requirement that, to qualify for recognition, an obligation must exist independently of an entity's future actions. Even if a failure to incur certain costs would result in a legal requirement to discontinue an entity's operations, no provision can be recognised. As discussed in section 5.2 below, IAS 37 considers the example of an airline required by law to overhaul its aircraft once every three years. It concludes that no provision is recognised because the entity can avoid the requirement to perform the overhaul, for example, by replacing the aircraft before the three-year period has expired. [IAS 37.IE Example 11B].

Significantly, however, such considerations do not apply in the case of obligations to dismantle or remove an asset at the end of its useful life, where an obligation is recognised despite the entity's ability to dispose of the asset before its useful life has expired. Such costs are required to be included by IAS 16 *Property, Plant and Equipment* as part of the measurement of an asset's initial cost. [IAS 16.16]. Decommissioning provisions are discussed in section 6.3 below. Accordingly, the determination of whether an obligation exists independently of an entity's future actions can be a matter of judgement that depends on the particular facts and circumstances of the case.

There is no requirement for an entity to know to whom an obligation is owed. The obligation may be to the public at large. It follows that the obligation could be to one party, but the amount ultimately payable will be to another party. For example, in the case of a constructive obligation for an environmental clean-up, the obligation is to the public, but the liability will be settled by making payment to the contractors engaged to carry out the clean-up. However, the principle is that there must be another party for the obligation to exist. It follows from this that a management or board decision will not give rise to a constructive obligation unless it is communicated in sufficient detail to those affected by it before the end of the reporting period. [IAS 37.20]. The most significant application of this requirement relates to restructuring provisions, which is discussed further in section 6.1 below.

The standard discusses the possibility that an event that does not give rise to an obligation immediately may do so at a later date, because of changes in the law or an act by the entity (such as a sufficiently specific public statement) which gives rise to a constructive obligation. [IAS 37.21]. Changes in the law will be relatively straightforward to identify. The only issue that arises will be to determine exactly when that change in the law is recognised. IAS 37 states that an obligation arises only when the legislation is virtually certain to be enacted as drafted and suggests that in many cases, this will not be until it is enacted. [IAS 37.22].

The more subjective area is the possibility that an act by the entity will give rise to a constructive obligation. The example given is of an entity publicly accepting responsibility for rectification of previous environmental damage in a way that creates a constructive obligation. [IAS 37.21]. This seems to introduce a certain amount of flexibility to management when reporting results. By bringing forward or delaying a public announcement of a commitment that management had always intended to honour, it can affect the reporting period in which a provision is recognised. Nevertheless, the existence of a public announcement provides a more transparent basis for recognising a provision than, for example, a decision made behind the closed doors of a boardroom.

3.1.2 'It is probable that an outflow of resources embodying economic benefits will be required to settle the obligation'

This requirement has been included as a result of the standard's attempt to incorporate contingent liabilities within the definition of provisions. This is discussed in section 3.2 below.

It is important to note that even if an entity will incur expenditure to settle an obligation, it will not suffer a net outflow of resources if it receives resources of equal value in exchange for that expenditure. That is, it must be probable that a net outflow of resources embodying economic benefits will be required to settle the obligation for a provision to be recognised.

The meaning of probable in these circumstances is that the outflow of resources is more likely than not to occur; that is, it has a probability of occurring that is greater than 50%. [IAS 37.23]. The standard also makes it clear that where there are a number of similar obligations, the probability that an outflow will occur is based on the class of obligations as a whole. This is because in the case of certain obligations such as warranties, the possibility of an outflow for an individual item may be small (likely to be much less than 50%) whereas the possibility of at least some outflow of resources for the population as a whole will be much greater (almost certainly greater than 50%). [IAS 37.24]. With regard to the measurement of a provision arising from a number of similar obligations, the standard refers to the calculation of an 'expected value', whereby the obligation is estimated by weighting all the possible outcomes by their associated probabilities. [IAS 37.39]. Where the obligation being measured relates to a single item, the standard suggests that the best estimate of the liability may be the individual most likely outcome. [IAS 37.40]. For the purposes of recognition, a determination that it is more likely than not that any outflow of resources will be required is sufficient. The measurement of provisions is discussed in section 4 below.

3.1.3 'A reliable estimate can be made of the amount of the obligation'

The standard takes the view that a sufficiently reliable estimate can almost always be made for a provision where an entity can determine a range of possible outcomes. Hence, the standard contends that it will only be in extremely rare cases that a range of possible outcomes cannot be determined and therefore no sufficiently reliable estimate of the obligation can be made. [IAS 37.25]. In these extremely rare circumstances, no liability is recognised. Instead, the liability must be disclosed as a contingent liability (see disclosure requirements in section 7.2 below). [IAS 37.26]. Whether such a situation is as rare as the standard asserts is open to question, especially for entities trying to determine estimates relating to potential obligations that arise from litigation and other legal claims (see section 6.11 below).

In the Practical example below, Alcon Inc. explains that it does not recognise provisions for potential damage awards for legal claims if the payment cannot be reliably estimated.

Practical example 3-1: Alcon Inc. (2023)

Switzerland

2023 Annual Report [extract]

Part III [extract]

ITEM 18. FINANCIAL STATEMENTS [extract]

CONSOLIDATED FINANCIAL STATEMENTS OF ALCON INC. [extract]

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS OF ALCON INC. [extract]

18. Provisions and other non-current liabilities [extract]

Provisions for litigation and other legal matters

Alcon has established provisions for certain litigation and other legal matters, where a potential cash outflow is probable and a reliable estimate can be made of the amount of the outflow. These provisions represent the current best estimate of the total financial effect for these matters. Potential cash outflows reflected in a provision may be fully or partially offset by insurance in certain circumstances.

Alcon has not established provisions for potential damage awards for certain additional legal claims if Alcon currently believes that a payment is either not probable or cannot be reliably estimated. A number of other legal matters are in such early stages or the issues presented are such that Alcon has not made any provisions since it cannot currently estimate either a potential outcome or the amount of any potential losses. For these reasons, among others, Alcon generally is unable to make a reliable estimate of possible loss with respect to such cases. It is therefore not practicable to provide information about the potential financial impact of those cases.

There might also be cases for which Alcon was able to make a reliable estimate of the possible loss or the range of possible loss, but Alcon believes that publication of such information on a case-by-case basis would prejudice Alcon's position in ongoing legal proceedings or in any related settlement discussions. Accordingly, in such cases, information would be disclosed with respect to the nature of the contingency, but no disclosure is provided as to an estimate of the possible loss or range of possible loss.

Note 25 contains additional information on contingencies.

3.2 Contingencies

IAS 37 says that contingent liabilities and contingent assets are not recognised, but only disclosed.

[IAS 37.27, IAS 37.28, IAS 37.31, IAS 37.34].

Contingent liabilities that are recognised separately as part of allocating the cost of a business combination are covered by the requirements of IFRS 3. [IFRS 3.23]. Such liabilities continue to be measured after the business combination at the higher of:

- (a) The amount that would be recognised in accordance with IAS 37
- (b) The amount initially recognised less, if appropriate, the cumulative amount of income recognised in accordance with the principles of IFRS 15 [IFRS 3.56]

The requirements in respect of contingent liabilities identified in a business combination are discussed in Chapter 10.

3.2.1 Contingent liabilities

Extract from IAS 37

10 The following terms are used in this Standard with the meanings specified:

...

A contingent liability is:

- (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity; or
- (b) a present obligation that arises from past events but is not recognised because:
 - (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or
 - (ii) the amount of the obligation cannot be measured with sufficient reliability.

...

[IAS 37.10].

At first glance, this definition is not easy to understand because a natural meaning of 'contingent' would include any event whose outcome depends on future circumstances. The meaning is perhaps clearer when considering the definition of a liability and the criteria for recognising a provision in the standard. A possible obligation whose existence is yet to be confirmed does not meet the definition of a liability; and a present obligation in respect of which an outflow of resources is not probable, or which cannot be measured reliably does not qualify for recognition. [IAS 37.14]. On that basis a contingent liability under IAS 37 means one of the following:

- (a) An obligation that is estimated to be less than 50+% likely to exist (i.e., it does not meet the definition of a liability). Where it is more likely than not that a present obligation exists at the end of the reporting period, a provision is recognised. [IAS 37.16(a)]. Where it is more likely than not that no present obligation exists, a contingent liability is disclosed (unless the possibility is remote). [IAS 37.16(b)].
- (b) A present obligation that has a less than 50+% chance of requiring an outflow of economic benefits (i.e., it meets the definition of a liability but does not meet the recognition criteria). Where it is not probable that there will be an outflow of resources, an entity discloses a contingent liability (unless the possibility is remote). [IAS 37.23].
Or
- (c) A present obligation for which a sufficiently reliable estimate cannot be made (i.e., it meets the definition of a liability but does not meet the recognition criteria). In these rare circumstances, a liability cannot be recognised and it is disclosed as a contingent liability. [IAS 37.26].

The term 'possible' is not defined, but literally it could mean any probability greater than 0% and less than 100%. However, the standard effectively divides this range into four components, namely 'remote', 'possible but not probable', 'probable' and 'virtually certain'. The standard requires a provision to be recognised if "...it is more likely than not that a present obligation exists at the end of the reporting period...". [IAS 37.16(a)]. Therefore, IAS 37 distinguishes between a 'probable' obligation (which is more likely than not to exist and, therefore requires recognition as a provision) and a 'possible' obligation (for which either the existence of a present obligation is yet to be confirmed or where the probability of an outflow of resources is 50% or less). [IAS 37.13]. Section A of the Implementation Guidance to IAS 37, in summarising the main requirements of the standard, uses the phrase "...a possible obligation ... that may, but probably will not, require an outflow of resources". Accordingly, the definition restricts contingent liabilities to those where either the existence of the liability or the transfer of economic benefits arising is less than 50+% probable (or where the obligation cannot be measured at all, but as noted in section 3.1.3 above, this would be relatively rare).

The standard requires that contingent liabilities are assessed continually to determine whether circumstances have changed, in particular whether an outflow of resources embodying economic benefits has become probable. Where this becomes the case, then provision is made in the period in which the change in probability occurs (except in the rare circumstances where no reliable estimate can be made). [IAS 37.30]. Other changes in circumstances might require disclosure of a previously remote obligation on the grounds that an outflow of resources has become possible (but not probable). The impact of changes in circumstances on the recognition of provisions is shown in Illustration 3-4 below, and the Practical example 3-2 below, from Shell plc:

Illustration 3-4: When the likelihood of an outflow of benefits becomes probable

After a wedding in 20X2, ten people died, possibly as a result of food poisoning from products sold by the entity. Legal proceedings are started seeking damages from the entity. The entity disputes any liability and, up to the date on which its financial statements for the year ended 31 December 20X2 are authorised for issue, its lawyers have advised that it is probable that the entity will not be found liable. However, when the entity prepares its financial statements for the year ended 31 December 20X3, its lawyers advise that, owing to developments in the case, it is probable that the entity will be found liable.

At 31 December 20X2, no provision is recognised and the matter is disclosed as a contingent liability unless the probability of any outflow is regarded as remote. On the basis of the evidence available when the financial statements were approved, there is no obligation as a result of a past event.

At 31 December 20X3, a provision is recognised for the best estimate of the amount required to settle the obligation. The fact that an outflow of economic benefits is now believed to be probable means that there is a present obligation. [IAS 37.IE Example 10].

Notes to the Consolidated Financial Statements [extract]

31 - Legal proceedings and other contingencies [extract]

Decommissioning and restoration of manufacturing facilities

Prior to 2020, in line with industry practice, Shell's policy had been not to recognise decommissioning and restoration provisions associated with manufacturing facilities in Oil Products and Chemicals. This was on the basis that these assets were considered to have indefinite lives and, therefore, that it was considered remote that an outflow of economic benefits would be required.

In 2020, the changed macroeconomic fundamentals were considered, together with Shell's plans to rationalise the Group's manufacturing portfolio. It was also reconsidered whether it remained appropriate not to recognise decommissioning and restoration provisions for manufacturing facilities.

It was concluded that the assumption of indefinite lives for manufacturing facilities was no longer appropriate, and the need for either recognition of decommissioning and restoration provisions or contingent liability disclosure was reviewed. In 2020, provisions had been recognised for certain shorter-lived manufacturing facilities, but for the remaining longer-lived facilities, where decommissioning would generally be more than 50 years away, it was concluded that, while there is a present obligation that has arisen from past events, the amount of the obligation cannot be measured with sufficient reliability. This conclusion was reached on the basis that the settlement dates are indeterminate; and that other estimates, such as extremely long-term discount rates for which there is no observable measure, are not reliable. Consequently, a decommissioning and restoration obligation exists that cannot be recognised or quantified and that is disclosed as a contingent liability.

3.2.2 Contingent assets

A contingent asset is defined in a more intuitive way. It is "...a possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity". [IAS 37.10]. In this case, the word 'possible' is not confined to a level of probability of 50% or less, which may further increase the confusion over the different meaning of the term in the definition of contingent liabilities. [IAS 37.32].

Extract from IAS 37

32 Contingent assets usually arise from unplanned or other unexpected events that give rise to the possibility of an inflow of economic benefits to the entity. An example is a claim that an entity is pursuing through legal processes, where the outcome is uncertain.

[IAS 37.32].

The standard states that contingent assets are not recognised, as this could give rise to recognition of income that may never be realised. However, when the realisation of income is virtually certain, then the related asset is no longer regarded as contingent and recognition is appropriate. [IAS 37.33].

Virtual certainty is not defined in the standard, but it is certainly a much higher hurdle than 'probable' and indeed more challenging than the term 'highly probable', defined in IFRS 5 as "Significantly more likely than probable". [IFRS 5 Appendix A]. We think it reasonable that virtual certainty is interpreted as being as close to 100% as to make any remaining uncertainty insignificant. What this means in practice requires each case to be decided on its merits and any judgement must be made in the knowledge that, in any event, it is rarely possible to accurately assess the probability of the outcome of a particular event.

The standard requires disclosure of the contingent asset when the inflow of economic benefits is probable. [IAS 37.34]. For the purposes of the standard 'probable' means that the event is more likely than not to occur; that is, it has a probability greater than 50%. [IAS 37.23]. The disclosure requirements are detailed in section 7.3 below.

As with contingent liabilities, any contingent assets are assessed continually to ensure that developments are appropriately reflected in the financial statements. If it has become virtually certain that an inflow of economic benefits will arise, the asset and the related income are recognised in the period in which the change occurs. If a previously unlikely inflow becomes probable, then the contingent asset must be disclosed. [IAS 37.35].

The requirement to recognise the effect of changing circumstances in the period in which the change occurs extends to the analysis of information available after the end of the reporting period and before the date of approval of the financial statements. In our view, such information would not give rise to an adjusting event after the reporting period. In contrast to contingent liabilities (in respect of which IAS 10 includes as a specific example of an adjusting event "...the settlement after the reporting period of a court case that confirms that the entity had a present obligation at the end of the reporting period..." [IAS 10.9]), no adjustment is made to reflect the subsequent settlement of a legal claim in favour of the entity. In this instance, the period in which the change occurs is subsequent to the reporting period. There is also no suggestion that the example in IAS 10 is referring to anything but liabilities. An asset could only be recognised if, at the end of the reporting period, the entity could show that it was virtually certain that its claim would succeed.

How we see it

In contrast to contingent liabilities, information available after the end of the reporting period and before the date of approval of the financial statements would not give rise to an adjusting event after the reporting period for contingent assets. No adjustment is made to reflect the subsequent settlement of a legal claim in favour of the entity. An asset could only be recognised if, at the end of the reporting period, the entity could show that it was virtually certain that its claim would succeed.

3.2.2.A Obligations contingent on the successful recovery of a contingent asset

Entities may sometimes be required to pay contingent fees to a third-party dependent upon the successful recovery of a contingent asset. For example, the payment of fees to a legal advisor in a contract agreed on a 'no win, no fee' basis will depend upon the successful outcome of a legal claim.

How we see it

Where entities are required to pay contingent fees to a third party, dependent upon the successful recovery of a contingent asset, the obligation for the success fee arises from an executory contract that must be evaluated separately from the legal claim. The liability for the success fee would therefore only be recognised by the entity upon winning the claim.

IAS 37 uses the term executory contracts to mean "...contracts under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent...". [IAS 37.3]. When a contract for services is wholly contingent on recovering a contingent asset, no service requiring payment is deemed to be provided until or unless the matter is resolved successfully. Unless the contract also required payment to be made in the event of failure, the amount of work put in by the lawyer to prepare a case and argue for recovery of the contingent asset is irrelevant to the existence of a liability to pay fees.

If the entity has deemed it appropriate to recognise an asset in respect of the claim, it would be appropriate to take account of any such fees in the measurement of that asset (in determining the net amount recoverable); but no accrual is made for the legal fees themselves unless a successful outcome is confirmed.

This analysis is specific to a no win-no fee arrangement related to a contingent asset and may not be appropriate in other circumstances.

3.2.3 How probability determines whether to recognise or disclose

The following matrix summarises the treatment of contingencies under IAS 37:

Likelihood of outcome	Accounting treatment: contingent liability	Accounting treatment: contingent asset
Virtually certain	Recognise	Recognise
Probable	Recognise	Disclose
Possible but not probable	Disclose	No disclosure permitted
Remote	No disclosure required	No disclosure permitted

The standard does not put a numerical measure of probability on either 'virtually certain' or 'remote'. In our view, the use of such measures would downgrade a process requiring the exercise of judgement into a mechanical exercise. It is difficult to imagine circumstances when an entity could reliably determine an obligation to be, for example, 92%, 95% or 99% likely, let alone be able to compare those probabilities objectively.

How we see it

In our view, it is reasonable to regard 'virtually certain' as describing a likelihood that is as close to 100% as to make any remaining uncertainty insignificant; to see 'remote' as meaning a likelihood of an outflow of resources that is not significant; and for significance to be a matter for judgement and determined according to the merits of each case.

3.3 Recognising an asset when recognising a provision

In most cases, the recognition of a provision results in an immediate expense in profit or loss. Nevertheless, in some cases it will be appropriate to recognise an asset. These issues are not discussed in IAS 37, which neither prohibits nor requires capitalisation of the costs recognised when a provision is made. It states that other IFRS accounting standards specify whether expenditures are treated as assets or expenses. [IAS 37.8].

Whilst the main body of IAS 37 is silent on the matter, the standard contains an example which concludes that an asset is recognised when a decommissioning provision is established. This example is replicated in the Illustration below.

Illustration 3-5: When the recognition of a provision gives rise to an asset

An entity operates an offshore oilfield where its licensing agreement requires it to remove the oil rig at the end of production and restore the seabed. 90% of the eventual costs relate to the removal of the oil rig and restoration of damage caused by building it, with 10% expected to arise through the extraction of oil. At the end of the reporting period, the rig has been constructed but no oil has been extracted.

A provision is recognised in respect of the probable costs relating to the removal of the rig and restoring damage caused by building it. This is because the construction of the rig, combined with the requirement under the licence to remove the rig and restore the seabed, creates an obligating event as at the end of the reporting period. These costs are included as part of the cost of the oil rig.

However, there is no obligation to rectify any damage that will be caused by the future extraction of oil. [IAS 37.IE Example 3].

This conclusion is supported by IAS 16, which requires the cost of an item of property, plant and equipment to include the initial estimate of the costs of dismantling and removing an asset and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period. [IAS 16.16(c), IAS 16.18]. The treatment of decommissioning costs is discussed further in section 6.3 below.

4 Measurement

Except in the case of an onerous contract, the amount required to be recognised as a provision is the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. [IAS 37.36]. In the case of an onerous contract, the amount required to be recognised as a provision is not based on an estimate of an expected outcome. Instead, the provision reflects the lower of the costs of fulfilling the contract and any compensation or penalties from a failure to fulfil it [IAS 37.68], regardless of what the entity expects to do. Onerous contracts are discussed in section 6.2 below.

4.1 Best estimate of provision

Extract from IAS 37

36 The amount recognised as a provision shall be the best estimate of the expenditure required to settle the present obligation at the end of the reporting period.

[IAS 37.36].

IAS 37 requires the amount to be recognised as a provision to be determined before tax, as the tax consequences of the provision, and changes to it, are dealt with under IAS 12. [IAS 37.41].

The standard equates this 'best estimate' with the amount that an entity would rationally pay to settle the obligation at the end of the reporting period or to transfer it to a third party at that time. [IAS 37.37]. It is interesting that a hypothetical transaction of this kind is proposed as the conceptual basis of the measurement required, rather than putting the main emphasis upon the actual expenditure that is expected to be incurred in the future.

The standard does acknowledge that it would often be impossible or prohibitively expensive to settle or transfer the obligation at the end of the reporting period. However, it goes on to state that "...the estimate of the amount that an entity would rationally pay to settle or transfer the obligation gives the best estimate of the expenditure required to settle the present obligation at the end of the reporting period". [IAS 37.37].

During the Provisions research project (see section 1.1 above), stakeholders noted that the measurement objective in IAS 37 is not precise and, in practice, is interpreted in different ways.⁵ Paragraph 36 of IAS 37 requires an entity to measure a provision at the best estimate of the expenditure required to settle the obligation, implying a 'fulfilment value' measurement basis. However, IAS 37.37 states that the best estimate is the amount that the entity would rationally pay to transfer the obligation to a third party at the reporting date, suggesting a 'transfer value' measurement basis. [IAS 37.36, IAS 37.37]. The assumptions that an entity makes regarding derecognition of the liability could influence how the entity determines the best estimate of the expenditure required to settle the obligation. In practice, there are several ways in which an IAS 37 obligation could be derecognised. For example:

- (a) The obligation is settled by the entity performing the obligation itself (for example, the entity uses its own personnel to clean up a site to satisfy an environmental clean-up obligation)
- (b) The entity employs a third party to perform the work required to settle the obligation (for example, the entity hires a third-party company to clean up the site)
- (c) The entity transfers the obligation to a third party (for example, another entity takes on the obligation to clean up the site, the entity pays the transferee, and is relieved of the obligation)

Or

- (d) The obligation is cash settled by negotiation with the party to whom the obligation is owed (for example, the entity negotiates a cash settlement with the local municipality in order to be relieved of the obligation)

In January 2020, the IASB decided that clarification of the measurement objective of IAS 37 would not be included in the scope of the current project to amend aspects of IAS 37.⁶ In our view, any of the assumptions above are acceptable bases for measurement provided that they appropriately reflect the facts and circumstances of the situation. If an entity exercises significant judgement in determining the most appropriate approach, consideration must be given to the disclosure requirements in paragraph 122 of IAS 1 *Presentation of Financial Statements*.⁷ See Chapter 3.

⁵ [IASB Staff Paper 22](#): Project: *Provisions*, Paper topic: *Education Session - scope of possible project to amend IAS 37*, IASB Meeting, May 2019. Available on the IFRS Foundation's website.

⁶ [IASB Update](#), January 2020, available on the IFRS Foundation's website.

⁷ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

How we see it

The assumptions that an entity makes regarding how an IAS 37 obligation will be derecognised could influence how the entity determines the best estimate of the expenditure required to settle the obligation. We believe that this is acceptable, provided that the measurement basis appropriately reflects the facts and circumstances of the situation.

The estimates of outcome and financial effect are determined by the judgement of the entity's management, supplemented by experience of similar transactions and, in some cases, reports from independent experts. The evidence considered will include any additional evidence provided by events after the reporting period. [IAS 37.38]. The standard suggests that there are various ways of dealing with the uncertainties surrounding the amount to be recognised as a provision. It mentions three, an expected value (or probability-weighted) method; the mid-point of the range of possible outcomes; and an estimate of the individual most likely outcome. An expected value approach would be appropriate when a large population of items is being measured, such as warranty costs. This is a statistical computation which weights the cost of all the various possible outcomes according to their probabilities, as shown in the following Illustration based on the example in IAS 37. [IAS 37.39].

Illustration 4-1: Calculation of expected value

An entity sells goods with a warranty under which customers are covered for the cost of repairs of any manufacturing defects that become apparent within the first six months after purchase. If minor defects were detected in all products sold, repair costs of CU1 million would result. If major defects were detected in all products sold, repair costs of CU4 million would result. The entity's past experience and future expectations indicate that, for the coming year, 75% of the goods sold will have no defects, 20% of the goods sold will have minor defects and 5% of the goods sold will have major defects. In accordance with IAS 37.24 (see section 3.1.2 above) an entity assesses the probability of a transfer for the warranty obligations as a whole.

The expected value of the cost of repairs is:

$(75\% \text{ of nil}) + (20\% \text{ of CU1m}) + (5\% \text{ of CU4m}) = \text{CU400,000}.$

In a situation where there is a continuous range of possible outcomes and each point in that range is as likely as any other, IAS 37 requires that the mid-point of the range is used. [IAS 37.39]. This is not a particularly helpful way of setting out the requirement, as it does not make it clear what the principle is meant to be. The mid-point in this case represents the median as well as the expected value. The latter may have been what was intended, but the median could be equally well justified on the basis that it is 50% probable that at least this amount will be payable, while anything in excess of that constitutes a possible but not a probable liability, that would be disclosed rather than accrued. Interestingly, US GAAP has a different approach to this issue in relation to contingencies. FASB ASC Topic 450 *Contingencies* states that where a contingent loss could fall within a range of amounts then, if there is a best estimate within the range, that amount is required to be accrued, with the remainder noted as a contingent liability. However, if there is no best estimate then the lowest figure within the range is accrued, with the remainder up to the maximum potential loss noted as a contingent liability.⁸

Where the obligation being measured relates to a single item, the standard suggests that the best estimate of the liability may be the individual most likely outcome. However, even in such a case, it notes that consideration must be given to other possible outcomes and where these are predominantly higher or mainly lower than the most likely outcome, the resultant 'best estimate' will be a higher or lower amount than the individual most likely outcome. To illustrate this, the standard gives an example of an entity that has to rectify a fault in a major plant that it has constructed for a customer. The most likely outcome is that the repair will succeed at the first attempt. However, a provision is made for a larger amount if there is a significant chance that further attempts will be necessary. [IAS 37.40].

As discussed in section 8 below, in November 2024 the IASB issued the Exposure Draft *Provisions - Targeted Improvements* which includes three targeted improvements to the standard, one of which is to clarify which costs are included in the measurement of a provision.⁹

⁸ FASB ASC Topic 450, *Contingencies*, para. 450-20-30-1 and para. 450-20-50-3.

⁹ Exposure Draft [ED/2024/8: Provisions-Targeted Improvements](#), IASB, November 2024. Available on the IFRS Foundation's website.

4.2 Dealing with risk and uncertainty in measuring a provision

It is clear from the definition of a provision as a liability of uncertain timing or amount that entities will have to deal with risk and uncertainty in estimating an appropriate measure of the obligation at the end of the reporting period. It is therefore interesting to consider how the measurement rules detailed in IAS 37 help entities achieve a faithful representation of the obligation in these circumstances. A faithful representation requires estimates that are neutral, that is, without bias. [CF 2.13, CF 2.15]. The *Conceptual Framework* notes that neutrality is supported by the exercise of prudence, i.e., the exercise of caution when making judgements under conditions of uncertainty. However, it warns that the exercise of prudence does not allow for the understatement of assets or income or the overstatement of liabilities or expenses. Such misstatements can lead to the overstatement or understatement of income or expenses in future periods. [CF 2.16]. The *Conceptual Framework* notes also that the exercise of prudence does not imply a need for asymmetry. [CF 2.17].

The standard does not refer to neutrality as such; however, it does discuss the concept of risk and the need for exercising caution and care in making judgements under conditions of uncertainty. It states that “The risks and uncertainties that inevitably surround many events and circumstances shall be taken into account in reaching the best estimate of a provision”. [IAS 37.42]. It refers to risk as being variability of outcome and suggests that a risk adjustment may increase the amount at which a liability is measured. [IAS 37.43]. Whilst the standard provides an example of a case in which the best estimate of an obligation might have to be larger than the individual most likely outcome, [IAS 37.40], it gives no indication of how this increment should be determined. It warns that caution is needed in making judgements under conditions of uncertainty, so that expenses or liabilities are not understated. However, it says that uncertainty does not justify the creation of excessive provisions or a deliberate overstatement of liabilities. Accordingly, care is needed to avoid duplicating adjustments for risk and uncertainty, for example, by estimating the costs of a particularly adverse outcome and then overestimating its probability. [IAS 37.43]. Any uncertainties surrounding the amount of the expenditure are to be disclosed (see section 7.1 below). [IAS 37.44].

The overall result of all this is somewhat confusing. Whilst a best estimate based solely on the expected value approach or the mid-point of a range addresses the uncertainties relating to there being a variety of possible outcomes, it does not fully reflect risk, because the actual outcome could still be higher or lower than the estimate. Therefore, the discussion on risk suggests that an additional adjustment is required. However, apart from indicating that the result may be to increase the recognised liability and pointing out the need to avoid duplicating the effect of risk in estimates of cash flows and probability, [IAS 37.43], it is not clear quite how this might be achieved. This leaves a certain amount of scope for variation in the estimation of provisions and is further complicated when the concept of risk is combined with considerations relating to the time value of money (see section 4.3.2 below).

4.3 Discounting the estimated cash flows to a present value

Extract from IAS 37

Present value

- 45 Where the effect of the time value of money is material, the amount of a provision shall be the present value of the expenditures expected to be required to settle the obligation.
- 46 Because of the time value of money, provisions relating to cash outflows that arise soon after the reporting period are more onerous than those where cash outflows of the same amount arise later. Provisions are therefore discounted, where the effect is material.
- 47 The discount rate (or rates) shall be a pre-tax rate (or rates) that reflect(s) current market assessments of the time value of money and the risks specific to the liability. The discount rate(s) shall not reflect risks for which future cash flow estimates have been adjusted.

[IAS 37.45, IAS 37.46, IAS 37.47]

The main types of provision where the impact of discounting will be significant are those relating to decommissioning and other environmental restoration liabilities. IFRIC 1 addresses some of the issues relating to the use of discounting (in the context of provisions for obligations to dismantle, remove or restore items of property, plant and equipment, referred to as ‘decommissioning, restoration and similar liabilities’) which are discussed in section 6.3.1 below.

Higher interest rates seen in some jurisdictions in recent years could lead to more provisions becoming subject to discounting, as the effect of the time value of money is more likely to be material.

4.3.1 Real versus nominal rate

IAS 37 does not indicate whether the discount rate should be a real discount rate or a nominal discount rate (although a real discount rate is referred to in Example 2 in Appendix D to IAS 37 which illustrates the narrative disclosure for decommissioning costs). The discount rate to be used depends on whether:

- (a) The future cash flows are expressed in current prices; in which case a real discount rate (which excludes the effects of general inflation) is used.

Or

- (b) The future cash flows are expressed in expected future prices, in which case a nominal discount rate (which includes a return to cover expected inflation) is used.

Either alternative is acceptable, and these methods would produce the same figure for the initial present value of the provision. However, the effect of the unwinding of the discount could be different in each case (see section 4.3.5 below).

4.3.2 Adjusting for risk and using a government bond rate

IAS 37 also requires that risk is taken into account in the calculation of a provision, but gives little guidance as to how this should be done. Where discounting is concerned, it merely says that the discount rate must not reflect risks for which the future cash flow estimates have been adjusted. [IAS 37.47]. One could use a discount rate that reflects the risk associated with the liability (a risk-adjusted rate). The following illustration shows how an entity might calculate such a risk adjusted rate.

Illustration 4-2: Calculation of a risk-adjusted rate

A company has a provision for which the expected value of the cash outflow in three years' time is CU250, and the risk-free rate (i.e., the nominal rate unadjusted for risk) is 5%. However, the possible outcomes lie within a range between CU200 and CU300. As the company is risk averse, management would settle instead for a certain payment of CU270 in three years' time rather than be exposed to the risk of the actual outcome being as high as CU300. The effect of risk in calculating the present value can be expressed as either:

- (a) Discounting the risk-adjusted cash flow of CU270 at the risk-free (unadjusted) rate of 5%, giving a present value of CU233.

Or

- (b) Discounting the expected cash flow (which is unadjusted for risk) of CU250 at a risk-adjusted rate that will give the present value of CU233, i.e., a rate of 2.35%.

As can be seen from this Illustration, the risk-adjusted discount rate is a lower rate than the unadjusted (risk-free) discount rate. This may seem counter-intuitive initially, because the experience of most borrowers is that banks and other lenders will charge a higher rate of interest on loans that are assessed to be higher risk to the lender. However, in the case of a provision, a risk premium is being suffered to eliminate the possibility of the actual cost being higher (thereby capping a liability), whereas in the case of a loan receivable, a premium is required to compensate the lender for taking on the risk of not recovering its full value (setting a floor for the value of the lender's financial asset). In both cases, the actual cash flows incurred by the paying entity are higher to reflect a premium for risk. In other words, the discount rate for an asset is increased to reflect the risk of recovering less and the discount rate for a liability is reduced to reflect the risk of paying more.

A problem with changing the discount rate to account for risk is that this adjusted rate is a theoretical rate, as it is unlikely that there would be a market assessment of the risks specific to the liability alone. [IAS 37.47]. However, the lower discount rate in the above example is consistent with the premise that a risk-adjusted liability is higher than a liability without accounting for the risk that the actual settlement amount is different to the estimate. [IAS 37.43]. It is also difficult to see how a risk-adjusted rate could be obtained in practice. In the above example, it was obtained only by reverse-engineering; it was already known that the net present value of a risk-adjusted liability was CU233, so the risk-adjusted rate was just the discount rate applied to unadjusted cash flow of CU250 to give that result.

IAS 37 offers an alternative approach - instead of using a risk-adjusted discount rate, the estimated future cash flows themselves can be adjusted for risk. [IAS 37.47]. This does of course present the problem of how to adjust the cash flows for risk (see section 4.2 above). However, this may be easier than attempting to risk-adjust the discount rate.

For the purposes of discounting post-employment benefit obligations, IAS 19 requires the discount rate to be determined by reference to market yields at the end of the reporting period on high quality corporate bonds (although in countries where there is no deep market in such bonds, the market yields on government bonds are required to be used). [IAS 19.83]. Although IAS 19 indicates that this discount rate reflects the time value of money (but not the actuarial or investment risk), [IAS 19.84], we do not believe it is appropriate to use the yield on a high-quality corporate bond for determining a risk-free rate to be used in discounting provisions under IAS 37. Where an entity is using a risk-free discount rate for the purposes of calculating a provision under IAS 37, we believe that rate must be based on a government bond rate with a similar currency and remaining term as the provision.

How we see it

Even as government bond rates have become more volatile in recent years, in most countries a government bond remains the most suitable of all the observable measures of the time value of money in a particular country. It follows that because a risk-adjusted rate is always lower than the risk-free rate, an entity cannot justify the discounting of a provision at a rate that is higher than a government bond rate with a similar currency and term to the provision.

Where government bond rates are negative or, more likely, result in a negative discount rate once adjusted for risk, we believe that it is not appropriate to apply a floor of zero to the discount rate as this would result in an understatement of the liability.

Whichever method of reflecting risk is adopted, IAS 37 emphasises that care must be taken that the effect of risk is not double-counted by inclusion in both the cash flows and the discount rate. [IAS 37.47].

In recent years, government bond rates have been more volatile as markets have changed rates to reflect (among other factors) heightened perceptions of sovereign debt risk. Several years ago, it was not uncommon for government debt to offer negative yields. It is now much less common. The question has therefore arisen whether government bond rates, at least in certain jurisdictions, should continue to be regarded as the default measure of a risk-free discount rate. Whilst the current volatility in rates has highlighted the fact that no debt (even government debt) is totally risk free, the challenge is to find a more reliable measure as an alternative. Any adjustment to the government bond rate to 'remove' the estimate of sovereign debt risk is conceptually flawed, as it is not possible to isolate one component of risk from all the other variables that influence the setting of an interest rate. Another approach might be to apply some form of average bond rate over a period of 3, 6 or 12 months to mitigate the volatility inherent in applying the spot rate at the period end. However, this is clearly inappropriate given the requirements in IAS 37 to determine the best estimate of an obligation by reference to the expenditure required to settle it at the end of the reporting period, [IAS 37.36], and to determine the discount rate on the basis of current market assessments of the time value of money. [IAS 37.47].

With 'risk' being a measure of potential variability in returns, it remains the case that in most countries a government bond will be subject to the lowest level of variability in that jurisdiction. As such, in most countries, it remains the most suitable of all the observable measures of the time value of money in a particular country. Several years ago, it was not uncommon for government debt to offer negative yields. Whilst this is now much less common, where government bond rates are negative or, more likely, result in a negative discount rate once adjusted for risk, we believe that it is not appropriate to apply a floor of zero to the discount rate as this would result in an understatement of the liability. As discussed above, and in section 4.3.1 above, IAS 37 offers various approaches to determining an appropriate discount rate. It could be the case that one or more of the allowed approaches result in a negative discount rate whereas the application of an alternative permitted approach would not. In order to avoid some of the presentational difficulties associated with a negative discount rate, entities faced with a negative real discount rate before risk adjustment could consider the alternative approach of discounting expected future cash flows expressed in future prices, at a nominal discount rate (see section 4.3.1 above), if the nominal rate is not negative. Similarly, entities that are faced with a negative risk-adjusted discount rate only because of risk adjustment (i.e., where risk free rates themselves are not negative) could adopt the alternative approach of adjusting the estimated future cash flows to reflect the risks associated with the liability, rather than risk-adjusting the discount rate.

A difficulty that can arise in certain countries is finding a government bond with a similar term to the provision, for example, when measuring a decommissioning provision expected to be settled in 30 years in a country where there are no government bonds with a term exceeding 10 years. In such cases, the government bond rate might be adjusted and the techniques adopted by actuaries for measuring retirement obligations with long maturities, which involve extrapolating current market rates along a yield curve, [IAS 19.86], might be considered. The difficulties of finding an appropriate discount rate in the context of retirement benefit obligations are discussed in Chapter 31.

4.3.3 Own credit risk

IAS 37 does not address whether an entity's own credit risk is a risk specific to a liability when determining a risk-adjusted discount rate. In March 2011, the IFRS IC decided not to take onto its agenda a request for interpretation of the phrase 'the risks specific to the liability' and whether this means that an entity's own credit risk is required to be excluded from any adjustments made to the discount rate used to measure liabilities. In doing so, the IFRS IC acknowledged that IAS 37 is not explicit on the question of own credit risk; but understood that the predominant practice was to exclude it for the reason that credit risk is generally viewed as a risk of the entity rather than a risk specific to the liability.¹⁰

How we see it

Whether own credit risk is considered a risk specific to a liability could depend, at least in part, on the way in which an entity measures a provision (i.e., how an entity determines the best estimate of the expenditure required to settle the obligation).

As discussed in section 4.1 above, the measurement objective in IAS 37 is not precise, and the term 'best estimate' can be interpreted in different ways. For example, an entity could determine the best estimate by assuming that the obligation will be cash settled by negotiation with the party to whom the obligation is owed. In this case, own credit risk could be considered relevant if the party to whom the obligation is owed would be willing to negotiate a lower settlement amount if the entity risks defaulting in the future. If an entity has exercised significant judgement in determining the best estimate of the expenditure required to settle an obligation, and whether own credit risk is taken into account, consideration must be given to the disclosure requirements in IAS 1.122. See Chapter 3.

As discussed in section 8 below, in November 2024, the IASB issued the Exposure Draft *Provisions - Targeted Improvements* which includes three targeted improvements to the standard, one of which specifies that the rate at which an entity discounts a provision does not reflect non-performance risk (i.e., the risk that the entity will not settle the obligation).¹¹

4.3.4 Pre-tax discount rate

Since IAS 37 requires provisions to be measured before tax, it follows that cash flows shall be discounted at a pre-tax discount rate. [IAS 37.47]. No further explanation of this is given in the standard.

This is probably because, in reality, the use of a pre-tax discount rate will be most common. Supposing, for example, that the risk-free rate of return is being used, then the discount rate used will be a government bond rate. This rate will be obtained gross. Thus, the idea of trying to determine a pre-tax rate (for example, by obtaining a required post-tax rate of return and adjusting it for the tax consequences of different cash flows) will seldom be relevant.

The calculation is shown in the following Illustration.

Illustration 4-3: Use of discounting and tax effect

It is estimated that the settlement of an environmental provision will give rise to a gross cash outflow of CU500,000 in three years' time. The gross interest rate on a government bond maturing in three years' time is 6%. The tax rate is 30%.

The net present value of the provision is CU419,810 ($CU500,000 \times 1 \div (1.06)^3$). Hence, a provision of CU419,810 is booked in the statement of financial position. A corresponding deferred tax asset of CU125,943 (30% of CU419,810) would be set up if it met the criteria for recognition in IAS 12 (see Chapter 29).

4.3.5 Unwinding of the discount

Extract from IAS 37

60 Where discounting is used, the carrying amount of a provision increases in each period to reflect the passage of time. This increase is recognised as borrowing cost.

[IAS 37.60].

10 [IFRIC Update](#), March 2011, p.4. Available on the IFRS Foundation's website.

11 Exposure Draft [ED/2024/8: Provisions-Targeted Improvements](#), IASB, November 2024. Available on the IFRS Foundation's website.

The extract above is the only guidance that the standard gives on the unwinding of the discount. IFRIC 1 in relation to provisions for decommissioning, restoration and similar liabilities requires that the periodic unwinding of the discount is recognised in profit or loss as a finance cost as it occurs. The IFRS IC concluded that the unwinding of the discount is not a borrowing cost for the purposes of IAS 23 *Borrowing Costs* and thus, cannot be capitalised under that standard. [IFRIC 1.8]. It noted that IAS 23 addresses funds borrowed specifically for the purpose of obtaining a particular asset and agreed that a decommissioning liability does not fall within this description since it does not reflect funds borrowed. Accordingly, the IFRS IC concluded that the unwinding of the discount is not a borrowing cost as defined in IAS 23. [IFRIC 1.BC26].

However, there is no discussion of the impact that the original selection of discount rate can have on its unwinding, that is, the selection of real versus nominal rates, and risk-free versus risk-adjusted rates and the fact that these different discount rates will unwind differently. This is best illustrated by way of an example.

Illustration 4-4: Effect on future profits of choosing a real or nominal discount rate

A provision is required to be set up for an expected cash outflow of CU100,000 (estimated at current prices), payable in three years' time. The appropriate nominal discount rate is 7.5%, and inflation is estimated at 5%. If the provision is discounted using the nominal rate, the expected cash outflow has to reflect future prices. Accordingly, if prices increase at the rate of inflation, the cash outflow will be CU115,762 ($CU100,000 \times 1.05^3$). The net present value of CU115,762, discounted at 7.5%, is CU93,184 ($CU115,762 \times 1 \div (1.075)^3$). If all assumptions remain valid throughout the three-year period, the movement in the provision would be as follows:

	Undiscounted cash flows	Provision
	CU	CU
Year 0	115,762	93,184
Unwinding of discount ($CU93,184 \times 0.075$)		6,989
Revision to estimate		-
Year 1	115,762	100,173
Unwinding of discount ($CU100,173 \times 0.075$)		7,513
Revision to estimate		-
Year 2	115,762	107,686
Unwinding of discount ($CU107,686 \times 0.075$)		8,076
Revision to estimate		-
Year 3	115,762	115,762

If the provision is calculated based on the expected cash outflow of CU100,000 (estimated at current prices), then it needs to be discounted using a real discount rate. This may be thought to be 2.5%, being the difference between the nominal rate of 7.5% and the inflation rate of 5%. However, it is more accurately calculated as 2.381%, being $(1.075 \div 1.05) - 1$. Accordingly, the net present value of CU100,000, discounted at 2.381%, is CU93,184 ($CU100,000 \times 1 \div (1.02381)^3$), the same as the calculation using future prices discounted at the nominal rate.

If all assumptions remain valid throughout the three-year period, the movement in the provision comprises both the unwinding of the discount and the increase in the level of current prices used to determine the estimate of cost, as follows:

	Undiscounted cash flows	Provision
	CU	CU
Year 0	100,000	93,184
Unwinding of discount ($CU93,184 \times 0.02381$)		2,219
Revision to estimate ($CU100,000 \times 0.05$)	5,000	4,770
Year 1	105,000	100,173
Unwinding of discount ($CU100,173 \times 0.02381$)		2,385
Revision to estimate ($CU105,000 \times 0.05$)	5,250	5,128
Year 2	110,250	107,686
Unwinding of discount ($CU107,686 \times 0.02381$)		2,564
Revision to estimate ($CU110,250 \times 0.05$)	5,512	5,512
Year 3	115,762	115,762

Although the total expense in each year is the same under either method, what will be different is the allocation of the change in provision between operating costs (assuming the original provision was treated as an operating expense) and finance charges. It can be seen from the second table in the above example that using the real discount rate will give rise to a much lower finance charge each year. However, this does not lead to a lower provision in the statement of financial position at the end of each year. Provisions have to be revised annually to reflect the current best estimate of the obligation. [IAS 37.59]. Thus, the provision in the above example at the end of each year needs to be adjusted to reflect current prices at that time (and any other adjustments that arise from changes in the estimate of the provision), as well as being adjusted for the unwinding of the discount. For example, the revised provision at the end of Year 1 is CU100,173, being CU105,000 discounted for two years at 2.381%. After allowing for the unwinding of the discount, this required an additional provision of CU4,770. Alternatively, entities could take the view that the amount included as a borrowing cost is based on the nominal discount rate. The basis for this argument is that IAS 37 requires the increase in a provision due to the passage of time to be recognised as a borrowing cost [IAS 37.60] and inflation, which is reflected in the nominal rate but not the real rate, must be treated as part of the time value of money.

A more significant difference will arise where the recognition of the original provision is included as part of the cost of property, plant or equipment, rather than as an expense, such as when a decommissioning provision is recognised. In that case, using a real discount rate will result initially in a lower charge to the income statement, since under IFRIC 1 any revision to the estimate of the provision is not taken to the income statement but is treated as an adjustment to the carrying value of the related asset, which is then depreciated prospectively over the remaining life of the asset (see section 6.3.1 below).

How we see it

As shown in Illustration 4-4 above, whether a provision is discounted at a real or nominal rate can impact the allocation of the year-on-year change in provision between operating costs (assuming the original provision was treated as an operating expense) and finance charges. Alternatively, entities could take the view that the amount included as a finance cost is based on the nominal discount rate. The basis for this argument is that IAS 37 requires the increase in a provision due to the passage of time to be recognised as a borrowing cost and inflation - which is reflected in the nominal rate, but not the real rate - must be treated as part of the time value of money.

A similar issue arises with the option of using the risk-free or the risk-adjusted discount rate. However, this is a more complex problem, because it is not clear what to do with the risk-adjustment built into the provision. This is shown in the following Illustration.

Illustration 4-5: Effect on future profits of choosing a risk-free or risk-adjusted rate

A company is required to make a provision for which the estimated value of the cash outflow in three years' time is CU150, when the risk-free rate (i.e., the rate unadjusted for risk) is 5%. However, the possible outcomes from which the expected value has been determined lie within a range between CU100 and CU200. The reporting entity is risk averse and would settle instead for a certain payment of, say, CU160 in three years' time rather than be exposed to the risk of the actual outcome being as high as CU200. The measurement options to account for risk can be expressed as either:

- (a) Discounting the risk-adjusted cash flow of CU160 at the risk-free (unadjusted) rate of 5%, giving a present value of CU138.
- Or
- (b) Discounting the expected cash flow (which is unadjusted for risk) of CU150 at a risk-adjusted rate that will give the present value of CU138, i.e., a rate of 2.8%.

If no changes in estimate were made to the provision during the three-year period, alternative (a) will unwind to give an overall finance charge of CU22 and a final provision of CU160. Alternative (b) will unwind to give an overall finance charge of CU12 and a final provision of CU150.

In this Illustration, the unwinding of different discount rates gives rise to different provisions. The difference of CU10 (CU22 - CU12) relates to the risk adjustment that has been made to the provision. However, as the actual date of settlement comes closer, the estimates of the range of possible outcomes (and accordingly the expected value of the outflow) and the premium the entity would accept for certainty would need to be re-estimated. As such, the effect of any initial difference related to the decision to apply a risk-free or risk-adjusted rate will be lost in the other estimation adjustments that would be made over time. In circumstances where a provision has been discounted using a negative discount rate (see section 4.3.2 above), entities will need to give some consideration to how the unwinding of the discount is presented in the statement of comprehensive income. The presentation of income and expense resulting from negative interest has been discussed by the IFRS IC in the context of financial instruments. Whilst that topic was not taken on to the IFRS IC's agenda, it was noted in the agenda decision that the expense arising on a financial asset because of a negative interest rate should not be presented as interest revenue, but in an appropriate expense classification.¹² Whilst negative interest rates on financial liabilities were not explicitly addressed in the agenda decision, the IFRS IC noted during discussions that an inflow of economic benefits arising from a liability cannot be characterised as revenue.¹³ In our view, similar considerations are appropriate to the presentation of the unwinding of the discount on a provision that has been discounted using a negative nominal discount rate.

How we see it

In our view, the IFRS IC agenda decision on the presentation of income and expense resulting from negative interest (see discussion above) is relevant when considering how to present unwinding of the discount on a provision that has been discounted using a negative discount rate in the statement of comprehensive income.

4.3.6 The effect of changes in interest rates on the discount rate applied

The standard requires the discount rate to reflect current market assessments of the time value of money. [IAS 37.47]. This means that where interest rates change, the provision must be recalculated on the basis of revised interest rates (see Illustration 4-6 below).

Any revision in the interest rate will give rise to an adjustment to the carrying value of the provision in addition to the unwinding of the previously estimated discount. The standard requires these movements to be disclosed in the notes to the financial statements (see section 7.1 below). [IAS 37.84(e)]. However, IAS 37 does not explicitly say how the effect of changes in interest rates should be classified in the income statement. We believe that this element is required to be treated separately from the effect of the passage of time, with only the charge for unwinding of the discount being classified as a finance cost. Any adjustment to the provision as a result of revising the discount rate is a change in accounting estimate, as defined in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* (see Chapter 3).¹⁴ Accordingly, it must be reflected in the line item of the income statement to which the expense establishing the provision was originally taken and not as a component of the finance cost. Indeed, this is the approach required by IFRIC 1 in relation to provisions for decommissioning, restoration and similar liabilities in relation to assets measured using the cost model (see section 6.3.1 below). However, in that case the original provision gives rise to an asset rather than an expense, so any subsequent adjustment is not included in profit or loss, [IAS 8.36], but added to or deducted from the cost of the asset to which it relates. [IFRIC 1.5]. The adjusted depreciable amount of the asset is then depreciated prospectively over its remaining useful life. [IFRIC 1.7]. Nevertheless, the effect is distinguished from the unwinding of the discount.

For entities applying IFRS 18 *Presentation and Disclosure in Financial Statements*, the effects of changes in the discount rate recognised in the statement of profit or loss are classified in the financing category because they are financing in nature. [IFRS 18.BC165, IFRS 18.BC166]. IFRS 18 is effective for annual reporting periods commencing on or after 1 January 2027, with early application permitted. [IFRS 18.C1]. See Chapter 4.

12 [IFRIC Update](#), January 2015, available on the IFRS Foundation's website.

13 [IASB Staff Paper 4](#): Project: IAS 39 Financial Instruments: Recognition and Measurement, Paper topic: *Negative interest rates: implication for presentation in the statement of comprehensive income*, IFRS IC Meeting, January 2015, p.6. Available on the IFRS Foundation's website.

14 When it issued IFRS 18 *Presentation and Disclosure in Financial Statements* in April 2024, the IASB changed the title of IAS 8 to *Basis of Preparation of Financial Statements*. IFRS 18 is effective for annual periods beginning on or after 1 January 2027. See Chapter 4.

In addition, IAS 37 gives no specific guidance on how or when the adjustment should be made. For example, it is unclear whether the new discount rate must be applied during the year or just at the year-end, and whether the rate must be applied to the new estimate of the provision or the old estimate. IFRIC 1 implies that the finance cost is adjusted prospectively from the date on which the liability is remeasured. Example 1 to IFRIC 1 states that if the change in the liability had resulted from a change in discount rate, instead of a change in the estimated cash flows, the change would still have been reflected in the carrying value of the related asset, but next year's finance cost would have reflected the new discount rate. [IFRIC 1.IE5]. This conclusion is consistent with the requirement in IAS 37 for the value of a provision to reflect the best estimate of the expenditure required to settle the obligation as at the end of the reporting period, [IAS 37.36], as shown in the following Illustration.

Illustration 4-6: Accounting for the effect of changes in the discount rate

A provision is required to be set up for an expected cash outflow of CU100,000 (estimated at current prices), payable in three years' time. The appropriate nominal discount rate is 7.5%, and inflation is estimated at 5%. At future prices the cash outflow will be CU115,762 ($\text{CU}100,000 \times 1.05^3$). The net present value of CU115,762, discounted at 7.5%, is CU93,184 ($\text{CU}115,762 \times 1 \div 1.075^3$).

At the end of Year 2, all assumptions remain valid, except it is determined that a current market assessment of the time value of money and the risks specific to the liability would require a decrease in the discount rate to 6.5%. Accordingly, at the end of Year 2, the revised net present value of CU115,762, discounted at 6.5%, is CU108,697 ($\text{CU}115,762 \div 1.065$).

The movement in the provision would be reflected as follows:

	Undiscounted cash flows	Provision
	CU	CU
Year 0	115,762	93,184
Unwinding of discount ($\text{CU}93,184 \times 0.075$)		6,989
Revision to estimate		-
Year 1	115,762	100,173
Unwinding of discount ($\text{CU}100,173 \times 0.075$)		7,513
	115,762	107,686
Revision to estimate ($\text{CU}108,697 - \text{CU}107,686$)		1,011
Year 2	115,762	108,697
Unwinding of discount ($\text{CU}108,697 \times 0.065$)		7,065
Revision to estimate		-
Year 3	115,762	115,762

In Year 2, the finance charge is based on the previous estimate of the discount rate. If the entity is not yet applying IFRS 18, the revision to the estimate of the provision would be charged to the same line item in the income statement that was used to establish the provision of CU93,184 at the start of Year 1.

If the entity is applying IFRS 18, the effects of the change in the discount rate in Year 2 would instead be classified in the financing category in the statement of profit or loss.

Where market rates of interest are more volatile, entities could decide to reassess the applicable discount rate for a provision during an annual reporting period. Equally, it would be appropriate to revise this assessment as at the end of any interim reporting period during the financial year to the extent that the impact is material.

4.4 Anticipating future events that may affect the estimate of cash flows

Extract from IAS 37

48 Future events that may affect the amount required to settle an obligation shall be reflected in the amount of a provision where there is sufficient objective evidence that they will occur.

[IAS 37.48].

Future events such as advances in technology and changes in legislation could impact the amount required to settle an obligation.

The requirement for objective evidence means that it is not appropriate to reduce the best estimate of future cash flows simply by assuming that a completely new technology will be developed before the liability is required to be settled. There will need to be sufficient objective evidence that such future developments are likely. For example, an entity may believe that the cost of cleaning up a site at the end of its life will be reduced by future changes in technology. The amount recognised has to reflect a reasonable expectation of technically qualified, objective observers, taking account of all available evidence as to the technology that will be available at the time of the clean-up. Thus, it is appropriate to include, for example, expected cost reductions associated with increased experience in applying existing technology or the expected cost of applying existing technology to a larger or more complex clean-up operation than has previously been carried out. [IAS 37.49].

Similarly, if new legislation is to be anticipated, there will need to be evidence both of what the legislation will demand and whether it is virtually certain to be enacted and implemented. In many cases, sufficient objective evidence will not exist until the new legislation is enacted. [IAS 37.50].

These requirements are most likely to impact provisions for liabilities that will be settled some distance in the future, such as decommissioning costs (see section 6.3 below).

4.5 Provisions that will be settled in a currency other than the entity's functional currency

Entities may sometimes expect to settle an obligation in a currency other than their functional currency. In such cases, the provision would be measured in the currency in which settlement is expected and then discounted using a discount rate appropriate for that currency. This approach is consistent with that required by IAS 36 *Impairment of Assets* for foreign currency cash flows in value in use calculations. [IAS 36.54]. The present value would be translated into functional currency at the spot exchange rate at the date at which the provision is recognised. [IAS 21.21]. If the provision is considered to be a monetary liability, i.e., it is expected to be paid in a fixed or determinable number of units of currency, [IAS 21.8], it would thereafter be retranslated at the spot exchange rate at each reporting date. [IAS 21.23]. In most cases, exchange differences arising on provisions will be taken to profit or loss in the period in which they arise, in accordance with the general rule for monetary items in IAS 21 *The Effects of Changes in Foreign Exchange Rates*. [IAS 21.28].

Exchange differences arising on decommissioning provisions recognised under IAS 37 and capitalised as part of the cost of an asset under IAS 16 are considered in Chapter 39.

4.6 Reimbursements, insurance and other recoveries from third parties

In some circumstances, an entity is able to look to a third party to reimburse part of the costs required to settle a provision or to pay the amounts directly to a third party. Examples are insurance contracts, indemnity clauses and suppliers' warranties. [IAS 37.55]. A reimbursement asset is recognised only when it is virtually certain to be received if the entity settles the obligation. The asset cannot be greater than the amount of the provision. No 'netting off' is allowed in the statement of financial position, with any asset classified separately from any provision. [IAS 37.53]. However, the expense relating to a provision can be shown in the income statement net of reimbursement. [IAS 37.54]. This means that if an entity has insurance cover in relation to a specific potential obligation, this is treated as a reimbursement right under IAS 37. It is not appropriate to record no provision (where the recognition criteria in the standard are met) on the basis that the entity's net exposure is expected to be zero.

The main area of concern with these requirements is whether the ‘virtually certain’ criterion that needs to be applied to the corresponding asset might mean that some reimbursements will not be capable of recognition at all. For items such as insurance contracts, this may not be an issue, as entities will probably be able to confirm the existence of cover for the obligation in question and accordingly be able to demonstrate that a recovery on an insurance contract is virtually certain if the entity is required to settle the obligation. Of course, it may be more difficult in complex situations for an entity to confirm it has cover against any loss. For other types of reimbursement, it may be more difficult to establish that recovery is virtually certain.

Except when an obligation is determined to be joint and several (see section 4.7 below), any form of net presentation in the statement of financial position is prohibited. This is because the entity would remain liable for the whole cost if the third party failed to pay for any reason, for example, as a result of the third party’s insolvency. In such situations, the provision must be made gross and any reimbursement must be treated as a separate asset (but only when it is virtually certain that the reimbursement will be received if the entity settles the obligation). [IAS 37.56].

If the entity has no liability in the event that the third party cannot pay, then these costs are excluded from the estimate of the provision altogether because, by its very nature, there is no liability. [IAS 37.57].

Where an entity is assessing an onerous contract, it is common for entities to apply what looks like a net approach (see section 6.2 below). However, even in the case of onerous contract provisions, a net approach is not permitted for insurance reimbursement assets. A separate reimbursement asset must be recognised when the entity is able to demonstrate that a recovery from insurance coverage is virtually certain if the entity incurs additional costs that cause the contract to become onerous (subject to contractual limitations, such as caps). [IAS 37.53].

4.7 Joint and several liability

It is interesting to contrast the approach of IAS 37 to reimbursements with the case where an entity is jointly and severally liable for an obligation. Joint and several liability arises when a number of entities are liable for a single obligation (for example, to damages), both individually and collectively. The holder of the obligation in these circumstances can collect the entire amount from any single member of the group or from any and all of the members in various amounts until the liability is settled in full. Even when the members have an agreement between themselves as to how the total obligation should be divided, each member remains liable to make good any deficiency on the part of the others. This situation is different from proportionate liability, where individual members of a group might be required to bear a percentage of the total liability, but without any obligation to make good any shortfall by another member. Joint and several liability can be established in a contract, by a court judgement or under legislation.

An entity that is jointly and severally liable recognises only its own share of the obligation, based on the amount it is probable that the entity will pay. The remainder that is expected to be met by other parties is treated only as a contingent liability. [IAS 37.29, IAS 37.58].

The fact that the other third parties in this situation have a direct (albeit shared) obligation for the past event itself, rather than only a contractual relationship with the entity, is enough of a difference in circumstances to allow a form of net determination of the amount to recognise. Arguably, the economic position is no different, because the entity is exposed to further loss in the event that the third parties are unable or unwilling to pay. However, IAS 37 does not treat joint and several liability in the same way as reimbursement, which would have required a liability to be set up for the whole amount with a corresponding asset recognised for the amount expected to be met by other parties.

4.8 Provisions are not reduced for gains on disposal of related assets

Extract from IAS 37

51 Gains from the expected disposal of assets shall not be taken into account in measuring a provision.

Gains from the expected disposal of assets are not taken into account in measuring a provision, even if the expected disposal is closely linked to the event giving rise to the provision. [IAS 37.51, IAS 37.52]. Such gains are instead recognised at the time specified by the standard dealing with the assets concerned. [IAS 37.52]. This is likely to be of particular relevance in relation to restructuring provisions (see section 6.1.4 below). However, it may also apply in other situations. Practical example 6-1 in section 6.3 below illustrates an example of a company excluding gains from the expected disposal of assets in determining its provision for decommissioning costs.

4.9 Changes and uses of provisions

After recognition, a provision will be re-estimated, used and released over the period up to the eventual determination of a settlement amount for the obligation. Once the exact amount and timing of settlement are agreed, for example, through negotiation with a counterparty or a decision of a court of law, the entity has an obligation to pay a fixed sum at an agreed point in time. The liability no longer meets the definition of a provision and instead is a financial liability in scope of IFRS 9.

Until determination of a settlement amount, IAS 37 requires that provisions are reviewed at the end of each reporting period and adjusted to reflect the current best estimate. If it is no longer probable that an outflow of resources embodying economic benefits will be required to settle the obligation, the provision must be reversed. [IAS 37.59]. Where discounting is applied, the carrying amount of a provision increases in each period to reflect the passage of time. This increase is recognised as a borrowing cost. [IAS 37.60]. As discussed in section 4.3.5 above, the periodic unwinding of the discount is recognised as a finance cost in the income statement, and it is not a borrowing cost capable of being capitalised under IAS 23. [IFRIC 1.8].

The standard does not allow provisions to be redesignated or otherwise used for expenditures for which the provision was not originally recognised. [IAS 37.61]. In such circumstances, a new provision is created and the amount no longer needed is reversed, as to do otherwise would conceal the impact of two different events. [IAS 37.62]. This means that the questionable practice of charging costs against a provision that was set up for a different purpose is specifically prohibited.

4.10 Changes in contingent liabilities recognised in a business combination

In a business combination, the usual requirements of IAS 37 do not apply and the acquirer recognises a liability at the acquisition date for those contingent liabilities of the acquiree that represent a present obligation arising as a result of a past event and in respect of which the fair value can be measured reliably. [IFRS 3.23]. After initial recognition, and until the liability is settled, cancelled or expires, the acquirer measures the contingent liability recognised in a business combination at the higher of:

- (a) The amount that would be recognised in accordance with IAS 37
- (b) The amount initially recognised less, if appropriate, the cumulative amount of income recognised in accordance with the principles of IFRS 15 [IFRS 3.56]

This requirement does not apply to contracts accounted for in accordance with IFRS 9. See Chapter 10.

This requirement prevents the immediate release to post acquisition profit of any contingency recognised in a business combination.

5 Cases in which no provision can be recognised

IAS 37 sets out three particular cases in which the recognition of a provision is prohibited. They are: future operating losses, repairs and maintenance of owned assets and staff training costs. The IFRS IC has also considered repeated requests relating to obligations arising on entities operating in a rate-regulated environment. The IFRS IC concluded that there is no justification for the recognition of a special regulatory liability, although IFRS 14 *Regulatory Deferral Accounts* provides some relief for first-time adopters of IFRS accounting standards who have recognised regulatory deferral account balances under their previous GAAP (see section 5.4 below). The common theme in these cases is that the potential obligation does not exist independently of an entity's future actions. In other words, the entity is able to change the future conduct of its business in a way that avoids the future expenditure. Only those obligations that exist independently of an entity's future actions are recognised as provisions. [IAS 37.19]. This principle is also relevant to determining the timing of recognition of a provision, whereby no liability is recognised until the obligation cannot otherwise be avoided by the entity. Examples include those arising from participation in a particular market under IFRIC 6 (see section 6.7 below) and an obligation for levies imposed by government under IFRIC 21 (see section 6.8 below).

5.1 Future operating losses

Extract from IAS 37

63 Provisions shall not be recognised for future operating losses.

[IAS 37.63]

Future operating losses do not meet the definition of a liability and the general recognition criteria of the standard. [IAS 37.64]. In particular, there is no present obligation as a result of a past event. Such costs must be left to be recognised as they occur in the future in the same way as future profits.

However, it would be wrong to assume that this requirement has effectively prevented the effect of future operating losses from being anticipated, because they are sometimes recognised as a result of requirements in another IFRS accounting standard, either in the measurement of an asset of the entity or to prevent inappropriate recognition of revenue. For example:

- Under IAS 2 *Inventories*, inventories are written down to the extent that they will not be recovered from future revenues, rather than leaving the non-recovery to show up as future operating losses (see Chapter 23).
- Under IAS 36, impairment is assessed on the basis of the present value of future operating cash flows, meaning that the effect of not only future operating losses but also sub-standard operating profits will be recognised (see Chapter 21). IAS 37 specifically makes reference to the fact that an expectation of future operating losses is an indication that certain assets may be impaired. [IAS 37.65].

This is therefore a rather more complex issue than IAS 37 acknowledges. Indeed, IAS 37 itself must navigate closely the dividing line between the general prohibition of the recognition of future losses and the recognition of contractual or constructive obligations that are expected to give rise to losses in future periods.

5.2 Repairs and maintenance of owned assets

Repairs and maintenance provisions in respect of owned assets are generally prohibited under IAS 37. Under the standard, the following principles apply:

- (a) Provisions are recognised only for obligations existing independently of the entity's future actions (i.e., the future conduct of its business) and in cases where an entity can avoid future expenditure by its future actions, for example, by changing its method of operation, it has no present obligation. [IAS 37.19].
- (b) Financial statements deal with an entity's position at the end of the reporting period and not its possible position in the future. Therefore, no provision is recognised for costs that need to be incurred to operate in the future. [IAS 37.18].
- (c) For an event to be an obligating event, the entity must have no realistic alternative to settling the obligation created by the event. [IAS 37.17].

These principles are applied strictly in the case of an obligation to incur repairs and maintenance costs in the future, even when this expenditure is substantial, distinct from what may be regarded as routine maintenance and essential to the continuing operations of the entity, such as a major refit or refurbishment of the asset. This is illustrated by two examples in an appendix to the standard.

Illustration 5-1: Prohibition on maintenance provisions relating to owned assets**Scenario 1: Re-lining costs of a furnace**

An entity operates a furnace, the lining of which needs to be replaced every five years for technical reasons. At the end of the reporting period, the lining has been in use for three years. In these circumstances, a provision for the cost of replacing the lining is not recognised because, at the end of the reporting period, no obligation to replace the lining exists independently of the entity's future actions. Even the intention to incur the expenditure depends upon the entity deciding to continue operating the furnace or to replace the lining. Instead of a provision being recognised, the initial cost of the lining is treated as a significant part of the furnace asset and depreciated over a period of five years. [IAS 16.43]. The re-lining costs are then capitalised when incurred and depreciated over the next five years. [IAS 37.IE Example 11A].

Scenario 2: Overhaul costs of an aircraft

An airline is required by law to overhaul its aircraft once every three years. Even with the legal requirement to perform the overhaul, there is no obligating event until the three-year period has elapsed. As with Scenario 1, no obligation exists independently of the entity's future actions. The entity could avoid the cost of the overhaul by selling the aircraft before the three-year period has elapsed. Instead of a provision being recognised, the overhaul cost is identified as a separate part of the aircraft asset under IAS 16 and is depreciated over three years. [IAS 37.IE Example 11B].

Entities might try to argue that a repairs and maintenance provision should be recognised on the basis that there is a clear intention to incur the expenditure at the appointed time and that this means it is more likely than not, as at the end of the reporting period, that an outflow of resources will occur. However, the application of the three principles noted above, particularly that an entity must not provide for future operating costs, make an entity's intentions irrelevant. In the example above, recognition was not allowed because the entity could do all manner of things to avoid the obligation, including selling the asset, however unlikely that might be in the context of the entity's business or in terms of the relative cost of replacement as compared to repair. The existence of a legal requirement, probably resulting in the aircraft being grounded, was still not enough. This detachment from intention or even commercial reality, regarded by some as extreme, is also exhibited in the IFRS IC's approach to the recognition of levies imposed by government under IFRIC 21 (see section 6.8 below).

The effect of the prohibition on setting up provisions for repairs obviously has an impact on presentation in the statement of financial position. It may not always, however, have as much impact on the statement of comprehensive income. This is because it is stated in the examples that depreciation would be adjusted to take account of the repairs. For example, in the case of the furnace lining, the lining is depreciated over five years in advance of its expected repair. Similarly, in the case of the aircraft overhaul, the example in the standard states that an amount equivalent to the expected maintenance costs is depreciated over three years. The result of this is that the depreciation charge recognised in profit or loss over the life of the component of the asset requiring regular repair may be equivalent to that which would previously have arisen from the combination of depreciation and a provision for repair. This is the way IAS 16 requires entities to account for significant parts of an item of property, plant and equipment which have different useful lives (see Chapter 19). [IAS 16.44, IAS 16.45].

5.3 Staff training costs

In the normal course of business, it is unlikely that provisions for staff training costs would be permissible, because it would normally contravene the general prohibition in the standard on the recognition of provisions for future operating costs. [IAS 37.18]. In the context of a restructuring, IAS 37 identifies staff retraining as an ineligible cost because it relates to the future conduct of the business. [IAS 37.81].

Illustration 3-2 in section 3.1.1 above reproduces an example in the standard where the government introduces changes to the income tax system, such that an entity in the financial services sector needs to retrain a large proportion of its administrative and sales workforce in order to ensure continued compliance with financial services regulation. The standard argues that there is no present obligation until the actual training has taken place and so no provision is recognised. We also note that in many cases the need to incur training costs is not only future operating expenditure but also fails the 'existing independently of an entity's future actions' criterion, [IAS 37.19], in that the cost could be avoided by the entity, for example, if it withdrew from that market or hired new staff who were already appropriately qualified.

This example again illustrates how important it is to properly understand the nature of any potential 'constructive obligation' or 'obligating event' and to determine separately its financial effect in relation to past transactions and events on the one hand and in relation to the future operation of the business on the other. Otherwise, it can be easy to mistakenly argue that a provision is required, such as for training costs to ensure that staff comply with new legal requirements, on the basis that the entity has a constructive obligation to ensure staff are appropriately skilled to adequately meet the needs of its customers. However, the obligation, constructive or not, declared or not, relates to the entity's future conduct, is a future cost of operation and is therefore ineligible for recognition under the standard until the training takes place.

5.4 Rate-regulated activities

In many countries, the provision of utilities (e.g., water, natural gas or electricity) to consumers is regulated by the national government. Regulations differ between countries but often regulators operate a cost-plus system under which a utility provider is allowed to make a fixed return on investment. Under certain national GAAPs, an entity could account for the effects of regulation by recognising a 'regulatory asset' that reflects the increase in future prices approved by the regulator or a 'regulatory liability' that reflects a requirement from the regulator to reduce tariffs or improve services so as to return the benefit of earlier excess profits to customers. This issue has for a long time been a matter of significant interest as entities in those countries adopt IFRS accounting standards, because the recognition of these regulatory assets and liabilities is prohibited under IFRS accounting standards. Just as the ability to charge higher prices for goods services to be rendered in the future does not meet the definition of an intangible asset in IAS 38 *Intangible Assets* (see Chapter 18), the requirement to charge a lower price for the delivery of goods and services in the future does not meet the definition of a past obligating event, or a liability, in IAS 37.

A liability is defined in IAS 37 as "...a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits". [IAS 37.10]. The return to customers of amounts mandated by a regulator depends on future events including:

- Future rendering of services
- Future volumes of output (generally consisting of utilities such as water or electricity) consumed by users
- The continuation of regulation

Similar considerations apply to actions that a regulator may require entities to complete in the future, such as an obligation to invest in equipment to improve efficiency. Other than decommissioning obligations (see section 6.3 below), such items do not meet the definition of a liability because there needs to be a present obligation at the end of the reporting period before a liability can be recognised.

Whilst the requirements of IAS 37 and the *Conceptual Framework* are clear in this respect, their perceived inflexibility in this regard has been identified as a significant barrier that prevents the entities affected by it from adopting IFRS accounting standards as a whole.¹⁵ In 2012, the IASB decided on a two-tier approach to address this.¹⁶ As a result, in January 2014, the IASB issued IFRS 14, an interim standard on the accounting for regulatory deferral accounts that would apply for first-time adopters of IFRS accounting standards until the completion of a more comprehensive project. [IFRS 14.BC10]. IFRS 14 became effective for annual periods beginning on or after 1 January 2016. [IFRS 14.C1].

Extract from IFRS 14

- 5** An entity is permitted to apply the requirements of this Standard in its *first IFRS financial statements* if and only if it:
- (a) conducts *rate-regulated activities*; and
 - (b) recognised amounts that qualify as regulatory deferral account balances in its financial statements in accordance with its previous GAAP.

The standard can be applied in only very limited circumstances. [IFRS 14.5]. In addition, a first-time adopter meeting the criteria in IFRS 14.5 is permitted, but not required, to apply IFRS 14 in its first IFRS financial statements. An entity shall not change its accounting policies in order to start to recognise regulatory deferral account balances. [IFRS 14.13].

¹⁵ Exposure Draft [ED/2013/5: Regulatory Deferral Accounts](#), IASB, April 2013, para. BC15. Available on the IFRS Foundation's website.

¹⁶ [IASB Update](#), September 2012; and [IASB Update](#), December 2012, available on the IFRS Foundation's website.

Entities can apply IFRS 14 after first-time adoption if, and only if, they had elected to apply the standard in their first IFRS financial statements and had recognised regulatory deferral account balances in those financial statements. [IFRS 14.6]. Therefore, the scope for applying this standard does not extend to existing IFRS reporters; nor to first-time adopters whose previous GAAP did not allow for the recognition of regulatory assets and liabilities; nor even to first-time adopters whose previous GAAP allowed such recognition but the entity chose not to do so.

The requirements of first-time adoption of IFRS accounting standards are discussed further in Chapter 6.

As regards its comprehensive standard-setting project, in January 2021, the Board published the Exposure Draft *Regulatory Assets and Regulatory Liabilities*.

The Exposure Draft sets out proposals for the recognition, measurement, presentation and disclosure of regulatory assets, regulatory liabilities, regulatory income and regulatory expense. It uses the term 'total allowed compensation' for the full amount of compensation for goods or services supplied that a regulatory agreement entitles a company to charge customers through regulated rates, in either the period when the company supplies those goods or services or in a different period. Under the proposals, when an entity has an enforceable right to add an amount in determining the regulated rate in future periods, because part of the total allowed compensation for goods and services already supplied will be included in revenue in the future, it must recognise this as a regulatory asset. Conversely, a regulatory liability must be recognised when an entity has an enforceable present obligation to deduct an amount in determining the regulated rate in future periods because the revenue already recognised includes an amount that will be part of the total allowed compensation for goods and services to be supplied in the future.

The comment period for the Exposure Draft closed on 30 July 2021. At the time of writing, an accounting standard expected to be issued in the first half of 2026.¹⁷ When issued, the accounting standard would replace IFRS 14.

6 Specific examples of provisions and contingencies

IAS 37 expands on its general recognition and measurement requirements by including more specific requirements for particular situations, i.e., future restructuring costs and onerous contracts. This section discusses those situations, looks at other examples, including those addressed in an appendix to the standard and other areas where the IFRS IC has considered how the principles of IAS 37 are required to be applied.

6.1 Restructuring provisions

IAS 37 allows entities to recognise restructuring provisions, but it has specific rules on the nature of obligations and the types of cost that are eligible for inclusion in such provisions, as discussed below. These rules ensure that entities recognise only obligations that exist independently of their future actions, [IAS 37.19], and that provisions are not made for future operating costs and losses. [IAS 37.63].

6.1.1 Definition

IAS 37 defines a restructuring as follows: [IAS 37.10, IAS 37.70]

Extract from IAS 37

- 10** The following terms are used in this Standard with the meanings specified:
- ...
- A restructuring is a programme that is planned and controlled by management, and materially changes either:**
- (a) the scope of a business undertaken by an entity; or
 - (b) the manner in which that business is conducted.
- 70** The following are examples of events that may fall under the definition of restructuring:
- (a) sale or termination of a line of business;
 - (b) the closure of business locations in a country or region or the relocation of business activities from one country or region to another;
 - (c) changes in management structure, for example, eliminating a layer of management; and
 - (d) fundamental reorganisations that have a material effect on the nature and focus of the entity's operations.

[IAS 37.10, IAS 37.70].

This definition is very wide and whilst it may be relatively straightforward to establish whether an operation has been sold, closed or relocated, the determination of whether an organisational change is fundamental, material or just part of a process of continuous improvement is a subjective judgement. Whilst organisational change is a perennial feature in most business sectors, entities could be tempted to classify all kinds of operating costs as restructuring costs and thereby invite the user of the financial statements to perceive them in a different light from the 'normal' costs of operating in a dynamic business environment. Even though the requirements in IAS 37 prevent such costs being recognised too early, the standard still leaves the question of classification open to judgement. As such, there can be a tension between the permitted recognition of expected restructuring costs, subject to meeting the criteria set out in section 6.1.2 below, and the general prohibition in IAS 37 against provision for future operating losses, which is discussed in section 5.1 above.

IAS 37 emphasises that when a restructuring meets the definition of a discontinued operation under IFRS 5, additional disclosures may be required under that standard (see Chapter 5). [IAS 37.9].

6.1.2 Recognition of a restructuring provision

IAS 37 requires that restructuring costs are recognised only when the general recognition criteria in the standard are met, i.e., there is a present obligation (legal or constructive) as a result of a past event, in respect of which a reliable estimate can be made of the probable cost. [IAS 37.71]. The standard's specific requirements for the recognition of a provision for restructuring costs seek to define the circumstances that give rise to a constructive obligation and thereby restrict the recognition of a provision to cases when an entity:

- (a) Has a detailed formal plan for the restructuring identifying at least:
 - (i) The business or part of a business concerned
 - (ii) The principal locations affected
 - (iii) The location, function, and approximate number of employees who will be compensated for terminating their services
 - (iv) The expenditures that will be undertaken
 - (v) When the plan will be implemented
- (b) Has raised a valid expectation in those affected that it will carry out the restructuring by starting to implement that plan or announcing its main features to those affected by it [IAS 37.72]

The standard gives examples of the entity's actions that would provide evidence that the entity has started to implement a plan, quoting the dismantling of plant or selling of assets, or the public announcement of the main features of the plan. However, it also emphasises that the public announcement of a detailed plan to restructure will not automatically create an obligation; the important principle is that the announcement is made in such a way and in sufficient detail to give rise to valid expectations in other parties such as customers, suppliers and employees that the restructuring will be carried out. [IAS 37.73].

The standard also suggests that for an announced plan to give rise to a constructive obligation, its implementation needs to be planned to begin as soon as possible and to be completed in a timeframe that makes significant changes to the plan unlikely. Any extended period before commencement of implementation, or if the restructuring will take an unreasonably long time, will mean that recognition of a provision is premature, because the entity is still likely to have a chance of changing the plan. [IAS 37.74].

In summary, these conditions require the plan to be detailed and specific, to have gone beyond the directors' powers of recall and to be put into operation without delay or significant alteration.

The criteria set out above for the recognition of provisions mean that a board decision, if it is the only relevant event arising before the end of the reporting period, is not sufficient. This message is reinforced specifically in the standard, the argument being made that a constructive obligation is not created by a management decision. There will only be a constructive obligation where the entity has, before the end of the reporting period:

- (a) Started to implement the restructuring plan
- Or
- (b) Announced the main features of the restructuring plan to those affected by it in a sufficiently specific manner to raise a valid expectation in them that the entity will carry out the restructuring [IAS 37.75]

If the restructuring is not started or announced in detail until after the end of the reporting period, no provision is recognised. Instead, the entity discloses a non-adjusting event after the reporting period.

[IAS 37.75, IAS 10.22(e)].

The following Illustrations, based on examples in IAS 37, show how a constructive obligation for a restructuring may or may not be created.

Illustration 6-1: The effect of timing of the creation of a constructive obligation on the recognition of a restructuring provision

Scenario 1: Closure of a division - no implementation before end of the reporting period

On 12 December 20X2, the board of Entity A decided to close down a division. No announcement was made before the end of the reporting period (31 December 20X2) and no other steps were taken to implement the decision before that date.

In these circumstances, no provision is recognised because management's actions are insufficient to create a constructive obligation before the end of the reporting period. [IAS 37.IE Example 5A].

Scenario 2: Closure of a division - communication/implementation before end of the reporting period

In another case, the board of Entity B decides on 12 December 20X2 to close down one of its manufacturing divisions. On 20 December 20X2 a detailed plan for closure was agreed by the board; letters were sent to customers warning them to seek an alternative source of supply and redundancy notices were sent to the staff of the division.

The communication of management's decision to customers and employees on 20 December 20X2 creates a valid expectation that the division will be closed, thereby giving rise to a constructive obligation from that date. Accordingly, a provision is recognised at 31 December 20X2 for the best estimate of the costs of closing the division. *[IAS 37.IE Example 5B].*

The standard acknowledges that there will be circumstances where a board decision could trigger recognition, but not on its own. Only if earlier events, such as negotiations with employee representatives for termination payments or with purchasers for the sale of an operation, have been concluded subject only to board approval would the decision of the board create an obligation. In such circumstances, it is reasoned that when board approval has been obtained and communicated to the other parties, the entity is committed to restructure, assuming all other conditions are met. *[IAS 37.76].*

There is also discussion in the standard of the situation that may arise in some countries where, for example, employee representatives may sit on the board, so that a board decision effectively communicates the decision to them, which may result in a constructive obligation to restructure. *[IAS 37.77].*

In practice, it can be very difficult to determine whether it is appropriate to recognise a provision for the future costs of a restructuring programme. The determination of whether an organisational change is fundamental, material or just part of a process of continuous improvement is a subjective judgement. Once it has been established that the activities in question constitute a restructuring rather than an ongoing operating cost, it can be difficult to determine whether management's actions before the reporting date have been sufficient to have raised a valid expectation in those affected. *[IAS 37.72].* Even if a trigger point is easily identifiable, such as the date of an appropriately detailed public announcement, it might not necessarily commit management to the whole restructuring, but only to specific items of expenditure such as redundancy costs. When the announcement is less clear, referring for example to consultations, negotiations or voluntary arrangements, particularly with employees, judgement is required. Furthermore, taken on its own, the 'valid expectation' test is at least as open to manipulation as one based on the timing of a board decision. Entities anxious to accelerate or postpone recognition of a liability could do so by advancing or deferring an event that signals such a commitment, such as a public announcement, without any change to the substance of their position.

In these situations, it is important to consider all the related facts and circumstances and not to 'home in' on a single recognition criterion. The objective of the analysis is to determine whether there is a past obligating event at the reporting date. The guidance in the standard about restructuring, referring as it does to constructive obligations and valid expectations is ultimately aimed at properly applying the principle in IAS 37 that only those obligations arising from past events and existing independently of an entity's future actions are recognised as provisions. *[IAS 37.19].* In essence, a restructuring provision qualifies for recognition if, as at the reporting date, it relates to a detailed plan of action from which management cannot realistically withdraw.

In many cases, a restructuring plan may involve the payment of termination benefits to employees. Termination benefits are employee benefits payable as a result of either:

- (a) An entity's decision to terminate an employee's employment before the normal retirement date.
Or
- (b) An employee's decision to accept an offer of benefits in exchange for the termination of employment.
[IAS 19.8].

Termination benefits are in scope of IAS 19. An entity should recognise termination benefits as a liability and an expense at the earlier of the following dates:

- (a) When it can no longer withdraw the offer of those benefits (discussed in Chapter 31).
And
- (b) When it recognises costs for a restructuring that is within the scope of IAS 37 and involves the payment of termination benefits. *[IAS 19.165].*

6.1.3 Recognition of obligations arising from the sale of an operation

IAS 37 has some further specific rules governing when to recognise an obligation arising on the sale of an operation, stating that no obligation arises for the sale of an operation until the entity is committed to the sale, i.e., there is a binding sale agreement. [IAS 37.78]. Thus, a provision cannot be made for a loss on sale unless there is a binding sale agreement by the end of the reporting period. The standard says that this applies even when an entity has taken a decision to sell an operation and announced that decision publicly, it cannot be committed to the sale until a purchaser has been identified and there is a binding sale agreement. Until there is such an agreement, the entity will be able to change its mind and indeed will have to take another course of action if a purchaser cannot be found on acceptable terms. [IAS 37.79].

Even in cases where it is part of a larger restructuring that qualifies for recognition under IAS 37, an obligation arising from the sale is not recognised until there is a binding sale agreement. Instead, the assets of the operation must be reviewed for impairment under IAS 36. This could therefore mean that an expense is recorded in the income statement; it is just that the expense gives rise to a reduction of the carrying amount of assets rather than the recognition of a liability. The standard also recognises that where a sale is only part of a restructuring, the entity could be committed to the other parts of restructuring before a binding sale agreement is in place. [IAS 37.79]. Hence, the costs of the restructuring will be recognised over different reporting periods.

6.1.4 Costs that can (and cannot) be included in a restructuring provision

Having met the specific tests in the standard for the recognition of a restructuring provision at the end of the reporting period, IAS 37 imposes further criteria to restrict the types of cost that can be provided for. Presumably, these additional restrictions are intended to ensure that the entity does not contravene the general prohibition in IAS 37 against provision for future operating losses. [IAS 37.63].

Extract from IAS 37

80 A restructuring provision shall include only the direct expenditures arising from the restructuring, which are those that are both:

- (a) necessarily entailed by the restructuring; and
- (b) not associated with the ongoing activities of the entity.

81 A restructuring provision does not include such costs as:

- (a) retraining or relocating continuing staff;
- (b) marketing; or
- (c) investment in new systems and distribution networks.

These expenditures relate to the future conduct of the business and are not liabilities for restructuring at the end of the reporting period. Such expenditures are recognised on the same basis as if they arose independently of a restructuring.

[IAS 37.80, IAS 37.81].

Illustration 6-2: Distinguishing restructuring costs from ongoing expenses

On 15 November 20X2, management announced its intention to close down its operation in the North of the country and relocate to a new site in the South, primarily to be closer to its key customers. Before the end of the reporting period (31 December 20X2), the principal elements of the plan were agreed with employee representatives, a lease signed for a building at the new location, and a decision was made to market the existing facility for sale; all on the basis that production would start at the new location on 31 March 20X3 and the existing site would be vacated on 30 April 20X3. Production would cease at the existing site on 28 February 20X3 to allow plant and equipment to be relocated. Inventory levels would be increased up to that date so that customers could be supplied with goods sent from the Northern facility until 31 March.

Whilst the majority of the 600 existing staff was expected to take redundancy on 28 February 20X3, 50 had agreed to accept the entity's offer of relocation, including an incentive of CU3,000 each towards relocation costs. Of those employees taking redundancy, 20 had agreed to continue to work for the entity until 30 June 20X3, to dismantle plant and equipment at the Northern site; install it at the new facility in the South; and train new staff on its operation. A bonus of CU4,500 per employee would be payable if they remained until 30 June. A further 60 had agreed to stay with the entity until 31 March 20X3, to ensure that inventory was sent out to customers before the new site was operational, of which 10 would remain until 30 April 20X3 to complete the decommissioning of the Northern facility. These employees would also receive a bonus for staying until the promised date.

The announcement of management's decision on 15 November 20X2 and the fact that the key elements of the plan were understood by employees and customers of the Northern site before the end of the reporting period give rise to a constructive obligation that requires a provision to be recognised at 31 December 20X2 for the best estimate of the costs of the reorganisation.

However, only those direct costs of the restructuring not associated with ongoing activities can be included in the provision. For example, as follows:

Type of expense	Direct cost of restructuring	Associated with ongoing activities
Redundancy payments to 550 staff	►	
Payroll costs to 28 February 20X3 (all 600 staff)		►
Relocation incentive of CU3,000 per employee (50 staff)		►
Payroll costs - to 31 March 20X3 (60 staff dispatching goods)		►
Payroll costs - March to June 20X3 (20 staff relocating plant) ^{Note 1}	►	►
Payroll costs - April 20X3 (10 staff decommissioning site)	►	
Costs of dismantling plant and equipment ^{Note 1}	►	►
Cost of transporting PP&E and inventory to the new site		►
Costs of recruiting and training staff for the Southern site		►
Rent of new site to 31 March 20X3 (pre-production)		►
Cost of invoices, forms and stationery showing new address		►

Note 1:

Costs relating to dismantling plant and equipment that is no longer intended for use in the business could be regarded as a direct cost of restructuring. However, costs relating to the dismantling and installation of equipment at the new site and training staff to operate it are costs associated with ongoing operations and, therefore, ineligible for inclusion in the restructuring provision.

The entity will need to consider whether the existing facility meets the criteria in IFRS 5 to be classified as a non-current asset held for sale. On the basis that management had decided to market the facility for sale, but had not yet actively begun to do so, it is unlikely that the criteria in IFRS 5 would be met as at 31 December 20X2. Classification of non-current assets held for sale is discussed in Chapter 5.

This example shows that individual classes of expenditure must be disaggregated into components that distinguish those elements associated with ongoing activities. Even if expenditure would not have been incurred without the restructuring activity, its association with ongoing activities means that it is ineligible for inclusion in a provision. IAS 37 requires the cost to be both necessarily entailed by the restructuring and not associated with the ongoing activities of the entity. [IAS 37.80].

For that reason, whilst the cost of making employees redundant is an eligible restructuring cost, any incremental amounts paid to retain staff to ensure a smooth transition of operations from one location to another are not eligible because they are incurred to facilitate ongoing activities. IAS 19 requires these to be treated as short-term employee benefits to the extent that they are expected to be settled within 12 months after the end of the reporting period.¹⁸ Similarly, whilst the costs of dismantling plant and equipment intended to be scrapped is an eligible restructuring cost, the costs of dismantling plant and equipment intended to be relocated and installed at the new site is ineligible, because it is associated with ongoing activities.

A further rule in IAS 37 is that the provision must not include identifiable future operating losses up to the date of the restructuring, unless they relate to an onerous contract. [IAS 37.82]. This means that even if the operation being reorganised is loss-making, its ongoing costs are not provided for. This is consistent with the general prohibition against the recognition of provisions for future operating losses. [IAS 37.63].

The general requirement in the standard that gains from the expected disposal of assets cannot be taken into account in the measurement of provisions, [IAS 37.51], is also relevant to the measurement of restructuring provisions, even if the sale of the asset is envisaged as part of the restructuring. [IAS 37.83]. Whilst the expected disposal proceeds from asset sales might have been a significant element of the economic case for a restructuring, the income from disposal is not anticipated just because it is part of a restructuring plan.

¹⁸ IAS 19 *Employee Benefits*, Example illustrating paras. 159-170.

6.2 Onerous contracts

Although future operating losses in general cannot be provided for, IAS 37 requires that “If an entity has a contract that is onerous, the present obligation under the contract shall be recognised and measured as a provision”. [IAS 37.66].

The standard notes that many contracts (for example, some routine purchase orders) can be cancelled without paying compensation to the other party, and therefore there is no obligation. However, other contracts establish both rights and obligations for each of the contracting parties. Where events make such a contract onerous, the contract falls within the scope of the standard and a liability exists which is recognised. Executory contracts that are not onerous fall outside the scope of the standard. [IAS 37.67].

IAS 37 defines an onerous contract as “...a contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it”. [IAS 37.10]. This requires that the contract is onerous to the point of being directly loss-making, not simply uneconomic by reference to current prices. For example, a change to more environmentally friendly materials or processes because of increased stakeholder interest in climate change could mean that contracts previously expected to be profitable are now expected to be loss making. Similarly, a requirement to purchase a minimum amount under a cross-border purchase contract where the amounts become subject to substantial new tariffs could mean that the purchase contract becomes loss making if there is insufficient margin in the entity’s selling prices to absorb the tariff and the entity does not believe that it will be able to increase its ultimate selling prices sufficiently. Some contracts that appear to be loss making may not give rise to an onerous contract provision under IAS 37, if they were entered into together with other contracts that provide an offsetting benefit. For example, if an entity has entered into a sales contract with a customer at below market value, but at the same time purchases equipment from the customer at below market value that is to be used in the fulfilment of the contract. In that case, the entity must consider the requirements within IFRS 15 to combine contracts entered into at, or near, the same time with the same customer if certain criteria are met. [IFRS 15.17]. This could result in the recognition of a contract liability in scope of IFRS 15 rather than an onerous contract in scope of IAS 37. The contract liability would reflect the value of the non-cash consideration in the form of discounted equipment that is considered part of the transaction price for IFRS 15 purposes and that will be recognised as revenue in the future. See Chapter 28.

IAS 37 considers that “...The unavoidable costs under a contract reflect the least net cost of exiting from the contract, which is the lower of the cost of fulfilling it and any compensation or penalties arising from failure to fulfil it”. [IAS 37.68]. This evaluation does not require an intention by the entity to fulfil or to exit the contract. It does not even require there to be specific terms in the contract that apply in the event of its termination or breach. Its purpose is to recognise only the unavoidable costs to the entity, which in the absence of specific clauses in the contract relating to termination or breach could include an estimation of the cost of ceasing to honour the contract and having the other party go to court for compensation for the resultant breach.

There has historically been some diversity in practice in how entities determine the unavoidable costs of fulfilling their obligations under a contract. In May 2020, the IASB issued *Onerous Contracts - Cost of Fulfilling a Contract (Amendments to IAS 37)* that clarified that “The cost of fulfilling a contract comprises the costs that relate directly to the contract. Costs that relate directly to a contract consist of both:

- (a) the incremental costs of fulfilling that contract - for example, direct labour and materials; and
- (b) an allocation of other costs that relate directly to fulfilling contracts - for example, an allocation of the depreciation charge for an item of property, plant and equipment used in fulfilling that contract among others.” [IAS 37.68A].

Whilst the amendment to IAS 37 was intended to clarify how to determine the unavoidable costs of fulfilling obligations under a contract, judgement will be required in determining which costs are directly related to contract activities. The Board noted in the Basis for Conclusions to the amendment that several IFRS accounting standards, such as IAS 2, specify the costs to include in measuring a non-monetary asset. Although the detailed requirements differ, they all require an entity to include both the incremental costs of purchasing or constructing the asset, and an allocation of other directly related or directly attributable costs, such as production overheads. The Board concluded that, in assessing whether a contract to deliver goods is onerous, the way in which an entity determines the cost of fulfilling the contract should be broadly consistent with the way it measures the costs of the goods when it holds them. [IAS 37.BC7]. Therefore, entities could look to other IFRS accounting standards, such as IAS 2 (see Chapter 23), IAS 16 (see Chapter 19), and IAS 38 (see Chapter 18) when considering which costs are included or excluded when assessing whether an onerous contract provision is recognised. In addition, we believe that the guidance in IFRS 15 on costs to fulfil a contract will be relevant (see Chapter 28). All of these IFRS accounting

standards specify that entities exclude 'general overhead' or 'administrative' costs when measuring the cost of an asset, although with some exceptions:

- (a) Under IFRS 15, general and administrative costs that are explicitly chargeable to customers could be costs to fulfil a contract that the entity recognises as an asset, subject to meeting certain criteria [IFRS 15.98] (see Chapter 28).
- (b) Under IAS 2, administrative overheads that contribute to bringing inventories to their present condition and location are included in the cost of inventories [IAS 2.16(c)] (see Chapter 23).
- (c) Under IAS 38, selling, administrative and other general overheads expenditure that can be directly attributed to preparing an internally generated intangible asset for use are included in the cost of the intangible asset [IAS 38.67(a)] (see Chapter 18).

Therefore, whilst we believe that general overhead or administrative costs typically would not relate directly to fulfilling contracts, judgement can sometimes be required in making this assessment. In addition, whilst IAS 2 refers to indirect costs of production being included in the cost of inventories, the examples the standard gives of such costs include depreciation and maintenance of factory buildings, and the cost of factory management and administration. [IAS 2.12]. These are similar to the depreciation and contract management and supervision costs that IFRS 15 gives as examples of costs that relate directly to a contract. [IFRS 15.97]. Therefore, an entity could determine that such costs do relate directly to fulfilling contracts for the sale of inventory when assessing whether an onerous contract provision is recognised.

Whilst the clarification regarding costs to fulfil a contract is part of IAS 37's recognition requirements for onerous contracts, rather than its measurement requirements, entities could reasonably decide that the same costs are also used to measure any onerous contract provision recognised.¹⁹ As discussed in section 8 below, in November 2024, the IASB issued the Exposure Draft *Provisions - Targeted Improvements*, which includes three targeted improvements to the standard, one of which is to clarify which costs are included in the measurement of a provision.²⁰

As noted above, IAS 37 defines an onerous contract as "...a contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it". [IAS 37.10]. There is also some diversity in practice in how entities determine the economic benefits expected to be received under a contract. In particular, whether the 'economic benefit expected to be received' should be interpreted narrowly (to include only the economic benefits to which the entity becomes directly entitled under the contract) or more broadly (to include other expected indirect benefits, such as access to future profitable contracts). However, in January 2020, the Board decided not to address this matter as part the planned targeted improvements to IAS 37.²¹

There is a subtle yet important distinction between making a provision in respect of the unavoidable costs under a contract (reflecting the least net cost of what the entity has to do) compared to making an estimate of the cost of what the entity intends to do. The first is an obligation, which merits the recognition as a provision, whereas the second is a choice of the entity, which fails the recognition criteria because it does not exist independently of the entity's future actions, [IAS 37.19], and is therefore akin to a future operating loss.

Illustration 6-3: Onerous supply contract

Entity P negotiated a contract in 20X0 for the supply of components when availability in the market was scarce. It agreed to purchase 100,000 units per annum for 5 years commencing 1 January 20X1 at a price of CU20 per unit. Since then, new suppliers have entered the market and the typical price of a component is now CU5 per unit. Whilst its activities are still profitable (Entity P makes a margin of CU6 per unit of finished product sold) changes to the entity's own business means that it will not use all of the components it is contracted to purchase. As at 31 December 20X3, Entity P expects to use 150,000 units in future and has 55,000 units in inventory. The contract requires 200,000 units to be purchased before the agreement expires in 20X5. If the entity terminates the contract before 20X5, compensation of CU1 million per year is payable to the supplier. Each finished product contains one unit of the component.

19 [IASB Staff Paper 22A](#): Project: *Provisions*, Paper topic: *Research summary*, IASB meeting, January 2020, para. 3.20; and Exposure Draft [ED/2018/2](#): *Onerous Contracts-Cost of Fulfilling a Contract: Proposed amendments to IAS 37*, IASB, December 2018, paragraph BC14. Available on the IFRS Foundation's website.

20 Exposure Draft [ED/2024/8](#): *Provisions-Targeted Improvements*, IASB, November 2024. Available on the IFRS Foundation's website.

21 [IASB Update](#), January 2020; and [IASB Staff Paper 22](#): Project: *Provisions*, Paper topic: *Project proposal*, IASB meeting, January 2020, para. 12. Available on the IFRS Foundation's website.

Therefore, the entity expects to achieve a margin of CU900,000 ($150,000 \times \text{CU}6$) on the units it will produce and sell; but will make a loss of CU15 ($\text{CU}20 - \text{CU}5$) per unit on each of the 105,000 components ($55,000 + 200,000 - 150,000$) it is left with at the end of 20X3 and now expects to sell in the components market.

In considering the extent to which the contract is onerous, Entity P does not concentrate solely on the net cost of the excess units of CU1,575,000 ($105,000 \times \text{CU}15$) that it is contracted to purchase but which are expected to be left unsold. Instead, the entity must consider all of the related benefits of the contract, which includes the profits earned as a result of having a secure source of supply of components. Therefore, the supply contract is onerous (directly loss making) only to the extent of the costs not covered by related revenues, justifying a provision of CU675,000 ($\text{CU}1,575,000 - \text{CU}900,000$).

IAS 37 requires that an impairment loss that has occurred on assets 'used in fulfilling' the contract be recognised before establishing a provision for the onerous contract. [IAS 37.69].

6.2.1 Onerous leases

As discussed in section 2.2.1.B above, IAS 37 specifically applies to leases only in limited circumstances. IAS 37 specifically applies only to:

- Leases that become onerous before the commencement date of the lease
- Short-term leases (as defined in IFRS 16) and leases for which the underlying asset is of low value that are accounted for in accordance with IFRS 16.6 and that have become onerous [IAS 37.5(c)]

The IASB noted in the Basis for Conclusions to IFRS 16 that it "...decided not to specify any particular requirements in IFRS 16 for onerous contracts. The IASB made this decision because: (a) for leases that have already commenced, no requirements are necessary. After the commencement date, an entity will appropriately reflect an onerous lease contract by applying the requirements of IFRS 16. For example, a lessee will determine and recognise any impairment of right-of-use assets applying IAS 36 *Impairment of Assets*..." [IFRS 16.BC72]. However, this raises the question how an entity should account for onerous variable lease payments that are not included in the measurement of right-of-use assets or lease liabilities under IFRS 16 (including variable payments related to non-lease components that have not been separated from the lease components, in accordance with IFRS 16.15). It is not immediately obvious whether such onerous variable lease payments fall within the scope of IFRS 16 (and IAS 36), or IAS 37.

As discussed in Chapter 21, we believe that contractual variable lease payments that are not included in the lease liability (such as those that are not based on an index or rate and are not in substance fixed) need to be reflected in cash flow forecasts used for value-in-use calculations for impairment testing purposes. In many cases, leased assets will be tested for impairment at a cash-generating-unit (CGU) level rather than at an individual asset level, as many leased assets are used as an input to the operating activities of an entity rather than generating largely independent cash flows. IAS 36 sets out requirements for the allocation of an impairment loss to assets within a CGU and requires that the allocation of the impairment loss does not reduce the carrying amount of an individual asset within the CGU below the highest of its fair value less costs of disposal, or value-in-use (if these can be established), or zero (see Chapter 21). It is therefore logically possible, after all assets and goodwill are either written off or down to their fair value less costs of disposal or value-in-use, for the carrying amount of a CGU to be higher than the computed recoverable amount. IAS 36 requires that a liability is recognised for any remaining amount of an impairment loss for a CGU only if that is required by another IFRS accounting standard. [IAS 36.108].

A question therefore arises as to whether, in such situations, an onerous lease provision should be recognised under the requirements of IAS 37, for any variable lease payments not included in the measurement of any right-of-use assets that are part of the CGU. A similar question arises for a right-of-use asset tested for impairment at the asset level rather than as part of a CGU. The answers will depend upon the interpretation of the scope exemption in IAS 37.5.

One view is that IAS 37.5 does not explicitly state that provisions for onerous leases are outside the scope of IAS 37, it merely provides examples of cases where other IFRS accounting standards address provisions, including IFRS 16. The general requirements of IFRS 16 are applied to the extent that there is a right-of-use asset and liability recognised and measured in accordance with the requirements of that standard. Any other lease payments not included in the measurement of the lease liability or right-of-use asset, such as variable lease payments that do not depend on an index or rate and are not in substance fixed, are in scope of the requirements of IAS 37 on onerous contracts. An onerous lease provision would be recognised for onerous variable lease payments that are not included in the measurement of right-of-use assets or lease liabilities under IFRS 16.

An alternative view is that the scope exemption in IAS 37.5 applies to all leases and lease payments other than the specific exceptions set out in IAS 37.5(c). An onerous lease provision would not be recognised for onerous variable lease payments not included in the measurement of right-of-use assets or lease liabilities under IFRS 16.

How we see it

Whether entities recognise onerous lease provisions for variable lease payments not included in the measurement of right-of-use assets recognised under IFRS 16 will depend upon their interpretation of the scope exemption in IAS 37.5. Where this has a material impact on entities financial statements, we would expect to see the entities interpretation disclosed as part of their material accounting policies as required by IAS 1.117.

In any case, where a lease contract contains non-lease components that have been accounted for separately from the lease components in accordance with IFRS 16.12, these non-lease components are in scope of IAS 37. This is because IFRS 16 specifies that once lease and non-lease components are elected not to be combined, a lessee accounts for non-lease components applying other applicable IFRS accounting standards. [IFRS 16.15, IFRS 16.16].

In practice, entering into a lease contract may sometimes require a lessee to pay costs related to the leased property to third parties, other than the lessor, over the lease term. For example, a lessee, as legal occupier of the property, may be required by law to pay a quarterly levy to the government. Such levies are statutory obligations, which fall in scope of IFRIC 21, [IFRIC 21.4], and are not part of the consideration for the lease contract. IFRIC 21 notes that the obligating event that gives rise to a liability to pay a levy is the activity that triggers the payment of the levy, as identified by the legislation. [IFRIC 21.8]. Applying the requirements of IFRIC 21, the lessee recognises the levy when the event that triggers the payment of the levy occurs, which would be on a quarterly basis over the period in which the lessee remains legal occupier in this case. In the event that the lessee vacates the property during the lease term, it would not be appropriate for the lessee to recognise an onerous contract provision in respect of levies payable over the remaining term of the lease. The signing of the lease contract is necessary, but not sufficient, to create a present obligation in respect of business rates for the remaining lease term. IFRIC 21 is discussed in section 6.8 below.

A lease could also require a lessee to incur other costs payable to third parties, which are not statutory obligations. For example, a lease may require a lessee to ensure that a leased property is adequately insured throughout the term of the lease. If the lessee vacates the leased property during the lease term, entering into a lease contract that requires the lessee to ensure that the property is adequately insured for the remainder of the lease term would be a 'past obligating event' that would require the recognition of an onerous contract provision by the lessee in respect of property insurance costs. [IAS 37.14]. If, however, the lease does not include such an obligation but the lessee simply chooses to continue insuring the property throughout the lease term, there is no 'past obligating event' in respect of insurance costs. In that case, no onerous contract provision would be recognised for the insurance cost, and the cost would instead be treated as a future operating cost to be expensed as incurred.

6.2.2 Contracts with customers that are, or have become, onerous

As IFRS 15 contains no specific requirements to address contracts with customers that are, or have become, onerous, IAS 37 applies to such contracts. [IAS 37.5(g)]. In assessing whether a contract is onerous, an entity is required to compare the unavoidable costs of meeting the obligations under the contract to the economic benefits expected to be received under it. The unavoidable costs under the contract are the lower of the cost of fulfilling the contract and any compensation or penalties arising from failure to fulfil the contract. [IAS 37.68]. As discussed in section 6.2 above, in May 2020, the IASB issued an amendment to IAS 37 that clarifies that the costs of fulfilling a contract comprise the costs that relate directly to the contract, rather than only the incremental costs of the contract.²²

One question that may arise, is how an entity should account for an onerous contract with a customer when the contract includes several 'over time' performance obligations that are satisfied consecutively. Since the requirements for onerous contracts are outside the scope of IFRS 15, an entity's accounting for onerous contracts does not affect the accounting for its revenue from contracts with customers in accordance with IFRS 15.

²² Onerous Contracts-Cost of Fulfilling a Contract: Amendments to IAS 37, IASB, May 2020.

How we see it

To account for an onerous contract with a customer when the contract includes several 'over time' performance obligations that are satisfied consecutively, we believe that an entity must use an 'overlay' approach, which consists of two steps:

- Apply the requirements of IFRS 15 to measure progress in satisfying each performance obligation, and account for the related costs when incurred in accordance with the applicable standards.
- At the end of each reporting period, apply IAS 37 to determine if the remaining contract as a whole is onerous. If the entity concludes that the remaining contract as a whole is onerous, it recognises a provision only to the extent that the amount of the remaining unavoidable costs under the contract exceed the remaining economic benefits to be received under it.

This approach is shown in Illustration 6-4 below.

Illustration 6-4: Onerous contract with several 'over time' performance obligations that are satisfied consecutively

Entity A enters into a contract that consists of two distinct performance obligations, which are satisfied consecutively. Revenue is recognised over time for both performance obligations. Entity A expects to satisfy the first performance obligation (PO1) during Years 1-4 and the second performance obligation (PO2) in Years 5-6. Entity A measures progress towards the satisfaction of both performance obligations based on costs incurred compared to the total expected costs (i.e., it applies an input method under IFRS 15).

If Entity A terminates the contract, a penalty of CU100,000 is payable.

The expected revenues and costs at the inception of the contract and the updated expectations at the beginning of Year 2 are as follows:

	At contract inception		Update in Year 2		
	<i>Expected costs</i>	<i>Expected revenue</i>	<i>Expected costs</i>	<i>Expected revenue</i>	<i>Expected progress</i>
PO1					
Year 1	24,000	30,000	24,000	30,000	25%
Year 2	24,000	30,000	24,000	30,000	25%
Year 3	24,000	30,000	24,000	30,000	25%
Year 4	24,000	30,000	24,000	30,000	25%
Total PO1	96,000	120,000	96,000	120,000	
PO2					
Year 5	10,000	15,000	32,000	15,000	50%
Year 6	10,000	15,000	32,000	15,000	50%
Total PO2	20,000	30,000	64,000	30,000	
Total contract	116,000	150,000	160,000	150,000	
Gross profit (loss)		34,000		(10,000)	

At contract inception, Entity A expects a positive margin for both performance obligations. At the beginning of Year 2, its estimates of the cost to fulfil the second performance obligation are increased by CU44,000.

Therefore, Entity A now expects to incur a loss of CU34,000 for the second performance obligation, resulting in a negative margin for the entire contract of CU10,000.

The contract as a whole is only onerous to the extent that the remaining costs to be incurred exceed the remaining benefits to be recognised. This is not the CU34,000 loss relating to the second performance obligation, because at the beginning of Year 2, Entity A has yet to recognise profits of CU18,000 for the completion of the first performance obligation. As a result, the net cost of fulfilling the contract at Year 2 is CU16,000. This cost is less than the termination penalty of CU100,000 and therefore, applying the 'overlay' approach explained above, Entity A recognises a provision under IAS 37 of CU16,000 in Year 2.

In Years 2 to 4, as the first performance obligation is being completed, the provision increases to reflect the higher net cost of satisfying the remaining performance obligations in the contract. As at the end of Year 4, only the revenues and costs relating to the second performance obligation remain, such that the provision now stands at CU34,000 and is utilised in Years 5 and 6 as the related losses are incurred.

The table below illustrates the effect of this accounting treatment (assuming that the actual outcome of the contract is the same as the updated estimates). This example ignores the time value of money for simplicity reasons.

	Provision			Profit or loss for the period	
	Costs	Revenue	Additions/ Utilisations	Balance	
Year 1	24,000	30,000	-	-	6,000
Year 2 (change in estimated total costs)	-	-	16,000	16,000	(16,000)
Year 2	24,000	30,000	6,000	22,000	-
Year 3	24,000	30,000	6,000	28,000	-
Year 4	24,000	30,000	6,000	34,000	-
Year 5	32,000	15,000	(17,000)	17,000	-
Year 6	32,000	15,000	(17,000)	-	-
Total	160,000	150,000	-	-	(10,000)

The effect of an onerous contract provision, or a change in the provision, is recognised as an expense in profit or loss and not as an adjustment to revenue.

As provisions for onerous contracts with customers are in the scope of IAS 37, they are classified as provisions in the balance sheet and disclosed in accordance with IAS 37 (see section 7.1 below). Onerous contract provisions are outside the scope of IFRS 15 and are not included within contract liabilities.

Since the definition of an onerous contract in IAS 37 refers only to a contract, the unit of account to determine whether an onerous contract exists is the contract itself, rather than the performance obligations identified in accordance with IFRS 15. [IAS 37.10]. As a result, the entity must consider the entire remaining contract, including remaining revenue to be recognised for unsatisfied, or partially unsatisfied, performance obligations and the remaining costs to fulfil those performance obligations.

As discussed in section 6.2 above, there is diversity in practice in how entities determine the economic benefits expected to be received under a contract for the purposes of assessing whether a contract is onerous. Where a contract with a customer contains an element of variable consideration, it is likely that judgement will be required in assessing the economic benefits expected to be received under a contract. This may particularly be the case where an entity is required to constrain the estimate of variable consideration to be included in the transaction price for revenue recognition purposes under IFRS 15. Variable consideration under IFRS 15 is discussed further in Chapter 28.

6.3 Decommissioning provisions

Decommissioning costs arise when an entity is required to dismantle or remove an asset at the end of its useful life and to restore the site on which it has been located, for example, when an oil rig or nuclear power station reaches the end of its economic life.

Rather than allowing an entity to build up a provision for the required costs over the life of the facility, IAS 37 requires that the liability is recognised as soon as the obligation arises. This is because the construction of the asset (and the environmental damage caused by it) creates the past obligating event requiring restoration in the future. [IAS 37.IE Example 3].

The accounting for decommissioning costs is dealt with in IAS 37 by way of an example relating to an oil rig in an offshore oilfield (see Illustration 3-5 in section 3.3 above). A provision is recognised at the time of constructing the oil rig in relation to the eventual costs that relate to its removal and the restoration of damage caused by building it. Additional provisions are recognised over the life of the oil field to reflect the need to reverse damage caused during the extraction of oil. [IAS 37.IE Example 3]. The total decommissioning cost is estimated, discounted to its present value and it is this amount which forms the initial provision. This 'initial estimate of the costs of dismantling and removing the item and restoring the site' is added to the corresponding asset's cost. [IAS 16.16]. Thereafter, the asset is depreciated over its useful life, while the discounted provision is progressively unwound, with the unwinding charge shown as a finance cost, as discussed in section 4.3.5 above.

The effect of discounting on the statement of comprehensive income is to split the cost of the eventual decommissioning into two components: an expense based on the present value of the expected future cash outflows; and a finance element representing the unwinding of the discount. The overall effect is to produce a rising pattern of cost over the life of the facility, often with much of the total cost of the decommissioning classified as a finance cost.

AngloGold Ashanti plc's accounting policies and provisions note in respect of decommissioning obligations and restoration obligations are shown in the following Practical example.

Practical example 6-1: AngloGold Ashanti plc (2023)

United Kingdom

Annual Report 2023 [extract]

Non-current	172	406	16	42	636

...

⁽¹⁾ The change in estimates relating to the provision for decommissioning and restoration is attributable to shifts in discount rates from global economic assumption changes, alterations in mine plans affecting cash flows, updates in design for closure of tailings storage facilities and in revised methodology following requests from the environmental regulatory authorities. These provisions are expected to unwind beyond the end of the life-of-mine.

⁽²⁾ Other provisions comprise claims filed by former employees in respect of loss of employment, work-related accident injuries and diseases, governmental fiscal claims relating to levies, surcharges and environmental legal disputes, a shareholder claim related to stamp duties and an onerous provision in Yatela. These liabilities are expected to be settled over the next five-year period.

...

Environmental obligations [extract]

Accounting policies

Environmental expenditure

The Group has long term remediation obligations comprising decommissioning and restoration liabilities relating to its past operations which are based on the Group's environmental management plans, in compliance with current environmental and regulatory requirements. Provisions for non-recurring remediation costs are made when there is a present obligation, it is probable that expenditure on remediation work will be required and the cost can be estimated within a reasonable range of possible outcomes. The costs are based on currently available facts, technology expected to be available at the time of the clean-up, laws and regulations presently or virtually certain to be enacted and prior experience in remediation of contaminated sites.

Decommissioning costs

The provision for decommissioning represents the cost that will arise from dismantling and removing an asset and restoring the site on which it is located. The obligation is incurred at the time the asset is put in place or as a consequence of using the asset for purposes other than to produce inventories. Accordingly, a provision and a decommissioning asset is recognised and included within mine infrastructure.

Decommissioning costs are provided at the present value of the expenditures expected to settle the obligation, using estimated cash flows based on current prices. The unwinding of the decommissioning obligation is included in the income statement as finance costs. Estimated future costs of decommissioning obligations are reviewed regularly and adjusted as appropriate for new circumstances or changes in law or technology. Changes in estimates are capitalised or reversed against the relevant asset. Estimates are discounted at a pre-tax rate that reflects current market assessments of the time value of money.

Gains or losses from the expected disposal of assets are not taken into account when determining the provision.

Restoration costs

The provision for restoration represents the cost of restoring site damage as a result of operating the asset to produce inventories. Changes in the provision are recorded in the income statement as a cost of production.

Restoration costs are estimated at the present value of the expenditures expected to settle the obligation, using estimated cash flows based on current prices and adjusted for risks specific to the liability. The estimates are discounted at a pre-tax rate that reflects current market assessments of the time value of money.

...

In the past, some entities may not have recognised provisions for the decommissioning costs of assets such as coal, or oil and gas plants, because they were considered to have indefinite useful lives. Climate-related risks, and any associated legislation, may require this judgement to be reconsidered and new decommissioning provisions recognised, or new contingent liabilities disclosed, as seen in Practical example 3-2 from Shell plc, in section 3.2.1 above.

6.3.1 Changes in estimated decommissioning costs (IFRIC 1)

IAS 37 requires provisions to be revised annually to reflect the current best estimate of the provision. [IAS 37.59]. However, the standard gives no guidance on accounting for changes in the decommissioning provision. Similarly, IAS 16 is unclear about the extent to which an item's carrying amount should be affected by changes in the estimated amount of dismantling and site restoration costs that occur after the estimate made upon initial measurement. This was addressed by the IASB with the publication of IFRIC 1. [IFRIC 1.1].

IFRIC 1 applies to any decommissioning, restoration or similar liability that has been both included as part of the cost of an asset measured in accordance with IAS 16 or as part of the cost of a right-of-use asset in accordance with IFRS 16 and recognised as a liability in accordance with IAS 37. [IFRIC 1.2]. It addresses how the effect of the following events that change the measurement of an existing decommissioning, restoration or similar liability is accounted for:

- (a) A change in the estimated outflow of resources embodying economic benefits (e.g., cash flows) required to settle the obligation
- (b) A change in the current market-based discount rate (this includes changes in the time value of money and the risks specific to the liability)
- (c) An increase that reflects the passage of time (also referred to as the unwinding of the discount) [IFRIC 1.3]

IFRIC 1 requires that (c) above, the periodic unwinding of the discount, is recognised in profit or loss as a finance cost as it occurs. [IFRIC 1.8]. The IFRS IC concluded that the unwinding of the discount is not a borrowing cost as defined in IAS 23, and thus cannot be capitalised under that standard. [IFRIC 1.BC26, IFRIC 1.BC27].

For a change caused by (a) or (b) above, however, the adjustment is taken to the income statement only in specific circumstances. Any revision to the provision (other than to reflect the passage of time) is first recognised in the carrying value of the related asset or in other comprehensive income, depending on whether the asset is measured at cost or using the revaluation model. [IFRIC 1.4, IFRIC 1.5, IFRIC 1.6, IFRIC 1.7].

If the related asset is measured using the cost model, the change in the liability is added to or deducted from the cost of the asset to which it relates. Where the change gives rise to an addition to cost, the entity must consider the need to test the new carrying value for impairment. This is particularly relevant for assets approaching the end of their useful life, as their remaining economic benefits are often small compared to the potential changes in the related decommissioning liability. Reductions over and above the remaining carrying value of the asset are recognised immediately in profit or loss. [IFRIC 1.5]. The adjusted depreciable amount of the asset is then depreciated prospectively over its remaining useful life. [IFRIC 1.7]. IFRIC 1 includes the following illustrative example.

Illustration 6-5: Changes in decommissioning costs - related asset measured at cost

An entity has a nuclear power plant and a related decommissioning liability. The nuclear power plant started operating on 1 January 20W3. The plant has a useful life of 40 years. Its initial cost was CU120,000,000; this included an amount for decommissioning costs of CU10,000,000, which represented CU70,400,000 in estimated cash flows payable in 40 years discounted at a risk-adjusted rate of 5%. The entity's financial year ends on 31 December.

On 31 December 20X2, the plant is 10 years old. Accumulated depreciation is CU30,000,000. Because of the unwinding of discount over the 10 years, the decommissioning liability has grown from CU10,000,000 to CU16,300,000.

On 31 December 20X2, the discount rate has not changed. However, the entity estimates that, as a result of technological advances, the net present value of the expected cash flows has decreased by CU8,000,000. Accordingly, the entity reduces the decommissioning liability from CU16,300,000 to CU8,300,000 and reduces the carrying amount of the asset by the same amount.

Following this adjustment, the carrying amount of the asset is CU82,000,000 (CU120,000,000 - CU8,000,000 - CU30,000,000), which will be depreciated over the remaining 30 years of the asset's life to give a depreciation expense for 20X2 of CU2,733,333 (CU82,000,000 ÷ 30). The next year's finance cost for the unwinding of the discount will be CU415,000 (CU8,300,000 × 5%). [IFRIC 1.IE1, IFRIC 1.IE2, IFRIC 1.IE3, IFRIC 1.IE4].

In illustrating the requirements of the Interpretation, the example in IFRIC 1 reduces the carrying value of the whole asset (comprising its construction cost and decommissioning cost) by the reduction in the present value of the decommissioning provision. The solution set out in the Illustration does not treat the decommissioning element as a separate component of the asset. Had this been the case, the component would have had accumulated depreciation as at 31 December 20X2 of CU2,500,000 ($\text{CU}10,000,000 \times 10/40$), giving a carrying amount of CU7,500,000 at that date and a gain of CU500,000 when reduced by the decrease in the provision of CU8,000,000. Accordingly, we believe that the example in IFRIC 1 indicates that it would not be appropriate to recognise any gain until the carrying value of the whole asset is extinguished.

If the related asset is measured using the revaluation model, changes in the liability alter the revaluation surplus or deficit previously recognised for that asset. Decreases in the provision are recognised in other comprehensive income and increase the value of the revaluation surplus in respect of the asset, except that:

- (a) A decrease in the provision is required to be recognised in profit or loss to the extent that it reverses a previous revaluation deficit on that asset that was recognised in profit or loss
- (b) If a decrease in the provision exceeds the carrying amount of the asset that would have been recognised under the cost model, the excess is required to be recognised in profit or loss [IFRIC 1.6]

Increases in the provision are recognised in profit or loss, except that they must be recognised in other comprehensive income, and reduce the revaluation surplus, to the extent of any credit balance existing in the revaluation surplus in respect of that asset. Changes in the provision might also indicate the need for the asset (and therefore all assets in the same class) to be revalued. [IFRIC 1.6].

The Illustration below, based on the examples in IFRIC 1 address this alternative.

Illustration 6-6: Changes in decommissioning costs - related asset carried at revaluation amount

Assume that the entity in Illustration 6-5 above instead adopts the revaluation model in IAS 16, and its policy is to eliminate accumulated depreciation at the revaluation date against the gross carrying amount of the asset.

The entity first revalues the asset as at 31 December 20W5 when the nuclear power plant is 3 years old. The valuation of CU115,000,000 comprises a gross valuation of CU126,600,000 and an allowance of CU11,600,000 for decommissioning costs, which represents no change to the original estimate, after the unwinding of three years' discount. The amounts included in the statement of financial position at 31 December 20W5 and the related revaluation reserve movements are therefore:

	Net book value	Valuation	Revaluation reserve
	CU'000	CU'000	CU'000
Cost or valuation	120,000	126,600	6,600
Accumulated depreciation (3/40)	(9,000)	-	9,000
Carrying amount of asset	111,000	126,600	15,600
Original provision	10,000		
Unwinding of discount (3 years @ 5%)	1,600		
	11,600	11,600	
Carrying amount less provision	99,400	115,000	15,600

The depreciation expense for 20W6 is therefore CU3,420,000 ($\text{CU}126,600,000 \div 37$) and the discount expense for 20W5 is CU580,000 (5% of CU11,600,000). On 31 December 20W6, the decommissioning liability (before any adjustment) is CU12,180,000 and the discount rate has not changed. However, on that date, the entity estimates that, as a result of technological advances, the present value of the decommissioning liability has decreased by CU5,000,000. Accordingly, the entity adjusts the decommissioning liability to CU7,180,000. To determine the extent to which any of the change to the provision is recognised in profit or loss, the entity has to keep a record of revaluations previously recognised in profit or loss; the carrying amount of the asset that would have been recognised under the cost model; and the previous revaluation surplus relating to that asset. [IFRIC 1.6]. In this example, the whole of the adjustment is taken to revaluation surplus, because it does not exceed the carrying amount that would have been recognised for the asset under the cost model of CU103,000 (see below). [IFRIC 1.IE6, IFRIC 1.IE7, IFRIC 1.IE8, IFRIC 1.IE9, IFRIC 1.IE10].

In addition, the entity decides that a full valuation of the asset is needed at 31 December 20W6, in order to ensure that the carrying amount does not differ materially from fair value. Suppose that the asset is now valued at CU107,000,000, which is net of an allowance of CU7,180,000 for the reduced decommissioning obligation. The valuation of the asset for financial reporting purposes, before deducting this allowance, is therefore CU114,180,000. The effect on the revaluation reserve of the revision to the estimate of the decommissioning provision and the new valuation can be illustrated in the table below. [IFRIC 1.IE11, IFRIC 1.IE12].

	Cost model	Revaluation	Revaluation reserve
	CU'000	CU'000	CU'000
Carrying amount as at 31 December 20W5	111,000	126,600	15,600
Depreciation charge for 20W6	(3,000)	(3,420)	
Carrying amount as at 31 December 20W6	108,000	123,180	
Revision to estimate of provision	(5,000)		
Revaluation adjustment in 20W6		(9,000)	(9,000)
	103,000	114,180	
Provision as at 31 December 20W5	11,600	11,600	
Unwinding of discount @ 5%	580	580	
Revision to estimate	(5,000)	(5,000)	5,000
Provision as at 31 December 20W6	7,180	7,180	
Carrying amount less provision	95,820	107,000	11,600

As indicated in section 4.3.6 above, IAS 37 is unclear whether a new discount rate should be applied during the year or just at the year-end, and whether the rate should be applied to the new estimate of the provision or the old estimate. Although IFRIC 1 requires that changes in the provision resulting from a change in the discount rate is added to, or deducted from, the cost of the related asset in the current period, it does not deal specifically with these points. However, Example 1 in the illustrative examples to IFRIC 1 indicates that a change in discount rate would be accounted for in the same way as other changes affecting the estimate of a provision for decommissioning, restoration and similar liabilities. That is, it is reflected as a change in the liability at the time the revised estimate is made and the new estimate is discounted at the revised discount rate from that point on. [IFRIC 1.IE5].

When accounting for revalued assets to which decommissioning liabilities attach, the illustrative example in IFRIC 1 states that it is important to understand the basis of the valuation obtained. For example:

- If an asset is valued on a discounted cash flow basis, some valuers may value the asset without deducting any allowance for decommissioning costs (a 'gross' valuation), whereas others may value the asset after deducting an allowance for decommissioning costs (a 'net' valuation), because an entity acquiring the asset will generally also assume the decommissioning obligation. For financial reporting purposes, the decommissioning obligation is recognised as a separate liability, and is not deducted from the asset. Accordingly, if the asset is valued on a net basis, it is necessary to adjust the valuation obtained by adding back the allowance for the liability, so that the liability is not counted twice. This is the case in Illustration 6-6 above.
- If an asset is valued on a depreciated replacement cost basis, the valuation obtained may not include an amount for the decommissioning component of the asset. If it does not, an appropriate amount will need to be added to the valuation to reflect the depreciated replacement cost of that component.

[IFRIC 1.IE7].

6.3.2 Changes in legislation after construction of the asset

The scope of IFRIC 1 is set out in terms of any existing decommissioning, restoration or similar liability that is both recognised as part of the cost of the asset under IAS 16 or as part of the cost of a right-of-use asset in accordance with IFRS 16; and recognised as a liability in accordance with IAS 37. [IFRIC 1.2]. The Interpretation does not address the treatment of obligations arising after the asset has been constructed, for example, as a result of changes in legislation. [IFRIC 1.BC23]. Nevertheless, in our opinion the cost of the related asset is to be measured in accordance with the principles set out in IFRIC 1 regardless of whether the obligation exists at the time of constructing the asset or arises later in its life.

As discussed in Chapter 19, IAS 16 makes no distinction in principle between the initial costs of acquiring an asset and any subsequent expenditure upon it. In both cases, any and all expenditure has to meet the recognition rules, and be expensed in profit or loss if it does not. IAS 16 states that the cost of an item of property, plant and equipment includes "...the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period." [IAS 16.16(c)]. For example, the introduction of new legislation to require the clean-up of sites that cease to be used as gasoline filling stations would give rise to the recognition of a decommissioning provision and, to the extent that the clean-up obligation arose as a result of the construction of the filling stations, an increase in the carrying value of the properties. Similarly, IFRS 16 states that the cost of a right-of-use asset includes "...an estimate of costs to be incurred by the lessee in dismantling and removing the underlying asset, restoring the site on which it is located or restoring the underlying asset to the condition required by the terms and conditions of the lease, unless those costs are incurred to produce inventories. The lessee incurs the obligation for those costs either at the commencement date or as a consequence of having used the underlying asset during a particular period." [IFRS 16.24(d)].

Both IAS 16 and IFRS 16 require an entity to apply IAS 2 to the costs of obligations for dismantling, removing and restoring the site on which an item is located that are incurred during a particular period as a consequence of having used the item to produce inventories during that period. [IAS 16.18, IFRS 16.25]. For example, the cost of restoring the site of a quarry would be reflected as part of the cost of the aggregate extracted from it, and not added to the carrying value of the site. Accordingly, if an entity previously had no obligation to restore the site and new legislation was introduced after 25% of the site had been excavated and 80% of that output had been sold, then 80% of the new estimate of the restoration cost would be expensed; 20% added to the cost of inventory; and none added to the carrying value of the site.

When changes in legislation give rise to a new decommissioning, restoration or similar liability that is added to the carrying amount of the related asset, it would be appropriate to perform an impairment review in accordance with IAS 36 (see Chapter 21).

6.3.3 Funds established to meet an obligation (IFRIC 5)

Some entities may participate in a decommissioning, restoration or environmental rehabilitation fund, the purpose of which is to segregate assets to fund some or all of the costs of decommissioning for which the entity has to make a provision under IAS 37. IFRIC 5 was issued to address this issue, referring to decommissioning to mean not only the dismantling of plant and equipment but also the costs of undertaking environmental rehabilitation, such as rectifying pollution of water or restoring mined land. [IFRIC 5.1].

Contributions to these funds may be voluntary or required by regulation or law, and the funds may have one of the following common structures:

- Funds that are established by a single contributor to fund its own decommissioning obligations, whether for a particular site, or for a number of geographically dispersed sites.
- Funds that are established with multiple contributors to fund their individual or joint decommissioning obligations, where contributors are entitled to reimbursement for decommissioning expenses to the extent of their fund contributions plus any actual earnings on those contributions less their share of the costs of administering the fund. Contributors may have an obligation to make potential additional contributions, for example, in the event of the bankruptcy of another contributor.
- Funds that are established with multiple contributors to fund their individual or joint decommissioning obligations when the required level of contributions is based on the current activity of a contributor, but the benefit obtained by that contributor is based on its past activity. In such cases there is a potential mismatch in the amount of contributions made by a contributor (based on current activity) and the value realisable from the fund (based on past activity). [IFRIC 5.2].

Such funds generally have the following features:

- The fund is separately administered by independent trustees.
- Entities (contributors) make contributions to the fund, which are invested in a range of assets that may include both debt and equity investments, and are available to help pay the contributors' decommissioning costs. The trustees determine how contributions are invested, within the constraints set by the fund's governing documents and any applicable legislation or other regulations.
- The contributors retain the obligation to pay decommissioning costs. However, contributors are able to obtain reimbursement of decommissioning costs from the fund up to the lower of the decommissioning costs incurred and the entity's share of assets of the fund.
- The contributors may have restricted or no access to any surplus of assets of the fund over those used to meet eligible decommissioning costs. [IFRIC 5.3].

IFRIC 5 applies to accounting in the financial statements of a contributor for interests arising from decommissioning funds that have both the following features:

- The assets are administered separately (either by being held in a separate legal entity or as segregated assets within another entity).
- A contributor's right to access the assets is restricted. [IFRIC 5.4].

A residual interest in a fund that extends beyond a right to reimbursement, such as a contractual right to distributions once all the decommissioning has been completed or on winding up the fund, may be an equity instrument within the scope of IFRS 9, and is not within the scope of IFRIC 5. [IFRIC 5.5].

The issues addressed by IFRIC 5 are:

- (a) How should a contributor account for its interest in a fund?
- (b) When a contributor has an obligation to make additional contributions, for example, in the event of the bankruptcy of another contributor, how should that obligation be accounted for? [IFRIC 5.6]

6.3.3.A Accounting for an interest in a fund

IFRIC 5 requires the contributor to recognise its obligations to pay decommissioning costs as a liability and recognise its interest in the fund separately, unless the contributor is not liable to pay decommissioning costs even if the fund fails to pay. [IFRIC 5.7].

The contributor determines whether it has control, joint control or significant influence over the fund by reference to IFRS 10 *Consolidated Financial Statements*, IFRS 11 *Joint Arrangements* and IAS 28 *Investments in Associates and Joint Ventures*. If the contributor determines that it has such control, joint control or significant influence, it is required to account for its interest in the fund in accordance with those standards (see Chapters 7, 13 and 12 respectively). [IFRIC 5.8].

Otherwise, the contributor must recognise the right to receive reimbursement from the fund as a reimbursement in accordance with IAS 37 (see section 4.6 above). This reimbursement is measured at the lower of:

- The amount of the decommissioning obligation recognised
- The contributor's share of the fair value of the net assets of the fund attributable to contributors [IFRIC 5.9]

This 'asset cap' means that the asset recognised in respect of the reimbursement rights can never exceed the recognised liability. Accordingly, rights to receive reimbursement to meet decommissioning liabilities that have yet to be recognised as a provision are not recognised. [IFRIC 5.BC14]. Although many respondents expressed concern about this asset cap and argued that rights to benefit in excess of this amount give rise to an additional asset, separate from the reimbursement asset, the IFRS IC, despite having sympathy with the concerns, concluded that to recognise such an asset would be inconsistent with the requirement in IAS 37 that the amount recognised for the reimbursement should not exceed the amount of the provision. [IFRIC 5.BC19, IFRIC 5.BC20].

Changes in the carrying value of the right to receive reimbursement other than contributions to and payments from the fund are required to be recognised in profit or loss in the period in which these changes occur. [IFRIC 5.9].

The effect of this requirement is that the amount recognised in the statement of comprehensive income relating to the reimbursement bears no relation to the expense recognised in respect of the provision, particularly for decommissioning liabilities where most changes in the measurement of the provision are not taken to the profit or loss immediately, but are recognised prospectively over the remaining useful life of the related asset (see section 6.3.1 above).

One company that has been affected by the 'asset cap' is Fortum Oyj as shown below. In this Practical example, the company observes that because IFRS accounting standards do not allow the asset to exceed the amount of the provision, [IFRIC 5.9, IFRIC 5.BC19, IFRIC 5.BC20], it recognises a reimbursement asset in its statement of financial position that is lower than its actual share of the fund.

Practical example 6-2: Fortum Oyj (2023)

Finland

Financials 2023 [extract]**FINANCIAL STATEMENTS [extract]****Consolidated financial statements [extract]****Notes to the consolidated financial statements [extract]****28 Nuclear-related assets and liabilities [extract]****ACCOUNTING POLICIES**

Fortum owns Loviisa nuclear power plant in Finland. In Fortum's consolidated balance sheet, Share in the State Nuclear Waste Management Fund and the Nuclear provisions relate to Loviisa nuclear power plant. Fortum's share in the State Nuclear Waste Management Fund is accounted for according to IFRIC 5, Rights to interests arising from decommissioning, restoration and environmental rehabilitation funds which states that the fund assets are measured at the lower of fair value or the value of the related liabilities since Fortum does not have control or joint control over the State Nuclear Waste Management Fund. The Nuclear Waste Management Fund is managed by governmental authorities. The related provisions are the provision for decommissioning and the provision for disposal of spent fuel.

...

Fortum's actual share of the State Nuclear Waste Management Fund, related to Loviisa nuclear power plant, is higher than the carrying value of the Fund on the balance sheet. The legal nuclear liability should, according to the Finnish Nuclear Energy Act, be fully covered by payments and guarantees to the State Nuclear Waste Management Fund. The legal liability is not discounted while the provisions are, and since the future cash flow is spread over a very long time horizon, the difference between the legal liability and the provisions are material.

...

28.1 Nuclear-related assets and liabilities for consolidated nuclear power plants

EUR million	2023	2022
Carrying values on the balance sheet		
BS Nuclear provisions	1,058	966
BS Fortum's share in the State Nuclear Waste Management Fund	1,058	966
Fortum's share of the fair value of the net assets in the State Nuclear Waste Management Fund	1,197	1,148
Share of fund not recognised on the balance sheet	139	182

Nuclear provision and fund accounted according to IFRS

Nuclear provisions include the provision for decommissioning and the provision for disposal of spent fuel. The carrying value of the nuclear provisions, calculated according to IAS 37, increased by EUR 92 million compared to 31 December 2022, totalling EUR 1,058 million at 31 December 2023. The change is mainly due to the Loviisa lifetime extension and updates in Posiva's project budget.

Fortum's share of the State Nuclear Waste Management Fund is from an IFRS perspective overfunded by EUR 139 million, since Fortum's share of the Fund on 31 December 2023 was EUR 1,197 million and the carrying value on the balance sheet was EUR 1,058 million. The Fund on Fortum's balance sheet can at maximum be equal to the amount of the provisions according to IFRS. As long as the Fund is overfunded from an IFRS perspective, the other financial items - net, is adjusted positively if the provisions increase more than the Fund, and negatively if the provision decreases below the actual value of the fund.

Legal liability for Loviisa nuclear power plant

The legal liability on 31 December 2023, decided by the Ministry of Economic Affairs and Employment in December 2023, was EUR 1,253 million.

The legal liability is based on a cost estimate, which is updated every year; and a technical plan, which is updated every three years. The legal liability is determined by assuming that the decommissioning would start at the beginning of the year following the assessment year and discounting is not applied in determining the amount.

Fortum's share in the Finnish Nuclear Waste Management Fund

According to Nuclear Energy Act, Fortum is obligated to contribute funds in full to the State Nuclear Waste Management Fund to cover the legal liability. Fortum contributes funds to the Finnish State Nuclear Waste Management Fund based on the yearly funding obligation target decided by the governmental authorities in connection with the decision of size of the legal liability. The current funding obligation target decided in December 2023 is EUR 1,253 million.

...

6.3.3.B Accounting for obligations to make additional contributions

IFRIC 5 requires that when a contributor has an obligation to make potential additional contributions, for example, in the event of the bankruptcy of another contributor or if the value of the investments held by the fund decreases to an extent that they are insufficient to fulfil the fund's reimbursement obligations, this obligation is a contingent liability that is within the scope of IAS 37. The contributor shall recognise a liability only if it is probable that additional contributions will be made. [IFRIC 5.10].

6.3.3.C Gross presentation of interest in the fund and the decommissioning liability

IFRIC 5 requires the contributor to a fund to recognise its obligations to pay decommissioning costs as a liability and recognise its interest in the fund separately, unless the contributor is not liable to pay decommissioning costs even if the fund fails to pay. [IFRIC 5.7]. Accordingly, in most cases it would not be appropriate to offset the decommissioning liability and the interest in the fund.

The IFRS IC reached this conclusion because IAS 37 requires an entity that remains liable for expenditure to recognise a provision even where reimbursement is available and to recognise a separate reimbursement asset only when the entity is virtually certain that it will be received when the obligation is settled. [IFRIC 5.BC7]. The IFRS IC also noted that the conditions in IAS 32 *Financial Instruments: Presentation* for offsetting a financial asset and a financial liability would rarely be met because of the absence of a legal right of set off and the likelihood that settlement will not be net or simultaneous. [IAS 32.42]. Arguments that the existence of a fund allows derecognition of the liability by analogy to IAS 39 *Financial Instruments: Recognition and Measurement*,²³ or a net presentation similar to a pension fund, were also rejected. [IFRIC 5.BC8].

6.3.3.D Disclosure of interests arising from decommissioning, restoration and environmental rehabilitation funds

IFRIC 5 requires the following disclosures:

- A contributor must disclose the nature of its interest in a fund and any restrictions on access to the assets in the fund. [IFRIC 5.11].
- When a contributor has an obligation to make potential additional contributions that is not recognised as a liability (see section 6.3.3.B above), it is required to provide the contingent liability disclosures required by IAS 37 (see section 7.2 below). [IFRIC 5.12].
- When a contributor accounts for its right to receive reimbursement from the fund as a reimbursement right under IAS 37 in accordance with IFRIC 5.9 (see section 6.3.3.A above), it must disclose the amount of the expected reimbursement and the amount of any asset that has been recognised for that expected reimbursement. [IFRIC 5.13].

6.3.4 Interaction of leases with asset retirement obligations

An entity may sometimes use, or expect to use, a leased asset to carry out decommissioning or remediation work for which it has recognised a decommissioning, remediation or asset retirement provision. For example, at the end of life of an oil field, an entity may use a leased ship or rig to undertake the plugging and abandonment of oil wells. The entity may have included the estimated cost of plugging and abandonment of the wells in the decommissioning provision set up at the commencement of oil production. If an entity uses leased assets to carry out decommissioning or remediation work for which it recognised a decommissioning, remediation, or asset retirement provision, the question arises as to whether, at lease commencement, the entity's recognition of a lease liability for the leased assets in accordance with IFRS 16 results in derecognition of the asset retirement obligation recognised in the balance sheet. Given that, prior to the commencement of any asset retirement obligation related activities, the entity still has an obligation to rehabilitate under IAS 37, it cannot derecognise the asset retirement obligation. Instead, it now has a separate lease liability for the financing of the lease of the asset. Accordingly, acquiring the right-of-use asset does not result in the derecognition of the asset retirement obligation liability, rather it would be the activity undertaken or output of the asset which would ultimately settle the asset retirement obligation. This is discussed further in Chapter 39.

23 IFRS 9 replaced IAS 39, effective for annual periods beginning on or after 1 January 2018. IFRS 9 applies to items that were previously within the scope of IAS 39.

How we see it

The recognition, at lease commencement, of an IFRS 16 lease liability for assets leased in order to fulfil an entity's asset retirement obligation, does not result in derecognition of the asset retirement obligation recognised in the balance sheet.

6.4 Environmental provisions - general guidance in IAS 37

The standard illustrates its recognition requirements in two examples relating to environmental provisions. The first deals with the situation where it is virtually certain that legislation will be enacted which will require the clean-up of land already contaminated. In these circumstances, the virtual certainty of new legislation being enacted means that the entity has a present legal obligation as a result of the past event (contamination of the land), requiring a provision to be recognised. [IAS 37.IE Example 2A]. However, in its discussion about what constitutes an obligating event, the standard notes that "...Differences in circumstances surrounding enactment make it impossible to specify a single event that would make the enactment of a law virtually certain. In many cases, it will be impossible to be virtually certain of the enactment of a law until it is enacted." [IAS 37.22]. The second example deals with a similar situation, except that the entity is not expected to be legally required to clean it up. Nevertheless, the entity has a widely publicised environmental policy undertaking to clean up all contamination that it causes, and has a record of honouring this policy. In these circumstances, a provision is still required because the entity has created a valid expectation that it will clean up the land, meaning that the entity has a present constructive obligation as a result of past contamination. [IAS 37.IE Example 2B]. It is therefore clear that where an entity causes environmental damage and has a present legal or constructive obligation to make it good; it is probable that an outflow of resources will be required to settle the obligation; and a reliable estimate can be made of the amount, a provision will be required. [IAS 37.14].

One company making provision for environmental costs is Koninklijke Philips N.V., which describes some of the uncertainties relating to its measurement in the Practical example below.

Practical example 6-3: Koninklijke Philips N.V. (2022)

Netherlands

Annual Report 2022 [extract]

Group financial statements [extract]

Notes to the Consolidated financial statements [extract]

19 Provisions [extract]

Environmental provisions

The environmental provisions include accrued costs recorded with respect to environmental remediation in various countries. In the United States, subsidiaries of the company have been named as potentially responsible parties in state and federal proceedings for the clean-up of certain sites.

Provisions for environmental remediation can change significantly due to the emergence of additional information regarding the extent or nature of the contamination, the need to utilize alternative technologies, actions by regulatory authorities as well as changes in judgments and discount rates.

Approximately EUR 73 million of the long-term provision is expected to be utilized after one to five years, with the remainder after five years. For more details on the environmental remediation refer to [Contingencies, starting on page 204](#).

Philips Group

Environmental provisions in millions of EUR

	2021	2022
Balance as of January 1	183	124
Additions	18	15
Utilizations	(15)	(17)
Releases	(64)	(2)
Changes in discount rate	(10)	(27)
Accretion	3	4
Translation differences and other	9	7
Balance as of December 31	124	104

The additions and the releases of the provisions originate from additional insights in relation to factors like the estimated cost of remediation, changes in regulatory requirements and efficiencies in completion of various site work phases.

Based on the progressive insight with respect to site remediation experience, technological progress and risk-based clean-up strategies, the estimated remaining duration of remediation activities for environmental liabilities for infinite environmental sites was revised in 2021 from 60 years to 30 years. The resulting release was EUR 55 million of which EUR 33 million is recorded in continuing operations and EUR 22 million in discontinued operations.

If the expenditure relating to an environmental obligation is not expected to be incurred for some time, a significant effect of the standard is its requirement that provisions are discounted, which can have a material impact.

6.5 Liabilities associated with emissions trading schemes

A number of countries around the world either have, or are developing, schemes to encourage reduced emissions of pollutants, in particular of greenhouse gases. These schemes comprise tradable emissions allowances or permits, an example of which is a 'cap and trade' model whereby participants are allocated emission rights or allowances equal to a cap (i.e., a maximum level of allowable emissions) and are permitted to trade those allowances. A cap and trade emission rights scheme typically has the following features:²⁴

- An entity participating in the scheme (participant) is set a target to reduce its emissions to a specified level (the cap). The participant is issued allowances equal in number to its cap by a government or government agency. Allowances may be issued free of charge, or participants may pay the government for them.
- The scheme operates for defined compliance periods.
- Participants are free to buy and sell allowances.
- If at the end of the compliance period a participant's actual emissions exceeded its emission rights, the participant will incur a penalty.
- In some schemes emission rights may be carried forward to future periods.
- The scheme may provide for brokers - who are not themselves participants - to buy and sell emission rights.

²⁴ IFRIC 3, *Emission Rights*, IASB, December 2004, para. 6.

In response to diversity in the accounting for cap and trade emission rights schemes, the IFRS IC added this matter to its agenda. Accordingly, in December 2004 the IASB issued IFRIC 3 to address the accounting for emission allowances that arise from cap and trade emission rights schemes.

IFRIC 3 took the view that a cap and trade scheme did not give rise to a net asset or liability, but that it gave rise to various items that were to be accounted for separately.²⁵

- (a) *An asset for allowances held* - Allowances, whether allocated by government or purchased, were to be regarded as intangible assets and accounted for under IAS 38. Allowances issued for less than fair value were to be measured initially at their fair value.²⁶
- (b) *A government grant* - When allowances are issued for less than fair value, the difference between the amount paid and fair value was a government grant that was required to be accounted for under IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance*. Initially the grant was to be recognised as deferred income in the statement of financial position and subsequently recognised as income on a systematic basis over the compliance period for which the allowances were issued, regardless of whether the allowances were held or sold.²⁷
- (c) *A liability for the obligation to deliver allowances equal to emissions that have been made* - As emissions are made, a liability was to be recognised as a provision that falls within the scope of IAS 37. The liability was to be measured at the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. This would usually be the present market price of the number of allowances required to cover emissions made up to the end of the reporting period.²⁸

However, the Interpretation met with significant resistance because application of IFRIC 3 would result in a number of accounting mismatches:²⁹

- A measurement mismatch between the assets and liabilities recognised in accordance with IFRIC 3
- A mismatch in the location in which the gains and losses on those assets are reported
- A possible timing mismatch because allowances would be recognised when they are obtained - typically at the start of the year - whereas the emission liability would be recognised during the year as it is incurred

Consequently, the IASB decided in June 2005 to withdraw IFRIC 3 despite the fact that it considered it to be "...an appropriate interpretation of existing IFRSs".³⁰ The IASB activated its project on emission trading schemes in December 2007, but work was suspended in November 2010. In May 2012, IASB members gave their unanimous support to giving priority to restarting research on emission trading schemes.³¹ In February 2015, the project was renamed from 'Emission trading schemes' to 'Pollutant pricing mechanisms'. This change was to reflect a decision by the Board in January 2015 to broaden the scope of the project to consider a variety of schemes that use emission allowances and other financial tools to manage the emission of pollutants. The Board also decided in January 2015 that they would take a 'fresh start' approach to the project rather than starting from the tentative decisions made in the previous project.³² In April 2022, the IASB decided to include the project on Pollutant pricing mechanisms on a reserve list of projects that would be added to the work plan only if additional capacity becomes available.³³ In January 2025, the IASB decided to defer the decision on whether to add a project on pollutant pricing mechanisms to its work plan until the next agenda consultation. A project on pollutant pricing mechanisms remains on the IASB's reserve list of projects and the IASB will continue to monitor the topic.³⁴

In the meantime, entities can either:

- (a) Apply IFRIC 3, which despite having been withdrawn, is considered to be an appropriate interpretation of existing IFRS accounting standards.
- Or
- (b) Develop its own accounting policy for cap and trade schemes based on the hierarchy of authoritative guidance in IAS 8.

A more detailed discussion of the issues and methods applied in practice is covered in Chapter 18.

6.6 Green certificates compared to emissions trading schemes

Some countries have launched schemes to promote the production of power from renewable sources based on green certificates - also known as renewable energy certificates (RECs), green tags, or tradable renewable certificates.

In a green certificates system, a producer of electricity from renewable sources is granted certificates by the government based on the power output (kWh) of green electricity produced. These certificates may be used in the current and future compliance periods as defined by the particular scheme. The certificates can be sold separately. Generally, the cost to produce green electricity is higher than the cost of producing an equivalent amount of electricity generated from non-renewable sources, although this is not always the case. Distributors of electricity sell green electricity at the same price as other electricity.

In a typical green certificates scheme, distributors of electricity to consumers (businesses, households etc.) are required to remit a number of green certificates based on the kWh of electricity sold on an annual basis. Distributors must therefore purchase green certificates in the market (such certificates having been sold by producers). If a distribution company does not have the number of required certificates, it is required to pay a penalty to the environmental agency. Once the penalty is paid, the entity is discharged of its obligations to remit certificates.

It is this requirement to remit certificates that creates a market in and gives value to green certificates (the value depends on many variables but primarily on the required number of certificates that have to be delivered relative to the amount of power that is produced from renewable sources, and the level of penalty payable if the required number of certificates are not remitted).

There are similarities between green certificates and emission rights. However, green certificates are granted to generators of cleaner energy as an incentive for 'good' production achieved, irrespective of whether or not there is a subsequent sale of that cleaner energy to an end consumer. For a distributor of energy, a green certificate gives a similar 'right to pollute' as an emission right except that a distributor of energy under a green certificate regime must acquire the certificates from the market (i.e., they are not granted to the distributor by the government). As with emission rights, the topic of green certificates cuts across a number of different areas of accounting, not just provisions. A more detailed discussion of the issues and methods applied in practice is covered in Chapter 18.

6.7 EU Directive on 'Waste Electrical and Electronic Equipment' (IFRIC 6)

This Directive regulates the collection, treatment, recovery and environmentally sound disposal of waste electrical or electronic equipment (WE&EE).³⁵ It applies to entities involved in the manufacture and resale of electrical or electronic equipment, including entities (both European and Non-European) that import such equipment into the EU. As member states in the EU began to implement this directive into their national laws, it gave rise to questions about when the liability for the decommissioning of WE&EE should be recognised. The Directive distinguishes between 'new' and 'historical' waste and between waste from private households and waste from sources other than private households. New waste relates to products sold after 13 August 2005. All household equipment sold before that date is deemed to give rise to historical waste for the purposes of the Directive. [IFRIC 6.3].

The Directive states that the cost of waste management for historical household equipment should be borne by producers of that type of equipment that are in the market during a period to be specified in the applicable legislation of each Member State (the measurement period). The Directive states that each Member State shall establish a mechanism to have producers contribute to costs proportionately "...e.g. in proportion to their respective share of the market by type of equipment." [IFRIC 6.4].

The IFRS IC was asked to determine in the context of the decommissioning of WE&EE what constitutes the obligating event in accordance with IAS 37.14(a) (discussed in section 3.1.1 above) for the recognition of a provision for waste management costs:

- The manufacture or sale of the historical household equipment?
- Participation in the market during the measurement period?
- The incurrence of costs in the performance of waste management activities? [IFRIC 6.8]

35 Directive 2002/96/EC of the European Parliament and of the Council of 27 January 2003 on waste electrical and electronic equipment; and Directive 2003/108/EC of the European Parliament and of the Council of 8 December 2003 amending Directive 2002/96/EC on waste electrical and electronic equipment.

IFRIC 6 was issued in September 2005 and provides guidance on the recognition, in the financial statements of producers, of liabilities for waste management under the EU Directive on WE&EE in respect of sales of historical household equipment. [IFRIC 6.6]. The interpretation addresses neither new waste nor historical waste from sources other than private households. The IFRS IC considers that the liability for such waste management is adequately covered in IAS 37. However, if, in national legislation, new waste from private households is treated in a similar manner to historical waste from private households, the principles of IFRIC 6 are to apply by reference to the hierarchy set out in IAS 8 (see Chapter 3). The IAS 8 hierarchy is also stated to be relevant for other regulations that impose obligations in a way that is similar to the cost attribution model specified in the EU Directive. [IFRIC 6.7].

Extract from IFRIC 6

Consensus

- 9 Participation in the market during the measurement period is the obligating event in accordance with paragraph 14(a) of IAS 37. As a consequence, a liability for waste management costs for historical household equipment does not arise as the products are manufactured or sold. Because the obligation for historical household equipment is linked to participation in the market during the measurement period, rather than to production or sale of the items to be disposed of, there is no obligation unless and until a market share exists during the measurement period. The timing of the obligating event may also be independent of the particular period in which the activities to perform the waste management are undertaken and the related costs incurred.

[IFRIC 6.9]

The following Illustration, which is based on an example within the accompanying Basis for Conclusions on IFRIC 6, illustrates its requirements.

Illustration 6-7: Illustration of IFRIC 6 requirements

An entity selling electrical equipment in 20X0 has a market share of 4% for that calendar year. It subsequently discontinues operations and is thus no longer in the market when the waste management costs for its products are allocated to those entities with market share in 20X2. With a market share of 0% in 20X2, the entity's obligation is zero. However, if another entity enters the market for electronic products in 20X2 and achieves a market share of 3% in that period, then that entity's obligation for the costs of waste management from earlier periods will be 3% of the total costs of waste management allocated to 20X2, even though the entity was not in the market in those earlier periods and has not produced any of the products for which waste management costs are allocated to 20X2. [IFRIC 6.BC5].

The IFRS IC concluded that the effect of the cost attribution model specified in the Directive is that the making of sales during the measurement period is the 'past event' that requires recognition of a provision under IAS 37 over the measurement period. Aggregate sales for the period determine the entity's obligation for a proportion of the costs of waste management allocated to that period. The measurement period is independent of the period when the cost allocation is notified to market participants. [IFRIC 6.BC6].

Some constituents asked the IFRS IC to consider the effect of the following possible national legislation: the waste management costs for which a producer is responsible because of its participation in the market during a specified period (for example 20X2) are not based on the market share of the producer during that period but on the producer's participation in the market during a previous period (for example 20X1). The IFRS IC noted that this affects only the measurement of the liability and that the obligating event is still participation in the market during 20X2. [IFRIC 6.BC7].

IFRIC 6 notes that terms used in the interpretation such as 'market share' and 'measurement period' may be defined very differently in the applicable legislation of individual Member States. For example, the length of the measurement period might be a year or only one month. Similarly, the measurement of market share and the formulae for computing the obligation may differ in the various national legislations. However, all of these examples affect only the measurement of the liability, which is not within the scope of the interpretation. [IFRIC 6.5].

As discussed in section 8 below, in November 2024, the IASB issued the Exposure Draft *Provisions - Targeted Improvements* which includes three targeted improvements to the standard.³⁶ The proposed amendments would also replace the requirements in IFRIC 6, which would be withdrawn.

36 Exposure Draft [ED/2024/8](#): Provisions-Targeted Improvements, IASB, November 2024. Available on the IFRS Foundation's website.

6.8 Levies imposed by governments

When governments or other public authorities impose levies on entities in relation to their activities, as opposed to income taxes and fines or other penalties, it is not always clear when the liability to pay a levy arises and a provision should be recognised. In May 2013, the IFRS IC issued IFRIC 21 to address this question. [IFRIC 21.2, IFRIC 21.7]. The Interpretation does not address the accounting for the costs arising out of an obligation to pay a levy, for example, to determine whether an asset or expense should be recorded. Other IFRS accounting standards are required to be applied in this regard. [IFRIC 21.3].

The Interpretation requires that, for levies within its scope, an entity recognises a liability only when the activity that triggers payment, as identified by the relevant legislation, occurs. [IFRIC 21.8].

As discussed in section 8 below, in November 2024, the IASB issued the Exposure Draft *Provisions - Targeted Improvements* which includes three targeted improvements to the standard.³⁷ The proposed amendments would also replace the requirements in IFRIC 21, which would be withdrawn, and the accounting for levies would be aligned with the general requirements for provisions.

6.8.1 Scope of IFRIC 21

A levy is defined as follows: [IFRIC 21.4]

Extract from IFRIC 21

- 4 For the purposes of this Interpretation, a levy is an outflow of resources embodying economic benefits that is imposed by governments on entities in accordance with legislation (ie laws and/or regulations), other than:
- (a) those outflows of resources that are within the scope of other Standards (such as income taxes that are within the scope of IAS 12 *Income Taxes*); and
 - (b) fines or other penalties that are imposed for breaches of the legislation.
- 'Government' refers to government, government agencies and similar bodies whether local, national or international.

In addition to income taxes (see Chapter 29) and fines, the Interpretation does not apply to contractual arrangements with government in which the entity acquires an asset (see Chapters 18 and 19) or receives services; and it is not required to be applied to liabilities that arise from emission trading schemes (see section 6.5 above). [IFRIC 21.5, IFRIC 21.6]. Although IFRIC 21 does not apply to income taxes in scope of IAS 12, the IFRS IC concluded that any taxes not within the scope of other IFRS accounting standards (such as IAS 12) are within the scope of IAS 37. Therefore, such taxes would be within the scope of IFRIC 21. [IFRIC 21.BC4].

IFRIC 21 was developed to address concerns over the timing of recognition for government-imposed levies in which the obligation to pay depended upon participation in a particular market on a specified date. However, the definition of levy in IFRIC 21 has resulted in the scope of the interpretation being broader than entities might have expected. The term 'levy' may not be widely used across jurisdictions, and may be referred to as a charge, duty or a tax, for example. However, it is not the terminology, but the nature of the payment, which must be considered when determining if it is in the scope of IFRIC 21.

Entities must consider all payments imposed by governments pursuant to legislation to determine whether they are in scope of IFRIC 21. The interpretation provides a broad definition of government, including municipal, provincial, state, federal or international governments or government agencies or organisations controlled or administered by government. [IFRIC 21.4].

IFRIC 21 clarifies that both levies that give rise to a liability under IAS 37, and levies whose timing or amounts are certain are within scope of the interpretation. [IFRIC 21.2]. Therefore, the scope of IFRIC 21 is broader than IAS 37. For example, a non-refundable fixed fee imposed by government payable at a specific date could be a levy within the scope of IFRIC 21.

In some cases, payments may pass through one or more non-governmental bodies or entities before being received by the government. In our view, IFRIC 21 does not distinguish between recipients of the payment; the key factor is whether the payment is required by law. Therefore, as long as the payments are required by law, they are generally considered to be imposed by the government. [IFRIC 21.4].

37 Exposure Draft [ED/2024/8](#): Provisions-Targeted Improvements, IASB, November 2024. Available on the IFRS Foundation's website.

How we see it

IFRIC 21 does not distinguish between recipients of the payment; the key factor is whether the payment is required by law. As long as the payments are required by law, they are generally considered to be imposed by the government.

Some of the legislation relating to payments imposed by governments can be complex, so entities must carefully analyse the facts and circumstances to determine whether a payment falls within the scope of IFRIC 21. However, where entities are making payments for any of the following items, it is necessary to assess for any potential IFRIC 21 impacts:

- Taxes other than income taxes, e.g., property tax, land tax and capital-based tax
- Certain fees, concessions, contributions or royalty fees imposed on industries which are regulated by government, e.g., telecommunications, mining, airline, banking, insurance, dairy produce and energy and natural resources
- Transaction taxes based on activity in a specified market, e.g., banking and insurance

6.8.2 Recognition and measurement of levy liabilities

For levies within the scope of the Interpretation, the activity that creates the obligation under the relevant legislation to pay the levy is the obligating event for recognition purposes. [IFRIC 21.8]. In many cases this activity is related to the entity's participation in a relevant market at a specific date or dates. The Interpretation states that neither a constructive nor a present obligation arises as a result of being economically compelled to continue operating; or from any implication of continuing operations in the future arising from the use of the going concern assumption in the preparation of financial statements. [IFRIC 21.9, IFRIC 21.10].

When a levy is payable progressively, for example, as the entity generates revenues, the entity recognises a liability over a period of time on that basis. This is because the obligating event is the activity that generates revenues. [IFRIC 21.11]. If an obligation to pay a levy is triggered in full as soon as a minimum threshold is reached, such as when the entity commences generating sales or achieves a certain level of revenue, the liability is recognised in full on the first day that the entity reaches that threshold. [IFRIC 21.12]. If an entity pays over amounts to government before it is determined that an obligation to pay that levy exists, it recognises an asset. [IFRIC 21.14].

Illustration 6-8: A levy is triggered in full as soon as the entity generates revenues

An entity with a calendar year end generates revenues in a specific market in 20X1. The amount of the levy is determined by reference to revenues generated by the entity in the market in 20X0 although the levy is only payable when revenues are generated in 20X1. The entity generated revenues in the market in 20X0 and starts to generate revenues in the market in 20X1 on 3 January 20X1.

In this example, the liability is recognised in full on 3 January 20X1 because the obligating event, as identified by the legislation, is the first generation of revenues in 20X1. The generation of revenues in 20X0 is necessary, but not sufficient, to create a present obligation to pay a levy. Before 3 January 20X1, the entity has no obligation. In other words, the activity that triggers the payment of the levy as identified by the legislation is the first generation of revenues at a point in time in 20X1. The generation of revenues in 20X0 is not the activity that triggers the payment of the levy. The amount of revenues generated in 20X0 only affects the measurement of the liability. [IFRIC 21.IE1 Example 2].

The table below summarises the illustrative examples that accompany IFRIC 21, which provide guidelines on how to account for the timing of the recognition for the various types of levies: [IFRIC 21.IE1]

Illustrative examples	Obligating event	Recognition of liability
Levy triggered progressively as revenue is generated in a specified period.	Generation of revenue in the specified period.	Recognise progressively. A liability must be recognised progressively because, at any point in time during the specified period, the entity has a present obligation to pay a levy on revenues generated to date.
Levy triggered in full as soon as revenue is generated in one period, based on revenues from a previous period.	First generation of revenue in subsequent period.	Full recognition at that point in time. Where an entity generates revenue in one period, which serves as the basis for measuring the amount of the levy, the entity does not become liable for the levy, and therefore cannot recognise a liability, until it first starts generating revenue in the subsequent period.
Levy triggered in full if the entity operates as a bank at the end of the annual reporting period.	Operating as a bank at the end of the reporting period.	Full recognition at the end of the annual reporting period. Before the end of the annual reporting period, the entity has no present obligation to pay a levy, even if it is economically compelled to continue operating as a bank in the future. The liability is recognised only at the end of the annual reporting period.
Levy triggered if revenues are above a minimum specified threshold (e.g., when a certain level of revenue has been achieved)	Reaching the specified minimum threshold.	Recognise an amount consistent with the obligation at that point of time. A liability is recognised only at the point that the specified minimum threshold is reached. For example, a levy is triggered when an entity generates revenues above specified thresholds: 0% for the first CU50 million and 2% above CU50 million. In this example, no liability is accrued until the entity's revenues reach the revenue threshold of CU50 million.

As set out in the table above, when a levy is triggered progressively, for example, as the entity generates revenues, the entity recognises a liability over the period of time on that basis. Some examples of progressive-type levies are set out below.

Illustration 6-9: Recognising a liability for levies that are triggered progressively

Scenario 1: Minimums

The legislation prescribes that no levy is triggered until revenues reach a certain threshold. There is a 0% tax rate on revenues until they reach CU50 million, with a payment of 2% of revenues in excess of that amount. For an entity that earns CU49 million as at 30 June 20X1, CU51 million as at 31 July 20X1 and CU100 million as at 31 December 20X1, the following liabilities are recognised:

- 30 June 20X1 - No provision is recognised
- 31 July 20X1 - CU20,000 provision is recognised ($2\% \times \text{CU1 million}$)
- And
- 31 December 20X1 - CU1 million provision is recognised ($2\% \times \text{CU50 million}$)

Scenario 2: Progressive tax rates

The legislation prescribes that the tax rate is escalating. There is a 2% tax rate on the first CU50 million in revenues and 3% for revenues in excess of CU50 million.

For an entity that earns CU49 million as at 30 June 20X1, CU51 million as at 31 July 20X1 and CU100 million as at 31 December 20X1, the following liabilities are recognised:

- 30 June 20X1 - CU980,000 provision is recognised ($2\% \times \text{CU49 million}$)
- 31 July 20X1 - CU1,030,000 provision is recognised ($(2\% \times \text{CU50 million}) + (3\% \times \text{CU1 million})$)
- And
- 31 December 20X1 - CU2.5 million provision is recognised ($(2\% \times \text{CU50 million}) + (3\% \times \text{CU50 million})$)

Scenario 3: Specified formula

The legislation prescribes that the levy is calculated based on a specified formula that does not match the actual activity for the period. A calendar year-end entity has to pay a monthly levy based on 0.1% of a 12-month rolling average of gross profit.

Under the legislation, the 12-month period which the rolling average of the gross profit would be based on relates to the preceding 12 months, for example:

Date	Preceding 12 months	12 month rolling average (CU)	Liability to be recognised (CU)
30 June 20X1	1 July 20X0 - 30 June 20X1	50 million	50,000
31 July 20X1	1 August 20X0 - 31 July 20X1	60 million	60,000
31 December 20X1	1 January 20X1 - 31 December 20X1	40 million	40,000

When the legislation provides that a levy is triggered by an entity operating in a market only at the end of its annual reporting period, no liability is recognised until the last day of the annual reporting period. No amount is recognised before that date in anticipation of the entity still operating in the market. Accordingly, a provision would not be permitted to be recognised in interim financial statements if the obligating event occurs only at the end of the annual reporting period. [IFRIC 21.IE1 Example 3]. The accounting treatment in interim reports is discussed in Chapter 37.

6.8.3 Recognition of an asset or expense when a levy is recorded

IFRIC 21 only provides guidance on when to recognise a liability, which is the credit side of the journal entry. The interpretation specifically states that it does not address whether the debit side of the journal entry is an asset or an expense, [IFRIC 21.3], except in the case of prepaid levies. [IFRIC 21.14].

Prepayments may be fairly common in arrangements in which the legislation requires entities to pay levies in advance and where the obligating events for these levies are progressive. For example, property taxes that are paid in advance at a specified date (e.g., 1 January) for an obligating event that relates to future periods (e.g., 1 January to 31 December). In such instances, the entity would recognise the prepaid levy as an asset. [IFRIC 21.14]. In this scenario, the prepaid levy would then be amortised over the period.

Aside from prepaid levies, there are also instances when the assessment of expensing the liability or recognising a corresponding asset requires the application of other IFRS accounting standards, such as IAS 2, IAS 16 or IAS 38. Given that levies are imposed by government and arise from non-exchange transactions, there would not typically be a clear linkage to future economic benefits. Consequentially, if the incurrence of the liability does not give rise to an identifiable future economic benefit to the entity, the recognition of an asset would be inappropriate as the definition of an asset would not be met. In such cases, the debit side would therefore be to an expense account.

In the case where asset recognition is appropriate under other IFRS accounting standards, levies are generally not expected to give rise to a stand-alone asset in its own right, given that payments for the acquisition of goods or services are scoped out of IFRIC 21. [IFRIC 21.5]. However, a levy may form part of the acquisition costs of some other asset, provided it meets the asset recognition criteria in other IFRS accounting standards. For example, an entity may be required to pay an import duty to the government under legislation for any large cargo trucks purchased from overseas. The entity uses the large cargo trucks as part of their operations to transport their goods to customers locally and therefore capitalises the trucks as part of property, plant and equipment under IAS 16. The import duty that is payable under the legislation could give rise to an IFRIC 21 levy, which would also be capitalised as part of the cost of the asset. [IAS 16.16(a)].

6.8.4 Payments relating to taxes other than income tax

As discussed in section 6.8.1 above, IFRIC 21 does not apply to income taxes in scope of IAS 12. However, the IFRS IC concluded that any taxes not within the scope of other IFRS accounting standards (such as IAS 12) are within the scope of IAS 37. Therefore, such taxes would be within the scope of IFRIC 21. [IFRIC 21.BC4].

In 2018, the IFRS IC began discussing a fact pattern where an entity is in dispute with a tax authority in respect of a tax other than income tax. The entity determines that it is probable that it does not have an obligation for the disputed amount and consequently, it does not recognise a liability applying IAS 37. The entity nonetheless pays the disputed amount to the tax authority, either voluntarily or because it is required to do so. The entity has no right to a refund of the amount before resolution of the dispute. Upon resolution, either the tax authority returns the payment to the entity (if the outcome of the dispute is favourable to the entity) or the payment is used to settle the tax liability (if the outcome of the dispute is unfavourable to the entity).

In January 2019, the IFRS IC observed that the payment made by the entity gives rise to an asset as defined in both the *Conceptual Framework for Financial Reporting* issued in March 2018, and the definition in the previous *Conceptual Framework* that was in place when many existing IFRS accounting standards were developed. The tax deposit gives the entity a right to receive future economic benefits, either in the form of a cash refund or by using the payment to settle the tax liability. The nature of the tax deposit, either voluntary or required, does not affect the conclusion that there is an asset. The right is not a contingent asset as defined in IAS 37 because it is an asset, and not a possible asset, of the entity. The entity therefore recognises an asset when it makes the payment to the tax authority.³⁸

6.9 Dilapidation and other provisions relating to leased assets

As discussed in section 5.2 above, it is not appropriate to recognise provisions that relate to repairs and maintenance of owned assets. However, the position can be different in the case of obligations relating to assets held under leases. Nevertheless, the same principles under IAS 37 apply:

- (a) Provisions are recognised only for obligations existing independently of the entity's future actions (i.e., the future conduct of its business) and in cases where an entity can avoid future expenditure by its future actions, for example, by changing its method of operation, it has no present obligation. [IAS 37.19].
- (b) Financial statements deal with an entity's position at the end of the reporting period and not its possible position in the future. Therefore, no provision is recognised for costs that need to be incurred to operate in the future. [IAS 37.18].
- (c) For an event to be an obligating event, the entity must have no realistic alternative to settling the obligation created by the event. [IAS 37.17].

Leases often contain clauses which specify that the lessee will incur periodic charges for maintenance, make good dilapidations or other damage occurring during the rental period or return the asset to the configuration that existed as at inception of the lease. These contractual provisions may restrict the entity's ability to change its future conduct to avoid the expenditure. For example, the entity might not be able to transfer the asset in its existing condition. Alternatively, the entity could return the asset to avoid the risk of incurring costs relating to any future damage, but would have to make a payment in relation of dilapidations incurred to date. Therefore, the contractual obligations in a lease could create an environment in which a present obligation could exist as at the reporting date from which the entity cannot realistically withdraw.

Under principle (b) above, any provision must reflect only the conditions as at the reporting date. This means that a provision for specific damage done to the leased asset would merit recognition, as the event giving rise to the obligation under the lease has certainly occurred. For example, if an entity has erected partitioning or internal walls in a leasehold property and under the lease these must be removed at the end of the term, then provision is made for this cost (on a discounted basis, if material) at the time of putting up the partitioning or the walls. In this case, an equivalent asset would be recognised and depreciated over the term of the lease. This is similar to a decommissioning provision discussed in section 6.3 above. Another example would be where an airline company leases aircraft, and upon delivery of the aircraft has made changes to the interior fittings and layout, but under the leasing arrangements must return the asset to the configuration that existed as at inception of the lease.

38 [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

What is less clear is whether a more general provision can be built up over time for maintenance charges and dilapidation costs in relation to a leased asset. It might be argued that in this case, the event giving rise to the obligation under the lease is simply the passage of time, and so a provision can be built up over time. However, in our view the phrase 'the event giving rise to the obligation under the lease' indicates that a more specific event must occur; there has to be specific evidence of dilapidation etc. before any provision can be made. That is, it cannot be assumed that the condition of a leased asset has deteriorated simply because time has passed. However, in practice, it will often be the case that dilapidations do occur over time, in which case a dilapidations provision would be recognised as those dilapidations occur over the lease term. Illustration 5-1 in section 5.2 above dealt with an owned aircraft that by law needs overhauling every three years, but no provision could be recognised for such costs. Instead, IAS 37 suggests that an amount equivalent to the expected maintenance costs is treated as a separate part of the asset and depreciated over three years. Airworthiness requirements for the airline industry are the same irrespective of whether the aircraft is owned or leased. So, if an airline company leases the aircraft, should a provision be made for the overhaul costs? The answer will depend on the terms of the lease.

How we see it

Leases often contain clauses which specify that the lessee is required to make good dilapidations or other damage occurring during the rental period or return the asset to the configuration that existed as at inception of the lease. However, there must be specific evidence of dilapidation before any provision can be made. It cannot be assumed that the condition of a leased asset has deteriorated simply because time has passed.

For a lessee, the accounting for contractual overhaul obligations will require careful consideration. IFRS 16 requires the depreciation requirements of IAS 16 to be applied in the subsequent measurement of a right-of-use asset. [IFRS 16.31]. Under the depreciation requirements of IAS 16, each part of an asset with a cost that is significant in relation to the total cost of the item must be depreciated separately. [IAS 16.44, IAS 16.45]. The application of this 'component approach' to the right-of-use asset could imply an approach similar to that suggested in Illustration 5-1 in section 5.2 above for owned assets. Determining an appropriate accounting policy for how the application of component accounting for the right-of-use asset would interact with the recognition of provisions for regulatory overhauls under IAS 37 requires judgement. The fact that a provision for repairs can be made at all for leased assets might appear inconsistent with the case where the asset is owned by the entity. In that case, as discussed in section 5.2 above, no provision for repairs could be made. There is, however, a difference between the two situations. Where the entity owns the asset, it has the choice of selling it rather than repairing it, and so the obligation is not independent of the entity's future actions. However, in the case of an entity leasing the asset, it can have a contractual obligation to repair any damage from which it cannot walk away.

6.10 Warranty provisions

Warranty provisions are specifically addressed in one of the examples appended to IAS 37. However, as noted in section 2.2.1.B above, an entity would apply IFRS 15 to separately purchased warranties and to those warranties determined to provide the customer with a service in addition to the assurance that the product complies with agreed-upon specifications. Only if a customer does not have the option to purchase a warranty separately and the warranty is determined only to provide assurance that the product complies with agreed-upon specifications would an entity consider IAS 37. [IFRS 15.B30]. The requirements for warranties falling within the scope of IFRS 15 are considered further in Chapter 28.

The following Illustration shows how warranty costs are addressed if IAS 37 applies.

Illustration 6-10: Recognition of a provision for warranty costs

A manufacturer gives warranties at the time of sale to purchasers of its product. Under the terms of the contract for sale, the manufacturer undertakes to make good, by repair or replacement, manufacturing defects that become apparent within three years from the date of sale. On past experience, it is probable (i.e., more likely than not) that there will be some claims under the warranties.

In these circumstances the obligating event is the sale of the product with a warranty, which gives rise to a legal obligation. Because it is more likely than not that there will be an outflow of resources for some claims under the warranties as a whole, a provision is recognised for the best estimate of the costs of making good under the warranty for those products sold before the end of the reporting period. [IAS 37.IE Example 1].

The assessment of the probability of an outflow of resources is made across the population as a whole, and not using each potential claim as the unit of account. [IAS 37.24]. On past experience, it is probable that there will be some claims under the warranties, so a provision is recognised.

The assessment over the class of obligations as a whole makes it more likely that a provision will be recognised, because the probability criterion is considered in terms of whether at least one item in the population will give rise to a payment. Recognition then becomes a matter of reliable measurement and entities calculate an expected value of the estimated warranty costs. IAS 37 discusses this method of 'expected value' and illustrates how it is calculated in an example of a warranty provision. [IAS 37.39]. See Illustration 4-1 in section 4.1 above.

An example of a company that makes a warranty provision is AB Volvo as shown below:

Practical example 6-4: AB Volvo (2023)

Sweden

VOLVO GROUP ANNUAL REPORT 2023 [extract]

Financial statements [extract]

Notes to the financial statements [extract]

21 Other provision [extract]

ACCOUNTING POLICY [extract]

Provisions for product warranty

Provisions for product warranty are recognized as cost of sales and include contractual warranty and campaign warranty. Provisions for contractual warranty are recognized when the products are sold. Provision for campaigns in connection with specific quality problems are recognized when the campaign is decided.

SOURCE OF ESTIMATION UNCERTAINTY AND CRITICAL JUDGMENTS [extract]

Provisions for product warranty

Warranty provisions are estimated with consideration of historical statistics with regard to known changes in warranty claims, warranty periods, the average time-lag between faults occurring until claims are received by the company and anticipated changes in quality indexes. The actual outcome of product warranties may deviate from the expected outcome and materially affect the warranty costs and provisions in future periods. Refunds from suppliers, that decrease the Volvo Group's warranty costs, are recognized to the extent these are considered to be certain.

2 ➤ Read more in Note 3 Acquisitions and divestments of operations, for a description of acquired and divested operations as well as assets and liabilities held for sale.

...

The Volvo Group has detected that an emissions control component used in certain markets and models, may degrade more quickly than expected, affecting the vehicles emission performance negatively. The Volvo Group made a provision of SEK 7 billion impacting the operating income in 2018, relating to the estimated costs to address the issue. The negative cash flow effect started in 2019 and will continue in the coming years. As of year-end 2023, approximately half of the initial provision had been utilized. The Volvo Group will continuously assess the size of the provision as the matter develops.

...

6.11 Litigation and other legal claims

IAS 37 includes an example of a court case in its appendix to illustrate how its principles distinguish between a contingent liability and a provision in such situations. See Illustration 3-4 in section 3.2.1 above. However, the assessment of the particular case in the example is clear-cut. In most situations, assessing the need to provide for legal claims is one of the most difficult tasks in the field of provisioning. This is due mainly to the inherent uncertainty in the judicial process itself, which may be very long and drawn out. Furthermore, this is an area where either provision or disclosure might risk prejudicing the outcome of the case, because they give an insight into the entity's own view on the strength of its defence that can assist the claimant.

In principle, whether a provision is recognised will depend on whether the three conditions for recognising a provision are met, i.e.,

- (a) There is a present obligation as a result of a past event
- (b) It is probable that an outflow of resources embodying economic benefits will be required to settle the obligation

And

- (c) A reliable estimate can be made of the amount of the obligation [IAS 37.14]

In situations such as these, a past event is deemed to give rise to a present obligation if, taking account of all available evidence (including, for example, the opinion of experts), it is more likely than not that a present obligation exists at the end of the reporting period. [IAS 37.15]. The evidence to be considered includes any additional evidence occurring after the end of the reporting period. Accordingly, if on the basis of the evidence it is concluded that a present obligation is more likely than not to exist, a provision will be required, assuming the other conditions are met. [IAS 37.16].

Condition (b) will be met if the transfer of economic benefits is more likely than not to occur, that is, it has a probability greater than 50%. In making this assessment, it is likely that any expert advice received would need to be considered.

As far as condition (c) is concerned, the standard takes the view that a reasonable estimate can generally be made and it is only in extremely rare cases that this will not be the case. [IAS 37.25].

Clearly, whether an entity is required to make provision for the costs of settling a case or to meet any award given by a court will depend on a reasoned assessment of the particular circumstances, based on appropriate legal advice.

Whilst litigation can arise in respect of many areas of business activities, lawsuits linked to climate-related matters may become more common as the focus on climate change by governments, other organisations and the public increases. The outcome of these lawsuits will often be uncertain. This is discussed in the disclosure below by Shell plc.

Practical example 6-5: Shell plc (2023)

United Kingdom

Annual Report and Accounts [extract]

Financial Statements and Supplements [extract]

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

31. Legal proceedings and other contingencies [extract]

Climate change litigation

In the USA, energy companies (including Shell), industry associations, and others have been named in several matters alleging responsibility for the impacts of climate change due to the use of fossil fuels. These matters assert a number of different theories of liability for a wide variety of harms, including but not limited to, impacts to public and private infrastructure, natural resources, and public health and services. As of December 31, 2023, 24 lawsuits naming Shell as a defendant were pending, three claims were filed but not yet served, and one petition to preserve testimony was pending.

In the Netherlands, in a case against Shell brought by a group of environmental non-governmental organisations (eNGOs) and individual claimants, the Court found that while Shell is not currently acting unlawfully, Shell must reduce the aggregate annual volume of CO₂ emissions of Shell operations and energy-carrying products sold across Scopes 1, 2 and 3 by 45% (net) by the end of 2030 relative to its 2019 emissions levels (the "Dutch Court Order"). For Scopes 2 and 3, this is a significant best-efforts obligation. Shell appealed that ruling and a hearing is scheduled to take place before the Dutch Court of Appeal of The Hague in April 2024.

Management believes the outcome of these matters should be resolved in a manner favourable to Shell, but there remains a high degree of uncertainty regarding the ultimate outcome of these lawsuits, as well as their potential effect on future operations, earnings, cash flows and Shell's financial condition.

6.12 Refunds policy

Illustration 3-1 in section 3.1.1 above reflects an example given in the appendix of IAS 37 of a retail store that has a policy of refunding goods returned by dissatisfied customers. There is no legal obligation to do so, but the company's policy of making refunds is generally known. The example argues that the conduct of the store has created a valid expectation on the part of its customers that it will refund purchases. The obligating event is the original sale of the item, and the probability of some economic outflow is greater than 50%, as there will nearly always be some customers demanding refunds. Hence, a provision is required, [IAS 37.IE Example 4], presumably calculated on the 'expected value' basis.

This example is straightforward when the store has a very specific and highly publicised policy on refunds. However, some stores' policies on refunds might not be so clear cut. A store may offer refunds under certain conditions, but not widely publicise its policy. In these circumstances, there might be doubt as to whether the store has created a valid expectation on the part of its customers that it will honour all requests for a refund.

As with warranty costs (discussed in section 6.10 above), the accounting treatment of refunds impinges into the area of revenue recognition. Under IFRS 15, an entity recognises the amount of expected returns as a refund liability, representing its obligation to return the customer's consideration. [IFRS 15.55]. As noted in section 2.2.1.B above, other than contracts with customers that are, or have become onerous, contracts in scope of IFRS 15 are outside the scope of IAS 37. [IAS 37.5(g)].

6.13 Self-insurance

Another situation where entities sometimes make provisions is self-insurance which arises when an entity decides not to take out external insurance in respect of a certain category of risk because it would be uneconomic to do so. The same position may arise when a group insures its risks with a captive insurance subsidiary, the effects of which have to be eliminated on consolidation. In fact, the term 'self-insurance' is potentially misleading, since it really means that the entity is not insured at all and will settle claims from third parties from its own resources in the event that it is found to be liable. Accordingly, the recognition criteria in IAS 37 must be applied, with a provision being justified only if there is a present obligation as a result of a past event; if it is probable that an outflow of resources will occur; and a reliable estimate can be determined. [IAS 37.14].

Therefore, losses are recognised based on their actual incidence and any provisions that appear in the statement of financial position must reflect only the amounts expected to be paid in respect of those incidents that have occurred by the end of the reporting period.

In certain circumstances, a provision will often be needed not simply for known incidents, but also for those which insurance companies call IBNR - Incurred But Not Reported - representing an estimate of claims that have occurred at the end of the reporting period but which have not yet been notified to the reporting entity. It is less likely to be appropriate when assessing a small number of distinct claims, but could be needed when estimating the amount of a provision for a larger population of claims with common characteristics. We believe that it is appropriate that provision for such expected claims is made to the extent that such items can be measured reliably.

6.14 Obligations to make donations to non-profit organisations

When an entity promises to make donations to a non-profit organisation it can be difficult to determine whether a past obligating event exists that requires a provision to be recognised or whether it is appropriate instead to account for the gift as payments are made.

Illustration 6-11: Accounting for donations to non-profit organisations

An entity decides to enter into an arrangement to 'donate' CU1m in cash to a university. A number of different options are available for the arrangement and the entity's management want to determine whether the terms of these options make any difference to the timing, measurement or presentation of the CU1m expenditure, as follows:

Option 1:

The entity enters into an unenforceable contract to contribute CU1m for general purposes. The benefits to the entity are deemed only to relate to its reputation as a 'good corporate citizen'; the entity does not receive any consideration or significant benefit from the university in return for the donation.

Option 2:

As per Option 1 except the entity publishes a press release in relation to the donation and announcing that payment is to be made in equal instalments of CU200,000 over 5 years.

Option 3:

As per Option 2, except that the contract is legally enforceable in the event that the entity does not pay all the instalments under the contract.

Option 4:

As per Option 2, except that the entity is only required to make the donation if the university raises CU4m from other sources.

Option 5:

As per Option 2, except that the contract is legally enforceable and the funds will be used for research and development activities specified by the entity. The entity will retain proprietary rights over the results of the research.

The following principles are relevant in determining when a promise to make a donation is recognised as an obligation:

- To the extent that there is an enforceable contract, the donor is required to recognise an expense and a liability upon entry into that contract.
- Where the agreement is not enforceable, the donor recognises an expense and a liability when a constructive obligation arises. The timing of recognition depends on whether the donation is conditional, whether it is probable that those conditions are substantially met and whether a past event has occurred.
- If the donor expects to receive benefits commensurate with the value of the donation, the arrangement is treated as an exchange transaction. Such transactions are, in some cases, executory contracts and could also give rise to the recognition of an asset rather than an expense.

In cases where the 'donation' is made under an enforceable contract, a present obligation is created when the entity enters into that contract. When payment is required in cash, the signing of an enforceable contract gives rise to a financial liability, [IAS 32.11], which is measured initially at fair value. [IFRS 9.5.1.1].

Where there is no legal obligation to make the payments, a liability is recognised when a constructive obligation arises. It is a matter of judgement whether and when a constructive obligation exists. In many unenforceable contracts, a signed contract would not, in itself, be sufficient to create a constructive obligation. Hence, in the absence of other facts and circumstances that would create a constructive obligation, the donor would recognise the expenditure when the cash or other assets are transferred.

By contrast, an exchange transaction is a reciprocal transfer in which each party receives and sacrifices approximately equal value. Assets and liabilities are not recognised until each party performs their obligations under the arrangement.

Applying these principles to the options listed in Illustration 6-11 above:

- In Option 1, the contract is unenforceable, there is no announcement or conditions preceding payment and there is no exchange of benefits. Accordingly, an expense would be recognised only when the entity transfers cash to the university.
- For Option 2, it could be appropriate for the entity to conclude that the entity's announcement of the donation to be paid by instalments indicates that there is a constructive obligation because the entity has created a valid expectation that it will make all of the payments promised. Alternatively, it could determine that once the first instalment is paid, the entity has created a valid expectation that it will make the remaining payments. This is a matter of judgement. In this case, the entity would recognise an expense and a liability, measured at the net present value of the 5 instalments of CU200,000, at the point when it is determined that a constructive obligation exists.
- Option 3 involves an enforceable contract with no exchange of benefits. Therefore, a liability and an expense are recognised on signing the enforceable contract, measured at the fair value of the 5 instalments of CU200,000.
- Under Option 4, the contract is unenforceable and the donation is subject to a condition. In these circumstances, whether there is a constructive obligation to make the donation is a matter of judgement. Management might conclude that no constructive obligation exists until it is probable that the condition is met (which might not be until the additional funds have been collected). Only then would a liability and expense be recognised, measured at the net present value of the CU1m promised.
- Option 5 involves an enforceable contract which could give rise to a liability when the contract is signed. However, there is an exchange of benefits relating to the research and development activities performed on behalf of the entity. Whether these benefits have a value of at least the present value of the 5 instalments of CU200,000 is a matter of judgement. If it is determined that this is an exchange transaction that is not onerous, the entity could regard the signing of the contract as executory and could apply the criteria in IAS 38 to determine whether an asset or expense would be recognised for the related research and development costs as incurred (see Chapter 18).

Where the arrangement gives rise to an exchange transaction rather than a donation, the expenditure incurred by the donor is recorded in accordance with the relevant IFRS accounting standard.

6.15 Settlement payments

A similar issue to that discussed in section 6.14 above arises when an entity promises to make a settlement payment in cases where an entity believes that there is no present legal obligation. For example, an entity dismisses an employee for behaving in a manner which breaches their employment contract. The entity determines that it has no present legal obligation under the terms of the employment contract or employment law, but promises to make a settlement payment to the former employee in order to avoid future possible lawsuits and unfavourable publicity. It can be difficult to determine whether a past obligating event exists that requires a provision to be recognised before payment to the employee is made.

Where there is no legal obligation to make the payments, a liability is recognised when a constructive obligation arises. It is a matter of judgement whether and when a constructive obligation exists. A binding agreement to make a payment to the former employee could give rise to a legal obligation. In the absence of facts and circumstances that would create a constructive or legal obligation prior to settlement, the entity would recognise the settlement as an expense when the cash is transferred.

6.16 Negative low emission vehicle credits

In 2021, the IFRS IC received a request asking whether particular government measures to encourage reductions in vehicle carbon emissions give rise to obligations that meet the definition of a liability. In the fact pattern discussed:

- Entities that produce or import passenger vehicles for sale in a specified market receive positive credits if, in a calendar year, they have produced or imported vehicles whose average fuel emissions are lower than a government target.
- Entities that have, in a calendar year, produced or imported vehicles whose average fuel emissions are higher than the target receive negative credits.
- The measures require an entity that receives negative credits for one year to eliminate these negative credits by obtaining and surrendering positive credits. The entity can obtain positive credits either by purchasing them from another entity or by generating them itself in the next year (by producing or importing more low-emission vehicles).
- If the entity fails to eliminate its negative credits, the government can impose sanctions on the entity. These sanctions would not require payment of fines or penalties, or any other outflow of resources embodying economic benefits, but could deny the entity opportunities in the future, for example, by restricting the entity's access to the market.

The IFRS IC observed that, in determining whether it has a liability, the entity described in the request would consider:

- (a) Whether settling an obligation to eliminate negative credits would result in an outflow of resources embodying economic benefits.
 - (b) Which event creates a present obligation to eliminate negative credits.
- And
- (c) Whether the entity has no realistic alternative to settling the obligation.

The IFRS IC concluded that:³⁹

- An entity can settle an obligation to eliminate negative credits either by purchasing credits from another entity or by generating positive credits itself next year. The IFRS IC concluded that either method of settling the obligation would result in an outflow of resources embodying economic benefits. These resources are the positive credits the entity would surrender to eliminate the negative balance. The entity could otherwise have used self-generated positive credits for other purposes - for example, to sell to other entities with negative credits.
- In the fact pattern described in the request, the activity that triggers a requirement to eliminate negative credits is the production or import of vehicles with average fuel emissions higher than the government target. If, in a calendar year, an entity has produced or imported vehicles with average fuel emissions higher than the government target, an obligation (a) has arisen from past events; (b) exists independently of the entity's future actions. The entity's future actions will determine only the means by which the entity settles its present obligation - whether it purchases positive credits from another entity or generates positive credits itself by producing or importing more low-emission vehicles.

The IFRS IC observed also that a present obligation could arise at any date within a calendar year, on the basis of the entity's production or import activities to that date, not only at the end of the calendar year.

- The measures described in the request could give rise to a legal obligation, as (a) obligations that arise under the measures derive from an operation of law; and (b) the sanctions the government can impose under the measures would be the mechanism by which settlement may be enforceable by law. The IFRS IC observed that an entity would have a legal obligation that is enforceable by law if accepting the possible sanctions for non-settlement is not a realistic alternative for that entity. Determining whether accepting sanctions is a realistic alternative requires judgement and will depend on the nature of the sanctions and the entity's specific circumstances.
- If an entity determines has no legal obligation to eliminate its negative credits, it would need to consider whether it has a constructive obligation to do so. It would have a constructive obligation if it has both (a) in a calendar year, produced or imported vehicles with average fuel emissions higher than the government target; and (b) taken an action that creates valid expectations in other parties that it will eliminate the resulting negative credits - for example, made a sufficiently specific current statement that it will do so.

The IFRS IC observed that, having identified an obligation arising from the government measures set out in the request, an entity would apply other requirements in IAS 37 to determine how to measure the liability. The IFRS IC did not discuss those other requirements.

6.17 Net zero commitments

In recent years, many entities have declared that they intend to reduce and / or offset their greenhouse gas emissions with the aim of achieving net zero emissions. Disclosed net-zero commitments might merely establish the intent to reduce greenhouse gas emissions without specifying how the entity expects to achieve its goals. However, others might provide details of their short- or medium-term plans. The financial reporting consequences of such net zero commitments will vary depending on the nature of the declarations. Entities will need to assess whether they have a legal or constructive obligation that requires recognition of a provision. Under IAS 37, only those obligations arising from past events that exist independently of an entity's future actions can be recognised as a provision. [IAS 37.19].

In November 2023, the IFRS IC discussed a submission related to climate-related (net-zero) commitments made by an entity. An agenda decision was subsequently published in March 2024.⁴⁰ The IFRIC IC discussed in detail the IAS 37 requirements with regards to the existence of constructive obligations. As discussed at section 3.1.1 above, a constructive obligation is an obligation that derives from an entity's actions where:

- (a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities
And
- (b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities [IAS 37.10]

³⁹ [IFRIC Update](#), June 2022, available on the IFRS Foundation's website.

⁴⁰ [IFRIC Update](#), March 2024, available on the IFRS Foundation's website.

IAS 37 states that an obligation always involves another party to whom the obligation is owed, but that it is not necessary to know the identity of that party - the obligation may be to the public at large. [IAS 37.20]. The IFRS IC observed that a constructive obligation to reduce or offset greenhouse gas emissions, if one exists, would be owed to all people adversely affected by the emissions so would extend to the public at large.

The IFRS IC noted that determining whether the entity has created a valid expectation will depend on the facts of the commitment and the circumstances surrounding it. Therefore, management needs to apply judgement to reach a conclusion. If those facts or circumstances change over time, the conclusion could do so as well. The IFRS IC discussed several factors, which are not exhaustive, that entities should consider in their analysis, such as:

- (a) What language is used in the statement? If statements describe the actions the entity 'will take', 'is committed to taking' or 'pledges to take', they are more likely to indicate that the entity will fulfil the commitment than statements that describe the entity's 'ambitions', 'targets' or 'aspirations'.
- (b) What is the specificity and status of plans supporting the statement? Statements are more likely to raise a valid expectation that the entity will achieve its target to reduce its greenhouse gas emissions if they are supported by formally-approved plans detailing, for example:
 - (i) The nature and timing of the actions the entity will take to achieve the reductions
 - (ii) Milestones the entity has committed to achieve on the path to longer term goals
 - (iii) How management will measure progress towards the milestones and longer-term goals (for example, the metrics an entity will use).
- (c) What is the expected timing of the actions required to fulfil the commitment? Plans for short- and medium-term actions are less likely to be changed than those for longer-term actions.
- (d) Is there publicly available evidence of progress to date? Evidence that the entity has achieved milestones it committed to in previous statements may enhance expectations that it will achieve milestones and longer-term goals it commits to in its current statement. Conversely, evidence that an entity has failed to achieve previous milestones may reduce those expectations.⁴¹

If the entity's statement has not created a constructive obligation, the entity does not recognise a provision. If the entity's statement has created a constructive obligation, consideration must then be given to whether that obligation satisfies the criteria for recognising a provision. IAS 37 requires an entity to recognise a provision when the following criteria are met:

- (a) The entity has a present obligation (legal or constructive) as a result of a past event
- (b) It is probable that an outflow of resources embodying economic benefits will be required to settle the obligation

And

- (c) A reliable estimate can be made of the obligation [IAS 37.14]

In considering criterion (a), the IFRS IC observed that, "...just as the enactment of a law is not sufficient to give an entity a present legal obligation, the publication of a policy or statement is not sufficient to give an entity a present constructive obligation-an entity has a present legal or constructive obligation only when the event to which the law, policy or statement applies has occurred. For example, as illustrated in Illustrative Example 2B accompanying IAS 37, an entity with a widely published policy of cleaning up land it contaminates incurs a present obligation only when it contaminates land-publishing the policy is necessary but not sufficient to give the entity a present obligation."⁴²

The IFRS IC noted that IAS 37 requires that provisions are not recognised for costs that need to be incurred to operate in the future [IAS 37.18], and it is only those obligations arising from past events that exist independently of an entity's future actions (i.e., the future conduct of its business) that are recognised as provisions. [IAS 37.19].

41 [IFRS IC Staff Paper 2](#), Project: Climate-related Commitments (IAS 37), Topic: Initial Consideration, November 2023. Available on the IFRS Foundation's website.

42 [IFRIC Update](#), March 2024, available on the IFRS Foundation's website.

In the context of climate-related (net-zero) commitments:

- When the entity publishes a climate-related (net-zero) commitment that requires future action (e.g., modifying its manufacturing methods, purchasing and retiring carbon credits in the future), the related costs need to be incurred to operate in the future. The obligations to incur those costs do not exist independently of the entity's future actions. Accordingly, there is no present obligation for those costs when the entity publishes its commitment.
- An entity will have a present obligation for the modifications to its manufacturing methods once it has to pay for resources it purchases to modify its methods - for example, to pay for new plant or equipment or for renewable energy - but only when it receives those resources. Similarly, in the case of a commitment to offset greenhouse gas emissions, the entity will have a present obligation only when the entity emits the gases it has committed to offset.

In considering criterion (b), whether a constructive obligation satisfies the probable outflows criterion depends on the nature of the actions required to settle it. Even if an entity will incur expenditure to settle an obligation, it will not suffer a net outflow of resources if it receives resources of equal value in exchange for that expenditure. For example, an entity may expect to incur expenditure on low-emission plant and equipment in order to modify its manufacturing methods to meet net zero commitments. In that case, the entity will receive resources (plant and equipment) of equal value in exchange for the cash outflow, and no net outflow of resources embodying economic benefits will be required to settle the obligation.

A contractual commitment to purchase low-emission plant and equipment would usually be in scope of IAS 16 rather than IAS 37 and would require disclosure. [IAS 16.74(c)]. Executory contracts, such as contractual commitments for the acquisition of plant and equipment, are within the scope of IAS 37 only if they are onerous. [IAS 37.3]. Executory contracts are dealt with in section 2.2.1.A above.

Where an entity has a constructive obligation to offset greenhouse gas emissions, settling the constructive obligation will require an outflow of resources embodying economic benefits, as the entity will be required to buy and retire carbon credits without receiving any resources embodying economic benefits in exchange.

In considering criterion (c), it is relevant to note that IAS 37 states that 'except in extremely rare cases, an entity will be able to determine a range of possible outcomes and can therefore make an estimate of the obligation that is sufficiently reliable to use in recognising a provision'. [IAS 37.25]. The IFRS IC observed that it is likely that the entity would be able to make a reliable estimate of the amount of a constructive obligation that satisfies the other recognition criteria.

If a provision is recognised, the IFRS IC observed that the corresponding amount is recognised as an expense, rather than as an asset, unless it gives rise to, or forms part of the cost of, an item that qualifies for recognition as an asset in accordance with an IFRS accounting standard.

Illustration 6-12 below, which is based on an example discussed by the IASB as part of its Provisions - Targeted Improvements project,⁴³ is consistent with the conclusions of the IFRS IC included in the agenda decision published in March 2024.

Illustration 6-12: Recognising a provision for a net zero commitment

In March 20X0, a manufacturer publicly announces its commitment to becoming 'net zero' by 20X5. It announces it will:

- (a) Immediately start to change the way it manufactures its products with the aim of gradually reducing its greenhouse gas emissions, so they are no more than 40% of their current level by 20X5; and
- (b) In 20X5 and thereafter, offset the remaining emissions by paying the forestry commissions of the countries in which it manufactures to plant trees

Present obligation as a result of a past event

The manufacturer's public announcement indicates to the public that it has accepted a responsibility to eliminate or offset its greenhouse gas emissions from 20X5 onwards. This announcement is judged to create a constructive obligation for the manufacturer if it creates a valid expectation among members of the public that it will discharge this responsibility. Whether the announcement creates such an expectation is a matter of judgement, determined by management taking into account the facts and circumstances.

43 [IASB Staff paper 22 \(Appendix B\)](#): Project: Provisions, Paper topic: Liability definition and 'present obligation' recognition criterion, IASB Meeting, April 2023. Available on the IFRS Foundation's website.

An announcement that fulfils the criteria for creating a constructive obligation is not sufficient in itself to recognise a provision. A present constructive obligation arises only when the manufacturer has taken actions that will require it to transfer an economic resource - that is, when it has emitted greenhouse gases it has committed to offset. It then has an obligation to pay for the amount of tree planting required to offset the past emissions. The manufacturer's commitment to change aspects of the way in which it manufactures its goods is not an obligation to transfer an economic resource.

Conclusion - The manufacturer recognises a provision as a result of its net zero commitment:

- (a) When it has emitted the greenhouse gases it has committed to offset; and
- (b) If at that time, management judges that its announcement has given rise to a constructive obligation to meet the net zero commitments.

The manufacturer would recognise a provision for the best estimate of the amounts payable to forestry commission in respect of past emissions.

Since an entity's specific plans are key to appropriately accounting for net-zero commitments, entities will need to provide sufficient disclosure to allow users of financial statements to understand the nature of their net-zero commitments and the impact on the financial statements, together with any key estimates and critical judgements required to be disclosed by IAS 1. [IAS 1.122, IAS 1.125]. Furthermore, entities should be careful to ensure that clear language is used in describing their aspirations, targets and intended actions in response to the climate change challenge. Without clear disclosure, a reader may have difficulty understanding the extent to which the entity can realistically withdraw from a course of action described in its transition plan.

How we see it

Climate-related matters potentially have a significant impact on the recognition and measurement of provisions, and the need for disclosure of contingent liabilities. However, under IAS 37, only those obligations arising from past events that exist independently of an entity's future actions shall be recognised as a provision.

Given the significant uncertainties involved in assessing the extent and impact of climate change, entities need to ensure that sufficient information is disclosed to allow users of financial statements to understand those uncertainties, how planned climate transition has been taken into account in the measurement of a provision or disclosure of a contingent liability, and the assumptions and judgements made by management in recognising and measuring provisions.

In a note to its 2023 financial statements, Vale S.A. discloses that it assessed its decarbonization goals and, considering the IAS 37 recognition criteria, concluded that no provision should be recognised.

Practical example 6-6: Vale S.A. (2023)

Brazil

Financial Statements [extract]

Notes to the Financial Statements [extract]

2. Basis of preparation of financial statements [extract]

f) Financial information related to sustainability [extract]

Decarbonization plan [extract]

...

Additionally, Vale has assessed its decarbonization goals considering the criteria for provision in accordance with IAS 37 – Provisions, Contingent Liabilities, and Contingent Assets and it did not record any provision since these commitments are not deemed a legal nor constructive obligation.

Regardless of whether an entity's commitment to reduce or offset its greenhouse gas emissions results in the recognition of a provision, the actions an entity plans to take to fulfil its commitment could also affect the amount at which it measures other assets and liabilities and the information it discloses about them. For example, they can impact the remaining useful lives of existing plant and equipment (see Chapter 19), assumptions used in impairment testing (see Chapter 21), and assessments of expected credit losses (see Chapter 47).

The recognition and measurement of liabilities related to obligations to make good emissions already made under emissions trading schemes are discussed in Section 6.5 above, and further in Chapter 18.

7 Disclosure requirements

A significant distinction between the accounting treatment of provisions and other liabilities, such as trade payables and accruals, is the level of disclosure required.

7.1 Provisions

For each class of provision an entity is required to provide a reconciliation of the carrying amount of the provision at the beginning and end of the period showing:

- (a) Additional provisions made in the period, including increases to existing provisions
- (b) Amounts used, i.e., incurred and charged against the provision, during the period
- (c) Unused amounts reversed during the period
- (d) The increase during the period in the discounted amount arising from the passage of time and the effect of any change in the discount rate

Comparative information is not required. [IAS 37.84].

It is not clear whether disclosure (d) allows a single amount to be provided for the sum of the unwinding of the discount and any change in the provision resulting from a reassessment of the discount rate to be used or it requires these amounts to be given separately. However, given our view (discussed in section 4.3.6 above) that, for entities not yet applying IFRS 18, only the charge for unwinding of the discount is classified as a finance cost, with any further charge or credit that arises if discount rates have changed being recorded in the same line item that was used to establish the provision, it would make sense to disclose these items separately. It is also interesting that there is no specific requirement in the standard to disclose the discount rate used, especially where the effect of using a different discount rate could be material, such as in the measurement of a decommissioning provision. However, entities must remember that IAS 1 requires disclosure of information about major sources of estimation uncertainty that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year. [IAS 1.125].

How we see it

We believe that the increase during the period in the discounted amount of a provision arising from the passage of time must be disclosed separately from the effect of any change in the discount rate on the provision.

One of the important disclosures which is reinforced here is the requirement to disclose the release of provisions found to be unnecessary. This disclosure, along with the requirement in the standard that provisions must be used only for the purpose for which the provision was originally recognised, [IAS 37.61], is designed to prevent entities from concealing expenditure by charging it against a provision that was set up for another purpose.

In addition, for each class of provision an entity is required to disclose the following:

- (a) A brief description of the nature of the obligation and the expected timing of any resulting outflows of economic benefits.
- (b) An indication of the uncertainties about the amount or timing of those outflows. Where necessary to provide adequate information, an entity is required to disclose the major assumptions made concerning future events, as addressed in IAS 37.48 (discussed in section 4.4 above). This refers to future developments in technology and legislation and is of particular relevance to environmental liabilities.
- (c) The amount of any expected reimbursement, stating the amount of any asset that has been recognised for that expected reimbursement. [IAS 37.85].

Section D of the implementation guidance to the standard provides examples of suitable disclosures in relation to warranties and decommissioning costs.

Most of the above disclosures are illustrated in the Practical example below, which includes the disclosure of provisions determined in accordance with IAS 37, contingent consideration provisions which would be determined in accordance with IFRS 3, and employee provisions (included within Other provisions) which would be determined in accordance with IAS 19.

...

Legal provisions

Legal provisions relate to a number of separate legal matters, including claims arising from trade, in various Group companies. By their nature the amounts and timings of any outflows are difficult to predict.

As part of the regular review of litigation matters, management has reassessed the provisions recorded for certain litigation matters. Based on the development of the various litigations, notably the Meso case, some of the provisions previously held were released which resulted in an income of CHF 171 million in 2023. In addition, a fine of CHF 59 million imposed by the French Competition Authority on the Avastin/Lucentis investigation in 2020 was reimbursed following a court decision. These were the major elements in the expenses for legal cases in 2023, which show a net income of CHF 182 million reported in other operating income (expense) (2022: net income of CHF 25 million). Details of the major legal cases outstanding are disclosed below.

Environmental provisions

Provisions for environmental matters relate to various separate environmental issues in a number of countries. By their nature the amounts and timings of any outflows are difficult to predict. At 31 December 2023 significant provisions were discounted by between 3% and 5% (2022: between 4% and 5%) where the time value of money was material. The significant provisions relate to the estimated remediation costs for the manufacturing site at Clarecastle, Ireland, which was shut down in the meantime, and to the US site in Nutley, New Jersey, which was divested in September 2016. In 2023 environmental provisions decreased by CHF 13 million, mainly due to utilisations and currency translation effects and partially offset by an increase in provisions. The net environmental expenses reported in other operating income (expense) in 2023 were CHF 60 million (2022: net expenses of CHF 3 million) and included an increase of provisions of CHF 61 million mainly for the Clarecastle site following a reassessment of the expected costs of the environmental remediation.

The Group's procedures on environmental protection are included in the Annual Report on pages 78 to 83. These include the actions taken by the Group with regard to climate change, notably the Group's commitment to reduce greenhouse gas emissions.

Restructuring provisions

These arise from planned programmes that materially change the scope of business undertaken by the Group or the manner in which business is conducted. Such provisions include only the costs necessarily entailed by the restructuring which are not associated with the recurring activities of the Group. The timings of these cash outflows are reasonably certain. Significant non-current provisions are discounted using an average discount rate of 1.4% (2022: 2.1%).

In the Pharmaceuticals Division the significant provisions relate to various business transformation initiatives, including the site development plans at the Basel/Kaiseraugst site and the resourcing flexibility plans, as well as to the redesign and the strategic realignment of its manufacturing network mainly in the US. In the Diagnostics Division the significant provisions are associated with manufacturing and supply chain optimisations, research and development productivity initiatives and business transformations measures. Additionally, provisions were also recorded for a cross-divisional transformation programme to simplify the systems landscape and reduce process complexity. Further details are given in Note 7.

...

Other provisions

Other provisions relate to the items shown in the table below. With the exception of employee provisions, the timing of cash outflows is by its nature uncertain.

Other provisions in millions of CHF

	2023	2022	2021
Sales returns ³	481	588	514
Employee provisions	406	366	384
Other items	423	768	683
Total other provisions	1,310	1,722	1,581

The standard states that in determining which provisions may be aggregated to form a class, it is necessary to consider whether the nature of the items is sufficiently similar for a single statement about them to fulfil the requirements of (a) and (b) above. An example is given of warranties: it is suggested that, while it may be appropriate to treat warranties of different products as a single class of provision, it would not be appropriate to aggregate normal warranties with amounts that are subject to legal proceedings. [IAS 37.87]. For entities disclosing restructuring costs, this requirement could result in material components of the costs being disclosed separately. However, materiality will be an important consideration in judging how much analysis is required.

As noted above, IAS 37 requires entities to disclose an indication of the uncertainties about the amount or timing of outflows. [IAS 37.85]. Illustrative example 7-1 below reproduces an example proposed in the Near-final staff draft - *Disclosures about Uncertainties in the Financial Statements Illustrated using Climate-related Examples*,⁴⁴ and illustrates how the Board proposes an entity might disclose this information even if the carrying amount of the associated provision is immaterial.

Illustration 7-1: Disclosures about decommissioning and restoration provisions (IAS 37)

Background

The entity is a manufacturer and has plant decommissioning and site restoration obligations for its facilities. The entity assumes it will continue to maintain and operate some of its facilities for an extremely long time. Consequently, the costs required to settle the obligations related to those facilities will be incurred so far into the future that, when discounted to their present value, their effect on the carrying amount of the entity's plant decommissioning and site restoration provision is immaterial. However, the costs to settle the obligations relating to these facilities will be high and there is a significant and increasing risk that the entity might be required to close the facilities earlier than it expects. This risk stems from efforts to transition to a lower-carbon economy, which might include shifting consumer demand for the entity's products and possible regulatory and policy actions to reduce greenhouse gas emissions in the jurisdiction in which the entity operates.

Application

Paragraph 85 of IAS 37 requires an entity to disclose information for each class of provision. The entity concludes that, although some of its plant decommissioning and site restoration provisions have an immaterial effect on the carrying amount of its plant decommissioning and site-restoration provision, information about these obligations is material. The entity reaches this conclusion after considering, among other factors:

- (a) *the size of the costs required to settle the obligations* - the costs of settling the obligations are high.
- (b) *the risk of early settlement* - the risk that the entity might be required to settle the obligations earlier than expected is significant and is increasing.
- (c) *external climate-related qualitative factors* - the industry and jurisdictions in which the entity operates (including the entity's market, economic, regulatory and legal environments) make the information about the obligations more likely to influence the decisions that primary users of the entity's financial statements make on the basis of the financial statements.

In applying paragraph 85 of IAS 37, the entity discloses information about its plant decommissioning and site restoration provision. This information includes information about the obligations that have an immaterial effect on the carrying amount of the provision. The information the entity discloses includes:

- (a) a brief description of the nature of the obligations and the expected timing of the outflows of economic benefits required to settle them.
- (b) an indication of the uncertainties about the amount or timing of those outflows. Where necessary to provide adequate information, the entity also discloses the major assumptions made concerning future events. These assumptions could include assumptions about the future use of each of the entity's main facilities - for example, when the entity expects to close the facilities.

Given the inherent uncertainty related to provisions, entities may also need to perform, and disclose, a sensitivity analysis of the impact of possible scenarios. In its 2023 financial statements, Equinor ASA provided a sensitivity analysis regarding its asset retirement obligation by quantifying the financial statement impact if it were to perform removals five years earlier than currently scheduled.

⁴⁴ [Near-final staff draft- Disclosures about Uncertainties in the Financial Statements Illustrated using Climate-related Examples](#), IASB, July 2025, Example 5. Available on the IFRS Foundation's website.

Practical example 7-2: Equinor ASA (2023)

Norway

2023 Integrated Annual Report [extract]**Financial statements [extract]****4.1 Consolidated financial statements [extract]****NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****Note 3. Climate change and energy transition [extract]****Effects on estimation uncertainty [extract]**Timing of Asset Retirement Obligations (ARO)

As mentioned above, there are currently no assets triggered for earlier cessation as a result of Equinor's ambition to become a net-zero company by 2050. However, if the business cases of Equinor's producing oil and gas assets should change materially, this could affect the timing of cessation of the assets. A shorter production period will increase the carrying value of the liability. To illustrate, performing removal five years earlier than currently scheduled would increase the liability by around USD 1.2 billion before tax (around USD 1 billion in 2022). See [note 23](#) Provisions and other liabilities for more information regarding Equinor's ARO, including expected timing of cash outflows of recognised asset retirement obligations. The most significant cash outflows are expected within the year 2043.

As indicated in section 6.1.1 above, IAS 37 emphasises that when a restructuring meets the definition of a discontinued operation under IFRS 5, additional disclosures may be required under that standard (see Chapter 5). [IAS 37.9].

7.2 Contingent liabilities

Unless the possibility of any outflow in settlement is remote, IAS 37 requires the disclosure for each class of contingent liability at the end of the reporting period to include a brief description of the nature of the contingent liability, and where practicable:

- (a) An estimate of its financial effect, measured in accordance with IAS 37.36 to 52 (discussed in section 4 above)
- (b) An indication of the uncertainties relating to the amount or timing of any outflow
- (c) The possibility of any reimbursement [IAS 37.86]

Where any of the information above is not disclosed because it is not practicable to do so, that fact must be stated. [IAS 37.91].

The guidance given in the standard on determining which provisions may be aggregated to form a class referred to in section 7.1 above also applies to contingent liabilities.

A further point noted in the standard is that where a provision and a contingent liability arise from the same circumstances, an entity must ensure that the link between the provision and the contingent liability is clear. [IAS 37.88]. This situation may occur, for instance, when an entity stratifies a population of known and potential claimants between different classes of obligation, and accounts for each class separately. For example, an entity's actions may have resulted in environmental damage. The entity identifies the geographical area over which that damage is likely to have occurred and recognises a provision based on its 'best estimate' of value of claims it expects to be submitted from residents in that geographical area. In addition, there is a chance (albeit possible rather than probable) that the pollution is found to have had an effect beyond the geographical area established by the entity. As noted in section 3.2.1 above, the latter, 'possible but not probable' obligation meets the definition of a contingent liability for which disclosure is required.

Another example of when a provision and a contingent liability may arise from the same circumstance would be where an entity is jointly and severally liable for an obligation. As noted in section 4.7 above, in these circumstances the part of the obligation that is expected to be met by other parties is treated as a contingent liability.

It is not absolutely clear what is meant by 'financial effect' in (a) above. Is it the potential amount of the loss or is it the *expected* amount of the loss? The cross-reference to the measurement principles in IAS 37.36 to 52 might imply the latter, but in any event, disclosure of the potential amount is likely to be relevant in explaining the uncertainties in (b) above.

7.3 Contingent assets

IAS 37 requires disclosure of contingent assets where an inflow of economic benefits is probable. The disclosures required are:

- (a) A brief description of the nature of the contingent assets at the end of the reporting period
- (b) Where practicable, an estimate of their financial effect, measured using the principles set out for provisions in IAS 37.36 to 52 [IAS 37.89]

Where any of the information above is not disclosed because it is not practicable to do so, that fact must be stated. [IAS 37.91]. The standard also notes that the disclosure must avoid giving misleading indications of the likelihood of income arising. [IAS 37.90].

One problem that arises with IAS 37 is that it requires the disclosure of an estimate of the potential financial effect for contingent assets to be measured in accordance with the measurement principles in the standard. Unfortunately, the measurement principles in the standard are all set out in terms of the settlement of obligations, and these principles cannot readily be applied to the measurement of contingent assets. Hence, judgement will have to be used as to how rigorously these principles are required to be applied.

7.4 Reduced disclosure when information is seriously prejudicial

IAS 37 contains an exemption from disclosure of information in the following circumstances. It says that "In extremely rare cases, disclosure of some or all of the information required by paragraphs 84-89 can be expected to prejudice seriously the position of the entity in a dispute with other parties on the subject matter of the provision, contingent liability or contingent asset..." [IAS 37.92].

In such circumstances, the information need not be disclosed. However, disclosure will still need to be made of the general nature of the dispute, together with the fact that, and the reason why, the required information has not been disclosed. [IAS 37.92].

The following Illustration, based on an example from the implementation guidance to the Standard, provides an example of the disclosures required where some of the information required by the standard is not given because it is expected to prejudice seriously the position of the entity.

Illustration 7-2: Reduced disclosure when information is seriously prejudicial

An entity is involved in a dispute with a competitor, who is alleging that the entity has infringed patents and is seeking damages of CU100 million. The entity recognises a provision for its best estimate of the obligation, but discloses none of the information required by IAS 37.84 and 85. The following information is disclosed:

Litigation is in process against the company relating to a dispute with a competitor who alleges that the company has infringed patents and is seeking damages of CU100 million. The information usually required by IAS 37 is not disclosed on the grounds that it can be expected to prejudice seriously the outcome of the litigation. The directors are of the opinion that the claim can be successfully resisted by the company.

[IAS 37.IE D Example 3].

As it can be seen in the above example, an entity applying the 'seriously prejudicial' exemption is still required to describe the general nature of the dispute, resulting in a level of disclosure that many entities might find uncomfortable in the circumstances.

8 Future Developments

In November 2024, the IASB issued the Exposure Draft *Provisions - Targeted Improvements*.⁴⁵ The Exposure Draft proposes targeted improvements to three aspects of IAS 37:

- The present obligation recognition criterion
- The costs to include in measuring a provision
- The discount rate requirements

The IASB has proposed to update the definition of a liability in IAS 37 to match the *Conceptual Framework* issued in 2018. The updated wording would replace the current requirement for an obligating event with three distinct conditions: obligation, transfer and past event. The proposed amendments include separate sections of requirements to support each of the conditions.

The proposed amendments would also replace the requirements in IFRIC 21, which would be withdrawn. The accounting for levies would be aligned with the general requirements for provisions. The proposed amendments would also supersede the requirements in IFRIC 6, which would be withdrawn.

With regards to measurement of provisions, IAS 37 requires an entity to measure a provision at the best estimate of the expenditure required to settle its present obligation. The IASB proposes to specify that this expenditure comprises the costs that relate directly to the obligation, which include both the incremental costs of settling that obligation and an allocation of other costs that relate directly to settling obligations of that type. Where the time value of money is material, the IASB proposes to specify that an entity discounts a provision using a rate that reflects: (i) the time value of money as represented by a risk-free rate; and (ii) the risks in expenditure required to settle the obligation, if not already reflected in expected cash flows. The proposed amendments also clarify that the discount rate does not reflect non-performance risk.

In addition, the IASB has proposed amendments to the *Guidance on implementing IAS 37* (Implementation Guidance), new disclosure requirements for discount rates, and proposed consequential amendments to other IFRS accounting standards.

The comment period for the Exposure Draft closed in March 2025.

Appendix B - Defined terms

Extract from IFRS accounting standards - Definitions

constructive obligation	<p>A <i>constructive obligation</i> is an obligation that derives from an entity's actions where:</p> <ul style="list-style-type: none"> (a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and (b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities. [IAS 37.10].
contingent asset	<p>A <i>contingent asset</i> is a possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity. [IAS 37.10].</p>
contingent liability	<p>A <i>contingent liability</i> is:</p> <ul style="list-style-type: none"> (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity; or (b) a present obligation that arises from past events but is not recognised because: <ul style="list-style-type: none"> (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or (ii) the amount of the obligation cannot be measured with sufficient reliability. [IAS 37.10].
executory contracts	<p>Executory contracts are contracts under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent. This Standard does not apply to executory contracts unless they are onerous. [IAS 37.3]</p>
Government	<p>'Government' refers to government, government agencies and similar bodies whether local, national or international. [IFRIC 21.4]</p>
legal obligation	<p>A <i>legal obligation</i> is an obligation that derives from:</p> <ul style="list-style-type: none"> (a) a contract (through its explicit or implicit terms); (b) legislation; or (c) other operation of law. [IAS 37.10].
levy	<p>For the purposes of this Interpretation, a levy is an outflow of resources embodying economic benefits that is imposed by governments on entities in accordance with legislation (ie laws and/or regulations), other than:</p> <ul style="list-style-type: none"> (a) those outflows of resources that are within the scope of other Standards (such as income taxes that are within the scope of IAS 12 <i>Income Taxes</i>); and (b) fines or other penalties that are imposed for breaches of the legislation. [IFRIC 21.4].
liability	<p>A <i>liability</i> is a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits.¹ [IAS 37.10].</p>
obligating event	<p>An <i>obligating event</i> is an event that creates a legal or constructive obligation that results in an entity having no realistic alternative to settling that obligation. [IAS 37.10].</p>

onerous contract	An <i>onerous contract</i> is a contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it. [IAS 37.10].
provision	A <i>provision</i> is a liability of uncertain timing or amount. [IAS 37.10].
restructuring	A <i>restructuring</i> is a programme that is planned and controlled by management, and materially changes either: (a) the scope of a business undertaken by an entity; or (b) the manner in which that business is conducted. [IAS 37.10].

1 The definition of a liability in this Standard was not revised following the revision of the definition of a liability in the *Conceptual Framework for Financial Reporting* issued in 2018.

Overview

Revenue is, arguably, one of the most important indicators of an entity's performance. It may be perceived as an indicator of the desirability of an entity's products and services, and the growth or decline over time of a business. However, revenue does not represent all income for an entity. As discussed in section 1.1 below, revenue is a subset of income, it is derived from the ordinary activities of an entity and may be referred to by a variety of different names, including sales, fees, interest, dividends, royalties and rent.

Identifying what is revenue and specifying how and when to measure and report it is critical to any accounting framework. IFRS 15 *Revenue from Contracts with Customers* (IFRS 15 or the standard) provides accounting requirements for all revenue arising from contracts with customers to provide goods or services (unless the contracts are in the scope of other IFRS accounting standards). Within IFRS accounting standards, several other standards deal with the recognition of revenue, for example, IFRS 16 *Leases* covers lease revenue and IFRS 9 *Financial Instruments* covers dividends and interest, which would represent revenue if they are part of an entity's ordinary activities.

This chapter primarily covers IFRS 15. As discussed further in section 1.1 below, IFRS 15 only covers a subset of revenue - specifically, revenue that arises from a contract when the counterparty to that contract is a customer (as defined, see section 2.3 below) and the contract is not specifically excluded from the standard (e.g., lease contracts within the scope of IFRS 16 or financial instruments within the scope of IFRS 9, see section 2.1 below for a complete list of scope exclusions).

Other revenue items that are not within the scope of IFRS 15 but arise in the course of the ordinary activities of an entity, as well as the disposal of non-financial assets that are not part of the ordinary activities of the entity, for which IFRS 15's requirements are relevant, are addressed in section 2.6 below.

IFRS 15 includes detailed application guidance. The International Accounting Standards Board (IASB or the Board) also published more than 60 illustrative examples that accompany IFRS 15. We list these examples in Appendix D to this chapter and provide references to where certain examples are included in this chapter. The standard, which is largely converged with the revenue guidance in US GAAP, also specifies the accounting for costs an entity incurs to obtain and fulfil a contract to provide goods or services to customers (see section 9.3 below) and provides a model for the measurement and recognition of gains and losses on the sale of certain non-financial assets, such as property, plant and equipment (see section 2.6.3 below).

Entities often find application of the standard to be a significant undertaking. This is because the standard requires entities to make many judgements and estimates, which affect their financial statements, business processes and internal controls over financial reporting. The complexity of the standard has also led to further standard setting and regulatory discussion, which continues to contribute to the overall understanding on how the standard should be applied.

While entities are now more familiar with its requirements, the application of IFRS 15 continues to be challenging for them when business practices and models evolve (e.g., increasing the use of online retail and platform services, changing to 'greener' practices, etc.) and operating environments change, raising new implementation questions. Entities may also have to consider the effect on their business of economic, social and political developments, both local and international. For example, in times of economic volatility, areas that may have been affected for revenue contracts include, but are not limited to, variable consideration, contract modifications and terminations, collectability and any extended payment terms (including whether they affect collectability assessments, estimates of variable consideration, subsequent impairment under IFRS 9 or impairment of contract cost assets), customer incentives and changes to selling prices and onerous contracts. See our publications, *Applying IFRS: Accounting considerations for geopolitical events and uncertainty*, which provides considerations for entities on the possible accounting effects of the geopolitical events and uncertainty and *IFRS Developments*, Issue 238: *IFRS accounting impacts of tariffs*.¹ Even if changes to the accounting for revenue contracts are not necessary, entities need to consider whether additional disclosure is required.

¹ Both available on [ey.com/IFRS](https://www.ey.com/IFRS).

Following the issuance of their revenue standards, the IASB and the US Financial Accounting Standards Board (FASB) (collectively, the Boards) created the Joint Transition Resource Group for Revenue Recognition (TRG) to help them determine whether more application guidance was needed. The members of the TRG included financial statement preparers, auditors and other users from a variety of industries and countries, as well as public and private entities. The TRG members' views are not authoritative, but entities should consider them as they apply the standards. In its July 2016 public statement, the European Securities and Markets Authority (ESMA) encouraged issuers to consider the TRG discussions when implementing IFRS 15.² Furthermore, the former Chief Accountant of the US Securities and Exchange Commission (SEC) encouraged SEC registrants, including foreign private issuers (that may report under IFRS accounting standards), to consult with his office if they are considering applying the standard in a manner that differs from the discussions in which the members of the TRG reached general agreement.³

We have incorporated our summaries of topics on which the members of the TRG generally agreed throughout this chapter (also see the listing of all TRG discussions and where they are discussed in this chapter in Appendix E). Unless otherwise specified, these summaries represent the discussions of the joint TRG. Where possible, we indicate if members of the IASB or its staff commented on the FASB TRG discussions. In addition, this chapter highlights relevant discussions by the IFRS IC. See Appendix F for a summary listing.

In the second half of 2022, the IASB began its post-implementation review (PIR) of IFRS 15. Following initial outreach activities by the IASB staff, a Request for Information was published in June 2023.⁴ In the Request for Information, the IASB included questions on a multitude of topics, including: the standard's overall objective; convergence with US GAAP; specific requirements in the standard, including determining when to recognise revenue, determining the transaction price, identifying performance obligations in a contract; and the interaction with other IFRS accounting standards and disclosure requirements. The Board also included some narrower questions on specific topics, including consideration payable to a customer, the presentation of negative revenue, over-time revenue recognition and principal versus agent considerations.

The IASB discussed the feedback to the Request for Information from January to July 2024, and the Board's discussions also included a review of academic literature and a joint FASB-IASB education meeting in June 2024, where the Boards discussed and compared the PIR processes of their respective revenue standards. In general, the IASB's view on the feedback received throughout the PIR process was that the requirements of the standard generally are working as intended.

In July 2024, the Board finalised its decisions in the PIR, and in September 2024, the IASB published the Project Summary and Feedback Statement for the PIR.^{5,6} The Board identified several matters it assessed to be of low priority and will therefore be considered in the next agenda consultation, see section 11 below for further discussion.⁷ These matters include assessing whether an entity is a principal or an agent, consideration payable to a customer and applying IFRS 15 with IFRIC 12 *Service Concession Arrangements*. The Board also confirmed its previous decision to not consider the issue of corporate wrappers in the PIR of IFRS 15, to gather evidence on the assessment of whether a transfer of an asset is a sale in a sale and leaseback transaction in the PIR of IFRS 16 and to take no action on any other matters identified during the PIR of IFRS 15.

This chapter discusses the IASB's standard (including all amendments) and highlights significant differences from the FASB's standard, Accounting Standards Codification (ASC) 606, *Revenue from Contracts with Customers*; a summary of significant differences is included in Appendix G.⁸

What you need to know

- IFRS 15 provides a single source of revenue requirements for all entities in all industries.
- IFRS 15 applies to revenue from contracts with customers, unless explicitly excluded from the scope (e.g., leasing contracts, financial instruments).
- IFRS 15 is principles-based and includes detailed application guidance. The lack of bright lines in some cases requires the use of judgement.
- While entities are more familiar with its requirements, application of IFRS 15 continues to be challenging for entities as business practices evolve and operating environments change.
- IFRS 15 also specifies the accounting treatment for certain items other than revenue, such as certain costs associated with obtaining and fulfilling a contract and the sale of certain non-financial assets.

⁸ Throughout this chapter, when we refer to the FASB's standard, we mean ASC 606 (including all amendments), unless otherwise noted.

1 Introduction

1.1 The distinction between income, revenue and gains

Income is defined in IFRS 15 as “increases in economic benefits during the accounting period in the form of inflows or enhancements of assets or decreases of liabilities that result in an increase in equity, other than those relating to contributions from equity participants”. [IFRS 15 Appendix A]. The *Conceptual Framework for Financial Reporting* defines income similarly. [CF 4.68].

This definition encompasses both ‘revenue’ and ‘gains’. IFRS 15 defines revenue as income that arises in the course of the ordinary activities of an entity. [IFRS 15 Appendix A]. As discussed in the Overview above, according to the IASB’s 2010 *Conceptual Framework for Financial Reporting* (which applied when IFRS 15 was issued), it can include sales, fees, interest, dividends, royalties and rent. [CF(2010) 4.29]. Gains represent other items that meet the definition of income and may, or may not, arise in the course of the ordinary activities of an entity. Gains include, for example, those arising on the disposal of non-current assets. The definition of income also includes unrealised gains; for example, those arising on the revaluation of marketable securities and those resulting from increases in the carrying amount of long-term assets. [CF(2010) 4.31]. The 2018 *Conceptual Framework for Financial Reporting* no longer contains a discussion about revenue and gains and losses. However, the definition of revenue in IFRS 15 remains unchanged. At the time the 2018 Conceptual Framework was issued, the Board noted it did not expect the removal of that discussion to cause any changes in practice. [CF BC4.96].

The rules on offsetting in IAS 1 *Presentation of Financial Statements* distinguish between revenue and gains.⁹ That standard states that an entity undertakes, in the course of its ordinary activities, other transactions that do not generate revenue but are incidental to the main revenue-generating activities. When this presentation reflects the substance of the transaction or other event, the results of such transactions are presented by netting any income with related expenses arising on the same transaction. For example, gains and losses on the disposal of non-current assets, including investments and operating assets, are reported by deducting from the proceeds on disposal the carrying amount of the asset and related selling expenses. [IAS 1.34]. IAS 16 *Property, Plant and Equipment* has a general rule that ‘gains shall not be classified as revenue’. [IAS 16.68]. The only exception to this rule is where an entity routinely sells property, plant and equipment that it has held for rental to others, which is discussed further in section 2.6.3.A below.

1.2 IFRS 15 - Overview of the standard

The revenue standard provides accounting requirements for all revenue arising from contracts with customers. They affect all entities that enter into contracts to provide goods or services to their customers, unless the contracts are in the scope of other IFRS accounting standards, such as that for leases. The standard also specifies the accounting for costs an entity incurs to obtain and fulfil a contract to provide goods or services to customers (see section 9.3 below) and provides a model for the measurement and recognition of gains and losses on the sale of certain non-financial assets, such as property, plant or equipment (see section 2.6.3 below).

IFRS 15 became effective for annual reporting periods beginning on or after 1 January 2018. Early adoption was permitted, provided that fact was disclosed. [IFRS 15.C1].

IFRS 15 required retrospective application. However, it allowed either a ‘full retrospective’ adoption (in which the standard was applied retrospectively to all of the periods presented in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*¹⁰) or a ‘modified retrospective’ adoption (in which the standard was applied retrospectively to only the most current period presented in the financial statements). Under both transition methods, the IASB granted transition practical expedients to provide relief.

⁹ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

¹⁰ The consequential amendments resulting from IFRS 18, once effective, change the title of IAS 8 to ‘Basis of Preparation of Financial Statements’ to better reflect the amended content of IAS 8. See Chapter 4 for more details.

Depending on the manner in which an entity elected to transition to IFRS 15, it may not have needed to apply the standard to contracts if they had completed performance before the date of initial application or the beginning of the earliest period presented (depending on the practical expedient and the transition method), even if they had not yet received the consideration and that consideration was still subject to variability. Applying a completed contract practical expedient might also have affected an entity's revenue recognition in subsequent reporting periods. That is, if an entity applied a practical expedient for completed contracts, it continued to apply its legacy revenue policy to its completed contracts, instead of IFRS 15. In some cases, even though an entity had fully transferred its identified goods or services, there may still be revenue to recognise in accordance with its legacy revenue policy in reporting periods after adoption of IFRS 15.

While we address the significant differences between the IASB's final standard and the FASB's final standard in Appendix G and highlight some differences throughout this chapter, the primary purpose of this chapter is to describe the IASB's standard, including all amendments to date, and focus on the effects for preparers applying IFRS accounting standards.¹¹ As such, we generally refer to the 'standard' in the singular in this chapter.

1.3 Core principle of IFRS 15

The standard describes the principles an entity must apply to measure and recognise revenue and the related cash flows. [IFRS 15.1]. The core principle is that an entity recognises revenue at an amount that reflects the consideration to which the entity expects to be entitled in exchange for transferring goods or services to a customer. [IFRS 15.2].

The principles in IFRS 15 are applied using the following five steps:

1. Identify the contract(s) with a customer (see section 3 below)
2. Identify the performance obligations in the contract (see section 4 below)
3. Determine the transaction price (see section 5 below)
4. Allocate the transaction price to the performance obligations in the contract (see section 6 below)
5. Recognise revenue when (or as) the entity satisfies a performance obligation (see section 7 below)

Entities need to exercise judgement when considering the terms of the contract(s) and all of the facts and circumstances, including implied contract terms. Entities also have to apply the requirements of the standard consistently to contracts with similar characteristics and in similar circumstances. [IFRS 15.3].

¹¹ For more information on the effect of the new revenue standard for US GAAP preparers, refer to our *Financial Reporting Developments: Revenue from contracts with customers* (ASC 606), available on [EY Accounting Link](#).

2 Scope

2.1 Scope of IFRS 15

IFRS 15 applies to all entities and all contracts with customers to provide goods or services in the ordinary course of business, except for the following contracts, which are specifically excluded: *[IFRS 15.5]*

- Lease contracts within the scope of IFRS 16
- Insurance contracts within the scope of IFRS 17 *Insurance Contracts*, except when an entity elects to apply IFRS 15 to certain service contracts in accordance with IFRS 17.8
- Financial instruments and other contractual rights or obligations within the scope of IFRS 9, IFRS 10 *Consolidated Financial Statements*, IFRS 11 *Joint Arrangements*, IAS 27 *Separate Financial Statements* and IAS 28 *Investments in Associates and Joint Ventures*
- Non-monetary exchanges between entities in the same line of business to facilitate sales to customers or potential customers

Arrangements must meet the criteria set out in IFRS 15.9, which are discussed in section 3.1 below, to be accounted for as a revenue contract under the standard.

For certain arrangements, entities have to evaluate their relationship with the counterparty to the contract in order to determine whether a vendor-customer relationship exists. Some collaboration arrangements, for example, are more akin to a partnership, while others have a vendor-customer relationship. Only transactions that are determined to be with a customer are within the scope of IFRS 15. *[IFRS 15.6]*. The definition of a customer is discussed in section 2.3 below. See section 2.4 below for a discussion on collaborative arrangements.

The interaction between IFRS 15 and other IFRS accounting standards can be challenging and might require significant judgement. Such interactions with IFRS 15 include when:

- An entity needs to apply other IFRS accounting standards' requirements to assets and liabilities arising from a revenue contract (e.g., applying certain requirements in IFRS 9 to contract assets, determining an entity's right to consideration becomes unconditional (i.e., a receivable) such that IFRS 9 applies to that asset instead of IFRS 15, see section 10.1 below for further discussion).
- Other IFRS accounting standards refer to guidance in IFRS 15 (e.g., the accounting for disposals of certain non-financial assets - as discussed in section 2.6.3 below, applying requirements in IFRS 15 to service concession arrangements that are within the scope of IFRIC 12 - see Chapter 26).
- Two or more contracts need to be assessed together to determine the appropriate IFRS accounting standard(s) to apply (e.g., sales with repurchase agreements (see section 7.3 below), sale and leaseback arrangements within the scope of IFRS 16) or the legal form of the arrangement is not consistent with the substance. When developing IFRS 16, the IASB noted that constituents had questions about how to distinguish between a lease and a sale or purchase when legal title to the underlying asset is not transferred. *[IFRS 16.BC79]*. If an arrangement does not meet the definition of a lease because the 'lessor' has a substantive right to substitute the underlying asset throughout the period of use and, hence, is out of scope of IFRS 16 (see Chapter 24), that entity might be providing a service within the scope of IFRS 15. The IASB decided not to provide guidance in this area and noted that the accounting for such leases would be similar to the sale or purchase of the respective asset and that the accounting also depends on the substance of the transaction and not its legal form. *[IFRS 16.BC138, IFRS 16.BC139]*. Refer to Chapter 24 for more information on IFRS 16.
- A contract falls within the scope of more than one IFRS accounting standard (e.g., lease with a non-lease revenue component, a contract that includes the issuance of a financial instrument and a revenue component within the scope of IFRS 15). When entities enter into transactions that are partially within the scope of IFRS 15 and partially within the scope of other IFRS accounting standards, IFRS 15 requires an entity to apply any separation and/or measurement requirements in the other IFRS accounting standard first, before applying the requirements in IFRS 15. *[IFRS 15.7]*. See section 2.5 below for further discussion.

As noted above, IFRS 17 could include in its scope certain contracts, particularly fixed-fee service contracts, which are contracts in which the level of service depends on an uncertain event, and certain warranties. Entities that enter into these contracts and might need to apply IFRS 17 are not limited to insurance companies; other financial institutions (e.g., banks), as well as other entities, such as manufacturers, also might be affected.

Fixed-fee service contracts can include roadside assistance programmes and maintenance contracts in which the service provider agrees to repair specified equipment after a malfunction for a fixed fee. IFRS 17 indicates that these are insurance contracts and, therefore, that standard would apply. However, if their primary purpose is the provision of services for a fixed fee, IFRS 17 permits entities the choice of applying IFRS 15 instead of IFRS 17 to such contracts if, and only if, all of the following conditions are met:

- The entity does not reflect an assessment of the risk associated with an individual customer in setting the price of the contract with that customer.
 - The contract compensates the customer by providing services, rather than by making cash payments to the customer.
- And
- The insurance risk transferred by the contract arises primarily from the customer's use of services rather than from uncertainty over the cost of those services. [IFRS 17.8].

The entity might make that choice on a contract-by-contract basis, but the choice for each contract is irrevocable. See Chapter 51 for further discussion.

Many entities issue warranties together with, and/or related to, goods or services provided to a customer. While IFRS 15 provides application guidance that applies to warranties, some might be within the scope of IFRS 17. Determining whether IFRS 15 or IFRS 17 applies might require significant judgement. This is discussed further in section 9.1 below. If IFRS 17 applies to a warranty within a contract with a customer, the requirements in IFRS 15.7 will need to be considered to determine how to allocate the contract consideration between the two standards. See section 2.5 below for further discussion.

2.1.1 Non-monetary exchanges

IFRS 15 does not apply to non-monetary exchanges between entities in the same line of business to facilitate sales to (potential) customers. For example, the standard does not apply to a contract between two oil companies that swap oil to fulfil demand from their respective customers in different locations on a timely basis and to reduce transportation costs. This scope exclusion applies even though the party exchanging goods or services with the entity might meet the definition of a customer on the basis that it has contracted with the entity to obtain an output of the entity's ordinary activities. As discussed in the Basis for Conclusions, this type of scenario might be common in industries with homogeneous products. [IFRS 15.BC58]. Not all non-monetary exchanges between entities are outside the scope of IFRS 15 and the standard does provide requirements for contracts involving non-cash consideration in exchange for goods or services (see section 5.6 below on non-cash consideration and section 5.6.2 below on barter transactions). Therefore, determining whether an exchange is to facilitate a sale to a customer could require judgement. Judgement might also be needed to determine whether entities are in the same line of business.

The following Illustration shows some of these considerations:

Illustration 2-1: Non-monetary exchange outside the scope of IFRS 15

An automobile dealer exchanges new model automobiles with another dealer to obtain the colour ordered by a customer. This non-monetary exchange is intended to facilitate a sale to a customer who is not a party to the exchange. In addition, it involves the exchange of inventory that both dealers hold for sale, as part of their ordinary activities, and the automobile dealers are in the same line of business. Accordingly, this transaction is outside the scope of IFRS 15.

Illustration 2-2: Non-monetary exchange in the scope of IFRS 15

An office supply retailer provides office equipment and supplies to an automobile dealer in exchange for an automobile. The automobile dealer will use the office equipment and supplies in its financing department. The new equipment is an upgrade from the automobile dealer's old equipment and will allow the automobile dealer to reduce administrative expenses. The office supply retailer will use the car received in its repair department, allowing the department to reduce response times and meet service level commitments. Although the exchange involves inventory held for sale by each entity, the transaction is not an exchange of a product held for sale in the ordinary course of business for a product to be sold in the same line of business to facilitate sales to customers. Accordingly, this transaction is within the scope of IFRS 15 for each entity.

2.2 Other scope considerations

Certain arrangements executed by entities include repurchase provisions, either as a component of a sales contract or as a separate contract that relates to the same or similar goods in the original agreement. The form of the repurchase agreement and whether the customer obtains control of the asset will determine whether the agreement is within the scope of the standard. See section 7.3 below for a discussion on repurchase agreements.

IFRS 15 also specifies the accounting for certain costs, such as the incremental costs of obtaining a contract and the costs of fulfilling a contract. However, the standard is clear that these requirements only apply if there are no other applicable requirements in IFRS accounting standards for those costs. [IFRS 15.8]. See section 9.3 below for further discussion on the requirements relating to contract costs in the standard.

Certain requirements in IFRS 15 are also relevant for the recognition and measurement of a gain or loss on the disposal of a non-financial asset not in the ordinary course of business (see section 2.6.3 below and see section 2.3 below for further discussion on determining whether a transaction is part of an entity's ordinary activities).

Entities sometimes enter into transactions with suppliers that result in the entity receiving consideration from a supplier (or from other parties that sell the goods or services to the supplier). In these situations, entities need to apply judgement to determine whether they need to account for the consideration received as revenue in accordance with the relevant standard (e.g., IFRS 15, IFRS 16 or IFRS 9), a reimbursement of a cost incurred on behalf of a supplier, or a reduction of costs of goods or services acquired. For further discussion on this topic, refer to our publication *Applying IFRS: Accounting for Payments from Suppliers*.¹²

2.3 Definition of a customer

The standard defines a customer as “a party that has contracted with an entity to obtain goods or services that are an output of the entity's ordinary activities in exchange for consideration”. [IFRS 15 Appendix A]. IFRS 15 does not define the term ‘ordinary activities’ because it was derived from the definitions of revenue in the respective conceptual frameworks of the IASB and the FASB in effect when the standards were developed. In particular, the description of revenue in the IASB's *Conceptual Framework for Financial Reporting* at that time referred specifically to the ‘ordinary activities’ of an entity - [CF(2010) 4.29] - and the definition of revenue in the FASB's (now superseded) Statement of Financial Accounting Concepts No. 6, which referred to the notion of an entity's ‘ongoing major or central operations’.¹³ In many transactions, a customer is easily identifiable. However, in transactions involving multiple parties, it might be less clear which counterparties are customers of the entity. For some arrangements, multiple parties could all be considered customers of the entity, while in other arrangements only some of the parties involved are considered customers.

During times of geopolitical and economic uncertainty, governments might grant wide-ranging assistance, particularly if there are restrictions on business activities. Identifying whether there is vendor-customer relationship might be challenging if the counterparty in an arrangement is the government or a similar body. To determine the appropriate IFRS accounting standard to apply, an entity needs to consider all relevant facts and circumstances to understand whether there is an exchange transaction arising from a vendor-customer relationship (to which IFRS 15 applies) or if, for example, the entity is receiving government assistance or a grant (as defined in IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance*). Factors to consider would include, but not be limited to, whether the government (or similar body) is providing assistance to the entity or to its customer (e.g., by paying the entity on a customer's behalf), and whether the government (or similar body) is providing assistance in their capacity as the government (or similar body) or as the entity's customer. An entity with an existing vendor-customer relationship with a government or similar body also needs to evaluate whether any additional assistance is a modification of a customer contract under IFRS 15. See section 3.4 below for contract modifications.

¹² Available on ey.com/IFRS.

¹³ US GAAP, *Statement of Financial Accounting Concepts (CON) No. 6* (2021), paragraph 78. In December 2021, the FASB superseded CON 6 with CON 8 which defines revenue as “inflows or other enhancements of assets of an entity or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities.” However, the definition of revenue in ASC 606 did not change.

The Illustration below shows how the party considered to be the customer might differ, depending on the specific facts and circumstances:

Illustration 2-3: Identification of a customer

An entity provides internet-based advertising services to companies. As part of those services, the entity purchases banner-space on various websites from a selection of publishers. For certain contracts, the entity provides a sophisticated service of matching the ad placement with the pre-identified criteria of the advertising party (i.e., the customer). In addition, the entity pre-purchases the banner-space from the publishers before it finds advertisers for that space. Assume that the entity appropriately concludes it is acting as the principal in these contracts (see section 4.4 below for further discussion on principal versus agent considerations). Accordingly, the entity identifies that its customer is the advertiser to whom it is providing services.

In other contracts, the entity simply matches advertisers with the publishers in its portfolio, but the entity does not provide any sophisticated ad-targeting services or purchase the advertising space from the publishers before it finds advertisers for that space. Assume that the entity appropriately concludes it is acting as the agent in these contracts. Accordingly, the entity identifies that its customer is the publisher to whom it is providing services.

In addition, the identification of the performance obligations in a contract (discussed further in section 4 below) can have a significant effect on the determination of which party is the entity's customer. Also see the discussion of the identification of an entity's customer when applying the application guidance on consideration paid or payable to a customer in section 5.7 below.

2.4 Collaborative arrangements

Entities often enter into collaborative arrangements to, for example, jointly develop and commercialise intellectual property such as a drug candidate in the life sciences industry or a motion picture in the entertainment industry. In such arrangements, a counterparty might not always be a 'customer' of the entity. Instead, the counterparty might be a collaborator or partner that shares in the risks and benefits of developing a product to be marketed. [IFRS 15.6]. This is common in the pharmaceutical, biotechnology, oil and gas, and health care industries. However, depending on the facts and circumstances, these arrangements might also contain a vendor-customer relationship component. Such contracts could still be within the scope of IFRS 15, at least partially, if the collaborator or partner meets the definition of a customer for some, or all, aspects of the arrangement. If the collaborator or partner is not a customer, the transaction is not within the scope of IFRS 15. An example of transactions between collaborators or partners not being within the scope of IFRS 15 was discussed by the IFRS IC in March 2019; it related to the output to which an entity is entitled from a joint operation, but which the entity has not yet received and sold to its customers (see Question 2-12 in section 2.5 below).

The IASB decided not to provide additional application guidance for determining whether certain revenue-generating collaborative arrangements are within the scope of IFRS 15. In the Basis for Conclusions, the IASB explained that it would not be possible to provide application guidance that applies to all collaborative arrangements. [IFRS 15.BC54]. Therefore, the parties to such arrangements need to consider all facts and circumstances to determine whether a vendor-customer relationship exists that is subject to the standard.

However, the IASB did determine that, in some circumstances, it might be appropriate for an entity to apply the principles in IFRS 15 to collaborations or partnerships (e.g., when there are no applicable or more relevant requirements that could be applied). [IFRS 15.BC56].

How we see it

Identifying the customer can be difficult, especially when multiple parties are involved in a transaction. This evaluation might require significant judgement and IFRS 15 does not provide many factors to consider.

Furthermore, transactions among partners in collaboration arrangements are not within the scope of IFRS 15. Therefore, entities need to use judgement to determine whether transactions are between partners acting in their capacity as collaborators or reflect a vendor-customer relationship.

2.5 Interaction with other IFRS accounting standards

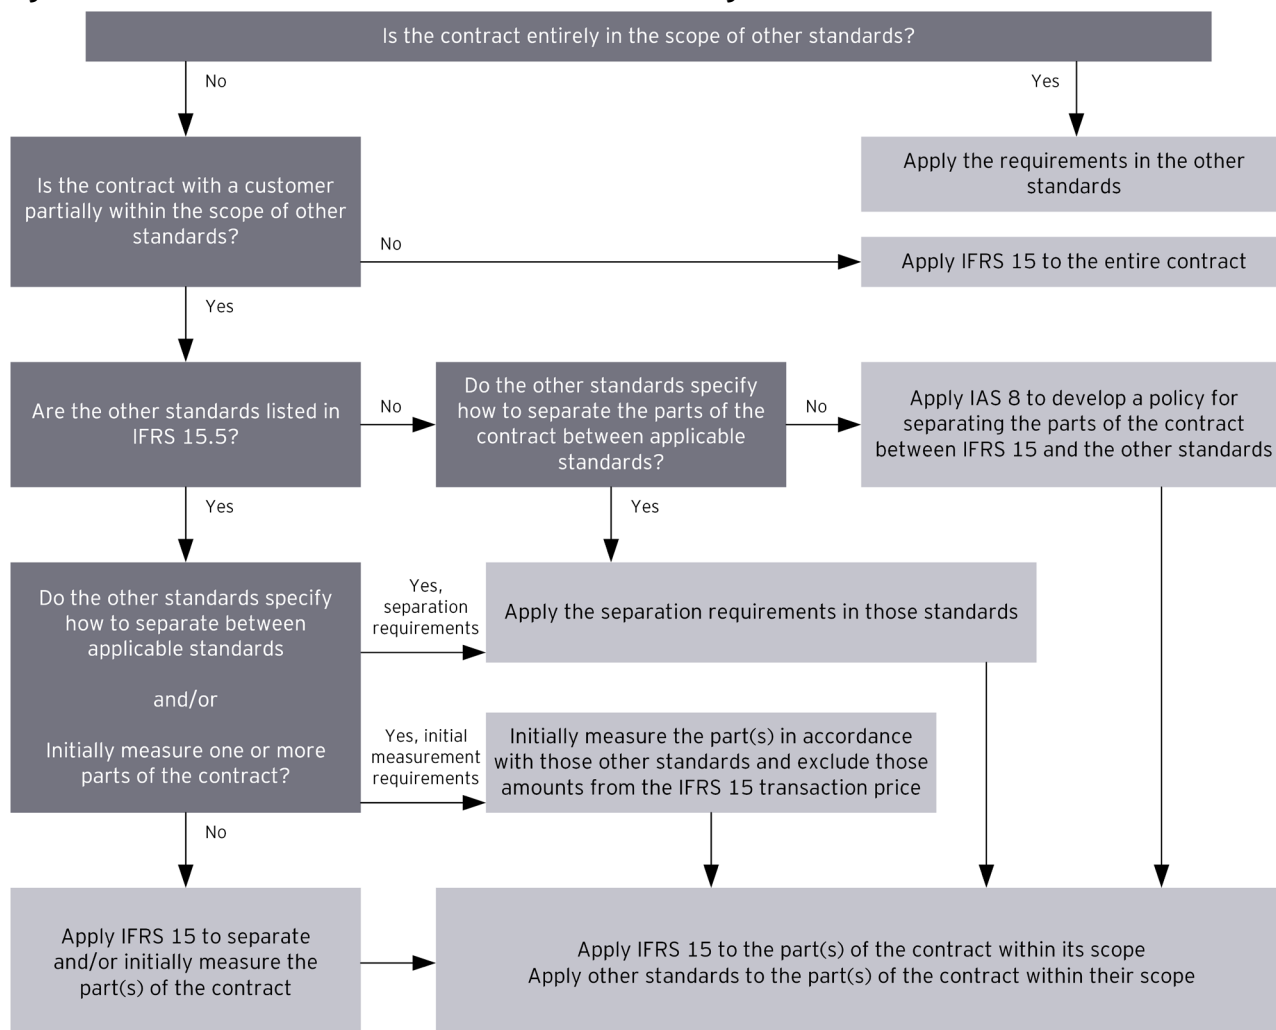

The standard provides requirements for arrangements partially within the scope of IFRS 15 and partially within the scope of other IFRS accounting standards that apply to contracts with customers, as follows: [IFRS 15.7]

Extract from IFRS 15

- 7 A contract with a customer may be partially within the scope of this Standard and partially within the scope of other Standards listed in paragraph 5.
- (a) If the other Standards specify how to separate and/or initially measure one or more parts of the contract, then an entity shall first apply the separation and/or measurement requirements in those Standards. An entity shall exclude from the transaction price the amount of the part (or parts) of the contract that are initially measured in accordance with other Standards and shall apply paragraphs 73-86 to allocate the amount of the transaction price that remains (if any) to each performance obligation within the scope of this Standard and to any other parts of the contract identified by paragraph 7(b).
 - (b) If the other Standards do not specify how to separate and/or initially measure one or more parts of the contract, then the entity shall apply this Standard to separate and/or initially measure the part (or parts) of the contract.

The requirements in IFRS 15.7 are only applicable to contracts that are partially within the scope of IFRS 15 and partially within the scope of any of the other IFRS accounting standards that are listed in IFRS 15.5. That is, the scope of IFRS 15.7 is narrow and not applicable to all contracts that might be partially within the scope of IFRS 15. [IFRS 15.5, IFRS 15.7]. Figure 2-1 below illustrates these requirements.

Figure 2-1: Interactions with other IFRS accounting standards

Consider the following example:

Illustration 2-4: Transactions that might be in the scope of multiple IFRS accounting standards

A bank, Company A, offers credit cards to consumers. The credit cards provide lending facilities that allow cardholders to make purchases on deferred payment terms. Cardholders pay an annual fee to obtain a credit card, and in return are entitled to ancillary services, such as concierge services. In addition, Company A provides guarantees to cardholders in respect of goods or services purchased using the credit card.

Company A must consider whether this contract is entirely, or partially, within the scope of one, or multiple, other IFRS accounting standards before it assesses whether IFRS 15 applies. For example, the guarantee provided to cardholders might give rise to an insurance contract that needs to be accounted for by applying IFRS 17 (see Chapter 51). Furthermore, Company A must determine whether the fees and other features of the credit card arrangement are within the scope of IFRS 9 (see Chapter 41). Only any remaining components of the arrangement that are not in scope of any other IFRS accounting standards are accounted for by applying IFRS 15 (see Question 2-4 below), if in scope of that standard.

If a component of the arrangement is covered by another IFRS accounting standard that is listed in IFRS 15.5 (for example, IFRS 9 or IFRS 17 in Illustration 2-4 above) and that other IFRS accounting standard specifies how to separate and/or initially measure that component, an entity needs to first apply that standard. The Board noted in the Basis for Conclusions that, “the more specific Standard would take precedence in accounting for a part of a contract ...”. [IFRS 15.BC66]. An entity then applies IFRS 15 to the remaining components of the arrangement. Some examples of where separation and/or initial measurement are addressed in other IFRS accounting standards include the following:

- IFRS 9 generally requires that a financial instrument be recognised at fair value at initial recognition. For contracts that include the issuance of a financial instrument and revenue components within the scope of IFRS 15 and the financial instrument is required to be initially recognised at fair value, the fair value of the financial instrument is first measured and the remainder of the estimated contract consideration is allocated among the other components in the contract that are accounted for in accordance with IFRS 15.
- A contract might contain a lease coupled with an agreement to sell other goods or services (e.g., subject to IFRS 15). IFRS 16 requires that a lessor accounts separately for the lease component (in accordance with IFRS 16) and any non-lease components (in accordance with other IFRS accounting standards) and provides application guidance on separating the components of such a contract. [IFRS 16.12, IFRS 16.B32, IFRS 16.B33]. A lessor allocates the consideration in a contract that contains a lease component and one or more additional lease or non-lease components by applying the requirements in IFRS 15 for allocating the transaction price to performance obligations and changes in the transaction price after contract inception (see section 6 below). [IFRS 16.17]. Care might be needed in such an allocation if the lease term (under IFRS 16) and the contract duration (under IFRS 15) differ. Refer to Chapter 24 for more information on IFRS 16.

Conversely, if a component of the arrangement is covered by another IFRS accounting standard listed in IFRS 15.5, but that standard does not specify how to separate and/or initially measure that component, the entity needs to apply IFRS 15 to separate and/or initially measure each component. For example, specific requirements do not exist for the separation and measurement of the different parts of an arrangement when an entity sells a business and also enters into a long-term supply agreement with the other party. See section 6.6 below for further discussion on the effect on the allocation of arrangement consideration when an arrangement includes both revenue and non-revenue components.

As noted above, if a contract includes a component that is covered by another IFRS accounting standard or interpretation that is not listed in IFRS 15.5, the requirements of IFRS 15.7 do not apply. For example, an IFRS 15 contract with a customer might also include the disposal of property, plant and equipment (within the scope of IAS 16) or an intangible asset (within the scope of IAS 38 *Intangible Assets*). Another example might be an IFRS 15 contract with a customer that includes a government grant that falls within the scope of IAS 20. Since the requirements of IFRS 15.7 do not apply, if the other IFRS accounting standard or interpretation does not specify how to separate the components between standards or interpretations, an entity would need to apply the requirements in IAS 8 to develop an accounting policy to determine how to separate the parts of the contract between IFRS 15 and the other standard or interpretation. When developing its policy, an entity must, in accordance with IAS 8.11, refer to, and consider the applicability of requirements in IFRS accounting standards that deal with similar and related issues. [IAS 8.11].

Frequently asked questions

Question 2-1: Before applying the financial instruments standards, are deferred-payment transactions that are part of Sharia-compliant instruments and transactions within the scope of the revenue standard?

(TRG meeting 26 January 2015 - Agenda paper no. 17)

Islamic financial institutions (IFIs) enter into Sharia-compliant instruments and transactions that do not result in IFIs earning interest on loans. Instead, these transactions involve purchases and sales of real assets (e.g., vehicles) on which IFIs can earn a premium to compensate them for deferred payment terms. Typically, an IFI makes a cash purchase of the underlying asset, takes legal possession, even if only for a short time, and immediately sells the asset on deferred payment terms. The financial instruments created by these transactions are within the scope of the financial instruments' standards.

At the January 2015 TRG meeting, the IASB TRG members discussed whether (before applying the financial instruments standards) deferred-payment transactions that are part of Sharia-compliant instruments and transactions are within the scope of IFRS 15. The IASB TRG members generally agreed that Sharia-compliant instruments and transactions might be outside the scope of the standard. However, the analysis depends on the specific facts and circumstances. This might require significant judgement as contracts often differ within and between jurisdictions. The FASB TRG members did not discuss this issue.

Question 2-2: Are certain fee-generating activities of financial institutions in the scope of the revenue standard (i.e., servicing and sub-servicing financial assets, providing financial guarantees and providing deposit-related services)?

(FASB TRG meeting 18 April 2016 - Agenda paper no. 52)

The FASB TRG members generally agreed that the standard provides a framework for determining whether certain contracts are in the scope of the FASB's standard, ASC 606, or other standards. While this was not specifically discussed by the IASB TRG, preparers that apply IFRS accounting standards might find the FASB TRG's discussions helpful in assessing whether certain contracts are within the scope of IFRS 15 or other standards. Furthermore, in 2024, the IFRS IC received a request related to guarantees provided by an entity to third parties on the obligations of a joint venture. In the final agenda decision, the IFRS IC noted that determining the applicable standard requires judgement and consideration of the facts and circumstances, and that based on this, the guarantee could be in the scope of IFRS 17, IFRS 9, IFRS 15 or IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 41 for further guidance on the accounting for guarantee contracts that are not in the scope of IFRS 15).¹⁴

As discussed above, under both IFRS accounting standards and US GAAP, the revenue standard's scope includes all contracts with customers to provide goods or services in the ordinary course of business, except for contracts with customers that are within the scope of certain other requirements that are listed as scope exclusions. If another accounting standard specifies the accounting for the consideration (e.g., a fee) received in the arrangement, the consideration is outside the scope of the revenue standard. If other standards do not specify the accounting for the consideration and there is a separate good or service provided, the consideration is in (or at least partially in) the scope of the revenue standard.

In considering this issue under US GAAP, the FASB staff applied the above framework in the TRG agenda paper to arrangements to service financial assets, provide financial guarantees and provide deposit-related services.

The FASB TRG members generally agreed that income from servicing financial assets (e.g., loans) is not within the scope of ASC 606. An asset servicer performs various services, such as communication with the borrower and payment collection, in exchange for a fee. The FASB TRG members generally agreed that an entity would look to ASC 860, *Transfers and Servicing*, to determine the appropriate accounting for these fees. This is because ASC 606 contains a scope exception for contracts that fall under ASC 860, which provides requirements on the recognition of the fees (despite not providing explicit requirements on revenue accounting).

¹⁴ [IFRIC Update](#), March 2025, available on the IFRS Foundation's website.

The FASB TRG members generally agreed that fees from providing financial guarantees are not within the scope of ASC 606. A financial institution might receive a fee for providing a guarantee of a loan. These types of financial guarantees are generally within the scope of ASC 460, *Guarantees* or ASC 815, *Derivatives and Hedging*. The FASB TRG members generally agreed that an entity would look to ASC 460 or ASC 815 to determine the appropriate accounting for these fees. This is because ASC 606 contains a scope exception for contracts that fall within those topics, which provide principles an entity can follow to determine the appropriate accounting to reflect the financial guarantor's release from risk (and credit to earnings).

The FASB TRG members also generally agreed that fees from deposit-related services are within the scope of ASC 606. In contrast to the conclusions above for servicing income and financial guarantees, the guidance in ASC 405, *Liabilities*, that financial institutions apply to determine the appropriate liability accounting for customer deposits, does not provide a model for recognising fees related to customer deposits (e.g., ATM fees, account maintenance or dormancy fees). Accordingly, the FASB TRG members generally agreed that deposit fees and charges are within the scope of ASC 606, even though ASC 405 is listed as a scope exception in ASC 606, because of the lack of guidance on the accounting for these fees in ASC 405.

Question 2-3: Are contracts in which the consideration is in the form of incentive-based capital allocations within the scope of IFRS 15?

As discussed above, IFRS 15's scope includes all contracts with customers to provide goods or services in the ordinary course of business, except for contracts with customers that are within the scope of certain other requirements that are listed as scope exclusions. When a contract with a customer includes consideration in the form of incentive-based capital allocations, judgement might be needed to determine whether some (or all) of the contract is within the scope of another IFRS accounting standard (e.g., IFRS 9) or IFRS 15.

If the contract includes an embedded derivative, some (or all) of the consideration might be within the scope of IFRS 9 (see Chapter 42). Assuming it is not an embedded derivative, if fund managers are entitled to incentive-based capital allocations in a contract with a customer in exchange for services that are within the scope of IFRS 15, the fees will be within the scope of IFRS 15 - that is, IFRS 15 applies irrespective of whether the consideration is cash or non-cash. [IFRS 15.5, IFRS 15.6, IFRS 15.IE Example 25, IFRS 15.IE129-IE133]. If the incentive-based capital allocation is paid for another reason (e.g., part of distributions to equity investors), the fees will not be within the scope of IFRS 15, and other IFRS accounting standards would apply.

Question 2-4: Are credit card fees in the scope of the revenue standard?

(TRG meeting 13 July 2015 - Agenda paper no. 36)

A bank that issues credit cards can have various income streams (e.g., annual fees) from a cardholder under various credit card arrangements. Some of these fees might entitle cardholders to ancillary services (e.g., concierge services, airport lounge access). The card issuer might also provide rewards to cardholders based on their purchases. At the July 2015 TRG meeting, the TRG members discussed a question raised by US GAAP stakeholders regarding whether such fees and programmes are within the scope of the revenue standard, particularly when a good or service is provided to a cardholder.

While this question was only raised by US GAAP stakeholders, the IASB TRG members generally agreed that a preparer that applies IFRS accounting standards first needs to determine whether the credit card fees are within the scope of IFRS 9. IFRS 9 requires that any fees that are an integral part of the effective interest rate for a financial instrument be treated as an adjustment to the effective interest rate. Conversely, any fees that are not an integral part of the effective interest rate of the financial instrument are generally accounted for under IFRS 15.

The FASB TRG members generally agreed that credit card fees that are accounted for under ASC 310, *Receivables* are not in the scope of ASC 606. This includes annual fees that might entitle cardholders to ancillary services. The FASB TRG members noted that this conclusion is consistent with legacy US GAAP requirements for credit card fees. However, the observer from the US SEC noted that the nature of the arrangement must truly be that of a credit card lending arrangement in order to be in the scope of ASC 310. As such, entities need to continue evaluating their arrangements as new programmes develop. Credit card fees could, therefore, be treated differently under IFRS accounting standards and US GAAP.

Question 2-5: Are rewards programmes linked to financial instruments (e.g., credit cards) in the scope of the revenue standard?*(TRG meeting 13 July 2015 - Agenda paper no. 36)*

Loyalty programmes might be linked to credit card arrangements or fixed-odds wagering contracts that are in the scope of IFRS 9. In those scenarios, the question is whether the loyalty programmes fall within the scope of IFRS 15.

The FASB TRG members discussed whether cardholder rewards programmes are within the scope of ASC 606. They generally agreed that if all consideration (i.e., credit card fees discussed in Question 2-4 above) related to the rewards programme is determined to be within the scope of ASC 310, the rewards programme is not in the scope of ASC 606. However, this determination has to be made based on the facts and circumstances due to the wide variety of credit card reward programmes offered.

While the IASB TRG members did not discuss this issue because the question was only raised in relation to US GAAP, as noted above, credit card reward programmes can vary significantly, for example, some include cash-back rewards, others involve the use of loyalty points. Similarly, some entities that offer fixed-odds wagering contracts to customers have established customer loyalty programmes, where customers earn loyalty points on their gambling activities, for example as a fixed percentage of the amounts spent by a customer. Such loyalty points, with a fixed expiry period, can typically be redeemed for on-site goods or services, such as food, beverages or hotel accommodation.

To determine the applicable IFRS accounting standard(s), entities need to carefully assess the nature of the promise to cardholders. This evaluation would consider contractual obligations to cardholders as well as any implied promises to provide incentives.

If an entity determines that such programmes are within the scope of IFRS 15, depending on the programme, the requirements for consideration payable to customers (which includes a customer's customer) and/or the application guidance for customer options for additional goods or services may be relevant.

Question 2-6: Are fixed-odds wagering contracts within the scope of the revenue standard?

In fixed-odds wagering contracts, the payout for wagers placed on gambling activities (e.g., table games, slot machines, sports betting) is known at the time the wager is placed. Under IFRS accounting standards, consistent with a July 2007 IFRS IC agenda decision, wagers that meet the definition of a derivative are within the scope of IFRS 9. Those that do not meet the definition of a derivative are within the scope of IFRS 15.

**FASB differences**

Under US GAAP, fixed-odds wagering arrangements are within the scope of ASC 606.

Question 2-7: Are pre-production activities in the scope of the revenue standard?

Manufacturing and production entities in various industries might perform activities and incur costs before they produce goods. In some arrangements (including long-term supply arrangements), entities perform upfront engineering and design activities and/or incur costs related to set-up activities to create new technology or adapt existing technology according to the needs of the customer. These pre-production activities are often a prerequisite to delivering any units under a production contract.

Entities need to evaluate whether the pre-production activities are promises in a contract with a customer (and potentially performance obligations) under IFRS 15. When making this evaluation, entities need to determine whether the activities transfer a good or service to a customer. Refer to Question 4-1 in section 4.1.1 below for further discussion on determining whether pre-production activities are promised goods or services under IFRS 15. If an entity determines that these activities are promised goods or services, it will apply the requirements in IFRS 15 to those goods or services. Also see Question 4-1 in section 4.1.1 below and Questions 9-18 and 9-19 in section 9.3.2 below for a discussion of scope and accounting considerations for costs related to pre-production activities and pre-contract or set-up activities, respectively.

Question 2-8: Are sales of by-products or scrap materials in the scope of the revenue standard?

Consider an example in which a consumer products entity sells by-products or accumulated scrap materials that are produced as a result of its manufacturing process. In determining whether the sale of by-products or scrap materials to third parties is in the scope of IFRS 15, an entity first determines whether the sale of such items is an output of the entity's ordinary activities. This is because IFRS 15 defines revenue as "income arising in the course of an entity's ordinary activities". [IFRS 15 Appendix A]. If an entity determines the sale of such items represents revenue from a contract with a customer, it would generally recognise the sale under IFRS 15.

If an entity determines that such sales are not in the course of its ordinary activities, the entity would recognise those sales separately from revenue from contracts with customers because they represent sales to non-customers.

How we see it

We do not believe that it would be appropriate for an entity to recognise the sale of by-products or scrap materials as a reduction of cost of goods sold. This is because recognising the sale of by-products or scrap materials as a reduction of cost of goods sold might inappropriately reflect the cost of raw materials used in manufacturing the main product. However, this interpretation would not apply if other IFRS accounting standards allow for recognition as a reduction of costs.

IAS 2 *Inventories* requires that the costs of conversion of the main product and the by-product be allocated between the products on a rational and consistent basis. [IAS 2.14]. However, IAS 2 mentions that most by-products, by their nature, are immaterial. When this is the case, they are often measured at net realisable value and this value is deducted from the cost of the main product. As a result, the carrying amount of the main product is not materially different from its cost.

In our view, the language in IAS 2 only relates to the allocation of the costs of conversion between the main product and by-product and does not allow the proceeds from the sale of by-products to be presented as a reduction of cost of goods sold.

Question 2-9: Are the sales of prepaid gift cards within the scope of IFRS 15?

Entities might sell prepaid gift cards in their normal course of business in exchange for cash. The prepaid gift cards typically provide the customer with the right to redeem those cards in the future for goods or services of the entity and/or third parties. For any unused balance of the prepaid gift cards, entities need to recognise a liability that will be released upon redemption of that unused balance. However, the features of each prepaid gift card might vary and the nature of the liability depends on the assessment of these features. Entities might need to use judgement in order to determine whether the prepaid gift card is within the scope of IFRS 15 or another IFRS accounting standard.

Prepaid gift cards that give rise to financial liabilities are within the scope of IFRS 9 (see Chapter 41). If a prepaid gift card does not give rise to a financial liability, it is likely to be within the scope of IFRS 15. For further guidance on applying IFRS 15 to prepaid gift cards within its scope, refer to section 7.9 below.

An example of a prepaid gift card that is within the scope of IFRS 9 was discussed by the IFRS IC at its March 2016 meeting. The issue related to the accounting treatment of any unused balance on a prepaid card issued by an entity in exchange for cash as well as the classification of the relevant liability that arises. The discussion was limited to prepaid cards that have the specific features described in the request to the IFRS IC. In particular, the prepaid card:¹⁵

- a. Has no expiry date and no back-end fees. That is, any unspent balance does not reduce unless it is spent by the cardholder
 - b. Is non-refundable, non-redeemable and non-exchangeable for cash
 - c. Can be redeemed only for goods or services to a specified monetary amount
- And
- d. Can be redeemed only at specified third-party merchants (the range of merchants accepting the specific card could vary depending on the card programme) and, upon redemption, the entity delivers cash to the merchant(s)

15 [IFRIC Update](#), March 2016, available on the IFRS Foundation's website.

The IFRS IC observed that when an entity issues a prepaid card with the above features, it is contractually obliged to deliver cash to the merchants on behalf of the cardholder. Although this obligation is conditional upon the cardholder redeeming the card by purchasing goods or services, the entity's right to avoid delivering cash to settle this contractual obligation is not unconditional. On this basis, the IFRS IC concluded that the entity's liability for such a prepaid card meets the definition of a financial liability and would fall within the scope of IFRS 9 and IAS 32 *Financial Instruments*:

Presentation. Entities might need to apply judgement to determine which IFRS accounting standard applies depending upon the specific facts and circumstances for scenarios other than the one discussed by the IFRS IC in its March 2016 meeting. The IFRS IC also noted in its agenda decision that its discussion on this issue did not include customer loyalty programmes.

Question 2-10: How does a utility entity determine whether a contract that includes a non-refundable upfront fee received for establishing a connection to a network (i.e., a connection fee) is within the scope of IFRS 15?

See response to Question 5-38 in section 5.8 below.

Question 2-11: Does an entity apply IFRS 10 or IFRS 15 to the sale of a corporate wrapper to a customer?

As part of their ordinary activities, entities might enter into contracts with customers to sell an asset by selling their equity interest in a separate entity (commonly referred to as a 'corporate wrapper' or 'single-asset entity') holding that asset (e.g., real estate), rather than by selling the asset itself. Entities might sell assets via a sale of equity interest in a corporate wrapper for tax or legal reasons or because of local regulation or business practice. Facts and circumstances might differ, for example, in relation to:

- When the corporate wrapper is created and the asset transferred into it
- When the entity enters into a contract with a customer
- If the asset is constructed by the entity, when construction starts
- When the equity interest in the corporate wrapper is legally transferred to the customer

In addition, a corporate wrapper could include only one asset (plus a related deferred tax asset or liability) or one or more other assets or liabilities, such as a financing liability.

Whether an entity needs to apply IFRS 10 or IFRS 15 to the sale of a corporate wrapper to a customer depends on facts and circumstances and might require significant judgement, including consideration of the following:

- IFRS 10 requires an entity that controls one or more entities (i.e., the parent) to present consolidated financial statements, with some limited exceptions, and sets out the requirements to determine whether, as an investor, it controls (and, therefore, must consolidate) an investee. A parent consolidates an entity that it controls (i.e., the subsidiary) from the date on which it first obtains control. It ceases consolidating that subsidiary on the date on which it loses control. [IFRS 10.2, IFRS 10.4-4B, IFRS 10.20, IFRS 10 Appendix A]. IFRS 10 also specifies how a parent accounts for the full or partial sale of a subsidiary. [IFRS 10.25]. See Chapters 7 and 8 for further discussion.¹⁶
- IFRS 15 excludes from its scope "... financial instruments and other contractual rights or obligations within the scope of ... IFRS 10" (see section 2.1 above). [IFRS 15.5(c)].

In practice, some entities apply IFRS 15 to all such contracts with customers because the transactions are part of the entity's ordinary activities and they believe doing so would better reflect the 'substance' of each transaction (e.g., the entity is 'in substance' selling the asset and not the equity interest; the structure is for legal, tax or risk reasons and they believe it does not affect the recognition of revenue).¹⁷

Judgement might also be needed in determining whether an investor controls the corporate wrapper. For example, the (selling) entity might act as an agent (in accordance with IFRS 10) in relation to the corporate wrapper based on the terms and conditions in the customer contract. IFRS 10 would not apply to the sale, if the entity does not control the corporate wrapper prior to sale.

¹⁶ IFRS 10.25-26 apply if a parent loses control of a subsidiary. IFRS 10.23-24 apply if a parent's ownership interest in a subsidiary changes without the parent losing control of that subsidiary.

¹⁷ [IASB Staff Paper 6](#): IFRS IC Agenda Paper 6, Project: *Sale of a single asset entity containing real estate (IFRS 10)*, Paper topic: *Initial Consideration*, IFRS IC meeting, June 2019, paragraphs 15-16. Available on the IFRS Foundation's website.

In June 2019, the IFRS IC discussed a request about the accounting for a transaction in which an entity, as part of its ordinary activities, enters into a contract with a customer to sell real estate by selling its equity interest in a subsidiary. The entity established the subsidiary some time before it enters into the contract with the customer; the subsidiary has one asset (real estate inventory) and a related tax asset or liability. The entity has applied IFRS 10 in consolidating the subsidiary before it loses control of the subsidiary as a result of the transaction with the customer. The IFRS IC discussed this issue, but did not issue an agenda decision on this matter. Instead, the issue was referred to the IASB.

In October 2019, the IASB directed its staff to research the feasibility of narrow-scope standard setting. In June 2020, the IASB discussed a possible narrow-scope amendment that would have required an entity to apply IFRS 15, instead of IFRS 10, to sales of subsidiaries where all of the following apply:

- The entity contracts with a customer for goods or services that are the output of its ordinary activities in exchange for consideration
- The subsidiary contains only inventory and any related income tax asset or liability
- The entity retains no interest in the inventory transferred to the customer

The Board decided against proposing this amendment.¹⁸

During the discussions held by both the IFRS IC and the IASB, a number of members of the IFRS IC and the Board considered that, absent an amendment, IFRS 10 (rather than IFRS 15) would apply to the transaction considered. During the June 2020 discussion, some Board members thought there was merit in a narrow-scope amendment. However, concerns were raised about potential unintended consequences of proposing a narrow-scope amendment without a more comprehensive discussion. Any narrow-scope amendment would affect the scope of both IFRS 10 and IFRS 15 and, as such, Board members wanted to learn more from stakeholders about the need for, and the consequences of, such a project.¹⁹ However, these considerations were not noted in the relevant IFRIC Update or IASB Update that were issued as summaries of the meetings. This matter was being considered as part of phase 2 of the post-implementation review (PIR) of IFRS 10. In June 2022, the Board assessed this matter as a low priority based on input received in the Third Agenda Consultation and concluded this topic could be explored if identified as a priority in the next agenda consultation. In the Request for Information for the PIR of IFRS 15 published in June 2023, the Board also explained that it decided against including the issue in the PIR, as any comprehensive solution would require significant resources and amendments to several different IFRS accounting standards.²⁰ The Board confirmed, during its discussion of responses to the Request for Information for the PIR, that it would defer this issue to the next agenda consultation.²¹ See Chapter 8 for further discussion.²²

How we see it

Even though the deliberation process on this question has been completed, there might continue to be some diversity in practice. However, in the meantime, entities might need to consider the discussions on this matter as they determine the appropriate standard to apply to transactions with customers involving the loss of control of a single asset entity.

It is noted that the applicable IFRS accounting standard (i.e., IFRS 10 or IFRS 15) is not just a matter of presentation. That is, it might also affect, for example, the timing of recognition (i.e., point in time versus over-time and, if point in time, the specific point in time) and the measurement of consideration (e.g., IFRS 10 does not constrain variable consideration). Furthermore, IFRS 10 provides specific requirements for the derecognition of all assets and liabilities of the former subsidiary on loss of control, which would not apply if the contract with the customer is within the scope of IFRS 15.

FASB differences

Under US GAAP, the sale of a corporate wrapper to a customer generally will be in the scope of ASC 606. However, the sale of a corporate wrapper to a counterparty that is not a customer might be in the scope of ASC 610-20, *Other Income - Gains and Losses from Derecognition of Nonfinancial Assets*, which applies to the recognition of gains or losses on transfers of non-financial assets and in-substance non-financial assets, including transfers of these assets when included in a consolidated subsidiary, that are not businesses, to counterparties that are not customers.

Question 2-12: Can a joint operator under IFRS 11 recognise as revenue under IFRS 15 amounts to which it is entitled as a joint operator that have not yet been sold to customers?

No. Revenue recognised in accordance with IFRS 15 must reflect an entity's performance in transferring a good or service to a customer.

Under IFRS 11, a joint operator is required to account for revenue relating to its interest in the joint operation (as defined in IFRS 11; see Chapter 13) by applying the IFRS accounting standards that are applicable to the particular revenue. [IFRS 11.21]. Therefore, while contracts with joint operators are excluded from the scope of IFRS 15, if revenue relating to an interest in a joint operation under IFRS 11 arises from a contract with a customer, it is recognised in accordance with IFRS 15.

As discussed in section 2.1 above, IFRS 15 applies only to contracts with customers. In addition, IFRS 11 requires a joint operator to recognise "its revenue from the sale of its share of the output arising from the joint operation". [IFRS 11.20(c)]. Therefore, revenue recognised by a joint operator must depict the output it has received from the joint operation and sold to customers, rather than the production of output or entitlement to output, as shown in Illustration 2-5 below.

This is consistent with the conclusion reached by the IFRS IC in March 2019. The IFRS IC discussed this issue using the following Illustration:²³

Illustration 2-5: Interaction between IFRS 11 and IFRS 15 in recognising revenue relating to an interest in a joint operation

Operators A and B establish an unincorporated joint operation (JO) that they expect will produce output over a 2-year period. According to the joint operating agreement, each operator is entitled to receive 50% of the output arising from the JO's activities and obliged to pay for 50% of the production costs incurred. For operational reasons, the output received by each joint operator and transferred to its customers in any one reporting period is different from the output to which it is entitled. Any difference between the operators' entitlement and the output received will be settled through future deliveries of output arising from the JO, not in cash.

Output from the JO's activities was CU100 in year 1 and CU150 in year 2. In Years 1 and 2, both operators paid for 50% of the production costs incurred.

	Operator A	Operator B
Year 1		
Entitlement to output	CU50	CU50
Output received and transferred to customers	(CU48)	(CU52)
Asset/(liability)	CU2	(CU2)
Year 2		
Entitlement to output	CU75	CU75
Output received and transferred to customers	(CU77)	(CU73)

Operators A and B consider whether to recognise as revenue in each period: the entitlement to the output produced from the joint operation's activities; or the output that was received and transferred to its customers.

²³ [IFRIC Update](#), March 2019; and [IASB Staff Paper 2](#): Project: *Output received by a joint operator (IFRS 11)*, Paper topic: *Initial Consideration*, IFRS IC meeting, November 2018. Available on the IFRS Foundation's website.

In this fact pattern, the IFRS IC concluded that, in accordance with IFRS 15, each joint operator recognises revenue to depict only the transfer of output to its customers in each reporting period. As such, if Operators A and B are entitled to output, but that output has not been received and sold to customers, they do not recognise revenue.

Therefore, Operator A recognises revenue from contracts with customers of CU48 in Year 1 and CU77 in Year 2. Similarly, Operator B recognises revenue from contracts with customers of CU52 in Year 1 and CU73 in Year 2.

Question 2-13: Are equity instruments issued by an entity to a customer in connection with a revenue arrangement within the scope of the revenue standard?

Whether or not an entity needs to apply IFRS 15 to a transaction in which equity instruments (e.g., shares) are issued to a customer in connection with a revenue arrangement depends on the substance and purpose of the transaction.

Many entities make payments to their customers. In some cases, the consideration paid or payable represents purchases by the entity of goods or services offered by the customer that satisfy a business need of the entity. In other cases, the consideration paid or payable represents incentives given by the entity to entice the customer to purchase, or continue purchasing, its goods or services.

According to IFRS 15.7, a contract with a customer may be partially within the scope of IFRS 15 and partially within the scope of other IFRS accounting standards. IFRS 15 does not specify whether equity instruments issued by an entity to a customer are a type of consideration paid or payable to customer. Nor does IFRS 2 *Share-based Payment* specifically address such transactions.

How we see it

Depending on the facts and circumstances, several standards (or a combination of standards) might be applicable (e.g., IFRS 2, IFRS 15, IAS 32). To determine the substance of the transaction and which standard(s) apply, entities will need to consider all relevant facts and circumstances, including the purpose of the transaction. Such determinations might require significant judgement.

FASB differences

Under US GAAP, equity instruments granted to customers in conjunction with the sale of goods or services (e.g., shares, options) are within the scope of the requirements for consideration payable to customers.²⁴

Question 2-14: Are litigation settlements with customers in the scope of IFRS 15?

Whether litigation settlement with customers are in the scope of IFRS 15 depends on the specific facts and circumstances. See Question 5-9 in section 5.2.1 below and Question 5-32 in section 5.7.1 below for further details.

2.6 Other income and other revenue

As income and revenue are defined broadly, not all income-generating transactions are in the scope of IFRS 15. As discussed in section 2.1 above, an entity applies IFRS 15 only to a contract in which the counterparty to the contract meets the definition of a customer (unless the contract is specifically excluded from the scope of IFRS 15 (see section 2.1 above for a list of scope exclusions)).

Below, we highlight some other items of income that are not within the scope of IFRS 15 and note whether they are covered by another IFRS accounting standard. Some of these items of income might represent other revenue (i.e., non-IFRS 15 revenue) if they are part of the entity's ordinary activities. For a further discussion of whether income outside the scope of IFRS 15 can be presented as revenue, please see Question 10-7 in section 10.2 below.

²⁴ ASU 2018-07 *Compensation - Stock Compensation (718): Improvements to Nonemployee Share-Based Payment accounting*.

2.6.1 Income and distributable profits

In general, IFRS accounting standards do not address the issue of the distribution of profit. Whether or not revenue and gains recognised in accordance with IFRS accounting standards are distributable to shareholders of an entity will depend entirely on the national laws and regulations with which the entity needs to comply. Thus, income reported in accordance with IFRS accounting standards does not necessarily imply that such income would either be realised or distributable under a reporting entity's applicable national legislation.

2.6.2 Interest and dividends

Entities (e.g., financial institutions) might earn interest or dividends in the course of their ordinary activities and, therefore, present these transactions as revenue. The relevant recognition and measurement requirements are included in IFRS 9. These transactions are recognised, as follows:

- Interest: calculated by using the effective interest method [IFRS 9 Appendix A, IFRS 9.5.4.1, IFRS 9.B5.4.1-B5.4.7] as discussed in Chapter 46.
- Dividends: when the shareholder's right to receive payment is established, it is probable that the economic benefits associated with the dividend will flow to the entity and the amount of the dividend can be measured reliably. [IFRS 9.5.7.1A]. See Chapter 46.

2.6.3 Disposal of non-financial assets not in the ordinary course of business

When an entity disposes of an asset that is within the scope of IAS 16, IAS 38 or IAS 40 *Investment Property*, and that disposal is not part of the entity's ordinary activities, the transaction is within the scope of those standards, not IFRS 15. However, IAS 16, IAS 38 and IAS 40 require entities to use certain of the requirements of IFRS 15 when recognising and measuring gains or losses arising from the sale or disposal of non-financial assets.

IAS 16, IAS 38 and IAS 40 require that the gain or loss arising from the disposal of a non-financial asset be included in profit or loss when the item is derecognised, unless IFRS 16 requires otherwise on a sale and leaseback. IAS 16 and IAS 38 specifically prohibit classification of any such gain as revenue. [IAS 16.68, IAS 38.113, IAS 40.69]. This was reiterated by the IFRS IC in June 2020 in relation to the presentation of player transfer payments resulting from the sale of an intangible asset within the scope of IAS 38.²⁵ However, IAS 16 mentions an exception in the case of entities that are in the business of renting and subsequently selling the same assets (discussed in section 2.6.3.A below). [IAS 16.68A, IAS 16.BC35C]. IFRS 16 applies to disposal via a sale and leaseback. [IAS 16.69, IAS 38.114, IAS 40.67].

The gain or loss on disposal of a non-financial asset is the difference between the net disposal proceeds, if any, and the carrying amount of the item. [IAS 16.71, IAS 38.113, IAS 40.69]. Under IAS 16 or IAS 38, if an entity applies the revaluation model for measurement after initial recognition, any revaluation surplus relating to the asset disposed of is transferred within equity to retained earnings when the asset is derecognised and not reflected in profit or loss. [IAS 16.41, IAS 38.87].

As noted above, IAS 16, IAS 38 and IAS 40 provide a consistent model for the measurement and recognition of gains or losses on the sale or disposal of non-financial assets to non-customers (i.e., not in the ordinary course of business) by referring to the requirements in IFRS 15. For sales of non-financial assets to non-customers, IAS 16, IAS 38 and IAS 40 require entities to:

- Determine the date of disposal (and, therefore, derecognition of the asset) using the requirements in IFRS 15 for determining when a performance obligation is satisfied (i.e., Step 5 requirements, see section 7 below). [IAS 16.69, IAS 38.114, IAS 40.67].
- Measure the consideration that is included in the calculation of the gain or loss on disposal in accordance with the requirements for determining the transaction price (i.e., Step 3 requirements, see section 5 below). Any subsequent changes to the estimate of the consideration (e.g., updates of variable consideration estimates, including reassessment of the constraint) are recognised in accordance with the requirements for changes in the transaction price. [IAS 16.72, IAS 38.116, IAS 40.70]. For example, if variable consideration is constrained at the time of disposal, it would not be recognised in profit or loss until it is no longer constrained, which could be in a subsequent period.

²⁵ [IFRIC Update](#), June 2020, available on the IFRS Foundation's website.

IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* provides additional requirements for assets that meet that standard's criteria to be classified as held for sale. These requirements include measurement provisions, which might affect the measurement of the amount of the subsequent gain or loss on disposal. These are discussed in Chapter 5.

IFRS 10 specifies how a parent accounts for the full or partial disposal of a subsidiary (see Chapter 8 for further discussion).²⁶ The accounting treatment might, therefore, differ depending on whether a non-financial asset is sold on its own (in which case, IAS 16, IAS 38 or IAS 40 would apply) or included within a full or partial disposal of a subsidiary (in which case, IFRS 10 would apply). Where there is a retained interest in a former subsidiary, other IFRS accounting standards (such as IAS 28, IFRS 11 or IFRS 9) might also apply in accounting for the transaction.

Similar considerations might apply to disposals of non-financial assets held in a corporate wrapper that are in the ordinary course of business, since IFRS 15 excludes transactions within the scope of IFRS 10. See Question 2-11 in section 2.5 above for further discussion.

FASB differences

ASC 610-20 provides guidance under US GAAP on how to account for any gain or loss resulting from the sale of non-financial assets or in-substance non-financial assets that are not an output of an entity's ordinary activities and are not a business. ASC 610-20 requires entities to apply certain recognition and measurement principles of ASC 606. Sales or transfers of businesses or subsidiaries that do not contain solely non-financial assets and in-substance non-financial assets to non-customers are accounted for using the deconsolidation guidance in ASC 810, *Consolidation*.

2.6.3.A Sale of assets held for rental

In general, IAS 16 prohibits the classification of gains arising from the derecognition of property, plant and equipment as revenue. [IAS 16.68A]. However, for entities that are in the business of renting and subsequently selling the same asset, the IASB has agreed that the presentation of revenue, rather than a net gain or loss on the sale of the assets, would better reflect the ordinary activities of such entities. [IAS 16.BC35C]. See Chapter 19 for further discussion.

Therefore, where an entity, in the course of its ordinary activities, routinely sells items of property, plant and equipment, that it has held for rental, to others, it is required to transfer the assets to inventories at their carrying amount when they cease to be rented and become held for sale. The proceeds from the sale of such assets are recognised as revenue in accordance with IFRS 15 on a gross basis. IFRS 5 does not apply when assets that are held for sale in the ordinary course of business are transferred to inventories. [IAS 16.68A].

IAS 7 *Statement of Cash Flows* requires presentation within operating activities of cash payments to manufacture or acquire such assets and cash receipts from rents and sales of such assets. [IAS 7.14]. The requirements of IAS 7 are discussed further in Chapter 36.

2.6.4 Regulatory assets and regulatory liabilities

In many countries, the provision of utilities (e.g., water, natural gas or electricity) to consumers is regulated by a government agency (regulator). The objective of this rate regulation is to ensure "quality, quantity and availability of supply", as well as "stability, predictability and affordability of pricing" for "goods or services that governments consider essential for a reasonable quality of life for their citizens and for which there are significant barriers to effective competition for supply".²⁷ Regulations differ between countries, but regulators might operate a cost-plus system under which a utility is allowed to make a fixed return on investment. When there is a rate-adjustment mechanism to adjust the future price, a utility is allowed to charge its customers for variances between estimated and actual inputs to the rate calculation. Hence, this adjustment creates timing differences as the future price might be influenced by past cost levels and investment levels.

²⁶ IFRS 10.25-26 apply if a parent loses control of a subsidiary. IFRS 10.23-24 apply if a parent's ownership interest in a subsidiary changes without the parent losing control of that subsidiary.

²⁷ [IASB Staff Paper 9A](#): Project: *Rate-regulated Activities*, Paper topic: *Background and summary of decisions to date*, IASB Meeting, July 2018, paragraph 5. Available on the IFRS Foundation's website.

Under some national GAAPs (including US GAAP), accounting practices have been developed that allow an entity to account for the effects of regulation by recognising a 'regulatory liability' or 'regulatory asset' that reflects the decrease in future prices required by the regulator to compensate for an excessive return on investment, and *vice versa* where an increase would be permitted.

In September 2012, the Board decided to restart its rate-regulated activities project and issued a discussion paper in September 2014 aiming to develop an accounting model so that investors can compare the effects of rate regulation on the financial position, performance and cash flows of any entity with significant rate-regulated revenue.²⁸ As an interim measure, the IASB issued IFRS 14 *Regulatory Deferral Accounts* to help entities that currently recognise rate-regulated assets and liabilities under their national GAAP to adopt IFRS accounting standards. IFRS 14 permits a first-time adopter of IFRS accounting standards to continue to use its previous accounting policies for rate-regulated assets and liabilities, with specific disclosure requirements (see Chapter 6 for discussion on first-time adoption).

The Board is currently undertaking a standard-setting project to develop a new accounting model to provide users of financial statements with useful information about an entity's rights and obligations arising from a defined rate regulation that are not captured by existing requirements in IFRS accounting standards. On 28 January 2021, the Board issued the exposure draft *Regulatory Assets and Regulatory Liabilities*. The exposure draft set out proposals for the recognition, measurement, presentation and disclosure of regulatory assets, regulatory liabilities, regulatory income and regulatory expense.

Under the exposure draft, an entity would continue to apply existing IFRS accounting standards, including IFRS 15, without modification (i.e., customer contracts perspective). The proposed requirements would then be applied to provide information about the effects of the timing differences between when a transaction or event takes place and when the effects of that transaction or event are reflected in the rate (i.e., total allowed compensation perspective). The rights and obligations reflecting these timing differences that are incremental to those reported using existing IFRS accounting standards (e.g., IFRS 15) would then be recognised in the statement of financial position as a regulatory asset or regulatory liability.²⁹

The Board completed its redeliberations of the proposals in response to the feedback it received on the exposure draft in July 2024 and discussed some final sweep issues in May 2025.³⁰ At the time of writing, the Board was expected to issue a new IFRS accounting standard, which will replace IFRS 14, in the first half of 2026.³¹ Until the new standard is issued and becomes effective, regulatory assets and liabilities are not eligible for recognition under IFRS accounting standards, unless the entity is a first-time adopter that can apply IFRS 14. For further details see Chapter 18, Chapter 26, and Chapter 27.

3 IFRS 15 - Identify the contract with the customer

To apply the five-step model in IFRS 15, an entity must first identify the contract, or contracts, to provide goods or services to customers.

A contract must create enforceable rights and obligations to fall within the scope of the model in the standard. Such contracts might be written, oral or implied by an entity's customary business practices. For example, if an entity has an established practice of starting performance based on oral agreements with its customers, it might determine that such oral agreements meet the definition of a contract. [IFRS 15.10].

As a result, an entity might need to account for a contract as soon as performance begins, rather than delay revenue recognition until the arrangement is documented in a signed contract. Certain arrangements might require a written contract to comply with laws or regulations in a particular jurisdiction. These requirements must be considered when determining whether a contract exists.

In the Basis for Conclusions, the Board acknowledged that entities need to look at the relevant legal framework to determine whether the contract is enforceable because factors that determine enforceability might differ among jurisdictions. [IFRS 15.BC32]. The Board also clarified that, while the contract must be legally enforceable to be within the scope of the model in the standard, all of the promises do not have to be enforceable to be considered performance obligations (see section 4.1 below). That is, a performance obligation can be based on the customer's valid expectations (e.g., due to the entity's business practice of providing an additional good or service that is not specified in the contract). In addition, the standard clarifies that some contracts have no fixed duration and can be terminated or modified by either party at any time. Other contracts automatically renew on a specified periodic basis. Entities are required to apply IFRS 15 to the contractual period in which the parties have present enforceable rights and obligations. [IFRS 15.11]. Contract enforceability and termination clauses are discussed in section 3.2 below.

Illustration 3-1: Oral contract

IT Support Co. provides online technology support for customers remotely via the internet. For a fixed fee, IT Support Co. will scan a customer's personal computer (PC) for viruses, optimise the PC's performance and solve any connectivity problems. When a customer calls to obtain the scan services, IT Support Co. describes the services it can provide and states the price for those services. When the customer agrees to the terms stated by the representative, payment is made over the telephone. IT Support Co. then gives the customer the information it needs to obtain the scan services (e.g., an access code for the website). It provides the services when the customer connects to the internet and logs onto the entity's website (which might be that day or a future date).

In this example, IT Support Co. and its customer are entering into an oral agreement, which is legally enforceable in this jurisdiction, for IT Support Co. to repair the customer's PC and for the customer to provide consideration by transmitting a valid credit card number and authorisation over the telephone. The required criteria for a contract with a customer (discussed further in section 3.1 below) are all met. As such, this agreement is within the scope of the model in the standard at the time of the telephone conversation, even if the entity has not yet performed the scanning services.

3.1 Attributes of a contract

To help entities determine whether (and when) their arrangements with customers are contracts within the scope of the model in the standard, the Board identified certain attributes that must be present, as follows: [IFRS 15.9]

- The parties have approved the contract and are committed to perform their respective obligations
- Each party's rights regarding the goods or services to be transferred can be identified
- Payment terms can be identified
- The contract has commercial substance
- It is probable that the entity will collect the consideration to which it will be entitled in exchange for the goods or services that will be transferred to the customer

The Board noted in the Basis for Conclusions that it added the criteria because when some, or all, of the criteria are not met, it is questionable whether the arrangement contains enforceable rights and obligations. [IFRS 15.BC33]. These criteria are assessed at the inception of the arrangement. If the criteria are met at that time, an entity does not reassess these criteria unless there is an indication of a significant change in facts and circumstances. [IFRS 15.13]. For example, as noted in IFRS 15.13, if the customer's ability to pay significantly deteriorates, an entity would have to reassess whether it is probable that the entity will collect the consideration to which it is entitled in exchange for transferring the remaining goods or services under the contract. The updated assessment is prospective in nature and would not change the conclusions associated with goods or services already transferred. That is, an entity would not reverse any receivables, revenue or contract assets already recognised under the contract. [IFRS 15.BC34].

If the criteria are not met (and until the criteria are met), the arrangement is not considered a revenue contract under the standard and the requirements discussed in section 3.5 below must be applied.

Example 4 in the standard provides an example of a significant change in facts and circumstances that results in the reassessment of the contract criteria in IFRS 15.9. [IFRS 15.IE Example 4, IFRS 15.IE14-IE17].

Frequently asked questions

Question 3-1: Does a master supply arrangement (MSA) create enforceable rights and obligations to be considered a contract within the scope of the model in IFRS 15?

An entity might use an MSA to govern the overall terms and conditions of a business arrangement between itself and a customer (e.g., scope of services, pricing, payment terms, warranties and other rights and obligations). Typically, when an entity and a customer enter into an MSA, purchases are subsequently made by the customer by issuing a non-cancellable purchase order or an approved online authorisation that explicitly references the MSA and specifies the products, services and quantities to be delivered.

In such cases, the MSA is unlikely to create enforceable rights and obligations, which are needed to be considered a contract within the scope of the model in IFRS 15. This is because, while the MSA might specify the pricing or payment terms, it usually does not specify the specific goods or services, or quantities thereof, to be transferred. Therefore, each party's rights and obligations regarding the goods or services to be transferred are not identifiable. It is likely that the MSA and the customer order, taken together, would constitute a contract under IFRS 15. As such, entities need to evaluate both the MSA and the subsequent customer order(s) together to determine whether and when the criteria in IFRS 15.9 are met. [IFRS 15.9].

If an MSA includes an enforceable clause requiring the customer to purchase a minimum quantity of goods or services, the MSA alone might constitute a contract under the standard because enforceable rights and obligations exist for this minimum amount of goods or services.

Question 3-2: How would an entity determine whether a contract exists within the scope of the model during a free trial period?

Free trial periods are common in certain subscription arrangements (e.g., magazines, streaming services). A customer might receive a number of 'free' months of goods or services at the inception of an arrangement; before the paid subscription begins; or as a bonus period at the beginning or end of a paid subscription period.

How we see it

Under IFRS 15, revenue is not recognised until an entity determines that a contract within the scope of the model exists. Once an entity determines that an IFRS 15 contract exists, it is required to identify the promises in the contract. Therefore, if the entity has transferred goods or services prior to the existence of an IFRS 15 contract, we believe that the free goods or services provided during the trial period would generally be accounted for as marketing incentives.

Consider an example in which an entity has a marketing programme to provide a three-month free trial period of its services to prospective customers. The entity's customers are not required to pay for the services provided during the free trial period and the entity is under no obligation to provide the services under the marketing programme. If a customer enters into a contract with the entity at the end of the free trial period that obliges the entity to provide services in the future (e.g., signing up for a subsequent 12-month period) and obliges the customer to pay for the services, the services provided as part of the marketing programme might not be promises that are part of an enforceable contract with the customer.

However, if an entity, as part of a negotiation with a prospective customer, agrees to provide three free months of services if the customer agrees to pay for 12 months of services (effectively providing the customer a discount on 15 months), the entity would identify the free months as promises in the contract because the contract requires it to provide them.

The above interpretation applies if the customer is not required to pay any consideration for the additional goods or services during the trial period (i.e., they are free). If the customer is required to pay consideration in exchange for the goods or services received during the trial period (even if it is only a nominal amount), a different accounting conclusion could be reached. Entities need to apply judgement to evaluate whether a contract exists that falls within the scope of the model in the standard.

Question 3-3: Do entities need to consider side agreements when determining whether a contract exists within the scope of the model?

All terms and conditions that create or negate enforceable rights and obligations must be considered when determining whether a contract exists under the standard. Understanding the entire contract, including any side agreements or other amendments, is critical to this determination.

Side agreements are amendments to a contract that can be either undocumented or documented separately from the main contract. The potential for side agreements is greater for complex or material transactions or when complex arrangements or relationships exist between an entity and its customers. Side agreements might be communicated in many forms (e.g., oral agreements, email, letters or contract amendments) and could be entered into for a variety of reasons.

Side agreements might provide an incentive for a customer to enter into a contract near the end of a financial reporting period or to enter into a contract that it would not enter into in the normal course of business. Side agreements might entice a customer to accept delivery of goods or services earlier than required or could provide the customer with rights in excess of those customarily provided by the entity. For example, a side agreement might extend contractual payment terms; expand contractually stated rights; provide a right of return; or commit the entity to provide future products or functionality not contained in the contract or to assist resellers in selling a product. Therefore, if the provisions in a side agreement differ from those in the main contract, an entity assesses whether the side agreement creates new rights and obligations or changes existing rights and obligations. See sections 3.3 and 3.4 below, respectively, for further discussion of the standard's requirements on combining contracts and contract modifications.

3.1.1 Parties have approved the contract and are committed to perform their respective obligations

Before applying the model in IFRS 15, the parties must have approved the contract. As indicated in the Basis for Conclusions, the Board included this criterion because a contract might not be legally enforceable without the approval of both parties. Furthermore, the Board decided that the form of the contract (i.e., oral, written or implied) is not determinative in assessing whether the parties have approved the contract. Instead, an entity must consider all relevant facts and circumstances when assessing whether the parties intend to be bound by the terms and conditions of the contract. In some cases, the parties to an oral or implied contract might have the intent to fulfil their respective obligations. However, in other cases, a written contract might be required before an entity can conclude that the parties have approved the arrangement. [IFRS 15.10, IFRS 15.BC35].

In addition to approving the contract, the entity must be able to conclude that both parties are committed to perform their respective obligations. [IFRS 15.9(a)]. That is, the entity must be committed to providing the promised goods or services. In addition, the customer must be committed to purchasing those promised goods or services. In the Basis for Conclusions, the Board clarified that an entity and a customer do not always have to be committed to fulfilling all of their respective rights and obligations for a contract to meet this requirement. [IFRS 15.BC36]. The Board cited, as an example, a supply agreement between two parties that includes stated minimums. The customer does not always buy the required minimum quantity and the entity does not always enforce its right to require the customer to purchase the minimum quantity. In this situation, the Board stated that it might still be possible for the entity to determine that there is sufficient evidence to demonstrate that the parties are substantially committed to the contract. This criterion does not address a customer's intent and ability to pay the consideration (i.e., collectability). Collectability is a separate criterion and is discussed in section 3.1.5 below.

Termination clauses are also an important consideration when determining whether both parties are committed to perform under a contract and, consequently, whether a contract within the scope of the model in IFRS 15 exists. See section 3.2 below for further discussion of termination clauses and how they affect contract duration.

3.1.2 Each party's rights regarding the goods or services to be transferred can be identified

This criterion is relatively straightforward. If the goods or services to be provided in the arrangement cannot be identified, it is not possible to conclude that an entity has a contract within the scope of the model in IFRS 15. The Board indicated that if the promised goods or services cannot be identified, the entity cannot assess whether those goods or services have been transferred because the entity would be unable to assess each party's rights with respect to those goods or services. [IFRS 15.BC37].

3.1.3 Payment terms can be identified

Identifying the payment terms does not require that the transaction price be fixed or stated in the contract with the customer. As long as there is an enforceable right to payment (i.e., enforceability as a matter of law) and the contract contains sufficient information to enable the entity to estimate the transaction price (see further discussion in section 5 below), the contract would qualify for accounting under the standard (assuming the remaining criteria set out in IFRS 15.9, discussed in section 3.1 above, have been met).

3.1.4 Commercial substance

The Board included a criterion that requires arrangements to have commercial substance (i.e., the risk, timing or amount of the entity's future cash flows is expected to change as a result of the contract) to prevent entities from artificially inflating revenue. [IFRS 15.BC40]. The model in IFRS 15 does not apply if an arrangement does not have commercial substance. Historically, some entities in high-growth industries allegedly engaged in transactions in which goods or services were transferred back and forth between the same entities in an attempt to show higher transaction volume and gross revenue (sometimes known as 'round-tripping'). This is also a risk in arrangements that involve non-cash consideration (e.g., barter transactions).

Determining whether a contract has commercial substance for the purposes of IFRS 15 could require significant judgement. In all situations, the entity must be able to demonstrate a substantive business purpose exists, considering the nature and structure of its transactions.

IFRS 15 does not contain requirements specific to advertising barter transactions. Entities need to carefully consider the commercial substance criterion when evaluating these types of transactions (see section 5.6.2 below for further discussion on barter transactions).

3.1.5 Collectability

Under IFRS 15, collectability refers to the customer's ability and intent to pay the amount of consideration to which the entity will be entitled in exchange for the goods or services that will be transferred to the customer. An entity needs to assess a customer's ability to pay based on the customer's financial capacity and its intention to pay considering all relevant facts and circumstances, including past experiences with that customer or customer class. [IFRS 15.BC45].

In the Basis for Conclusions, the Board noted that the purpose of the criteria in IFRS 15.9 is to require an entity to assess whether a contract is valid and represents a genuine transaction. The collectability criterion (i.e., determining whether the customer has the ability and the intention to pay the promised consideration) is a key part of that assessment. In addition, the Board noted that, in general, entities only enter into contracts in which it is probable that the entity will collect the amount to which it will be entitled.

[IFRS 15.BC43]. That is, in most instances, an entity would not enter into a contract with a customer if there was significant credit risk associated with that customer without also having adequate economic protection to ensure that it would collect the consideration. The IASB expects that only a small number of arrangements might fail to meet the collectability criterion. [IFRS 15.BC46E].

IFRS 15.9(e) requires an entity to evaluate at contract inception whether it is *probable* that it will *collect the consideration to which it will be entitled in exchange for the goods or services that will be transferred to a customer*. An entity is also required to reassess collectability after contract inception, when significant facts and circumstances change (see Question 3-5 in section 3.1.5.B below for further discussion). We discuss each of the italicised concepts below:

- *Probable* - For purposes of this analysis, the meaning of the term 'probable' is consistent with the existing definition in IFRS accounting standards, i.e., "more likely than not". [IFRS 5 Appendix A]. If it is not probable that the entity will collect amounts to which it is entitled, the model in IFRS 15 is not applied to the contract until the concerns about collectability have been resolved. However, other requirements in IFRS 15 apply to such arrangements (see section 3.5 below for further discussion).
- *Consideration to which it will be entitled in exchange for the goods or services that will be transferred to a customer* - The amount of consideration that is assessed for collectability is the amount to which the entity will be entitled. That is, the amount of consideration assessed for collectability is often the transaction price, but it could be a lesser amount in certain circumstances, as discussed further below.

It is important to note that the transaction price might be less than the stated contract price for the goods or services in the contract. Entities need to determine the transaction price in Step 3 of the model (as discussed in section 5 below) before assessing the collectability of that amount. The contract price and transaction price most often will differ because of variable consideration (e.g., rebates, discounts, or explicit or implicit price concessions) that reduces the amount of consideration stated in the contract. For example, the transaction price for the items expected to be transferred might be less than the stated contract price for those items if an entity concludes that it has offered, or is willing to accept, a price concession on products sold to a customer. See section 5.2.1.A below for further discussion on price concessions.

An entity deducts from the contract price any variable consideration that would reduce the amount of consideration to which it expects to be entitled (e.g., an estimated price concession) at contract inception in order to derive the transaction price for those items. The collectability assessment is then performed on the determined transaction price.

IFRS 15.9(e) specifies that an entity assesses only the consideration to which it will be entitled in exchange for the goods or services that will be transferred to the customer (rather than the total amount promised for all goods or services in the contract). [IFRS 15.9(e)]. In the Basis for Conclusions, the Board noted that, if the customer were to fail to perform as promised and the entity were able to stop transferring additional goods or services to the customer in response, the entity would not consider the likelihood of payment for those goods or services that would not be transferred in its assessment of collectability. [IFRS 15.BC46].

In the Basis for Conclusions, the Board also noted that the assessment of collectability criteria requires an entity to consider how the entity's contractual rights to the consideration relate to its performance obligations. That assessment considers the business practices available to the entity to manage its exposure to credit risk throughout the contract (e.g., through advance payments or the right to stop transferring additional goods or services). [IFRS 15.BC46C].

In addition to the IFRS 15 collectability assessment, an entity has to assess any contract assets or trade receivables arising from an IFRS 15 contract under the expected credit loss model in IFRS 9 (for further discussion see section 10.1 below and Chapter 47).

How we see it

At contract inception, significant judgement is required to determine when an expected partial payment indicates that: (i) there is an implied price concession in the contract that affects the determination of the transaction price and the amount assessed for collectability under IFRS 15; (ii) there is an expected credit loss (accounted for as an impairment loss under IFRS 9); or (iii) the arrangement lacks sufficient substance to be considered a contract under the standard. See section 5.2.1.A below for further discussion on implicit price concessions.

FASB differences

ASC 606 also uses the term 'probable' for the collectability assessment. However, 'probable' under US GAAP is a higher threshold than under IFRS accounting standards.³²

The FASB's standard includes additional guidance to clarify the intention of the collectability assessment. However, the IASB stated in the Basis for Conclusions on IFRS 15 that it does not expect differences in outcomes under IFRS and US GAAP in relation to the evaluation of the collectability criterion. [IFRS 15.BC46E].

3.1.5.A Variable consideration versus credit risk

In the Basis for Conclusions on IFRS 15, the IASB acknowledged that in some cases, it might be difficult to determine whether the entity has implicitly offered a price concession (i.e., variable consideration) or whether the entity has chosen to accept the risk of default by the customer of the contractually agreed-upon consideration (i.e., impairment losses under IFRS 9). [IFRS 15.BC194]. The Board did not develop detailed guidance for distinguishing between price concessions (recognised as variable consideration through revenue) and an expected credit loss to be accounted for as an impairment loss under IFRS 9 (i.e., outside of revenue). Therefore, an entity needs to consider all relevant facts and circumstances when analysing situations in which, at contract inception, it is willing to accept a lower price than the amount stated in the contract. In section 5.2.1.A below, we discuss certain factors that might suggest the entity has implicitly offered a price concession to the customer.

After the entity has determined the amount to assess for collectability under IFRS 15.9(e), it also has to apply the requirements in IFRS 9 to account for any expected credit losses for the receivable (or contract asset) that is recorded (i.e., after consideration of any variable consideration, such as an implicit price concession). Also, it presents any resulting impairment loss as an expense under IFRS 9 (i.e., not as a reduction of the transaction price).

Example 2, Example 3 and Example 23 from the standard illustrate situations where the transaction price that is evaluated for collectability is not the amount stated in the contract. Example 2 is included in section 5.2.1.A below and Example 23 is included in section 5.2.3 below. Example 3, which is not replicated in this chapter, illustrates a healthcare transaction with an uninsured patient where the entity determines that the transaction price is not the standard rate but is variable, as it expects to grant a price concession. In contrast, the TRG discussed an example (included in Question 3-4 in section 3.1.5.B below) in which an entity, at contract inception, believes it is probable that its customers will pay amounts owed and the transaction price (i.e., revenue recorded) equals the contract price, even though, on a portfolio basis, 2% is not expected to be collected.

3.1.5.B Example of assessing the collectability criterion

The standard provides the following example of how an entity would assess the collectability criterion: [IFRS 15.IE Example 1, IFRS 15.IE3-IE6]

Extract from IFRS 15

Example 1-Collectability of the consideration

An entity, a real estate developer, enters into a contract with a customer for the sale of a building for CU1 million¹. The customer intends to open a restaurant in the building. The building is located in an area where new restaurants face high levels of competition and the customer has little experience in the restaurant industry.

The customer pays a non-refundable deposit of CU50,000 at inception of the contract and enters into a long-term financing agreement with the entity for the remaining 95 per cent of the promised consideration. The financing arrangement is provided on a non-recourse basis, which means that if the customer defaults, the entity can repossess the building, but cannot seek further compensation from the customer, even if the collateral does not cover the full value of the amount owed. The entity's cost of the building is CU600,000. The customer obtains control of the building at contract inception.

In assessing whether the contract meets the criteria in paragraph 9 of IFRS 15, the entity concludes that the criterion in paragraph 9(e) of IFRS 15 is not met because it is not probable that the entity will collect the consideration to which it is entitled in exchange for the transfer of the building. In reaching this conclusion, the entity observes that the customer's ability and intention to pay may be in doubt because of the following factors:

³² For US GAAP, the term 'probable' is defined in the master glossary of the US Accounting Standards Codification as "The future event or events are likely to occur".

- (a) the customer intends to repay the loan (which has a significant balance) primarily from income derived from its restaurant business (which is a business facing significant risks because of high competition in the industry and the customer's limited experience);
- (b) the customer lacks other income or assets that could be used to repay the loan; and
- (c) the customer's liability under the loan is limited because the loan is non-recourse.

Because the criteria in paragraph 9 of IFRS 15 are not met, the entity applies paragraphs 15-16 of IFRS 15 to determine the accounting for the non-refundable deposit of CU50,000. The entity observes that none of the events described in paragraph 15 have occurred—that is, the entity has not received substantially all of the consideration and it has not terminated the contract. Consequently, in accordance with paragraph 16, the entity accounts for the non-refundable CU50,000 payment as a deposit liability. The entity continues to account for the initial deposit, as well as any future payments of principal and interest, as a deposit liability, until such time that the entity concludes that the criteria in paragraph 9 are met (ie the entity is able to conclude that it is probable that the entity will collect the consideration) or one of the events in paragraph 15 has occurred. The entity continues to assess the contract in accordance with paragraph 14 to determine whether the criteria in paragraph 9 are subsequently met or whether the events in paragraph 15 of IFRS 15 have occurred.

1 In these examples monetary amounts are denominated in 'currency units' (CU).

Frequently asked questions

Question 3-4: How would an entity assess collectability for a portfolio of contracts?

(TRG meeting 26 January 2015 - Agenda paper no. 13)

The TRG members generally agreed that if an entity has determined it is probable that a customer will pay amounts owed under a contract, but the entity has historical experience that it will not collect consideration from some of the customers within a portfolio of contracts (see section 3.3.1 below), it would be appropriate for the entity to record revenue for the contract in full and separately evaluate the corresponding contract asset or receivable for impairment. That is, the entity would not conclude the arrangement contains an implicit price concession and would not reduce revenue for the uncollectable amounts. See section 5.2.1.A below for a discussion of evaluating whether an entity has offered an implicit price concession.

If an entity determines that collection is probable, that does not mean that the risk of an expected credit loss is zero. Entities still need to apply IFRS 9 to estimate the expected credit losses on contract assets or receivables resulting from the application of IFRS 15.

Consider the following Illustration based on the example included in the TRG agenda paper:

Illustration 3-2: Assessing collectability for a portfolio of contracts

An entity has a large volume of similar customer contracts for which it invoices its customers in arrears, on a monthly basis. Before accepting a customer, the entity performs procedures designed to determine if it is probable that the customer will pay the amounts owed. It does not accept customers if it is not probable that the customer will pay the amounts owed. Because these procedures are only designed to determine whether collection is probable (and, thus, not a certainty), the entity anticipates that it will have some customers that will not pay all of the amounts owed. While the entity collects the entire amount due from the vast majority of its customers, on average, the entity's historical evidence (which is representative of its expectations for the future) indicates that the entity will only collect 98% of the amounts invoiced.

In this case, the entity would recognise revenue for the full amount due. That is, when the entity satisfies the performance obligations in the contracts, it would recognise revenue of 100% of the amount due and a corresponding receivable for the same amount representing its unconditional right to the full consideration. It would then recognise an impairment loss in accordance with IFRS 9 for 2% of the amount due (i.e., the amount the entity does not expect to collect).

In this example, the entity concludes that collectability is probable for each customer based on procedures it performed prior to accepting each customer and on its historical experience with this customer class, while also accepting that there is some credit risk inherent with this customer class. Furthermore, the entity concludes that any amounts not collected do not represent implied price concessions. Instead, they are due to credit risk that is present in a limited number of customer contracts.

Some of the TRG members cautioned that the analysis to determine whether to recognise an impairment loss for a contract in the same period in which revenue is recognised (instead of reducing revenue for an anticipated price concession) will require judgement. Refer to Chapter 47 for further information on estimating the expected credit loss on receivables and contract assets recognised as a result of the application of IFRS 15.

Question 3-5: When would an entity reassess collectability?**(TRG meeting 26 January 2015 - Agenda paper no. 13)**

As discussed in section 3.1.5 above, IFRS 15.13 requires an entity to reassess whether it is probable that it will collect the consideration to which it will be entitled when significant facts and circumstances change. Example 4 in IFRS 15 illustrates a situation in which a customer's financial condition declines and its current access to credit and available cash on hand is limited. In this case, the entity does not reassess the collectability criterion. However, in a subsequent year, the customer's financial condition further declines after losing access to credit and its major customers. Example 4 in IFRS 15 illustrates that this subsequent change in the customer's financial condition is so significant that a reassessment of the criteria for identifying a contract is required, resulting in the collectability criterion not being met.

[IFRS 15.IE Example 4, IFRS 15.IE14-IE17]. As noted in the TRG agenda paper, this example illustrates that it was not the Board's intent to require an entity to reassess collectability when changes occur that are relatively minor in nature (i.e., those that do not call into question the validity of the contract). The TRG members generally agreed that entities need to exercise judgement to determine whether changes in the facts and circumstances are significant enough to indicate that a contract no longer exists under the standard.³³

Example 4 in the standard also notes that the entity accounts for any impairment of the existing receivable in accordance with IFRS 9 (see Chapter 47). [IFRS 15.IE17].

3.2 Contract enforceability and termination clauses

An entity has to determine the duration of the contract (i.e., the stated contractual term or a shorter period) before applying certain aspects of the revenue model (e.g., identifying performance obligations, determining the transaction price). The contract duration under IFRS 15 is the period in which parties to the contract have present enforceable rights and obligations. An entity cannot assume that there are present enforceable rights and obligations for the entire term stated in the contract and it is likely that an entity will have to consider enforceable rights and obligations in individual contracts, as described in the standard: [IFRS 15.11]

Extract from IFRS 15

- 11 Some contracts with customers may have no fixed duration and can be terminated or modified by either party at any time. Other contracts may automatically renew on a periodic basis that is specified in the contract. An entity shall apply this Standard to the duration of the contract (ie the contractual period) in which the parties to the contract have present enforceable rights and obligations.

The period in which enforceable rights and obligations exist might be affected by termination provisions in the contract. Significant judgement is required to determine the effect of termination provisions on the contract duration. Entities need to review the overall contractual arrangements, including any master service arrangements, wind-down provisions and business practices to identify terms or conditions that might affect the enforceable rights and obligations in their contracts.

Under the standard, this determination is critical because the contract duration to which the standard is applied might affect the number of performance obligations identified and the determination of the transaction price. It might also affect the amounts disclosed in some of the required disclosures. See Questions 3-6 to 3-8 in this section below for further discussion on how termination provisions might affect the contract duration.

If each party has the unilateral right to terminate a 'wholly unperformed' contract (as defined in IFRS 15.12) without compensating the counterparty, IFRS 15 states that, for purposes of the standard, a contract does not exist and its accounting and disclosure requirements would not apply. This is because the contracts would not affect an entity's financial position or performance until either party performs. Any arrangement in which the entity has not provided any of the contracted goods or services and has not received or is not entitled to receive any of the contracted consideration is considered to be a 'wholly unperformed' contract. [IFRS 15.12].

The requirements for 'wholly unperformed' contracts do not apply if the parties to the contract have to compensate the other party if either of them exercises their right to terminate the contract and the termination payment is considered substantive. Significant judgement will be required to determine whether a termination payment is substantive, and all facts and circumstances related to the contract need to be considered.

33 TRG Agenda paper no. 25, January 2015 Meeting - Summary of Issues Discussed and Next Steps, dated 30 March 2015.

Because the contract duration is determined on the basis of the period over which the parties to the contract have present enforceable rights and obligations, certain economic factors (e.g., economic compulsion) are not considered in this assessment because they do not create or modify the present enforceable rights and obligations of either party in the contract.

For example, consider a long-term contract between an entity and a customer that permits the customer to terminate the contract at any time without paying a substantive termination penalty. The entity believes that it is virtually certain that the customer will not terminate the contract because the customer's business relies on a good or service that only the entity can provide. However, when determining the duration of the contract, the entity would not consider the perceived economic compulsion on the customer's part because it does not create or modify any present enforceable rights and obligations. As a result, the contract would have a shorter duration than the stated term because the terminating party is not required to compensate the other party.

Similarly, if there are no contractual penalties (e.g., termination fees, monetary penalties for not meeting contractual minimums), the contract duration does not extend beyond the period in which both parties have present enforceable rights and obligations even when a customer is expected to be economically compelled to exercise an option for additional goods and services (e.g., the customer would forgo a substantial discount on the optional purchases if it were to cancel the contract). Rather, the discount on optional purchases is assessed to determine whether it conveys a material right. See Question 4-19 in section 4.6 below for further discussion.

How we see it

Under IFRS 15, entities are required to account for contracts with longer stated terms as month-to-month (or possibly a shorter duration) contracts if the parties can terminate the contract without penalty. When determining a contract's duration, entities need to carefully evaluate the contractual terms (including any substantive termination provisions) and the present enforceable rights and obligations of both parties. Certain economic factors (e.g., economic compulsion) are not relevant because they do not create or modify present enforceable rights and obligations of either party.

Frequently asked questions

Question 3-6: How do termination clauses and termination payments affect the duration of a contract (i.e., the contractual period)?

(TRG meeting 31 October 2014 - Agenda paper no. 10)

Entities need to carefully evaluate termination clauses and any related termination payments to determine how they affect contract duration (i.e., the period in which there are enforceable rights and obligations).

The TRG members generally agreed that enforceable rights and obligations exist throughout the term in which each party has the unilateral enforceable right to terminate the contract by compensating the other party. For example, if a contract includes a substantive termination payment, the duration of the contract would equal the period through which a termination penalty would be due. This could be the stated contractual term or a shorter duration if the termination penalty does not extend to the end of the contract. However, the TRG members observed that the determination of whether a termination penalty is substantive, and what constitutes enforceable rights and obligations under a contract, requires judgement and consideration of the facts and circumstances. The TRG agenda paper also noted that, if an entity concludes that the duration of the contract is less than the stated term because of a termination clause, any termination penalty needs to be included in the transaction price. If the termination penalty is variable, the requirements for variable consideration, including the constraint (see section 5.2.3 below), apply.

The TRG members also agreed that if a contract with a stated contractual term can be terminated by either party at any time for no consideration, the contract duration ends when control of the goods or services that have already been provided transfers to the customer (e.g., a month-to-month service contract), regardless of the contract's stated contractual term. In this case, entities also need to consider whether a contract includes a notification or cancellation period (e.g., the contract can be terminated with 90 days' notice) that would cause the contract duration to extend beyond the date when control of the goods or services that have already been provided were transferred to the customer. If such a period exists, the contract duration would be shorter than the stated contractual term, but would extend beyond the date when control of the goods or services that have already been provided were transferred to the customer. Consider the following illustrations that show how termination provisions affect the duration of a contract:

Illustration 3-3: Determining the duration of the contract

Entity A enters into a four-year service contract with a customer. The customer is required to pay a non-refundable annual fee of CU100,000, which is the stand-alone selling price for each year of service.

To determine the duration of the contract in each of the scenarios below, the entity considers these facts and whether the contract provides cancellation rights and termination penalties.

Scenario A

Assume no cancellation rights are provided to either party. In this case, the enforceable rights and obligations exist for the entire stated contractual term and the contract duration is four years.

Scenario B

Assume the contract provides the customer with a right to cancel the contract at the end of each year without cause, but with a termination penalty. The penalty decreases annually throughout the contract term at the end of each year. The following illustrates the payments under the contract:

	Year 1	Year 2	Year 3	Year 4
Annual fee (CU)	100,000	100,000	100,000	100,000
Termination penalty (CU)	225,000	150,000	75,000	-

If Entity A determines that the penalty is substantive in each period, enforceable rights and obligations exist for the stated contractual term of four years.

Scenario C

Assume the contract provides the customer with a right to cancel at the end of each year, with no termination penalty.

In this case, Entity A determines that the contract duration is one year, with options to renew for each of the following three years because the customer can choose whether to receive the service during those years. That is, Entity A determines that enforceable rights and obligations do not exist throughout the entire stated contractual term because there is no substantive termination penalty. The options to renew are not material rights because they are offered at the stand-alone selling price of CU100,000.

Illustration 3-4: Duration of a contract without a termination penalty

Entity A enters into a three-year contract with a customer to provide maintenance services. Entity A begins providing the services immediately. Consideration is payable in equal monthly instalments and each party has the unilateral right to terminate the contract without compensating the other party if it provides 30 days' notice.

While the stated contractual term is three years, Entity A's rights and obligations are enforceable only for 30 days. Therefore, under IFRS 15, the contract is accounted for as a one-month contract with a renewal option for additional months of maintenance services. This is because the customer or Entity A could cancel the agreement with 30 days' notice without paying a substantive termination payment.

Entity A also needs to evaluate the accounting for the renewal option(s) to determine whether it is a material right (see section 4.6 below).

Question 3-7: How would an entity evaluate the contract term when only the customer has the right to cancel the contract without cause and how do termination penalties affect this analysis?

(TRG meeting 9 November 2015 - Agenda paper no. 48)

Enforceable rights and obligations exist throughout the term in which each party has the unilateral enforceable right to terminate the contract by compensating the other party. The TRG members did not view a customer-only right to terminate sufficient to warrant a different conclusion than one in which both parties have the right to terminate, as discussed in Question 3-6 above.

The TRG members generally agreed that a substantive termination penalty payable by a customer to the entity is evidence of enforceable rights and obligations of both parties throughout the period covered by the termination penalty. For example, consider a four-year service contract in which the customer has the right to cancel without cause at the end of each year, but for which the customer would incur a termination penalty that decreases each year and is determined to be substantive. TRG members generally agreed that the arrangement would be treated as a four-year contract. Refer to Illustration 3-3, Scenario B in Question 3-6 above.

The TRG members also discussed situations in which a contractual penalty for not meeting contractual minimums would result in including optional goods or services in the accounting for the original contract (see Question 4-21 in section 4.6 below).

The TRG members observed that the determination of whether a termination penalty is substantive, and what constitutes enforceable rights and obligations under a contract, requires judgement and consideration of the facts and circumstances. In addition, it is possible that payments that effectively act as a termination penalty and create or negate enforceable rights and obligations might not be labelled as such in a contract. The TRG agenda paper included an illustration in which an entity sells equipment and consumables. The equipment is sold at a discount, but the customer is required to repay some or all of the discount if it does not purchase a minimum number of consumables. The TRG paper concludes that the penalty (i.e., repaying the upfront discount) is substantive and is evidence of enforceable rights and obligations up to the minimum quantity. This example is discussed further in Question 4-21 of section 4.6 below.

If enforceable rights and obligations do not exist throughout the entire term stated in the contract, the TRG members generally agreed that customer cancellation rights would be treated as customer options. Examples include when there are no (or non-substantive) contractual penalties that compensate the entity upon cancellation and when the customer has the unilateral right to terminate the contract for reasons other than cause or contingent events outside the customer's control. In the Basis for Conclusions, the Board noted that a cancellation option or termination right can be similar to a renewal option. [IFRS 15.BC391]. An entity would need to determine whether a cancellation option indicates that the customer has a material right that would need to be accounted for as a performance obligation (e.g., there is a discount for goods or services provided during the cancellable period that provides the customer with a material right) (see section 4.6 below for further discussion on customer options and the determination of whether an option represents a material right).

Question 3-8: If an entity has a past practice of not enforcing termination payments, does this affect the duration of the contract (i.e., the contractual period)?

(TRG meeting 31 October 2014 - Agenda paper no. 10)

A TRG agenda paper for the October 2014 TRG meeting noted that the evaluation of the termination payment in determining the duration of a contract depends on whether the law (which might vary by jurisdiction) considers past practice as limiting the parties' enforceable rights and obligations. An entity's past practice of allowing customers to terminate the contract early without enforcing collection of the termination payment only affects the contract duration in cases in which the parties' legally enforceable rights and obligations are limited because of the lack of enforcement by the entity. If that past practice does not change the parties' legally enforceable rights and obligations, the contract duration equals the period throughout which a substantive termination penalty would be due (which could be the stated contractual term or a shorter duration if the termination penalty did not extend to the end of the contract).

Question 3-9: How would an entity account for a partial termination of a contract (e.g., a change in the contract term from three years to two years prior to the beginning of year two)?

How we see it

We believe an entity accounts for the partial termination of a contract as a contract modification (see section 3.4 below) because it results in a change in the scope of the contract.

IFRS 15 states that "a contract modification exists when the parties to a contract approve a modification that either creates new or changes existing enforceable rights and obligations of the parties to the contract". [IFRS 15.18]. A partial termination of a contract results in a change to the enforceable rights and obligations in the existing contract (also see Question 3-20 in section 3.4.2.C below regarding contract modifications that decrease the scope of a contract). This conclusion is consistent with TRG agenda paper no. 48, which states, "a substantive termination penalty is evidence of enforceable rights and obligations throughout the contract term. The termination penalty is ignored until the contract is terminated at which point it is accounted for as a modification".³⁴

Consider the following Illustration:

Illustration 3-5: Partial termination of a contract

An entity enters into a contract with a customer to provide monthly maintenance services for three years at a fixed price of CU500 per month (i.e., total consideration of CU18,000). The contract includes a termination clause that allows the customer to cancel the third year of the contract by paying a termination penalty of CU1,000 (which is considered substantive for the purpose of this example). That is, the entity

³⁴ TRG Agenda paper no. 48, *Customer options for additional goods and services*, dated 9 November 2015, paragraph 47a.

determines the contract duration is three years. However, at the end of the first year, the customer decides to cancel the third year of the contract and pays the CU1,000 termination penalty specified in the contract. In this example, the modification is not accounted for as a separate contract because it does not result in the addition of distinct goods or services (see section 3.4.2 below). Since the remaining services are distinct, the entity applies the requirements in IFRS 15.21(a) and accounts for the modification prospectively. The remaining consideration of CU7,000 (CU6,000 per year under the original contract for the second year, plus the CU1,000 payment upon modification) is recognised over the remaining revised contract period of one year. That is, the entity recognises the CU1,000 termination penalty over the remaining performance period.

In contrast, if the entity determined that the termination penalty was not substantive, the contract duration would be two years (not the three-year stated term). As discussed in Question 3-6 above, because the entity concluded that the contract duration was less than the stated term due to a termination clause, the termination penalty would need to be included in the transaction price at contract inception. The penalty would effectively result in an adjusted price per month of CU542 for two years (i.e., total consideration of CU13,000 ÷ 24 months). Determining whether a termination penalty is substantive will require judgement and consideration of the facts and circumstances.

Question 3-10: How is consideration that was received from a customer, but not yet recognised as revenue, accounted for when the contract is cancelled?

When a contract is cancelled (by either the customer or the entity), it is a contract modification that reduces the scope of the contract. As discussed in Question 3-9 above and Question 3-20 in section 3.4.2.C below, such a modification would not be accounted for as a separate contract because it does not result in the addition of distinct goods or services. Rather, the accounting will depend on whether there are any remaining goods and services to be provided after the cancellation and, if so, whether they are distinct from the goods and services already provided as discussed in section 3.4 below. That is, if a contract is cancelled but there are remaining goods and services to be provided, the entity applies the standard's contract modification requirements.

If there are no remaining goods and services to be provided after the cancellation, the accounting depends on whether the consideration is refundable or non-refundable. To determine whether consideration is refundable or non-refundable, entities might need to consider termination penalties, legal requirements for refund, customary business practices of providing refunds or statements made to customers that create a constructive or legal obligation to provide a refund.

If the consideration received from the customer is refundable and there are no remaining goods and services to be provided after the cancellation, the entity has a refund liability. This might require the entity to reclassify any existing contract liability to refund liability. In some cases, the entity might ask the customer to waive their right to a refund of the consideration in exchange for vouchers, for example, and/or discounts on future goods or services. The accounting for such offers (including the accounting for the liability) depends on the specific facts and circumstances and could require judgement.

How we see it

If the consideration received from the customer is non-refundable and there are no remaining goods and services to be provided after the cancellation, we believe that the entity can recognise revenue for the consideration received when the contract is cancelled, and the related contract liability would also be derecognised.

This accounting treatment is similar to the application guidance for breakage (e.g., for gift cards, see section 7.9 below) and the recognition of revenue for arrangements that fail the IFRS 15 contract criteria in accordance with IFRS 15.15 (see section 3.5 below). In both of those situations, IFRS 15 provides guidance that permits an entity to derecognise a liability and recognise revenue, provided the relevant criteria are met, being when: the entity expects the customer will not exercise its contractual rights (for breakage); [IFRS 15.B46] or the contract is effectively completed or cancelled (for contracts that do not meet the contract criteria in IFRS 15.9). [IFRS 15.15, IFRS 15.BC48].

In some cases, an entity might be entitled to termination fees in the event of cancellation. The accounting for termination fees is discussed in Question 3-9 above.

Question 3-11: How does an entity account for services provided during a period after contract expiration in which enforceable rights and obligations do not exist until the contract is renewed?

How we see it

If an entity continues to provide services to a customer during a period when a contract does not exist because a previous contract has expired and the contract has not yet been renewed, we believe that the entity would need to recognise revenue for providing those services on a cumulative catch-up basis at the time the contract is renewed (i.e., when enforceable rights and obligations exist between the entity and its customer).

As discussed in section 3.1 above, determining whether an enforceable contract exists under the model might require judgement and an evaluation of the relevant legal framework.

This approach to record revenue on a cumulative catch-up basis reflects the performance obligations that are partially satisfied at the time enforceable rights and obligations exist and is consistent with the overall principle of the standard that requires revenue to be recognised when (or as) an entity transfers control of goods or services to a customer under an enforceable contract. This conclusion is also consistent with the discussion in Question 7-20 in section 7.1.4.E below on the accounting for goods or services provided to a customer before the contract establishment date.

Consider the following Illustration:

Illustration 3-6: Services provided during a period after contract expiration

Entity A enters into a non-cancellable one-year contract with a customer on 1 January 20X1 to provide web-hosting services that are transferred to the customer over time. The total consideration of CU1,200 is payable upfront and is non-refundable. After the expiration of the contract, at its discretion, Entity A continues to provide web-hosting services to the customer for a limited time to allow the customer to contemplate renewing the contract. If the customer renews the contract, the pricing would include the web-hosting services provided during the period between the original contract expiration and the contract renewal.

The customer agrees to renew the contract on 1 February 20X2. Entity A agrees to provide web-hosting services from 1 January 20X2 to 31 December 20X2 for total consideration of CU1,200, which is payable on the renewal date. Entity A determines that enforceable rights and obligations exist on 1 February 20X2 and recognises revenue on a cumulative catch-up basis to reflect the entity's transfer of control of the web-hosting services for one month (i.e., January 20X2). Accordingly, Entity A recognises CU100 on 1 February 20X2 for the web-hosting services provided to the customer before the renewal date. The remaining consideration of CU1,100 is recognised from 1 February 20X2 to 31 December 20X2 as the entity performs.

An entity might receive consideration from the customer for the goods or services transferred before the existence of an enforceable contract. If so, the entity would need to follow the requirements in IFRS 15.14-16 (discussed in section 3.5 below). This requires that when an arrangement does not meet the criteria to be a contract under the standard, an entity would recognise the non-refundable consideration received as revenue only if one of the two events has occurred (e.g., the entity has no remaining obligations to transfer goods or services to the customer and all, or substantially all, of the consideration promised by the customer has been received by the entity and is non-refundable).

3.3 Combining contracts

In most cases, entities apply the model to individual contracts with a customer. However, the standard requires entities to combine contracts entered into at, or near, the same time with the same customer (or related parties of the customer as defined in IAS 24 *Related Party Disclosures*) if they meet one or more of the following criteria: [IFRS 15.17, IFRS 15.BC74]

- The contracts are negotiated together with a single commercial objective
- The consideration to be paid for one contract is dependent on the price or performance of another contract
- The goods or services promised in the contracts are a single performance obligation (see section 4 below)

In the Basis for Conclusions, the Board explained that it included the requirements on combining contracts in the standard because, in some cases, the amount and timing of revenue might differ depending on whether an entity accounts for contracts as a single contract or separately. [IFRS 15.BC71].

Entities need to apply judgement to determine whether contracts are entered into at or near the same time because the standard does not provide a bright line for making this assessment. In the Basis for Conclusions, the Board noted that the longer the period between entering into different contracts, the more likely it is that the economic circumstances affecting the negotiations of those contracts will have changed. [IFRS 15.BC75].

Negotiating multiple contracts at the same time is not sufficient evidence to demonstrate that the contracts represent a single arrangement for accounting purposes. In the Basis for Conclusions, the Board noted that there are pricing interdependencies between two or more contracts when either of the first two criteria (i.e., the contracts are negotiated with a single commercial objective or the price in one contract depends on the price or performance of the other contract) are met, so the amount of consideration allocated to the performance obligations in each contract might not faithfully depict the value of the goods or services transferred to the customer if those contracts were not combined.

The Board also explained that it decided to include the third criterion (i.e., the goods or services in the contracts are a single performance obligation) to avoid any structuring opportunities that would effectively allow entities to bypass the requirements for identifying performance obligations. [IFRS 15.BC73]. That is, an entity cannot avoid determining whether multiple promises made to a customer at, or near, the same time need to be bundled into one or more performance obligations in accordance with Step 2 of the model (see section 4 below) solely by including the promises in separate contracts.

3.3.1 Portfolio approach practical expedient

Under the standard, the five-step model is applied to individual contracts with customers, unless the contract combination requirements discussed in section 3.3 above are met. However, the IASB recognised that there might be situations in which it could be more practical for an entity to group contracts for revenue recognition purposes, rather than attempt to account for each contract separately. Specifically, the standard includes the following practical expedient: [IFRS 15.4]

Extract from IFRS 15

- | | |
|---|---|
| 4 | This Standard specifies the accounting for an individual contract with a customer. However, as a practical expedient, an entity may apply this Standard to a portfolio of contracts (or <i>performance obligations</i>) with similar characteristics if the entity reasonably expects that the effects on the financial statements of applying this Standard to the portfolio would not differ materially from applying this Standard to the individual contracts (or performance obligations) within that portfolio. When accounting for a portfolio, an entity shall use estimates and assumptions that reflect the size and composition of the portfolio. |
|---|---|

In order to use the portfolio approach, an entity must reasonably expect that the accounting result will not be materially different from the result of applying the standard to the individual contracts. However, in the Basis for Conclusions, the Board noted that it does not intend for an entity to quantitatively evaluate every possible outcome when concluding that the portfolio approach is not materially different. Instead, they indicated that an entity would be able to take a reasonable approach to determine portfolios that are representative of its types of customers and that an entity needs to use judgement in selecting the size and composition of those portfolios. [IFRS 15.BC69].

How we see it

Application of the portfolio approach will likely vary based on the facts and circumstances of each entity. An entity can choose to apply the portfolio approach to only certain aspects of the model (e.g., determining the transaction price in Step 3).

Frequently asked questions

Question 3-12: How would an entity assess collectability for a portfolio of contracts?
(TRG meeting 26 January 2015 - Agenda paper no. 13)

See response to Question 3-4 in section 3.1.5.B above.

3.4 Contract modifications

Parties to an arrangement frequently agree to modify the scope or price (or both) of their contract. If that happens, an entity must determine whether the modification is accounted for as a new contract or as part of the existing contract. Generally, it is clear when a contract modification has taken place, but in some circumstances, that determination is more difficult. To assist entities when making this determination, the standard states the following: [IFRS 15.18, IFRS 15.19]

Extract from IFRS 15

- 18 A contract modification is a change in the scope or price (or both) of a contract that is approved by the parties to the contract. In some industries and jurisdictions, a contract modification may be described as a change order, a variation or an amendment. A contract modification exists when the parties to a contract approve a modification that either creates new or changes existing enforceable rights and obligations of the parties to the contract. A contract modification could be approved in writing, by oral agreement or implied by customary business practices. If the parties to the contract have not approved a contract modification, an entity shall continue to apply this Standard to the existing contract until the contract modification is approved.
- 19 A contract modification may exist even though the parties to the contract have a dispute about the scope or price (or both) of the modification or the parties have approved a change in the scope of the contract but have not yet determined the corresponding change in price. In determining whether the rights and obligations that are created or changed by a modification are enforceable, an entity shall consider all relevant facts and circumstances including the terms of the contract and other evidence. If the parties to a contract have approved a change in the scope of the contract but have not yet determined the corresponding change in price, an entity shall estimate the change to the transaction price arising from the modification in accordance with paragraphs 50-54 on estimating variable consideration and paragraphs 56-58 on constraining estimates of variable consideration.

The extract above illustrates that the Board intended these requirements to apply more broadly than only to finalised modifications. That is, IFRS 15 indicates that an entity might have to account for a contract modification prior to the parties reaching final agreement on changes in scope or pricing (or both). Instead of focusing on the finalisation of a modification, IFRS 15 focuses on the enforceability of the changes to the rights and obligations in the contract. Once an entity determines the revised rights and obligations are enforceable, it accounts for the contract modification. Contract terminations (either partial or full) are also considered a form of contract modification under IFRS 15.

The standard provides the following example to illustrate the accounting for an unapproved modification: [IFRS 15.IE Example 9, IFRS 15.IE42-IE43]

Extract from IFRS 15

Example 9-Unapproved change in scope and price

An entity enters into a contract with a customer to construct a building on customer-owned land. The contract states that the customer will provide the entity with access to the land within 30 days of contract inception. However, the entity was not provided access until 120 days after contract inception because of storm damage to the site that occurred after contract inception. The contract specifically identifies any delay (including *force majeure*) in the entity's access to customer-owned land as an event that entitles the entity to compensation that is equal to actual costs incurred as a direct result of the delay. The entity is able to demonstrate that the specific direct costs were incurred as a result of the delay in accordance with the terms of the contract and prepares a claim. The customer initially disagreed with the entity's claim.

The entity assesses the legal basis of the claim and determines, on the basis of the underlying contractual terms, that it has enforceable rights. Consequently, it accounts for the claim as a contract modification in accordance with paragraphs 18-21 of IFRS 15. The modification does not result in any additional goods and services being provided to the customer. In addition, all of the remaining goods and services after the modification are not distinct and form part of a single performance obligation. Consequently, the entity accounts for the modification in accordance with paragraph 21(b) of IFRS 15 by updating the transaction price and the measure of progress towards complete satisfaction of the performance obligation. The entity considers the constraint on estimates of variable consideration in paragraphs 56-58 of IFRS 15 when estimating the transaction price.

Once an entity has determined that a contract has been modified, the entity determines the appropriate accounting treatment for the modification. Certain modifications are treated as separate stand-alone contracts (discussed in section 3.4.1 below), while others are combined with the original contract (discussed in section 3.4.2 below) and accounted for in that manner. In addition, an entity accounts for some modifications on a prospective basis and others on a cumulative catch-up basis. The Board explained that it developed different approaches to account for different types of modifications with an overall objective of faithfully depicting an entity's rights and obligations in each modified contract. [IFRS 15.BC76].

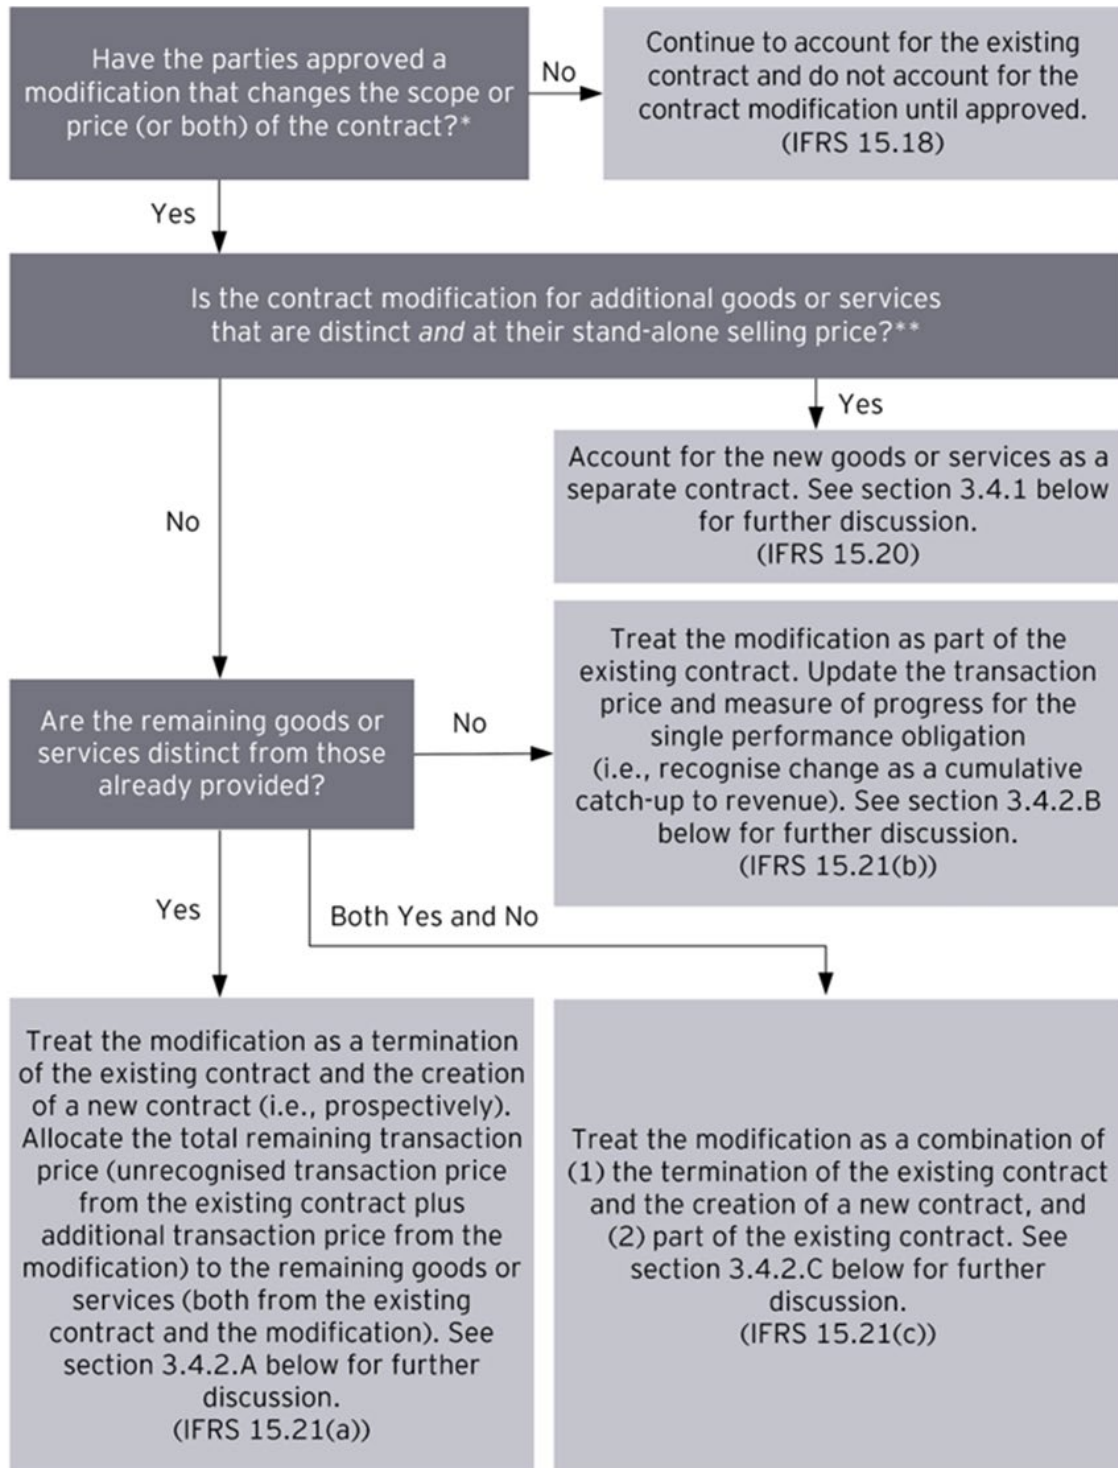

The standard includes the following requirements for determining the appropriate accounting treatment: [IFRS 15.20, IFRS 15.21]

Extract from IFRS 15

- 20 An entity shall account for a contract modification as a separate contract if both of the following conditions are present:
- (a) the scope of the contract increases because of the addition of promised goods or services that are distinct (in accordance with paragraphs 26-30); and
 - (b) the price of the contract increases by an amount of consideration that reflects the entity's stand-alone selling prices of the additional promised goods or services and any appropriate adjustments to that price to reflect the circumstances of the particular contract. For example, an entity may adjust the stand-alone selling price of an additional good or service for a discount that the customer receives, because it is not necessary for the entity to incur the selling-related costs that it would incur when selling a similar good or service to a new customer.
- 21 If a contract modification is not accounted for as a separate contract in accordance with paragraph 20, an entity shall account for the promised goods or services not yet transferred at the date of the contract modification (ie the remaining promised goods or services) in whichever of the following ways is applicable:
- (a) An entity shall account for the contract modification as if it were a termination of the existing contract and the creation of a new contract, if the remaining goods or services are distinct from the goods or services transferred on or before the date of the contract modification. The amount of consideration to be allocated to the remaining performance obligations (or to the remaining distinct goods or services in a single performance obligation identified in accordance with paragraph 22(b)) is the sum of:
 - (i) the consideration promised by the customer (including amounts already received from the customer) that was included in the estimate of the transaction price and that had not been recognised as revenue; and
 - (ii) the consideration promised as part of the contract modification.
 - (b) An entity shall account for the contract modification as if it were a part of the existing contract if the remaining goods or services are not distinct and, therefore, form part of a single performance obligation that is partially satisfied at the date of the contract modification. The effect that the contract modification has on the transaction price, and on the entity's measure of progress towards complete satisfaction of the performance obligation, is recognised as an adjustment to revenue (either as an increase in or a reduction of revenue) at the date of the contract modification (ie the adjustment to revenue is made on a cumulative catch-up basis).
 - (c) If the remaining goods or services are a combination of items (a) and (b), then the entity shall account for the effects of the modification on the unsatisfied (including partially unsatisfied) performance obligations in the modified contract in a manner that is consistent with the objectives of this paragraph.

The following flow chart illustrates these requirements:

Figure 3-1: Contract modifications

* Under IFRS 15, a contract modification can be approved in writing, by oral agreement or implied by customary business practices. IFRS 15.19 states that an entity may have to account for a contract modification prior to the parties reaching final agreement on changes in scope or pricing (or both), provided the rights and obligations that are created or changed by a modification are enforceable.

** In accordance with IFRS 15.20, an entity may make appropriate adjustments to the stand-alone selling price to reflect the circumstances of the contract and still meet the criteria to account for the modification as a separate contract.

When determining how to account for a contract modification, an entity must consider whether any additional goods or services are distinct, often giving careful consideration to whether those goods or services are distinct within the context of the modified contract (see section 4.2.1 below for further discussion on evaluating whether goods or services are distinct). That is, although a contract modification might add a new good or service that would be distinct in a stand-alone transaction, that new good or service might not be distinct when considered in the context of the contract, as modified. For example, in a building renovation project, a customer might request a contract modification to add a new room. The construction firm might commonly sell the construction of an added room on a stand-alone basis, which would indicate that the service is capable of being distinct. However, when that service is added to an existing contract and the entity has already determined that the entire project is a single performance obligation, the added goods or services would normally be combined with the existing bundle of goods or services.

In contrast to the construction example (for which the addition of otherwise distinct goods or services are combined with the existing single performance obligation and accounted for in that manner), a contract modification that adds distinct goods or services to a single performance obligation that comprise a series of distinct goods or services (see section 4.2.2 below) is accounted for either as a separate contract or as the termination of the old contract and the creation of a new contract (i.e., prospectively). In the Basis for Conclusions, the Board explained that it clarified the accounting for modifications that affect a single performance obligation that is made up of a series of distinct goods or services (e.g., repetitive service contracts) to address some stakeholders' concerns that an entity otherwise would have been required to account for these modifications on a cumulative catch-up basis. [IFRS 15.BC79].

In addition to determining whether any additional goods or services are distinct, an entity also needs to determine whether the additional goods or services are added at the stand-alone selling price that exists at the contract modification date. As stated in IFRS 15.20, an entity might make appropriate adjustments to the stand-alone selling price to reflect the circumstances of the contract and still meet the criteria to account for the modification as a separate contract. See further discussion in section 3.4.1 below.

Furthermore, as illustrated in Example 5 in the standard, Case B (see section 3.4.2.A below), a contract modification might include compensation to a customer for performance issues (e.g., poor service by the entity, defects present in transferred goods). An entity might need to account for the compensation to the customer as a change in the transaction price (see section 6.5 below) separate from other modifications to the contract.

Frequently asked questions

Question 3-13: When would an entity evaluate a contract under the contract modification requirements?

An entity typically enters into a separate contract with a customer to provide additional goods or services. Stakeholders had questioned whether a new contract with an existing customer needs to be evaluated under the contract modification requirements.

A new contract with an existing customer needs to be evaluated under the contract modification requirements if the new contract results in a change in the scope or price of the original contract. IFRS 15.18 states that "a contract modification exists when the parties to a contract approve a modification that either creates new or changes existing enforceable rights and obligations of the parties to the contract". [IFRS 15.18]. Therefore, an entity needs to evaluate whether a new contract with an existing customer represents a legally enforceable change in scope or price (or both) to an existing contract. A legally enforceable change in scope or price to an existing contract could also be accomplished by terminating the existing contract and entering into a new contract with the same customer. In those situations, entities also need to consider the contract modification requirements in IFRS 15.

In some cases, the determination of whether a new contract with an existing customer creates new or changes existing enforceable rights and obligations is straightforward because the new contract does not contemplate goods or services in the existing contract, including the pricing of those goods or services. Purchases of additional goods or services under a separate contract that do not modify the scope or price of an existing contract do not need to be evaluated under the contract modification requirements. Rather, they are accounted for as new (separate) contract.

How we see it

In other cases, the determination of whether a new contract is a modification of an existing contract requires judgement. In such circumstances, we believe an entity needs to consider the specific facts and circumstances surrounding the new contract in order to determine whether it represents a contract modification, which could include considering factors such as those included in the contract combination requirements discussed below.

The factors in the contract combination requirements (see section 3.3 above) include:

- Whether the contracts were negotiated as a package with a single commercial objective (this might be the case in situations where the existing contract contemplates future modifications)
- Whether the amount of consideration to be paid in one contract depends on the price or performance of the other contract
- Whether the goods or services promised in the contracts (or some goods or services promised in each of the contracts) are a single performance obligation

If the pricing in the new contract is dependent on the original contract, or if the terms of the new contract are in some other way negotiated based on the original contract, it is likely that the new contract needs to be evaluated under the contract modification requirements.

Question 3-14: When an arrangement that has already been determined to meet the standard's contract criteria is modified, would an entity need to reassess whether that arrangement still meets the criteria to be considered a contract within the scope of the five-step model and/or the stand-alone selling prices of the underlying goods and services?

How we see it

Whether an entity needs to make these reassessments depends on the nature of the modification. For a contract modification that is accounted for by updating the transaction price and measure of progress for the single performance obligation in the modified contract (in accordance with IFRS 15.21(b) - see section 3.4.2.B below), an entity will need to apply judgement to determine whether to reassess the contract and determine whether it still meets the criteria to be considered a contract in the scope of the model. However, if a contract is modified, we believe that might indicate that "a significant change in facts and circumstances" has occurred (see section 3.1 above) and that the entity should reassess the criteria in IFRS 15.9 for the modified contract.

Any reassessment is prospective in nature and would not change the conclusions associated with goods or services already transferred. That is, an entity would not reverse any receivables, revenue or contract assets already recognised under the contract because of the reassessment of the contract criteria in IFRS 15.9. However, due to the contract modification accounting, the entity might need to adjust contract assets or cumulative revenue recognised in the period of the contract modification, but it would not update the stand-alone selling prices of the goods and services underlying the existing, modified contract.

For a contract modification that is accounted for as a separate contract (in accordance with IFRS 15.20 - see section 3.4.1 below), an entity needs to assess whether that separate contract meets the criteria to be considered a contract within the scope of the model in the standard. If the separate contract meets the criteria to be considered a contract under the model, the entity applies the requirements in IFRS 15 to account for the separate contract, including assessing the stand-alone selling price of the underlying goods and services as at the separate contract's inception date (i.e., the modification date). The accounting for the original contract would not be affected. That is, an entity would not need to reassess whether the original contract still meets the criteria to be considered a contract with the scope of the model in the standard, and the stand-alone selling prices of the underlying goods and services in the original contract would also not be updated.

For a modification that is accounted for as a termination of the old contract and the creation of a new contract (in accordance with IFRS 15.21(a) - see section 3.4.2.A below), an entity needs to assess whether the new contract meets the criteria to be considered a contract within the scope of the model. If the new contract meets the criteria to be considered a contract, the entity applies the requirements in IFRS 15 to account for the new contract, including assessing the stand-alone selling price of the remaining underlying goods and services as at the new contract's inception date (i.e., the modification date).

For a modification that is accounted for as a combination of a modification of the existing contract and the creation of a new contract (in accordance with IFRS 15.21(c) - see section 3.4.2.C below), many of the considerations noted above are also relevant. Entities need to apply judgement to appropriately reassess the related contracts and stand-alone selling prices for these types of modifications.

For further discussion on updating stand-alone selling prices, refer to section 6.1.3 below.

Question 3-15: How would an entity distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception?

An entity might need to apply judgement to determine whether a change in the transaction price is the result of either:

- A contract modification (due to a change in the parties' enforceable rights and obligations after contract inception)
- Or
- New information obtained about variable consideration that existed (and was estimated) at contract inception

While a contract modification might result in a change in the transaction price, not all changes in the transaction price are due to contract modifications. An entity needs to carefully evaluate the facts and circumstances related to the change in the transaction price to assess whether it creates new or changes existing enforceable rights and obligations or is a change in the estimate of variable consideration. For example, a decision by both parties to reduce the amount of goods or services promised in the contract would generally represent a contract modification.

Conversely, a change in transaction price due to an update of the estimate of variable consideration does not create new or change existing enforceable rights and obligations. When a contract with a customer includes variable consideration (see section 5.2 below), the entity is generally required to estimate, at contract inception and throughout the contract term, the amount of consideration to which it will be entitled in exchange for transferring promised goods or services.

Changes to the transaction price that are related to a change in estimates of variable consideration (because they result in the resolution of variability that existed at contract inception), are allocated to the performance obligations in the contract on the same basis as at contract inception (see section 6.5 below). [IFRS 15.88, IFRS 15.89]. In contrast, changes in the transaction price that are related to a contract modification are accounted for in accordance with the contract modification requirements (as described above in IFRS 15.18-21).

Question 3-16: How would an entity distinguish between a contract modification and a marketing offer when an entity provides customer incentives?

An entity might provide incentives to customers to encourage demand. Customer incentives might include free goods or services, options for additional goods and services at a discount (e.g., additional loyalty points, prospective coupons or discounts) or cash payments to customers. The accounting for these incentives will depend on the facts and circumstances of the offer. An offer to a current customer that creates new enforceable rights and obligations or changes the enforceable rights and obligations of the parties to an existing contract is accounted for as a contract modification. In some cases, an offer might not result in a contract modification and would be accounted for as a marketing offer (i.e., an expense).

How we see it

Entities need to carefully consider the terms and conditions of any customer incentive to determine whether the offer needs to be accounted for as a contract modification or a marketing offer, including consideration of the above circumstances.

In addition, as discussed in Question 3-13 above, we believe that the accounting principles for determining when contracts have to be combined under IFRS 15.17 will be helpful when determining whether an offer of free goods or services to an existing customer is a contract modification.

An offer that is the result of negotiations with a specific customer or group of customers might indicate the addition of new enforceable rights and obligations to an existing contract or changes to existing enforceable rights and obligations. However, the following circumstances might indicate that the entity has made a marketing offer:

- The same offer is available to both existing customers and counterparties that do not meet the definition of a customer
- The offer is available to a broad group of (or all) current customers and is not the result of negotiations with individual customers
- The entity has the right to rescind the offer

For any payments to customers, entities will need to consider the requirements for consideration paid or payable to a customer (see section 5.7 below). Such payments would be accounted for as a reduction of the transaction price (and, therefore, revenue) unless the payment to the customer is in exchange for a distinct good or service that the customer transfers to the entity.

Question 3-17: How would an entity account for the exercise of a material right? That is, would an entity account for it as: a contract modification, a continuation of the existing contract or variable consideration?

(TRG meeting 30 March 2015 - Agenda paper no. 32)

See response to Question 4-27 in section 4.6 below.

Question 3-18: How do entities account for modifications and other changes to licences of intellectual property?

See response to Question 8-1 in section 8.1.4 below.

3.4.1 Contract modification represents a separate contract

Certain contract modifications are treated as separate, new contracts. [IFRS 15.20]. For these modifications, the accounting for the original contract is not affected by the modification and the revenue recognised to date on the original contract is not adjusted. Furthermore, any performance obligations remaining under the original contract continue to be accounted for under the original contract. The accounting for this type of modification reflects the fact that there is no economic difference between a separate contract for additional goods or services and a modified contract for those same items, provided the two criteria required for this type of modification are met.

The first criterion that must be met for a modification to be treated as a separate contract is that the additional promised goods or services in the modification must be distinct from the promised goods or services in the original contract. This assessment is done in accordance with IFRS 15's general requirements for determining whether promised goods or services are distinct (see section 4.2.1 below). Only modifications that add distinct goods or services to the arrangement can be treated as separate contracts. Arrangements that reduce the amount of promised goods or services or change the scope of the original promised goods or services cannot, by their very nature, be considered separate contracts. Instead, they are modifications of the original contract (see section 3.4.2 below). [IFRS 15.20(a)].

The second criterion is that the amount of consideration expected for the added promised goods or services must reflect the stand-alone selling prices of those promised goods or services at the contract modification date. However, when determining the stand-alone selling price, entities have some flexibility to adjust the stand-alone selling price, depending on the facts and circumstances. For example, an entity might give an existing customer a discount on additional goods because the entity would not incur selling-related costs that it would typically incur for new customers. In this example, the entity might determine that the additional transaction consideration meets the criterion, even though the discounted price is less than the stand-alone selling price of that good or service for a new customer. In another example, an entity might conclude that, with the additional purchases, the customer qualifies for a volume-based discount (see Questions 4-23 and 4-24 in section 4.6 below on volume discounts). [IFRS 15.20(b)].

The following Illustration shows considerations for determining whether the amount of consideration expected for the additional goods and services reflects the stand-alone selling price:

Illustration 3-7: Determining whether the amount of consideration reflects the stand-alone selling price of additional goods or services

Entity E agrees to construct a manufacturing facility on a customer's land for CU10 million. During construction, the customer determines that a separate storage facility is needed at the location. The parties agree to modify the contract to include the construction of the storage facility, which is to be completed within three months of completing the manufacturing facility, for a total price of CU11 million (i.e., when the contract is modified, an additional CU1 million is added to the consideration Entity E will receive). Assume that Entity E determines that the construction of the separate storage facility is distinct (i.e., a performance obligation) and that it transfers control of each facility over time. Entity E must determine whether the CU1 million represents the stand-alone selling price of the separate storage facility.

Scenario A

Entity E determines that CU1.1 million is the stand-alone selling price at the contract modification date for the construction of a similar facility. However, much of the equipment and labour force necessary to complete construction of the storage facility is already onsite and available for use by Entity E. Thus, Entity E concludes that the additional CU1 million reflects the stand-alone selling price at contract modification, adjusted for the circumstances of the contract.

Scenario B

Entity E determines that CU1.5 million is the stand-alone selling price at the contract modification date for the construction of a similar facility. While Entity E can attribute some of the discount to its ability to use equipment and labour that are already onsite, the price reduction was primarily driven by other factors (e.g., a desire to maintain the customer relationship). Therefore, the additional CU1 million does not reflect the stand-alone selling price at contract modification.

In situations with highly variable pricing, determining whether the additional consideration in a modified contract reflects the stand-alone selling price for the additional goods or services might not be straightforward. Entities need to apply judgement when making this assessment. Evaluating whether the price in the modified contract is within a range of prices for which the goods or services are typically sold to similar customers might be an acceptable approach.

The following example illustrates a contract modification that represents a separate contract: [IFRS 15.IE Example 5 Case A, IFRS 15.IE19-IE21]

Extract from IFRS 15

Example 5-Modification of a contract for goods

An entity promises to sell 120 products to a customer for CU12,000 (CU100 per product). The products are transferred to the customer over a six-month period. The entity transfers control of each product at a point in time. After the entity has transferred control of 60 products to the customer, the contract is modified to require the delivery of an additional 30 products (a total of 150 identical products) to the customer. The additional 30 products were not included in the initial contract.

Case A-Additional products for a price that reflects the stand-alone selling price

When the contract is modified, the price of the contract modification for the additional 30 products is an additional CU2,850 or CU95 per product. The pricing for the additional products reflects the stand-alone selling price of the products at the time of the contract modification and the additional products are distinct (in accordance with paragraph 27 of IFRS 15) from the original products.

In accordance with paragraph 20 of IFRS 15, the contract modification for the additional 30 products is, in effect, a new and separate contract for future products that does not affect the accounting for the existing contract. The entity recognises revenue of CU100 per product for the 120 products in the original contract and CU95 per product for the 30 products in the new contract.

3.4.2 Contract modification is not a separate contract

If one or both of the criteria discussed in section 3.4.1 above are not met (i.e., distinct goods or services are not added or the distinct goods or services are not priced at their stand-alone selling price), the contract modifications are accounted for as changes to the original contract and not as separate contracts. This includes contract modifications that modify or remove previously agreed-upon goods or services or reduce the price of the contract. An entity accounts for the effects of these modifications differently, depending on which of the three scenarios described in IFRS 15.21 (see the extract in section 3.4 above), and discussed in sections 3.4.2.A-3.4.2.C below, most closely aligns with the facts and circumstances of the modification. [IFRS 15.21].

3.4.2.A Modification is a termination of the existing contract and the creation of a new contract

If the remaining goods or services after the contract modification are distinct from the goods or services transferred on, or before, the contract modification (but the distinct goods or services added in the modification were not added at their stand-alone selling prices at the date of the contract modification), the entity accounts for the modification as if it were a termination of the old contract and the creation of a new contract. [IFRS 15.21(a)].

For these modifications, the revenue recognised to date on the original contract (i.e., the amount associated with the completed performance obligations) is not adjusted. Instead, the remaining portion of the original contract and the modification are accounted for, together, on a prospective basis by allocating the remaining consideration (i.e., the unrecognised transaction price from the existing contract plus the additional transaction price from the modification) to the remaining performance obligations (or to the remaining distinct goods or services in a single performance obligation identified as a series, see section 4.2.2 below), including those added in the modification. [IFRS 15.21(a)].

Example 7 in the standard illustrates the accounting for a contract modification of a services contract that is determined to be a series of distinct goods or services (see section 4.2.2 below) and meets the criteria in IFRS 15.21(a) to be accounted for as a termination of the existing contract and the creation of a new contract. As the performance obligation is a series, the services provided after the contract modification are distinct from those provided before the contract modification. [IFRS 15.IE Example 7, IFRS 15.IE33-IE36].

The following example from the standard also illustrates a modification that is treated as a termination of an existing contract and the creation of a new contract: [IFRS 15.IE Example 5 Case B, IFRS 15.IE19, IFRS 15.IE22-IE24]

Extract from IFRS 15

Example 5-Modification of a contract for goods

An entity promises to sell 120 products to a customer for CU12,000 (CU100 per product). The products are transferred to the customer over a six-month period. The entity transfers control of each product at a point in time. After the entity has transferred control of 60 products to the customer, the contract is modified to require the delivery of an additional 30 products (a total of 150 identical products) to the customer. The additional 30 products were not included in the initial contract.

...

Case B-Additional products for a price that does not reflect the stand-alone selling price

During the process of negotiating the purchase of an additional 30 products, the parties initially agree on a price of CU80 per product. However, the customer discovers that the initial 60 products transferred to the customer contained minor defects that were unique to those delivered products. The entity promises a partial credit of CU15 per product to compensate the customer for the poor quality of those products. The entity and the customer agree to incorporate the credit of CU900 (CU15 credit × 60 products) into the price that the entity charges for the additional 30 products. Consequently, the contract modification specifies that the price of the additional 30 products is CU1,500 or CU50 per product. That price comprises the agreed-upon price for the additional 30 products of CU2,400, or CU80 per product, less the credit of CU900.

At the time of modification, the entity recognises the CU900 as a reduction of the transaction price and, therefore, as a reduction of revenue for the initial 60 products transferred. In accounting for the sale of the additional 30 products, the entity determines that the negotiated price of CU80 per product does not reflect the stand-alone selling price of the additional products. Consequently, the contract modification does not meet the conditions in paragraph 20 of IFRS 15 to be accounted for as a separate contract. Because the remaining products to be delivered are distinct from those already transferred, the entity applies the requirements in paragraph 21(a) of IFRS 15 and accounts for the modification as a termination of the original contract and the creation of a new contract.

Consequently, the amount recognised as revenue for each of the remaining products is a blended price of CU93.33 $\{[(CU100 \times 60 \text{ products not yet transferred under the original contract}) + (CU80 \times 30 \text{ products to be transferred under the contract modification})] \div 90 \text{ remaining products}\}$.

In Example 5, Case B, in the extract above, the entity attributed a portion of the discount provided on the additional products to the previously delivered products because they contained defects. This is because the compensation provided to the customer for the previously delivered products is a discount on those products, which results in variable consideration (i.e., a price concession) for them. The new discount on the previously delivered products was recognised as a reduction of the transaction price (and, therefore, revenue) on the date of the modification. Changes in the transaction price after contract inception are accounted for in accordance with IFRS 15.88-90 (see section 6.5 below).

In similar situations, it might not be clear from the change in the contract terms whether an entity has offered a price concession on previously transferred goods or services to compensate the customer for performance issues related to those items (that would be accounted for as a reduction of the transaction price) or has offered a discount on future goods or services (that would be included in the accounting for the contract modification). An entity needs to apply judgement when performance issues exist for previously transferred goods or services to determine whether to account for any compensation to the customer as a change in the transaction price for those previously transferred goods or services.

3.4.2.B Modification is part of the existing contract

The remaining goods or services to be provided after the contract modification might not be distinct from those goods or services already provided and, therefore, form part of a single performance obligation that is partially satisfied at the date of modification. [IFRS 15.21(b)].

If this is the case, the entity accounts for the contract modification as if it were part of the original contract. This would be the case regardless of whether the additional goods or services were added at their stand-alone selling prices at the contract modification date. The entity adjusts revenue previously recognised (either up or down) to reflect the effect that the contract modification has on the transaction price and update the measure of progress (i.e., the revenue adjustment is made on a cumulative catch-up basis). This scenario is illustrated, as follows: [IFRS 15.IE Example 8, IFRS 15.IE37-IE41]

Extract from IFRS 15

Example 8-Modification resulting in a cumulative catch-up adjustment to revenue

An entity, a construction company, enters into a contract to construct a commercial building for a customer on customer-owned land for promised consideration of CU1 million and a bonus of CU200,000 if the building is completed within 24 months. The entity accounts for the promised bundle of goods and services as a single performance obligation satisfied over time in accordance with paragraph 35(b) of IFRS 15 because the customer controls the building during construction.

At the inception of the contract, the entity expects the following:

	CU
Transaction price	1,000,000
Expected costs	700,000
Expected profit (30%)	300,000

At contract inception, the entity excludes the CU200,000 bonus from the transaction price because it cannot conclude that it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur. Completion of the building is highly susceptible to factors outside the entity's influence, including weather and regulatory approvals. In addition, the entity has limited experience with similar types of contracts.

The entity determines that the input measure, on the basis of costs incurred, provides an appropriate measure of progress towards complete satisfaction of the performance obligation. By the end of the first year, the entity has satisfied 60 per cent of its performance obligation on the basis of costs incurred to date (CU420,000) relative to total expected costs (CU700,000). The entity reassesses the variable consideration and concludes that the amount is still constrained in accordance with paragraphs 56-58 of IFRS 15. Consequently, the cumulative revenue and costs recognised for the first year are as follows:

	CU
Revenue	600,000
Costs	420,000
Gross profit	180,000

In the first quarter of the second year, the parties to the contract agree to modify the contract by changing the floor plan of the building. As a result, the fixed consideration and expected costs increase by CU150,000 and CU120,000, respectively. Total potential consideration after the modification is CU1,350,000 (CU1,150,000 fixed consideration + CU200,000 completion bonus). In addition, the allowable time for achieving the CU200,000 bonus is extended by 6 months to 30 months from the original contract inception date. At the date of the modification, on the basis of its experience and the remaining work to be performed, which is primarily inside the building and not subject to weather conditions, the entity concludes that it is highly probable that including the bonus in the transaction price will not result in a significant reversal in the amount of cumulative revenue recognised in accordance with paragraph 56 of IFRS 15 and includes the CU200,000 in the transaction price. In assessing the contract modification, the entity evaluates paragraph 27(b) of IFRS 15 and concludes (on the basis of the factors in paragraph 29 of IFRS 15) that the remaining goods and services to be provided using the modified contract are not distinct from the goods and services transferred on or before the date of contract modification; that is, the contract remains a single performance obligation.

Consequently, the entity accounts for the contract modification as if it were part of the original contract (in accordance with paragraph 21(b) of IFRS 15). The entity updates its measure of progress and estimates that it has satisfied 51.2 per cent of its performance obligation (CU420,000 actual costs incurred ÷ CU820,000 total expected costs). The entity recognises additional revenue of CU91,200 [(51.2 per cent complete × CU1,350,000 modified transaction price) - CU600,000 revenue recognised to date] at the date of the modification as a cumulative catch-up adjustment.

3.4.2.C Modification is part of the existing contract and the creation of a new contract

A change in a contract might also be treated as a combination of the two: a modification of the existing contract and the creation of a new contract. This would be the case when some, but not all, of the goods or services added in the modification are distinct from those already provided as at the date of the modification.

In this case, the unrecognised transaction price from the existing contract (if any) plus any additional consideration promised as part of the modification would be allocated to the remaining goods and services on the modification date and recognised as follows:

- For the remaining goods or services that are distinct from the goods or services transferred on or before the date of the contract modification (including distinct goods or services in a single performance obligation identified as a series (see section 4.2.2 below)), the entity would recognise the allocated amount of the transaction price on a prospective basis.
- For the remaining goods or services that are not distinct, and, therefore, form part of a single performance obligation that is partially satisfied at the date of the contract modification, the entity would adjust revenue previously recognised, either up or down, to reflect the effect of the contract modification based on an updated measure of progress (i.e., the revenue adjustment is made on a cumulative catch-up basis).

An entity would not adjust the accounting for completed performance obligations at the modification date that are distinct from the modified goods or services. [IFRS 15.21(c)].

Frequently asked questions

Question 3-19: How would an entity account for a partial termination of a contract (e.g., a change in the contract term from three years to two years prior to the beginning of year two)?

See response to Question 3-9 in section 3.2 above.

Question 3-20: How would an entity account for a contract modification that decreases the scope of a contract?

A modification that decreases the scope of a contract is not accounted for as a separate contract because it does not result in the addition of distinct goods or services (see section 3.4.2 above). The accounting will depend on whether the remaining goods and services to be provided after the contract modification are distinct from the goods and services already provided. If the remaining goods and services are distinct (including goods or services that are part of a single performance obligation that is a series of distinct goods or services), the contract modification is accounted for as a termination of the old contract and the creation of a new contract (i.e., prospectively). If the remaining goods and services are not distinct, the contract modification is accounted for as if it were part of the original contract (i.e., cumulative catch-up). See Question 3-9 in section 3.2 above regarding a partial termination of a contract.

How we see it

To modify a contract, a customer might agree to pay a fee to terminate, or decrease the scope of, some of the rights and obligations included in the original contract (e.g., a termination fee, one-time payment, lump-sum payment). We believe that such a fee is additional consideration that needs to be included in the modified transaction price and allocated to the remaining goods and services to be provided to the customer.

Consider the following Illustration:

Illustration 3-8: Contract modification that decreases the scope of the promised goods or services in a contract

Entity X enters into a non-cancellable contract with a customer to provide information technology (IT) outsourcing services continuously for a three-year period. Entity X determines that the arrangement contains a single performance obligation comprising a series of distinct services that is transferred to the customer over time. Entity X bills the customer a fixed price of CU500 per month (i.e., the total consideration is CU500 x 36 months = CU18,000).

At the end of the second year, Entity X and the customer modify the contract to remove certain discrete services from the overall outsourcing service. As part of the modification, the customer agrees to pay a contract modification fee of CU500 and reduce the monthly payments to CU400 per month.

The services provided after the contract modification are distinct from those provided before the contract modification. This is because the performance obligation is a series of distinct services. Accordingly, Entity X applies the requirements in IFRS 15.21(a) and accounts for the modification prospectively. The remaining consideration of CU5,300 (CU400 x 12 months = CU4,800 for the services to be provided in the third year, plus the CU500 payment upon modification) is recognised over the remaining contract period of one year. That is, Entity X recognises the CU500 contract modification fee over the remaining performance period.

Question 3-21: How would an entity account for a 'blend-and-extend' contract modification?

A 'blend-and-extend' contract modification typically is one in which an entity, in exchange for a customer extending the term of the contract (and, therefore, purchasing additional units of a good or service), agrees to decrease the price per unit for all units to be provided (i.e., the new units, as well as the remaining units on the existing contract), resulting in a new blended price per unit. These types of contracts often occur in the power and utilities industry when market prices for the good or service decline after contract inception.

These arrangements are subject to the contract modification requirements in IFRS 15. Since these arrangements typically include the addition of distinct goods or services, the next step is for entities to evaluate whether the additional distinct goods or services are added at their stand-alone selling price in order to determine the accounting for the contract modification (i.e., as a separate contract or as a termination of the existing contract and the creation of a new contract).

When making this evaluation, stakeholders have questioned whether an entity needs to compare the blended contractual cash selling price or the overall contract price increase to the stand-alone selling price of the additional promised goods or services.

How we see it

We believe that entities need to establish an approach based on the facts and circumstances of their modifications and apply that approach consistently to similar fact patterns.

Consider the following Illustration:

Illustration 3-9: Blend-and-extend contract modification

Entity N enters into a four-year non-cancellable contract with Customer A to provide 100,000 widgets per year at a fixed price of CU10 per widget. Each widget is a distinct good transferred at a point in time.

At the end of the second year, Entity N and Customer A modify the contract to extend the term of the contract by another two years (i.e., Entity N will continue to provide 100,000 widgets in years 5 and 6). The stand-alone selling price of the widget has declined and is now CU8 per widget. As part of the modification, Entity N agrees to reduce the price to a blended rate of CU9 per widget (based on CU10 in years 3 and 4 and CU8 in years 5 and 6) in exchange for Customer A extending the contract term.

Entity N determines that each widget provided after the modification date is distinct from the widgets provided before the modification date.

Approach A - Compare the overall contract price increase to the stand-alone selling price of the additional promised goods or services

Since the price of the contract increases by an amount of consideration that reflects the stand-alone selling prices of the additional widgets (i.e., CU8 per widget in years 5 and 6), Entity N determines that the contract modification is accounted for as a separate contract in accordance with IFRS 15.20. Entity N will continue to recognise revenue of CU10 per widget for the remaining period in the initial contract (i.e., years 3 and 4) and recognise revenue of CU8 per widget in years 5 and 6.

Approach B - Compare the blended contractual cash selling price to the stand-alone selling price of the additional promised goods or services

Since the blended price of CU9 per widget does not reflect the stand-alone selling price of widgets at the modification date (i.e., CU8 per widget), Entity N applies the requirements in IFRS 15.21(a) and accounts for the modification as if it were a termination of the original contract and the creation of a new contract. Total consideration of CU3,600,000 ($100,000 \times \text{CU}10 \times 2 \text{ years} = \text{CU}2,000,000$ for the widgets to be provided the years 3 and 4, plus $\text{CU}1,600,000$ ($100,000 \times \text{CU}8 \times 2 \text{ years}$) for the widgets to be provided in years 5 and 6) is allocated to each of the remaining widgets to be provided (400,000 widgets). Entity N will recognise revenue for each widget at a blended rate of CU9 per widget ($\text{CU}3,600,000 \div 400,000 \text{ widgets}$).

The accounting will be different in contract modifications where an entity determines that the remaining goods or services to be provided after the modification date are not distinct from those goods or services provided before the modification date.

There is no presumption that such contract modifications contain a financing component that would be required to be accounted for separately. That is, the mere act of blending the rate in connection with a contract extension in which the customer pays more cash consideration for the same amount of goods or services at the beginning of the contract than the end of the contract does not automatically create a financing. However, each contract's facts and circumstances would need to be evaluated to determine whether a significant financing component exists (see section 5.5 below for further discussion on significant financing components).

Question 3-22: How would an entity account for a contract asset that exists when a contract is modified if the modification is treated as the termination of an existing contract and the creation of a new contract? (FASB TRG meeting 18 April 2016 - Agenda paper no. 51)

See response to Question 10-5 in section 10.1.5 below.

3.5 Arrangements that do not meet the definition of a contract under the standard

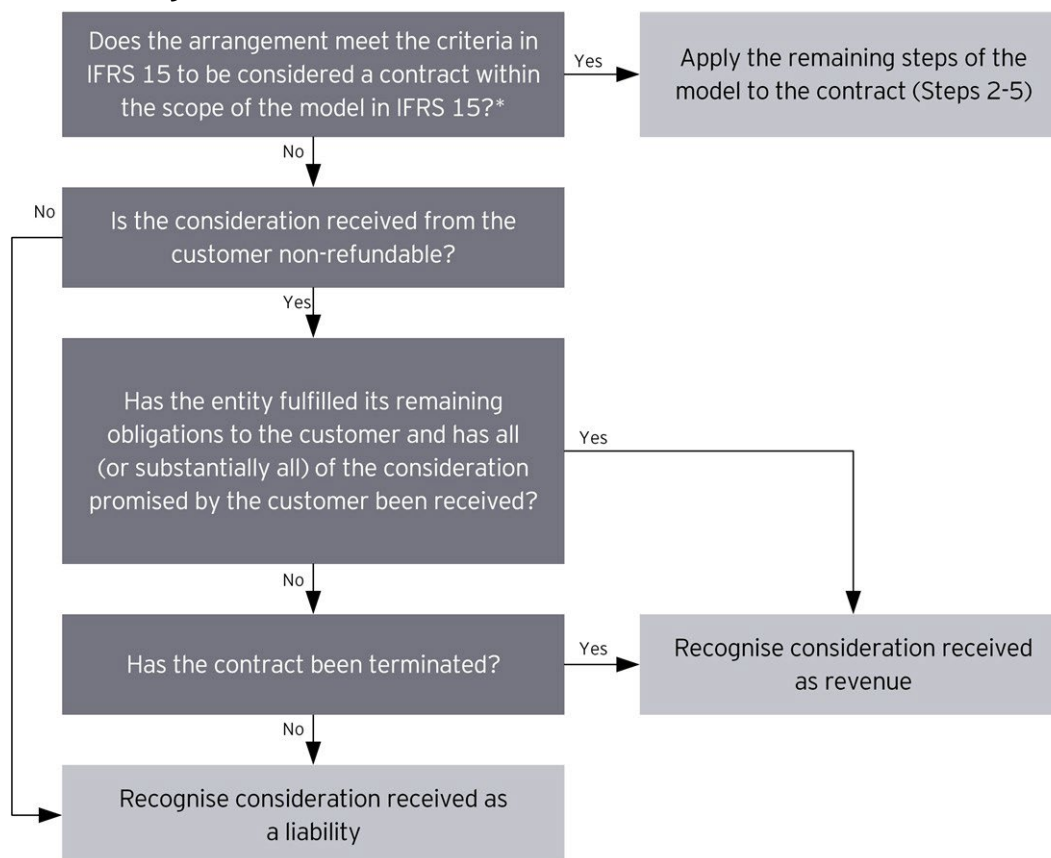

If an arrangement does not meet the criteria to be considered a contract under the standard, it must be accounted for as follows: [IFRS 15.15, IFRS 15.16]

Extract from IFRS 15

- 15 When a contract with a customer does not meet the criteria in paragraph 9 and an entity receives consideration from the customer, the entity shall recognise the consideration received as revenue only when either of the following events has occurred:
- (a) the entity has no remaining obligations to transfer goods or services to the customer and all, or substantially all, of the consideration promised by the customer has been received by the entity and is non-refundable; or
 - (b) the contract has been terminated and the consideration received from the customer is non-refundable.
- 16 An entity shall recognise the consideration received from a customer as a liability until one of the events in paragraph 15 occurs or until the criteria in paragraph 9 are subsequently met (see paragraph 14). Depending on the facts and circumstances relating to the contract, the liability recognised represents the entity's obligation to either transfer goods or services in the future or refund the consideration received. In either case, the liability shall be measured at the amount of consideration received from the customer.

The following flow chart illustrates this requirement:

Figure 3-2: Arrangements that do not meet the definition of a contract under the standard

* Entities need to continue to assess the criteria throughout the term of the arrangement to determine whether they are subsequently met.

If a contract does not initially meet the criteria in IFRS 15.9 (as discussed in section 3.1 above), an entity continues to assess the criteria throughout the term of the arrangement to determine whether they are subsequently met. Once the criteria are met, the model in the standard applies, rather than the requirements discussed below. [IFRS 15.14]. If an entity determines that the criteria in IFRS 15.9 are subsequently met, revenue is recognised on a cumulative catch-up basis as at the date when a contract exists within the scope of the model (i.e., at the 'contract establishment date', reflecting the performance obligations that are partially, or fully, satisfied at that date). This accounting is consistent with the discussion in TRG agenda paper no. 33, which states that the cumulative catch-up method "best satisfies the core principle" in IFRS 15.2.³⁵ See Question 7-20 in section 7.1.4.E below for further discussion.

If an arrangement does not meet the criteria in IFRS 15.9 (and until the criteria are met), an entity only recognises non-refundable consideration received as revenue when one of the events outlined above has occurred (i.e., full performance and all (or substantially all) consideration received or the contract has been terminated) or the arrangement subsequently meets the criteria in IFRS 15.9.

Until one of these events happens, any consideration received from the customer is initially accounted for as a liability (not revenue) and the liability is measured at the amount of consideration received from the customer.

In the Basis for Conclusions, the Board indicated that it intended this accounting to be "similar to the 'deposit method' that was previously included in US GAAP and that was applied when there was no consummation of a sale". [IFRS 15.BC48]. As noted in the Basis for Conclusions, the Board decided to include the requirements in IFRS 15.14-16 to prevent entities from seeking alternative guidance or improperly analogising to the five-step revenue recognition model in IFRS 15 in circumstances in which an executed contract does not meet the criteria in IFRS 15.9. [IFRS 15.BC47].

FASB differences

Under the FASB's standard, when the arrangement does not meet the criteria to be accounted for as a revenue contract under the standard, an entity can also recognise revenue (at the amount of the non-refundable consideration received) when the entity has transferred control of the goods or services and has stopped transferring (and has no obligation to transfer) additional goods or services. IFRS 15 does not include a similar requirement.

Frequently asked questions

Question 3-23: When is a contract considered terminated for purposes of applying IFRS 15.15(b)?
Determining whether a contract is terminated might require significant judgement.

In the Basis for Conclusions on IFRS 15, "the IASB noted that contracts often specify that an entity has the right to terminate the contract in the event of non-payment by the customer and that this would not generally affect the entity's rights to recover any amounts owed by the customer. The IASB also noted that an entity's decision to stop pursuing collection would not typically affect the entity's rights and the customer's obligations under the contract with respect to the consideration owed by the customer. On this basis, ... the existing requirements in IFRS 15 are sufficient for an entity to conclude ... that a contract is terminated when it stops providing goods or services to the customer." [IFRS 15.BC46H].

³⁵ TRG Agenda paper no. 33, *Partial Satisfaction of Performance Obligations Prior to Identifying the Contract*, dated 30 March 2015.

4 IFRS 15 - Identify the performance obligations in the contract

To apply the standard, an entity is required to identify the promised goods or services within the contract and determine which of those goods or services are separate performance obligations. As noted in the Basis for Conclusions, the Board developed the notion of a 'performance obligation' to assist entities with appropriately identifying the unit of account for the purposes of applying the standard. [IFRS 15.BC85]. Because the standard requires entities to allocate the transaction price to performance obligations, identifying the correct unit of account is fundamental to recognising revenue on a basis that faithfully depicts the entity's performance in transferring the promised goods or services to the customer.

The standard provides the following requirements with respect to identifying the performance obligations in a contract: [IFRS 15.22, IFRS 15.23]

Extract from IFRS 15

- 22** At contract inception, an entity shall assess the goods or services promised in a contract with a customer and shall identify as a performance obligation each promise to transfer to the customer either:
- (a) a good or service (or a bundle of goods or services) that is distinct; or
 - (b) a series of distinct goods or services that are substantially the same and that have the same pattern of transfer to the customer (see paragraph 23).
- 23** A series of distinct goods or services has the same pattern of transfer to the customer if both of the following criteria are met:
- (a) each distinct good or service in the series that the entity promises to transfer to the customer would meet the criteria in paragraph 35 to be a performance obligation satisfied over time; and
 - (b) in accordance with paragraphs 39-40, the same method would be used to measure the entity's progress towards complete satisfaction of the performance obligation to transfer each distinct good or service in the series to the customer.

4.1 Identifying the promised goods or services in the contract

As a first step in identifying the performance obligation(s) in the contract, the standard requires an entity to identify, at contract inception, the promised goods or services in the contract. The standard provides guidance on the types of items that could be goods or services promised in the contract, as follows:

[IFRS 15.24, IFRS 15.25, IFRS 15.26]

Extract from IFRS 15

- 24** A contract with a customer generally explicitly states the goods or services that an entity promises to transfer to a customer. However, the performance obligations identified in a contract with a customer may not be limited to the goods or services that are explicitly stated in that contract. This is because a contract with a customer may also include promises that are implied by an entity's customary business practices, published policies or specific statements if, at the time of entering into the contract, those promises create a valid expectation of the customer that the entity will transfer a good or service to the customer.
- 25** Performance obligations do not include activities that an entity must undertake to fulfil a contract unless those activities transfer a good or service to a customer. For example, a services provider may need to perform various administrative tasks to set up a contract. The performance of those tasks does not transfer a service to the customer as the tasks are performed. Therefore, those setup activities are not a performance obligation.

- 26 Depending on the contract, promised goods or services may include, but are not limited to, the following:
- (a) sale of goods produced by an entity (for example, inventory of a manufacturer);
 - (b) resale of goods purchased by an entity (for example, merchandise of a retailer);
 - (c) resale of rights to goods or services purchased by an entity (for example, a ticket resold by an entity acting as a principal, as described in paragraphs B34-B38);
 - (d) performing a contractually agreed-upon task (or tasks) for a customer;
 - (e) providing a service of standing ready to provide goods or services (for example, unspecified updates to software that are provided on a when-and-if-available basis) or of making goods or services available for a customer to use as and when the customer decides;
 - (f) providing a service of arranging for another party to transfer goods or services to a customer (for example, acting as an agent of another party, as described in paragraphs B34-B38);
 - (g) granting rights to goods or services to be provided in the future that a customer can resell or provide to its customer (for example, an entity selling a product to a retailer promises to transfer an additional good or service to an individual who purchases the product from the retailer);
 - (h) constructing, manufacturing or developing an asset on behalf of a customer;
 - (i) granting licences (see paragraphs B52-B63B); and
 - (j) granting options to purchase additional goods or services (when those options provide a customer with a material right, as described in paragraphs B39-B43).

In order for an entity to identify the promised goods or services in a contract, IFRS 15 indicates that an entity considers whether there is a valid expectation on the part of the customer that the entity will provide a good or service. [IFRS 15.24]. If the customer has a valid expectation that it will receive certain goods or services, it is likely that the customer would view those promises as part of the negotiated exchange. This expectation is most commonly created from an entity's explicit promise in a contract to transfer a good(s) or service(s) to the customer.

However, in other cases, promises to provide goods or services might be implied by the entity's customary business practices or standard industry norms (i.e., outside of the written contract). As discussed in section 3 above, the Board clarified that, while the contract must be legally enforceable to be within the scope of the revenue model, not all of the promises (explicit or implicit) have to be legally enforceable to be considered when determining the entity's performance obligations. [IFRS 15.BC32, IFRS 15.BC87]. That is, a performance obligation can be based on a customer's valid expectations (e.g., due to the entity's business practice of providing an additional good or service that is not specified in the contract).

Promised goods or services might include items such as 'free' handsets provided by telecommunication entities, 'free' maintenance provided by automotive manufacturers and customer loyalty points awarded by supermarkets, airlines and hotels. [IFRS 15.BC88]. When the IASB sought comments on the draft standard, some respondents suggested that these types of promised goods or services would be excluded from the scope and accounted for as marketing expenses or incidental obligations, even though the promises would meet the definition of a performance obligation. The Board concluded that, while an entity might not consider those goods or services to be the 'main' items that the customer contracts to receive, they are goods or services for which the customer pays and to which the entity allocates consideration for the purpose of recognising revenue. [IFRS 15.BC89].

IFRS 15 states that promised goods or services do *not* include activities that an entity must undertake to fulfil a contract unless those activities transfer control of a good or service to a customer. [IFRS 15.25]. For example, internal administrative activities that an entity must perform to satisfy its obligation to deliver the promised goods or services, but do not transfer control of a good or service to a customer, would not be promised goods or services. The IFRS IC reiterated this point during its January 2019 meeting (see below for further discussion).

How we see it

An entity might have to apply judgement when determining whether an activity it will perform is a promised good or service that will be transferred to a customer. The following questions could be relevant for an entity to consider when making this judgement:

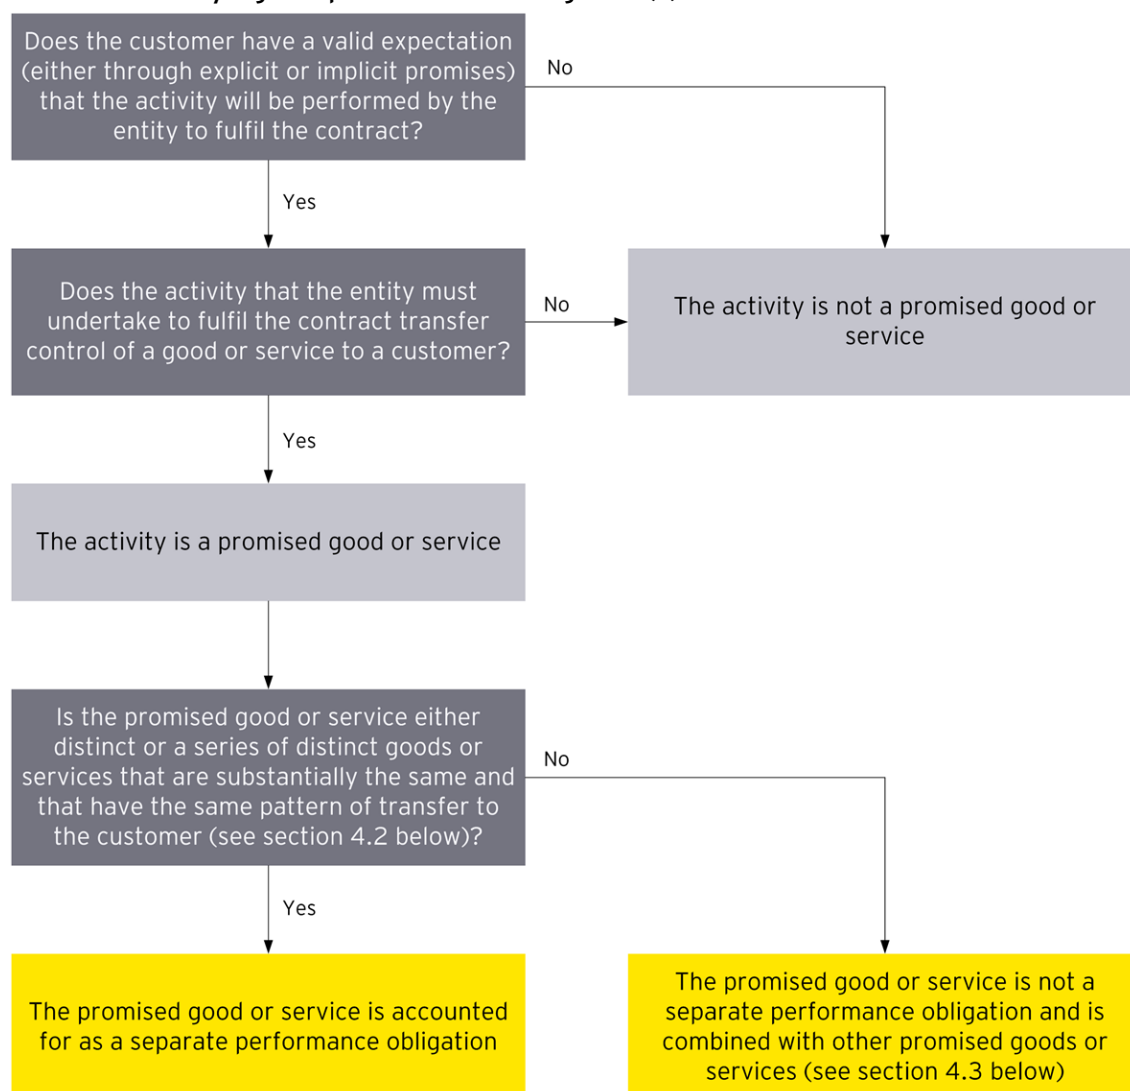

- Is the activity identified as a good or service to be provided in the contractual arrangement with the customer? Activities that are not specifically identified could relate to an internal process of the entity, but they could also relate to implicit promises to the customer.
- Does the activity relate to the entity establishing processes and procedures or training its employees, so that it can render the contracted goods or services to the customer (e.g., set-up activities)?
- Is the activity administrative in nature (e.g., tasks performed to determine whether to accept or reject a customer, establishing the customer's account, invoicing the customer)?
- Is the customer aware of when the activity will be performed?

IFRS 15.26 provides examples of promised goods or services that may be included in a contract with a customer, such as a good produced by an entity or a contractually agreed-upon task (or service) performed for a customer. IFRS 15.26(e) describes a stand-ready obligation as a promised service that consists of standing ready to provide goods or services or making goods or services available for a customer to use as and when it decides to use it. [IFRS 15.26(e)]. That is, a stand-ready obligation is the promise that the customer has access to a good or service, rather than a promise to transfer the underlying good or service itself. Stand-ready obligations are common in the software industry (e.g., unspecified updates to software on a when-and-if-available basis) and might be present in other industries. See Questions 4-2 and 4-3 below for further discussion on stand-ready obligations.

IFRS 15.26(g) notes that a promise to a customer may include granting rights to goods or services to be provided in the future that the customer can resell or provide to its own customers. [IFRS 15.26(g)]. Such a right might represent promises to the customer if it existed at the time that the parties agreed to the contract. As noted in the Basis for Conclusions, the Board thought it was important to clarify that a performance obligation might exist for a promise to provide a good or service in the future (e.g., when an entity makes a promise to provide goods or services to its customer's customer). [IFRS 15.BC92]. These types of promises exist in distribution networks in various industries and are common in the automotive industry.

After identifying the promised goods or services in the contract, an entity then determines which of these promised goods or services (or bundle of goods or services) represent separate performance obligations.

The following flowchart illustrates the guidance an entity uses to assess whether the activities it will perform are promised goods or services and whether they are accounted for as performance obligations under Step 2 of the five-step model in IFRS 15:

Figure 4-1: Identifying the performance obligation(s) in the contract

The standard includes the following example to illustrate how an entity would identify the promised goods or services in a contract (including both explicit and implicit promises). The example also evaluates whether the identified promises are performance obligations, which we discuss in section 4.2 below. [IFRS 15.IE Example 12 Case A, IFRS 15.IE59-IE65A]. The IFRS IC also discussed the assessment of whether there is an implicit promise in a contract as part of a principal versus agent assessment during its April 2022 meeting. See Illustration 4-18 in section 4.4.2 below for further details.

Extract from IFRS 15

Example 12-Explicit and implicit promises in a contract

An entity, a manufacturer, sells a product to a distributor (ie its customer) who will then resell it to an end customer.

Case A-Explicit promise of service

In the contract with the distributor, the entity promises to provide maintenance services for no additional consideration (ie 'free') to any party (ie the end customer) that purchases the product from the distributor. The entity outsources the performance of the maintenance services to the distributor and pays the distributor an agreed-upon amount for providing those services on the entity's behalf. If the end customer does not use the maintenance services, the entity is not obliged to pay the distributor.

The contract with the customer includes two promised goods or services - (a) the product and (b) the maintenance services. The promise of maintenance services is a promise to transfer goods or services in the future and is part of the negotiated exchange between the entity and the distributor. The entity assesses whether each good or service is distinct in accordance with paragraph 27 of IFRS 15. The entity determines that both the product and the maintenance services meet the criterion in paragraph 27(a) of IFRS 15. The entity regularly sells the product on a stand-alone basis, which indicates that the customer

can benefit from the product on its own. The customer can benefit from the maintenance services together with a resource the customer already has obtained from the entity (ie the product).

The entity further determines that its promises to transfer the product and to provide the maintenance services are separately identifiable (in accordance with paragraph 27(b) of IFRS 15) on the basis of the principle and the factors in paragraph 29 of IFRS 15. The product and the maintenance services are not inputs to a combined item in the contract. The entity is not providing a significant integration service because the presence of the product and the services together in this contract do not result in any additional or combined functionality. In addition, neither the product nor the services modify or customise the other. Lastly, the product and the maintenance services are not highly interdependent or highly interrelated because the entity would be able to fulfil each of the promises in the contract independently of its efforts to fulfil the other (ie the entity would be able to transfer the product even if the customer declined maintenance services and would be able to provide maintenance services in relation to products sold previously through other distributors). The entity also observes, in applying the principle in paragraph 29 of IFRS 15, that the entity's promise to provide maintenance is not necessary for the product to continue to provide significant benefit to the customer. Consequently, the entity allocates a portion of the transaction price to each of the two performance obligations (ie the product and the maintenance services) in the contract.

Case B-Implicit promise of service

The entity has historically provided maintenance services for no additional consideration (ie 'free') to end customers that purchase the entity's product from the distributor. The entity does not explicitly promise maintenance services during negotiations with the distributor and the final contract between the entity and the distributor does not specify terms or conditions for those services.

However, on the basis of its customary business practice, the entity determines at contract inception that it has made an implicit promise to provide maintenance services as part of the negotiated exchange with the distributor. That is, the entity's past practices of providing these services create valid expectations of the entity's customers (ie the distributor and end customers) in accordance with paragraph 24 of IFRS 15. Consequently, the entity assesses whether the promise of maintenance services is a performance obligation. For the same reasons as in Case A, the entity determines that the product and maintenance services are separate performance obligations.

Case C-Services are not a promised service

In the contract with the distributor, the entity does not promise to provide any maintenance services. In addition, the entity typically does not provide maintenance services and, therefore, the entity's customary business practices, published policies and specific statements at the time of entering into the contract have not created an implicit promise to provide goods or services to its customers. The entity transfers control of the product to the distributor and, therefore, the contract is completed. However, before the sale to the end customer, the entity makes an offer to provide maintenance services to any party that purchases the product from the distributor for no additional promised consideration.

The promise of maintenance is not included in the contract between the entity and the distributor at contract inception. That is, in accordance with paragraph 24 of IFRS 15, the entity does not explicitly or implicitly promise to provide maintenance services to the distributor or the end customers.

Consequently, the entity does not identify the promise to provide maintenance services as a performance obligation. Instead, the obligation to provide maintenance services is accounted for in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*.

Although the maintenance services are not a promised service in the current contract, in future contracts with customers the entity would assess whether it has created a business practice resulting in an implied promise to provide maintenance services.

4.1.1 Identifying the promised goods or services in the contract: January 2019 IFRS IC discussion

In 2018, the IFRS IC received a request regarding the recognition of revenue by a stock exchange that provides listing services to customers. The request asked whether the stock exchange is providing an admission service that is distinct from an ongoing listing service. At its January 2019 meeting, the IFRS IC concluded that the principles and requirements in IFRS 15 provide sufficient guidance for an entity to assess the promised goods and services in a contract with a customer. Consequently, the IFRS IC decided not to add this matter to its agenda. [IFRS 15.BC87].³⁶

³⁶ [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

In considering this request, the IFRS IC noted that the main question relates to the assessment of the promised goods or services in the contract, rather than the assessment of whether the admission and the listing service are 'distinct' based on IFRS 15.27-30. In their agenda decision, the IFRS IC highlighted that:

- Before identifying its performance obligations, an entity needs to identify the goods and services promised in the contract. [IFRS 15.24].³⁷
- Performing various tasks (e.g., set-up activities) that do not transfer a good or service to a customer is not a performance obligation - a performance obligation does not include activities that an entity must undertake to fulfil a contract, unless those activities transfer a good or service to a customer. [IFRS 15.25].³⁸
- If a non-refundable upfront fee relates to an activity that is undertaken at or near contract inception to fulfil the contract but does not result in transfer of a promised good or service to a customer (i.e., the activities only represent tasks to set up a contract), the fee is an advance payment for future goods or services. [IFRS 15.B49].³⁹

The IFRS IC discussed what the promised goods and services are in the contract using the following Illustration.⁴⁰

Illustration 4-1: Identification of promised good or service in a contract by a stock exchange that provides listing service to a customer

A stock exchange entity provides its customers with access to the capital markets by admitting them for listing in the stock exchange. The entity charges its customers a non-refundable upfront admission fee and an ongoing listing fee. The non-refundable upfront fee relates to various activities that are undertaken by the entity at or near contract inception to enable admission to the exchange, including:

- Performing due diligence for new applications
- Reviewing the customer's listing application forms, including determining whether the application should be accepted
- Issuing tickers and reference numbers for the new security
- Processing of the listing on, and admission to, the exchange
- Publishing the security on the order book
- Issuing the dealing notice on the applicable admission date

Once the customer has been admitted, the entity provides ongoing market access and maintains the listing. The listing service transferred to the customer is the same on initial listing and on all subsequent days for which the customer remains listed.

As part of identifying the goods and services promised to the customer in the contract, the stock exchange considers whether the above activities undertaken at or near contract inception transfer a service to the customer as the activities are performed. This assessment depends on the facts and circumstances of the contract.

In this fact pattern, the IFRS IC concluded that, while the activities undertaken at or near contract inception are required to fulfil the contract with the customer (which promises to provide the customer with the service of being listed on the exchange), it is likely that the stock exchange would conclude that the activities do not transfer separate services to the customer as they are performed. Accordingly, they are not promised goods or services to be identified under Step 2 of the model.

How we see it

Entities might need to use judgement to identify promised goods or services in a contract. For example, some 'free' goods or services that might seem like marketing incentives have to be evaluated under the standard to determine whether they represent promised goods or services in a contract. In addition, the standard makes it clear that certain activities are not promised goods or services, such as activities that an entity must perform to satisfy its obligation to deliver the promised goods or services (e.g., internal administrative activities).

37 [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

38 [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

39 [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

40 [IASB Staff Paper 3](#): Project: Assessment of promised goods or services (IFRS 15), Paper topic: Agenda decision to finalise, IFRS IC meeting, January 2019; and [IASB Staff Paper 2](#): IFRS 15 Revenue from Contracts with Customers-Assessment of promised goods or services, Paper topic: Initial Consideration, IFRS IC meeting, September 2018; and [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

The Board noted in the Basis for Conclusions that it intentionally “decided not to exempt an entity from accounting for performance obligations that the entity might regard as being perfunctory or inconsequential.”⁴¹ Instead, an entity should assess whether those performance obligations are immaterial to its financial statements”. [IFRS 15.BC90].

In January 2015, the TRG members noted that entities cannot disregard items that they deem to be perfunctory or inconsequential and need to consider whether ‘free’ goods or services represent promises to a customer. For example, telecommunications entities might have to allocate consideration to the ‘free’ handsets that they provide. Likewise, automobile manufacturers might have to allocate consideration to ‘free’ maintenance that might have been considered a marketing incentive in the past. However, entities would consider materiality in determining whether items are promised goods or services. [IFRS 15.BC88].⁴²

FASB differences

The FASB’s standard allows entities to disregard promises that are deemed to be immaterial in the context of a contract. IFRS 15 does not include explicit language to indicate an entity can disregard promised goods or services that are immaterial in the context of the contract. Nonetheless, entities applying IFRS 15 would consider materiality in determining the promises in the contract.

The FASB’s standard also allows entities to elect to account for shipping and handling activities performed after the control of a good has been transferred to the customer as a fulfilment cost (i.e., an expense). IFRS 15 does not.

Frequently asked questions

Question 4-1: How would an entity assess whether pre-production activities are a promised good or service?

(TRG meeting 9 November 2015 - Agenda paper no. 46)

Manufacturing and production entities in various industries might perform activities and incur costs before they produce goods. Some arrangements (including long-term supply arrangements) require an entity to incur upfront costs, such as non-recurring engineering and design costs or costs related to set-up activities, to create new technology or adapt existing technology to the needs of the customer.

These pre-production activities are often a prerequisite to delivering any units under a production contract. For example, a manufacturer might incur costs to perform certain services related to the design and development of products it will sell under long-term supply arrangements. It might also incur costs to design and develop moulds, dies and other tools that will be used to produce those products. A contract might require the customer to reimburse the manufacturer for these costs. Alternatively, reimbursement might be implicitly guaranteed as part of the price of the product or by other means.

At the meeting in November 2015, the TRG members generally agreed that the determination of whether pre-production activities are a promised good or service or fulfilment activities requires judgement and consideration of the facts and circumstances. When assessing whether pre-production activities are promises in a contract with a customer (and potentially performance obligations under IFRS 15), entities need to determine whether the activities transfer a good or service to a customer. If an entity determines that these activities are promised goods or services, it applies the requirements in IFRS 15 to those goods or services. Also see Questions 9-15 and 9-16 in section 9.3.2 below for a discussion of how an entity accounts for costs related to pre-production activities and pre-contract or set-up activities, respectively.

The TRG members generally agreed that, if an entity is having difficulty determining whether a pre-production activity is a promised good or service in a contract, the entity needs to consider whether control of that good or service transfers to the customer. For example, if an entity is performing engineering and development services as part of developing a new product for a customer and the customer will own the resulting intellectual property (e.g., patents), it is likely that the entity would conclude that it is transferring control of the intellectual property and that the engineering and development activities are a promised good or service in the contract.

The TRG members noted that assessing whether control transfers in such arrangements might be challenging. In some arrangements, legal title of the good or service created from the pre-production

41 “The FASB subsequently decided to amend Topic 606 to state that an entity is not required to assess whether promised goods or services are performance obligations if they are immaterial within the context of the contract with the customer. The IASB’s considerations for deciding not to make similar amendments to IFRS 15 are explained in paragraphs BC116A-BC116E.”

42 TRG Agenda paper no. 25, *January 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 30 March 2015.

activity is transferred to the customer. However, the TRG members generally agreed that an entity has to consider all indicators of control transfer under IFRS 15 and that the transfer of legal title is not a presumptive indicator.

The IASB staff noted in the TRG agenda paper that, when an entity is determining whether control transfers to a customer in such arrangements, one of the three over-time revenue recognition criteria may be applicable to pre-production activities. That criterion is whether the customer simultaneously receives and consumes the benefits provided by the entity's performance as the entity performs.

[IFRS 15.35(a)]. As further discussed in section 7.1.1 below, IFRS 15.B4 notes that if an entity cannot readily identify whether this criterion is met, it considers whether another entity would need to re-perform the work the entity had completed to date if that other entity were required to fulfil the remaining performance obligation. [IFRS 15.B4].

For example, assume an entity is performing engineering and development as part of developing a new product for a customer. If the entity provided the customer with periodic progress reports in a level of detail that would not require the customer to contract with another entity to re-perform the work, or if the entity were required to provide the customer with the design information completed to date in the case of a termination, it is likely that the entity would conclude that control of that service transfers to the customer as the entity performs.

If a pre-production activity is determined to be a promised good or service, an entity allocates a portion of the transaction price to that good or service (as a single performance obligation or as part of a combined performance obligation that includes the pre-production activities along with other goods or services). If the pre-production activities are included in a performance obligation satisfied over time, they are considered when measuring progress toward satisfaction of that performance obligation (see section 7.1.4 below).

If a pre-production activity does not result in the transfer of control of a good or service to a customer, an entity considers other requirements that might be applicable (e.g., IAS 16, IAS 38, IFRS 15.95-98 on costs to fulfil a contract with a customer) and whether reimbursements for pre-production activity costs would be part of the transaction price for other goods or services transferred to the customer.

Question 4-2: What is the nature of the promise in a 'typical' stand-ready obligation?

(TRG meeting 26 January 2015 - Agenda paper no. 16)

At the January 2015 TRG meeting, the TRG members discussed numerous examples of stand-ready obligations and generally agreed that the nature of the promise in a stand-ready obligation is the promise that the customer will have access to a good or service, not the delivery of the underlying good or service. The standard describes a stand-ready obligation as a promised service that consists of standing ready to provide goods or services or making goods or services available for a customer to use as and when it decides to do so.

The TRG agenda paper included the following types of promises to a customer that could be considered stand-ready obligations, depending on the facts and circumstances:

- Obligations for which the delivery of the good, service or intellectual property is within the control of the entity, but is still being developed (e.g., a software entity's promise to transfer unspecified software upgrades at its discretion)
- Obligations for which the delivery of the underlying good or service is outside the control of the entity and the customer (e.g., an entity's promise to remove snow from an airport runway in exchange for a fixed fee for the year)
- Obligations for which the delivery of the underlying good or service is within the control of the customer (e.g., an entity's promise to provide periodic maintenance on a when-and-if needed basis on a customer's equipment after a pre-established amount of usage by the customer)
- Obligations to make a good or service available to a customer continuously (e.g., a gym membership that provides unlimited access to a customer for a specified period of time)

An entity needs to carefully evaluate the facts and circumstances of its contracts to appropriately identify whether the nature of a promise to a customer is the delivery of the underlying good(s) or service(s) or the service of standing ready to provide goods or services. Entities also have to consider other promises in a contract that includes a stand-ready obligation to appropriately identify the performance obligations in the contract. The TRG members generally agreed that all contracts with a

stand-ready element do not necessarily include a single performance obligation (refer to Question 4-3 below).⁴³

Refer to Question 4-13 in section 4.2.2 below for a discussion on whether stand-ready obligations are generally considered to be a series of distinct goods or services.

Stand-ready obligations are common in the software industry and might be present in other industries. For example, a software entity's promise to provide an unspecified number of software updates on a when-and-if-available basis typically represents a stand-ready obligation. In contrast, a promise to provide certain specified software updates would generally not be a stand-ready obligation.

Furthermore, an arrangement that requires the customer to make additional purchasing decisions (e.g., through the submission of a purchase order) is generally not a stand-ready obligation. This is because the entity is not obligated to fulfil the purchase order until it is submitted. Therefore, the nature of the promise to the customer is the delivery of the underlying goods or service and not a promise to stand ready to provide goods or services.

For details of the TRG members' discussion on measuring progress toward satisfaction for a stand-ready obligation that is satisfied over time, see Question 7-14 in section 7.1.4.E below.

Question 4-3: Do all contracts with a stand-ready element include a single performance obligation that is satisfied over time?

(TRG meeting 9 November 2015 - Agenda paper no. 48)

The TRG members generally agreed that the stand-ready element in a contract does not always represent a single performance obligation satisfied over time. This conclusion is consistent with the discussion in Question 4-2 above that, when identifying the nature of a promise to a customer, an entity might determine that a stand-ready element exists, but it is not the promised good or service for revenue recognition purposes. Instead, the underlying goods or services are the goods or services promised to the customer and accounted for by the entity.

Consider the following Illustration based on the example in the TRG agenda paper:

Illustration 4-2: Determining the nature of the promise in a contract with a stand-ready element

An entity is required to stand ready to produce a part for a customer under an MSA. The customer is not obligated to purchase any parts (i.e., there is no minimum guaranteed volume). However, it is highly likely the customer will purchase parts because the part is required to manufacture the customer's product and it is not practical for the customer to buy parts from multiple suppliers. The TRG members generally agreed that the nature of the promise in this example is the delivery of the parts, rather than a service of standing ready. When the customer submits a purchase order under the master supply arrangement, it is contracting for a specific number of distinct goods and the purchase order creates new performance obligations for the entity. However, if the entity determined that the nature of the promise is a service of standing ready, the contract would be accounted for as a single performance obligation satisfied over time. In that situation, the entity might be required to estimate the number of purchases to be made throughout the contract term (i.e., make an estimate of variable consideration and apply the constraint on variable consideration) and continually update the transaction price and its allocation among the transferred goods or services.

The TRG agenda paper also noted that, in this example, the entity is not obligated to transfer any parts until the customer submits a purchase order (i.e., the customer makes a separate purchasing decision). This contrasts with a stand-ready obligation, which requires the entity to make a promised service available to the customer and does not require the customer to make any additional purchasing decisions.

See Question 4-20 in section 4.6 below for further discussion on determining whether a contract involving variable quantities of goods or services is accounted for as variable consideration (i.e., if the nature of the promise is to transfer one overall service to the customer, such as a stand-ready obligation) or a contract containing customer options (i.e., if the nature of the promise is to transfer the underlying distinct goods or services).

43 TRG Agenda paper no. 48, *Customer options for additional goods and services*, dated 9 November 2015.

Question 4-4: How would an entity evaluate whether an exclusivity provision in a contract with customer represents a promised good or service?

How we see it

We believe that an exclusivity provision does not generally represent a promised good or service.

Contracts with customers involving the sale of products or services might contain exclusivity clauses whereby the entity agrees that it will not provide the products or services to others or will do so only on a limited basis. Such provisions could restrict the distribution of the products or services in certain geographical areas and/or prohibit the sale of the products or services to a customer's competitors. For example, an entity that provides advertising on its website might agree to run a banner advertisement for one customer for a specified period of time and exclude advertisements for similar products or services from the advertiser's competitors.

In the Basis for Conclusions on IFRS 15, the IASB discussed exclusivity in relation to licences of intellectual property and concluded that exclusivity is a restriction that represents an attribute of a licence, rather than the nature of the underlying intellectual property or the entity's promise in granting the licence. That is, exclusivity provisions define the scope of the customer's rights to intellectual property and would not be accounted for separately (see section 8.1.3 below for further discussion).

[IFRS 15.BC412(b)].

As explained above, we believe that the same principles would apply when evaluating exclusivity provisions in contracts that do not contain a licence of intellectual property. That is, exclusivity is an attribute of the promise to the customer, rather than a separate promised good or service. This is because exclusivity does not change the nature of the entity's performance to provide the underlying goods or services to the customer.

Any upfront payment received from a customer related to an exclusivity provision would need to be evaluated to determine whether it represents a material right (see further discussion in section 5.8 below). Conversely, an entity might make a payment to a customer for being the customer's exclusive provider for certain goods or services. Any payment made by the entity to the customer would need to be evaluated in accordance with the requirements for consideration paid or payable to a customer (see further discussion in section 5.7 below).

Question 4-5: Does a guarantee to defend or maintain a patent represent a promised good or service?

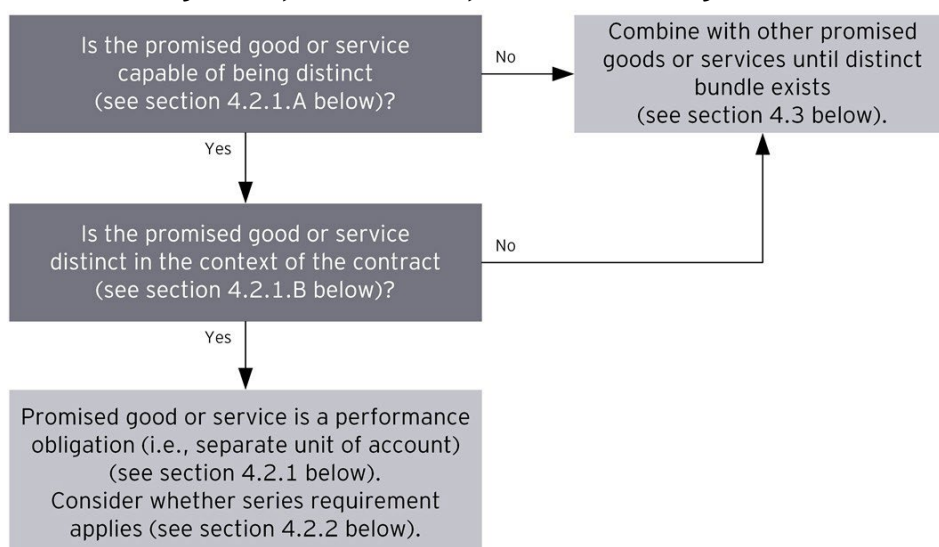

A guarantee to defend or maintain a patent does not represent a promised good or service. This is consistent with IFRS 15.B62(b) (discussed in section 8.1.4 below). *[IFRS 15.B62(b)].*

4.2 Determining when promises are performance obligations

After identifying the promised goods or services within a contract, an entity determines which of those goods or services will be treated as separate performance obligations. That is, the entity identifies the individual units of account. Promised goods or services represent separate performance obligations if the goods or services are distinct (by themselves, or as part of a bundle of goods or services) (see section 4.2.1 below) or if the goods or services are part of a series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer (see section 4.2.2 below).

If a promised good or service is not distinct, an entity is required to combine that good or service with other promised goods or services until it identifies a bundle of goods or services that, together, is distinct.

[IFRS 15.30]. An entity is required to account for all the goods or services promised in a contract as a single performance obligation if the entire bundle of promised goods or services is the only performance obligation identified. See section 4.3 below for further discussion. The following flow chart illustrates these requirements:

Figure 4-2: Determining when promises are performance obligations

A single performance obligation could include a licence of intellectual property and other promised goods or services. IFRS 15 identifies two examples of licences of intellectual property that are not distinct from other promised goods or services in a contract: (1) a licence that is a component of a tangible good and that is integral to the functionality of the tangible good; and (2) a licence that the customer can benefit from only in conjunction with a related service (e.g., an online hosting service that enables a customer to access the content provided by the licence of intellectual property). [IFRS 15.B54]. See section 8.1.2 below for further discussion on these two examples.

The standard also specifies that the following items are performance obligations:

- Customer options for additional goods or services that provide material rights to customers (see section 4.6 below) [IFRS 15.B39-B43]
- Service-type warranties (see in section 9.1 below) [IFRS 15.B28-B33]

Entities do not apply the general model to determine whether these goods or services are performance obligations because the Board deemed them to be performance obligations if they are identified as promises in a contract.

The Board noted that an entity is not precluded from accounting for distinct goods or services that are delivered concurrently and have the same pattern of transfer, as a single performance obligation, if the outcome would be the same as accounting for the goods and services as individual performance obligations. [IFRS 15.BC116].

4.2.1 Determination of 'distinct'

IFRS 15 outlines a two-step process for determining whether a promised good or service (or a bundle of goods or services) is distinct: [IFRS 15.27]

- Consideration at the level of the individual good or service of whether the customer can benefit from the good or service on its own or with other readily available resources (i.e., the good or service is capable of being distinct)
- Consideration of whether the good or service is separately identifiable from other promises in the contract (i.e., the promise to transfer the good or service is distinct within the context of the contract)

Both of these criteria must be met to conclude that the good or service is distinct. If these criteria are met, the individual good or service must be accounted for as a separate unit of account (i.e., a performance obligation).

The Board concluded that both steps are important in determining whether a promised good or service is accounted for separately. The first criterion (i.e., capable of being distinct) establishes the minimum characteristics for a good or service to be accounted for separately. However, even if the individual goods or services promised in a contract are capable of being distinct, it might not be appropriate to account for each of them separately because doing so would not result in a faithful depiction of the entity's performance in that contract or appropriately represent the nature of an entity's promise to the customer. [IFRS 15.BC102]. Therefore, an entity also needs to consider the interrelationship of those goods or services to apply the second criterion (i.e., distinct within the context of the contract) and determine the performance obligations within a contract.

The IFRS IC received a request about the identification of performance obligations in a contract for the sale of a real estate unit that includes the transfer of land, which is discussed in section 4.2.1.G below.

4.2.1.A Capable of being distinct

The first criterion requires that a promised good or service must be capable of being distinct by providing a benefit to the customer either on its own or together with other resources that are readily available to the customer.

The standard provides the following requirements on how to determine whether a promised good or service is capable of being distinct: *[IFRS 15.28]*

Extract from IFRS 15

28 A customer can benefit from a good or service in accordance with paragraph 27(a) if the good or service could be used, consumed, sold for an amount that is greater than scrap value or otherwise held in a way that generates economic benefits. For some goods or services, a customer may be able to benefit from a good or service on its own. For other goods or services, a customer may be able to benefit from the good or service only in conjunction with other readily available resources. A readily available resource is a good or service that is sold separately (by the entity or another entity) or a resource that the customer has already obtained from the entity (including goods or services that the entity will have already transferred to the customer under the contract) or from other transactions or events. Various factors may provide evidence that the customer can benefit from a good or service either on its own or in conjunction with other readily available resources. For example, the fact that the entity regularly sells a good or service separately would indicate that a customer can benefit from the good or service on its own or with other readily available resources.

Determining whether a good or service is capable of being distinct is straightforward in many situations. For example, if an entity regularly sells a good or service separately, this fact would demonstrate that the good or service provides benefit to a customer on its own or with other readily available resources.

The evaluation might require more judgement in other situations, particularly when the good or service can only provide benefit to the customer with readily available resources provided by other entities. These are resources that meet either of the following conditions:

- They are sold separately by the entity (or another entity).
- The customer has already obtained them from the entity (including goods or services that the entity has already transferred to the customer under the contract) or from other transactions or events.

As noted in the Basis for Conclusions, the assessment of whether the customer can benefit from the goods or services (either on its own or with other readily available resources) is based on the characteristics of the goods or services themselves, instead of how the customer might use the goods or services. *[IFRS 15.BC100]*. Consistent with this notion, an entity disregards any contractual limitations that might prevent the customer from obtaining readily available resources from a party other than the entity when making this assessment (as illustrated in Example 11, Case D from the standard, included in section 4.2.3 below). The IFRS IC also reiterated this point during its March 2018 meeting (see section 4.2.1.G below for further discussion). *[IFRS 15.IE Example 11 Case D, IFRS 15.IE58E-IE58F]*.

In the Basis for Conclusions, the Board explained that it did not require that a delivered item have 'value to the customer on a stand-alone basis' for an entity to account for that item separately. The Board said it wanted to avoid implying that an entity must assess a customer's intended use for a promised good or service when it is identifying performance obligations because it observed that it would be difficult, if not impossible, for an entity to know a customer's intent. *[IFRS 15.BC101]*.

4.2.1.B Distinct within the context of the contract

Once an entity has determined whether a promised good or service is capable of being distinct based on the individual characteristics of the promise, the entity considers the second criterion of whether the good or service is separately identifiable from other promises in the contract (i.e., whether the promise to transfer the good or service is distinct within the context of the contract).

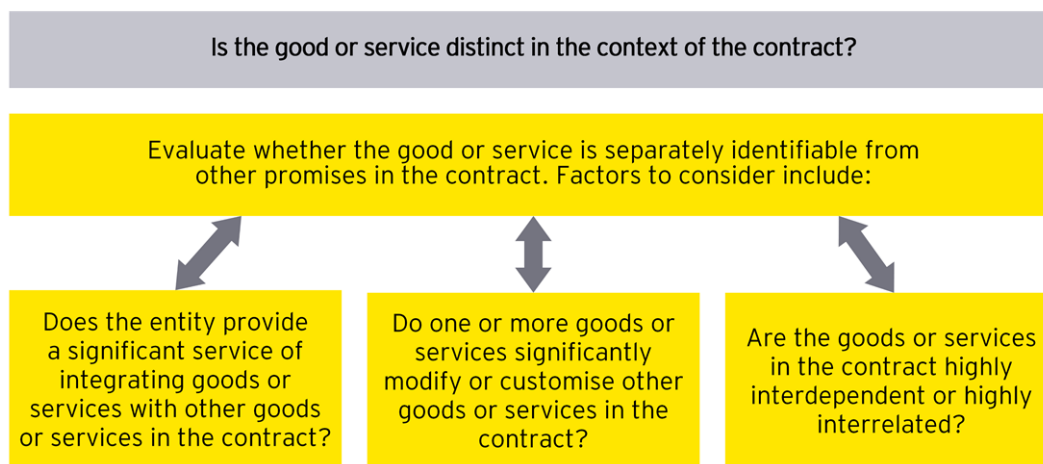

The standard provides the following requirements for making this determination: [IFRS 15.29]

Extract from IFRS 15

- 29 In assessing whether an entity's promises to transfer goods or services to the customer are separately identifiable in accordance with paragraph 27(b), the objective is to determine whether the nature of the promise, within the context of the contract, is to transfer each of those goods or services individually or, instead, to transfer a combined item or items to which the promised goods or services are inputs. Factors that indicate that two or more promises to transfer goods or services to a customer are not separately identifiable include, but are not limited to, the following:
- (a) the entity provides a significant service of integrating the goods or services with other goods or services promised in the contract into a bundle of goods or services that represent the combined output or outputs for which the customer has contracted. In other words, the entity is using the goods or services as inputs to produce or deliver the combined output or outputs specified by the customer. A combined output or outputs might include more than one phase, element or unit.
 - (b) one or more of the goods or services significantly modifies or customises, or are significantly modified or customised by, one or more of the other goods or services promised in the contract.
 - (c) the goods or services are highly interdependent or highly interrelated. In other words, each of the goods or services is significantly affected by one or more of the other goods or services in the contract. For example, in some cases, two or more goods or services are significantly affected by each other because the entity would not be able to fulfil its promise by transferring each of the goods or services independently.

The following figure depicts the above requirements:

Figure 4-3: Distinct in the context of the contract

4.2.1.C Distinct within the context of the contract: separately identifiable principle

To determine whether promised goods or services are separately identifiable (i.e., whether a promise to transfer a good or service is distinct within the context of the contract), an entity needs to evaluate whether its promise is to transfer each good or service individually or a combined item (or items) that comprises the individual goods or services promised in the contract. Therefore, an entity would evaluate whether the promised goods or services in the contract are outputs or they are inputs to a combined item (or items). In the Basis for Conclusions, the Board noted that, in many cases, a combined item (or items) is more than (or substantially different from) the sum of the underlying promised goods or services. [IFRS 15.BC116J].

The evaluation of whether an entity's promise is separately identifiable considers the relationship between the various goods or services in the context of the process to fulfil the contract. Therefore, an entity considers the level of integration, interrelation or interdependence among the promises to transfer goods or services. In the Basis for Conclusions, the Board observed that, rather than considering whether one item, by its nature, depends on the other (i.e., whether two items have a functional relationship), an entity evaluates whether there is a transformative relationship between the two or more items in the process of fulfilling the contract. [IFRS 15.BC116K]. The point was also reiterated by the IFRS IC during its March 2018 meeting (see the discussion in section 4.2.1.G below).

The Board also emphasised that the separately identifiable principle is applied within the context of the bundle of promised goods or services in the contract. It is not within the context of each individual promised good or service. That is, the separately identifiable principle is intended to identify when an entity's performance in transferring a bundle of goods or services in a contract is fulfilling a single promise to a customer. Therefore, to apply the 'separately identifiable' principle, an entity evaluates whether two or more promised goods or services significantly affect each other in the contract (and are, therefore, highly interdependent or highly interrelated). [IFRS 15.BC116L].

As an example of this evaluation, the IASB discussed in the Basis for Conclusions a typical construction contract that involves transferring to the customer many goods or services that are capable of being distinct (e.g., various building materials, labour, project management services). In this example, the IASB concluded that identifying all of the individual goods or services as separate performance obligations would be impractical and would not faithfully represent the nature of the entity's promise to the customer. That is, the entity would recognise revenue when the materials and other inputs to the construction process are provided rather than when it performs (and uses those inputs) in the construction of the item the customer has contracted to receive (e.g., a building, a house). As such, when determining whether a promised good or service is distinct, an entity not only determines whether the good or service is capable of being distinct but also whether the promise to transfer the good or service is distinct within the context of the contract. [IFRS 15.BC102].

IFRS 15 includes three factors (discussed individually in sections 4.2.1.D - 4.2.1.F below) that are intended to help entities identify when the promises in a bundle of promised goods or services are not separately identifiable and, therefore, need to be combined into a single performance obligation. [IFRS 15.29]. In the Basis for Conclusions, the IASB noted that these three factors are not an exhaustive list and that not all of the factors need to exist in order to conclude that the entity's promises to transfer goods or services are not separately identifiable. As emphasised by the IFRS IC during its March 2018 meeting (see the discussion in section 4.2.1.G below), the three factors also are not intended to be criteria that are evaluated independently of the separately identifiable principle. Given the wide variety of arrangements that are within the scope of IFRS 15, the Board expects that there are some instances in which the factors are less relevant to the evaluation of the separately identifiable principle. [IFRS 15.BC116N]. Entities might need to apply significant judgement to evaluate whether a promised good or service is separately identifiable. The evaluation requires a thorough understanding of the facts and circumstances present in each contract. An entity would consider the following questions, which summarise what is discussed in the Basis for Conclusions: [IFRS 15.BC116J, IFRS 15.BC116K, IFRS 15.BC116L]

- Is the combined item greater than, or substantively different from, the sum of the promised goods or services?
- Is an entity, in substance, fulfilling a single promise to the customer?
- Is the risk an entity assumes to fulfil its obligation to transfer a promised good or service inseparable from the risk relating to the transfer of the other promised goods or services in the bundle?
- Do two or more promised goods or services each significantly affect the other?
- Does each promised good or service significantly affect the other promised good or service's utility to the customer?

In a speech, a member of staff from the US SEC focused on considerations for determining whether a promise to transfer a good or service to a customer is separately identifiable from other promises in the contract, which could require significant judgement, as noted above. The SEC staff member emphasised the importance of supporting a registrant's conclusions by providing a well-reasoned analysis of the guidance in the revenue standard, rather than just referring to the manner in which the goods and services are sold to customers. The SEC staff member stated that the SEC staff are not persuaded that promises are combined into a single performance obligation simply because they are provided as part of a 'solution'. Instead, they expect registrants to provide a robust assessment of the requirements in the revenue standard to support an assertion that the promises to transfer goods are not separately identifiable.

To illustrate this, the SEC staff member described a consultation with the Office of the Chief Accountant (OCA) in which the staff did not object to a registrant's conclusion that software and software updates represent a combined performance obligation. The registrant was able to demonstrate that the software updates were integral to maintaining the utility of the software. That is, without the software updates, the customer's ability to benefit from the software would be significantly limited over the contract term. Based on this point and other facts and circumstances, the registrant was able to demonstrate that the combined output was greater than, or substantively different from, the individual promises of the software and software updates.⁴⁴

44 [Speech](#), Remarks before the 2019 AICPA Conference on Current SEC and PCAOB Developments, by Susan M. Mercier, Professional Accounting Fellow, SEC Office of the Chief Accountant, 9 December 2019. Available on the SEC's website.

4.2.1.D Distinct within the context of the contract: significant integration service

The first factor (included in IFRS 15.29(a)) is the presence of a significant integration service. [IFRS 15.29(a)]. The IASB determined that, when an entity provides a significant service of integrating a good or service with other goods or services in a contract, the bundle of integrated goods or services represents a combined output or outputs. In other words, when an entity provides a significant integration service, the risk of transferring individual goods or services is inseparable from the bundle of integrated goods or services because a substantial part of an entity's promise to the customer is to make sure the individual goods or services are incorporated into the combined output or outputs. [IFRS 15.BC107]. When evaluating this factor, entities need to consider whether they are providing a significant integration service that effectively *transforms* the individual promised goods or services (the inputs) into a combined output(s), as discussed in Example 11, Case E (included in section 4.2.3 below). This is consistent with the notion discussed above that a combined item (or items) would be greater than (or substantially different from) the sum of the underlying promised goods or services.

This factor applies even if there is more than one output. Furthermore, as described in IFRS 15.29(a), a combined output or outputs might include more than one phase, element or unit.

In the Basis for Conclusions, the IASB noted that this factor might be relevant in many construction contracts in which a contractor provides an integration (or contract management) service to manage and coordinate the various construction tasks and to assume the risks associated with the integration of those tasks. An integration service provided by the contractor often includes coordinating the activities performed by any subcontractors and making sure the quality of the work performed is in compliance with contract specifications and that the individual goods or services are appropriately integrated into the combined item that the customer has contracted to receive. [IFRS 15.BC107]. This type of construction contract and the analysis of whether it contains a significant integration service is illustrated in Example 10, Case A (included in section 4.2.3 below), [IFRS 15.IE Example 10 Case A, IFRS 15.IE45-IE48], and in Illustration 4-3 below. In addition, when more than one party (e.g., a subcontractor) is involved in providing goods or services to a customer, the standard requires the entity to determine whether it is a principal or an agent in these transactions (see section 4.4).

Illustration 4-3: Significant integration service

Contractor Q, a construction firm, enters into a contract with a customer to design and construct a concert hall. The project has two phases, design and construction and the contract provides separate compensation for each phase.

For purposes of this example, assume that the individual goods and services provided in each phase are capable of being distinct. Contractor Q must then determine whether each of the individual goods and services in each phase are distinct in the context of the contract. Contractor Q provides a significant service of: (1) integrating the various design services to produce project plans in the design phase; and (2) integrating the various materials and construction services to build the concert hall in the construction phase. Contractor Q then evaluates whether the aggregated goods and services in the design phase (i.e., project plans) and aggregated goods and services in the construction phase (i.e., concert hall) are distinct in the context of the contract and, therefore, are two performance obligations or whether together they represent a single performance obligation.

In this Illustration, the design and construction of a concert hall is necessary to satisfy Contractor Q's contract with the customer. Given the complex nature of the project, assume Contractor Q will be required to frequently alter the design of the concert hall during construction and to continually assess the propriety of the materials to be used. These changes might cause Contractor Q to rework the construction of the concert hall. Contractor Q determines it is providing a significant service of integrating goods and services into the combined output for which the customer has contracted (i.e., a completed concert hall). Contractor Q concludes that the design services and construction services are not distinct in the context of the contract and instead are combined and accounted for as one performance obligation.

The Board observed that this factor could apply to other industries as well. [IFRS 15.BC108]. In a speech, a member of the US SEC staff described a consultation with the OCA in which an entity concluded that it was providing a significant integration service that transformed equipment (e.g., cameras, sensors) and monitoring services into a combined output (i.e., a 'smart' security solution) that provided its customers with an overall service offering that was greater than the customer could receive from each individual promise. In this consultation, OCA did not object to the entity's conclusion that its promises comprised a single performance obligation.⁴⁵

45 [Speech](#), Remarks before the 2018 AICPA Conference on Current SEC and PCAOB Developments, by Sheri L. York, Professional Accounting Fellow, SEC Office of the Chief Accountant, 10 December 2018. Available on the SEC's website.

4.2.1.E Distinct within the context of the contract: significant modification or customisation

The second factor in IFRS 15.29(b) is the presence of significant modification or customisation. [IFRS 15.29(b)]. In the Basis for Conclusions, the IASB explained that in some industries, the notion of inseparable risks is more clearly illustrated by assessing whether one good or service significantly modifies or customises another. This is because if a good or service modifies or customises another good or service in a contract, each good or service is being assembled together (as an input) to produce a combined output. [IFRS 15.BC109].

In the Basis for Conclusions on IFRS 15, the Board provided an example which the following Illustration is based on: [IFRS 15.BC110]

Illustration 4-4: Significant customisation service

Assume that an entity promises to provide a customer with software that it will significantly customise to make the software function with the customer's existing infrastructure. Based on its facts and circumstances, the entity determines that it is providing the customer with a fully integrated system and that the customisation service requires it to significantly modify the software in such a way that the risks of providing it and the customisation service are inseparable (i.e., the software and customisation service are not separately identifiable).

The *significance* of modification or customisation services can affect an entity's conclusion about the number of identified performance obligations for similar fact patterns. Consider Example 11, Case A, and Example 11, Case B, in the standard (included in section 4.2.3 below). In Case A, each of the promised goods or services are determined to be distinct because the installation services being provided to the customer do not significantly modify the software. In Case B, two of the promised goods or services are combined into one performance obligation because one promise (the installation) significantly customises another promise (the software). [IFRS 15.IE Example 11 Case A-Case B, IFRS 15.IE49-IE58].

4.2.1.F Distinct within the context of the contract: highly interdependent or highly interrelated

The third factor in IFRS 15.29(c) is whether the promised goods or services are highly interdependent or highly interrelated. [IFRS 15.29(c)]. This is often the most difficult distinct factor for entities to assess. Promised goods or services are highly interdependent or highly interrelated if each of the promised goods or services is significantly affected by one or more of the other goods or services in the contract. Effectively, the combination of the promised goods or services fundamentally transforms the overall utility of those goods or services.

As discussed above, the Board clarified that an entity would evaluate how two or more promised goods or services affect each other and not just evaluate whether one item, by its nature, depends on the other. That is, an entity needs to evaluate whether there is a *significant two-way dependency* or transformative relationship between the promised goods or services to determine whether the promises are highly interdependent or highly interrelated. Determining whether a two-way dependency is significant such that the promises are highly interdependent or highly interrelated with each other is a judgement that requires careful consideration.

In the Basis for Conclusions on IFRS 15, the Board provided an example, which the following Illustration is based on. [IFRS 15.BC112].

Illustration 4-5: Highly interdependent and highly interrelated

An entity promises to design an experimental new product for a customer and to manufacture ten prototype units of that product. Because the product and manufacturing process is unproven, the entity is required to continue to revise the design of the product during the construction and test of the prototypes and make any necessary modifications to in-progress or completed prototypes. The entity expects that most, or all, of the units to be produced will require some rework because of design changes made during the production process. That is, the customer is not likely to be able to choose whether to purchase only the design service or the manufacturing service without one significantly affecting the other. The entity determines that the design and manufacturing promises are highly interdependent on, and highly interrelated with, the other promises in the contract. Consequently, although each promise might provide a benefit on its own, the promises are not separately identifiable within the context of the contract.

Conversely, if the design was similar to that of a previous product and/or the entity did not expect to have to rework the prototypes due to design changes, the entity might determine that the two promises are not highly interdependent or highly interrelated and might conclude the contract contains multiple performance obligations.

Goods or services might not be separately identifiable if they are so highly interdependent on, or highly interrelated with, other goods or services under the contract. This might occur when the customer's decision not to purchase one promised good or service would significantly affect the other promised goods or services. In other words, the promised goods or services are so highly interrelated or highly interdependent with each other that the entity could not fulfil an individual promise independently from the other promises in the contract. In contrast, the combination of some promised goods or services may provide an overall benefit to the customer but not fundamentally change the promised goods or services or require them to depend on one another. These promises could be distinct because they do not prevent the entity from fulfilling each obligation separately.

One aspect on which this evaluation should focus is the specific utility that can only be delivered through the combination of the goods or services. That is, it is important to establish that the utility each good or service can provide on its own is significantly less than the utility of the combined goods or services. Often, gaining sufficient understanding of the specific utility of the individual goods or services, as well as the combined offering, might involve discussion with employees from various departments (e.g., engineering, sales), in addition to those in the accounting and finance departments. An entity also needs to consider how its products and services are described in publicly available information (e.g., the entity's website, investor relations reports, financial statement filings). Those descriptions might indicate which functionalities are critical to the overall offering and influence customer expectations and whether those functionalities significantly affect the utility of other goods or services in the contract. Overall, the specific facts and circumstances of each offering and contract have to be carefully considered.

The concept regarding an entity's ability to separately fulfil a promise to a customer is highlighted in Example 11, Case E, (included in section 4.2.3 below) in the standard. This example includes a contract for the sale of equipment and specialised consumables to be used with the equipment. In this example, the entity determines that the equipment and consumables do not fundamentally transform each other or the combined output and are not highly interdependent or highly interrelated because the two promises do not significantly affect each other. As part of its analysis, the entity concludes that it would be able to fulfil each of its promises in the contract independently of the other promises.

4.2.1.G Distinct within the context of the contract: March 2018 IFRS IC discussion

In 2017, the IFRS IC received a request regarding the identification of performance obligations in a contract for the sale of a real estate unit that includes the transfer of land. The request also asked about the timing of revenue recognition for each performance obligation (either over time or at a point in time), which is discussed in Question 7-11 in section 7.1.3.B below. At its March 2018 meeting, the IFRS IC concluded that the principles and requirements in IFRS 15 provide sufficient guidance for an entity to recognise revenue in a contract for the sale of a real estate unit that includes the transfer of land. Consequently, the IFRS IC decided not to add this matter to its agenda.⁴⁶

In considering this request, the IFRS IC noted that the assessment of the distinct criteria requires judgement. Furthermore:

- The assessment of the first criterion is based on the characteristics of the goods or services themselves. Accordingly, an entity disregards any contractual limitations that might preclude the customer from obtaining readily available resources from a source other than the entity (see section 4.2.1.A above). [IFRS 15.BC100].
- The objective underlying the second criterion is to determine the nature of the promise within the context of the contract. That is, whether the entity has promised to transfer either the promised goods or services individually or a combined item to which those goods or services are inputs. IFRS 15 also includes some factors that indicate that two or more promises to transfer goods or services are not separately identifiable. [IFRS 15.29]. However, these factors are not intended to be criteria that an entity evaluates independently of the 'separately identifiable' principle because, in some instances, one or more of the factors might be less relevant to the evaluation of that principle (see section 4.2.1.C above). [IFRS 15.BC116N].

In the Basis for Conclusion, the Board indicated that the separately identifiable concept is influenced by the idea of separable risks. That is, whether the risk assumed to fulfil the obligation to transfer one of the promised goods or services to the customer is separable from the risk relating to the transfer of the other promised goods or services. Evaluating whether an entity's promise is separately identifiable considers the interrelationship between the goods or services within the contract in the context of the process to fulfil the contract. Accordingly, an entity considers the level of integration, interrelation or

⁴⁶ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

interdependence among the promises in the contract to transfer goods or services. An entity evaluates whether, in the process of fulfilling the contract, there is a transformative relationship between the promises, rather than considering whether one item, by its nature, depends upon another (i.e., whether the promises have a functional relationship). [IFRS 15.BC105, IFRS 15.BC116J, IFRS 15.BC116K]. That is, the conclusion about whether the promised goods or services are separately identifiable hinges on whether there is a *significant two-way dependency* between the items. Determining whether a two-way dependency is significant such that the promises are separately identifiable is a judgement that requires careful consideration (this is discussed further in section 4.2.1.F above).

The following Illustration is based on the example from the IFRS IC agenda paper used by the IFRS IC when it discussed the identification of performance obligations in its March 2018 meeting:⁴⁷

Illustration 4-6: Identification of performance obligations in a contract for the sale of a real estate unit that includes the transfer of land

Entity A enters into a non-cancellable contract with a customer for the sale of a real estate unit that involves the transfer of a plot of land and a building that Entity A constructs on that land. The land represents all of the area on which the building will be constructed and the contract is for the entire building.

At contract inception, Entity A transfers the legal title of the land and the customer pays the price specified in the contract for it. The transfer of legal title to the customer cannot be revoked, regardless of what happens during the construction of the building. Throughout the construction period, the customer makes milestone payments that do not necessarily correspond to the amount of work completed to date.

The design and specification of the building were agreed between the counterparties before the contract was signed. However, during the construction of the building, the customer can request changes to the design and specification that are priced by Entity A based on a methodology specified in the contract. If the customer decides to proceed with the proposed changes, Entity A can reject them only for a limited number of reasons (e.g., when the change would breach planning permission). Entity A can only request changes if not doing so would lead to an unreasonable increase in costs or delay construction. However, the customer must approve those changes.

Entity A first assesses whether the land and the building are each capable of being distinct in accordance with IFRS 15.27(a). Entity A determines that the customer could benefit from the land on its own or together with other resources readily available to it (e.g., by hiring another developer to construct a building on the land). Also, Entity A determines that the customer could benefit from the construction of the building on its own or together with other resources readily available to it (e.g., by obtaining the construction services from Entity A or another developer without transferring the land). Therefore, Entity A concludes that the land and the building are each capable of being distinct.

The criterion in paragraph 27(b) is then assessed by Entity A in order to determine whether the land and the building are distinct in the context of the contract. In making this assessment, Entity A considers the factors in IFRS 15.29, including the following:

- a. Whether it provides a significant service of integrating the land and the building into a combined output. Entity A analyses the transformative relationship between the transfer of the land and the construction of the building in the process of fulfilling the contract. As part of this analysis, it considers whether its performance in constructing the building would be different if it did not also transfer the land and *vice versa*. Despite the functional relationship between the land and the building (because the building cannot exist without the land on which its foundations will be built), the risks assumed by Entity A in transferring the land might, or might not, be separable from those assumed in constructing the building.
- b. Whether the land and the building are highly interdependent or highly interrelated. Entity A determines whether its promise to transfer the land could be fulfilled if it did not also construct the building and *vice versa*.

The IFRS IC concluded that the two promises would be separately identifiable if Entity A concluded that “(a) its performance in constructing the building would be the same regardless of whether it also transferred the land; and (b) it would be able to fulfil its promise to construct the building even if it did not also transfer the land, and would be able to fulfil its promise to transfer the land even if it did not also construct the building.”⁴⁸

4.2.1.H Distinct within the context of the contract: examples

The IASB included a number of examples in the standard that illustrate the application of the requirements for identifying performance obligations. The examples include analysis of how an entity might determine whether the promises to transfer goods or services are distinct within the context of the contract. Refer to section 4.2.3 below for full extracts of several of these examples.

How we see it

The assessment of whether a good or service is distinct must consider the specific contract with a customer. That is, an entity cannot assume that a particular good or service is distinct (or not distinct) in all instances. The manner in which promised goods or services are bundled within a contract can affect the conclusion of whether a good or service is distinct. As a result, entities might account the same goods or services differently, depending on how those goods or services are bundled within a contract.

Frequently asked questions

Question 4-6: How does an entity determine whether 'connected' hardware sold with cloud services represent one or more performance obligations?

To identify performance obligations in contracts containing connected hardware and cloud services, entities must determine whether the hardware and cloud services are each capable of being distinct and whether they are distinct within the context of the contract (as discussed in section 4.2.1 above). An increasing number of connected hardware devices are now available (e.g., security cameras, home equipment). In contracts where a customer purchases hardware, the hardware might require the installation of an app or the purchase of a cloud service subscription in order to be used. Alternatively, the hardware might provide additional functionalities when paired with the cloud service.

In evaluating the distinct criteria, entities need to consider: whether the hardware can be used without the cloud service; how the hardware and cloud service affect each other (e.g., whether the cloud service enables the hardware to 'learn' or perform its intended function better over time); whether there are additional functionalities that result from using the hardware with the cloud service; and other details of how the hardware and cloud services function and are sold.

Consider the following Illustration where an entity concludes that the connected hardware and cloud services are separately identifiable:

Illustration 4-7: Hardware sold with cloud services

Entity L enters into a contract with a customer to provide a smart home security camera bundled with cloud services, which enable the customer to view live images from the camera in an app on internet-connected devices (e.g., tablets, phones). Entity L also provides the cloud services to customers who purchase the camera through secondary markets.

Entity L concludes that the customer can benefit from each of the goods and services either on its own or together with other goods or services that are readily available. That is, each good or service is capable of being distinct under IFRS 15.27(a).

The camera is capable of being distinct because the customer can benefit from it together with the cloud services, which are a readily available resource since they can be obtained separately. Furthermore, the customer can benefit from the camera because it can be resold through secondary markets for more than scrap value.

The cloud services are capable of being distinct because the customer can benefit from them together with the camera transferred at the outset of the contract or the customer can purchase the camera separately through the secondary markets and obtain the cloud services from the entity.

Entity L then considers the factors in IFRS 15.29 and determines that the promise to transfer each good and service is distinct within the context of the contract. In reaching this conclusion, the entity notes that it does not provide a significant service of integrating the cloud services with the camera into a combined output, and the cloud services and the camera do not significantly modify or customise one another.

Entity L also determines that the camera and the cloud services are not highly interdependent or highly interrelated because it can fulfil its promise to transfer the cloud services independently from its promise to provide the camera (i.e., since customers can purchase the camera in secondary markets).

The cloud services provide only the basic functionality of connecting the camera to a personal device using Wi-Fi (instead of a traditional electrical cable). Therefore, the utility the customer can derive from the camera and the cloud services (when transferred together) is not greater than, or substantially different from, the utility the customer would receive if the camera and cloud services had been transferred separately.

As a result, Entity L identifies two performance obligations: the camera and the cloud services.

Entities will need to evaluate the specific features and functionality of the cloud services in arrangements that include connected hardware devices. Evaluating whether hardware and cloud services are separate performance obligations in arrangements for connected devices might be complex and require significant judgement when the cloud service has sophisticated features or functionality that the device cannot do independently. In these cases, there might be a high degree of interdependency between the hardware and the cloud service or a significant integration service might be present.

How we see it

To conclude that hardware and a cloud service are a single performance obligation, entities will need to demonstrate that the functionality of both the hardware and the service is significantly elevated when they are used together. Many technology entities have concluded that they have separate performance obligations because the hardware and the cloud service do not significantly affect each other and because the hardware can be sold separately from the cloud service.

Question 4-7: How would entities determine whether implementation services are distinct?

Entities will need to assess their implementation services and consider all relevant facts and circumstances to determine whether they are separate performance obligations (i.e., they are capable of being distinct and are distinct within the context of a contract, as discussed in section 4.2.1 above).

Entities might include promises to provide implementation services to customers as part of their product or service contracts (i.e., the implementation activities have been determined to transfer a service to the customer, as discussed in section 4.1 above). For example, these services might include training of customer personnel and data conversion.

When assessing whether implementation services are capable of being distinct, an entity first considers whether the customer can benefit from those services on their own. There is strong evidence to suggest that implementation services are capable of being distinct if third party vendors offer (or are capable of offering) implementation services for the entity's products or services, or if the customer could perform these services on its own. This evidence would demonstrate that the implementation services provide benefit to the customer on their own (i.e., apart from the other promised products or services purchased from the entity).

If an entity concludes that the customer is not able to benefit from the implementation services on their own, the entity considers whether the customer can benefit from the services together with other readily available resources. Readily available resources include the other promised products or services from the contract if they are sold separately by the entity or if they are transferred to the customer before the implementation services. An entity disregards any contractual limitations that prevent the customer from obtaining readily available resources from a party other than the entity when making this assessment. That is, contractually restricting a customer from using another vendor to perform the installation services would not preclude an entity from determining that the implementation services are capable of being distinct.

In assessing whether the implementation services are distinct within the context of the contract, an entity needs to consider whether: the implementation services modify or customise the other promised products or services; the entity is providing a significant service of integrating the promised products or services with the implementation services into one combined output; or the entity would be able to fulfil its promise to transfer the other promised products or services in the contract independently from its promise to provide the implementation services (i.e., whether the implementation services are highly interdependent or interrelated with the other products or services). This evaluation might require judgement and is based on the facts and circumstances of the entity's contracts.

The following Illustrations depict implementation services that are distinct and are not distinct, respectively:

Illustration 4-8: Implementation services are distinct

Technology entity P enters into an arrangement with a customer to perform implementation services and to provide software as a service (SaaS) for a three-year period. The entity regularly sells the SaaS and implementation services separately. The implementation services include changing the layout of the main dashboard for each type of user (e.g., marketing, finance) and do not alter the source code of the underlying software or add any new functionality. The implementation service is routinely performed by third parties and does not significantly modify or customise the SaaS.

Technology entity P evaluates the promised goods and services to determine which promises would be accounted for as separate performance obligations.

Technology entity P concludes that the implementation services are capable of being distinct because they can be used with the SaaS, a readily available resource, and because they can be purchased from third parties. Furthermore, the implementation services are distinct within the context of the contract for the following reasons: they are routine; they do not significantly modify or customise the SaaS; they are not integrated with the SaaS into a combined output; and they are not highly interdependent or interrelated with the SaaS since the entity can fulfil its promise to transfer the SaaS independently from its promise to provide the implementation services.

Based on this assessment, Technology entity P identifies two performance obligations (i.e., the SaaS and the implementation services).

Illustration 4-9: Implementation services are not distinct

Consider the same promised goods or services as in Illustration 4-8 above, except that the nature of the implementation services is to set up data feeds and interfaces with third-party applications and to connect the customer's SaaS account to Technology entity P's infrastructure.

Technology entity P does not sell the SaaS without the implementation services, and the customer cannot use the SaaS until the implementation services are complete, which might be up to nine months after entering into a contract. The implementation services cannot be provided by other entities because they require access to Technology entity P's systems.

Technology entity P evaluates the promised goods and services to determine which promises would be accounted for as separate performance obligations. The SaaS is capable of being distinct because it can be used together with the implementation services that are provided at the outset of the contract. However, the implementation services are not capable of being distinct because: they are not sold separately by the Technology entity P; they cannot be provided by a third party; and they do not provide benefit to the customer without SaaS (which is not a readily available resource).

Based on this assessment, Technology entity P identifies one performance obligation (i.e., the implemented SaaS comprised of the SaaS and implementation services).

Question 4-8: Does a licence to a content library include more than one performance obligation?

See response to Question 8-4 in section 8.1.4 below.

4.2.2 Series of distinct goods or services that are substantially the same and have the same pattern of transfer

As discussed above, IFRS 15.22(b) defines, a second type of performance obligation, a promise to transfer to the customer a series of distinct goods or services that are substantially the same and that have the same pattern of transfer, if both of the following criteria from IFRS 15.23 are met: [IFRS 15.22(b), IFRS 15.23]

- Each distinct good or service in the series that the entity promises to transfer represents a performance obligation that would be satisfied over time, in accordance with IFRS 15.35 (see below and section 7.1 below), if it were accounted for separately.
- The entity would measure its progress toward satisfaction of the performance obligation using the same measure of progress for each distinct good or service in the series (see section 7.1.4 below).

Figure 4-4: The series requirement criteria

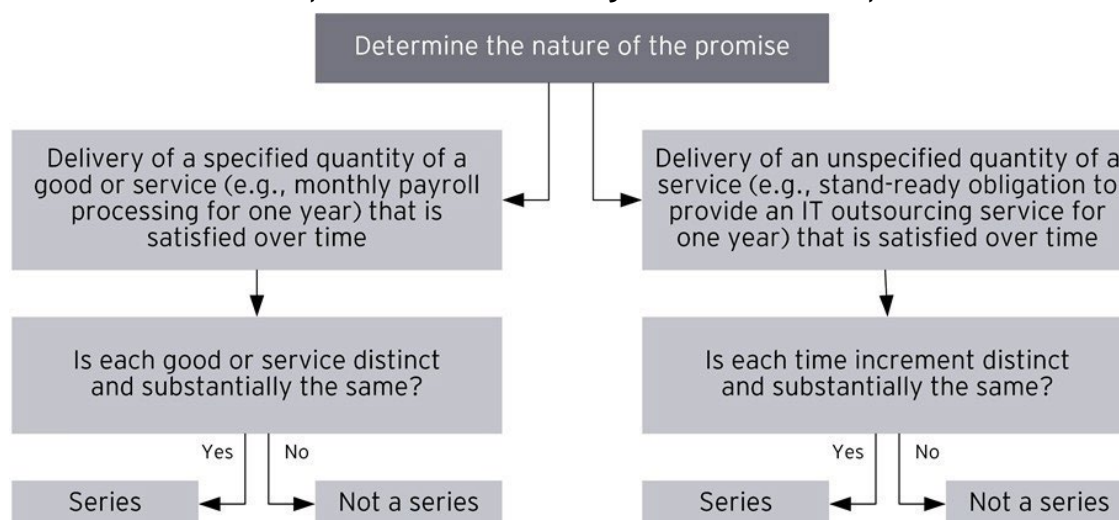

If a series of distinct goods or services meets the criteria in IFRS 15.22(b) and IFRS 15.23 (i.e., the series requirement), an entity is required to treat that series as a single performance obligation (i.e., it is not optional). The Board incorporated this requirement to simplify the model and promote consistent identification of performance obligations in cases when an entity provides the same good or service over a period of time. [IFRS 15.BC113]. In the Basis for Conclusions, the Board provided three examples of repetitive services (i.e., cleaning, transaction processing and delivering electricity) that meet the series requirement. [IFRS 15.BC114]. Without the series requirement, the Board noted that applying the revenue model might present operational challenges because an entity would have to identify multiple distinct goods or services, allocate the transaction price to each distinct good or service on a stand-alone selling price basis and then recognise revenue when those performance obligations are satisfied. The IASB determined that this would not be cost effective. Instead, an entity identifies a single performance obligation and allocates the transaction price to that performance obligation. It will then recognise revenue by applying a single measure of progress to that performance obligation. [IFRS 15.BC114].

Distinct goods and services that are “substantially the same”

For distinct goods or services to be accounted for as a series, one of the criteria is that they must be substantially the same. This is often the most difficult criterion for entities to assess. In addition, the TRG members generally agreed that when determining whether distinct goods or services are substantially the same, entities need to first determine the nature of their promise. This is because a series could consist of either specified quantities of the underlying good or service delivered (e.g., each unit of a good) or distinct time increments (e.g., an hourly service), depending on the nature of the promise. That is, if the nature of the promise is to deliver a specified quantity of service (e.g., monthly payroll services over a defined contract period), the evaluation considers whether each service is distinct and substantially the same. In contrast, if the nature of the entity's promise is to stand ready or provide a single service for a period of time (i.e., because there is an unspecified quantity to be delivered), the evaluation considers whether each time increment (e.g., hour, day), rather than the underlying activities, is distinct and substantially the same.⁴⁹

The following flow chart illustrates how the determination of the nature of the promise might affect whether the series requirement applies:

Figure 4-5: The series requirement: determining the nature of the promise

It is important to highlight that even if the underlying activities an entity performs to satisfy a promise vary significantly throughout the day and from day to day, that fact, by itself, does not mean the distinct goods or services are not substantially the same. Consider an example where the nature of the promise is to provide a daily hotel management service (i.e., an obligation to provide an unspecified quantity of a service for 20 years). Therefore, the entity evaluates whether each time increment is distinct and substantially the same. The service is comprised of activities that might vary each day (e.g., cleaning services, reservation services or property maintenance). However, the entity determines that the daily hotel management services are substantially the same because the nature of the entity's promise is the same each day and the entity is providing the same overall management service each day. Furthermore, each day of service is distinct because the management services provided on any day during the 20-year contract period are not dependent on, or interrelated with, the management services provided on any other day during the period. See Question 4-11 below for further discussion on determining the nature of an entity's promise and evaluating the 'substantially the same' criterion.

⁴⁹ TRG Agenda paper no. 39, *Application of the Series Provision and Allocation of Variable Consideration*, dated 13 July 2015.

Satisfied over time

A July 2015 TRG agenda paper explained that, when considering the nature of the entity's promise and the applicability of the series requirement (including whether a good or service is distinct), it could be helpful to consider which over-time criterion in IFRS 15.35 was met (i.e., why the entity concluded that the performance obligation is satisfied over time).⁵⁰ As discussed further in section 7.1 below, a performance obligation is satisfied over time if one of three criteria are met. For example, if a performance obligation is satisfied over time because the customer simultaneously receives and consumes the benefits provided as the entity performs (i.e., the first over-time criterion in IFRS 15.35(a)), that might indicate that each increment of service is capable of being distinct. If that is the case, the entity would need to evaluate whether each increment of service is separately identifiable (and substantially the same). If a performance obligation is satisfied over time based on the other two criteria in IFRS 15.35 (i.e., (1) the entity's performance creates or enhances an asset that the customer controls as the asset is created or enhanced; or (2) the entity's performance does not create an asset with an alternative use to the entity and the entity has an enforceable right to payment for performance completed to date), the nature of that promise might be to deliver a single specified good or service (e.g., a contract to construct a single piece of equipment), which would not be considered a series because the individual goods or services within that performance obligation are not distinct.

An entity's determination of whether a performance obligation is a single performance obligation comprising a series of distinct goods or services or a single performance obligation comprising goods or services that are not distinct from one another affects the accounting in the following areas: (1) allocation of variable consideration (see section 6.3 below); (2) contract modifications (see section 3.4 above); and (3) changes in transaction price (see section 6.5 below). As the IASB discussed in the Basis for Conclusions, an entity considers the underlying distinct goods or services in the contract, rather than the single performance obligation identified under the series requirement, when applying the requirements for these three areas of the model. [IFRS 15.BC115].

The following Illustration, based on the example included in a March 2015 TRG agenda paper, shows how the allocation of variable consideration might differ for a single performance obligation identified under the series requirement and a single performance obligation comprising non-distinct goods and/or services:⁵¹

Illustration 4-10: Allocation of variable consideration for a series versus a single performance obligation comprising non-distinct goods and/or services

Consider a five-year service contract that includes payment terms of a fixed annual fee plus a performance bonus upon completion of a milestone at the end of year two. If the entire service period is determined to be a single performance obligation comprising a series of distinct services, the entity might be able to conclude that the variable consideration (i.e., the bonus amount) is allocated directly to its efforts to perform the distinct services up to the date that the milestone is achieved (e.g., the underlying distinct services in years one and two). This could result in the entity recognising the entire bonus amount at the end of year two (when it is highly probable that a significant revenue reversal will not occur). See Question 4-10 below for several examples of services for which it would be reasonable to conclude that they meet the series requirement.

In contrast, if the entity determines that the entire service period is a single performance obligation that is comprised of non-distinct services, the bonus would be included in the transaction price (subject to the constraint on variable consideration see section 5.2.3 below) and recognised based on the measure of progress determined for the entire service period. For example, assume the bonus becomes part of the transaction price at the end of year two (when it is highly probable that a significant revenue reversal will not occur). In that case, a portion of the bonus would be recognised at that the end of year two based on performance completed to date and a portion would be recognised as the remainder of the performance obligation is satisfied. As a result, the bonus amount would be recognised as revenue through to the end of the five-year service period.

How we see it

We believe that entities might need to apply significant judgement when determining whether a promised good or service in a contract with a customer meets the criteria to be accounted for as a series of distinct goods or services. As illustrated in Question 4-10 below, promised goods or services that meet the series criteria are not limited to a particular industry and can encompass a wide array of promised goods or services.

⁵⁰ TRG Agenda paper no. 39, *Application of the Series Provision and Allocation of Variable Consideration*, dated 13 July 2015.

⁵¹ TRG Agenda paper no. 27, *Series of Distinct Goods or Services*, dated 30 March 2015.

Frequently asked questions

Question 4-9: In order to apply the series requirement, must the goods or services be consecutively transferred?

(TRG meeting 30 March 2015 - Agenda paper no. 27)

The TRG members generally agreed that a series of distinct goods or services do not need to be consecutively transferred. That is, the series requirement must be applied even when there is a gap or an overlap in an entity's transfer of goods or services, provided that the criteria in IFRS 15.23 are met. The IASB TRG members also noted that entities might need to carefully consider whether the series requirement applies, depending on the length of the gap between an entity's transfer of goods or services.

Stakeholders had asked this question because the Basis for Conclusions uses the term 'consecutively' when it discusses the series requirement. [IFRS 15.BC113, IFRS 15.BC116]. However, the TRG agenda paper concluded that the Board's discussion was not meant to imply that the series requirement only applies to circumstances in which the entity provides the same good or service consecutively over a period of time. Consider the following Illustration based on the example from the TRG agenda paper:

Illustration 4-11: A series in which the goods or services are not consecutively transferred

An entity has a contract with a customer to provide a manufacturing service for the production of 24,000 units of a product over a two-year period. The units produced under the service arrangement are distinct, substantially the same and manufactured in accordance with the customer's specifications.

The entity determines that the service is satisfied over time (see section 7.1 below), meeting the over-time recognition criterion in IFRS 15.35(c), because the performance of the service does not create an asset with an alternative use to the entity (since the units are manufactured in accordance with the customer's specifications). Furthermore, if the contract were to be cancelled, the entity would have an enforceable right to payment for performance completed to date (cost plus a reasonable profit margin). Therefore, the criteria for the series requirement in IFRS 15.23 have been met.

The conclusion in the TRG agenda paper was not influenced by whether the entity would perform the service evenly over the two-year period (e.g., produce 1,000 units per month). That is, the entity could produce 2,000 units in some months and none in others, but this would not be a determining factor in concluding whether the contract met the criteria to be accounted for as a series.

Question 4-10: In order to apply the series requirement, does the accounting result need to be the same as if the underlying distinct goods or services were accounted for as separate performance obligations?

(TRG meeting 30 March 2015 - Agenda paper no. 27)

The TRG members generally agreed that the accounting result does not need to be the same. Furthermore, an entity is not required to prove that the result would be the same if instead the goods or services were accounted for as separate performance obligations.⁵²

Consider the following Illustration based on the example from the TRG agenda paper to illustrate this point:

Illustration 4-12: A series for which the accounting result would be different if not treated as a series

An entity contracts with a customer to perform a manufacturing service that results in the production of 10 widgets. The manufacturing service will be performed over a three-year period. The contract price is CU100 million and the stand-alone selling price for each widget is CU10 million.

Total expected costs are CU80 million. The service the entity will provide to the customer in producing each widget is substantially the same. However, the design is new, so the entity expects a decline in production costs over time. Production of the first five units is expected to cost CU9 million per widget. The costs to produce the other five widgets are expected to be CU7 million per widget.

For purposes of this example, the entity determines that each service that it will provide to produce one of the 10 widgets is distinct and meets the criteria to be satisfied over time, and that the same cost-based measure of progress would be used (i.e., the series requirement criteria in IFRS 15.23 are met). The following table demonstrates the difference in accounting between concluding that the series requirement applies and concluding that the contract is for 10 separate performance obligations:

⁵² TRG Agenda paper no. 34, March 2015 Meeting - Summary of Issues Discussed and Next Steps, dated 13 July 2015.

(in CU millions)	Total contract	Series requirement (one performance obligation)		10 separate performance obligations	
		Units 1-5	Units 6-10	Units 1-5	Units 6-10
Revenue	100	56	44	50	50
Cost	(80)	(45)	(35)	(45)	(35)
Margin	20	11	9	5	15

Although CU20 million in margin is recognised for the contract under both scenarios, there is a difference in the timing of revenue recognition (and margin) because more revenue is recognised in relation to the service to produce the first five widgets (and less in relation to its service to produce the final five widgets) when the series is accounted for as a single performance obligation using a single measure of progress towards complete satisfaction.

Also see Question 9-17 below on how the effect of learning curve costs are addressed in IFRS 15.

Question 4-11: In order to apply the series requirement, how does an entity consider whether a performance obligation consists of distinct goods or services that are 'substantially the same'? (TRG meeting 13 July 2015 - Agenda paper no. 39)

As discussed in section 4.2.2 above, the TRG members generally agreed that the TRG paper, which primarily focused on the application of the series requirement to service contracts, will help entities understand how to determine whether a performance obligation consists of distinct goods or services that are 'substantially the same' under IFRS 15.

The TRG agenda paper noted that, when making the evaluation of whether goods or services are distinct and substantially the same, an entity first needs to determine the nature of the entity's promise in providing services to the customer. That is, if the nature of the promise is to deliver a specified quantity of service (e.g., monthly payroll services over a defined contract period), the evaluation considers whether each specified quantity of the underlying service is distinct and substantially the same. In contrast, if the nature of the entity's promise is to stand ready or provide a single service for a period of time (i.e., because there is an unspecified quantity to be delivered), the evaluation would consider whether each time increment (e.g., hour, day), rather than the underlying activities, is distinct and substantially the same. The TRG agenda paper noted that the Board intended that a series could consist of either specified quantities of the underlying good or service delivered (e.g., each unit of a good) or distinct time increments (e.g., an hourly service), depending on the nature of the promise.

It is important to highlight that the underlying activities an entity performs to satisfy a performance obligation could vary significantly throughout a day and from day to day. However, the TRG agenda paper noted that this is not determinative in the assessment of whether a performance obligation consists of goods or services that are distinct and substantially the same. Consider an example where the nature of the promise is to provide a daily hotel management service (i.e., an obligation to provide an unspecified quantity of a service for 20 years). Therefore, the entity evaluates whether each time increment is distinct and substantially the same. The hotel management service comprises various activities that might vary each day (e.g., cleaning services, reservation services, property maintenance). However, the entity determines that the daily hotel management services are substantially the same because the nature of the entity's promise is the same each day and the entity is providing the same overall management service each day. Furthermore, each day of service is distinct because the management services provided on any day during the 20-year contract period are not dependent on, or interrelated with, the management services provided on any other day during the period.

The TRG agenda paper included several examples of promised goods or services that might meet the series requirement and the analysis that supports that conclusion. The evaluation of the nature of the promise for each example is consistent with Example 13 of IFRS 15 (included in section 7.1.1 below), [IFRS 15.IE Example 13, IFRS 15.IE67-IE68], on monthly payroll processing.

Below we have summarised some of the examples and analysis in the TRG agenda paper.

Illustration 4-13: IT outsourcing - series provision is met

A vendor and customer execute a 10-year IT outsourcing arrangement in which the vendor continuously delivers the outsourced activities over the contract term (e.g., it provides server capacity, manages the customer's software portfolio, runs an IT help desk). The total monthly invoice is calculated based on different units consumed for the respective activities. The vendor concludes that the customer simultaneously receives and consumes the benefits provided by its services as it performs (meeting the over-time recognition criterion in IFRS 15.35(a)).

The vendor first considers the nature of its promise to the customer. Because the vendor has promised to provide an unspecified quantity of activities, rather than a defined number of services, the TRG agenda paper noted that the vendor could reasonably conclude that the nature of the promise is an obligation to stand ready to provide the integrated outsourcing service each day. If the nature of the promise is the overall IT outsourcing service, each day of service could be considered distinct because the customer can benefit from each day of service on its own and each day is separately identifiable. The TRG agenda paper also noted that the vendor could reasonably conclude that each day of service is substantially the same. That is, even if the individual activities that comprise the performance obligation vary from day to day, the nature of the overall promise is the same from day to day. Accordingly, it would be reasonable for an entity to conclude that this contract meets the series requirement.

Illustration 4-14: Transaction processing - series provision is met

A vendor enters into a 10-year contract with a customer to provide continuous access to its system and to process all transactions on behalf of the customer. The customer is obliged to use the vendor's system, but the ultimate quantity of transactions is unknown. The vendor concludes that the customer simultaneously receives and consumes the benefits as it performs (meeting the over-time recognition criterion in IFRS 15.35(a)).

If the vendor concludes that the nature of its promise is to provide continuous access to its system, rather than process a particular quantity of transactions, it might conclude that there is a single performance obligation to stand ready to process as many transactions as the customer requires. If that is the case, the TRG agenda paper noted that it would be reasonable to conclude that there are multiple distinct time increments of the service. Each day of access to the service provided to the customer could be considered substantially the same since the customer is deriving a consistent benefit from the access each day, even if a different number of transactions are processed each day.

If the vendor concludes that the nature of the promise is the processing of each transaction (i.e., a specified quantity of transactions), the TRG agenda paper noted that each transaction processed could be considered substantially the same even if there are multiple types of transactions that generate different payments. Furthermore, the TRG agenda paper noted that each transaction processed could be a distinct service because the customer could benefit from each transaction on its own and each transaction could be separately identifiable. Accordingly, it would be reasonable for an entity to conclude that this contract meets the series requirement.

Illustration 4-15: Hotel management - series provision is met

A hotel manager (HM) enters into a 20-year contract to manage properties on behalf of a customer. HM receives monthly consideration of 1% of the monthly rental revenue, as well as reimbursement of labour costs incurred to perform the service and an annual incentive payment. HM concludes that the customer simultaneously receives and consumes the benefits of its services as it performs (meeting the over-time recognition criterion in IFRS 15.35(a)).

HM considers the nature of its promise to the customer. If the nature of its promise is the overall management service (because the underlying activities are not distinct from each other), the TRG agenda paper noted that each day of service could be considered distinct because the customer can benefit from each day of service on its own and each day of service is separately identifiable.

Assuming the nature of the promise is the overall management service (i.e., an unspecified quantity of service), the TRG agenda paper noted that the service performed each day could be considered distinct and substantially the same. This is because, even if the individual activities that comprise the performance obligation vary significantly throughout the day and from day to day, the nature of the overall promise to provide the management service is the same from day to day. Accordingly, it would be reasonable for an entity to conclude that this contract meets the series requirement.

The following is another Illustration of promised goods and services that might meet the series requirement and the analysis that supports that conclusion:

Illustration 4-16: Determining whether promised goods and services represent a series - series provision is met

A SaaS provider enters into a three-year contract with Customer X to provide access to its SaaS basic customer relationship management (CRM) application for CU300,000. The contract also includes professional services that will personalise the user's interface based on the user's role. These services are sold separately from the CRM application and can be provided by third party vendors. The customer can benefit from the CRM application without the professional services, which do not significantly customise or modify the CRM application.

The SaaS provider determines that the CRM application and professional services are distinct (i.e., the CRM application and the professional services are not combined into a single performance obligation). The two services are each capable of being distinct because Customer X can benefit from them on their own. The services are distinct within the context of the contract because there is no significant integration service, they are not highly interdependent or interrelated and each service does not significantly modify or customise the other.

The SaaS provider first determines that the nature of the CRM application promise is to provide continuous access to its CRM application for the three-year period (i.e., an unspecified quantity of service). Although the activities that Customer X might be able to perform via the CRM application might vary from day to day, the overall promise is to provide continuous access to the CRM application to Customer X for a period of three years.

The SaaS provider determines that access to the CRM application represents a series of distinct services that are substantially the same and have the same pattern of transfer to Customer X. Each day of service is capable of being distinct because Customer X benefits each day from access to the CRM application. Each day is distinct within the context of the contract because there are no significant integration services, each day does not modify or customise another day and each day is not highly interdependent or interrelated. Each day of service is substantially the same because Customer X derives a consistent benefit from the access to the CRM application and has the same pattern of transfer over the term of the contract. Each distinct service represents a performance obligation that is satisfied over time and has the same measure of progress (e.g., time-elapsed). Therefore, the criteria to account for access to the CRM application as a series of distinct services (i.e., a single performance obligation) are met.

The SaaS provider also considers whether the professional services meet the criteria to be accounted for as a series. As part of this assessment, the entity considers whether each day of the professional services is distinct from the other days or whether the nature of the promise for the professional services is for a combined output from all of the days. The entity also considers the complexity of the professional services and whether the activity of each day builds on one another or if each day is substantially the same. This analysis requires judgement and is based on the facts and circumstances of the professional services performed.

Question 4-12: Can an entity choose whether to apply the series requirement?

If a series of distinct goods or services meets the criteria in IFRS 15.22(b) and 23, an entity is required to treat that series as a single performance obligation (i.e., it is not an optional requirement).

[IFRS 15.22(b), IFRS 15.23].

Question 4-13: Do all stand-ready obligations meet the criteria to be accounted for as a series?

How we see it

We generally believe that stand-ready obligations (i.e., when the nature of the entity's promise is to provide an unspecified quantity of a service over time) will meet the criteria and, therefore, need to be accounted for as a series of distinct goods or services.

As discussed in Questions 4-2 and 4-3 in section 4.1.1 above, entities might need to apply judgement to determine whether the nature of a promise to a customer is the service of standing ready to provide goods or services (i.e., a stand-ready obligation) or the delivery of the underlying goods or services (i.e., not a stand-ready obligation).

4.2.3 Examples of identifying performance obligations

The standard includes several examples that illustrate the application of the requirements for identifying performance obligations. The examples explain the judgements made to determine whether the promises to transfer goods or services are capable of being distinct and distinct within the context of the contract. We have extracted these examples in full below.

The following example illustrates contracts with promised goods or services that, while capable of being distinct, are not distinct within the context of the contract because of a significant integration service that combines the inputs (the underlying goods or services) into a combined output: [IFRS 15.IE Example 10, IFRS 15.IE45-IE48C]

Extract from IFRS 15

Example 10-Goods and services are not distinct

Case A-Significant integration service

An entity, a contractor, enters into a contract to build a hospital for a customer. The entity is responsible for the overall management of the project and identifies various promised goods and services, including engineering, site clearance, foundation, procurement, construction of the structure, piping and wiring, installation of equipment and finishing.

The promised goods and services are capable of being distinct in accordance with paragraph 27(a) of IFRS 15. That is, the customer can benefit from the goods and services either on their own or together with other readily available resources. This is evidenced by the fact that the entity, or competitors of the entity, regularly sells many of these goods and services separately to other customers. In addition, the customer could generate economic benefit from the individual goods and services by using, consuming, selling or holding those goods or services.

However, the promises to transfer the goods and services are not separately identifiable in accordance with paragraph 27(b) of IFRS 15 (on the basis of the factors in paragraph 29 of IFRS 15). This is evidenced by the fact that the entity provides a significant service of integrating the goods and services (the inputs) into the hospital (the combined output) for which the customer has contracted.

Because both criteria in paragraph 27 of IFRS 15 are not met, the goods and services are not distinct. The entity accounts for all of the goods and services in the contract as a single performance obligation.

Case B-Significant integration service

An entity enters into a contract with a customer that will result in the delivery of multiple units of a highly complex, specialised device. The terms of the contract require the entity to establish a manufacturing process in order to produce the contracted units. The specifications are unique to the customer, based on a custom design that is owned by the customer and that were developed under the terms of a separate contract that is not part of the current negotiated exchange. The entity is responsible for the overall management of the contract, which requires the performance and integration of various activities including procurement of materials, identifying and managing subcontractors, and performing manufacturing, assembly and testing.

The entity assesses the promises in the contract and determines that each of the promised devices is capable of being distinct in accordance with paragraph 27(a) of IFRS 15 because the customer can benefit from each device on its own. This is because each unit can function independently of the other units.

The entity observes that the nature of its promise is to establish and provide a service of producing the full complement of devices for which the customer has contracted in accordance with the customer's specifications. The entity considers that it is responsible for overall management of the contract and for providing a significant service of integrating various goods and services (the inputs) into its overall service and the resulting devices (the combined output) and, therefore, the devices and the various promised goods and services inherent in producing those devices are not separately identifiable in accordance with paragraph 27(b) and paragraph 29 of IFRS 15. In this case, the manufacturing process provided by the entity is specific to its contract with the customer. In addition, the nature of the entity's performance and, in particular, the significant integration service of the various activities means that a change in one of the entity's activities to produce the devices has a significant effect on the other activities required to produce the highly complex, specialised devices such that the entity's activities are highly interdependent and highly interrelated. Because the criterion in paragraph 27(b) of IFRS 15 is not met, the goods and services that will be provided by the entity are not separately identifiable and, therefore, are not distinct. The entity accounts for all of the goods and services promised in the contract as a single performance obligation.

The determination of whether a 'significant integration service' exists within a contract, as illustrated in Case A and Case B above, requires significant judgement and is heavily dependent on the unique facts and circumstances for each individual contract with a customer.

The following example illustrates how the significance of installation services can affect an entity's conclusion about the number of identified performance obligations for similar fact patterns. In Case A, each of the promised goods and services are determined to be distinct. In Case B, two of the promised goods and services are combined into a single performance obligation because one promise (the installation) significantly customises another promise (the software). [IFRS 15.IE Example 11 Case A-Case B, IFRS 15.IE49-IE58].

Extract from IFRS 15

Example 11-Determining whether goods or services are distinct

Case A-Distinct goods or services

An entity, a software developer, enters into a contract with a customer to transfer a software licence, perform an installation service and provide unspecified software updates and technical support (online and telephone) for a two-year period. The entity sells the licence, installation service and technical support separately. The installation service includes changing the web screen for each type of user (for example, marketing, inventory management and information technology). The installation service is routinely performed by other entities and does not significantly modify the software. The software remains functional without the updates and the technical support.

The entity assesses the goods and services promised to the customer to determine which goods and services are distinct in accordance with paragraph 27 of IFRS 15. The entity observes that the software is delivered before the other goods and services and remains functional without the updates and the technical support. The customer can benefit from the updates together with the software licence transferred at the start of the contract. Thus, the entity concludes that the customer can benefit from each of the goods and services either on their own or together with the other goods and services that are readily available and the criterion in paragraph 27(a) of IFRS 15 is met.

The entity also considers the principle and the factors in paragraph 29 of IFRS 15 and determines that the promise to transfer each good and service to the customer is separately identifiable from each of the other promises (thus the criterion in paragraph 27(b) of IFRS 15 is met). In reaching this determination, the entity considers that, although it integrates the software into the customer's system, the installation services do not significantly affect the customer's ability to use and benefit from the software licence because the installation services are routine and can be obtained from alternative providers. The software updates do not significantly affect the customer's ability to use and benefit from the software licence during the licence period. The entity further observes that none of the promised goods or services significantly modify or customise one another, nor is the entity providing a significant service of integrating the software and the services into a combined output. Lastly, the entity concludes that the software and the services do not significantly affect each other and, therefore, are not highly interdependent or highly interrelated, because the entity would be able to fulfil its promise to transfer the initial software licence independently from its promise to subsequently provide the installation service, software updates or technical support.

On the basis of this assessment, the entity identifies four performance obligations in the contract for the following goods or services:

- (a) the software licence;
- (b) an installation service;
- (c) software updates; and
- (d) technical support.

The entity applies paragraphs 31-38 of IFRS 15 to determine whether each of the performance obligations for the installation service, software updates and technical support are satisfied at a point in time or over time. The entity also assesses the nature of the entity's promise to transfer the software licence in accordance with paragraph B58 of IFRS 15 (see Example 54 in paragraphs IE276-IE277).

Case B-Significant customisation

The promised goods and services are the same as in Case A, except that the contract specifies that, as part of the installation service, the software is to be substantially customised to add significant new functionality to enable the software to interface with other customised software applications used by the customer. The customised installation service can be provided by other entities.

The entity assesses the goods and services promised to the customer to determine which goods and services are distinct in accordance with paragraph 27 of IFRS 15. The entity first assesses whether the criterion in paragraph 27(a) has been met. For the same reasons as in Case A, the entity determines that the software licence, installation, software updates and technical support each meet that criterion. The entity next assesses whether the criterion in paragraph 27(b) has been met by evaluating the principle

and the factors in paragraph 29 of IFRS 15. The entity observes that the terms of the contract result in a promise to provide a significant service of integrating the licenced software into the existing software system by performing a customised installation service as specified in the contract. In other words, the entity is using the licence and the customised installation service as inputs to produce the combined output (ie a functional and integrated software system) specified in the contract (see paragraph 29(a) of IFRS 15). The software is significantly modified and customised by the service (see paragraph 29(b) of IFRS 15). Consequently, the entity determines that the promise to transfer the licence is not separately identifiable from the customised installation service and, therefore, the criterion in paragraph 27(b) of IFRS 15 is not met. Thus, the software licence and the customised installation service are not distinct.

On the basis of the same analysis as in Case A, the entity concludes that the software updates and technical support are distinct from the other promises in the contract.

On the basis of this assessment, the entity identifies three performance obligations in the contract for the following goods or services:

- (a) software customisation (which comprises the licence for the software and the customised installation service);
- (b) software updates; and
- (c) technical support.

The entity applies paragraphs 31-38 of IFRS 15 to determine whether each performance obligation is satisfied at a point in time or over time.

The following example illustrates contracts that include multiple promised goods or services, all of which are determined to be distinct. The examples highlight the importance of considering both the separately identifiable principle and the underlying factors in IFRS 15.29.

Case C illustrates a contract that includes the sale of equipment and installation services. The equipment can be operated without any customisation or modification. The installation is not complex and can be performed by other entities. The entity determines that the two promises in the contract are distinct.

Case D illustrates that certain types of contractual restrictions, including those that require a customer to only use the entity's services, would not affect the evaluation of whether a promised good or service is distinct.

Case E illustrates a contract that includes the sale of equipment and specialised consumables to be used with the equipment. Even though the consumables can only be produced by the entity, they are sold separately. The entity determines that the two promises in the contract are distinct and the example walks through the analysis for determining whether the promises are capable of being distinct and distinct in the context of the contract. As part of this analysis, the entity concludes that the equipment and consumables are not highly interrelated nor highly interdependent because the two promises do not significantly affect each other. That is, the entity would be able to fulfil each of its promises in the contract independently of the other promises. [IFRS 15.IE Example 11 Case C-Case E, IFRS 15.IE58A-IE58K].

Extract from IFRS 15

Example 11-Determining whether goods or services are distinct

...

Case C-Promises are separately identifiable (installation)

An entity contracts with a customer to sell a piece of equipment and installation services. The equipment is operational without any customisation or modification. The installation required is not complex and is capable of being performed by several alternative service providers.

The entity identifies two promised goods and services in the contract: (a) equipment and (b) installation. The entity assesses the criteria in paragraph 27 of IFRS 15 to determine whether each promised good or service is distinct. The entity determines that the equipment and the installation each meet the criterion in paragraph 27(a) of IFRS 15. The customer can benefit from the equipment on its own, by using it or reselling it for an amount greater than scrap value, or together with other readily available resources (for example, installation services available from alternative providers). The customer also can benefit from the installation services together with other resources that the customer will already have obtained from the entity (ie the equipment).

The entity further determines that its promises to transfer the equipment and to provide the installation services are each separately identifiable (in accordance with paragraph 27(b) of IFRS 15). The entity considers the principle and the factors in paragraph 29 of IFRS 15 in determining that the equipment and the installation services are not inputs to a combined item in this contract. In this case, each of the

factors in paragraph 29 of IFRS 15 contributes to, but is not individually determinative of, the conclusion that the equipment and the installation services are separately identifiable as follows:

- (a) The entity is not providing a significant integration service. That is, the entity has promised to deliver the equipment and then install it; the entity would be able to fulfil its promise to transfer the equipment separately from its promise to subsequently install it. The entity has not promised to combine the equipment and the installation services in a way that would transform them into a combined output.
- (b) The entity's installation services will not significantly customise or significantly modify the equipment.
- (c) Although the customer can benefit from the installation services only after it has obtained control of the equipment, the installation services do not significantly affect the equipment because the entity would be able to fulfil its promise to transfer the equipment independently of its promise to provide the installation services. Because the equipment and the installation services do not each significantly affect the other, they are not highly interdependent or highly interrelated.

On the basis of this assessment, the entity identifies two performance obligations in the contract for the following goods or services:

- (i) the equipment; and
- (ii) installation services.

The entity applies paragraphs 31-38 of IFRS 15 to determine whether each performance obligation is satisfied at a point in time or over time.

Case D-Promises are separately identifiable (contractual restrictions)

Assume the same facts as in Case C, except that the customer is contractually required to use the entity's installation services.

The contractual requirement to use the entity's installation services does not change the evaluation of whether the promised goods and services are distinct in this case. This is because the contractual requirement to use the entity's installation services does not change the characteristics of the goods or services themselves, nor does it change the entity's promises to the customer. Although the customer is required to use the entity's installation services, the equipment and the installation services are capable of being distinct (ie they each meet the criterion in paragraph 27(a) of IFRS 15) and the entity's promises to provide the equipment and to provide the installation services are each separately identifiable, ie they each meet the criterion in paragraph 27(b) of IFRS 15. The entity's analysis in this regard is consistent with that in Case C.

Case E-Promises are separately identifiable (consumables)

An entity enters into a contract with a customer to provide a piece of off-the-shelf equipment (ie the equipment is operational without any significant customisation or modification) and to provide specialised consumables for use in the equipment at predetermined intervals over the next three years. The consumables are produced only by the entity, but are sold separately by the entity.

The entity determines that the customer can benefit from the equipment together with the readily available consumables. The consumables are readily available in accordance with paragraph 28 of IFRS 15, because they are regularly sold separately by the entity (ie through refill orders to customers that previously purchased the equipment). The customer can benefit from the consumables that will be delivered under the contract together with the delivered equipment that is transferred to the customer initially under the contract. Therefore, the equipment and the consumables are each capable of being distinct in accordance with paragraph 27(a) of IFRS 15.

The entity determines that its promises to transfer the equipment and to provide consumables over a three-year period are each separately identifiable in accordance with paragraph 27(b) of IFRS 15. In determining that the equipment and the consumables are not inputs to a combined item in this contract, the entity considers that it is not providing a significant integration service that transforms the equipment and consumables into a combined output. In addition, neither the equipment nor the consumables are significantly customised or modified by the other. Lastly, the entity concludes that the equipment and the consumables are not highly interdependent or highly interrelated because they do not significantly affect each other. Although the customer can benefit from the consumables in this contract only after it has obtained control of the equipment (ie the consumables would have no use without the equipment) and the consumables are required for the equipment to function, the equipment and the consumables do not each significantly affect the other. This is because the entity would be able to fulfil each of its promises in the contract independently of the other. That is, the entity would be able to fulfil its promise to transfer the equipment even if the customer did not purchase any consumables and would be able to fulfil its promise to provide the consumables, even if the customer acquired the equipment separately.

On the basis of this assessment, the entity identifies two performance obligations in the contract for the following goods or services:

- (a) the equipment; and
- (b) the consumables.

The entity applies paragraphs 31-38 of IFRS 15 to determine whether each performance obligation is satisfied at a point in time or over time.

4.3 Promised goods or services that are not distinct

If a promised good or service does not meet the criteria to be considered distinct, an entity is required to combine that good or service with other promised goods or services until the entity identifies a bundle of goods or services that, together, is distinct. This could result in an entity combining a good or service that is not considered distinct with another good or service that, on its own, would meet the criteria to be considered distinct (see section 4.2.1 above). [IFRS 15.30].

The standard provides two examples (Example 10, Case A, and Example 10, Case B) of contracts with promised goods or services that, while capable of being distinct, are not distinct in the context of the contract because of a significant integration service that combines the inputs (the underlying goods or services) into a combined output. These examples are included in section 4.2.3 above. [IFRS 15.IE Example 10, IFRS 15.IE45-IE48C].

4.4 Principal versus agent considerations

When more than one party is involved in providing goods or services to a customer, the standard requires an entity to determine whether it is a principal or an agent in these transactions by evaluating the nature of its promise to the customer. For example, an entity that issues loyalty points to its customers that are redeemable for another entity's goods or services needs to assess whether it is a principal or an agent in relation to the redemption of the points.

An entity is a principal (and, therefore, records revenue on a gross basis) if it controls a promised good or service before transferring that good or service to the customer. [IFRS 15.B35]. An entity is an agent (and, therefore, records as revenue the net amount that it retains for its agency services) if its role is to arrange for another entity to provide the goods or services. [IFRS 15.B36].

The principal-agent evaluation could also affect the identification of the entity's customer and/or the determination of its performance obligation. The performance obligation of a principal is to provide a good or service to a customer. The performance obligation of an agent is to arrange for another party to provide a good or service to an end-consumer. In some cases, an agent might conclude that it has more than one customer (e.g., both the principal and the end consumer), depending on the roles and relationships within the arrangement.

In the Basis for Conclusions, the Board explained that for an entity to conclude that it is providing the good or service to the customer, it must first control that good or service. That is, the entity cannot provide the good or service to a customer if the entity does not first control it. If an entity controls the good or service, the entity is a principal in the transaction. If an entity does not control the good or service before it is transferred to the customer, the entity is an agent in the transaction. [IFRS 15.BC385D].

In the Basis for Conclusions, the Board noted that an entity that itself manufactures a good or performs a service is always a principal if it transfers control of that good or service to another party. There is no need for such an entity to evaluate the principal versus agent application guidance because it transfers control of or provides its own good or service directly to its customer without the involvement of another party. For example, if an entity transfers control of a good to an intermediary that is a principal in providing that good to an end-consumer, the entity records revenue as a principal in the sale of the good to its customer (the intermediary). [IFRS 15.BC385E].

An entity applies judgement in making its overall assessment of whether it is a principal or agent. Therefore, appropriate disclosures are important, in particular: (a) significant judgements in accordance with paragraph 122 of IAS 1; and (b) information required by IFRS 15, including information about its performance obligations and the judgements made in applying the standard that significantly affect the determination of the amount and timing of revenue recognised. The IFRS IC reiterated this point in its April 2022 meeting (see section 4.4.2 below for more on this IFRS IC discussion).⁵³

⁵³ [IFRIC Update](#), April 2022, available on the IFRS Foundation's website.

How we see it

Entities need to carefully evaluate whether they are acting as a principal or as an agent. As a reminder, the application guidance in IFRS 15 focuses on control of the specified goods or services as the overarching principle for entities to consider in determining whether they are acting as a principal or an agent. That is, an entity first evaluates whether it controls the specified good or service before reviewing the standard's principal indicators. As discussed above, appropriate disclosure in accordance with IAS 1 and IFRS 15 will be required.

As part of understanding the relationships between the parties involved in the transaction, it might be helpful to understand the flow of consideration between the parties. However, whether the entity receives consideration from one or more parties involved in the transaction on a gross or net basis is not determinative in the principal versus agent analysis.

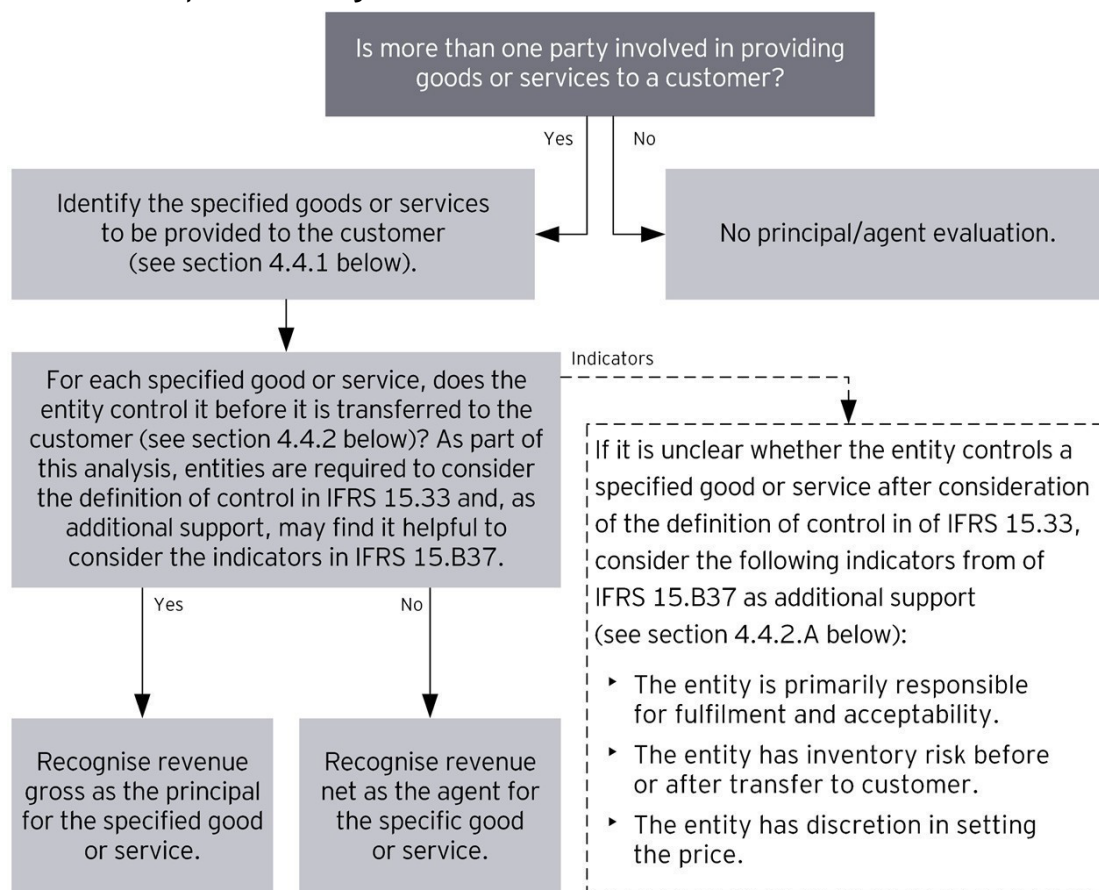

IFRS 15 states the overall principle for the principal versus agent evaluation, as follows: [IFRS 15.B34, IFRS 15.B34A, IFRS 15.B35]

Extract from IFRS 15

- B34** When another party is involved in providing goods or services to a customer, the entity shall determine whether the nature of its promise is a performance obligation to provide the specified goods or services itself (ie the entity is a principal) or to arrange for those goods or services to be provided by the other party (ie the entity is an agent). An entity determines whether it is a principal or an agent for each specified good or service promised to the customer. A specified good or service is a distinct good or service (or a distinct bundle of goods or services) to be provided to the customer (see paragraphs 27-30). If a contract with a customer includes more than one specified good or service, an entity could be a principal for some specified goods or services and an agent for others.
- B34A** To determine the nature of its promise (as described in paragraph B34), the entity shall:
- (a) identify the specified goods or services to be provided to the customer (which, for example, could be a right to a good or service to be provided by another party (see paragraph 26)); and
 - (b) assess whether it controls (as described in paragraph 33) each specified good or service before that good or service is transferred to the customer.
- B35** An entity is a principal if it controls the specified good or service before that good or service is transferred to a customer. However, an entity does not necessarily control a specified good if the entity obtains legal title to that good only momentarily before legal title is transferred to a customer. An entity that is a principal may satisfy its performance obligation to provide the specified good or service itself or it may engage another party (for example, a subcontractor) to satisfy some or all of the performance obligation on its behalf.

The following flow chart illustrates the process for performing a principal versus agent evaluation:

Figure 4-6: Principal versus agent evaluation

How we see it

The principal versus agent application guidance applies regardless of the type of transaction under evaluation or the industry in which the entity operates. Entities that: (a) do not stock inventory and might employ independent warehouses or fulfilment houses to drop-ship merchandise to customers on their behalf; or (b) offer services to be provided by an independent service provider (e.g., travel agents, magazine subscription brokers and retailers that sell goods through catalogues or that sell goods on consignment) might need to apply significant judgement when applying this application guidance.

Frequently asked questions

Question 4-14: Can an entity make an accounting policy choice to report revenue from contracts with customers on a gross or net basis?

The principal versus agent assessment is not something about which an entity can make a policy choice. Entities must carefully consider the facts and circumstances of each contract to determine the appropriate accounting.

4.4.1 Identifying the specified good or service

In accordance with IFRS 15.B34A, an entity must first identify the specified good or service (or unit of account for the principal versus agent evaluation) to be provided to the customer in order to determine the nature of its promise (i.e., whether it is to provide the specified goods or services to its customer as a principal or to arrange for those goods or services to be provided to an end-consumer by another party as an agent). [IFRS 15.B34A]. A specified good or service is defined as “a distinct good or service (or a distinct bundle of goods or services) to be provided to the customer”. [IFRS 15.B34]. That is, specified goods or services are the distinct goods or services (or a distinct bundle of goods or services) identified using the requirements in IFRS 15.27-29 (see section 4.2 above) that are transferred to the end-consumer. Because the specified goods or services are determined from the perspective of the end-consumer, they will not always be the same as the entity’s performance obligation - particularly when the entity is an agent, as discussed below.

The IASB noted in the Basis for Conclusions that, while the definition of specified goods or services is similar to that of a performance obligation, it created this new term because using 'performance obligation' would have been confusing in agency relationships. [IFRS 15.BC385B]. That is, because an agent's performance obligation is to arrange for goods or services to be provided by another party, providing the specified goods or services to the end-consumer is not the agent's performance obligation. For example, consider Example 45 in the standard, in which an entity operates a website that enables users to purchase goods from a range of suppliers who then deliver the goods directly to the users. In this example, the entity concludes that the specified goods to be provided to the users of the website (i.e., the end-consumer) are the goods provided by the suppliers, and no other goods or services are promised to the end-consumer by the entity. The entity further concludes that it does not control the specified goods before they are transferred to the end-consumer, and it is an agent in the transaction. Therefore, its performance obligation is to arrange for the provision of goods to the end-consumer by the supplier (i.e., not the provision of the specified goods themselves).

A specified good or service might be a distinct good or service or a distinct bundle of goods or services. In the Basis for Conclusions, the Board noted that if individual goods or services are not distinct from one another, they might be inputs to a combined item and each good or service might represent only a part of a single promise to the customer. For example, in a contract in which goods or services provided by another party are inputs to a combined item (or items), the entity would assess whether it controls the combined item (or items) before that item (or items) is transferred to the customer. [IFRS 15.BC385Q]. If yes, in determining whether it is a principal or an agent, an entity evaluates that single promise to the customer, rather than the individual inputs that make up that promise. However, in order to conclude that it controls the combined item(s), IFRS 15.B35A(c) (further discussed in section 4.4.2 below) notes that it is likely an entity will need to conclude it performs a significant service of integrating the individual goods or services because it also controls the underlying inputs before integration.

Appropriately identifying the specified good or service to be provided is a critical step in determining whether an entity is a principal or an agent in a transaction. In many situations, especially those involving tangible goods, identifying the specified good or service is relatively straightforward. For example, if an entity is reselling laptop computers, the specified good that is transferred to the end-consumer is a laptop computer.

However, the assessment might require significant judgement in other situations, such as those involving intangible goods or services. In accordance with IFRS 15.B34A(a), the specified good or service might be the underlying good or service the end-consumer ultimately wants to obtain (e.g., a flight, a meal) or a right to obtain that good or service (e.g., in the form of a ticket or voucher). In the Basis for Conclusions, the Board noted that when the specified good or service is a right to a good or service that will be provided by another party, the entity would determine whether its performance obligation is a promise to provide that right (and it is, therefore, a principal) or whether it is arranging for the other party to provide that right (and it is, therefore, an agent). The fact that the entity does not provide the underlying goods or services itself is not determinative. [IFRS 15.BC385Q]. As well as considering the goods or services explicitly promised in the contract, an entity also needs to consider any implicit promises (see section 4.1 above and Illustration 4-18 in section 4.4.2 below for further discussion), which might require judgement. [IFRS 15.24].

The Board acknowledged that it might be difficult in some cases to determine whether the specified good or service is the underlying good or service or a right to obtain that good or service. Therefore, it provided examples in the standard. Example 47 (included in section 4.4.4 below) involves an airline ticket reseller. In this example, the entity pre-purchases airline tickets that it will later sell to customers. While the customer ultimately wants airline travel, the conclusion in Example 47 is that the specified good or service is the right to fly on a specified flight (in the form of a ticket) and not the underlying flight itself. The entity itself does not fly the plane and it cannot change the service (e.g., change the flight time or destination). However, the entity obtained the ticket prior to identifying a specific customer to purchase the ticket. As a result, the entity holds an asset (in the form of a ticket) that represents a right to fly. The entity could, therefore, transfer that right to a customer (as depicted in the example) or decide to use the right itself. [IFRS 15.IE Example 47, IFRS 15.IE239-IE243].

Example 46A (included in section 4.4.4 below) involves an office maintenance service provider. In this example, the entity concludes that the specified good or service is the underlying office maintenance service (rather than a right to that service). While the entity obtained the contract with the customer prior to engaging a third party to perform the requested services, the right to the subcontractor's services never transfers to the customer. Instead, the entity retains the right to direct the service provider. That is, the entity can direct the right to use the subcontractor's services as it chooses (e.g., to fulfil the customer contract, to fulfil another customer contract, to service its own facilities). Furthermore, the customer in Example 46A is indifferent as to who carries out the office maintenance services. [IFRS 15.IE Example 46A, IFRS 15.IE238A-IE238G]. This is not the case in Example 47, in which the customer wants the ticket reseller to sell one of its tickets on a specific flight.

If a contract with a customer includes more than one specified good or service, IFRS 15 clarifies that an entity might be a principal for some specified goods or services and an agent for others. [IFRS 15.B34]. Example 48A in IFRS 15 provides an illustration of this. [IFRS 15.IE Example 48A, IFRS 15.IE248A-IE248F]. Also consider the following Illustration:

Illustration 4-17: Entity is both a principal and an agent

A software reseller sells software licences bundled with post-contract support (PCS) and other IT solutions to end-users. The reseller has entered into contracts with several software manufacturers that provide the reseller with the right to sell licences to the software with PCS to end-users during non-cancellable periods of time in exchange for fixed fees per licence sold. The reseller can set the prices it charges end-users, but is contractually required to pay the software manufacturer the fixed fee, regardless of the price paid by end-users. The software reseller does not have a commitment to make a minimum number of purchases from the software manufacturer and does not make purchases in advance.

The software reseller is responsible for identifying which software will address the customer's needs (including the feasibility of integrating it with the customer's existing technology environment), ordering the software from the manufacturer, assisting customers if they encounter issues downloading the software (all software is provided electronically) and with other basic technical support. The software reseller is also responsible for providing refunds or remedies to the customer if the software product is not suitable for the customer's needs. The software manufacturer provides higher levels of technical support and provides PCS directly to the customer.

As part of its principal-versus-agent evaluation for these contracts, the software reseller determines that the software licence and PCS are separate specified goods or services.

When assessing control for the software licence, the reseller concludes that it controls the software licence before the licence is provided to the end-user. This is because the reseller has the right to direct the software manufacturer to provide the software to the end-user on the reseller's behalf, including the right to redirect the software to another end user (consistent with the requirements in IFRS 15.B35A(b), which are discussed in section 4.4.2 below). As part of this assessment, the software reseller also considers the three indicators of control in the standard and makes the following determinations that support its overall control evaluation:

- The software reseller is responsible for fulfilling the promise to the customer and the entity takes responsibility for much of the purchasing process, as described above.
- There is no inventory risk associated with the software provided electronically.
- The software reseller has discretion to establish prices.

Conversely, the reseller concludes that it does not control the PCS before it is provided to the end-user because the software manufacturer creates the updates that it delivers electronically to end-users of the software directly through the internet and all but the most basic level of technical support will be provided by the software manufacturer. As part of this assessment, the software reseller also considers the three indicators of control in the standard and makes the following determinations that support its overall control evaluation:

- The software manufacturer is responsible for fulfilling the promise to the customer because, in this example, it provides the updates directly to the end-users.
- There is no inventory risk associated with the PCS provided electronically.
- The software reseller has discretion to establish prices.

The software reseller believes that the first of the indicators is the most relevant to consider in this assessment and that it supports its overall control assessment. Therefore, the software reseller concludes that it is the principal for the software licence, but is an agent for the PCS, because it does not control the PCS before it is transferred to the end-user.

How we see it

Appropriately identifying the specified good or service to be provided to the end-consumer is a critical step in identifying whether the nature of an entity's promise is to act as a principal or an agent. Entities need to carefully examine their contract terms and might need to apply significant judgement to determine whether the specified good or service is the underlying good or service or a right to obtain that good or service.

4.4.2 Control of the specified good or service

In accordance with IFRS 15.B34A, the second step in determining the nature of the entity's promise (i.e., whether it is to provide the specified goods or services or to arrange for those goods or services to be provided by another party) is for the entity to determine whether the entity controls the specified good or service before it is transferred to the customer. An entity cannot provide the specified good or service to a customer (and, therefore, be a principal) unless it controls that good or service prior to its transfer. That is, as the Board noted in the Basis for Conclusions, control is the determining factor when assessing whether an entity is a principal or an agent. [IFRS 15.BC385S].

In assessing whether an entity controls the specified good or service prior to transfer to the customer, IFRS 15.B34A(b) requires the entity to consider the definition of control that is included in Step 5 of the model, in accordance with IFRS 15.33 (discussed further in section 7 below). [IFRS 15.B34A(b), IFRS 15.33].

Extract from IFRS 15

- 33 Goods and services are assets, even if only momentarily, when they are received and used (as in the case of many services). Control of an asset refers to the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. Control includes the ability to prevent other entities from directing the use of, and obtaining the benefits from, an asset. The benefits of an asset are the potential cash flows (inflows or savings in outflows) that can be obtained directly or indirectly in many ways, such as by:
- (a) using the asset to produce goods or provide services (including public services);
 - (b) using the asset to enhance the value of other assets;
 - (c) using the asset to settle liabilities or reduce expenses;
 - (d) selling or exchanging the asset;
 - (e) pledging the asset to secure a loan; and
 - (f) holding the asset.

How we see it

When evaluating the definition of control in IFRS 15.33, we believe it could be helpful for entities to consider the indicators in IFRS 15.38 (see section 7.2 below) that the IASB included to help determine the point in time when a customer obtains control of a particular good or service (e.g., legal title, physical possession, risks and rewards of ownership).

If, after evaluating the requirement in IFRS 15.33, an entity concludes that it controls the specified good or service before it is transferred to the customer, the entity is a principal in the transaction. If the entity does not control that good or service before transfer to the customer, it is an agent.

The control principle is often easier to apply to tangible goods than to intangible goods or services because intangible goods or services generally exist only at the moment they are delivered. Therefore, the standard includes application guidance on how the control principle applies to certain types of arrangements (including service transactions) by explaining what a principal controls before the specified good or service is transferred to the customer: [IFRS 15.B35A]

Extract from IFRS 15

- B35A When another party is involved in providing goods or services to a customer, an entity that is a principal obtains control of any one of the following:
- (a) a good or another asset from the other party that it then transfers to the customer.
 - (b) a right to a service to be performed by the other party, which gives the entity the ability to direct that party to provide the service to the customer on the entity's behalf.
 - (c) a good or service from the other party that it then combines with other goods or services in providing the specified good or service to the customer. For example, if an entity provides a significant service of integrating goods or services (see paragraph 29(a)) provided by another party into the specified good or service for which the customer has contracted, the entity controls the specified good or service before that good or service is transferred to the customer. This is because the entity first obtains control of the inputs to the specified good or service (which includes goods or services from other parties) and directs their use to create the combined output that is the specified good or service.

In the Basis for Conclusions, the Board observed that an entity can control a service to be provided by another party when it controls the right to the specified service that will be provided to the customer. [IFRS 15.BC385U]. Generally, the entity then either transfers the right (in the form of an asset, such as a ticket) to its customer, in accordance with IFRS 15.B35A(a) (as in Example 47 involving the airline ticket reseller discussed in section 4.4.1 above) or uses its right to direct the other party to provide the specified service to the customer on the entity's behalf, in accordance with IFRS 15.B35A(b) (as in Example 46A involving the office maintenance services discussed in section 4.4.1 above).

The condition described in IFRS 15.B35A(a) includes contracts in which an entity transfers to the customer a right to a future service to be provided by another party. If the specified good or service is a right to a good or service to be provided by another party, the entity evaluates whether it controls the right to the goods or services before that right is transferred to the customer (rather than whether it controls the underlying goods or services). In the Basis for Conclusions, the Board noted that, in assessing such rights, it is often relevant to assess whether the right is created only when it is obtained by the customer or whether the right exists before the customer obtains it. If the right does not exist before the customer obtains it, an entity would not be able to control right before it is transferred to the customer. [IFRS 15.BC385O].

The standard includes two examples to illustrate this point. In Example 47 (discussed above in section 4.4.1 above and included in section 4.4.4 below), which involves an airline ticket reseller, the specified good or service is determined to be the right to fly on a specified flight (in the form of a ticket). One of the determining factors for the principal-agent evaluation in this example is that the entity pre-purchases the airline tickets before a specific customer is identified. Accordingly, the right existed prior to a customer obtaining it. The example concludes that the entity controls the right before it is transferred to the customer (and is, therefore, a principal). [IFRS 15.IE Example 47, IFRS 15.IE239-IE243].

In Example 48 (included in section 4.4.4 below), an entity sells vouchers that entitle customers to future meals at specified restaurants selected by the customer. The specified good or service is determined to be the right to a meal (in the form of a voucher). One of the determining factors for the principal-agent evaluation is that the entity does not control the voucher (the right to a meal) at any time. It does not pre-purchase or commit itself to purchase the vouchers from the restaurants before they are sold to a customer. Instead, the entity waits to purchase the voucher until a customer requests a voucher for a particular restaurant. In addition, vouchers are created only at the time that they are transferred to a customer and do not exist before that transfer. Accordingly, the right does not exist before the customer obtains it. Therefore, the entity does not at any time have the ability to direct the use of the vouchers or obtain substantially all of the remaining benefits from the vouchers before they are transferred to customers. The example concludes that the entity does not control the right before it is transferred to the customer (and is, therefore, an agent). [IFRS 15.IE Example 48, IFRS 15.IE244-IE248].

In the Basis for Conclusions, the IASB acknowledged that determining whether an entity is a principal or an agent may be more difficult when evaluating whether a contract falls under IFRS 15.B35A(b) (i.e., when a right to a service exists). That is, it might be difficult to determine whether an entity has the ability to direct another party to provide the service on its behalf (and is, therefore, a principal) or is only arranging for the other party to provide the service (and is, therefore, an agent). As depicted in Example 46A (as discussed in section 4.4.1 above and included in section 4.4.4 below), an entity could control the right to the specified service and be a principal by entering into a contract with the subcontractor in which the entity defines the scope of service to be performed by the subcontractor on its behalf. This situation is equivalent to the entity fulfilling the contract using its own resources. Furthermore, the entity remains responsible for the satisfactory provision of the specified service in accordance with the contract with the customer. In contrast, when the specified service is provided by another party and the entity does not have the ability to direct those services, the entity typically is an agent because the entity is facilitating, rather than controlling the rights to, the service. [IFRS 15.BC385V, IFRS 15.IE Example 46A, IFRS 15.IE238A-IE238G].

In a speech, a member of the US SEC staff described a consultation regarding a registrant that had performed some of the specified services for its customer but had fully relied on another service provider for others, due to certain regulatory restrictions. The SEC staff member noted that it was critical to evaluate whether the entity could control the specified services before transferring them to the customer. In this case, the registrant was able to demonstrate that it had the contractual ability to control the other service provider by determining when the service provider delivered the services because the service provider could not contractually deny services to the customer, even though the service provider had discretion in how it fulfilled its obligations. The registrant concluded, and the SEC staff did not object, that the registrant was the principal in the arrangement, based on this analysis and an analysis of the other relevant indicators of control (e.g., the registrant was responsible for handling most customer concerns that arose from the services provided by the other service provider).⁵⁴

⁵⁴ [Speech](#), Remarks before the 2019 AICPA Conference on Current SEC and PCAOB Developments, by Lauren K. Alexander, Professional Accounting Fellow, SEC Office of the Chief Accountant, 9 December 2019. Available on the SEC's website.

In accordance with IFRS 15.B35A(c), if an entity provides a significant service of integrating two or more goods or services into a combined item that is the specified good or service the customer contracted to receive, the entity controls that specified good or service before it is transferred to the customer. This is because the entity first obtains control of the inputs to the specified good or service (which can include goods or services from other parties) and directs their use to create the combined item that is the specified good or service. The inputs would be a fulfilment cost to the entity. However, as noted by the Board in the Basis for Conclusions, if a third party provides the significant integration service, the entity's customer for its good or services (which would be inputs to the specified good or service) is likely to be the third party. [IFRS 15.BC385R].

In a speech, a member of the SEC staff discussed consultations in which entities have concluded that they are a principal primarily because they integrate goods or services from a third party with their own goods or services and sell the combined good or service to the end-consumer. The SEC staff member said that, when an entity assesses whether it controls the combined good or service before transfer to the end-consumer, it is helpful to determine the nature and significance of the integration service and to evaluate whether the entity first controls the inputs to the combined good or service. That is, it might be unclear how an entity could conclude that it is a principal if the integration service is not significant or it does not control the inputs to the combined good or service.⁵⁵

While IFRS 15.B35A provides helpful guidance, significant judgement may still be needed to determine whether the entity controls the specified good or service before it is transferred to the customer. In 2021, the IFRS IC received a request regarding the determination of whether a reseller of software licences is a principal or agent. At its April 2022 meeting, the IFRS IC concluded that the principles and requirements in IFRS 15 provide an adequate basis for a reseller to determine this in the submitted fact pattern. Consequently, the IFRS IC decided not to add a standard-setting project to the work plan.

In considering this request, the IFRS IC noted that the assessment of control requires an entity to consider specific facts and circumstances, including the terms and conditions of the contracts between each of the parties involved. If it is unclear whether the entity controls the specified good or service, the entity would consider the indicators in IFRS 15.B37 to assess whether it obtains control. The IFRS IC noted that part of applying judgement in the principal versus agent assessment involves "considering the relevance of the indicators to the assessment of control and the degree to which they provide evidence of control".⁵⁶

The following Illustration is based on the example from the IFRS IC agenda paper used by the IFRS IC when it discussed whether a reseller of software licences is a principal or agent in its April 2022 meeting:⁵⁷

Illustration 4-18: Determination of whether a reseller of software licences is a principal or agent

A reseller of standard software licences has a distribution agreement with a software manufacturer to sell licences to customers. The reseller has discretion in pricing the software licences. The reseller provides pre-sales advice to each customer to identify the type and number of the licences that meet the customer's needs. If the customer decides not to buy software licences, the reseller and the customer do not enter into an agreement, and the customer does not pay anything.

If the customer decides to buy the software licences, the reseller negotiates the selling price with the customer, places an order with the software manufacturer (and pays the manufacturer) and invoices the customer. The software licences are issued in the customer's name via a software portal with an activation key. If the pre-sale advice is incorrect, the customer might not accept the licences. However, the reseller cannot return unaccepted licences to the software manufacturer or sell them to another customer.

Identify the specified goods or services in the contract

The IFRS IC observed that the pre-sales advice the reseller provides is not an implicit promise in the contract. Since the reseller has already provided the advice at the time of entering into the contract with the customer, there is no further advice to be provided by the reseller after the contract inception. Therefore, the specified goods in the contract are the standard software licences as described in IFRS 15.B34A(a).

Assess whether the entity controls the specified good before it is transferred to the customer

The reseller assesses whether it obtains control of the standard software licences from the software manufacturer before they are transferred to the customer. After applying IFRS 15.B35-B35A, if it is unclear, the reseller considers the indicators in IFRS 15.B37. The IFRS IC observed that:

55 Remarks by Jonathan Wiggins, Senior Associate Chief Accountant, SEC Office of the Chief Accountant, 6 December 2021. Refer to our publication, *2021 AICPA & CIMA Conference on Current SEC and PCAOB Developments - Compendium of significant accounting and reporting issues*, on [Accounting Link](#).

56 [IFRIC Update](#), April 2022, available on the IFRS Foundation's website.

57 [IFRIC Update](#), April 2022, available on the IFRS Foundation's website.

- The software manufacturer is responsible for fulfilling the promise to provide the licences to the customer (IFRS 15.B37(a)), for example, the software's functionality, issuing and activating the licences.
- The reseller is responsible for fulfilling the promise to provide the licences to the customer (IFRS 15.B37(a)), for example, engaging with the customer before and after the software licences are provided to the customer and taking unaccepted licences.
- The reseller has no inventory risk before the licences are provided to the customer but then has inventory risk until the customer accepts the licences (IFRS 15.B37(b)).
- The reseller has discretion in establishing the price for the software licences (IFRS 15.B37(c)), which might be less relevant if, for example, the market has limited flexibility in establishing the price.

The reseller would apply judgement in making its overall assessment, including considering the relevance of the indicators to the assessment of control and the degree to which they provide evidence of control.

4.4.2.A Principal indicators

After considering the application guidance discussed above, it still might not be clear whether an entity controls the specified good or service. Therefore, the standard provides three indicators of when an entity controls the specified good or service (and is, therefore, a principal): [IFRS 15.B37]

Extract from IFRS 15

- B37** Indicators that an entity controls the specified good or service before it is transferred to the customer (and is therefore a principal (see paragraph B35)) include, but are not limited to, the following:
- (a) the entity is primarily responsible for fulfilling the promise to provide the specified good or service. This typically includes responsibility for the acceptability of the specified good or service (for example, primary responsibility for the good or service meeting customer specifications). If the entity is primarily responsible for fulfilling the promise to provide the specified good or service, this may indicate that the other party involved in providing the specified good or service is acting on the entity's behalf.
 - (b) the entity has inventory risk before the specified good or service has been transferred to a customer or after transfer of control to the customer (for example, if the customer has a right of return). For example, if the entity obtains, or commits itself to obtain, the specified good or service before obtaining a contract with a customer, that may indicate that the entity has the ability to direct the use of, and obtain substantially all of the remaining benefits from, the good or service before it is transferred to the customer.
 - (c) the entity has discretion in establishing the price for the specified good or service. Establishing the price that the customer pays for the specified good or service may indicate that the entity has the ability to direct the use of that good or service and obtain substantially all of the remaining benefits. However, an agent can have discretion in establishing prices in some cases. For example, an agent may have some flexibility in setting prices in order to generate additional revenue from its service of arranging for goods or services to be provided by other parties to customers.

The principal indicators above are meant to support an entity's assessment of control, not to replace it. Each indicator explains how it supports the assessment of control. As emphasised in the Basis for Conclusions, the indicators do not override the assessment of control, are not meant to be viewed in isolation and do not constitute a separate or additional evaluation. Furthermore, they are not a checklist of criteria to be met or factors to be considered in all scenarios. IFRS 15.B37A notes that considering one or more of the indicators will often be helpful and, depending on the facts and circumstances, individual indicators will be more or less relevant or persuasive to the assessment of control. [IFRS 15.B37A, IFRS 15.BC385H]. The IFRS IC reiterated this point in its April 2022 discussions (see section 4.4.2 above for further discussion). If an entity reaches different conclusions about whether it controls the specified good or service by applying the standard's definition of control versus the principal indicators, the entity re-evaluates its assessment, considering the facts and circumstances of its contract. This is because an entity's conclusions about control and the principal indicators need to align.

4.4.2.B Principal indicators: primarily responsible for fulfilling the promise

The first indicator that an entity is a principal, in IFRS 15.B37(a), is that the entity is primarily responsible for fulfilling the promise to provide the specified good or service to the customer, which typically includes responsibility for the acceptability of the specified good or service.

How we see it

We believe that one of the reasons that the indicator in IFRS 15.B37(a) supports the assessment of control of the specified good or service is because an entity generally controls a specified good or service if it is responsible for transferring control to a customer.

The terms of the contract and representations (written or otherwise) made by an entity during marketing generally provide evidence of which party is responsible for fulfilling the promise to provide the specified good or service and for the acceptability of that good or service.

It is possible that one entity might not be solely responsible for both providing the specified good or service and for the acceptability of that same good or service. For example, a reseller might sell goods or services that are provided to the customer by a supplier. However, if the customer is dissatisfied with the goods or services it receives, the reseller might be solely responsible for providing a remedy to the customer. The reseller might promote such a role during the marketing process or might agree to such a role as claims arise in order to maintain its relationship with its customer. In this situation, both the reseller and the supplier possess characteristics of this indicator. Therefore, it is likely that other indicators will need to be considered to determine which entity is the principal. However, if the reseller is responsible for providing a remedy to a dissatisfied customer but can then pursue a claim against the supplier to recoup any remedies it provides, that might indicate that the reseller is not ultimately responsible for the acceptability of the specified good or service.

4.4.2.C Principal indicators: inventory risk

The second indicator that an entity is a principal, in IFRS 15.B37(b), is that the entity has inventory risk (before the specified good or service is transferred to the customer or upon customer return). Inventory risk is the risk normally taken by an entity that acquires inventory in the hope of reselling it at a profit. Inventory risk exists if a reseller obtains (or commits to obtain) the specified good or service before it is ordered by a customer. Inventory risk also exists if a customer has a right of return and the reseller will take back the specified good or service if the customer exercises that right.

This indicator supports the assessment of control of the specified good or service because when an entity obtains (or commits to obtain) the specified good or service before it has contracted with a customer, it is likely that the entity has the ability to direct the use of and obtain substantially all of the remaining benefits from the good or service. For example, inventory risk can exist in a customer arrangement involving the provision of services if an entity is obliged to compensate the individual service provider(s) for work performed, regardless of whether the customer accepts that work. However, this indicator often does not apply to intangible goods or services.

Factors might exist that mitigate a reseller's inventory risk. For example, a reseller's inventory risk might be significantly reduced or eliminated if it has the right to return to the supplier goods it cannot sell or goods that are returned by customers. Another example is if a reseller receives inventory price protection from the supplier. In these cases, the inventory risk indicator might be less relevant or persuasive to the assessment of control.

4.4.2.D Principal indicators: pricing discretion

The third principal indicator, in IFRS 15.B37(c), is that the entity has discretion in establishing the price of the specified good or service. Reasonable latitude, within economic constraints, to establish the price with a customer for the product or service might indicate that the entity has the ability to direct the use of that good or service and obtain substantially all of the remaining benefits (i.e., the entity controls the specified good or service). However, because an agent might also have discretion in establishing the price of the specified good or service, the facts and circumstances of the transaction need to be carefully evaluated.

In a speech, a US SEC staff member described a consultation involving a registrant that produces and sells a commodity, which it might source from its own production, a related party's production or from a third party. For sales sourced from the related party, the registrant took possession and legal title of the product and had the right to redirect the product to other customers during shipment. The price of the commodity generally was determined based on the market price at delivery, and payment was made by the end-consumer to the registrant. The registrant then remitted the payment, less a fixed percentage fee, to the related-party producer. The registrant evaluated the indicators of control and concluded it was an agent because it did not receive substantially all the benefits of the sale due to the fixed percentage commission. The staff objected to this conclusion based on the facts presented. That is, a fixed commission structure alone does not provide conclusive evidence that an entity does not control the specified good or service.⁵⁸

⁵⁸ [Speech](#), Remarks before the 2020 AICPA Conference on Current SEC and PCAOB Developments, by Jillian Pearce, Professional Accounting Fellow, SEC Office of the Chief Accountant, 7 December 2020. Available on the SEC's website.

4.4.2.E Principal indicators: examples

Illustration 4-19 below, which is similar to Example 45 in the standard, shows how an entity might conclude that it is an agent:

Illustration 4-19: Entity is an agent

An entity operates a website that provides a marketplace for customers to purchase goods from a variety of suppliers who deliver the goods directly to the customers. The entity's website facilitates customer payments to suppliers at prices that are set by the suppliers. The entity requires payment from customers before orders are processed and all orders are non-refundable. The entity has no further obligations to the customers after arranging for the products to be provided to them; the entity is not responsible for the acceptability of goods provided to customers.

First, the entity evaluates the specified goods and concludes that there are no other goods or services provided to the customer except for those provided directly by the suppliers. Next, the entity considers whether it controls the specified goods before they are transferred to the customers. Since the entity does not at any time have the ability to direct the use of the goods transferred to the customers, the entity concludes that it does not control the specified goods before they are transferred. As part of this assessment, the entity considers the three indicators of control in the standard and makes the following determinations that support its overall control evaluation:

- The suppliers are responsible for fulfilling the promise to the customer and the entity does not take responsibility for the acceptability of the goods
- The entity does not have inventory risk because it does not obtain the goods at any time
- The entity does not have discretion to establish prices because they are set by the suppliers

The entity concludes that it is an agent for the goods sold through its website because the nature of its performance obligation is to arrange for goods to be provided to the customers.

In contrast, consider the following Illustration of an entity that concludes it is acting as a principal:

Illustration 4-20: Entity is a principal

An entity operates a website that provides a marketplace for customers to purchase digital content. The entity has entered into contracts with suppliers that provide it with the right to sell the digital content during a non-cancellable period of time in exchange for a fixed fee per unit of content. The entity can set the price for the content to be sold to customers on its website. The entity is contractually required to pay the supplier a fixed price or rate for any digital content it sells to its customers and that price or rate is unaffected by the price paid by the end-consumers. The entity is responsible for assisting customers if they encounter issues downloading the content or with the user experience, and customers do not interact with the suppliers.

The entity first evaluates the specified goods and concludes that the digital content is the only specified good or service. Next, the entity considers whether it controls the digital content before it is transferred to the customer. The entity concludes that it controls the specified goods before they are transferred because it has entered into a non-cancellable distribution agreement that permits the entity to sell the digital content to its customers. This conclusion differs from the entity's conclusion in Illustration 4-19 above because that entity provided a platform to connect suppliers to customers and did not have the ability to sell the suppliers' goods. As part of this assessment, the entity also considers the three indicators of control in the standard and makes the following determinations that support its overall control evaluation:

- The entity is responsible for fulfilling the promise to the customer and the entity takes responsibility for the acceptability of the digital content
- There is no inventory risk associated with digital content
- The entity has discretion to establish prices

The entity concludes that it is a principal for the digital content sold through its website because it controls the content before it is transferred to the customer.

4.4.3 Recognising revenue as principal or agent

The determination of whether the entity is acting as a principal or an agent affects the amount of revenue the entity recognises. When the entity is the principal in the arrangement, the revenue recognised is the gross amount to which the entity expects to be entitled. [IFRS 15.B35B]. When the entity is the agent, the revenue recognised is the net amount that the entity is entitled to retain in return for its services as the agent. The entity's fee or commission might be the net amount of consideration that the entity retains after paying the other party the consideration received in exchange for the goods or services to be provided by that party. [IFRS 15.B36].

After an entity determines whether it is the principal or the agent and the amount of gross or net revenue that would be recognised, the entity recognises revenue when (or as) it satisfies its performance obligation. An entity satisfies its performance obligation by transferring control of the specified good or service underlying the performance obligation, either at a point in time or over time (as discussed in section 7 below). That is, a principal would recognise revenue when (or as) it transfers the specified good or service to the customer. An agent would recognise revenue when its performance obligation to arrange for the specified good or service is complete.

In the Basis for Conclusions, the Board noted that, in some contracts in which the entity is the agent, control of specified goods or services promised by the agent might transfer before the end-consumer receives related goods or services from the principal. For example, an entity might satisfy its promise to provide customers with loyalty points when those points are transferred to the customer if:

- The entity's promise is to provide loyalty points to customers when the customer purchases goods or services from the entity.
- The points entitle the customers to future discounted purchases with a third party (i.e., the points represent a material right to a future discount).
- The entity determines that it is an agent (i.e., its promise is to arrange for the customers to be provided with points) and the entity does not control those points (i.e., the specified good or service) before they are transferred to the customer.

In contrast, if the points entitle the customers to future goods or services to be provided by the entity, the entity might conclude it is not an agent. This is because the entity's promise is to provide those future goods or services and, therefore, the entity controls both the points and the future goods or services before they are transferred to the customer. In these cases, the entity's performance obligation might only be satisfied when the future goods or services are provided.

In other cases, the points might entitle customers to choose between future goods or services provided by either the entity or a third party. For example, many airlines allow loyalty programme members to redeem loyalty points for goods or services provided by a partner (e.g., travel on another airline, hotel accommodation). In this situation, the nature of the entity's performance obligation might not be known until the customer makes its choice. That is, until the customer has chosen the goods or services to be provided (and, therefore, whether the entity or the third party will provide those goods or services), the entity is obliged to stand ready to deliver goods or services. Therefore, the entity might not satisfy its performance obligation until it either delivers the goods or services or is no longer obliged to stand ready. If the customer subsequently chooses to receive the goods or services from a third party, the entity would need to consider whether it was acting as an agent and would, therefore, only recognise revenue for a fee or commission that it received for arranging the ultimate transaction between the customer and the third party. [IFRS 15.BC383, IFRS 15.BC384, IFRS 15.BC385].

How we see it

The above discussion illustrates that control of specified goods or services promised by an agent might transfer before the end-consumer receives related goods or services from the principal. An entity needs to assess each loyalty programme in accordance with the principles of the principal versus agent application guidance to determine if revenue would be reported on a gross or net basis.

In addition, if an entity that was initially the principal in a transaction transfers to another entity its obligation to provide the specified goods or services to the customer, the standard says that, in such a transfer, the entity shall not continue to recognise revenue as a principal. Instead, after the transfer of its obligation, the entity must evaluate whether it is acting as an agent and would recognise as revenue the net amount of consideration that the entity retains in accordance with IFRS 15.B36: [IFRS 15.B38]

Extract from IFRS 15

B38 If another entity assumes the entity's performance obligations and contractual rights in the contract so that the entity is no longer obliged to satisfy the performance obligation to transfer the specified good or service to the customer (ie the entity is no longer acting as the principal), the entity shall not recognise revenue for that performance obligation. Instead, the entity shall evaluate whether to recognise revenue for satisfying a performance obligation to obtain a contract for the other party (ie whether the entity is acting as an agent).

4.4.4 Examples of principal versus agent considerations

The standard includes six examples to illustrate the principal versus agent application guidance discussed above. We have included four of them below.

The standard includes the following example of when the specified good or service (see section 4.4.1 above) is the underlying service, rather than the right to obtain that service. The entity in this example is determined to be a principal: *[IFRS 15.IE Example 46A, IFRS 15.IE238A-IE238G]*

Extract from IFRS 15

Example 46A-Promise to provide goods or services (entity is a principal)

An entity enters into a contract with a customer to provide office maintenance services. The entity and the customer define and agree on the scope of the services and negotiate the price. The entity is responsible for ensuring that the services are performed in accordance with the terms and conditions in the contract. The entity invoices the customer for the agreed-upon price on a monthly basis with 10-day payment terms.

The entity regularly engages third-party service providers to provide office maintenance services to its customers. When the entity obtains a contract from a customer, the entity enters into a contract with one of those service providers, directing the service provider to perform office maintenance services for the customer. The payment terms in the contracts with the service providers are generally aligned with the payment terms in the entity's contracts with customers. However, the entity is obliged to pay the service provider even if the customer fails to pay.

To determine whether the entity is a principal or an agent, the entity identifies the specified good or service to be provided to the customer and assesses whether it controls that good or service before the good or service is transferred to the customer.

The entity observes that the specified services to be provided to the customer are the office maintenance services for which the customer contracted, and that no other goods or services are promised to the customer. While the entity obtains a right to office maintenance services from the service provider after entering into the contract with the customer, that right is not transferred to the customer. That is, the entity retains the ability to direct the use of, and obtain substantially all the remaining benefits from, that right. For example, the entity can decide whether to direct the service provider to provide the office maintenance services for that customer, or for another customer, or at its own facilities. The customer does not have a right to direct the service provider to perform services that the entity has not agreed to provide. Therefore, the right to office maintenance services obtained by the entity from the service provider is not the specified good or service in its contract with the customer.

The entity concludes that it controls the specified services before they are provided to the customer. The entity obtains control of a right to office maintenance services after entering into the contract with the customer but before those services are provided to the customer. The terms of the entity's contract with the service provider give the entity the ability to direct the service provider to provide the specified services on the entity's behalf (see paragraph B35A(b)). In addition, the entity concludes that the following indicators in paragraph B37 of IFRS 15 provide further evidence that the entity controls the office maintenance services before they are provided to the customer:

- (a) the entity is primarily responsible for fulfilling the promise to provide office maintenance services. Although the entity has hired a service provider to perform the services promised to the customer, it is the entity itself that is responsible for ensuring that the services are performed and are acceptable to the customer (ie the entity is responsible for fulfilment of the promise in the contract, regardless of whether the entity performs the services itself or engages a third-party service provider to perform the services).
- (b) the entity has discretion in setting the price for the services to the customer.

The entity observes that it does not commit itself to obtain the services from the service provider before obtaining the contract with the customer. Thus, the entity has mitigated inventory risk with respect to the office maintenance services. Nonetheless, the entity concludes that it controls the office maintenance services before they are provided to the customer on the basis of the evidence in paragraph IE238E.

Thus, the entity is a principal in the transaction and recognises revenue in the amount of consideration to which it is entitled from the customer in exchange for the office maintenance services.

The standard also includes the following example of when the specified good or service is the right to obtain a service and not the underlying service itself. The entity in this example is determined to be a principal: *[IFRS 15.IE Example 47, IFRS 15.IE239-IE243]*

Extract from IFRS 15**Example 47-Promise to provide goods or services (entity is a principal)**

An entity negotiates with major airlines to purchase tickets at reduced rates compared with the price of tickets sold directly by the airlines to the public. The entity agrees to buy a specific number of tickets and must pay for those tickets regardless of whether it is able to resell them. The reduced rate paid by the entity for each ticket purchased is negotiated and agreed in advance.

The entity determines the prices at which the airline tickets will be sold to its customers. The entity sells the tickets and collects the consideration from customers when the tickets are purchased.

The entity also assists the customers in resolving complaints with the service provided by the airlines. However, each airline is responsible for fulfilling obligations associated with the ticket, including remedies to a customer for dissatisfaction with the service.

To determine whether the entity's performance obligation is to provide the specified goods or services itself (ie the entity is a principal) or to arrange for those goods or services to be provided by another party (ie the entity is an agent), the entity identifies the specified good or service to be provided to the customer and assesses whether it controls that good or service before the good or service is transferred to the customer.

The entity concludes that, with each ticket that it commits itself to purchase from the airline, it obtains control of a right to fly on a specified flight (in the form of a ticket) that the entity then transfers to one of its customers (see paragraph B35A(a)). Consequently, the entity determines that the specified good or service to be provided to its customer is that right (to a seat on a specific flight) that the entity controls. The entity observes that no other goods or services are promised to the customer.

The entity controls the right to each flight before it transfers that specified right to one of its customers because the entity has the ability to direct the use of that right by deciding whether to use the ticket to fulfil a contract with a customer and, if so, which contract it will fulfil. The entity also has the ability to obtain the remaining benefits from that right by either reselling the ticket and obtaining all of the proceeds from the sale or, alternatively, using the ticket itself.

The indicators in paragraphs B37(b)-(c) of IFRS 15 also provide relevant evidence that the entity controls each specified right (ticket) before it is transferred to the customer. The entity has inventory risk with respect to the ticket because the entity committed itself to obtain the ticket from the airline before obtaining a contract with a customer to purchase the ticket. This is because the entity is obliged to pay the airline for that right regardless of whether it is able to obtain a customer to resell the ticket to or whether it can obtain a favourable price for the ticket. The entity also establishes the price that the customer will pay for the specified ticket.

Thus, the entity concludes that it is a principal in the transactions with customers. The entity recognises revenue in the gross amount of consideration to which it is entitled in exchange for the tickets transferred to the customers.

In the following example, the entity also determines that the specified good or service is the right to obtain a service and not the underlying service itself. However, the entity in this example is determined to be an agent. [IFRS 15.IE Example 48, IFRS 15.IE244-IE248].

Extract from IFRS 15

Example 48-Arranging for the provision of goods or services (entity is an agent)

An entity sells vouchers that entitle customers to future meals at specified restaurants. The sales price of the voucher provides the customer with a significant discount when compared with the normal selling prices of the meals (for example, a customer pays CU100 for a voucher that entitles the customer to a meal at a restaurant that would otherwise cost CU200). The entity does not purchase or commit itself to purchase vouchers in advance of the sale of a voucher to a customer; instead, it purchases vouchers only as they are requested by the customers. The entity sells the vouchers through its website and the vouchers are non-refundable.

The entity and the restaurants jointly determine the prices at which the vouchers will be sold to customers. Under the terms of its contracts with the restaurants, the entity is entitled to 30 per cent of the voucher price when it sells the voucher.

The entity also assists the customers in resolving complaints about the meals and has a buyer satisfaction programme. However, the restaurant is responsible for fulfilling obligations associated with the voucher, including remedies to a customer for dissatisfaction with the service.

To determine whether the entity is a principal or an agent, the entity identifies the specified good or service to be provided to the customer and assesses whether it controls the specified good or service before that good or service is transferred to the customer.

A customer obtains a voucher for the restaurant that it selects. The entity does not engage the restaurants to provide meals to customers on the entity's behalf as described in the indicator in paragraph B37(a) of IFRS 15. Therefore, the entity observes that the specified good or service to be provided to the customer is the right to a meal (in the form of a voucher) at a specified restaurant or restaurants, which the customer purchases and then can use itself or transfer to another person. The entity also observes that no other goods or services (other than the vouchers) are promised to the customers.

The entity concludes that it does not control the voucher (right to a meal) at any time. In reaching this conclusion, the entity principally considers the following:

- (a) the vouchers are created only at the time that they are transferred to the customers and, thus, do not exist before that transfer. Therefore, the entity does not at any time have the ability to direct the use of the vouchers, or obtain substantially all of the remaining benefits from the vouchers, before they are transferred to customers.
- (b) the entity neither purchases, nor commits itself to purchase, vouchers before they are sold to customers. The entity also has no responsibility to accept any returned vouchers. Therefore, the entity does not have inventory risk with respect to the vouchers as described in the indicator in paragraph B37(b) of IFRS 15.

Thus, the entity concludes that it is an agent with respect to the vouchers. The entity recognises revenue in the net amount of consideration to which the entity will be entitled in exchange for arranging for the restaurants to provide vouchers to customers for the restaurants' meals, which is the 30 per cent commission it is entitled to upon the sale of each voucher.

IFRS 15.B34 clarifies that an entity might be a principal for some specified goods or services in a contract and an agent for others. The standard includes the Example 48A to illustrate a contract in which an entity is determined to be both principal and agent. [IFRS 15.IE Example 48A, IFRS 15.IE248A-IE248F].

Frequently asked questions

Question 4-15: How would an entity determine whether it is a principal or an agent in a transaction for a specified good for which it only takes title momentarily or never has physical possession?

An entity's determination of whether it is a principal or an agent in a transaction for a specified good for which it only takes title momentarily or never has physical possession requires significant judgement and careful consideration of the facts and circumstances. Entities might enter into contracts with third-party vendors (the vendors) to provide goods or services to be sold through their sales channels to their customers. In these arrangements, the entity might take legal title to the good only momentarily before the good is transferred to the customer, such as in scan-based trading or 'flash title' contracts (e.g., the vendor is responsible for stocking, rotating and otherwise managing the product until the final point of sale). Alternatively, the entity might never take physical possession or legal title to the good (e.g., 'drop shipment arrangements' when goods are shipped directly from a vendor to the customer). In these situations, the entity needs to carefully evaluate whether it obtains control of the specified good and, therefore, is the principal in the transaction with the end-consumer.

How we see it

When evaluating the control principle and the principal indicators provided in the standard, we believe some questions an entity might consider when making this judgement could include the questions listed below.

- Does the entity take title to the goods at any point in the order-to-delivery process? If not, why?
- Is the vendor the party that the customer will hold responsible for the acceptability of the product (e.g., handling of complaints and returns)? If so, why?
- Does the entity have a return-to-vendor agreement with the vendor or have a history of returning goods to the vendor after a customer returns the good(s)? If so, why?
- Does the vendor have discretion in establishing the price for the goods (e.g., setting the floor or ceiling)? If so, why?
- Is the vendor responsible for the risk of loss or damage (e.g., shrinkage) while the goods are in the entity's store? If so, why?
- Does the vendor have the contractual right to take back the goods delivered to the entity and, if so, has the vendor exercised that right in situations other than when the goods were at the end of their useful lives?
- Can the entity move goods between their stores or relocate goods within their stores without first obtaining permission from the vendor? If not, why?
- Does the entity have any further obligation to the customer after remitting the customer's order to the vendor? If not, why?
- Once a customer order is placed, can the entity direct the product to another entity or prevent the product from being transferred to the customer? If not, why?

A US SEC staff member said in a speech that the application of the principal-versus-agent application guidance can be especially challenging when an entity never obtains physical possession of a good. While noting that the staff has seen these types of fact patterns with conclusions of both principal and agent, the staff member further discussed certain facts and circumstances of a registrant consultation in which the SEC staff did not object to a principal determination in a transaction in which certain specialised goods were shipped directly to the end-consumer by the vendor (not the registrant). In reaching this conclusion, the SEC staff member reiterated that the determination requires consideration of the definition of control in the standard, which often includes consideration of the indicators in IFRS 15.B37. However, inventory risk is only one of those indicators and it is possible that physical possession will not coincide with control of a specified good.⁵⁹ This conclusion is consistent with Example 46 in the standard in which an entity is deemed to be the principal even though the supplier delivers the specified good or service (i.e., a piece of specialised equipment) directly to the customer.

In another speech, an SEC staff member shared observations from a consultation involving a registrant that operated a platform that facilitated an advertiser's purchase of digital advertising space from a publisher. The registrant concluded that it was an agent in the transaction, despite the fact that it

⁵⁹ [Speech](#), Remarks before the 2018 AICPA Conference on Current SEC and PCAOB Developments, by Sheri L. York, Professional Accounting Fellow, SEC Office of the Chief Accountant, 10 December 2018. Available on the SEC's website.

obtained momentary title of the digital advertising space, because the registrant was unable to direct the use of the potential advertising space to an ad other than the advertiser's predetermined ad. The registrant further evaluated the indicators of control and determined that it was not primarily responsible for fulfilment and did not have inventory risk. The staff did not object to the registrant's conclusion that it was an agent in the transaction.⁶⁰

Understanding the business purpose and rationale for the contractual terms between the vendor and the entity might help the entity assess whether it controls the specified goods prior to the transfer to the end-consumer and is, therefore, the principal in the sale to the end-consumer.

Question 4-16: How would entities determine the presentation of amounts billed to customers (e.g., shipping and handling, expenses or cost reimbursements and taxes) under the standards (i.e., as revenue or as a reduction of costs)?

(TRG meeting 18 July 2014 - Agenda paper no. 2)

The TRG members generally agreed that the standard is clear that any amounts not collected on behalf of third parties would be included in the transaction price (i.e., revenue). As discussed in section 5 below, IFRS 15.47 says that "the transaction price is the amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties (for example, some sales taxes)". Therefore, if the amounts were earned by the entity in fulfilling its performance obligations, the amounts are included in the transaction price and recorded as revenue.

Shipping and handling

The appropriate presentation of amounts billed to customers for shipping and handling activities would depend on whether the entity is a principal or an agent in the shipping arrangement (see Question 10-8 in section 10.3 below for further discussion on presentation of shipping and handling costs incurred by the entity).

Expense or cost reimbursements

Many service providers routinely incur incidental expenses, commonly referred to as 'out-of-pocket' expenses, in the course of conducting their normal operations. Those expenses often include, but are not limited to, airfare, other travel-related costs (such as car rentals and hotel accommodation) and telecommunications charges. The entity (i.e., the service provider) and the customer might agree that the customer will reimburse the entity for the actual amount of such expenses incurred. Alternatively, the parties might negotiate a single fixed fee that is intended to compensate the service provider for both professional services rendered and out-of-pocket expenses incurred.

Out-of-pocket expenses are often costs incurred by an entity in fulfilling its performance obligation(s) (i.e., the out-of-pocket expenses are fulfilment costs) and do not transfer a good or service to the customer. In these situations, reimbursement for such costs generally is included in the entity's estimate of the transaction price and recognised as revenue when (or as) the performance obligation(s) is (are) satisfied, even if the entity is reimbursed at 'cost' (i.e., at zero margin). Alternatively, if an entity concludes that the costs *do* transfer a good or service to the customer, it considers the principal-versus-agent application guidance when determining whether reimbursement amounts received from its customer need to be recorded on a gross or net basis.

In some cases, it might be appropriate to include the reimbursement in the transaction price and recognise that amount as revenue when the applicable expense is incurred. That is, an entity might not have to estimate out-of-pocket expenses in its determination of the transaction price at contract inception. This was discussed in a US Private Company Council meeting under US GAAP. The FASB staff observed in the related staff paper the following situations in which this would be the case:⁶¹

- The entity is an agent as it relates to the specified good or service identified (see section 4.4 above). That is, in cases in which the entity is an agent and the reimbursement is equal to the cost, the net effect on revenue would be zero and, therefore, no estimation would be required.

60 [Speech](#), Remarks before the 2020 AICPA Conference on Current SEC and PCAOB Developments, by Geoff Griffin, Professional Accounting Fellow, SEC Office of the Chief Accountant, 7 December 2020. Available on the SEC's website.

61 FASB staff Private Company Council Memo, *Reimbursement of Out-of-Pocket Expenses*, dated 26 June 2018. Refer to the [FASB's website](#).

- The variable consideration is constrained (see section 5.2.3 below). That is, if a portion of the transaction price related to reimbursements of out-of-pocket expenses is constrained, an entity would not include an estimate in the transaction price for that amount until it becomes highly probable that a significant revenue reversal will not occur, which might be when the underlying out-of-pocket expenses are incurred in some cases. For example, an entity might not be able to make reliable estimates of expenses and the related reimbursements that will not be subject to a significant revenue reversal due to a lack of historical evidence.
- The variable consideration relates specifically to a performance obligation or a distinct good or service in a series and the entity meets the variable consideration exception (see section 6.3 below).
- The entity qualifies to apply the 'right to invoice' practical expedient (see section 7.1.4.B below).
- The entity applies a 'costs incurred' measure of progress when recognising revenue for over-time performance obligations (see section 7.1.4 below). That is, if an entity selects a 'costs incurred' method, the timing of the costs being incurred and the revenue recognition associated with those costs would align.

Taxes or other assessments

Several of the TRG members noted that this would require entities to evaluate taxes collected in all jurisdictions in which they operate to determine whether a tax is levied on the entity or the customer. TRG members generally agreed that an entity would apply the principal versus agent application guidance when it is not clear whether the amounts are collected on behalf of third parties. This could result in amounts billed to a customer being recorded as an offset to costs incurred (i.e., on a net basis). See section 5.1 below for further discussion on consideration for sales (and other similar) taxes.

Question 4-17: How does an entity allocate the transaction price in a contract with multiple performance obligations in which the entity acts as both a principal and an agent?

See response to Question 6-10 in section 6.2 below.

FASB differences

Under US GAAP, an entity that is the principal is not permitted to estimate its gross transaction price when it is unable to determine the ultimate price charged to the customer by an intermediary and the uncertainty related to the transaction price is not ultimately expected to be resolved.⁶² The IASB did not specifically consider how the transaction price requirements would be applied in these situations (i.e., when an entity that is a principal does not know and expects not to know the price charged to its customer by an agent), but concluded in the Basis for Conclusions that an entity that is a principal would generally be able to apply judgement and determine the consideration to which it is entitled using all information available to it. [IFRS 15.BC385Z].

4.5 Consignment arrangements

The standard provides specific application guidance for a promise to deliver goods on a consignment basis to other parties. See section 7.4 below.

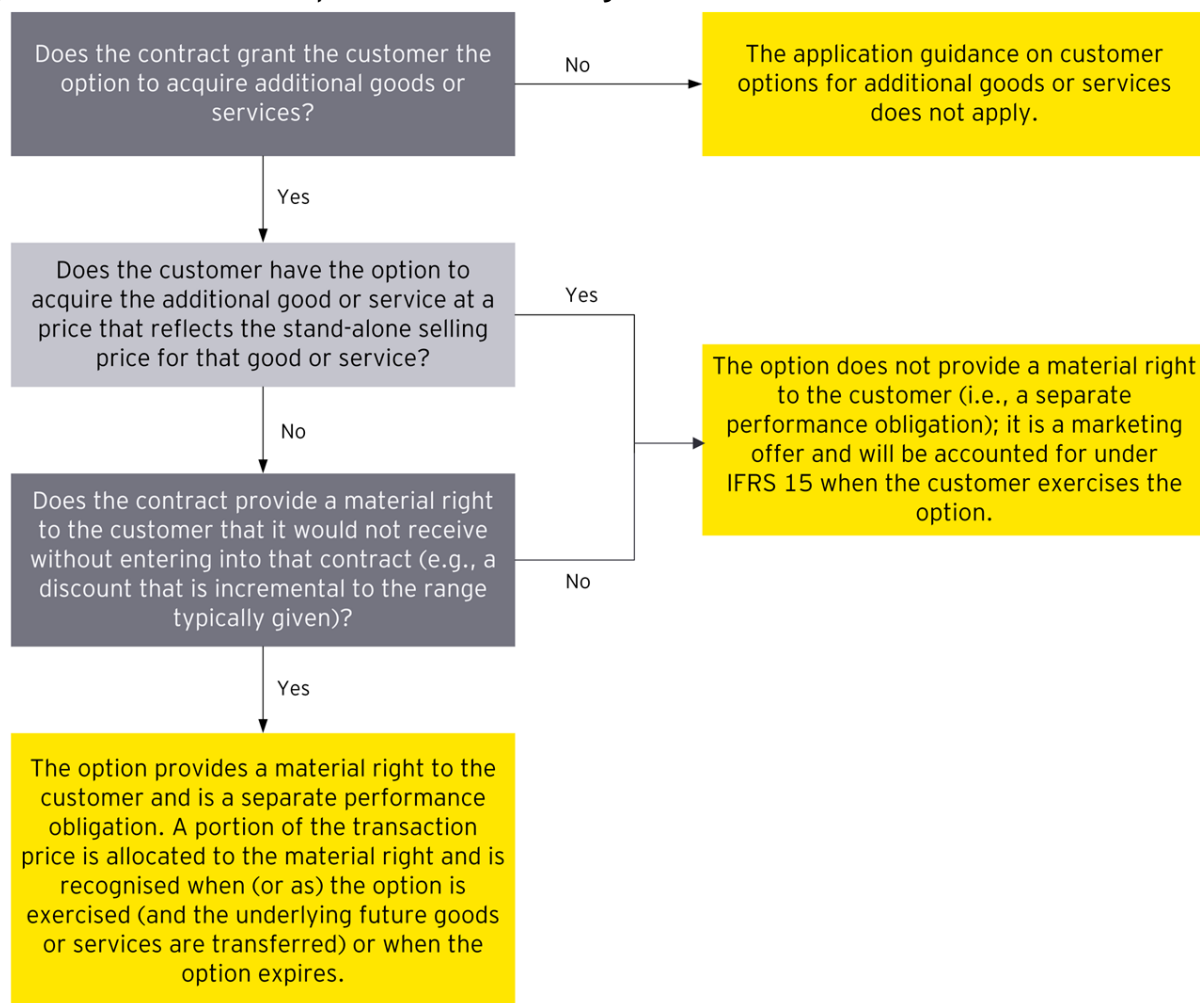

4.6 Customer options for additional goods or services

Many sales contracts give customers the option to acquire additional goods or services. These additional goods or services might be priced at a discount or might even be free of charge. Options to acquire additional goods or services at a discount can come in many forms, including sales incentives, volume-tiered pricing structures, customer award credits (e.g., frequent flyer points) or contract renewal options (e.g., waiver of certain fees, reduced future rates). [IFRS 15.B39]. See the Questions that follow this section, which discuss many of these different types of customer options.

⁶² FASB ASU 2016-08, *Revenue from Contracts with Customers (Topic 606): Principal versus Agent Considerations* (March 2016), paragraph BC38.

The following flowchart illustrates this application guidance:

Figure 4-7: Customer options for additional goods or services

When an entity grants a customer the option to acquire additional goods or services, that option is only a separate performance obligation if it provides a material right to the customer that the customer would not receive without entering into the contract (e.g., a discount that exceeds the range of discounts typically given for those goods or services to that class of customer in that geographical area or market). Refer to Question 4-22 below for further discussion on the evaluation of class of customer. If the option provides a material right to the customer, the customer has, in effect, paid in advance for future goods or services. As such, the entity recognises revenue when those future goods or services are transferred or when the option expires. [IFRS 15.40]. In the Basis for Conclusions, the IASB indicated that the purpose of this requirement is to identify and account for options that customers are paying for (often implicitly) as part of the current transaction. [IFRS 15.BC386].

The Board did not provide any bright lines as to what constitutes a 'material' right. However, the standard requires that an option to purchase additional goods or services at their stand-alone selling prices does not provide a material right and, instead, is a marketing offer. This is the case even if the customer has obtained the option only as a result of entering into a previous contract. However, an option to purchase additional goods or services in the future at the current stand-alone selling price could be a material right if prices are highly likely to significantly increase. This could also be the case if a renewal option at the current stand-alone selling price is offered for an extended period of time and the stand-alone selling price for the product is highly likely to significantly increase, depending on the facts and circumstances of the contract. This is because the customer is being offered a discount on future goods or services compared to what others will have to pay in the future as a result of entering into the previous contract. The standard states that this is the case even if the option can only be exercised because the customer entered into the earlier transaction. An entity that has made a marketing offer accounts for it in accordance with IFRS 15 only when the customer exercises the option to purchase the additional goods or services. [IFRS 15.B41].

How we see it

Significant judgement might be required to determine whether a customer option represents a material right. This determination is important because it affects the accounting and disclosures for the contract at inception and throughout the life of the contract.

The standard includes the following example to illustrate an option that represents a material right (see section 6.1.5 below for a discussion of the measurement of options that are separate performance obligations and section 7.8 below for revenue recognition related to customer options for additional goods or services): [IFRS 15.IE Example 49, IFRS 15.IE250-IE253]

Extract from IFRS 15

Example 49-Option that provides the customer with a material right (discount voucher)

An entity enters into a contract for the sale of Product A for CU100. As part of the contract, the entity gives the customer a 40 per cent discount voucher for any future purchases up to CU100 in the next 30 days. The entity intends to offer a 10 per cent discount on all sales during the next 30 days as part of a seasonal promotion. The 10 per cent discount cannot be used in addition to the 40 per cent discount voucher.

Because all customers will receive a 10 per cent discount on purchases during the next 30 days, the only discount that provides the customer with a material right is the discount that is incremental to that 10 per cent (ie the additional 30 per cent discount). The entity accounts for the promise to provide the incremental discount as a performance obligation in the contract for the sale of Product A.

To estimate the stand-alone selling price of the discount voucher in accordance with paragraph B42 of IFRS 15, the entity estimates an 80 per cent likelihood that a customer will redeem the voucher and that a customer will, on average, purchase CU50 of additional products. Consequently, the entity's estimated stand-alone selling price of the discount voucher is CU12 (CU50 average purchase price of additional products × 30 per cent incremental discount × 80 per cent likelihood of exercising the option). The stand-alone selling prices of Product A and the discount voucher and the resulting allocation of the CU100 transaction price are as follows:

Performance obligations	Stand-alone selling price	
		CU
Product A	100	
Discount voucher	12	
Total	112	
	Allocated transaction price	
Product A	89	(CU100 ÷ CU112 × CU100)
Discount voucher	11	(CU12 ÷ CU112 × CU100)
Total	100	

The entity allocates CU89 to Product A and recognises revenue for Product A when control transfers. The entity allocates CU11 to the discount voucher and recognises revenue for the voucher when the customer redeems it for goods or services or when it expires.

The standard also includes an illustrative example relating to an option that does not provide the customer with a material right. [IFRS 15.IE Example 50, IFRS 15.IE254-IE256].

Evaluating whether an option provides a material right might be more complex when the stand-alone selling price of the good or service is highly variable, as illustrated below:

Illustration 4-21: Evaluating a customer option when the stand-alone selling price is highly variable

A technology entity enters into a contract with a customer for a perpetual licence of a software, with one year of post-contract support (PCS). The contract also includes an option to purchase additional licences of the software and one year of PCS at 40% off the list price.

The entity does not sell the software separately, but it sells PCS separately in the form of renewals that are consistently priced at 20% of the net licence fee. Assume that the technology entity uses the residual method to estimate the stand-alone selling price of the perpetual licence for the software (see section 6.1.2 below). Also assume that the price the technology entity charges for the bundle of the perpetual licence and PCS is highly variable. That is because the price the technology entity charges to customers in the same class and same market as the customer who have not made prior purchases ranges from the list price to a discounted price of up to 70% off the list price for the bundle. Assume that the entity has appropriately stratified its contracts/customers to evaluate the range of discounts and has a sufficient amount of transactions to support that this is the range of discounts it offers.

Since the 40% discount the technology entity offered to the customer is within the range of discounts it typically offers to customers in the same class as the customer, the technology entity concludes that this option does not represent a material right.

While the customer option is determined not to be a material right in this example, that might not always be the case. An entity would need to evaluate all customer options, even those for which the price of the good or service that is subject to the option is highly variable and for which the residual approach was used.

Frequently asked questions

Question 4-18: Would entities consider only the current transaction or would they consider past and future transactions with the same customer when determining whether an option for additional goods or services provides the customer with a material right?

(TRG meeting 31 October 2014 - Agenda paper no. 6)

The TRG members generally agreed that entities would consider all relevant transactions with a customer (i.e., current, past and future transactions), including those that provide accumulating incentives, such as loyalty programmes, when determining whether an option represents a material right. That is, the evaluation is not solely performed in relation to the current transaction.⁶³

Question 4-19: Is the material right evaluation solely a quantitative evaluation or does the evaluation also consider qualitative factors?

(TRG meeting 31 October 2014 - Agenda paper no. 6)

The TRG members generally agreed that the evaluation considers both quantitative and qualitative factors that would be known to the entity (e.g., what a new customer would pay for the same service, the availability and pricing of competitors' service alternatives, whether the average customer life indicates that the fee provides an incentive for customers to remain beyond the stated contract term, whether the right accumulates). This is because a customer's perspective on what constitutes a 'material right' might consider qualitative factors. This is consistent with the notion that when identifying promised goods or services in Step 2, an entity considers reasonable expectations of the customer that the entity will transfer a good or service to it.⁶⁴

Question 4-20: How would an entity distinguish between a contract that contains an option to purchase additional goods or services and a contract that includes variable consideration (see section 5.2 below) based on a variable quantity (e.g., a usage-based fee)?

(TRG meeting 9 November 2015 - Agenda paper no. 48)

Entities have found it challenging to distinguish between a contract that includes customer options to purchase additional goods or services and one that includes variable consideration based on a variable quantity (e.g., a usage-based fee). This is because, under both types of contracts, the ultimate quantity

63 TRG Agenda paper no. 6, *Customer options for additional goods and services and non-refundable upfront fees*, dated 31 October 2014, and TRG Agenda paper no. 11, *October 2014 Meeting - Summary of Issues Discussed and Next Steps*, dated 26 January 2015.

64 TRG Agenda paper no. 6, *Customer options for additional goods and services and non-refundable upfront fees*, dated 31 October 2014, and TRG Agenda paper no. 11, *October 2014 Meeting - Summary of Issues Discussed and Next Steps*, dated 26 January 2015.

of goods or services to be transferred to the customer is often unknown at contract inception. The TRG members generally agreed that this determination requires judgement and consideration of the facts and circumstances. They also generally agreed that the TRG agenda paper on this question provides a framework that helps entities to make this determination.

This determination is important because it affects the accounting for the contract at inception and throughout the life of the contract, as well as disclosures. If an entity concludes that a customer option for additional goods or services provides a material right, the option itself is deemed to be a performance obligation in the contract, but the underlying goods or services are not accounted for until the option is exercised (as discussed below in Question 4-21 below). As a result, the entity is required to allocate a portion of the transaction price to the material right at contract inception and to recognise that revenue when (or as) the option is exercised or the option expires. If an entity, instead, concludes that an option for additional goods or services is not a material right, there is no accounting for the option and no accounting for the underlying optional goods or services until those subsequent purchases occur.

However, if the contract includes variable consideration (rather than a customer option), an entity has to estimate at contract inception the variable consideration expected over the life of the contract and update that estimate each reporting period (subject to the constraint on variable consideration) (see section 5.2 below). There are also more disclosures required for variable consideration (e.g., the requirement to disclose the remaining transaction price for unsatisfied performance obligations) (see section 10.5.1.C below) than for options that are not determined to be material rights.

The TRG agenda paper explained that the first step (in determining whether a contract involving variable quantities of goods or services are accounted for as a contract containing customer options or variable consideration) is for the entity to determine the nature of its promise in providing goods or services to the customer and the rights and obligations of each party.

In a contract in which the variable quantity of goods or services results in variable consideration, the nature of the entity's promise is to transfer to the customer an overall service. In providing this overall service, an entity might perform individual tasks or activities. At contract inception, the entity is presently obliged by the terms and conditions of the contract to transfer all promised goods or services provided under the contract and the customer is obliged to pay for those promised goods or services. This is because the customer entered into a contract that obliges the entity to transfer those goods or services. The customer's subsequent actions to utilise the service affect the measurement of revenue (in the form of variable consideration), but do not oblige the entity to provide additional distinct goods or services beyond those promised in the contract.

For example, consider a contract between a transaction processor and a customer in which the processor will process all of the customer's transactions in exchange for a fee paid for each transaction processed. The ultimate quantity of transactions that will be processed is not known. The nature of the entity's promise is to provide the customer with continuous access to the processing platform so that submitted transactions are processed. By entering into the contract, the customer has made a purchasing decision that obliges the entity to provide continuous access to the transaction processing platform. The consideration paid by the customer results from events (i.e., additional transactions being submitted for processing to the processor) that occur after (or as) the entity transfers the payment processing service. The customer's actions do not oblige the processor to provide additional distinct goods or services because the processor is already obliged (starting at contract inception) to process all transactions submitted to it.

Another example described in the TRG agenda paper of contracts that might include variable consideration was related to certain IT outsourcing contracts. Under this type of contract (similar to the transaction processing contract, discussed above), the entity provides continuous delivery of a service over the contract term and the amount of service provided is variable.

Illustration 4-22: Variable consideration (IT outsourcing arrangement)

An entity enters into a 10-year IT outsourcing arrangement with a customer in which it provides continuous delivery of outsourced activities over the contract term. The entity provides server capacity, manages the customer's software portfolio and runs an IT help desk. The total monthly invoice is calculated based on the units consumed for each activity. For example, the billings might be based on millions of instructions per second of computing power, the number of software applications used or the number of employees supported. The price per unit differs for each type of activity.

At contract inception, it is unknown how many outsourced activities the entity will perform for the customer throughout the life of the contract. The question that arises is whether the customer makes optional

purchases when it sends activities to the entity to be performed or whether its use of the service affects the measurement of revenue (in the form of variable consideration).

The conclusion in the TRG agenda paper was that it is likely that this contract contains variable consideration because of the nature of the entity's promise. The customer is paying for the entity to stand ready to perform in an outsourcing capacity on any given day. The customer does not make a separate purchasing decision each time it sends a unit for processing. Instead, the customer made its purchasing decision when it entered into the outsourcing contract with the entity. Therefore, the customer's actions to use the service also do not oblige the entity to provide any additional distinct goods or services.

In contrast, when an entity provides a customer option, the nature of its promise is to provide the quantity of goods or services specified in the contract, if any, and a right for the customer to choose the amount of additional distinct goods or services the customer will purchase. That is, the entity is not obliged to provide any additional distinct goods or services until the customer exercises the option. The customer has a contractual right that allows it to choose the amount of additional distinct goods or services to purchase, but the customer has to make a separate purchasing decision to obtain those additional distinct goods or services. Prior to the customer's exercise of that right, the entity is not obliged to provide (nor does it have a right to consideration for transferring) those goods or services.

Since an option that is a marketing offer (i.e., not a material right or separate performance obligation) is considered a new contract if it is exercised, the IASB staff noted in the TRG agenda paper that an analogy to the contract modification requirements in IFRS 15.20-21 (see section 3.4 above) could be helpful when an entity is distinguishing between optional purchases and variable consideration. For a modification to be considered a separate contract, one of the criteria is that the modification results in the addition of promised goods or services that are distinct. Similarly, the IASB staff noted that the exercise of a customer option would typically result in the addition of promised goods or services that are distinct.

The TRG agenda paper included an example, which the following Illustration is based on, of a contract that includes a customer option (rather than variable consideration).

Illustration 4-23: Customer option that is not a material right

Entity B enters into a contract to provide 100 widgets to Customer Y in return for consideration of CU10 per widget. Each widget is a distinct good transferred at a point in time. The contract also gives Customer Y the right to purchase additional widgets at the stand-alone selling price of CU10 per widget. Therefore, the quantity that might be purchased by Customer Y is variable.

The conclusion in the TRG agenda paper was that, while the quantity of widgets that might be purchased is variable, the transaction price for the existing contract is fixed at CU1,000 [100 widgets x CU10 per widget].

That is, the transaction price only includes the consideration for the 100 widgets specified in the contract and the customer's decision to purchase additional widgets is an option. While Entity B might be required to deliver additional widgets in the future, Entity B is not legally obligated to provide the additional widgets until Customer Y exercises the option. In this example, the option is accounted for as a separate contract because there is no material right, since the pricing of the option is at the stand-alone selling price of the widgets.

Contrast the above Illustration with another contract that includes a customer option that is determined to be a material right:

Illustration 4-24: Customer option that is a material right

Entity B enters into a contract to provide 100 widgets to Customer Y at CU10 per widget (which is the widget's stand-alone selling price at contract inception). Each widget is a distinct good transferred at a point in time. The contract also gives Customer Y the right to purchase additional widgets at CU9 per widget. Therefore, the quantity that might be purchased by Customer Y is variable.

While the quantity of widgets that might be purchased is variable, the transaction price for the existing contract is fixed at CU1,000 [100 widgets x CU10 per widget]. That is, the transaction price only includes the consideration for the 100 widgets specified in the contract, and the customer's decision to purchase additional widgets is an option. While Entity B might be required to deliver additional widgets in the future, Entity B is not legally obligated to provide the additional widgets until Customer Y exercises the option.

Entity B determines that Customer Y obtained a discount on future widgets because CU9 per widget is lower than the stand-alone selling price of each widget at contract inception (i.e., CU10 per widget), as well as being lower than the expected stand-alone selling price at renewal. In this example, the option is accounted for as a material right.

The TRG agenda paper also included an example, which the following Illustration is based on, of a contract in which the variable quantity of goods or services includes a customer option:

Illustration 4-25: Customer option

A supplier enters into a five-year master supply arrangement in which the supplier is obliged to produce and sell parts to a customer at the customer's request. That is, the supplier is not obliged to transfer any parts until the customer submits a purchase order. In addition, the customer is not obliged to purchase any parts; however, it is highly likely it will do so because the part is required to manufacture the customer's product and it is not practical to obtain parts from multiple suppliers. Each part is determined to be a distinct good that transfers to the customer at a point in time.

The conclusion in the TRG agenda paper was that the nature of the promise in this example is the delivery of parts (and not a service of standing ready to produce and sell parts). That is, the contract provides the customer with a right to choose the quantity of additional distinct goods (i.e., it provides a customer option), rather than a right to use the services for which control to the customer has (or is currently being) transferred (such as in the transaction processor example above). Similarly, the supplier is not obliged to transfer any parts until the customer submits the purchase order (another important factor in distinguishing a customer option from variable consideration). In contrast, in certain other fact patterns, the supplier is obliged to make the promised services available to the customer without any additional decisions made by the customer.

The TRG agenda paper contrasted this example with other contracts that might include a stand-ready obligation (e.g., a customer's use of a health club). When the customer submits a purchase order under the master supply arrangement, it is contracting for a specific number of distinct goods, which creates new performance obligations for the supplier. In contrast, a customer using services in a health club is using services that the health club is already obliged to provide under the present contract. That is, there are no new obligations arising from the customer's usage.

The TRG agenda paper also included an example, which the following Illustration is based on, of a contract in which the variable quantity of goods or services results in variable consideration:

Illustration 4-26: Variable consideration (variable quantities of goods or services)

Entity A enters into a contract to provide equipment to Customer X. The equipment is a single performance obligation transferred at a point in time. Entity A charges Customer X based on its usage of the equipment at a fixed rate per unit of consumption. The contract has no minimum payment guarantees. Customer X is not contractually obliged to use the equipment. However, Entity A is contractually obliged to transfer the equipment to Customer X.

The conclusion in the TRG agenda paper was that the usage of the equipment by Customer X is a variable quantity that affects the amount of consideration owed to Entity A. It does not affect Entity A's performance obligation, which is to transfer the piece of equipment. That is, Entity A has performed by transferring the distinct good. Customer X's actions, which result in payment to Entity A, occur after the equipment has been transferred and do not require Entity A to provide additional goods or services.

Question 4-21: When, if ever, would an entity consider the goods or services underlying a customer option as a separate performance obligation?

(TRG meeting 9 November 2015 - Agenda paper no. 48)

The TRG members generally agreed that an entity does not need to identify the additional goods or services underlying the option as promised goods or services (or performance obligations) if there are no contractual penalties (e.g., termination fees, monetary penalties for not meeting contractual minimums), even if it believes that it is virtually certain that a customer will exercise its option for additional goods or services. Only the option is assessed to determine whether it represents a material right (and accounted for as a performance obligation). As a result, any consideration that would be received in return for optional goods or services is not included in the transaction price at contract inception. The TRG agenda paper included an example, which the following Illustration is based on, of a contract in which it is virtually certain that a customer will exercise its option for additional goods or services:

Illustration 4-27: Customer option with no contractual penalties

An entity sells equipment and consumables, both of which are determined to be distinct goods that are recognised at a point in time. The stand-alone selling price of the equipment and each consumable is CU10,000 and CU100, respectively. The equipment costs the entity CU8,000 to produce, and each consumable costs the entity CU60. The entity sells the equipment for CU6,000 (i.e., at a 40% discount on its stand-alone selling price) with a customer option to purchase each consumable for CU100 (i.e., equal to

its stand-alone selling price). There are no contractual minimums, but the entity estimates the customer will purchase 200 parts over the next two years. This is an exclusive contract in which the customer cannot purchase the consumables from any other vendors during the contract term.

TRG members generally agreed that the consumables underlying each option would not be considered part of the contract. Furthermore, the option does not represent a material right because it is priced at the stand-alone selling price for the consumable. This is the case even though the customer is compelled to exercise its option for the consumables because the equipment cannot function without the consumables and the contract includes an exclusivity clause that requires the customer to acquire the consumables only from the entity. Accordingly, the transaction price is CU6,000 and it is entirely attributable to the equipment. This would result in a loss for the entity of CU2,000 when it transfers control of the equipment to the customer.

However, contractual minimums might represent fixed consideration in a contract, even if the contract also contains optional purchases. For example, an MSA might set minimum purchase quantities that the entity is obliged to provide, but any quantities above the minimum might require the customer to make a separate purchasing decision (i.e., exercise a customer option). If contractual penalties exist (e.g., termination fees, monetary penalties assessed) for not meeting contractual minimums, it might be appropriate to include some or all of the goods or services underlying customer options as part of the contract at inception. This is because the penalty effectively creates a minimum purchase obligation for the goods or services that would be purchased if the penalty were enforced.

Illustration 4-28: Customer option with contractual penalties

Consider the same facts as in Illustration 4-27 above, except that the customer will incur a penalty if it does not purchase at least 200 consumables. That is, the customer will be required to repay some or all of the CU4,000 discount provided on the equipment. Per the contract terms, the penalty decreases as each consumable is purchased at a rate of CU20 per consumable.

The conclusion in the TRG agenda paper was that the penalty is substantive and it effectively creates a minimum purchase obligation. As a result, the entity concludes that the minimum number of consumables required to avoid the penalty would be evidence of enforceable rights and obligations. The entity would then calculate the transaction price as CU26,000 [(200 consumables x CU100/consumable) + CU6,000 (the selling price of the equipment)]. Furthermore, the conclusion in the TRG agenda paper was that, if the customer failed to purchase 200 consumables, the entity accounts for the resulting penalty as a contract modification.

Question 4-22: How does an entity consider the class of customer when evaluating whether a customer option is a material right?

(FASB TRG meeting 18 April 2016 - Agenda paper no. 54)

The FASB TRG members generally agreed that an entity considers 'class of customer' when determining whether a customer option to acquire additional goods or services represents a material right. When making this evaluation, they agreed that an entity first determines whether the customer option exists independently of the existing contract. That is, the entity must consider if it would offer the same pricing to a similar customer independent of a prior contract with the entity. If the pricing is independent, the option is considered a marketing offer and there is no material right. The FASB TRG members also generally agreed that it is likely that the determination will require an entity to exercise significant judgement and consider all facts and circumstances. In addition, a volume rebate or discount that is provided prospectively to all customers within a class of customers might also provide a material right. Refer to Question 4-23 below for additional discussion.

As discussed above, IFRS 15.B40 states that when an entity grants a customer the option to acquire additional goods or services, that option is a separate performance obligation if it provides a material right that the customer would not receive without entering into the contract (e.g., a discount that exceeds the range of discounts typically given for those goods or services to that class of customer in that region or market). [IFRS 15.B40]. Furthermore, IFRS 15.B41 states that an option to purchase additional goods or services at their stand-alone selling prices does not provide a material right and instead is a marketing offer. [IFRS 15.B41]. The FASB staff noted in the TRG agenda paper that these requirements are intended to make clear that a customer option to acquire additional goods or services would not give rise to a material right if a customer could execute a separate contract to obtain the goods or services at the same price. That is, customer options that would exist independently of an existing contract with a customer do not constitute performance obligations in that existing contract.

The TRG agenda paper provided several examples of the FASB staff's views on this topic, including one that the following Illustration is based on:

Illustration 4-29: Class of customer evaluation

Retailer owns and operates several electronic stores and currently provides customers who purchase a 50-inch television with a coupon for 50% off the purchase of a stereo system. The coupon must be redeemed at one of Retailer's stores and is valid for one year. Retailer has never offered a discount of this magnitude to a customer that does not purchase a television (or another item of similar value).

Customer A purchases a 50-inch television from Retailer. At the time of purchase, Customer A receives a coupon for 50% off a stereo system. In evaluating whether the 50% discount provided to Customer A exists independently of its existing contract to purchase a television, Retailer needs to compare the discount offered to Customer A (50%) with the discount typically offered to other customers independent of a prior contract (purchase) with Retailer. For customers that do not purchase a 50-inch television, the only promotion Retailer is running on the stereo system is offering a 5% off coupon to all customers walking into the store. It would not be appropriate for Retailer to compare the discount offered to Customer A with a discount offered to another customer that also purchased a 50-inch television. This is because the objective of the requirements in IFRS 15.B40-B41 is to determine whether a customer option exists independently of an existing contract with a customer.

Retailer determines that the discount offered to Customer A is not comparable to the discount typically offered to customers without a prior contract (purchase). Rather, Customer A is receiving an incremental discount that it would not have received had it not entered into a contract to purchase a 50-inch television. The incremental discount provided to Customer A represents a material right.

Question 4-23: Are volume rebates and/or discounts on goods or services accounted for as variable consideration or as customer options to acquire additional goods or services at a discount?

How we see it

We believe the appropriate accounting for volume rebates and/or discounts depends on whether the rebate or discount programme is applied retrospectively (variable consideration) or prospectively (a customer option).

Generally, if a volume rebate or discount is applied prospectively, we believe the rebate or discount would be accounted for as a customer option (not variable consideration). This is because the consideration for the goods or services in the present contract is not contingent upon or affected by any future purchases. Rather, the discounts available from the rebate programme affect the price of future purchases. Entities need to evaluate whether the volume rebate or discount provides the customer with an option to purchase goods or services in the future at a discount that represents a material right (and is, therefore, accounted for as a performance obligation) (see Question 4-24 below). In addition, a volume rebate or discount that is provided prospectively to all customers within a class of customer might also provide a material right. The fact that other customers receive the same volume rebate or discount is not relevant to the assessment if those customers similarly must first make purchases at a higher price in order to receive a right to discount on purchases in the future. That is, consistent with the guidance in Question 4-24 below, an entity does not compare discounts given to other customers who receive a similar volume-based discount. Rather, the entity must evaluate whether the option exists independently of an existing contract with the customer.

However, we believe a volume rebate or discount that is applied retrospectively is accounted for as variable consideration (see section 5.2 below). This is because the final price of each good or service sold depends upon the customer's total purchases that are subject to the rebate programme. That is, the consideration is contingent upon the occurrence or non-occurrence of future events. This view is consistent with Example 24 in the standard (which is extracted in full in section 5.2.1 below). [IFRS 15.IE Example 24, IFRS 15.IE124-IE128].

Entities should keep in mind that they need to evaluate whether contract terms, other than those specific to the rebate or discount programme, create variable consideration that needs to be separately evaluated (e.g., if the goods subject to the rebate programme are also sold with a right of return).

Question 4-24: How does an entity consider whether prospective volume discounts determined to be customer options are material rights?

(FASB TRG meeting 18 April 2016 - Agenda paper no. 54)

The FASB TRG members generally agreed that in making this evaluation, similar to the discussion in Question 4-22 and Question 4-23 above, an entity would first evaluate whether the option exists independently of the existing contract. That is, the entity must consider whether it would offer the same pricing to a similar high-volume customer independent of a prior contract with the entity. If yes, it indicates that the volume discount is not a material right, as it is not incremental to the discount typically

offered to a similar high-volume customer. If the entity typically charges a higher price to a similar customer, it might indicate that the volume discount is a material right as the discount is incremental. The TRG agenda paper included an example, which the following Illustration is based on:

Illustration 4-30: Volume discounts

Entity enters into a long-term master supply arrangement with Customer A to provide an unspecified volume of non-customised parts. The price of the parts in subsequent years is dependent upon Customer A's purchases in the current year. That is, Entity charges Customer A CU1.00 per part in year one and if Customer A purchases more than 100,000 parts, the year two price will be CU0.90 per part.

When determining whether the contract between Entity and Customer A includes a material right, Entity first evaluates whether the option provided to Customer A exists independently of the existing contract. To do this, Entity compares the discount offered to Customer A with the discount typically offered to a similar high-volume customer that receives a discount independent of a prior contract with Entity. Such a similar customer could be Customer B who places a single order with Entity for 105,000 parts. Comparing the price offered to Customer A in year two with offers to other customers that also receive pricing that is contingent on prior purchases would not help Entity determine whether Customer A would have been offered the year two price had it not entered into the original contract.

Volume discounts or tiered pricing can make an entity's assessment of whether a customer option to purchase additional goods or services is a material right more complex. It is likely that this assessment will require significant judgement, as illustrated below:

Illustration 4-31: Evaluating a customer option with volume discounts

Semi-conductor Entity S sells microchips for use in cell phones. The entity executes a contract with a customer to sell one million units of microchip M for CU0.50 each (or CU500,000). The contract provides the right for the customer to purchase an additional 200,000 microchips for CU0.40 each.

The entity concludes that it has provided the customer with an option to purchase the additional microchips since the entity is not obligated to provide the additional goods until the customer makes a purchasing decision. Furthermore, the volume discount is applied prospectively and does not affect the transaction price in the original contract.

Scenario A

For microchip M, Semi-conductor Entity S provides volume discounts as part of its standard pricing practices and typically prices the first one million microchips at CU0.50 each, the second million at CU0.40 each and any additional amounts at CU0.35 each.

Semi-conductor Entity S considers whether the option provides the customer with a material right. To make this evaluation, the entity compares the discount offered in this option with the discount it typically offers to a similar high-volume customer that receives a discount without having had a prior contract. In other words, the entity compares the pricing in this contract to the pricing it typically offers to customers that purchase between one million and two million units of microchip M without having made any prior purchases.

The entity has sold, and continues to sell, the same volume of microchip M at the same price to other customers in the same class of customer who have not made prior purchases (i.e., similar customers pay CU0.50 each for the first one million microchips and CU0.40 each for the second million). That is, the price offered to the customer in the option exists independently of the existing contract. Therefore, Semi-conductor Entity S concludes that it has not provided the customer with a material right.

Scenario B

For microchip M, Semi-conductor Entity S provides volume discounts as part of its standard pricing practices and typically prices the first three million microchips at CU0.50 each and any additional amounts at CU0.30 each.

Semi-conductor Entity S considers whether the option provides the customer with a material right. To make this evaluation, the entity compares the discount offered in this option with the discount it typically offers to a similar high-volume customer that receives a discount without having had a prior contract.

For similar high-volume customers of the same customer class who have not made prior purchases, the entity typically does not provide this pricing (e.g., similar customers would pay CU0.50 per microchip for all of the 1.2 million microchips). Therefore, the entity concludes that it has provided the customer with a material right.

Question 4-25: How would an entity consider whether a renewal option is a material right?

An entity assesses whether a renewal option represents a material right in the same manner as other customer options discussed above. That is, an entity would determine whether the customer renewal option would be offered at the same price to a similar class of customer, independent of a prior contract with the entity. Customer renewal options might be explicitly included in the original contract or, as discussed in section 5.8 below, the existence of a non-refundable upfront fee might indicate that the contract includes a renewal option for future goods or services (e.g., if the customer renews the contract without the payment of an additional upfront fee).

As discussed above in this section, IFRS 15.B41 specifies that if a customer has the option to purchase additional goods or services (e.g., by exercising a renewal option) at a price that would reflect the stand-alone selling prices of those goods or services, the renewal option would not provide a material right and, instead, is a marketing offer. [IFRS 15.B41]. Determining the stand-alone selling price of a renewal option might require significant judgement. For example, a renewal option offered at the current stand-alone selling price might or might not be determined to be a material right. That is, if the pricing for the goods and services are expected to remain stable, it would be appropriate for a renewal option offered at a current stand-alone selling price to be considered a marketing offer. In contrast, a renewal option at the current stand-alone selling price could be a material right if, for example, prices are highly likely to significantly increase or the renewal option is offered for an extended period of time.

Example 51 from the standard describes the accounting for a renewal option that is a material right. That example also includes guidance on how to allocate a portion of the transaction price to the material right, which is further discussed in section 6.1.5 below. [IFRS 15.IE Example 51, IFRS 15.IE257-IE266].

Question 4-26: How would an entity consider whether a loyalty or reward programme is a material right?

Entities frequently offer loyalty or reward programmes under which customers accumulate points that they can redeem for 'free' or discounted products or services. Under IFRS 15.B40, an entity typically concludes that such a loyalty or reward programme provides a material right to customers that they would not receive without entering into a contract. This is because the customer effectively pays in advance for the right to obtain a future good or service (e.g., travel, upgrades, products) or a discount on that good or service.

This is also consistent with the discussion of the TRG members, as noted in Questions 4-18 and 4-19 above, that entities need to consider all relevant transactions with a customer (i.e., current, past and future transactions) and both quantitative and qualitative factors, including those that provide accumulating incentives, when determining whether an option represents a material right. Example 52 in the standard (included in section 7.9 below) illustrates the accounting for a loyalty programme. [IFRS 15.IE Example 52, IFRS 15.IE267-IE270].

Question 4-27: How would an entity account for the exercise of a material right? That is, would an entity account for it as: a contract modification, a continuation of the existing contract or variable consideration?

(TRG meeting 30 March 2015 - Agenda paper no. 32)

The TRG members generally agreed that it is reasonable for an entity to account for the exercise of a material right as either a contract modification (see section 3.4 above) or as a continuation of the existing contract (i.e., a change in the transaction price). TRG members also generally agreed that it is not appropriate to account for the exercise of a material right as variable consideration.

Under the approach that treats the exercise of a material right as a continuation of the existing contract (i.e., because the customer decided to purchase additional goods or services contemplated in the original contract), an entity would update the transaction price of the contract to include any consideration to which the entity expects to be entitled as a result of the exercise, in accordance with the requirements for changes in the transaction price included in IFRS 15.87-90 (see section 6.5 below).

Under these requirements, changes in the total transaction price are generally allocated to the separate performance obligations on the same basis as the initial allocation. However, IFRS 15.89 requires an entity to allocate a change in the transaction price entirely to one or more, but not all, performance obligations if the criteria of IFRS 15.85 are met. [IFRS 15.89]. These criteria (discussed further in section 6.3 below) are that the additional consideration specifically relates to the entity's efforts to satisfy the performance obligation(s) and that allocating the additional consideration entirely to one or more, but not all, performance obligation(s) is consistent with the standard's allocation objective (see section 6 below). The additional consideration received for the exercise of the option is likely to meet the

criteria to be allocated directly to the performance obligation(s) underlying the material right. Revenue would be recognised when (or as) the performance obligation(s) is (are) satisfied. [IFRS 15.85].

The TRG agenda paper included an example, which the following Illustration is based on:

Illustration 4-32: Exercise of a material right under the requirements for changes in the transaction price

Entity enters into a contract with Customer to provide two years of Service A for CU100 and includes an option for Customer to purchase two years of Service B for CU300. The stand-alone selling prices of Services A and B are CU100 and CU400, respectively. Entity concludes that the option represents a material right and its estimate of the stand-alone selling price of the option is CU33. Entity allocates the CU100 transaction price to each performance obligation as follows:

	Transaction price	Stand-alone selling price	%	Allocation
Service A		CU100	75%	CU75
Option		CU33	25%	CU25
Totals	CU100	CU133	100%	CU100

Upon executing the contract, Customer pays CU100 and Entity begins transferring Service A to Customer. The consideration of CU75 that is allocated to Service A is recognised over the two-year service period. The consideration of CU25 that is allocated to the option is deferred until Service B is transferred to the customer or the option expires.

Six months after executing the contract, Customer exercises the option to purchase two years of Service B for CU300. Following the requirements for changes in the transaction price, the consideration of CU300 related to Service B is added to the amount previously allocated to the option to purchase Service B (i.e., $CU300 + CU25 = CU325$). This is recognised as revenue over the two-year period in which Service B is transferred. Entity is able to allocate the additional consideration received for the exercise of the option to Service B because it specifically relates to Entity's efforts to satisfy the performance obligation and the allocation in this manner is consistent with the standard's allocation objective.

Under the second approach, which treats the exercise of a material right as a contract modification (i.e., because there is a change in the scope and/or price of a contract), an entity follows the contract modification requirements in IFRS 15.18-21 (see section 3.4 above).

Since more than one approach would be acceptable, the TRG members generally agreed that an entity needs to consider which approach is most appropriate, based on the facts and circumstances, and consistently apply that approach to similar contracts.⁶⁵

Question 4-28: Is an entity required to evaluate whether a customer option that provides a material right includes a significant financing component? If so, how would entities perform this evaluation? (TRG meeting 30 March 2015 - Agenda paper no. 32)

The TRG members generally agreed that an entity has to evaluate whether a material right includes a significant financing component (see section 5.5 below) in the same way that it evaluates any other performance obligation. This evaluation requires judgement and consideration of the facts and circumstances.⁶⁶

On this question, the TRG agenda paper discussed a factor that might be determinative in this evaluation. IFRS 15.62(a) indicates that if a customer provides advance payment for a good or service, but the customer can choose when the good or service is transferred, no significant financing component exists. [IFRS 15.62(a)]. As a result, if the customer can choose when to exercise the option, it is unlikely that there will be a significant financing component.

Question 4-29: How would revenue be recognised for customer options for additional goods or services that represent a material right but do not have an expiration date (i.e., can an entity recognise breakage for these options)?

Stakeholders asked this question because IFRS 15.B40 states that an entity recognises revenue allocated to options that are material rights when the future goods or services resulting from the option are transferred or when the option expires. [IFRS 15.B40]. However, in some cases, options might be perpetual and not have an expiration date. For example, loyalty points likely provide a material right to a customer and, sometimes, these points do not expire.

⁶⁵ TRG Agenda paper no. 34, March 2015 Meeting - Summary of Issues Discussed and Next Steps, dated 13 July 2015.

⁶⁶ TRG Agenda paper no. 34, March 2015 Meeting - Summary of Issues Discussed and Next Steps, dated 13 July 2015.

How we see it

We believe an entity might apply the requirements in IFRS 15 on customers' unexercised rights (or breakage), which are discussed in section 7.9 below (i.e., IFRS 15.B44-B47) to customer options that represent a material right but do not have an expiry date. That is, we believe it is appropriate for revenue allocated to a customer option that does not expire to be recognised at the earlier of when the future goods or services, resulting from the option, are transferred or, if the goods or services are not transferred, when the likelihood of the customer exercising the option becomes remote.

4.7 Sale of products with a right of return

An entity might provide its customers with a right to return a transferred product. A right of return might be contractual, an implicit right that exists due to the entity's customary business practice or a combination of both (e.g., an entity has a stated return period, but generally accepts returns over a longer period). A customer exercising its right to return a product might receive a full or partial refund, a credit that can be applied to amounts owed, a different product in exchange or any combination of these items. [IFRS 15.B20].

Offering a right of return in a sales agreement obliges the selling entity to stand ready to accept any returned product. IFRS 15.B22 states that such an obligation does not represent a performance obligation. [IFRS 15.B22]. Instead, the Board concluded that an entity makes an uncertain number of sales when it provides goods with a return right. That is, until the right of return expires, the entity is not certain how many sales will fail. Therefore, the Board concluded that an entity does not recognise revenue for sales that are expected to fail as a result of the customer exercising its right to return the goods. [IFRS 15.BC364]. Instead, the potential for customer returns needs to be considered when an entity estimates the transaction price because potential returns are a component of variable consideration. This concept is discussed further in section 5.4 below.

IFRS 15.B26 clarifies that exchanges by customers of one product for another of the same type, quality, condition and price (e.g., one colour or size for another) are not considered returns for the purposes of applying the standard. [IFRS 15.B26]. Furthermore, contracts in which a customer might return a defective product in exchange for a functioning product need to be evaluated in accordance with the requirements on warranties included in IFRS 15. [IFRS 15.B27]. See further discussion on warranties in section 9.1 below.

5 IFRS 15 - Determine the transaction price

When (or as) an entity satisfies a performance obligation, it recognises revenue at the amount of the transaction price (which excludes constrained estimates of variable consideration - see section 5.2.3 below) that is allocated to that performance obligation. [IFRS 15.46].

The standard provides the following requirements for determining the transaction price: [IFRS 15.47, IFRS 15.48, IFRS 15.49]

Extract from IFRS 15

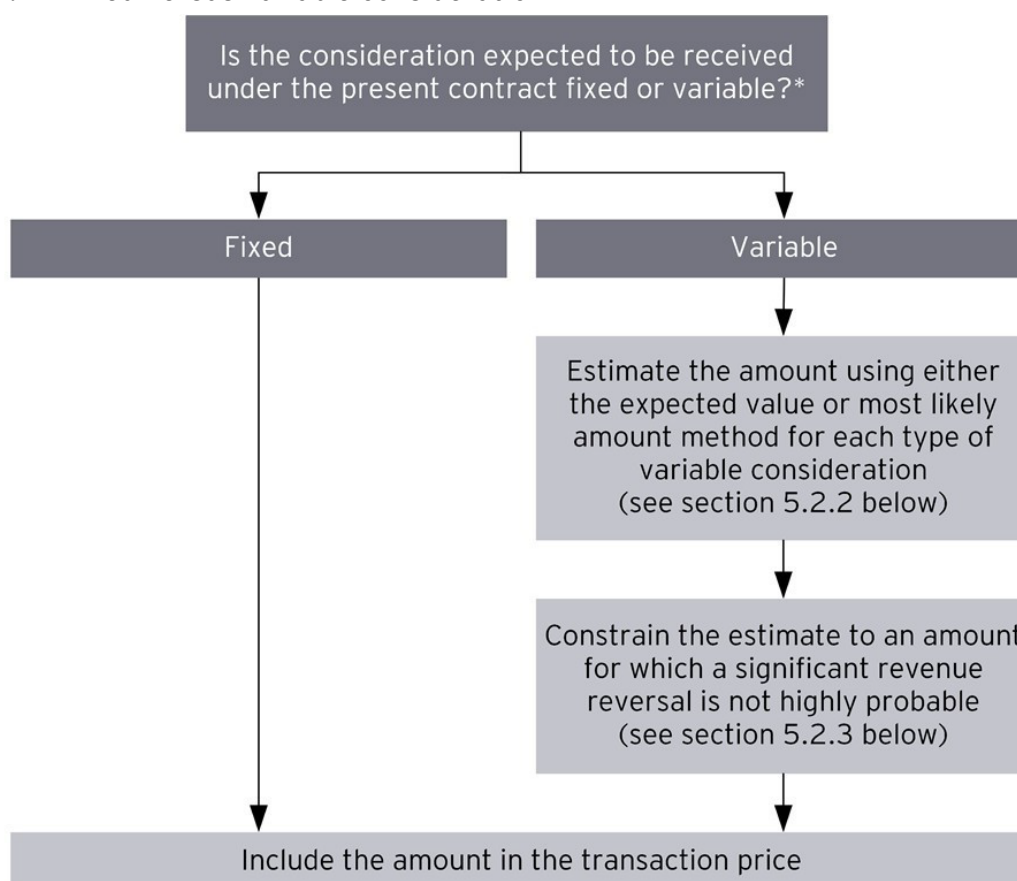

- 47** An entity shall consider the terms of the contract and its customary business practices to determine the transaction price. The transaction price is the amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer, excluding amounts collected on behalf of third parties (for example, some sales taxes). The consideration promised in a contract with a customer may include fixed amounts, variable amounts, or both.
- 48** The nature, timing and amount of consideration promised by a customer affect the estimate of the transaction price. When determining the transaction price, an entity shall consider the effects of all of the following:
- (a) variable consideration (see paragraphs 50-55 and 59);
 - (b) constraining estimates of variable consideration (see paragraphs 56-58);
 - (c) the existence of a significant financing component in the contract (see paragraphs 60-65);
 - (d) non-cash consideration (see paragraphs 66-69); and
 - (e) consideration payable to a customer (see paragraphs 70-72).
- 49** For the purpose of determining the transaction price, an entity shall assume that the goods or services will be transferred to the customer as promised in accordance with the existing contract and that the contract will not be cancelled, renewed or modified.

The transaction price is based on the amount to which the entity expects to be 'entitled'. This is meant to reflect the amount to which the entity has rights under the present contract (see section 3.2 above on contract enforceability and termination clauses). That is, the transaction price does not include estimates of consideration resulting from future change orders for additional goods or services. The amount to which the entity expects to be entitled also excludes amounts collected on behalf of another party, such as sales taxes. As noted in the Basis for Conclusions, the Board decided that the transaction price would not include the effects of the customer's credit risk, unless the contract includes a significant financing component (see section 5.5 below). [IFRS 15.BC185].

The IASB also clarified in the Basis for Conclusions that entities might have rights under the present contract to amounts that are to be paid by parties other than the customer and, if so, these amounts would be included in the transaction price. For example, in the healthcare industry, an entity might be entitled under the present contract to payments from the patient, insurance companies and/or government organisations. If that is the case, the total amount to which the entity expects to be entitled needs to be included in the transaction price, regardless of the source. [IFRS 15.BC187].

Determining the transaction price is an important step in applying IFRS 15 because this amount is allocated to the identified performance obligations and is recognised as revenue when (or as) those performance obligations are satisfied. In many cases, the transaction price is readily determinable because the entity receives payment when it transfers promised goods or services and the price is fixed (e.g., a restaurant's sale of food with a no refund policy). Determining the transaction price is more challenging when the consideration is variable, when payment is received at a time that differs from when the entity provides the promised goods or services or when payment is in a form other than cash. Consideration paid or payable by the entity to the customer might also affect the determination of the transaction price.

Figure 5-1 illustrates how an entity would determine the transaction price if the consideration to be received is fixed or variable:

Figure 5-1: Fixed versus variable consideration

* Consideration expected to be received under the contract can be variable even when the stated price in the contract is fixed. This is because the entity may be entitled to consideration only upon the occurrence or non-occurrence of a future event (see section 5.2.1 below).

Frequently asked questions

Question 5-1: How would entities determine the presentation of amounts billed to customers (e.g., shipping and handling, expenses or cost reimbursements and taxes under the revenue standards (i.e., as revenue or as a reduction of costs)?

(TRG meeting 18 July 2014 - Agenda paper no. 2)

See response to Question 4-16 in section 4.4.4 above.

5.1 Presentation of sales (and other similar) taxes

Various types of taxes based on the production, use, consumption or sale of goods and services are common in many jurisdictions (e.g., taxes levied on tobacco, alcohol, gasoline, sugar). Sales and excise taxes are those levied by taxing authorities on the sales of goods or services. Although various names are used for these taxes, sales taxes generally refer to taxes levied on the purchasers of the goods or services and excise taxes refer to those levied on the sellers of goods or services. Significant variations exist in how these taxes are calculated and administered and the regulations might differ significantly from one country to another. In some cases, these taxes are collected by an entity from a customer on behalf of the tax authorities while, in other cases, the entity is directly liable for the tax obligation.

The standard includes a general principle that an entity determines the transaction price exclusive of amounts collected on behalf of third parties (e.g., some sales taxes). Following the issuance of the standard, some stakeholders informed the Board's staff that there could be multiple interpretations regarding whether certain items that are billed to customers need to be presented as revenue or as a reduction of costs. Examples of such amounts include shipping and handling fees, reimbursements of out-of-pocket expenses and taxes or other assessments collected and remitted to government authorities.

At the July 2014 TRG meeting, the TRG members generally agreed that the standard is clear that any amounts that are not collected on behalf of third parties would be included in the transaction price (i.e., revenue). That is, if the amounts were earned by the entity in fulfilling its performance obligations, the amounts are included in the transaction price and recorded as revenue.

Several TRG members noted that this would require entities to evaluate taxes collected in all jurisdictions in which they operate to determine whether a tax is levied on the entity or the customer. That is, whether the entity is liable for the tax (regardless of whether it can pass that cost onto its customers) or the customer is liable, and the entity would be collecting the tax on behalf of the tax authority. Assume an entity sets the price for a good at CU99, which includes an amount equivalent to the sales tax of CU9:

- If the tax is levied on the entity (i.e., the entity is liable for the tax), the CU9 charged to the customer is because the entity is able to increase its prices to cover the sales tax (its own cost). Therefore, CU9 is actually part of the transaction price that the entity earns from the customer in exchange for fulfilling its performance obligation(s). That is, CU99 is the transaction price (i.e., revenue) and the entity would recognise an expense of CU9 when it is liable for the tax.
- If the tax is levied on the customer (i.e., the entity is collecting the tax on behalf of the tax authority), the transaction price would be CU90. This is because the sales tax of CU9 is being collected by the entity on behalf of the tax authority. Furthermore, the entity would not incur any costs in respect of the tax, since it is the customer who is liable, rather than the entity.

The TRG members also indicated that an entity would apply the principal versus agent application guidance (see section 4.4 above) when it is not clear whether the amounts are collected on behalf of third parties. This could result in amounts billed to a customer being recorded net of costs incurred (i.e., on a net basis).⁶⁷ Because sales or similar taxes are an obligation to a tax authority, rather than a good or service promised to a customer, the principal versus agent application guidance is applied by analogy and judgement might, therefore, be needed.

Determining whether an entity is a principal (i.e., directly liable for the tax obligation) or an agent (i.e., collecting the tax on behalf of the tax authority) in relation to such taxes will depend on the specific facts and circumstances, including the intention and underlying characteristics of the tax in the particular jurisdiction. The basis on which the tax is calculated might be informative (e.g., the sales price, units sold or consumed, units produced, imported or exported). However, the measurement point will not, in and of itself, determine the economic nature of the tax. Tax authorities might simply utilise a basis that is at a convenient point in the process and is easy to verify.

The July 2014 TRG paper included indicators identified by stakeholders, noting that one or more might indicate that the entity is the principal in relation to taxes and other assessments remitted to governmental authorities:⁶⁸

- *The entity is primarily responsible for fulfilling the tax obligation* - The TRG paper gives the example of a tax imposed upon telecommunication entities in the US based upon their revenues. In relation to that particular tax, the TRG paper noted that the entities “are responsible for that assessment regardless of whether they choose to seek full or partial reimbursement of that assessment through billings to their customers.” This example is contrasted with some in other jurisdictions where “the customer may be responsible for payment of sales (...) taxes even though the jurisdiction may require the entity to collect the tax from the customer and remit the entire amount to the jurisdiction.” In that context, the TRG paper noted that the customer might be responsible for remitting the tax to the appropriate authority if the entity does not collect the tax.
- *The entity has latitude with respect to the amount charged to the customer* - If the entity is able to make its own decision about whether and how it recovers the tax from its customers, it might be the principal. For example, the TRG paper noted that, “entities that are required to collect sales tax from customers are required to do so at the amount owed to the jurisdiction and remit that amount to the jurisdiction”, while other entities “make their own decision about whether and how they recover the costs” from their customers.
- *The amount retained by the entity is not fixed* - If the entity is required to remit what it collects from the customer and its retention is fixed (at zero), it might indicate it is an agent. Conversely, the entity might be a principal if its margins on the tax are not fixed and the selling price represents a business decision about the price that customers are willing to pay for the goods or services.
- *The entity has credit risk* - The TRG paper noted that an entity would have credit risk if it “is solely responsible for payment of the full tax or other assessment amount, regardless of whether it collects any amounts it has billed to its customers”.

⁶⁷ TRG Agenda paper no. 5, *July 2014 Meeting - Summary of Issues Discussed and Next Steps*, originally dated 31 October 2014, reissued 18 March 2015.

⁶⁸ TRG Agenda paper no. 2, *Gross versus Net Revenue: Amounts Billed to Customers*, dated 18 July 2014.

In addition to the above indicators, the TRG paper noted that, while it might vary depending on the nature of the sales (or similar) tax, some stakeholders thought it might not be clear “whether those amounts represent consideration to which the entity expects to be entitled *in exchange for transferring promised goods or services to a customer*”. That is, the amount billed to the customer in respect of the tax might not relate to the entity’s performance in satisfying a performance obligation. The TRG paper notes that this “may be evident in circumstances when the price of the good or service varies among jurisdictions by the statutorily mandated tax ... For example, when a good is sold over the internet, a sales tax amount is added (or not added) at time of checkout based on where the customer resides. In addition, in some jurisdictions, certain types of entities might not be required to pay sales tax for certain products, while other types of entities are required to pay sales tax for the same products.” Since the price variation in those examples is entirely attributable to the tax (not to any incremental performance), one might conclude that the tax amount should not be part of the transaction price (i.e., excluded from revenue).⁶⁹

FASB differences

The FASB’s standard allows an entity to make an accounting policy election to present revenue net of certain types of taxes (including sales, use, value-added and some excise taxes) with a requirement for preparers to disclose the policy. The IASB decided not to include a similar accounting policy election in IFRS 15. [IFRS 15.BC188D].

5.2 Variable consideration

The transaction price reflects an entity’s expectations about the consideration to which it will be entitled to receive from the customer. The standard provides the following requirements for determining whether consideration is variable and, if so, how it would be treated under the model: [IFRS 15.50, IFRS 15.51, IFRS 15.52]

Extract from IFRS 15

- | | |
|----|--|
| 50 | If the consideration promised in a contract includes a variable amount, an entity shall estimate the amount of consideration to which the entity will be entitled in exchange for transferring the promised goods or services to a customer. |
| 51 | An amount of consideration can vary because of discounts, rebates, refunds, credits, price concessions, incentives, performance bonuses, penalties or other similar items. The promised consideration can also vary if an entity’s entitlement to the consideration is contingent on the occurrence or non-occurrence of a future event. For example, an amount of consideration would be variable if either a product was sold with a right of return or a fixed amount is promised as a performance bonus on achievement of a specified milestone. |
| 52 | <p>The variability relating to the consideration promised by a customer may be explicitly stated in the contract. In addition to the terms of the contract, the promised consideration is variable if either of the following circumstances exists:</p> <ul style="list-style-type: none"> (a) the customer has a valid expectation arising from an entity’s customary business practices, published policies or specific statements that the entity will accept an amount of consideration that is less than the price stated in the contract. That is, it is expected that the entity will offer a price concession. Depending on the jurisdiction, industry or customer this offer may be referred to as a discount, rebate, refund or credit. (b) other facts and circumstances indicate that the entity’s intention, when entering into the contract with the customer, is to offer a price concession to the customer. |

These concepts are discussed in more detail below.

5.2.1 Forms of variable consideration

IFRS 15.51 describes ‘variable consideration’ broadly to include discounts, rebates, refunds, credits, price concessions, incentives, performance bonuses (e.g., meeting specified performance conditions where there is uncertainty about the outcome) and penalties. [IFRS 15.51]. Variable consideration can result from explicit terms in a contract to which the parties to the contract agreed or can be implied by an entity’s past business practices or intentions under the contract. It is important for entities to appropriately identify the different instances of variable consideration included in a contract because the second step of estimating variable consideration requires entities to apply a constraint (as discussed further in section 5.2.3 below) to all variable consideration.

⁶⁹ TRG Agenda paper no. 2, Gross versus Net Revenue: Amounts Billed to Customers, dated 18 July 2014.

The Board noted in the Basis for Conclusions that consideration can be variable even when the stated price in the contract is fixed. This is because the entity might be entitled to consideration only upon the occurrence or non-occurrence of a future event. [IFRS 15.BC191]. For example, IFRS 15's description of variable consideration includes amounts resulting from variability due to customer refunds or returns. As a result, a contract to provide a customer with 100 widgets at a fixed price per widget would be considered to include a variable component if the customer has the right to return the widgets (see section 5.4 below).

In many transactions, entities have variable consideration as a result of rebates and/or discounts on the price of products or services they provide to customers once the customers meet specific volume thresholds. The standard contains the following example relating to volume discounts: [IFRS 15.IE Example 24, IFRS 15.IE124-IE128]

Extract from IFRS 15

Example 24-Volume discount incentive

An entity enters into a contract with a customer on 1 January 20X8 to sell Product A for CU100 per unit. If the customer purchases more than 1,000 units of Product A in a calendar year, the contract specifies that the price per unit is retrospectively reduced to CU90 per unit. Consequently, the consideration in the contract is variable.

For the first quarter ended 31 March 20X8, the entity sells 75 units of Product A to the customer. The entity estimates that the customer's purchases will not exceed the 1,000-unit threshold required for the volume discount in the calendar year.

The entity considers the requirements in paragraphs 56-58 of IFRS 15 on constraining estimates of variable consideration, including the factors in paragraph 57 of IFRS 15. The entity determines that it has significant experience with this product and with the purchasing pattern of the entity. Thus, the entity concludes that it is highly probable that a significant reversal in the cumulative amount of revenue recognised (ie CU100 per unit) will not occur when the uncertainty is resolved (ie when the total amount of purchases is known). Consequently, the entity recognises revenue of CU7,500 (75 units × CU100 per unit) for the quarter ended 31 March 20X8.

In May 20X8, the entity's customer acquires another company and in the second quarter ended 30 June 20X8 the entity sells an additional 500 units of Product A to the customer. In the light of the new fact, the entity estimates that the customer's purchases will exceed the 1,000-unit threshold for the calendar year and therefore it will be required to retrospectively reduce the price per unit to CU90.

Consequently, the entity recognises revenue of CU44,250 for the quarter ended 30 June 20X8. That amount is calculated from CU45,000 for the sale of 500 units (500 units × CU90 per unit) less the change in transaction price of CU750 (75 units × CU10 price reduction) for the reduction of revenue relating to units sold for the quarter ended 31 March 20X8 (see paragraphs 87 and 88 of IFRS 15).

How we see it

IFRS 15 requires entities to disclose how they estimate variable consideration when determining the transaction price in contracts with customers, including the following:

- Significant payment terms (including whether the consideration is variable and whether the estimate is typically constrained, rights of return, etc.)
- Significant judgements used in determining the transaction price, including information about methods, inputs and assumptions used to estimate variable consideration and assess whether the estimate is constrained

As a result, entities might need to explain the different forms of variable consideration included in their contracts with customers. Entities, therefore, need to carefully consider and identify all forms of variable consideration when they determine the transaction price for their customer contracts and review their disclosures to verify that they meet the disclosure requirements in IFRS 15.119, 123 and 126 (see section 10.5 below for further discussion of disclosure requirements).

Frequently asked questions

Question 5-2: Are volume rebates and/or discounts on goods or services accounted for as variable consideration or as customer options to acquire additional goods or services at a discount?

See response to Question 4-23 in section 4.6 above.

Question 5-3: How would an entity distinguish between a contract that contains an option to purchase additional goods or services and a contract that includes variable consideration based on a variable quantity (e.g., a usage-based fee)?

(TRG Meeting 9 November 2015 - Agenda paper no. 48)

See response to Question 4-20 in section 4.6 above.

Question 5-4: Are liquidated damages, penalties or compensation from other similar clauses accounted for as variable consideration or as warranties under the standard?

How we see it

Most liquidated damages, penalties and similar payments are accounted for as variable consideration. However, in limited situations, we believe that amounts that are based on the actual performance of a delivered good or service could be considered similar to warranty payments (e.g., in situations in which an entity pays the customer's direct costs to remedy a defect).

Some contracts provide for liquidated damages, penalties or other damages if an entity fails to deliver future goods or services or if the goods or services fail to meet certain specifications. IFRS 15.51 includes 'penalties' as an example of variable consideration and describes how promised consideration in a contract can be variable if the right to receive the consideration is contingent on the occurrence or non-occurrence of a future event (e.g., the contract specifies that an entity pays a penalty if it fails to perform according to the agreed upon terms). [IFRS 15.51].

Cash fines or penalties paid to a customer would generally be accounted for under the requirements on consideration payable to a customer (which might be treated as variable consideration, see section 5.7 below). However, we believe there might be situations in which it is appropriate to account for cash payments to a customer as an assurance-type warranty (e.g., an entity's direct reimbursement to the customer for costs paid by the customer to a third party for repair of a product, see section 9.1 below on warranties).

Example 20 in the standard illustrates a performance penalty that is a form of variable consideration. [IFRS 15.IE Example 20, IFRS 15.IE102-IE104].

In 2019, the IFRS IC received a request asking whether an airline accounts for its obligation to compensate customers for delayed or cancelled flights as variable consideration or, separate from the contract, by applying IAS 37.

When the issue was discussed at the September 2019 meeting, the IFRS IC observed that the compensation for delays or cancellations gives rise to variable consideration because it:

- Relates directly to the entity's fulfilment of its performance obligation (i.e., failure to perform as promised triggers the compensation payment)
- And
- Does not represent compensation for harm or damage caused by the entity's products (and, therefore, IFRS 15.B33 does not apply)

The IFRS IC also observed that the compensation payment was similar to penalties for delayed transfer of an asset, which also gives rise to variable consideration, as is illustrated in Example 20 of the standard.⁷⁰

Question 5-5: If a contract includes an undefined quantity of outputs, but the contractual rate per unit is fixed, is the consideration variable?

(TRG meeting 13 July 2015 - Agenda paper no. 39)

The TRG members generally agreed that if a contract includes an unknown quantity of tasks, throughout the contract period, for which the entity has enforceable rights and obligations (i.e., the unknown quantity of tasks is not an option to purchase additional goods or services, as described in Question 4-20 in section 4.6 above) and the consideration received is contingent upon the quantity completed, the total transaction price would be variable. This is because the contract has a range of possible transaction

⁷⁰ [IFRIC Update](#), September 2019, available on the IFRS Foundation's website.

prices and the ultimate consideration depends on the occurrence or non-occurrence of a future event (e.g., customer usage), even though the rate per unit is fixed.

The TRG agenda paper on this topic noted that an entity would need to consider contractual minimums (or other clauses) that would make some or all of the consideration fixed.

Question 5-6: If a contract is denominated in a currency other than the entity's functional currency, would changes in the contract price due to exchange rate fluctuations be accounted for as variable consideration?

Changes to the contract price due to exchange rate fluctuations are a consequence of entering into a contract that is denominated in a foreign currency.

How we see it

The variability resulting from changes in foreign exchange rates relates to the form of the consideration (i.e., it is in a currency other than the entity's functional currency), rather than as a result of a contractual term like a discount or rebate or one that depends on the occurrence or non-occurrence of a future event, as described in IFRS 15.51. As such, we believe that it would not be considered variable consideration when determining the transaction price.

Such variability might, instead, need to be accounted for in accordance with IFRS 9 if it is a separable embedded derivative. Otherwise, an entity would account for this variability in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates*.

IFRIC 22 *Foreign Currency Transactions and Advance Consideration* specifies that when consideration denominated in a foreign currency is recognised in advance of the associated revenue, the appropriate application of IAS 21 is to measure the revenue using the exchange rate at the date the advanced receipt is recognised, normally the payment date (see Chapter 16). [IFRIC 22.8].

Question 5-7: How would an entity account for price protection or price matching clauses included in a contract with a customer?

How we see it

Consideration subject to price protection or price matching clauses that require an entity to refund a portion of the consideration to the customer in certain situations must be accounted for as variable consideration under IFRS 15. That is, we believe that, if an entity is required to retrospectively apply lower prices to previous purchases made by a customer (or has a past business practice of doing so, even if the contractual terms would only require prospective application), the consideration would be accounted for as variable consideration.

Examples include contracts between an entity and a customer that provide, either as a matter of formal agreement or due to an entity's business practices, that the entity will refund or provide a credit equal to a portion of the original purchase price towards future purchases if the entity subsequently reduces its price for a previously delivered product and the customer still has inventory of that product on hand. An entity might also offer to match a competitor's price and provide a refund of the difference if the customer finds the same product offered by one of the entity's competitors for a lower price during a specified period of time following the sale.

Contracts with customers also might contain 'most favoured nation' or 'most favoured customer' clauses under which the entity guarantees that the price of any products sold to the customer after contract inception will be the lowest price the entity offers to any other customer. How consideration from such contracts would be accounted for under IFRS 15 depends on the terms of the clause (i.e., whether the price protection is offered prospectively or retrospectively).

How we see it

We believe that clauses that require an entity to prospectively provide a customer with its best prices on any purchases of products after the execution of a contract have no effect on the revenue recognised for goods or services already transferred to the customer (i.e., the consideration would not be accounted for as variable consideration).

However, if an entity is required to retrospectively apply lower prices to previous purchases made by a customer (or has a past business practice of doing so even if the written contractual terms would only require prospective application), we believe the contract includes a form of price protection and the consideration subject to this provision would be accounted for as variable consideration, as discussed above.

We note that these clauses might be present in arrangements with governmental agencies. For example, an entity might be required to monitor discounts given to comparable customers during the contract period and to refund the difference between what was paid by the government and the price granted to comparable commercial customers.

Question 5-8: Do early payment (or prompt payment) discounts represent a form of variable consideration?

Contracts with customers might include a discount for early payment (or 'prompt payment' discount) under which the customer can pay less than an invoice's stated amount if the payment is made within a certain period of time. For example, a customer might receive a 2% discount if the payment is made within 15 days of receipt (if payment is otherwise due within 45 days of receipt).

How we see it

Because the amount of consideration to be received by the entity would vary depending on whether the customer takes advantage of the discount, we believe the transaction price is variable.

Question 5-9: How does an entity account for a dispute related to a contract accounted for in accordance with IFRS 15 that might result in consideration received or receivable from a customer?

A dispute related to a contract accounted for in accordance with IFRS 15 may result in consideration received or receivable from a customer. Disputes might involve third-party arbitration or litigation proceedings, or they might not (e.g., a resolution negotiated only between the entity and the customer).

For settlements (or potential settlements) received or receivable from a customer, an entity needs to apply judgement to determine the appropriate accounting based on a thorough analysis of facts and circumstances. Such settlements might be in the scope of IFRS 15 but might also be (partially) in the scope of another standard, for example, if the entity is entitled to compensation for specific legal expenses it has incurred in connection with pursuing the dispute. If the entity receives (or expects to receive) consideration from its customer as part of a settlement related to a contract accounted for in accordance with IFRS 15, the payment may represent variable consideration to which the entity is entitled based on its performance under that contract. The requirements for estimating and constraining variable consideration in IFRS 15 would apply.

An entity will also need to determine whether the settlement with the customer represents a contract modification, (see section 3.4 above, including Question 3-13). This would be the case if the settlement results in a change in the scope and/or price of a contract that either creates new or changes existing enforceable rights and obligations of the parties. Judgement may also be required to distinguish between a contract modification and a change in the estimated transaction price due to variable consideration, as discussed in Question 3-15 in section 3.4 above.

If a dispute arises, but the payment or anticipated payment was not contemplated in the original contract and the settlement does not yet represent a contract modification, the requirements for contingent assets in IAS 37 (see Chapter 27) might apply until there is a contract modification under IFRS 15.

For settlements (or potential settlements) from litigation or disputes that result in consideration paid or payable to a customer, please see response to Question 5-32 in section 5.7.1 below.

5.2.1.A Implicit price concessions

For some contracts, the stated price has easily identifiable variable components. However, for other contracts, the consideration might be variable because the facts and circumstances indicate that the entity might accept a lower price than the amount stated in the contract (i.e., it expects to provide an implicit price concession). [IFRS 15.52(b)]. This could be a result of the customer having a valid expectation that the entity will reduce its price based on the entity's customary business practices, published policies or statements made by the entity.

An implicit price concession could also result from other facts and circumstances indicating that the entity intended to offer a price concession to the customer when it entered into the contract. For example, an entity might accept a lower price than the amount stated in the contract to develop or enhance a customer relationship or because the incremental cost of providing the service to the customer is not significant and the consideration it expects to collect provides a sufficient margin.

An entity deducts from its contract price any estimated price concessions to derive the transaction price at contract inception (i.e., the amount the entity expects to be entitled in exchange for the goods or services that will be transferred to the customer). The IFRS 15 collectability assessment is then performed on the transaction price (see section 3.1.5 above). An entity also has to assess any contract assets or trade receivables arising from an IFRS 15 contract under the expected credit loss model in IFRS 9 (see Chapter 47).

The standard provides the following example of when an implicit price concession exists and, as a result, the transaction price is not the amount stated in the contract: [IFRS 15.IE Example 2, IFRS 15.IE7-IE9]

Extract from IFRS 15

Example 2-Consideration is not the stated price - implicit price concession

An entity sells 1,000 units of a prescription drug to a customer for promised consideration of CU1 million. This is the entity's first sale to a customer in a new region, which is experiencing significant economic difficulty. Thus, the entity expects that it will not be able to collect from the customer the full amount of the promised consideration. Despite the possibility of not collecting the full amount, the entity expects the region's economy to recover over the next two to three years and determines that a relationship with the customer could help it to forge relationships with other potential customers in the region.

When assessing whether the criterion in paragraph 9(e) of IFRS 15 is met, the entity also considers paragraphs 47 and 52(b) of IFRS 15. Based on the assessment of the facts and circumstances, the entity determines that it expects to provide a price concession and accept a lower amount of consideration from the customer. Accordingly, the entity concludes that the transaction price is not CU1 million and, therefore, the promised consideration is variable. The entity estimates the variable consideration and determines that it expects to be entitled to CU400,000.

The entity considers the customer's ability and intention to pay the consideration and concludes that even though the region is experiencing economic difficulty, it is probable that it will collect CU400,000 from the customer. Consequently, the entity concludes that the criterion in paragraph 9(e) of IFRS 15 is met based on an estimate of variable consideration of CU400,000. In addition, on the basis of an evaluation of the contract terms and other facts and circumstances, the entity concludes that the other criteria in paragraph 9 of IFRS 15 are also met. Consequently, the entity accounts for the contract with the customer in accordance with the requirements in IFRS 15.

Examples 3 and 23 from the standard also illustrate situations where an implicit price concession exists at contract inception and, therefore, the transaction price evaluated for collectability is not the amount stated in the contract due to implicit price concessions that exist at contract inception. Example 23 is included in section 5.2.3 below. Example 3, is not replicated in this chapter.

Variable consideration might also result from extended payment terms in a contract and any resulting uncertainty about whether the entity will be willing to accept a lower payment amount in the future. That is, an entity has to evaluate whether the extended payment terms represent an implied price concession because the entity does not intend to collect all amounts due in future periods. Offering extended payment terms might also indicate that the contract includes a significant financing component (see section 5.5 below).

5.2.1.B Variable consideration versus credit risk

As discussed in section 3.1.5 above, entities need to determine at contract inception whether they expect to collect a lower amount of consideration than the amount stated in the contract. In the Basis for Conclusions, the IASB acknowledged that, in some cases, it might be difficult to determine whether the entity has implicitly offered a price concession (i.e., variable consideration) or whether the entity has chosen to accept the risk of the customer defaulting on the contractually agreed consideration (i.e., impairment losses under IFRS 9, see Chapter 47). [IFRS 15.BC194]. The Board did not develop detailed application guidance to assist in distinguishing between price concessions (recognised as variable consideration, within revenue) and an expected credit loss to be accounted for as an impairment loss under IFRS 9 (i.e., outside of revenue). Therefore, entities need to consider all relevant facts and circumstances when analysing situations in which an entity is willing to accept a lower price than the amount stated in the contract.

How we see it

We believe the following factors might suggest that the entity has implicitly offered a price concession to the customer:

- The entity has an established business practice that indicates it is willing to accept consideration less than its contractually stated prices. For example, an entity routinely accepts reduced payments on services for which it earns high margins, indicating that it is willing to accept an amount of consideration that is less than the contract price.
- The entity has a history of not enforcing its contractual rights to promised consideration in similar contracts under similar circumstances such that customers expect the entity to offer price concessions. For example, the customer has a valid expectation that the entity is willing to accept a lower amount of consideration than the contractually stated price based on its past experience with the entity.
- The entity is willing to enter into a contract with a customer even though facts and circumstances indicate that the customer intends to pay an amount of consideration that is less than the contractually stated price. For example, the entity willingly enters into a contract expecting that it will receive less than the stated contract price, implicitly reducing the transaction price to the expected lesser consideration.

Appropriately distinguishing between price concessions (i.e., reductions of revenue) and customer credit risk (i.e., impairment loss) for collectability concerns, that were known at contract inception, is also important because it affects whether a valid contract exists (see section 3.1.5 above). If an entity determines at contract inception that a contract includes a price concession (i.e., variable consideration), the estimated amount of the concession is reflected in the transaction price (i.e., as a reduction of the stated contract price). As illustrated in Example 2 in IFRS 15 in the extract in section 5.2.1.A above (and also in Examples 3 and 23 in IFRS 15, see example 23 included in section 5.2.3 below), entities might estimate a transaction price that is significantly lower than the stated invoice or contractual amount, but still consider the difference between those amounts to be variable consideration (e.g., a price concession), rather than a collectability issue that would result in expected credit losses.

After the entity has determined the amount to assess for collectability under IFRS 15.9(e), it also has to apply the requirements in IFRS 9 to account for any expected credit losses for the receivable (or contract asset) that is recorded (i.e., after consideration of any variable consideration, such as an implicit price concession). Also, it presents any resulting impairment loss as an expense under IFRS 9 (i.e., not as a reduction of the transaction price). This is illustrated in an example from a January 2015 TRG agenda paper included in Question 3-4 in section 3.1.5.B above.⁷¹

After contract inception, entities need to update both their estimate of variable consideration under IFRS 15 (see section 5.2.4 below) and their assessment of expected credit losses under IFRS 9, respectively, at the end of each reporting period. When the amount an entity expects to collect changes after contract inception, the entity might need to exercise significant judgement to determine whether that change is due to: (1) a change in estimate of the variable consideration identified at contract inception (and, therefore, would be accounted for as a change in the transaction price, as discussed in section 6.5 below); or (2) an identifiable credit event (e.g., a known or expected decline in a customer's operations, a known or expected bankruptcy filing or other financial reorganisation or the request for a concession on payment terms due to economic reasons) that would trigger a credit loss to be accounted for as an

⁷¹ TRG Agenda paper no. 13, *Collectibility*, dated 26 January 2015.

impairment loss under IFRS 9 (i.e., outside revenue). It is likely that this determination will require entities to establish policies to differentiate between price concessions and customer credit events, both at contract inception and as facts and circumstances change over the life of the contract. Such assessments could, for example, be needed during a pandemic or following a natural disaster because customers' ability and intent to pay might be affected and/or entities might be more willing to accept partial payment or extended payment terms. Importantly, if the parties need to change the terms of contracts with existing customers as a result, entities need to determine whether there is a contract modification (see section 3.4 above).

When making this evaluation, the entity needs to consider the facts and circumstances that led to its change in expectation about the amount it expects to collect. For example, if an entity that had contemplated an implicit price concession at contract inception decides to increase the amount of the concession it is willing to provide to further enhance the relationship with its customer, it might conclude that this is variable consideration. Therefore, it would be a reduction of the transaction price, i.e., revenue. In contrast, if the entity determines it will collect less consideration than it originally estimated due to its customer filing for bankruptcy, it is likely the entity would conclude that this is an impairment loss to be accounted for outside of IFRS 15 (i.e., there would be no adjustment to revenue).

An entity might also need to make the following assessments when evaluating changes in expectations about the amount it expects to collect after contract inception:

- Reassess collectability of the remaining contract consideration if the entity concludes that the change in expectation is due to a significant change in facts and circumstances (see Question 3-5 in section 3.1.5.B above).
- Consider whether the change in expectation is due to a contract modification. A contract modification is defined in IFRS 15 as “a change in the scope or price (or both) of a contract that is approved by the parties to the contract”. [IFRS 15.18]. See section 3.4 above for further discussion on contract modifications.
- Consider whether the change in expectation indicates that the entity needs to assess related capitalised costs to obtain or fulfil a contract for impairment (see section 9.3 below).

How we see it

Determining, at contract inception, whether an entity has implicitly offered a price concession (i.e., variable consideration) or whether it has accepted the risk that a customer might default on the contractually agreed-upon consideration (i.e., impairment losses) might require significant judgement. The entity needs to consider its specific facts and circumstances, including its customary business practices and any other indicators about whether it intended at contract inception to offer a price concession to the customer.

Entities might also need to apply judgement when determining whether a change in the amount it expects to collect after contract inception is due to a change in an estimate of variable consideration (and, therefore, needs to be accounted for as change in transaction price) or due to a change in estimated credit losses that would be accounted for as impairment loss.

5.2.2 Estimating variable consideration

If a contract with a customer includes variable consideration, IFRS 15.50 (see section 5.2 above) states that “an entity shall estimate the amount of consideration to which the entity will be entitled in exchange for transferring the promised goods or services to a customer”. Entities are generally required to estimate variable consideration at contract inception and at the end of each reporting period (see section 5.2.4 below for reassessment requirements). In Question 5-10 below, we discuss limited situations in which the estimation of variable consideration might not be required.

Variable consideration generally needs to be estimated, instead of waiting for the variable consideration to be received or known with a high degree of certainty (e.g., upon receipt of a report from a customer detailing the amount of revenue due to the entity). For example, it would not be acceptable for entities that sell their products through distributors or resellers to wait until the end-sale has occurred if the only uncertainty is the variability in the pricing. This is because IFRS 15 requires an entity to estimate the variable consideration (the end-sales price in our example) based on the information available, taking into consideration the effect of the constraint on variable consideration (see section 5.2.3 below), unless one of the limited situations discussed in Question 5-10 occurs.

An entity is required to estimate variable consideration using either the 'expected value' or the 'most likely amount' method, as described in the standard: [IFRS 15.53, IFRS 15.54]

Extract from IFRS 15

- 53 An entity shall estimate an amount of variable consideration by using either of the following methods, depending on which method the entity expects to better predict the amount of consideration to which it will be entitled:
- (a) The expected value-the expected value is the sum of probability-weighted amounts in a range of possible consideration amounts. An expected value may be an appropriate estimate of the amount of variable consideration if an entity has a large number of contracts with similar characteristics.
 - (b) The most likely amount-the most likely amount is the single most likely amount in a range of possible consideration amounts (ie the single most likely outcome of the contract). The most likely amount may be an appropriate estimate of the amount of variable consideration if the contract has only two possible outcomes (for example, an entity either achieves a performance bonus or does not).
- 54 An entity shall apply one method consistently throughout the contract when estimating the effect of an uncertainty on an amount of variable consideration to which the entity will be entitled. In addition, an entity shall consider all the information (historical, current and forecast) that is reasonably available to the entity and shall identify a reasonable number of possible consideration amounts. The information that an entity uses to estimate the amount of variable consideration would typically be similar to the information that the entity's management uses during the bid-and-proposal process and in establishing prices for promised goods or services.

An entity is required to choose between the expected value method and the most likely amount method based on which method better predicts the amount of consideration to which it will be entitled. That is, the method selected is not meant to be a 'free choice'. Rather, an entity must select the method that is best suited, based on the specific facts and circumstances of the contract. [IFRS 15.53].

An entity applies the selected method consistently to each type of variable consideration throughout the contract term and updates the estimated variable consideration at the end of each reporting period. Once it selects a method, an entity is required to apply that method consistently for similar types of variable consideration in similar types of contracts. In the Basis for Conclusions, the Board noted that a contract might contain different types of variable consideration. [IFRS 15.BC202]. As such, it might be appropriate for an entity to use different methods (i.e., expected value or most likely amount) for estimating different types of variable consideration within a single contract. This is illustrated in Example 21 in the standard. [IFRS 15.IE Example 21, IFRS 15.IE105-IE108].

Entities determine the expected value of variable consideration using the sum of probability-weighted amounts in a range of possible amounts under the contract. To do this, an entity identifies the possible outcomes of a contract and the probabilities of those outcomes. The Board indicated in the Basis for Conclusions that the expected value method is likely to better predict expected consideration when an entity has a large number of contracts with similar characteristics. [IFRS 15.BC200]. This method might also better predict consideration when an entity has a single contract with a large number of possible outcomes. The IASB clarified that an entity preparing an expected value calculation is not required to consider all possible outcomes, even if the entity has extensive data and can identify many possible outcomes. Instead, the IASB noted in the Basis for Conclusions that, in many cases, a limited number of discrete outcomes and probabilities can provide a reasonable estimate of the expected value. [IFRS 15.BC201].

Illustration 5-1: Estimating the transaction price using the expected value method

Entity A enters into contracts with customers to construct commercial buildings. The contracts include similar terms and conditions and contain a fixed fee plus variable consideration for a performance bonus related to the timing of Entity A's completion of the construction. Based on Entity A's historical experience, the expected bonus amounts and associated probabilities for achieving each bonus are, as follows:

Bonus amount	Probability of outcome
CU0	25%
CU100,000	50%
CU150,000	25%

Entity A determines that using the expected value method would better predict the amount of consideration to which it will be entitled because it has a large number of contracts that have characteristics that are similar to the new contract. Under the expected value method, Entity A estimates variable consideration of CU87,500, as follows:

Bonus amount (a)	Probability of outcome (b)	Expected value amount (a × b)
CU0	25%	CU0
CU100,000	50%	CU50,000
CU150,000	25%	CU37,500
Total		CU87,500

Entity A needs to consider the effect of applying the constraint on variable consideration (see section 5.2.3 below).

Entities determine the most likely amount of variable consideration using the single most likely amount in a range of possible consideration amounts. The Board indicated in the Basis for Conclusions that the most likely amount method might be the better predictor when the entity expects to be entitled to one of two possible amounts. [IFRS 15.BC200]. For example, a contract in which an entity is entitled to receive all or none of a specified performance bonus, but not a portion of that bonus.

Illustration 5-2: Estimating the transaction price using the most likely amount

Entity A enters into a six-month advertising campaign agreement (CU500,000 fixed fee) that also includes a potential CU100,000 performance bonus linked to certain goals. Entity A estimates that it is 90% likely to receive the entire performance bonus and 10% likely to receive none of the bonus.

Because of the binary nature of the outcome (i.e., the entity will either receive the performance bonus or not receive it), Entity A determines that the most likely amount method is the better predictor of the amount to which it expects to be entitled. Because it is 90% probable that Entity A will receive the CU100,000 performance bonus, Entity A estimates the most likely amount it will receive is CU600,000 (i.e., CU500,000 fixed fee plus the entire CU100,000 bonus).

However, Entity A also needs to consider the effect of applying the constraint on variable consideration (see section 5.2.3 below) and determine whether it is highly probable that a significant reversal will not occur if it includes the entire CU100,000 performance bonus in the transaction price.

The standard requires that when applying either of these methods, an entity considers all information (historical, current and forecast) that is reasonably available to the entity. Some stakeholders questioned whether an entity would be applying the portfolio approach practical expedient in IFRS 15.4 (see section 3.3.1 above) when considering evidence from other, similar contracts to develop an estimate of variable consideration using an expected value method. The TRG members discussed this question and generally agreed that an entity would not be applying the portfolio approach practical expedient if it used a portfolio of data from its historical experience with similar customers and/or contracts. The TRG members noted that an entity could choose to apply the portfolio approach practical expedient, but would not be required to do so.⁷² Use of this practical expedient requires an entity to assert that it does not expect the use of the expedient to differ materially from applying the standard to an individual contract. The TRG agenda paper noted that using a portfolio of data is not equivalent to using the portfolio approach practical expedient, so entities that use the expected value method to estimate variable consideration would not be required to assert that the outcome from the portfolio is not expected to materially differ from an assessment of individual contracts.

⁷² TRG Agenda paper no. 38, *Portfolio Practical Expedient and Application of Variable Consideration Constraint*, dated 13 July 2015.

Frequently asked questions

Question 5-10: Are there any situations in which an entity would not have to estimate variable consideration at contract inception under IFRS 15?

An entity would not have to estimate variable consideration at the inception of a contract in the following situations:

- **Variable consideration allocation exception** - When the terms of a variable payment relate to an entity's efforts to satisfy a specific part of a contract (i.e., one or more, but not all, performance obligations or distinct goods or services promised in a series) and allocating the consideration to this specific part is consistent with the overall allocation objectives of the standard, IFRS 15 requires variable consideration to be allocated entirely to that specific part of a contract. As a result, variable consideration would not be estimated for the purpose of recognising revenue. For example, an entity that provides a series of distinct hotel management services and receives a variable fee based on a fixed percentage of rental revenue would need to allocate the percentage of monthly rental revenue entirely to the period in which the consideration is earned if the criteria to use this allocation exception are met.

However, an entity that is required to allocate variable consideration to a separate performance obligation in a contract, may need to include expected variable consideration in its estimate of the stand-alone selling price of one or more of the performance obligations to assess whether the resulting allocation is consistent with the allocation objective in IFRS 15.73-74 when considering all of the performance obligations and payment terms in the contract.

See section 6.3 below for further discussion of the variable consideration allocation exception.
- **The 'right to invoice' practical expedient** - When an entity recognises revenue over-time, the right to invoice practical expedient allows it to recognise revenue as invoiced if the entity's right to payment is for an amount that corresponds directly with the value to the customer of the entity's performance to date. For example, an entity would not be required to estimate the variable consideration for a three-year service contract under which it has a right to invoice the customer a fixed amount for each hour of service rendered, provided that fixed amount reflects the value to the customer. See section 7.1.4.B below for further discussion of the right to invoice practical expedient.
- **Recognition constraint for sales-based and usage-based royalties related to licences of intellectual property** - The standard provides explicit application guidance for recognising consideration from sales-based and usage-based royalties provided in exchange for licences of intellectual property. The standard states that an entity recognises sales-based and usage-based royalties as revenue at the later of when: (1) the subsequent sales or usage occurs; or (2) the performance obligation to which some, or all, of the sales-based or usage-based royalty has been allocated has been satisfied (or partially satisfied). In many cases, using this application guidance results in the same pattern of revenue recognition as fully constraining the estimate of variable consideration associated with the future royalty stream. However, in cases where an entity is required to allocate sales-based or usage-based royalties to separate performance obligations in a contract, it might need to include expected royalties in its estimate of the stand-alone selling price of one or more of the performance obligations. See section 8.5 below for further discussion about sales-based and usage-based royalties related to licences of intellectual property.

5.2.3 Constraining estimates of variable consideration

Before an entity can include any amount of variable consideration in the transaction price, it must consider whether the amount of variable consideration is required to be constrained. The Board explained in the Basis for Conclusions that it created this constraint on variable consideration to address concerns raised by many constituents that the standard could otherwise require recognition of revenue before there was sufficient certainty that the amounts recognised would faithfully depict the consideration to which an entity expects to be entitled in exchange for the goods or services transferred to a customer. [IFRS 15.BC203].

The IASB explained in the Basis for Conclusions that it did not intend to eliminate the use of estimates from the revenue recognition standard. Instead, it wanted to make sure the estimates are robust and result in useful information. [IFRS 15.BC204]. Following this objective, the Board concluded that it was appropriate to include estimates of variable consideration in revenue only when an entity has a 'high degree of confidence' that revenue will not be reversed in a subsequent reporting period.

Therefore, as the following extract from the standard states, the constraint is aimed at preventing the over-recognition of revenue (i.e., the standard focuses on potential significant reversals of revenue): [IFRS 15.56, IFRS 15.57]

Extract from IFRS 15

- 56 An entity shall include in the transaction price some or all of an amount of variable consideration estimated in accordance with paragraph 53 only to the extent that it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur when the uncertainty associated with the variable consideration is subsequently resolved.
- 57 In assessing whether it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur once the uncertainty related to the variable consideration is subsequently resolved, an entity shall consider both the likelihood and the magnitude of the revenue reversal. Factors that could increase the likelihood or the magnitude of a revenue reversal include, but are not limited to, any of the following:
- (a) the amount of consideration is highly susceptible to factors outside the entity's influence. Those factors may include volatility in a market, the judgement or actions of third parties, weather conditions and a high risk of obsolescence of the promised good or service.
 - (b) the uncertainty about the amount of consideration is not expected to be resolved for a long period of time.
 - (c) the entity's experience (or other evidence) with similar types of contracts is limited, or that experience (or other evidence) has limited predictive value.
 - (d) the entity has a practice of either offering a broad range of price concessions or changing the payment terms and conditions of similar contracts in similar circumstances.
 - (e) the contract has a large number and broad range of possible consideration amounts.

The standard has a different model “for consideration in the form of a sales-based or usage-based royalty that is promised in exchange for a licence of intellectual property”. [IFRS 15.58]. See section 8.5 below for further discussion about sales-based and usage-based royalties related to licences of intellectual property.

To include variable consideration in the estimated transaction price, the entity has to conclude that it is ‘highly probable’ that a significant revenue reversal will not occur in future periods once the uncertainty related to the variable consideration is resolved. For the purpose of this analysis, the meaning of the term ‘highly probable’ is consistent with the existing definition in IFRS accounting standards, i.e., “significantly more likely than probable”.⁷³

FASB differences

ASC 606 uses the term ‘probable’ as the confidence threshold for applying the constraint, rather than ‘highly probable’, which is defined as “the future event or events are likely to occur”.⁷⁴ However, the meaning of ‘probable’ under US GAAP is intended to be the same as ‘highly probable’ under IFRS accounting standards. [IFRS 15.BC211].

Furthermore, the IASB noted that an entity's analysis to determine whether its estimate of variable consideration must be constrained is largely qualitative. [IFRS 15.BC212]. That is, an entity needs to use judgement to evaluate whether it has met the objective of the constraint (i.e., it is highly probable that a significant revenue reversal will not occur in future periods) considering the factors provided in the standard that increase the probability of a significant revenue reversal (discussed further below). In addition, conclusions about amounts that could result in a significant revenue reversal might change as an entity satisfies a performance obligation.

⁷³ As defined in IFRS 5, Appendix A.

⁷⁴ Master glossary of the US Accounting Standards Codification.

An entity needs to consider both the likelihood and magnitude of a revenue reversal to apply the constraint:

- **Likelihood** - assessing the likelihood of a future reversal of revenue requires significant judgement. Entities want to ensure they adequately document the basis for their conclusions. The presence of any one of the indicators cited in the extract above does not necessarily mean that a reversal will occur if the variable consideration is included in the transaction price. The standard includes 'factors', rather than 'criteria', to signal that the list of items to consider is not a checklist for which all items need to be met. In addition, the factors provided are not meant to be an all-inclusive list and entities might need to consider additional factors that are relevant to their facts and circumstances.
- **Magnitude** - when assessing the probability of a significant revenue reversal, an entity is also required to assess the magnitude of that reversal. The constraint is based on the probability of a reversal of an amount that is 'significant' relative to the cumulative revenue recognised for the contract. When assessing the significance of the potential revenue reversal, the cumulative revenue recognised at the date of the potential reversal includes both fixed and variable consideration and includes revenue recognised from the entire contract, not just the transaction price allocated to a single performance obligation.

An entity must carefully evaluate the factors that could increase the likelihood or the magnitude of a revenue reversal, including those listed in IFRS 15.57: [IFRS 15.57]

- The amount of consideration is highly susceptible to factors outside the entity's influence (e.g., volatility in a market, judgement or actions of third parties, weather conditions, high risk of obsolescence of the promised good or service).
- The uncertainty about the amount of consideration is not expected to be resolved for a long period of time.
- The entity's experience (or other evidence) of similar types of contracts is limited, or that experience (or other evidence) has limited predictive value.
- The entity has a practice of either offering a broad range of price concessions or changing the payment terms and conditions of similar contracts in similar circumstances.
- The contract has a large number and broad range of possible consideration amounts.

Illustration 5-3: Evaluating the factors that could increase the likelihood or magnitude of a significant revenue reversal

Assume that an insurance broker receives 'trailing commissions' of CU100 every time a consumer signs up for a new insurance policy and CU50 whenever one of those consumers renews a policy.

In this fact pattern, the broker has a large pool of historical data about customer renewal patterns, given its significant experience with similar contracts. The broker considers the above factors and notes that the amount of consideration is highly susceptible to factors outside its influence and the uncertainty could remain over several years. However, it also has significant experience with similar types of contracts and its experience has predictive value.

As a result, even though the amount of consideration the entity will be entitled to is uncertain and depends on the actions of third parties (i.e., customer renewals), it is likely that the entity can estimate a minimum amount of variable consideration for which it is highly probable that a significant reversal of cumulative revenue will not occur. Assuming the broker's performance is complete upon initial signing of a contract, the broker would recognise the initial CU100 fee plus the minimum amount related to future renewals that is not constrained.

There are some types of variable consideration that are frequently included in contracts that have significant uncertainties. It is likely to be more difficult for an entity to assert it is highly probable that these types of estimated amounts will not be subsequently reversed. Examples of the types of variable consideration include, but are not limited to, the following:

- Payments contingent on regulatory approval (e.g., regulatory approval of a new drug)
- Long-term commodity supply arrangements that are settled based on market prices at the future delivery date
- Contingency fees based on litigation or regulatory outcomes (e.g., fees based on the positive outcome of litigation or the settlement of claims with government agencies)

When an entity determines that it cannot meet the highly probable threshold if it includes all of the variable consideration in the transaction price, the amount of variable consideration that must be included in the transaction price is limited to the amount that would not result in a significant revenue reversal. That is, the estimate of variable consideration is reduced until it reaches an amount that can be included in the transaction price that, if subsequently reversed when the uncertainty associated with the variable consideration is resolved, would not result in a significant reversal of cumulative revenue recognised. When there is significant uncertainty about the ultimate pricing of a contract, entities must not default to constraining the estimate of variable consideration to zero. During the post-implementation review of IFRS 15, a non-authoritative IASB staff paper noted that, while the constraint includes a downward bias, the intention behind the constraint was not to limit the amount of variable consideration included in the transaction price to nil.⁷⁵

The standard includes an example in which the application of the constraint limits the amount of variable consideration included in the transaction price and one in which it does not: [IFRS 15.IE Example 23, IFRS 15.IE116-IE123]

Extract from IFRS 15

Example 23-Price concessions

An entity enters into a contract with a customer, a distributor, on 1 December 20X7. The entity transfers 1,000 products at contract inception for a price stated in the contract of CU100 per product (total consideration is CU100,000). Payment from the customer is due when the customer sells the products to the end customers. The entity's customer generally sells the products within 90 days of obtaining them. Control of the products transfers to the customer on 1 December 20X7.

On the basis of its past practices and to maintain its relationship with the customer, the entity anticipates granting a price concession to its customer because this will enable the customer to discount the product and thereby move the product through the distribution chain. Consequently, the consideration in the contract is variable.

Case A-Estimate of variable consideration is not constrained

The entity has significant experience selling this and similar products. The observable data indicate that historically the entity grants a price concession of approximately 20 per cent of the sales price for these products. Current market information suggests that a 20 per cent reduction in price will be sufficient to move the products through the distribution chain. The entity has not granted a price concession significantly greater than 20 per cent in many years.

To estimate the variable consideration to which the entity will be entitled, the entity decides to use the expected value method (see paragraph 53(a) of IFRS 15) because it is the method that the entity expects to better predict the amount of consideration to which it will be entitled. Using the expected value method, the entity estimates the transaction price to be CU80,000 (CU80 × 1,000 products).

The entity also considers the requirements in paragraphs 56-58 of IFRS 15 on constraining estimates of variable consideration to determine whether the estimated amount of variable consideration of CU80,000 can be included in the transaction price. The entity considers the factors in paragraph 57 of IFRS 15 and determines that it has significant previous experience with this product and current market information that supports its estimate. In addition, despite some uncertainty resulting from factors outside its influence, based on its current market estimates, the entity expects the price to be resolved within a short time frame. Thus, the entity concludes that it is highly probable that a significant reversal in the cumulative amount of revenue recognised (ie CU80,000) will not occur when the uncertainty is resolved (ie when the total amount of price concessions is determined). Consequently, the entity recognises CU80,000 as revenue when the products are transferred on 1 December 20X7.

Case B-Estimate of variable consideration is constrained

The entity has experience selling similar products. However, the entity's products have a high risk of obsolescence and the entity is experiencing high volatility in the pricing of its products. The observable data indicate that historically the entity grants a broad range of price concessions ranging from 20-60 per cent of the sales price for similar products. Current market information also suggests that a 15-50 per cent reduction in price may be necessary to move the products through the distribution chain.

75 [IASB Agenda paper 6A](#), *Determining the transaction price*, dated March 2024, available on the IFRS Foundation's website.

To estimate the variable consideration to which the entity will be entitled, the entity decides to use the expected value method (see paragraph 53(a) of IFRS 15) because it is the method that the entity expects to better predict the amount of consideration to which it will be entitled. Using the expected value method, the entity estimates that a discount of 40 per cent will be provided and, therefore, the estimate of the variable consideration is CU60,000 (CU60 × 1,000 products).

The entity also considers the requirements in paragraphs 56-58 of IFRS 15 on constraining estimates of variable consideration to determine whether some or all of the estimated amount of variable consideration of CU60,000 can be included in the transaction price. The entity considers the factors in paragraph 57 of IFRS 15 and observes that the amount of consideration is highly susceptible to factors outside the entity's influence (ie risk of obsolescence) and it is likely that the entity may be required to provide a broad range of price concessions to move the products through the distribution chain. Consequently, the entity cannot include its estimate of CU60,000 (ie a discount of 40 per cent) in the transaction price because it cannot conclude that it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur. Although the entity's historical price concessions have ranged from 20-60 per cent, market information currently suggests that a price concession of 15-50 per cent will be necessary. The entity's actual results have been consistent with then-current market information in previous, similar transactions. Consequently, the entity concludes that it is highly probable that a significant reversal in the cumulative amount of revenue recognised will not occur if the entity includes CU50,000 in the transaction price (CU100 sales price and a 50 per cent price concession) and therefore, recognises revenue at that amount. Therefore, the entity recognises revenue of CU50,000 when the products are transferred and reassesses the estimates of the transaction price at each reporting date until the uncertainty is resolved in accordance with paragraph 59 of IFRS 15

In some situations, it is appropriate for an entity to include in the transaction price an estimate of variable consideration that is not a possible outcome of an individual contract. The TRG discussed this topic using an example from the TRG agenda paper, which the following illustration is based on:⁷⁶

Illustration 5-4: Estimating variable consideration using the expected value method

Entity A develops websites for customers. The contracts include similar terms and conditions and contain a fixed fee, plus variable consideration for a performance bonus related to the timing of Entity A completing the website. Based on Entity A's historical experience, the bonus amounts and associated probabilities for achieving each bonus are, as follows:

Bonus amount	Probability of outcome
-	15%
CU50,000	40%
CU100,000	45%

Entity A determines that using the expected value method would better predict the amount of consideration to which it will be entitled than using the most likely amount method because it has a large number of contracts that have characteristics that are similar to the new contract.

Under the expected value method, Entity A estimates variable consideration of CU65,000 [(0 × 15%) + (50,000 × 40%) + (100,000 × 45%)]. Entity A must then consider the effect of applying the constraint on variable consideration. To do this, Entity A considers the factors that could increase the likelihood of a revenue reversal in IFRS 15.57 and concludes that it has relevant historical experience with similar types of contracts and that the amount of consideration is not highly susceptible to factors outside of its influence.

In determining whether the entity would include CU50,000 or CU65,000 in the transaction price, the TRG members generally agreed that when an entity has concluded that the expected value approach is the appropriate method to estimate variable consideration, the constraint is also applied based on the expected value method. That is, the entity is not required to switch from an expected value method to a most likely amount for purposes of applying the constraint. As a result, if an entity applies the expected value method for a particular contract, the estimated transaction price might not be a possible outcome in an individual contract. Therefore, the entity could conclude that, in this example, CU65,000 is the appropriate estimate of variable consideration to include in the transaction price. It is important to note that in this example, the entity had concluded that none of the factors in IFRS 15.57 or any other factors indicate a likelihood of a significant revenue reversal.

⁷⁶ TRG Agenda paper no. 38, *Portfolio Practical Expedient and Application of Variable Consideration Constraint*, dated 13 July 2015.

When an entity uses the expected value method and determines that the estimated amount of variable consideration is not a possible outcome in the individual contract, the entity must still consider the constraint on variable consideration. Depending on the facts and circumstances of each contract, an entity might need to constrain its estimate of variable consideration, even though it has used an expected value method, if the factors in IFRS 15.57 indicate a likelihood of a significant revenue reversal. However, using the expected value method and considering probability-weighted amounts sometimes achieve the objective of the constraint on variable consideration. When an entity estimates the transaction price using the expected value method, the entity reduces the probability of a revenue reversal because the estimate does not include all of the potential consideration due to the probability weighting of the outcomes. In some cases, the entity does not need to constrain the estimate of variable consideration if the factors in IFRS 15.57 do not indicate a likelihood of a significant revenue reversal.

Example 25 in the standard illustrates a situation in which a qualitative analysis of the factors in IFRS 15.57 indicates that it is not highly probable that a significant reversal would not occur if an entity includes a performance-based incentive fee in the transaction price of an investment management contract. [IFRS 15.IE Example 25, IFRS 15.IE129-IE133].

See section 6 below for a discussion of allocating the transaction price.

Frequently asked questions

Question 5-11: Is the constraint on variable consideration applied at the contract or performance obligation level?

(TRG meeting 26 January 2015 - Agenda paper no. 14)

The TRG members generally agreed that the constraint would be applied at the contract level and not at the performance obligation level. That is, the significance assessment of the potential revenue reversal would consider the total transaction price of the contract (and not the portion of transaction price allocated to a performance obligation).

Question 5-12: Would an entity be required to follow a two-step approach to estimate variable consideration (i.e., first estimate the variable consideration and then apply the constraint to that estimate)?

The Board noted in the Basis for Conclusions that an entity is not required to strictly follow a two-step process (i.e., first estimate the variable consideration and then apply the constraint to that estimate) if its internal processes incorporate the principles of both steps in a single step. [IFRS 15.BC215]. For example, if an entity already had a single process to estimate expected returns when calculating revenue from the sale of goods in a manner consistent with the objectives of applying the constraint, the entity would not need to estimate the transaction price and then separately apply the constraint.

A TRG agenda paper also noted that applying the expected value method, which requires an entity to consider probability-weighted amounts, might sometimes achieve the objective of the constraint on variable consideration.⁷⁷ That is, in developing its estimate of the transaction price in accordance with the expected value method, an entity reduces the probability of a revenue reversal and might not need to further constrain its estimate of variable consideration. However, to meet the objective of the constraint, the entity's estimated transaction price would need to incorporate its expectations of the possible consideration amounts (e.g., products not expected to be returned) at a level at which it is highly probable that including the estimate of variable consideration in the transaction price would not result in a significant revenue reversal (e.g., such that it is highly probable that additional returns above the estimated amount would not result in a significant reversal).

Question 5-13: How does an entity apply the constraint on variable consideration to milestone payments?

An entity might need to apply significant judgement to determine whether and, if so, how much of a milestone payment is constrained. Assuming the payment is not subject to the sales-based or usage-based royalty recognition constraint (see section 8.5 below), a milestone payment is a form of variable consideration that needs to be estimated and included in the transaction price, subject to the variable consideration constraint.

Milestone payments are often binary (i.e., the entity will either achieve the target or desired outcome and become entitled to the milestone payment or not). In these situations, entities generally conclude that the most likely amount method is the better predictor of the amount to which it expects to be entitled. The entity will then consider the constraint on variable consideration to determine whether it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur when the uncertainties related to the milestone payments have been resolved. When assessing the

⁷⁷ TRG Agenda paper no. 38, *Portfolio Practical Expedient and Application of Variable Consideration Constraint*, dated 13 July 2015.

significance of the potential revenue reversal of a future milestone payment, the cumulative revenue recognised at the date of the potential reversal would include any fixed consideration in addition to the variable consideration for the entire contract.

How we see it

Applying the constraint to milestone payments often requires significant judgement, especially when uncertainty exists about the underlying activities necessary to meet the target or desired outcome that entitle the entity to the milestone payment. Entities need to analyse the facts and circumstances of each milestone payment and consider all information (historical, current and forecast) that is reasonably available to them to assess whether the revenue needs to be constrained. In addition, there could be external factors that affect an entity's assessment of the contract and the probability of entitlement to milestone payments. For example, we expect entities to conclude in many instances that milestone payments contingent on regulatory approval (e.g., regulatory approval of a new drug) are constrained, preventing them from recognising these payments until the uncertainty associated with the payments is resolved.

Consider the following Illustration:

Illustration 5-5: Milestone payments

Biotech enters into an arrangement with Pharma under which Biotech provides a licence to a product candidate that is starting phase II clinical studies and performs research and development services for a specified period of time. Assume that these two promises are determined to be distinct. Biotech receives an upfront payment upon execution of the arrangement and is entitled to receive milestone payments upon: (1) enrolment of a specified number of patients in a phase II clinical study; (2) completion of phase III clinical studies, (3) regulatory approval in the US; and (4) regulatory approval in the European Union.

Under the standard, Biotech includes in the transaction price the upfront payment and its estimate of the milestone payments it expects to receive. The amount of consideration that Biotech can include in the transaction price is limited to amounts for which it is highly probable that a significant reversal of cumulative revenues recognised under the contract will not occur in future periods.

The milestone for patient enrolment only has two possible outcomes (e.g., Biotech enrolls or does not enrol the specified number of patients). Therefore, Biotech determines that the most likely amount method is the better predictor of the milestone payment. It then determines that it can include the amount associated with the enrolment milestone in the transaction price because it is highly probable that doing so will not result in a significant revenue reversal, based on: its prior experience with enrolling participants in similar studies; clinical trial results on the product candidate to date; and the significance of the milestone payment compared to the cumulative revenues expected to be recognised under the contract at the time of the enrolment milestone.

Due to the significant uncertainty associated with the other future events that would result in milestone payments, however, Biotech initially determines that it cannot include these amounts in the transaction price (i.e., the other milestone payments are fully constrained at contract inception). At the end of each reporting period, Biotech updates its assessment of whether the milestone payments are constrained by considering both the likelihood and magnitude of a potential revenue reversal.

The evaluation of the constraint considers the probability of reversal (i.e., not achieving the target or desired outcome) and whether any such reversal would be significant in relation to cumulative revenue recognised to date on the total contract. There are many variables that need to be factored into this assessment. Thus, entities need to carefully evaluate each milestone to determine when it is appropriate to include the milestone in the transaction price.

For example, an entity might consider the variable consideration constraint and conclude that the milestone payment is not constrained at contract inception because including the milestone payment in the transaction price would not result in a significant reversal of cumulative revenue in the event that the milestone requirements are not achieved (i.e., the entity is not entitled to the consideration). This would be the case when an entity expects to recognise a significant amount of the contract revenue early in the life of the contract and the milestone payment amount is not significant in relation to the cumulative revenue that will be recognised by the time the uncertainties related to the milestone have been resolved.

As discussed in section 5.2.4 below, an entity is required to update its estimate of variable consideration (including any amounts that are constrained) at the end of each reporting period to reflect its revised expectations of the amount of consideration to which it expects to be entitled. For example, an entity might initially conclude that a milestone payment is constrained and, therefore, exclude it from the transaction price. However, in a later reporting period, when reassessing the amount of variable

consideration that must be included in the transaction price, the entity might conclude a milestone payment is no longer constrained even though the target or desired outcome has not been achieved. That is, based on new information, an entity might conclude that it expects to achieve the target or desired outcome and, therefore, concludes that it is now highly probable that a significant revenue reversal will not occur.

5.2.4 Reassessment of variable consideration

When a contract includes variable consideration, an entity needs to update its estimate of the transaction price throughout the term of the contract to depict conditions that exist at the end of each reporting period. This involves updating the estimate of the variable consideration (including any amounts that are constrained) to reflect an entity's revised expectations about the amount of consideration to which it expects to be entitled, considering uncertainties that are resolved or new information that is gained about remaining uncertainties. The entity accounts for changes in the transaction price in accordance with IFRS 15.87-90. [IFRS 15.59]. As discussed in section 5.2.3 above, conclusions about amounts that could result in a significant revenue reversal might change as an entity satisfies a performance obligation. See section 6.5 below for a discussion of allocating changes in the transaction price after contract inception.

The IASB noted in the Basis for Conclusions that, in some cases, an estimate of variable consideration made at the end of an accounting period could be affected by information that arises after the end of the reporting period, but before the release of the financial statements. The Board decided not to include guidance in IFRS 15 on accounting in these situations, because it noted that the accounting for subsequent events is already addressed in IAS 10 *Events after the Reporting Period* (see Chapter 34). [IFRS 15.BC228].

Frequently asked questions

Question 5-14: How would an entity distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception?

See response to Question 3-15 in section 3.4 above.

5.3 Refund liabilities

An entity might receive consideration that it will need to refund to the customer in the future because the consideration is not an amount to which the entity ultimately will be entitled under the contract. If an entity expects to refund some or all of that consideration, the amounts received (or receivable) need to be recorded as refund liabilities.

A refund liability is measured "at the amount of consideration received (or receivable) for which the entity does not expect to be entitled (i.e., amounts not included in the transaction price)". An entity is required to update its estimates of refund liabilities (and the corresponding change in the transaction price) at the end of each reporting period. The standard also notes that, if a refund liability relates to a sale with a right of return, an entity applies the specific application guidance for sales with a right of return. [IFRS 15.55].

While the most common form of refund liabilities is related to sales with a right of return (see section 5.4 below), the refund liability requirements also apply when an entity expects that it will need to refund consideration received due to poor customer satisfaction with a service provided (i.e., there was no good delivered or returned) and/or if an entity expects to have to provide retrospective price reductions to a customer (e.g., if a customer reaches a certain threshold of purchases, the unit price is retrospectively adjusted).

The standard includes an illustrative example relating to when an entity expects to provide retrospective price reductions to a customer based on a certain threshold of purchases. [IFRS 15.IE Example 40, IFRS 15.IE205-IE208].

Frequently asked questions

Question 5-15: Is a refund liability a contract liability (and, thus, subject to the presentation and disclosure requirements of a contract liability)?

See response to Question 10-4 in section 10.1.5 below.

5.4 Rights of return

The standard notes that, in some contracts, an entity might transfer control of a product to a customer but grant the customer a right of return. In return, the customer might receive a full or partial refund of any consideration paid; a credit that can be applied against amounts owed, or that will be owed, to the entity; another product in exchange; or any combination thereof. [IFRS 15.B20]. As discussed in section 4.7 above, the standard states that a right of return does not represent a separate performance obligation.

[IFRS 15.B22]. Instead, a right of return affects the transaction price and the amount of revenue an entity can recognise for satisfied performance obligations. In other words, rights of return create variability in the transaction price.

Under IFRS 15, rights of return do not include exchanges by customers of one product for another of the same type, quality, condition and price (e.g., one colour or size for another). [IFRS 15.B26]. Nor do rights of return include situations where a customer might return a defective product in exchange for a functioning product; these are, instead, evaluated in accordance with the application guidance on warranties (see section 9.1 below).

The standard provides the following application guidance to determine how rights of return would be treated: [IFRS 15.B21]

Extract from IFRS 15

- B21** To account for the transfer of products with a right of return (and for some services that are provided subject to a refund), an entity shall recognise all of the following:
- (a) revenue for the transferred products in the amount of consideration to which the entity expects to be entitled (therefore, revenue would not be recognised for the products expected to be returned);
 - (b) a refund liability; and
 - (c) an asset (and corresponding adjustment to cost of sales) for its right to recover products from customers on settling the refund liability.

Under the standard, an entity estimates the transaction price and applies the constraint to the estimated transaction price to determine the amount of consideration to which the entity expects to be entitled. In doing so, it considers the products expected to be returned in order to determine the amount to which the entity expects to be entitled (excluding consideration for the products expected to be returned). The entity recognises revenue based on the amount to which it expects to be entitled through to the end of the return period (considering expected product returns). An entity does not recognise the portion of the revenue subject to the constraint until the amount is no longer constrained, which could be at the end of the return period. The entity recognises the amount received or receivable that is expected to be returned as a refund liability, representing its obligation to return the customer's consideration (see section 5.3 above). Subsequently, at the end of each reporting period, the entity updates its assessment of amounts for which it expects to be entitled. [IFRS 15.B23].

As part of updating its estimate, an entity must update its assessment of expected returns and the related refund liabilities. [IFRS 15.B24]. This remeasurement is performed at the end of each reporting period and reflects any changes in assumptions about expected returns. Any adjustments made to the estimate result in a corresponding adjustment to amounts recognised as revenue for the satisfied performance obligations (e.g., if the entity subsequently revises the expected number of returns to a number lower than originally estimated, it would have to increase the amount of revenue recognised and decrease the refund liability). [IFRS 15.B23, IFRS 15.B24].

Finally, when customers exercise their rights of return, the entity might receive the returned product in a saleable or repairable condition. Under the standard, at the time of the initial sale (i.e., when recognition of revenue is deferred due to the anticipated return), the entity recognises a return asset (and adjusts the cost of goods sold) for its right to recover the goods returned by the customer. [IFRS 15.B21]. The entity initially measures this asset at the former carrying amount of the inventory, less any expected costs to recover the goods, including any potential decreases in the value of the returned goods. The consideration of potential decreases in value of the returned products is important because the returned products might not be in the same condition they were in when they were sold (e.g., due to damage or use) and this helps to ensure that the value of the return asset is not impaired.

The following table provides a summary of what an entity initially recognises in relation to a right of return in accordance with the requirements in IFRS 15 (also see Example 22 from the standard below).

Figure 5-2: Rights of return

Revenue	The amount to which the entity expects to be entitled through to the end of the return period (considering expected product returns)
Cost of sales	The carrying amount of goods transferred, less the return asset
Refund liability	The amount received or receivable that is expected to be returned
Return asset	The former carrying amount of the inventory the entity expects to recover (i.e., goods expected to be returned by the customer), less any expected costs to recover the goods, including potential decreases in the value of the returned goods

Along with remeasuring the refund liability at the end of each reporting period (as discussed above), the entity updates the measurement of the asset recorded for any revisions to its expected level of returns, as well as any additional potential decreases in the value of the returned products. [IFRS 15.B25]. Because the standard includes specific remeasurement requirements for the return asset, an entity applies those requirements, rather than other impairment models (e.g., the model for inventory in IAS 2). The standard also requires the refund liability to be presented separately from the corresponding asset (i.e., on a gross basis, rather than a net basis). [IFRS 15.B25].

How we see it

While the standard does not explicitly state this, we believe that the return asset would generally be presented separately from inventory.

The standard provides the following example of rights of return: [IFRS 15.IE Example 22, IFRS 15.IE110-IE115]

Extract from IFRS 15

Example 22-Right of return

An entity enters into 100 contracts with customers. Each contract includes the sale of one product for CU100 (100 total products × CU100 = CU10,000 total consideration). Cash is received when control of a product transfers. The entity's customary business practice is to allow a customer to return any unused product within 30 days and receive a full refund. The entity's cost of each product is CU60.

The entity applies the requirements in IFRS 15 to the portfolio of 100 contracts because it reasonably expects that, in accordance with paragraph 4, the effects on the financial statements from applying these requirements to the portfolio would not differ materially from applying the requirements to the individual contracts within the portfolio.

Because the contract allows a customer to return the products, the consideration received from the customer is variable. To estimate the variable consideration to which the entity will be entitled, the entity decides to use the expected value method (see paragraph 53(a) of IFRS 15) because it is the method that the entity expects to better predict the amount of consideration to which it will be entitled. Using the expected value method, the entity estimates that 97 products will not be returned.

The entity also considers the requirements in paragraphs 56-58 of IFRS 15 on constraining estimates of variable consideration to determine whether the estimated amount of variable consideration of CU9,700 (CU100 × 97 products not expected to be returned) can be included in the transaction price. The entity considers the factors in paragraph 57 of IFRS 15 and determines that although the returns are outside the entity's influence, it has significant experience in estimating returns for this product and customer class. In addition, the uncertainty will be resolved within a short time frame (ie the 30-day return period). Thus, the entity concludes that it is highly probable that a significant reversal in the cumulative amount of revenue recognised (ie CU9,700) will not occur as the uncertainty is resolved (ie over the return period).

The entity estimates that the costs of recovering the products will be immaterial and expects that the returned products can be resold at a profit.

Upon transfer of control of the 100 products, the entity does not recognise revenue for the three products that it expects to be returned. Consequently, in accordance with paragraphs 55 and B21 of IFRS 15, the entity recognises the following:

- (a) revenue of CU9,700 (CU100 × 97 products not expected to be returned);
- (b) a refund liability of CU300 (CU100 refund × 3 products expected to be returned); and
- (c) an asset of CU180 (CU60 × 3 products for its right to recover products from customers on settling the refund liability).

In ASC 606, the same example includes the following journal entries to illustrate how the entity would account for the contract in Example 22 in accordance with the US GAAP equivalents of IFRS 15.55 and B21 when the product is transferred to the customer.⁷⁸ These entries would also apply to entities applying IFRS 15:

Dr	Cash	CU10,000 ^(a)	
	Cr Revenue		CU9,700 ^(b)
	Cr Refund liability		CU300 ^(c)
Dr	Cost of sales	CU5,820 ^(d)	
Dr	Asset	CU180 ^(e)	
	Cr Inventory		CU6,000 ^(f)

(a) (CU100 × 100 products transferred).

(b) (CU100 × 97 products not expected to be returned)

(c) (CU100 refund × 3 products expected to be returned)

(d) (CU60 × 97 products not expected to be returned)

(e) (CU60 × 3 products for its right to recover products from customers on settling the refund liability)

(f) (CU60 × 100 products)

Frequently asked questions

Question 5-16: Is an entity applying the portfolio approach practical expedient when accounting for rights of return?

(TRG meeting 13 July 2015 - Agenda paper no. 38)

An entity can, but would not be required to, apply the portfolio approach practical expedient to estimate variable consideration for expected returns using the expected value method. Similar to the discussion in section 5.2.2 above on estimating variable consideration, the TRG agenda paper noted that an entity can consider evidence from other, similar contracts to develop an estimate of variable consideration using the expected value method without applying the portfolio approach practical expedient. In order to estimate variable consideration in a contract, an entity frequently makes judgements considering its historical experience with other, similar contracts. Considering historical experience does not necessarily mean the entity is applying the portfolio approach practical expedient.

This question arises, in part, because Example 22 from the standard (in the extract above) states that the entity is using the portfolio approach practical expedient in IFRS 15.4 to calculate its estimate of returns. Use of this practical expedient requires an entity to assert that it does not expect the use of the expedient to differ materially from applying the standard to an individual contract.

We expect that entities often use the expected value method to estimate variable consideration related to returns because doing so would likely better predict the amount of consideration to which the entities will be entitled. This is despite the fact that there are two potential outcomes for each contract from the variability of product returns: the product either will be returned or will not be returned. That is, the revenue for each contract ultimately either will be 100% or will be 0% of the total contract value (assuming returns create the only variability in the contract). However, entities might conclude that the expected value is the appropriate method for estimating variable consideration because they have a large number of contracts with similar characteristics. The TRG agenda paper noted that using a portfolio of data is not equivalent to using the portfolio approach practical expedient, so entities that use the expected value method to estimate variable consideration for returns would not be required to assert that the outcome from the portfolio is not expected to materially differ from an assessment of individual contracts.

Question 5-17: How does an entity account for restocking fees for goods that are expected to be returned?

(TRG meeting 13 July 2015 - Agenda paper no. 35)

Entities sometimes charge customers a 'restocking fee' when a product is returned. This fee might be levied by entities to compensate them for the costs of repackaging, shipping and/or reselling the item at a lower price to another customer. Stakeholders had raised questions about how to account for restocking fees and related costs.

⁷⁸ ASC 606-10-55-207.

The TRG members generally agreed that restocking fees for goods that are expected to be returned would be included as variable consideration in the estimate of the transaction price at contract inception and recorded as revenue when (or as) control of the good transfers. That is, selling a product subject to a restocking fee if it is returned is not different from providing a partial return right and must be accounted for similarly.

Consider the following Illustration based on an example in the TRG agenda paper:

Illustration 5-6: Restocking fees

Entity A enters into a contract with a customer to sell 10 widgets for CU100 each. The customer has the right to return the widgets, but, if it does so, it will be charged a 10% restocking fee (or CU10 per returned widget). The entity estimates that 10% of all widgets that are sold will be returned. Upon transfer of control of the 10 widgets, the entity will recognise revenue of CU910 [(9 widgets not expected to be returned x CU100 selling price) + (1 widget expected to be returned x CU10 restocking fee)]. A refund liability of CU90 will also be recorded [1 widget expected to be returned x (CU100 selling price - CU10 restocking fee)].

Question 5-18: How does an entity account for restocking costs related to expected returns (e.g., shipping or repackaging costs)?

(TRG meeting 13 July 2015 - Agenda paper no. 35)

The TRG members generally agreed that restocking costs (e.g., shipping and repackaging costs) would be recorded as a reduction of the amount of the return asset when (or as) control of the good is transferred to the customer. This accounting treatment is consistent with the requirement in IFRS 15.B25 that the return asset be initially measured at the former carrying amount of the inventory, less any expected costs to recover the goods (e.g., restocking costs). *[IFRS 15.B25]*.

Question 5-19: How can an entity evaluate a conditional call option to repurchase an asset?

See response to Question 7-24 in section 7.3.1 below.

Question 5-20: Does an entity account for a customer's return of a defective item in exchange for compensation (i.e., not for a replacement item) as a right of return or an assurance-type warranty?

See response to Question 9-3 in section 9.1.1 below.

5.5 Significant financing component

For some transactions, the receipt of the consideration does not match the timing of the transfer of goods or services to the customer (e.g., the consideration is prepaid or is paid after the services are provided). When the customer pays in arrears, the entity is effectively providing financing to the customer. Conversely, when the customer pays in advance, the entity has effectively received financing from the customer.

IFRS 15 states the following in relation to a significant financing component in a contract: *[IFRS 15.60-64]*

Extract from IFRS 15

- 60 In determining the transaction price, an entity shall adjust the promised amount of consideration for the effects of the time value of money if the timing of payments agreed to by the parties to the contract (either explicitly or implicitly) provides the customer or the entity with a significant benefit of financing the transfer of goods or services to the customer. In those circumstances, the contract contains a significant financing component. A significant financing component may exist regardless of whether the promise of financing is explicitly stated in the contract or implied by the payment terms agreed to by the parties to the contract.
- 61 The objective when adjusting the promised amount of consideration for a significant financing component is for an entity to recognise revenue at an amount that reflects the price that a customer would have paid for the promised goods or services if the customer had paid cash for those goods or services when (or as) they transfer to the customer (ie the cash selling price). An entity shall consider all relevant facts and circumstances in assessing whether a contract contains a financing component and whether that financing component is significant to the contract, including both of the following:
- (a) the difference, if any, between the amount of promised consideration and the cash selling price of the promised goods or services; and
 - (b) the combined effect of both of the following:

	(i) the expected length of time between when the entity transfers the promised goods or services to the customer and when the customer pays for those goods or services; and
	(ii) the prevailing interest rates in the relevant market.
62	Notwithstanding the assessment in paragraph 61, a contract with a customer would not have a significant financing component if any of the following factors exist:
	(a) the customer paid for the goods or services in advance and the timing of the transfer of those goods or services is at the discretion of the customer.
	(b) a substantial amount of the consideration promised by the customer is variable and the amount or timing of that consideration varies on the basis of the occurrence or non-occurrence of a future event that is not substantially within the control of the customer or the entity (for example, if the consideration is a sales-based royalty).
	(c) the difference between the promised consideration and the cash selling price of the good or service (as described in paragraph 61) arises for reasons other than the provision of finance to either the customer or the entity, and the difference between those amounts is proportional to the reason for the difference. For example, the payment terms might provide the entity or the customer with protection from the other party failing to adequately complete some or all of its obligations under the contract.
63	As a practical expedient, an entity need not adjust the promised amount of consideration for the effects of a significant financing component if the entity expects, at contract inception, that the period between when the entity transfers a promised good or service to a customer and when the customer pays for that good or service will be one year or less.
64	To meet the objective in paragraph 61 when adjusting the promised amount of consideration for a significant financing component, an entity shall use the discount rate that would be reflected in a separate financing transaction between the entity and its customer at contract inception. That rate would reflect the credit characteristics of the party receiving financing in the contract, as well as any collateral or security provided by the customer or the entity, including assets transferred in the contract. An entity may be able to determine that rate by identifying the rate that discounts the nominal amount of the promised consideration to the price that the customer would pay in cash for the goods or services when (or as) they transfer to the customer. After contract inception, an entity shall not update the discount rate for changes in interest rates or other circumstances (such as a change in the assessment of the customer's credit risk).

The Board explained in the Basis for Conclusions that, conceptually, a contract that includes a financing component is comprised of two transactions - one for the sale of goods and/or services and one for the financing. [IFRS 15.BC229]. Accordingly, the Board decided to require entities to adjust the amount of promised consideration for the effects of financing only if the timing of payments specified in the contract provides the customer or the entity with a significant benefit of financing. The IASB's objective in requiring entities to adjust the promised amount of consideration for the effects of a significant financing component is for entities to recognise as revenue the 'cash selling price' of the underlying goods or services at the time of transfer. [IFRS 15.BC230].

5.5.1 Practical expedient

As a practical expedient, an entity is not required to adjust the promised amount of consideration for the effects of a significant financing component if the entity expects, at contract inception, that the period between when the entity transfers a promised good or service to a customer and when the customer pays for that good or service will be one year or less. The Board added this practical expedient to the standard because it simplifies the application of this aspect of IFRS 15 and because the effect of accounting for a significant financing component (or of not doing so) should be limited in financing arrangements with a duration of less than 12 months. [IFRS 15.BC236]. If an entity uses this practical expedient, it applies the expedient consistently to similar contracts in similar circumstances. [IFRS 15.BC235].

It is important to note that if the period between when the entity transfers a promised good or service to a customer and the customer pays for that good or service is more than one year and the financing component is deemed to be significant, the entity must account for the entire financing component. That is, an entity cannot exclude the first 12 months of the period between when the entity transfers a promised good or service to a customer and when the customer pays for that good or service from the calculation of the potential adjustment to the transaction price. An entity also cannot exclude the first 12 months in its determination of whether the financing component of a contract is significant.

Entities might need to apply judgement to determine whether the practical expedient applies to some contracts. For example, the standard does not specify whether entities must assess the period between payment and performance at the contract level or at the performance obligation level. In addition, the TRG discussed how an entity would consider whether the practical expedient applies to contracts with a single payment stream for multiple performance obligations. See Question 5-24 in section 5.5.4 below.

5.5.2 Existence of a significant financing component

Absent the use of the practical expedient, to determine whether a significant financing component exists, an entity needs to consider all relevant facts and circumstances, including:

- (a) The difference between the cash selling price and the amount of promised consideration for the promised goods or services.
And
- (b) The combined effect of the expected length of time between the transfer of the goods or services and the receipt of consideration and the prevailing market interest rates. The Board acknowledged that a difference in the timing between the transfer of and payment for goods or services is not determinative, but the combined effect of timing and the prevailing interest rates may provide a strong indication that an entity is providing or receiving a significant benefit of financing. [IFRS 15.BC232].

Even if conditions in a contract would otherwise indicate that a significant financing component exists, the standard includes several situations that the Board has determined do not provide the customer or the entity with a significant benefit of financing. These situations, as described in IFRS 15.62, include the following: [IFRS 15.62]

- The customer has paid for the goods or services in advance and the timing of the transfer of those goods or services is at the discretion of the customer. In these situations (e.g., prepaid phone cards, customer loyalty programmes), the Board noted in the Basis for Conclusions that the payment terms are not related to a financing arrangement between the parties and the costs of requiring an entity to account for a significant financing component would outweigh the benefits because an entity would need to continually estimate when the goods or services will transfer to the customer. [IFRS 15.BC233].
- A substantial amount of the consideration promised by the customer is variable and is based on factors outside the control of the customer or entity. In these situations, the Board noted in the Basis for Conclusions that the primary purpose of the timing or terms of payment might be to allow for the resolution of uncertainties that relate to the consideration, rather than to provide the customer or the entity with the significant benefit of financing. In addition, the terms or timing of payment in these situations might be to provide the parties with assurance of the value of the goods or services (e.g., an arrangement for which consideration is in the form of a sales-based royalty). [IFRS 15.BC233].
- The difference between the promised consideration and the cash selling price of the good or service arises for reasons other than the provision of financing to either the customer or the entity (e.g., a payment is made in advance or in arrears in accordance with the typical payment terms of the industry or jurisdiction) and the difference between those amounts is proportional to the reason for the difference. In certain situations, the Board determined the purpose of the payment terms might be to provide the customer with assurance that the entity will complete its obligations under the contract, rather than to provide financing to the customer or the entity. Examples include a customer withholding a portion of the consideration until the contract is complete (illustrated in Example 27, included in section 5.5.4 below) or a milestone is reached, or an entity requiring a customer to pay a portion of the consideration upfront in order to secure a future supply of goods or services. See Question 5-21 in section 5.5.4 below for further discussion.

5.5.2.A Advance payments

As explained in the Basis for Conclusions, the Board decided not to provide an overall exemption from accounting for the effects of a significant financing component arising from advance payments. This is because ignoring the effects of advance payments could skew the amount and timing of revenue recognised if the advance payment is significant and the purpose of the payment is to provide the entity with financing. [IFRS 15.BC238]. For example, an entity might require a customer to make advance payments to avoid obtaining the financing from a third party. If the entity obtained third-party financing, it would likely charge the customer additional amounts to cover the finance costs incurred. The Board decided that an entity's revenue should be consistent regardless of whether it receives the significant financing benefit from a customer or from a third party because, in either scenario, the entity's performance is the same.

How we see it

In order to conclude that an advance payment does not represent a significant financing component, we believe that an entity needs to support why the advance payment does not provide a significant financing benefit and describe its substantive business purpose.⁷⁹ As a result, it is important that entities analyse all of the relevant facts and circumstances.

In a 2018 speech, a member of the US SEC staff discussed a consultation with the Office of the Chief Accountant (OCA) in which a registrant concluded that a contract with a large upfront payment did not have a significant financing component because: (1) the upfront payment was made for reasons other than to provide a significant financing benefit; and (2) the difference between the upfront payment and what the customer would have paid, had the payments been made over the term of the arrangement, was proportional to the reason identified for the difference. The SEC staff member noted that, like other consultations that OCA has evaluated in relation to the revenue standard, the evaluation was based on the facts and circumstances. In this fact pattern, the staff did not object to the registrant's conclusion that the contract did not have a significant financing component based on the nature of the transaction and the purpose of the upfront payment.⁸⁰

Example 29 (included in section 5.5.4 below) illustrates an entity's determination that a customer's advance payment represents a significant financing component. Example 30 (included in section 5.5.4 below) illustrates an entity's determination that a customer's advance payment does not represent a significant financing component.

5.5.2.B Assessment of significance

The assessment of significance is made at the individual contract level. As noted in the Basis for Conclusions, the Board decided that it would be an undue burden to require an entity to account for a financing component if the effects of the financing component are not significant to the individual contract, but the combined effects of the financing components for a portfolio of similar contracts were material to the entity as a whole. [IFRS 15.BC234].

5.5.3 Determination of the discount rate

When an entity concludes that a financing component is significant to a contract, in accordance with IFRS 15.64, it determines the transaction price by applying a discount rate to the amount of promised consideration. [IFRS 15.64]. As stated above, the objective of requiring entities to adjust the promised consideration for the effects of a significant financing component is for the revenue recognised to approximate an amount that reflects the cash selling price that a customer would have paid for the promised goods or services. However, to achieve this objective, the entity does not need to estimate that cash selling price. Rather, the entity determines an interest rate and applies it to the amount of the promised consideration.

The entity uses the same interest rate that it would use if it were to enter into a separate financing transaction with the customer at contract inception. The interest rate needs to reflect the credit characteristics of the borrower in the contract, which could be either the entity or the customer (depending on who receives the financing). Using the risk-free rate or a rate explicitly stated in the contract that does not correspond with a separate financing rate would not be acceptable. [IFRS 15.BC239]. Example 28, Case B (included in section 5.5.4 below) illustrates a contractual discount rate that does not reflect the rate in a

⁷⁹ Consistent with the discussions within TRG Agenda paper no. 30, *Significant Financing Components*, dated 30 March 2015.

⁸⁰ [Speech](#), *Remarks before the 2018 AICPA Conference on Current SEC and PCAOB Developments*, by Sarah N. Esquivel, Associate Chief Accountant, SEC Office of the Chief Accountant, 10 December 2018. Available on the SEC's website.

separate financing transaction. [IFRS 15.IE Example 28, IFRS 15.IE143-IE147]. Furthermore, using a contract's implicit interest rate (i.e., the interest rate that would make alternative payment options economically equivalent) would also not be acceptable if that rate does not reflect the rate in a separate financing transaction (as illustrated in Example 29, included in section 5.5.4 below). [IFRS 15.IE Example 29, IFRS 15.IE148-IE151].

How we see it

While not explicitly stated in the standard, we believe an entity would consider the expected term of the financing when determining the interest rate in light of current market conditions at contract inception.

IFRS 15.64 is clear that an entity does not update the interest rate for changes in circumstances or market interest rates after contract inception. The Board noted that “an entity should not update the discount rate for a change in circumstances because an entity should reflect in the measurement of the transaction price only the discount rate that is determined at contract inception.” It also observed that it would be “impractical for an entity to update the transaction price for changes in the assessment of the discount rate”. [IFRS 15.BC243].

However, the standard does not discuss situations in which expectations change after contract inception regarding the timing difference between the receipt of consideration and the transfer of goods and services to the customer (e.g., a change in the timing of delivery).

How we see it

As discussed above in section 5.5.1 above, the standard includes a practical expedient in IFRS 15.63 that allows an entity to not identify a significant financing component when it expects at contract inception that the period between transfer to, and payment from, the customer will be less than one year. To the extent this period of time extends beyond one year (due to events unknown at contract inception), we believe an entity would not be required to reconsider the use of this expedient because the guidance does not contemplate updating this assessment after contract inception.

If an entity has accounted for a significant financing component at contract inception and the expected timing of the transfer of goods or services then changes, it is important to understand the reason for the expectation change. For example, if the expected delivery date was revised as a consequence of the customer exercising its contractual right to change that date (i.e., it was at the discretion of the customer), it is likely that the entity previously concluded there was no significant financing component, as discussed above. [IFRS 15.62(a)]. If the change to the delivery date was part of a larger contract modification that changed the scope and/or price of the contract, the entity would need to apply the contract modification requirements (see section 3.4 above for further discussion on accounting for contract modifications). If the change to the delivery date was at the entity's discretion or was due to circumstances that were not foreseen at contract inception, the standard does not specify how an entity would account for that change and an entity needs to use judgement to determine the appropriate accounting treatment.

How we see it

The standard requires that the interest rate be a rate similar to one that the entity would have used in a separate financing transaction with the customer. Because most entities are not in the business of entering into free-standing financing arrangements with their customers, they might find it difficult to identify an appropriate rate. However, most entities perform some level of credit analysis before financing purchases for a customer, so they likely have some information about the customer's credit risk. For entities that have different pricing for products depending on the time of payment (e.g., cash discounts), the standard indicates that the appropriate interest rate, in some cases, could be determined by identifying the rate that discounts the nominal amount of the promised consideration to the cash selling price of the good or service.

It is likely that entities will have to exercise significant judgement to determine whether a significant financing component exists when there is more than one year between the transfer of goods or services and the receipt of contract consideration. Entities need to consider sufficiently documenting their analyses to support their conclusions.

5.5.4 Examples of significant financing components

The standard includes several examples to illustrate these concepts. Example 26 illustrates a contract that contains a significant financing component because the cash selling price at contract inception differs from the promised amount of consideration payable after delivery and there are no other factors present that would indicate that this difference arises for reasons other than financing. In this example, the implicit interest rate in the contract is determined to be commensurate with the rate that would be reflected in a separate financing transaction between the entity and its customer at contract inception. [IFRS 15.IE Example 26, IFRS 15.IE135-IE140].

Extract from IFRS 15

Example 26-Significant financing component and right of return

An entity sells a product to a customer for CU121 that is payable 24 months after delivery. The customer obtains control of the product at contract inception. The contract permits the customer to return the product within 90 days. The product is new and the entity has no relevant historical evidence of product returns or other available market evidence.

The cash selling price of the product is CU100, which represents the amount that the customer would pay upon delivery for the same product sold under otherwise identical terms and conditions as at contract inception. The entity's cost of the product is CU80.

The entity does not recognise revenue when control of the product transfers to the customer. This is because the existence of the right of return and the lack of relevant historical evidence means that the entity cannot conclude that it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur in accordance with paragraphs 56-58 of IFRS 15. Consequently, revenue is recognised after three months when the right of return lapses.

The contract includes a significant financing component, in accordance with paragraphs 60-62 of IFRS 15. This is evident from the difference between the amount of promised consideration of CU121 and the cash selling price of CU100 at the date that the goods are transferred to the customer.

The contract includes an implicit interest rate of 10 per cent (ie the interest rate that over 24 months discounts the promised consideration of CU121 to the cash selling price of CU100). The entity evaluates the rate and concludes that it is commensurate with the rate that would be reflected in a separate financing transaction between the entity and its customer at contract inception. The following journal entries illustrate how the entity accounts for this contract in accordance with paragraphs B20-B27 of IFRS 15.

- (a) When the product is transferred to the customer, in accordance with paragraph B21 of IFRS 15:

Asset for right to recover product to be returned	CU80 ^(a)	
Inventory		CU80

(a) This example does not consider expected costs to recover the asset.

- (b) During the three-month right of return period, no interest is recognised in accordance with paragraph 65 of IFRS 15 because no contract asset or receivable has been recognised.

- (c) When the right of return lapses (the product is not returned):

Receivable	CU100 ^(a)	
Revenue		CU100
Cost of sales	CU80	
Asset for product to be returned		CU80

(a) The receivable recognised would be measured in accordance with IFRS 9. This example assumes there is no material difference between the fair value of the receivable at contract inception and the fair value of the receivable when it is recognised at the time the right of return lapses. In addition, this example does not consider the impairment accounting for the receivable.

Until the entity receives the cash payment from the customer, interest revenue would be recognised in accordance with IFRS 9. In determining the effective interest rate in accordance with IFRS 9, the entity would consider the remaining contractual term.

Example 26 also illustrates the requirement in IFRS 15.65, which provides that interest income or interest expense is recognised only to the extent that a contract asset (or receivable) or a contract liability is recognised in accounting for a contract with a customer. See further discussion in section 5.5.5 below.

In Example 27, the difference between the promised consideration and the cash selling price of the good or service arises for reasons other than the provision of financing. In this example, the customer withholds a portion of each payment until the contract is complete in order to protect itself from the entity failing to complete its obligations under the contract, as follows: [IFRS 15.IE Example 27, IFRS 15.IE141-IE142]

Extract from IFRS 15

Example 27-Withheld payments on a long-term contract

An entity enters into a contract for the construction of a building that includes scheduled milestone payments for the performance by the entity throughout the contract term of three years. The performance obligation will be satisfied over time and the milestone payments are scheduled to coincide with the entity's expected performance. The contract provides that a specified percentage of each milestone payment is to be withheld (ie retained) by the customer throughout the arrangement and paid to the entity only when the building is complete.

The entity concludes that the contract does not include a significant financing component. The milestone payments coincide with the entity's performance and the contract requires amounts to be retained for reasons other than the provision of finance in accordance with paragraph 62(c) of IFRS 15. The withholding of a specified percentage of each milestone payment is intended to protect the customer from the contractor failing to adequately complete its obligations under the contract.

Example 28 illustrates two situations. In one, a contractual discount rate reflects the rate in a separate financing transaction. In the other, it does not. [IFRS 15.IE Example 28, IFRS 15.IE143-IE147].

Extract from IFRS 15

Example 28-Determining the discount rate

An entity enters into a contract with a customer to sell equipment. Control of the equipment transfers to the customer when the contract is signed. The price stated in the contract is CU1 million plus a five per cent contractual rate of interest, payable in 60 monthly instalments of CU18,871.

Case A-Contractual discount rate reflects the rate in a separate financing transaction

In evaluating the discount rate in the contract that contains a significant financing component, the entity observes that the five per cent contractual rate of interest reflects the rate that would be used in a separate financing transaction between the entity and its customer at contract inception (ie the contractual rate of interest of five per cent reflects the credit characteristics of the customer).

The market terms of the financing mean that the cash selling price of the equipment is CU1 million. This amount is recognised as revenue and as a loan receivable when control of the equipment transfers to the customer. The entity accounts for the receivable in accordance with IFRS 9.

Case B-Contractual discount rate does not reflect the rate in a separate financing transaction

In evaluating the discount rate in the contract that contains a significant financing component, the entity observes that the five per cent contractual rate of interest is significantly lower than the 12 per cent interest rate that would be used in a separate financing transaction between the entity and its customer at contract inception (ie the contractual rate of interest of five per cent does not reflect the credit characteristics of the customer). This suggests that the cash selling price is less than CU1 million.

In accordance with paragraph 64 of IFRS 15, the entity determines the transaction price by adjusting the promised amount of consideration to reflect the contractual payments using the 12 per cent interest rate that reflects the credit characteristics of the customer. Consequently, the entity determines that the transaction price is CU848,357 (60 monthly payments of CU18,871 discounted at 12 per cent). The entity recognises revenue and a loan receivable for that amount. The entity accounts for the loan receivable in accordance with IFRS 9.

Example 29 illustrates a contract with an advance payment from the customer that the entity concludes represents a significant benefit of financing. It also illustrates a situation in which the implicit interest rate does not reflect the interest rate that would be used in a separate financing transaction between the entity and its customer at contract inception, as follows: [IFRS 15.IE Example 29, IFRS 15.IE148-IE151]

Extract from IFRS 15

Example 29-Advance payment and assessment of discount rate

An entity enters into a contract with a customer to sell an asset. Control of the asset will transfer to the customer in two years (ie the performance obligation will be satisfied at a point in time). The contract includes two alternative payment options: payment of CU5,000 in two years when the customer obtains control of the asset or payment of CU4,000 when the contract is signed. The customer elects to pay CU4,000 when the contract is signed.

The entity concludes that the contract contains a significant financing component because of the length of time between when the customer pays for the asset and when the entity transfers the asset to the customer, as well as the prevailing interest rates in the market.

The interest rate implicit in the transaction is 11.8 per cent, which is the interest rate necessary to make the two alternative payment options economically equivalent. However, the entity determines that, in accordance with paragraph 64 of IFRS 15, the rate that should be used in adjusting the promised consideration is six per cent, which is the entity's incremental borrowing rate.

The following journal entries illustrate how the entity would account for the significant financing component:

- (a) recognise a contract liability for the CU4,000 payment received at contract inception:
- | | | |
|------|--------------------|---------|
| Cash | CU4,000 | |
| | Contract liability | CU4,000 |
- (b) during the two years from contract inception until the transfer of the asset, the entity adjusts the promised amount of consideration (in accordance with paragraph 65 of IFRS 15) and accretes the contract liability by recognising interest on CU4,000 at six per cent for two years:
- | | | |
|------------------|----------------------|-------|
| Interest expense | CU494 ^(a) | |
| | Contract liability | CU494 |
- (a) $CU494 = CU4,000 \text{ contract liability} \times (6 \text{ per cent interest per year for two years})$.
- (c) recognise revenue for the transfer of the asset:
- | | | |
|--------------------|---------|---------|
| Contract liability | CU4,494 | |
| | Revenue | CU4,494 |

In Example 30, involving a contract with an advance payment from the customer, the entity determines that a significant financing component does not exist because the difference between the amount of promised consideration and the cash selling price of the good or service arises for reasons other than the provision of financing, as follows: [IFRS 15.IE Example 30, IFRS 15.IE152-IE154]

Extract from IFRS 15

Example 30-Advance payment

An entity, a technology product manufacturer, enters into a contract with a customer to provide global telephone technology support and repair coverage for three years along with its technology product. The customer purchases this support service at the time of buying the product. Consideration for the service is an additional CU300. Customers electing to buy this service must pay for it upfront (ie a monthly payment option is not available).

To determine whether there is a significant financing component in the contract, the entity considers the nature of the service being offered and the purpose of the payment terms. The entity charges a single upfront amount, not with the primary purpose of obtaining financing from the customer but, instead, to maximise profitability, taking into consideration the risks associated with providing the service. Specifically, if customers could pay monthly, they would be less likely to renew and the population of customers that continue to use the support service in the later years may become smaller and less diverse over time (ie customers that choose to renew historically are those that make greater use of the service, thereby increasing the entity's costs). In addition, customers tend to use services more if they pay monthly rather than making an upfront payment. Finally, the entity would incur higher administration costs such as the costs related to administering renewals and collection of monthly payments.

In assessing the requirements in paragraph 62(c) of IFRS 15, the entity determines that the payment terms were structured primarily for reasons other than the provision of finance to the entity. The entity charges a single upfront amount for the services because other payment terms (such as a monthly payment plan) would affect the nature of the risks assumed by the entity to provide the service and may make it uneconomical to provide the service. As a result of its analysis, the entity concludes that there is not a significant financing component.

Frequently asked questions

Question 5-21: The standard states that a significant financing component does not exist if the difference between the promised consideration and the cash selling price of the good or service arises for reasons other than the provision of finance. How broadly would this factor be applied?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

According to IFRS 15, a significant financing component does not exist if the difference between the promised consideration and the cash selling price of the good or service arises for reasons other than the provision of finance. [IFRS 15.62(c)]. The TRG members discussed how broadly this factor would be applied.

The TRG members generally agreed that there is likely significant judgement involved in determining whether either party is providing financing or the payment terms are for another reason. The TRG members also generally agreed that the Board did not seem to intend to create a presumption that a significant financing component exists if the cash selling price differs from the promised consideration (or there is a long period of time between transfer of the goods and payment).

The TRG agenda paper noted that, although IFRS 15.61 states that the measurement objective for a significant financing component is to recognise revenue for the goods or services at an amount that reflects the cash selling price, this measurement objective is only followed when an entity has already determined that a significant financing component exists. [IFRS 15.61]. The fact that there is a difference in the promised consideration and the cash selling price is not a principle for determining whether a significant financing component actually exists. It is only one factor to consider.

Many TRG members noted that it requires significant judgement in some circumstances to determine whether a transaction includes a significant financing component.⁸¹ The TRG members also acknowledged that when entities consider whether the difference between the promised consideration and cash selling price is for a reason other than financing, they must consider whether the difference between those amounts is proportional to the reason for the difference, as contemplated in IFRS 15.62(c).

⁸¹ TRG Agenda paper no. 34, March 2015 Meeting - Summary of Issues Discussed and Next Steps, dated 13 July 2015.

Question 5-22: If the promised consideration is equal to the cash selling price, does a financing component exist?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

The TRG members generally agreed that even if the list price, cash selling price and promised consideration of a good or service are all equal, an entity must not automatically assume that a significant financing component does not exist. This would be a factor to consider, but it would not be determinative.⁸²

As discussed above in Question 5-21, while IFRS 15.61 states that the measurement objective for a significant financing component is to recognise revenue for the goods or services at an amount that reflects the cash selling price, this measurement objective is only followed when an entity has already determined that a significant financing component exists. The fact that there is no difference between the promised consideration and the cash selling price is not determinative in the evaluation of whether a significant financing component actually exists. It is a factor to consider, but it is not the only factor and is not determinative. As discussed above, an entity needs to consider all facts and circumstances in this evaluation.

The TRG agenda paper noted that the list price might not always equal the cash selling price (i.e., the price that a customer would have paid for the promised goods or services if the customer had paid cash for those goods or services when (or as) they transfer to the customer, as defined in IFRS 15.61). For example, if a customer offers to pay cash upfront when the entity is offering 'free' financing to customers, the customer that offers the upfront payment might be able to pay less than the list price. Determining a 'cash selling price' might require judgement and the fact that an entity provides 'interest-free financing' does not necessarily mean that the cash selling price is the same as the price another customer would pay over time. Entities would have to consider the cash selling price in comparison to the promised consideration in making the evaluation based on the overall facts and circumstances of the arrangement.

This notion is consistent with IFRS 15.77 on allocating the transaction price to performance obligations based on stand-alone selling prices (see section 6.1 below), which indicates that a contractually stated price or a list price for a good or service may be (but is not presumed to be) the stand-alone selling price of that good or service. The TRG agenda paper noted that it might be possible for a financing component to exist, but that it might not be significant. As discussed above in this section, entities need to apply judgement in determining whether the financing component is significant.

Question 5-23: Does the standard preclude accounting for financing components that are not significant?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

The TRG members generally agreed that the standard does not preclude an entity from deciding to account for a financing component that is not significant. For example, an entity might have a portfolio of contracts in which there is a mix of significant and insignificant financing components. An entity could choose to account for all of the financing components as if they were significant in order to avoid having to apply different accounting methods to each.

An entity electing to apply the requirements for significant financing components to an insignificant financing component would need to be consistent in its application to all similar contracts with similar circumstances.⁸³

Question 5-24: How do entities consider whether the significant financing component practical expedient applies to contracts with a single payment stream for multiple performance obligations?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

The standard includes a practical expedient that allows an entity not to assess a contract for a significant financing component if the period between the customer's payment and the entity's transfer of the goods or services is one year or less. [IFRS 15.63]. The TRG members generally agreed that entities either apply an approach of allocating any consideration received:

- (1) To the earliest good or service delivered
- Or
- (2) Proportionately between the goods or services depending on the facts and circumstances

⁸² TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

⁸³ TRG Agenda paper no. 30, *Significant Financing Components*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

The TRG agenda paper on this topic provided an example of a telecommunications entity that enters into a two-year contract to provide a device at contract inception and related data services over 24 months in exchange for 24 equal monthly instalments.⁸⁴ Under approach (1) above, an entity would be allowed to apply the practical expedient because the period between transfer of the good or service and customer payment would be less than one year for both the device and the related services. This is because, in the example provided, the device would be 'paid off' after five months. Under approach (2) above, an entity would not be able to apply the practical expedient because the device would be deemed to be paid off over the full 24 months (i.e., greater than one year).

Approach (2) above would be appropriate in circumstances similar to the example in the TRG agenda paper, when the cash payment is not directly tied to the earliest good or service delivered in a contract. Approach (1) would be appropriate when the cash payment is directly tied to the earliest good or service delivered in a contract. However, the TRG members noted it might be difficult to tie a cash payment directly to a good or service because cash is fungible. Accordingly, judgement is required based on the facts and circumstances.⁸⁵

Question 5-25: If a significant financing component exists in a contract, how does an entity calculate the adjustment to revenue?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

The TRG members generally agreed that the standard does not contain requirements for how to calculate the adjustment to the transaction price due to a significant financing component. A financing component is recognised as interest expense (when the customer pays in advance) or interest income (when the customer pays in arrears). Entities need to consider requirements outside IFRS 15 to determine the appropriate accounting treatment (i.e., IFRS 9).⁸⁶

Question 5-26: How does an entity allocate a significant financing component when there are multiple performance obligations in a contract?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

The standard is clear that, when determining the transaction price in Step 3 of the model, the effect of financing is excluded from the transaction price prior to the allocation of the transaction price to performance obligations (which occurs in Step 4). However, stakeholders had questioned whether an adjustment for a significant financing component could ever be attributed to only one or some of the performance obligations in the contract, rather than to all of the performance obligations in the contract. This is because the standard only includes examples in which there is a single performance obligation.

The TRG members generally agreed that it might be reasonable for an entity to attribute a significant financing component to one or more, but not all, of the performance obligations in the contract. In doing so, the entity would analogise to the exceptions for allocating variable consideration and/or discounts to one or more (but not all) performance obligations, if specified criteria are met (see sections 6.3 and 6.4 below, respectively).⁸⁷ However, attribution of a financing component to one (or some) of the performance obligations requires the use of judgement, especially because cash is fungible.

Question 5-27: Is an entity required to evaluate whether a customer option that provides a material right includes a significant financing component? If so, how would entities perform this evaluation?

(TRG meeting 30 March 2015 - Agenda paper no. 32)

See response to Question 4-28 in section 4.6 above.

Question 5-28: Can an entity consider an interest expense arising from a customer contract with a significant financing component as borrowing costs eligible for capitalisation?

IAS 23 *Borrowing Costs* requires borrowing costs to be capitalised if they are directly attributable to the acquisition, construction or production of a qualifying asset (whether or not the funds have been borrowed specifically for that purpose) (see Chapter 22). [IAS 23.8]. IAS 23 and IFRS 15 do not specifically address whether interest expense arising from a customer contract with a significant financing component can be considered as borrowing costs eligible for capitalisation.

⁸⁴ TRG Agenda paper no. 30, *Significant Financing Components*, dated 30 March 2015.

⁸⁵ TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

⁸⁶ TRG Agenda paper no. 30, *Significant Financing Components*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

⁸⁷ TRG Agenda paper no. 30, *Significant Financing Components*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

According to IAS 23, borrowing costs are “interest and other costs that an entity incurs in connection with the borrowing of funds”. [IAS 23.5]. Interest expense arising from customer contracts with a significant financing component might qualify as borrowing costs eligible for capitalisation if they are directly attributable to the acquisition, construction or production of a qualifying asset.

For most revenue transactions, it is likely that entities would be considering inventory when determining whether there is a qualifying asset. According to IAS 23, inventory can be a qualifying asset, but “... inventories that are manufactured, or otherwise produced, over a short period of time, are not qualifying assets. Assets that are ready for their intended use or sale when acquired are not qualifying assets”. [IAS 23.7]. Significant judgement might be needed to determine whether inventories take a substantial period of time to manufacture or produce before being ready for their intended use or sale. However, it might be helpful for an entity to consider how it satisfies its performance obligations as part of this determination. In particular, it is important to note that, if a performance obligation is satisfied over-time, by definition, the customer obtains control of the good or service (and the entity derecognises any related inventory) as the entity performs. As discussed in Question 7-17 in section 7.1.4.E below, its performance would not result in the creation of a material asset in the entity’s accounts (e.g., work in progress).

It is also important to note that capitalisation of borrowing costs is not required by IAS 23 for inventories that are manufactured, or otherwise produced, in large quantities on a repetitive basis even if they meet the definition of a qualifying asset. [IAS 23.4(b)].

In late 2018, the IFRS IC received a request about the capitalisation of borrowing costs in relation to assets being developed for sale for which revenue is recognised over time as control transfers to the customer as the asset is constructed.

At its March 2019 meeting, the IFRS IC noted that, when applying IAS 23 an entity assesses whether there is a qualifying asset (i.e., an asset that necessarily takes a substantial period of time to get ready for its intended use or sale). The request referred to real estate units, which might take a substantial period of time to construct. However, the IFRS IC concluded that:

- *For any sold units:* there is no qualifying asset. When any of the criteria in IFRS 15.35 are met (and revenue is recognised over time), control transfers to the customer as the entity performs. Therefore, the entity holds no inventory. Instead, it recognises a receivable or contract asset for its right to receive consideration in exchange for its performance to date. IAS 23 explicitly states that receivables are not a qualifying asset. [IAS 23.7]. Like receivables, the intended use of a contract assets is to collect cash (or another asset), which is not a use for which it necessarily takes a substantial period of time to get ready. Therefore, the IFRS IC observed that contract assets are also not qualifying assets.
- *For any unsold units:* any inventory (work-in-progress) for unsold units under construction is not a qualifying asset if: (i) the entity intends to sell the part-completed units as soon as it finds suitable customers - this is because the units are already ready for sale in their part-completed state; and (ii) control of the part-completed units transfers to the customer on signing the contract (which is the case if revenue is recognised over time).⁸⁸

5.5.5 Financial statement presentation of financing component

As discussed above, when a significant financing component exists in a contract, the transaction price is adjusted so that the amount recognised as revenue is the ‘cash selling price’ of the underlying goods or services at the time of transfer. Essentially, a contract with a customer that has a significant financing component would be separated into a revenue component (for the notional cash selling price) and a loan component (for the effect of the deferred or advance payment terms). [IFRS 15.BC244]. Consequently, the accounting for accounts receivable arising from a contract that has a significant financing component should be comparable to the accounting for a loan with the same features. [IFRS 15.BC244].

The amount allocated to the significant financing component would have to be presented separately from revenue recognised from contracts with customers. The financing component is recognised as interest expense (when the customer pays in advance) or interest income (when the customer pays in arrears). The interest income or expense is recognised over the financing period using the effective interest method described in IFRS 9. The standard notes that interest is only recognised to the extent that a contract asset, contract liability or receivable is recognised in accordance with IFRS 15. [IFRS 15.65]. For entities that apply IFRS 18 *Presentation and Disclosure in Financial Statements* early, IFRS 18 clarifies that interest expenses

⁸⁸ [IFRIC Update](#), March 2019, available on the IFRS Foundation’s website.

on contract liabilities with significant financing components must be classified in the financing category in the statement of profit or loss. See Chapter 4 for further detail on the new concepts and classification requirements in IFRS 18, as well as a discussion on the classification of interest income on contract assets. [IFRS 18.61, IFRS 18.65(b)(i), IFRS 18.B53(b), IFRS 18.B54(b)].

As discussed in section 10.1 below, a contract asset (or receivable) or contract liability is generated (and presented on the balance sheet) when either party to a contract performs, depending on the relationship between the entity's performance and the customer's payment. Example 26 in the standard (see section 5.5.4 above) illustrates a situation in which an entity transfers control of a good to a customer, but the customer is not required to pay for the good until two years after delivery. The contract includes a significant financing component. Furthermore, the customer has the right to return the good for 90 days. The product is new and the entity does not have historical evidence of returns activity. Therefore, the entity is not able to recognise revenue (or a contract asset or receivable) upon delivery because it cannot assert that it is highly probable that a significant revenue reversal will not occur (i.e., it cannot assert that it is highly probable that the product will not be returned). Accordingly, during the 90-day return period, the entity also cannot record interest income. However, as depicted in the example, once the return period lapses, the entity can record revenue and a receivable, as well as begin to recognise interest income.

The IASB noted in the Basis for Conclusions that the requirement in IFRS 15.65 does not preclude an entity from presenting interest income as revenue when interest income represents income from an entity's ordinary activities, which might be the case for banks and other entities with similar types of operations. [IFRS 15.BC247].

Although there are two components within the contract when there is a significant financing component (i.e., the revenue component and the significant financing component), it is only in the case of deferred payment terms that there are two cash flow components. In that case, the revenue component cash flows are classified as cash flows from operating activities, and the cash flows related to the significant financing component are classified consistent with the entity's choice to present cash flows from interest received in accordance with IAS 7.33 (i.e., as cash flows from operating or investing activities). If the customer pays in advance, the sum of the cash amount and the accrued interest represent revenue, and thus there is only one cash flow component. Accordingly, the cash received is classified as cash flows from operating activities. See Chapter 36 for further discussion. For entities that apply IFRS 18 and the consequential amendments to IAS 7 early, the amendments to IAS 7 clarify that interest received must be classified as cash flows from investing activities. However, entities that have a specified main business activity (see Chapter 4) must instead classify interest received by reference to how interest income is classified in the statement of profit or loss. [IAS 7(2027).34A(b), IAS 7(2027).34B].

Impairment losses on receivables, with or without a significant financing component, are presented in line with the requirements of IAS 1 (or IFRS 18 if applied early - see Chapter 4) and disclosed in accordance with IFRS 7 *Financial Instruments: Disclosures*. However, IFRS 15 makes it clear that such amounts are disclosed separately from impairment losses from other contracts. [IFRS 15.113(b)].

How we see it

We believe entities might need to expend additional effort to track impairment losses on assets arising from contracts that are within the scope of IFRS 15 separately from impairment losses on assets arising from other contracts. Entities need to ensure that they have the appropriate systems, internal controls, policies and procedures in place to collect and separately present this information.

5.6 Non-cash consideration

Customer consideration might be in the form of goods, services or other non-cash consideration (e.g., property, plant and equipment, a financial instrument). When an entity (i.e., the seller or vendor) receives, or expects to receive, non-cash consideration, the fair value of the non-cash consideration is included in the transaction price. [IFRS 15.66].

It is likely that an entity will apply the requirements of IFRS 13 *Fair Value Measurement* or IFRS 2 when measuring the fair value of any non-cash consideration. If an entity cannot reasonably estimate the fair value of non-cash consideration, it measures the non-cash consideration indirectly by reference to the stand-alone selling price of the promised goods or services. [IFRS 15.67]. Significant judgement and consideration of specific facts and circumstances might be required in such situations (e.g., advertising barter transactions, see section 5.6.2 below for further discussion on barter transactions).

For contracts with both non-cash consideration and cash consideration, an entity needs to measure the fair value of the non-cash consideration and it looks to other requirements within IFRS 15 to account for the cash consideration. For example, for a contract in which an entity receives non-cash consideration and a sales-based royalty, the entity would measure the fair value of the non-cash consideration and refer to the requirements within the standard for the sales-based royalties.

The fair value of non-cash consideration might change both because of the form of consideration (e.g., a change in the price of a share an entity is entitled to receive from a customer) and for reasons other than the form of consideration (e.g., a change in the exercise price of a share option because of the entity's performance). Under IFRS 15, if an entity's entitlement to non-cash consideration promised by a customer is variable for reasons other than the form of consideration (i.e., there is uncertainty as to whether the entity receives the non-cash consideration if a future event occurs or does not occur), the entity considers the constraint on variable consideration. [IFRS 15.68].

In some transactions, a customer contributes goods or services, such as equipment or labour, to facilitate the fulfilment of the contract. If the entity obtains control of the contributed goods or services, it would consider them non-cash consideration and account for that consideration as described above. [IFRS 15.69]. Assessing whether the entity obtains control of the contributed goods or services by the customer might require judgement.

The Board also noted that any assets recognised as a result of non-cash consideration are accounted for in accordance with other relevant IFRS accounting standards (e.g., IAS 16). [IFRS 15.BC253].

The standard provides the following example of a transaction for which non-cash consideration is received in exchange for services provided: [IFRS 15.IE Example 31, IFRS 15.IE156-IE158]

Extract from IFRS 15

Example 31-Entitlement to non-cash consideration

An entity enters into a contract with a customer to provide a weekly service for one year. The contract is signed on 1 January 20X1 and work begins immediately. The entity concludes that the service is a single performance obligation in accordance with paragraph 22(b) of IFRS 15. This is because the entity is providing a series of distinct services that are substantially the same and have the same pattern of transfer (the services transfer to the customer over time and use the same method to measure progress—that is, a time-based measure of progress).

In exchange for the service, the customer promises 100 shares of its common stock per week of service (a total of 5,200 shares for the contract). The terms in the contract require that the shares must be paid upon the successful completion of each week of service.

The entity measures its progress towards complete satisfaction of the performance obligation as each week of service is complete. To determine the transaction price (and the amount of revenue to be recognised), the entity measures the fair value of 100 shares that are received upon completion of each weekly service. The entity does not reflect any subsequent changes in the fair value of the shares received (or receivable) in revenue.

5.6.1 Non-cash consideration application considerations

Stakeholders raised questions about the date to use when measuring the fair value of non-cash consideration for inclusion within the transaction price. In addition, constituents noted that the variability of non-cash consideration could arise both from its form (e.g., shares) and for other reasons (e.g., performance factors that affect the amount of consideration to which the entity will be entitled). Consequently, they questioned how the constraint on variable consideration would be applied in such circumstances.

At the January 2015 TRG meeting, the TRG members discussed these questions and agreed that, while the standard requires non-cash consideration (e.g., shares, advertising provided as consideration from a customer) to be measured at fair value, it is unclear when that fair value must be measured (i.e., the measurement date). The TRG members discussed three measurement date options:

- Contract inception
- When the non-cash consideration is received (or receivable)
- Or
- At the earlier of (i) when the non-cash consideration is received (or is receivable) and (ii) when (or as) the related performance obligation is satisfied

Consider Example 31 in the standard (included in section 5.6 above). Under the first view, the entity would measure fair value of all of the 5,200 shares on 1 January 20X1 (i.e., contract inception). Under the second view (which is illustrated in Example 31), it would measure the fair value of 100 shares at the end of each week, since this is when each week's shares are received (or receivable). Under the third view, the entity would measure the fair value of the weekly 100 shares over the course of each week. This is because the entity satisfies its performance obligation over time each week and this is earlier than when the non-cash consideration is received (or receivable), which is at the end of the week. As noted in Example 31, the entity does not reflect any subsequent changes in fair value in revenue. [IFRS 15.IE158].

Each view received support from some TRG members.⁸⁹ Since IFRS 15 does not specify the measurement date, an entity needs to use its judgement to determine the most appropriate measurement date when measuring the fair value of non-cash consideration. However, in accordance with IFRS 15.126, information about the methods, inputs and assumptions used to measure non-cash consideration needs to be disclosed. [IFRS 15.126, IFRS 15.BC254E].

Whichever method is selected, the objective is to choose a single measurement date. That is, the fact that IFRS 15 does not specify the measurement date does not change the requirement in the standard not to update the fair value measurement if the reason for the change is solely because of its form (i.e., because it is non-cash). [IFRS 15.68].

IFRS 15 requires that the constraint on variable consideration be applied to non-cash consideration only if the variability is due to factors other than the form of consideration (i.e., variability arising for reasons other than changes in the price of the non-cash consideration). The constraint does not apply if the non-cash consideration varies because of its form (e.g., listed shares for which the share price changes). However, the standard does not address how the constraint would be applied when the non-cash consideration is variable due to both its form and other reasons. While some of the TRG members said the standard could be interpreted to require an entity to split the consideration based on the source of the variability, other TRG members highlighted that this approach would be overly complex and would not provide useful information.

FASB differences

The FASB's standard specifies that the fair value of non-cash consideration needs to be measured at contract inception when determining the transaction price. Any subsequent changes in the fair value of the non-cash consideration due to its form (e.g., changes in share price) are not included in the transaction price and would be recognised, if required, as a gain or loss in accordance with other accounting standards, but would not be recognised as revenue from contracts with customers. The use of a measurement date other than contract inception would not be precluded under IFRS accounting standards. [IFRS 15.BC254E].

The FASB's standard also specifies that when the variability of non-cash consideration is due to both the form of the consideration and for other reasons, the constraint on variable consideration would apply only to the variability for reasons other than its form. While IFRS 15 does not have a similar requirement, the IASB decided to constrain variability in the estimate of the fair value of the non-cash consideration if that variability relates to changes in the fair value for reasons other than the form of the consideration. In practice, it might be difficult to distinguish between variability in the fair value due to the form of the consideration and other reasons, in which case applying the variable consideration constraint to the whole estimate of the non-cash consideration might be more practical. [IFRS 15.BC254H].

5.6.2 Barter transactions

An entity might enter into barter transactions to provide goods or services in exchange for receiving similar or dissimilar goods or services from its customers. In some cases, barter transactions include cash consideration in addition to the non-cash consideration. IFRS 15 does not contain specific requirements for barter transactions. Therefore, significant judgement and consideration of the specific facts and circumstances will be needed when accounting for such transactions.

⁸⁹ TRG Agenda paper no. 15, *Noncash consideration*, dated 26 January 2015, and TRG Agenda paper no. 25, *January 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 30 March 2015.

Aspects of the standard that will be particularly important to consider include, but are not limited to:

- *Understanding whether the transaction is within the scope of the standard* - barter transactions involve non-monetary exchanges. Therefore, an entity first needs to determine whether the barter transaction involves a non-monetary exchange between entities in the same line of business to facilitate sales to (potential) customers. If it does, it is excluded from the scope of IFRS 15 (see section 2.1.1 above). For barter transactions not subject to this scope exclusion (i.e., they are within the scope of IFRS 15), an entity needs to understand whether there is vendor-customer relationship with the counterparty and whether the transaction is in the ordinary course of its business. This is because IFRS 15 only applies to contracts that provide goods or services to customers in the ordinary course of business (see sections 2.1 and 2.3 above).
- *Determining whether the transaction has commercial substance (such that the contract meets the criteria to be considered a contract under the five-step model in IFRS 15)* - exchanging goods or services in a barter transaction might lack commercial substance. An entity needs to determine whether the risk, timing or amount of an entity's future cash flows change as a result of the barter transaction (see section 3.1.4 above).
- *Identifying the promised goods or services to be transferred to the customer* - barter transactions might involve the exchange of a good or service, but not necessarily the transfer of its control. An entity needs to understand whether the customer will obtain control of a good or service (see section 7 below). That is, whether there is a promised good or service in the contract (see section 4.1 above).
- *Determining whether the entity will obtain control of any non-cash consideration* - barter transactions involve the exchange of non-cash items. Only non-cash items for which the entity obtains control from the customer would be non-cash consideration for purposes of applying the standard (as noted above in this section).
- *Determining the fair value of any non-cash consideration received from the customer (see section 5.6 above)* - in order to recognise revenue in the barter transaction, the non-cash consideration obtained from a customer needs to be measured either: (a) directly, at its fair value if it can be reasonably estimated; or (b) indirectly, by reference to the stand-alone selling price of the promised good or service transferred to the customer if the fair value of the non-cash consideration cannot be reasonably estimated. IFRS 15 does not permit an entity to avoid recognising revenue if the fair value cannot be estimated reliably. Therefore, if the transaction is within the scope of IFRS 15, revenue must be recognised.

5.7 Consideration paid or payable to a customer

Many entities make payments to their customers. In some cases, the consideration paid or payable represents purchases by the entity of goods or services offered by the customer that satisfy a business need of the entity. In other cases, the consideration paid or payable represents incentives given by the entity to entice the customer to purchase, or continue purchasing, its goods or services.

The standard provides the following requirements for consideration paid or payable to a customer:
[IFRS 15.70, IFRS 15.71, IFRS 15.72]

Extract from IFRS 15

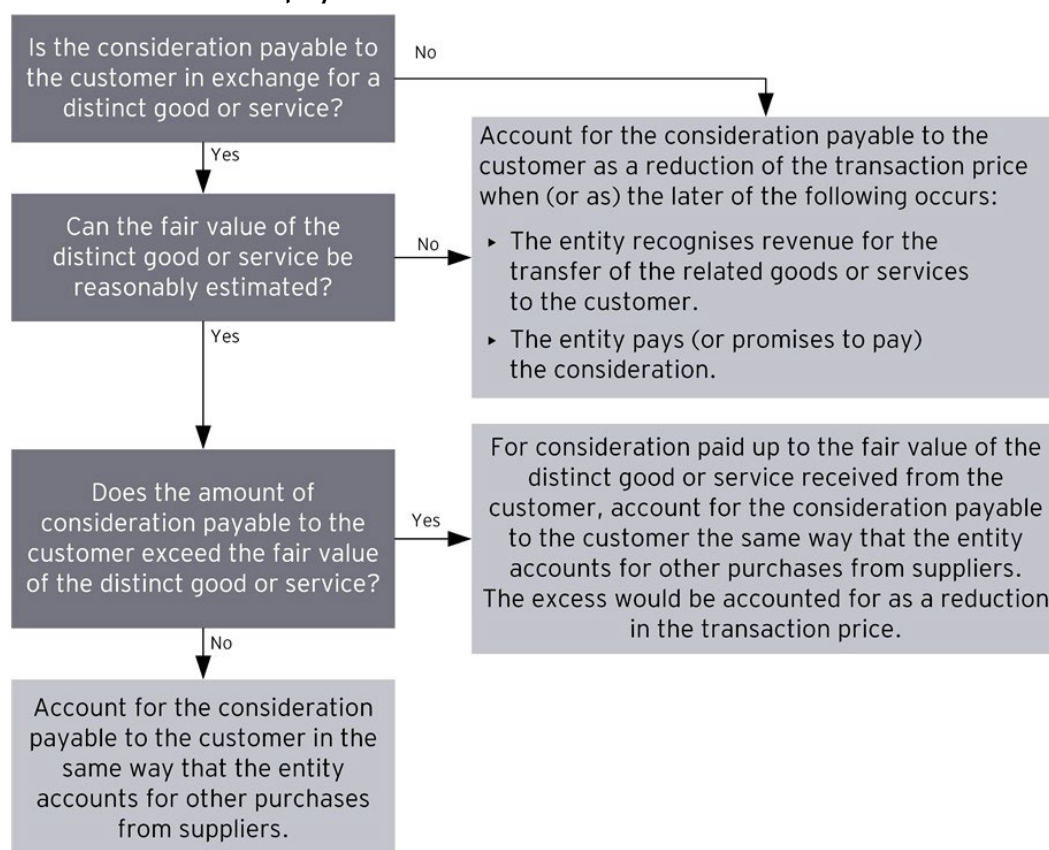

Consideration payable to a customer

- 70 Consideration payable to a customer includes cash amounts that an entity pays, or expects to pay, to the customer (or to other parties that purchase the entity's goods or services from the customer). Consideration payable to a customer also includes credit or other items (for example, a coupon or voucher) that can be applied against amounts owed to the entity (or to other parties that purchase the entity's goods or services from the customer). An entity shall account for consideration payable to a customer as a reduction of the transaction price and, therefore, of revenue unless the payment to the customer is in exchange for a distinct good or service (as described in paragraphs 26-30) that the customer transfers to the entity. If the consideration payable to a customer includes a variable amount, an entity shall estimate the transaction price (including assessing whether the estimate of variable consideration is constrained) in accordance with paragraphs 50-58.

- 71 If consideration payable to a customer is a payment for a distinct good or service from the customer, then an entity shall account for the purchase of the good or service in the same way that it accounts for other purchases from suppliers. If the amount of consideration payable to the customer exceeds the fair value of the distinct good or service that the entity receives from the customer, then the entity shall account for such an excess as a reduction of the transaction price. If the entity cannot reasonably estimate the fair value of the good or service received from the customer, it shall account for all of the consideration payable to the customer as a reduction of the transaction price.
- 72 Accordingly, if consideration payable to a customer is accounted for as a reduction of the transaction price, an entity shall recognise the reduction of revenue when (or as) the later of either of the following events occurs:
- the entity recognises revenue for the transfer of the related goods or services to the customer; and
 - the entity pays or promises to pay the consideration (even if the payment is conditional on a future event). That promise might be implied by the entity's customary business practices.

Figure 5-3 below illustrates these requirements.

Figure 5-3: Consideration payable to a customer

The standard indicates that an entity accounts for the consideration payable to a customer, regardless of whether the purchaser receiving the consideration is a direct or indirect customer of the entity. This includes consideration to any purchasers of the entity's products at any point along the distribution chain. This would include entities that make payments to the customers of resellers or distributors that purchase directly from the entity (e.g., manufacturers of breakfast cereals might offer coupons to end-consumers, even though their direct customers are the grocery stores that sell to end-consumers). The requirements in IFRS 15 apply to entities that derive revenue from sales of services, as well as entities that derive revenue from sales of goods.

The requirements for consideration payable to a customer may also be helpful for entities receiving such consideration from vendors to consider in the absence of other, specific guidance. For further discussion of this topic, refer to our publication *Applying IFRS: Accounting for Payments from Suppliers*.⁹⁰

Frequently asked questions

Question 5-29: Who is considered to be an entity's customer when applying the requirements for consideration payable to a customer?

(TRG meetings 30 March 2015 - Agenda paper no. 28; and 13 July 2015 - Agenda paper no. 37)

The TRG members generally agreed that the requirements for consideration payable to a customer apply to all payments made to entities/customers in the distribution chain for that contract. However, they agreed that there could also be situations in which the requirements would apply to payments made to any customer of an entity's customer outside the distribution chain if both parties are considered the entity's customers. For example, in an arrangement with a principal, an agent and an end-consumer, an agent might conclude that its only customer is the principal or it might conclude that it has two customers - the principal and the end-consumer. Regardless of this assessment, an agent's payment to a principal's end-consumer that was contractually required based on an agreement between the entity (agent) and the principal would represent consideration payable to a customer. Absent similar contract provisions that clearly indicate when an amount is consideration payable, the TRG members agreed that agents need to evaluate their facts and circumstances to determine whether payments made to an end-consumer would be considered a reduction of revenue or a marketing expense.⁹¹

Question 5-30: How does an entity that acts as an agent account for incentive payments made to end-consumers that are not the entity's customers and are outside the distribution chain?

An entity might make incentive payments to an end-consumer that is not the entity's direct customer and is not identified as an indirect customer (e.g., the end-consumer does not purchase the entity's goods or services at any point along the distribution chain). Incentive payments of this nature might be common in arrangements in which an entity acts as an agent to facilitate the sale of its customer's (i.e., the principal's) goods or services to an end-consumer (e.g., incentive payments offered by platform entities). The entity will need to apply significant judgement to determine: (1) whether the end-consumer is a customer (see section 2.3 above); and (2) the appropriate accounting treatment for incentive payments made to an end-consumer that is not identified as a customer (e.g., whether to account for the payment as a reduction of revenue or as a marketing expense).

The entity first has to consider whether the payment to the end-consumer is in exchange for a distinct good or service acquired from the end-consumer at fair value. If it is, the entity must account for the payment in the same way it accounts for other purchases from suppliers. [IFRS 15.71]. If the incentive payment is not in exchange for a distinct good or service, the entity will need to apply significant judgement to determine whether the payment results in a reduction to revenue.

In a speech, a member of the US SEC staff noted that, when determining whether incentive payments need to be recorded as a reduction of revenue, it is important to consider whether the entity has a contractual or an implied obligation to provide incentives to the end-consumer on the seller's behalf. The SEC staff member noted that this includes assessing whether an entity is, in substance, providing a price concession to the seller. For example, a company would consider whether "the seller would have a valid expectation that the company would provide incentives to the end user".⁹²

An entity's customer might have a valid expectation that the payment will be made to the end-consumer based on reasonably available information about the entity's incentive programme, including written or oral communications (e.g., advertisements, press releases, published policies, customer reporting) and any customary business practices of the entity. Entities will need to carefully consider their facts and circumstances to determine whether a valid expectation exists.

Similar to a contractually required obligation, an implied obligation to a customer to provide incentive payments to an end-consumer is accounted for as consideration payable to a customer and results in a reduction to the transaction price if the payment to the end-consumer is not in exchange for a distinct good or service.

91 TRG Agenda paper no. 28, *Consideration Payable to a Customer*, dated 30 March 2015, TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015, and TRG Agenda paper no. 37, *Consideration Payable to a Customer*, dated 13 July 2015.

92 Speech by Jonathan Wiggins, Senior Associate Chief Accountant, SEC Office of the Chief Accountant, 6 December 2021. Refer to our publication, *2021 AICPA & CIMA Conference on Current SEC and PCAOB Developments - Compendium of significant accounting and reporting issues*, on [Accounting Link](#).

In certain arrangements, an entity might make a payment to an end-consumer in exchange for a distinct good or service and the payment exceeds the fair value of that good or service. The entity will need to apply significant judgement in these arrangements to determine whether the excess payment represents an implied obligation to its customer. If the entity determines the excess payment is an implied obligation to the customer, then the excess payment must result in a reduction to the transaction price. [IFRS 15.71]. Given the judgement involved with such arrangements, an entity needs to consider the disclosure requirements in IFRS 15.123 and IFRS 15.126 (see section 10.5.2 below).

5.7.1 Forms of consideration paid or payable to a customer

Consideration paid or payable to customers commonly takes the form of discounts and coupons, among others. Furthermore, the promise to pay the consideration might be implied by the entity's customary business practice, as stated in IFRS 15.72. [IFRS 15.72].

Since consideration paid or payable to a customer can take many different forms, entities have to carefully evaluate each transaction to determine the appropriate treatment of such amounts (i.e., as payment for a distinct good or service, a reduction of the transaction price or a combination of both, as illustrated in Figure 5-3 in section 5.7 above). Some common examples of consideration paid to customers are given below:

- **Slotting fees** - Manufacturers of consumer products commonly pay retailers fees to have their goods displayed prominently on store shelves. Generally, such fees do not provide a distinct good or service to the manufacturer and are treated as a reduction of the transaction price.
- **Co-operative advertising arrangements** - In some arrangements, an entity agrees to reimburse a reseller for a portion of costs incurred by the reseller to advertise the entity's products. The determination of whether the payment from the vendor is in exchange for a distinct good or service at fair value depends on a careful analysis of the facts and circumstances of the contract.
- **Price protection** - An entity might agree to reimburse a retailer up to a specified amount for shortfalls in the sales price received by the retailer for the entity's products over a specified period of time. Normally such payments do not provide a distinct good or service to the manufacturer and are treated as a reduction of the transaction price (see Question 5-7 in section 5.2.1 above).
- **Coupons and rebates** - An indirect customer of an entity might receive a refund of a portion of the purchase price of the product or service acquired by returning a form to the retailer or the entity. Generally, such payments do not provide a distinct good or service to the manufacturer and are treated as a reduction of the transaction price.
- **'Pay-to-play' arrangements** - In some arrangements, an entity pays an upfront fee to the customer prior to, or in conjunction with, entering into a contract. In most cases, these payments are not associated with any distinct good or service to be received from the customer and are treated as a reduction of the transaction price.
- **Purchase of goods or services** - Entities often enter into supplier-vendor arrangements with their customers in which the customers provide them with a distinct good or service. For example, a software entity buys its office supplies from one of its software customers. In such situations, the entity has to carefully determine whether the payment made to the customer is solely for the goods or services received or whether part of the payment is actually a reduction of the transaction price for the goods or services the entity is transferring to the customer.

Frequently asked questions

Question 5-31: Which payments to a customer are within the scope of the requirements for consideration payable to a customer?

(TRG meetings 30 March 2015 - Agenda paper no. 28; and 13 July 2015 - Agenda paper no. 37)

The TRG members generally agreed that an entity does not need to separately analyse each payment to a customer if it is apparent that the payment is for a distinct good or service acquired in the normal course of business at a market price. However, if the business purpose of a payment to a customer is unclear or the goods or services are acquired in a manner that is inconsistent with market terms that other entities would receive when purchasing the customer's good or services, the payment needs to be evaluated under these requirements.⁹³

In the Basis for Conclusions, the IASB noted that the amount of consideration received from a customer for goods or services and the amount of any consideration paid to that customer for goods or services could be linked even if they are separate events. *[IFRS 15.BC257]*.

Question 5-32: Do litigation settlements payable by an entity to its customer represent consideration payable to a customer?

An entity might be sued (for example, as a result of anti-competition investigations related to the price of the goods or services) by a current or previous customer in relation to goods or services that have already been transferred (or partially transferred) to a customer. If the entity is ordered to pay compensation to the customer, the entity needs to consider the accounting for the payment and the corresponding effects on the entity's statement of profit or loss. However, not all disputes with customers result in third-party arbitration or litigation proceeding. For example, an entity might agree to transfer consideration to a customer because of a resolution negotiated only between the entity and the customer.

Entities need to carefully consider all relevant facts and circumstances to determine the appropriate accounting, including whether compensation paid represents consideration payable to a customer. Factors to consider include whether the litigation is related to a revenue contract and whether the contract related to the litigation was previously completed, which might require judgement to determine. If a litigation settlement is related to a revenue contract and that contract is not completed, IFRS 15 would apply unless it is covered by an assurance type warranty accounted for in accordance with IAS 37 (see section 9.1.3 below).

If a litigation settlement is related to a revenue contract and that contract is completed, an entity might conclude it is appropriate to apply IAS 37 to account for any (contingent) liability because there is no longer a contract or a customer relationship. If the entity reaches that conclusion, the compensation to the customer charged by the court's decision would not be part of the price that the parties agreed for the completed contract, nor related to any future contracts with that customer. However, an entity that applies IAS 37 might determine that it only applies to the recognition and measurement of any provision and not to the impact on profit or loss, and that, instead, it would apply IFRS 15 to determine the classification in profit or loss, in accordance with the requirements for consideration payable to a customer. This is because IAS 37 states that "Other Standards specify whether expenditures are treated as assets or as expenses. These issues are not addressed in this Standard". *[IAS 37.8]*.

However, an entity might conclude that only IFRS 15 applies because IAS 37 excludes from its scope any provision, contingent liability or contingent asset addressed by IFRS 15, except for onerous contracts, *[IAS 37.5(g)]*, and IFRS 15 provides specific requirements for consideration payable to a customer. Although there is no longer a contract or customer relationship, the litigation is directly attributable to a previously completed customer contract, and an entity might thus conclude it is reasonable, considering the scope exemption in IAS 37, to apply IFRS 15.

If an entity applies IFRS 15, it might need to apply the requirements for contract modifications. This is because, as a result of the court's decision, the entity has an enforceable obligation to pay the customer and an (implicit or explicit) agreement between the entity and customer leads to a reduction of the total consideration in the original contract. *[IFRS 15.10, IFRS 15.18]*. If the court finds in favour of the customer, but the amount to pay is not finalised, the consideration payable to the customer would be variable, *[IFRS 15.19, IFRS 15.50]*, and the entity would need to apply the variable consideration requirements (including the constraint).

⁹³ TRG Agenda paper no. 28, *Consideration Payable to a Customer*, dated 30 March 2015, TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015, and TRG Agenda paper no. 37, *Consideration Payable to a Customer*, dated 13 July 2015.

How we see it

If the revenue contract related to the litigation is not yet completed, an entity needs to apply IFRS 15 to account for the litigation settlement as consideration payable to a customer, unless it is covered by an assurance-type warranty that is accounted for under IAS 37.

If the revenue contract related to the litigation was previously completed, we believe an entity needs to apply judgement, based on the specific facts and circumstances, to determine whether to either apply IAS 37 or IFRS 15 to account for any (contingent) liability, and apply the judgement consistently to similar transactions. Even if IAS 37 is applied to the liability for litigation settlements, an entity might conclude that, because it is a payment to a customer, the requirements for consideration payable to a customer apply when determining the classification in profit or loss, which might result in a reduction of revenue.

For settlements of litigation or disputes that result in consideration received or receivable from a customer, please see response to Question 5-9 in section 5.2.1 above.

Question 5-33: How does an entity evaluate payments made to third parties on behalf of a customer?

Entities might make payments to third parties on behalf (or for the benefit) of their customers. For example, an entity might pay a fee to a third party (e.g., a financing company) to provide a loan to its customer in which the customer will use the proceeds to purchase the entity's goods and services. In these situations, the entity will need to carefully evaluate the specific facts and circumstances, including the nature and purpose of any payments made to the third party to determine whether those payments are linked to a revenue contract with its customer and are therefore in substance consideration payable to a customer (despite being paid to a third party). This determination could require the application of significant judgement.

If the entity determines that the payments made to the third party are consideration payable to a customer and not in exchange for a distinct good or service, then those payments are treated as a reduction to the transaction price in the entity's revenue contract with its customer.

Chapter 36 highlights some considerations when determining whether a payment was made on an entity's behalf, and these considerations might also be helpful when making the judgement discussed above. Also refer to Question 5-29, in section 5.7 above, relating to payments to entities/customers in the distribution chain.

FASB differences

Under US GAAP, equity instruments granted to customers in conjunction with selling goods or services (e.g., shares, options) are within the scope of the requirements for consideration payable to customers.⁹⁴ Entities are also required to measure and classify share-based payment awards (both equity-classified and liability-classified) granted to a customer in a revenue arrangement and are not in exchange for a distinct good or service in accordance with ASC 718, *Compensation - Stock Compensation*.⁹⁵

In May 2025, the FASB issued ASU 2025-04 *Clarifications to Share-Based Consideration Payable to a Customer*, which clarified the accounting for share-based consideration payable to a customer in conjunction with selling goods or services (e.g., customer incentive awards). The ASU revised the definition of a performance condition to include conditions based on a customer's purchases and eliminated the policy election in ASC 718 allowing grantors to account for forfeitures of customer awards as they occur. It also clarified that the requirements for constraining estimates of variable consideration does not apply to share-based consideration payable to a customer that is measured and classified under ASC 718. Rather, the grantor would need to assess whether an award will vest using only the requirements in ASC 718.

IFRS 15 does not include similar requirements. For further discussion, see Question 2-13 in section 2.5 above.

⁹⁴ ASU 2018-07, *Compensation - Stock Compensation (718): Improvements to Nonemployee Share-Based Payment accounting*.

⁹⁵ ASU 2019-08, *Compensation - Stock Compensation (Topic 718) and Revenue from Contracts with Customers (Topic 606): Codification Improvements - Share-Based Consideration Payable to a Customer*.

5.7.2 Classification and measurement of consideration paid or payable to a customer

To determine the appropriate accounting treatment (and as illustrated in Figure 5-3 in section 5.7 above), an entity must first determine whether the consideration paid or payable to a customer is a payment for a distinct good or service. If it is not in exchange for a distinct good or service, an entity accounts for consideration payable to a customer as a reduction in the transaction price. This is because IFRS 15.70 states that “an entity shall account for consideration payable to a customer as a reduction of the transaction price and, therefore, of revenue unless the payment to the customer is in exchange for a distinct good or service” (see section 5.7 above). [IFRS 15.70]. That is, for a payment by the entity to a customer to be treated as something other than a reduction of the transaction price, the good or service provided by the customer must be distinct (as discussed in section 4.2.1 above).

If it is in exchange for a distinct good or service at fair value, an entity accounts for consideration payable to a customer in the same way it accounts for other purchases from suppliers. However, as noted in IFRS 15.71, if the payment to the customer is in excess of the fair value of the distinct good or service received, the entity must account for such excess as a reduction of the transaction price. In the event that the entity cannot reasonably estimate the fair value of the good or service received from the customer, it will need to account for all of the consideration payable to the customer as a reduction in the transaction price. [IFRS 15.71].

Illustration 5-7: Consideration paid to a customer in exchange for a distinct good or service
