- Employee demographics (age, sex, tenure, position, etc.)
- Path of share price - for example, if options are deeply out-of-the-money, they may have little retention value and more employees may leave than if the options were at- or in-the-money
- Economic conditions and other share prices

8.5.3 Expected volatility of share price

Expected volatility is a measure of the amount by which a price is expected to fluctuate during a period. Share price volatility has a powerful influence on the estimation of the fair value of an option, much of the value of which is derived from its potential for appreciation. The more volatile the share price, the more valuable the option. It is therefore essential that the choice of volatility assumption can be properly supported.

IFRS 2 notes that: [IFRS 2.B22]

Extract from IFRS 2

B22 Expected volatility is a measure of the amount by which a price is expected to fluctuate during a period. The measure of volatility used in option pricing models is the annualised standard deviation of the continuously compounded rates of return on the share over a period of time. Volatility is typically expressed in annualised terms that are comparable regardless of the time period used in the calculation, for example, daily, weekly or monthly price observations.

The expected annualised volatility of a share is the range within which the continuously compounded annual rate of return is expected to fall approximately two-thirds of the time. For example, to say that a share with an expected continuously compounded rate of return of 12% has a volatility of 30% means that the probability that the rate of return on the share for one year will be between minus 18% ($12\% - 30\%$) and 42% ($12\% + 30\%$) is approximately two-thirds. If the share price is CU100 at the beginning of the year, and no dividends are paid, the year-end share price would be expected to be between CU83.53 ($CU100 \times e^{-0.18}$) and CU152.20 ($CU100 \times e^{0.42}$) approximately two-thirds of the time.

The rate of return (which may be positive or negative) on a share for a period measures how much a shareholder has benefited from dividends and appreciation (or depreciation) of the share price. [IFRS 2.B23, IFRS 2.B24].

IFRS 2 gives examples of factors to consider in estimating expected volatility including the following:
[IFRS 2.B25]

- *Implied volatility from traded share options*

Implied volatility is the volatility derived by using an option pricing model with the traded option price (if available) as an input and solving for the volatility as the unknown on the entity's shares. It may also be derived from other traded instruments of the entity that include option features (such as convertible debt).

Implied volatilities are often calculated by analysts and reflect market expectations for future volatility as well as imperfections in the assumptions in the valuation model. For this reason, the implied volatility of a share may be a better measure of prospective volatility than historical volatility (see below). However, traded options are usually short-term, ranging in general from one month to two years. If the expected lives are much longer than this, both the implied and historical volatilities will need to be considered.

- *Historical volatility*

It may be relevant to consider the historical volatility of the share price over the most recent period that is generally commensurate with the expected term of the option (taking into account the remaining contractual life of the option and the effects of expected early exercise). However, this assumes that past share price behaviour is likely to be representative of future share price behaviour. Upon any restructuring of an entity, the question of whether or not past volatility will be likely to predict future volatility would need to be reassessed.

The historical volatilities of similar entities may be relevant for newly listed entities, unlisted entities or entities that have undergone substantial restructuring (see sections 8.5.3.A to 8.5.3.C below).

- *The length of time the entity's shares have been publicly traded*

A newly listed entity might have a high historical volatility, compared with similar entities that have been listed longer. Further guidance for newly listed entities is given in section 8.5.3.A below.

- *'Mean-reverting tendency'*

This refers to the tendency of volatility to revert to its long-term average level, and other factors indicating that expected future volatility might differ from past volatility. For example, if an entity's share price was extraordinarily volatile for some identifiable period of time because of a failed takeover bid or a major restructuring, that period could be disregarded in computing historical average annual volatility. However, an entity must not exclude general economic factors such as the effect of an economic downturn on share price volatility.

- *Appropriate and regular intervals for price observations*

The price observations should be consistent from period to period. For example, an entity might use the closing price for each week or the opening price for the week, but it should not use the closing price for some weeks and the opening price for other weeks. Also, the price observations should be expressed in the same currency as the exercise price.

How we see it

In our view, at least thirty observations are generally required to calculate a statistically valid standard deviation. Our experience has been that, in general, it is more appropriate to make such observations daily or weekly rather than monthly.

8.5.3.A Newly listed entities

As noted under 'Historical volatility' in section 8.5.3 above, an entity should consider the historical volatility of the share price over the most recent period that is generally commensurate with the expected option term. If a newly listed entity does not have sufficient information on historical volatility, it should compute historical volatility for the longest period for which trading activity is available. It could also consider the historical volatility of similar entities following a comparable period in their lives. [IFRS 2.B26].

8.5.3.B Unlisted entities

An unlisted entity will have neither historical nor current market information to consider when estimating expected volatility. IFRS 2 suggests that, in some cases, an unlisted entity that regularly issues options or shares might have set up an internal market for its shares. The volatility of those share prices could be considered when estimating expected volatility. Alternatively, if the entity has based the value of its shares on the share prices of similar listed entities, the entity could consider the historical or implied volatility of the shares of those similar listed entities. [IFRS 2.B27, IFRS 2.B28, IFRS 2.B29].

If the entity has not used a valuation methodology based on the share prices of similar listed entities, the entity could derive an estimate of expected volatility consistent with the valuation methodology used. For example, the entity might consider it appropriate to value its shares on a net asset or earnings basis if this approximates to the fair value of the equity instruments, in which case it could consider the expected volatility of those net asset values or earnings. [IFRS 2.B30].

8.5.3.C Listed entities that have undergone significant restructuring

An issue not specifically addressed by IFRS 2 is the approach required in the case of an entity that has been listed for some time but which has recently undergone significant restructuring or refocusing of the business (e.g., as a result of acquisitions, disposals or refinancing). In such cases, it may well be appropriate to adopt the approach advocated for newly listed entities in section 8.5.3.A above.

8.5.3.D Expected volatility under the Black-Scholes-Merton formula

In calculating the fair value of a share option using the Black-Scholes-Merton formula, a single expected volatility assumption must be used. That amount is required to be based on the volatility expected over the expected term of the option. Frequently, expected volatility is based on observed historical share price volatility during the period of time equal to the expected term of the option and ending on the grant date. Implied volatilities (i.e., volatilities implied by actual option prices on the entity's shares observed in the market) also may be considered in determining the expected volatility assumption (see section 8.5.3 above).

When developing an expected volatility assumption, current and prior implied volatilities for publicly traded options and historical realised share volatilities must be considered for shares of the grantor and shares of other entities in the grantor's industry and comparable entities.

The volatility of a market index will not generally provide an appropriate input as the diversified nature of the index tends to produce a lower volatility figure than that applicable to individual shares.

8.5.3.E Expected volatility under lattice models

Expected volatility is more accurately taken into account by lattice models than by the Black-Scholes-Merton formula, because lattice models can accommodate dynamic assumptions regarding the term structure and path-dependence of volatility. For example, there is evidence that volatility during the life of an option depends on the term of the option and, in particular, that short-term options often exhibit higher volatility than similar options with longer terms. Additionally, volatility is path-dependent, in that it is often lower (higher) after an increase (decrease) in share price.

An entity that can observe sufficiently extensive trading of options over its shares may decide, when developing a term structure of expected volatility, to place greater weight on current implied volatilities than on historical observed and prior implied volatilities. It is likely that current implied volatilities are better indicators of the expectations of market participants about future volatility.

8.5.4 Expected dividends

The valuation of an award of options depends on whether or not the holder is entitled to dividends or dividend equivalents (whether in the form of cash payments or reductions in the exercise price) before the award is ultimately exercised. [IFRS 2.B31, IFRS 2.B32, IFRS 2.B34]. The accounting treatment of awards that entitle the holder to dividends before exercise is discussed further in section 15.3 below.

Dividends paid on the underlying share will impact the share option value - the higher the expected dividend yield (i.e., dividend per share ÷ share price), the lower the option value. Option holders generally do not have dividend rights until they actually exercise the options and become shareholders. All other things being equal, a share option for a share yielding a high dividend is less valuable than one for a share yielding a low dividend.

Where employees are entitled to dividends or dividend equivalents, the options granted should be valued as if no dividends will be paid on the underlying shares, so that the input for expected dividends (which would otherwise reduce the valuation of an option) is zero. Conversely, where employees are not entitled to dividends or dividend equivalents, the expected dividends should be included in the application of the pricing model. [IFRS 2.B31, IFRS 2.B32, IFRS 2.B34].

While option pricing models generally call for an expected dividend yield, they may be modified to use an expected dividend amount rather than a yield. Where an entity uses expected payments rather than expected yields, it should consider its historical pattern of increases in dividends. For example, if an entity's policy has generally been to increase dividends, its estimated option value should not assume a fixed dividend amount throughout the life of the option unless there is evidence to support that assumption.

[IFRS 2.B35].

Determination of the expected dividends over the expected term of the option requires judgement. Generally, the expected dividend assumption should be based on current expectations about an entity's anticipated dividend policy. For example, an entity that has demonstrated a stable dividend yield in past years, and has indicated no foreseeable plans to change its dividend policy, may simply use its historical dividend yield to estimate the fair value of its options. If an entity has never paid a dividend, but has publicly announced that it will begin paying a dividend yielding 2% of the current share price, it is likely that an expected dividend yield of 2% would be assumed in estimating the fair value of its options.

Generally, assumptions about expected dividends should be based on publicly available information. Thus, an entity that does not pay dividends and has no plans to do so should assume an expected dividend yield of zero. However, an emerging entity with no history of paying dividends might expect to begin paying dividends during the expected lives of its employee share options. Such entities could use an average of their past dividend yield (zero) and the mean dividend yield of a comparable peer group of entities.

[IFRS 2.B36].

8.5.4.A Expected dividends under the Black-Scholes-Merton formula

Closed-form option-pricing models generally call for a single expected dividend yield as an input. That input must be determined based on the guidance in section 8.5.4 above.

8.5.4.B Expected dividends under the binomial model and other lattice models

Lattice models can be adapted to use an expected dividend amount rather than a dividend yield, and therefore can also take into account the impact of anticipated dividend changes. Such approaches might better reflect expected future dividends, since dividends do not always move in a fixed fashion with changes in the entity's share price. This may be a time- or price-dependent assumption, similar to those described in the discussion of the binomial model in section 8.3.2 above. Expected dividend estimates in a lattice model must be determined based on the general guidance above. Additionally, when the present value of dividends becomes significant in relation to the share price, standard lattice models may need to be amended.

8.5.5 Risk-free interest rate

Extract from IFRS 2

B37 Typically, the risk-free interest rate is the implied yield currently available on zero-coupon government issues of the country in whose currency the exercise price is expressed, with a remaining term equal to the expected term of the option being valued (based on the option's remaining contractual life and taking into account the effects of expected early exercise). It may be necessary to use an appropriate substitute, if no such government issues exist or circumstances indicate that the implied yield on zero-coupon government issues is not representative of the risk-free interest rate (for example, in high inflation economies). Also, an appropriate substitute should be used if market participants would typically determine the risk-free interest rate by using that substitute, rather than the implied yield of zero-coupon government issues, when estimating the fair value of an option with a life equal to the expected term of the option being valued.

[IFRS 2.B37].

The risk-free interest rate will not have an impact on most free share grants unless the counterparty is not entitled to dividends during the vesting period and the fair value of the grant has been reduced by the present value of the dividends. Otherwise, grants of free shares have an exercise price of zero and therefore involve no cash outflow for the holder.

8.5.5.A Risk-free interest rate under the Black-Scholes-Merton formula

The Black-Scholes-Merton formula expressed in section 8.3.1 above uses a continuously compounded interest rate, which means that any interest rate calculated or obtained needs to be in this format. The continuously compounded interest rate is given by the formula:

$$\text{continuously compounding rate} = \ln(1 + \text{annual rate}),$$

where \ln represents a natural logarithm. For example, a 1.50% annual effective rate results in a continuously compounded rate of 1.49%:

$$1.49\% = \ln(1 + 0.0150)$$

8.5.5.B Risk-free interest rate under binomial and other lattice models

At each node in the lattice, the option values in the lattice must be discounted using an appropriate forward rate as determined by a yield curve constructed from the implied yield on zero-coupon government bond issues. In stable economies this will have minimal impact and it is therefore likely that a flat risk-free rate that is consistent with the expected life assumption will be a reasonable estimate for this input.

8.6 Capital structure effects and dilution

Typically, traded share options are written by third parties, not the entity issuing the shares that are the subject of the option. When these share options are exercised, the writer delivers to the option holder shares acquired from existing shareholders. Hence the exercise of traded share options has no dilutive effect. By contrast, when equity-settled share options written by the entity are exercised, new shares may be issued (either in form or in substance, if shares previously repurchased and held in treasury are used), giving rise to dilution. This actual or potential dilution may reduce the share price, so that the option holder does not make as large a gain on exercise as would be the case on exercising an otherwise similar traded option that does not dilute the share price. [IFRS 2.B38, IFRS 2.B39].

Whether or not this has a significant effect on the value of the share options granted depends on various factors, such as the number of new shares that will be issued on exercise of the options compared with the number of shares already issued. Also, if the market already expects that the option grant will take place, the market may have already factored the potential dilution into the share price at the date of grant. However, the entity should consider whether the possible dilutive effect of the future exercise of the share options granted might have an impact on their estimated fair value at grant date. Option pricing models can be adapted to take into account this potential dilutive effect. [IFRS 2.B40, IFRS 2.B41].

How we see it

In practice, in our view, it is unlikely that a listed entity would be required to make such an adjustment unless it makes a very large, unanticipated grant of share options. Indeed, even in that case, if the potential dilution is material and is not already incorporated into the share price, it would be expected that the announcement of the grant would cause the share price to decline by a material amount. Unlisted entities should consider whether the dilutive impact of a very large option grant is already incorporated into the estimated share price used in their option-pricing model. If that is not the case, some adjustment to the fair value may be appropriate.

8.7 Valuation of equity-settled awards other than options

As noted in section 8.1 above, the discussion in sections 8.3 to 8.5 above may well be relevant to share-based payments other than options. These include, but are not restricted to:

- Awards of shares (see section 8.7.1 below).
- Non-recourse loans (see section 8.7.2 below).
- Share appreciation rights (SARs) (see section 8.7.3 below).
- Performance rights (see section 8.7.4 below).

8.7.1 Shares

IFRS 2 requires shares granted to employees to be valued at their market price (where one exists) or an estimated market value (where the shares are not publicly traded), in either case adjusted to take into account the terms and conditions on which the shares were granted, other than those vesting conditions that IFRS 2 requires to be excluded in determining the grant date fair value (see section 6.2 above).

[IFRS 2.B2].

For example, the valuation must take into account restrictions on the employee's right:

- To receive dividends in the vesting period (see below).
- To transfer shares after vesting, but only to the extent that such restrictions would affect the price that a knowledgeable and willing market participant would pay for the shares. Where the shares are traded in a deep and liquid market, the effect may be negligible.

The valuation must not, however, take into account restrictions on transfer or other restrictions that exist during the vesting period and which stem from the existence of vesting conditions. [IFRS 2.B3].

Whether dividends must be taken into account in measuring the fair value of shares depends on whether the counterparty is entitled to dividends or dividend equivalents (which might be paid in cash) during the vesting period. When the grant date fair value of shares granted to employees is estimated, no adjustment is required if the employees are entitled to receive dividends during the vesting period (as they are in no different a position in this respect than if they already held shares). However, where employees are not entitled to receive dividends during the vesting period, the valuation should be reduced by the present value of dividends expected to be paid during the vesting period. [IFRS 2.B31, IFRS 2.B33, IFRS 2.B34]. The basis on which expected dividends during the vesting period might be determined is discussed in the context of the impact of expected dividends on the fair value of share options in section 8.5.4 above.

The accounting treatment of awards which give the right to receive dividends or dividend equivalents during the vesting period is discussed further in section 15.3 below.

8.7.2 Non-recourse loans

Non-recourse loans are loans granted by an entity to the employee to allow the employee to buy shares, and are discussed in more detail in section 15.2 below. Generally, however, the loan is interest-free, with the dividends received on the purchased shares being used to repay the loan. The loan acts like an option, in that, at the point in time when the holder decides to sell the shares to repay the loan, if the shares are worth less than the loan, the remaining part of the loan is forgiven, with the effect that, just as in the case of an option, the holder bears no risk of ownership.

8.7.3 Share appreciation rights (SARs)

A share appreciation right (SAR) is a grant whereby the employee will become entitled either to shares or, more commonly, to a future cash payment based on the increase in the entity's share price from a specified level over a period of time (see further discussion in section 9 below on cash-settled awards). This essentially has the same payoff as a call option, except the award is generally cash- rather than equity-settled.

8.7.4 Performance rights

A performance right is the right to acquire further shares after vesting, upon certain criteria being met. These criteria may include certain performance conditions which can usually be modelled with either a Black-Scholes-Merton formula or a binomial lattice model or a Monte Carlo Simulation depending on the nature of the conditions attached to the rights. Such awards may be structured as matching share awards, as discussed in more detail in section 15.1 below.

8.8 Awards whose fair value cannot be measured reliably

IFRS 2 acknowledges that there may be rare cases where it is not possible to determine the fair value of equity instruments granted. In such cases, the entity is required to adopt a method of accounting based on the intrinsic value of the award (i.e., the price of the underlying share less the exercise price, if any, for the award). This is slightly puzzling in the sense that, for unlisted entities, a significant obstacle to determining a reliable fair value for equity instruments is the absence of a market share price, which is also a key input in determining intrinsic value. In fact, the intrinsic value model is arguably more onerous than the fair value model since, as discussed further in sections 8.8.1 and 8.8.2 below, it requires intrinsic value to be determined not just once, but at initial measurement date and each subsequent reporting date until exercise.

8.8.1 Intrinsic value method - the basic accounting treatment

Under the intrinsic value method:

- (a) The entity measures the intrinsic value of the award at each reporting date between grant date and settlement (whether through exercise, forfeiture or lapse).
- (b) At each reporting date during the vesting period the cumulative expense must be determined as the intrinsic value of the award at that date multiplied by the expired portion of the vesting period, with all changes in the cumulative expense recognised in profit or loss.
- (c) Once options have vested, all changes in their intrinsic value until settlement must be recognised in profit or loss. [IFRS 2.24(a)].

The cumulative expense during the vesting period, like that for awards measured at fair value, must always be based on the best estimate of the number of awards that will actually vest (see section 6 above). However, the distinction between market conditions, non-market vesting conditions and non-vesting conditions that would apply to equity-settled awards measured at fair value (see sections 6.1 to 6.4 above) does not apply in the case of awards measured at intrinsic value. [IFRS 2.24(b)]. In other words, where an award measured at intrinsic value is subject to a market condition or non-vesting condition that is not met, there is ultimately no accounting expense for that award. This is consistent with a model requiring constant remeasurement.

The cost of awards measured at intrinsic value is ultimately revised to reflect the number of awards that are actually exercised. However, during the vesting period the cost must be based on the number of awards estimated to vest and thereafter on the number of awards that have vested. In other words, any post-vesting forfeiture or lapse must not be anticipated, but must be accounted for as it occurs. [IFRS 2.24(b)].

Illustration 8-2 is based on IG Example 10 in the implementation guidance to IFRS 2 and illustrates the intrinsic value method. [IFRS 2.IG Example 10].

Illustration 8-2: Intrinsic value method

At the beginning of year 1, an entity grants 1,000 share options to 50 employees.

The share options will vest at the end of year 3, provided the employees remain in service until then. The options can be exercised at the end of year 4, and then at the end of each subsequent year up to and including year 10. The exercise price, and the entity's grant date share price, is CU60. At the date of grant, the entity concludes that it cannot estimate reliably the fair value of the share options granted.

At the end of year 1, the entity estimates that 10 of the employees will have left employment by the end of the vesting period and so 80% of the share options will vest. At the end of year 2, the entity revises the number of leavers to 7 and its estimate of the number of share options that it expects will vest to 86%.

During the vesting period, a total of 7 employees leave, so that 43,000 share options vest.

The intrinsic value of the options, and the number of share options exercised during years 4-10, are as follows:

Year	Share price at year end CU	Intrinsic value CU	Number exercised at year end
1	63	3	
2	65	5	
3	75	15	
4	88	28	6,000
5	100	40	8,000
6	90	30	5,000
7	96	36	9,000
8	105	45	8,000
9	108	48	5,000
10	115	55	2,000

The expense recognised under IFRS 2 will be as follows. In the period up to vesting the 'cumulative expense' methodology used in the Illustrations in sections 6.1 to 6.4 above can be adopted to derive the expense for each period:

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	50,000 options × CU3 × 80% × 1/3	40,000	40,000
2	50,000 options × CU5 × 86% × 2/3	143,333	103,333
3	43,000 options × CU15	645,000	501,677

In years 4 to 10 it is more straightforward to calculate the expense directly. Since all options exercised during each year are exercised at the end of that year, the annual expense can be calculated as the change in intrinsic value during each year of the options outstanding at the start of the year.

Year	Expense for period (CU)
4	43,000 options × CU(28 - 15) 559,000
5	43,000 - 6,000 = 37,000 options × CU(40 - 28) 444,000
6	37,000 - 8,000 = 29,000 options × CU(30 - 40) (290,000)
7	29,000 - 5,000 = 24,000 options × CU(36 - 30) 144,000
8	24,000 - 9,000 = 15,000 options × CU(45 - 36) 135,000
9	15,000 - 8,000 = 7,000 options × CU(48 - 45) 21,000
10	7,000 - 5,000 = 2,000 options × CU(55 - 48) 14,000

If, more realistically, the options had been exercisable, and were exercised, at other dates, it would have been necessary to record as an expense for those options the movement in intrinsic value from the start of the year until exercise date. For example, if the 6,000 options in year 4 had been exercised during the year when the intrinsic value was CU20, the expense for that period would have been CU511,000 comprising CU481,000 change in value for the options outstanding at the end of year [37,000 options × CU(28 - 15)] and CU30,000 change in value of options exercised during the period [6,000 options × CU(20 - 15)].

How we see it

Since the intrinsic value method will initially be applied at the date at which the entity obtains the goods or the counterparty renders service and continues to be applied at the end of each reporting period until the date of final settlement, in our view the entity would continue to apply this method of measurement throughout the life of such an award even if it becomes possible to measure the fair value of the award at some stage prior to its settlement.

8.8.2 Modification, cancellation and settlement

The methodology of the intrinsic value method has the effect that modification or cancellation is dealt with automatically, and the rules for modification and cancellation of awards measured at fair value (see section 7 above) therefore do not apply. [IFRS 2.25].

Where an award accounted for at intrinsic value is settled in cash, the following provisions apply, which are broadly similar to the rules for settlement of awards accounted for at fair value.

If settlement occurs before vesting, the entity must treat this as an acceleration of vesting and "recognise immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period". [IFRS 2.25(a)]. The wording here is the same as that applicable to settlement of awards accounted for at fair value, which we discuss in more detail in section 7.4.3 above.

Any payment made on settlement must be deducted from equity, except to the extent that it is greater than the intrinsic value of the award at settlement date. Any such excess is accounted for as an expense.

[IFRS 2.25(b)].

8.9 Awards with reload features

Some share options contain a reload feature (see section 5.5.1 above). Reloads commonly provide that, where an exercise price is satisfied in shares of the issuing entity rather than cash, there is a new grant of at-the-money options over as many shares as are equal to the exercise price of the exercised option. For example, if there were 100 options with an exercise price of CU10, and the new share price was CU15, 67 options ($CU1,000 \div CU15$) would be re-issued.

Even though the reload feature (i.e., the possibility that additional options would be issued in the future) is a feature of the original option, and can be readily incorporated into the valuation of the original option using a lattice model, the IASB concluded that the fair value of a reload feature should not be incorporated into the estimate of the fair value of the award at grant date. As a result, subsequent grants of reload awards under the reload feature would be accounted for as new awards and measured on their respective grant dates. [IFRS 2.BC188-BC192].

On the assumption that the exercise price of an award is at least the share price at grant date, the grant-date fair value of the reload award will generally be greater than the incremental value of the reload feature as at the date the original award was granted. This is because the reload award will only be granted if the original option is in-the-money and is exercised. As a result, the award would have increased in the period between the original grant date and the reload grant date, and the higher share price would be used to value the reload grant. However, from the perspective of the aggregate compensation cost, this result is mitigated by the fact that, as the value of the underlying share increases, fewer shares must be tendered to satisfy the exercise price requirement of the exercised option and, therefore, fewer reload options will be granted (as above when only 67 options are re-issued for the 100 originally issued).

If the reload feature were incorporated into the valuation of the original grant, then not only would a lower price be used, but the valuation would consider the possibility that the original option would never be exercised and, therefore, that the reload options would not be granted. Under the approach in IFRS 2, if the original award expires unexercised, no compensation cost results from the reload feature, so that the compensation cost is lower than would be the case if the value of the reload feature were incorporated into the measurement of the original award. Effectively, the approach in IFRS 2 incorporates subsequent share price changes into the valuation of a reload award.

8.10 Awards of equity instruments to a fixed monetary value

Entities may make an award of shares equivalent to a fixed monetary value (see section 5.3.5 above). This is commonly found as part of a matching share award where an employee may be offered the choice of receiving cash or shares of an equivalent value, or a multiple of that value (see section 15.1 below).

IFRS 2 does not address directly the valuation of such awards. Illustration 8-3 below demonstrates how such awards are valued:

Illustration 8-3: Award of shares to a fixed monetary value

At the beginning of year 1 the reporting entity grants:

- To Employee A an award of 1,000 shares subject to remaining in employment for three years.
- To Employee B CU10,000 subject to remaining in employment for three years, to be paid in as many shares as are (at the end of year 3) worth CU10,000.

Both awards vest, and the share price at the end of year 3 is CU10, so that both employees receive 1,000 shares.

The IFRS 2 charge for A's award is clearly $1000 \times$ the fair value as at the beginning of year 1 of a share deliverable in three years' time. What is the charge for B's award?

How we see it

In our view, the fair value of the equity instruments granted for B's award would be the CU10,000 adjusted for the time value of money, as the value employee B will receive is fixed at CU10,000 and is independent of the share price. This amount, determined at grant date, would be recognised as an expense over the vesting period, which in this case is a three year service condition for employee B.

Although IFRS 2 does not directly address the valuation of awards of equity instruments equivalent to a fixed monetary value, IFRS 2 does require the grant date fair value of the equity instruments awarded to be recognised, which for a fixed monetary award would be the fixed monetary amount to be received adjusted for the time value of money.

9 Cash-settled transactions

Throughout the discussion in this section, 'cash' must be read as including 'other assets' in accordance with the definition of a cash-settled share-based payment in Appendix A to IFRS 2. [IFRS 2 Appendix A].

Extract from IFRS 2

Appendix A IFRS 2

Defined terms

cash-settled share-based payment transaction

A **share-based payment transaction** in which the entity acquires goods or services by incurring a liability to transfer cash or other assets to the supplier of those goods or services for amounts that are based on the price (or value) of **equity instruments** (including shares or **share options**) of the entity or another group entity.

9.1 Scope of requirements

Cash-settled share-based payment transactions include transactions such as:

- Share appreciation rights (SARs), where employees are entitled to a cash payment equivalent to the gain that would have arisen from a holding of a particular number of shares from the date of grant to the date of exercise.
- Phantom options, where employees are entitled to a cash payment equivalent to the gain that would have been made by exercising options at a notional price over a notional number of shares and then selling the shares at the date of exercise. [IFRS 2.31].

However, IFRS 2 looks beyond the simple issue of whether an award entitles an employee to receive instruments that are in the form of shares or options to the terms of those instruments. For example, an award of shares or options over shares whose terms provide for their redemption either mandatorily according to their terms (e.g., on cessation of employment) or at the employee's option would be treated as a cash-settled, not an equity-settled, award under IFRS 2. [IFRS 2.31]. This is consistent with the fact that IAS 32 would regard a share with these terms as a financial liability rather than an equity instrument of the issuer (see Chapter 43).

In some cases, the boundary between equity-settled and cash-settled schemes may appear somewhat blurred, so that further analysis may be required to determine whether a particular arrangement is equity-settled or cash-settled. Some examples of such arrangements are discussed in section 9.2 below.

9.2 What constitutes a cash-settled award?

There are a number of possible circumstances in which, on, or shortly after, settlement of an equity-settled award either:

- The entity incurs a cash outflow equivalent to that which would arise on cash-settlement (e.g., because it purchases shares in the market at fair value to deliver to counterparties).
- Or
- The counterparty receives a cash inflow equivalent to that which would arise on cash-settlement (e.g., because the shares are sold in the market for cash on behalf of the counterparty).

Such situations raise the question of whether such schemes are in fact truly equity-settled or cash-settled.

Examples of relatively common mechanisms for delivering the cash-equivalent of an equity-settled award to employees are discussed below. It emerges from the analysis below that, in reality, IFRS 2 is driven by questions of form rather than substance. To put it rather crudely, what matters is often not so much whether the entity has made a cash payment for the fair value of the award, but rather the name of the payee.

The significance of this is that the analysis affects the profit or loss charge for the award, as demonstrated by Illustration 9-1 below.

Illustration 9-1: Equity-settled award satisfied with market purchase of treasury shares

An entity awards an employee a free share with a fair value at grant date of CU5 which has a fair value of CU8 at vesting. At vesting the entity purchases a share in the market for CU8 for delivery to the employee. If the scheme were treated as cash-settled, there would be a charge to profit or loss of CU8 (the fair value at vesting date - see section 9.3 below). If it were treated as equity-settled (as required in this case by IFRS 2), profit or loss would show a charge of only CU5 (the fair value at grant date), with a further net charge of CU3 in equity, comprising the CU8 paid for the share accounted for as a treasury share (see Chapter 43) less the CU5 credit to equity (being the credit entry corresponding to the CU5 charge to profit or loss - see section 4.2 above).

The analyses below all rely on a precise construction of the definition of a cash-settled share-based payment transaction, i.e., one "in which the entity acquires goods or services *by incurring a liability to transfer cash or other assets to the supplier of those goods or services* for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity" (emphasis added). [IFRS 2 Appendix A]. Thus, if the entity is not actually required - legally or constructively - to pay cash to the counterparty, there is no cash-settled transaction under IFRS 2, even though the arrangement may give rise to an external cash flow and, possibly, a liability under another standard.

9.2.1 Formal and informal arrangements for the entity to purchase illiquid shares or otherwise settle in cash (awards to be treated as cash-settled, including unlisted company schemes)

Some share-based payment awards, particularly when made by unlisted entities, might appear to be equity-settled in form but, in our view, may need to be accounted for as cash-settled awards under IFRS 2. This reflects either specific arrangements put in place by the entity (or a shareholder) for the employees to sell their shares or, more generally, the illiquid market in the shares which, in the absence of compelling evidence to the contrary, is likely to result in a cash payment by the entity to the counterparty at some stage. Such awards need to be carefully analysed, in the light of their particular facts and circumstances.

How we see it

Share-based payment awards, made by unlisted entities, may need to be accounted for as cash-settled awards under IFRS 2. Such awards need to be carefully analysed, in the light of their particular facts and circumstances.

This is similar to the assessment for awards where the agreement states that entities have a choice of settlement in equity or cash (see section 10.2.1.A below).

9.2.2 Market purchases of own equity used to satisfy awards

It is common for an entity to choose to settle equity-settled transactions using shares previously purchased in the market rather than by issuing new shares. This does not mean that the transaction is cash-settled, since there is no obligation to deliver cash to the counterparty. [IFRS 2.B48, IFRS 2.B49].

The purchase of own shares is accounted for in accordance with the provisions of IAS 32 relating to treasury shares and other transactions over own equity (see Chapter 43).

A question sometimes asked is whether the entity is required to recognise some form of liability to repurchase its own equity in situations where the entity has a stated policy of settling equity-settled transactions using previously purchased treasury shares.

How we see it

In our view, the normal provisions of IAS 32 would apply in these situations.

To illustrate this point, a public commitment to settle equity-settled transactions by purchasing treasury shares is no different in substance to a commitment to a share buyback programme. There would be no question under IAS 32 of recognising a liability to repurchase own equity on the basis merely of a declared intention. It is only when the entity enters into a forward contract or a call option with a third party that some accounting recognition of a future share purchase may be required.

9.2.3 Market purchases of own equity following equity-settlement of award

An entity might sometimes make a market purchase of its own shares shortly after issuing a similar number of shares in settlement of an equity-settled transaction. This raises the question of whether such a scheme would be considered as in substance cash-settled.

In our view, further enquiry into the detailed circumstances of the market purchase is required in order to determine the appropriate analysis under IFRS 2.

Broadly speaking, so long as there is no obligation (explicit or implicit) for the entity to settle in cash with the counterparty, such market purchase arrangements will not require a scheme to be treated as cash-settled under IFRS 2. This will be the case even where the entity, as a means of managing the dilutive impact on earnings per share of equity-settlement, routinely buys back shares broadly equivalent to the number issued in settlement.

However, in our view, there might be situations in which post-settlement market share purchases are indicative of an obligation to the counterparty, such that treatment as a cash-settled scheme would be appropriate.

For example, the shares might be quoted in a market which is not very deep, or in which the entity itself is a major participant. If the entity were to create an expectation by employees that any shares awarded can always be liquidated immediately, because the entity will ensure that there is sufficient depth in the market to do so, it could well be appropriate to account for such a scheme as cash-settled. The treatment of schemes in which the entity has a choice of settlement, but has created an expectation of cash-settlement, provides a relevant analogy (see section 10.2.1 below).

A more extreme example of such a situation would be where the entity has arranged for the shares delivered to the counterparty to be sold on the counterparty's behalf by a broker (see section 9.2.4 below), but has at the same time entered into a contract to purchase those shares from the broker. In that situation, in our view, the substance is that:

- The entity has created an expectation by the counterparty of a right to receive cash.
- The broker is no more than an agent paying that cash to the counterparty on behalf of the entity.

Accordingly, it would be appropriate to account for such an arrangement as a cash-settled award.

In a situation where the entity had pre-arranged to purchase some, but not all, the shares from the broker, in our view it would generally be appropriate to treat the award as cash-settled only to the extent of the shares subject to the purchase agreement.

How we see it

In summary, where an entity might sometimes make a market purchase of its own shares shortly after issuing a similar number of shares in settlement of an equity-settled transaction, detailed analysis is required to determine the appropriate classification of the share-based payment award.

If an entity were to create an expectation by employees that shares can be liquidated quickly by the entity ensuring there is depth in the market, our view is that it could be appropriate to account for the award as cash-settled.

Where the entity arranges a broker to purchase some or all shares from the counterparty on the counterparty's behalf and the entity then purchases those shares from the broker, it would be appropriate to account for the purchase arrangement of those shares as a cash-settled share-based payment transaction (see section 9.2.4 below).

9.2.4 Arrangements to sell employees' shares including 'broker settlement'

Many recipients of share awards, particularly employees in lower and middle ranking positions within an entity, do not wish to become long-term investors in the entity and prefer instead to realise any equity-settled awards in cash soon after receipt. In order to facilitate this, the entity may either sell the shares in the market on the employees' behalf or, more likely, arrange for a third-party broker to do so.

Such an arrangement (sometimes referred to as 'broker settlement') does not of itself create a cash-settled award, provided that the entity has not created any obligation to provide cash to the employees. If, however, the entity has either created an expectation among employees that it will step in to make good any lack of depth in the market, or has indeed itself contracted to repurchase the shares in question, that may well mean that analysis as a cash-settled scheme is more appropriate (see also section 9.2.3 above).

Broker settlement arrangements may raise a general concern that an entity may be masking what are really issues of shares to raise cash to pay its employees as sales of shares on behalf of employees. If an entity were simply to issue shares (or reissue treasury shares) for cash, and then use that cash to pay an employee's salary, the normal accounting treatment for such a transaction would be to credit equity with the proceeds of issue or reissue of shares, and to charge the payment to the employee to profit or loss.

By contrast, a sale of shares on behalf of an employee is undertaken by the entity as agent and does not give rise to an increase in equity and an expense, although an expense will be recognised for the award of shares under IFRS 2. However, the entity may enter into much the same transaction with a broker whether it is selling shares on its own behalf or on behalf of its employees. The challenge is therefore for the entity to be able to demonstrate the true economic nature of the transaction.

For this reason, some take the view that a sale of shares can be regarded as part of a broker settlement arrangement only if the shares are first legally registered in the name of the employee. Whilst we understand the concerns that lie behind this view, we nevertheless question whether legal registration is necessary to demonstrate the substance of a broker settlement arrangement. For example, suppose that 100 shares vest in each of 10 employees who all express a wish that the entity sell the shares on their behalf, and the entity then sells 1,000 treasury shares on behalf of the employees, but without first re-registering title to the shares to the employees. We do not believe that the entity is automatically precluded from regarding this as a broker settlement arrangement, particularly where the treasury shares are held not by the entity directly but through an employee benefit trust or similar vehicle (see section 12.3 below) that is permitted to hold or sell shares only for the benefit of employees.

By contrast, the entity might regularly purchase and sell treasury shares, but identify some of the sales as being undertaken on behalf of employees only after they have occurred. Such an arrangement, in our view, is more difficult to construe as a true broker-settlement arrangement.

Where shares are sold on behalf of an employee, they will typically attract transaction costs, such as brokerage fees or taxes. If such costs are borne by the entity, they must, in our view, be included within profit or loss as an additional component of employment costs, rather than deducted from equity as a cost of a transaction in own shares.

This highlights a commercial disadvantage of broker settlement arrangements. The entity may have to:

- Purchase shares in the market (incurring transaction costs) on behalf of an employee who does not want them and then sell them back into the market on the employee's behalf (incurring more transaction costs).
- Or
- Sell shares in the market (incurring transaction costs) on behalf of an employee who does not want them and then buy them back in the market on behalf of another employee who does want them (incurring more transaction costs).

In order to avoid this, entities may try to structure arrangements with their brokers involving back-to-back sale and purchase contracts, under which shares are never physically delivered, but the entity makes a cash payment to the broker in purported settlement of the purchase by the broker of shares on behalf of the entity and the broker passes it on to the employee in purported settlement of the sale of the shares by the broker on behalf of the employee.

In our view, such arrangements cannot be seen as equity-settled transactions with broker settlement, but must be regarded as cash-settled share-based payment transactions, using the broker as paying agent.

How we see it

In summary, to help facilitate the sale of shares awarded to employees, the entity may either sell the shares in the market on the employees' behalf or, more likely, arrange for a third party broker to do so. Such an arrangement (sometimes referred to as 'broker settlement') does not of itself create a cash-settled award, provided that the entity has not created any obligation to provide cash to the employees. Brokerage and taxes incurred on behalf of employees, in our view, must be recognised in profit or loss as an employee cost rather than deducted from equity as a cost of transaction in own shares.

However, a structured arrangement with an entity's broker involving back-to-back sale and purchase contracts, under which shares are never physically delivered, but the entity makes a cash payment to the broker in purported settlement of the purchase by the broker of shares on behalf of the entity and the broker passes it on to the employee in purported settlement of the sale of the shares by the broker on behalf of the employee; must be regarded as a cash-settled share-based payment transaction.

Related issues are raised by the 'drag along' and 'tag along' rights that are often a feature of awards designed to reward employees for a successful flotation or other exit event (see section 15.4.6 below).

9.3 Cash-settled transactions: required accounting

9.3.1 Basic accounting treatment

It is clear that the ultimate cost of a cash-settled transaction must be the actual cash paid to the counterparty, which will be the fair value at settlement date. Moreover, the cumulative cost recognised until settlement is clearly a liability, not a component of equity.

The liability is recognised and measured as follows:

- At each reporting date between grant and settlement the fair value of the award is determined in accordance with the specific requirements of IFRS 2.
- During the vesting period, the liability recognised at each reporting date is the IFRS 2 fair value of the award at that date multiplied by the expired portion of the vesting period.
- From the end of the vesting period until settlement, the liability recognised is the full fair value of the liability at the reporting date.

All changes in the liability are recognised in profit or loss for the period. *[IFRS 2.30-33D, IFRS 2.IG Example 12, IFRS 2.IG Example 12A].*

When goods or services are acquired, an entity initially recognises a liability, when the entity obtains the goods or as the services are rendered, measured at the fair value of the liability. Thereafter, until the liability is settled, the entity is required to remeasure the fair value of the liability at the end of each reporting period and at the date of settlement, with any changes in fair value recognised in profit or loss for the period. *[IFRS 2.30, IFRS 2.IG18]* Where the cost of services received in a cash-settled transaction is recognised in the carrying amount of an asset (e.g., inventory) in the entity's statement of financial position, the carrying amount of the asset is not adjusted for changes in the fair value of the liability. *[IFRS 2.IG19].*

The fair value of the liability must be determined, initially and at each reporting date until it is settled, by applying an option pricing model, taking into account the terms and conditions on which the cash-settled transaction was granted, and the extent to which the employees have rendered service to date. *[IFRS 2.33].* Determination of fair value is subject to the requirements of IFRS 2.33A-33D, these paragraphs clarify the treatment of vesting and non-vesting conditions and are discussed further in section 9.3.2 below. *[IFRS 2.33].*

This has the effect that, although the liability will ultimately be settled at its then intrinsic value, its measurement at reporting dates before settlement is based on its fair value. Before the initial publication of IFRS 2, a number of respondents to the IASB's earlier exposure draft suggested that, for reasons of consistency and simplicity of calculation, cash-settled transactions should be measured at intrinsic value throughout their entire life. The IASB, while accepting these merits of the intrinsic value approach, rejected it on the basis that, since it does not include a time value, it is not an adequate measure of either the liability or the cost of services consumed. *[IFRS 2.BC246-251].*

As noted in section 5.5 above, the approach to determining the fair value of share-based payments continues to be that specified in IFRS 2 as share-based payments fall outside the scope of IFRS 13 which applies more generally to the measurement of fair value under IFRS accounting standards (see Chapter 15). *[IFRS 2.6A].*

IFRS 2 uses the term 'share appreciation rights' when referring to measurement of the liability but makes clear that this must be read as including any cash-settled share-based payment transaction and therefore measured at fair value. *[IFRS 2.31].*

To estimate the fair value of the liability an entity will use judgements and estimation assumptions, for example, selecting an option pricing model (i.e., measurement technique) and developing inputs in applying the option pricing model (i.e., applying the measurement technique). IAS 8, includes guidance that clarifies the distinction between changes in accounting estimates and changes in accounting policies. A change in an input or inputs (e.g., volatility assumption or measurement technique) are changes in accounting estimate unless they result from the correction of a prior period error (see Chapter 3). *[IAS 8.IG Example 5].*

9.3.2 Application of the accounting treatment

The treatment required by IFRS 2 for cash-settled transactions is demonstrated by Illustration 9-2 below and by Illustration 9-3 in section 9.3.2.C below. These examples are based, respectively, on IG Examples 12 and 12A in the implementation guidance accompanying IFRS 2. *[IFRS 2.IG Example 12, IFRS 2.IG Example 12A].*

Illustration 9-2: Cash-settled transaction with service condition

An entity grants 100 cash-settled share appreciation rights (SARs) to each of its 500 employees, on condition that the employees remain in its employment for the next three years. The SARs can be exercised on the third, fourth and fifth anniversary of the grant date.

During year 1, 35 employees leave. The entity estimates that a further 60 will leave during years 2 and 3 (i.e., the award will vest in 405 employees).

During year 2, 40 employees leave and the entity estimates that a further 25 will leave during year 3 (i.e., the award will vest in 400 employees).

During year 3, 22 employees leave, so that the award vests in 403 employees. At the end of year 3, 150 employees exercise their SARs (leaving 253 employees still to exercise).

Another 140 employees exercise their SARs at the end of year 4, leaving 113 employees still to exercise, who do so at the end of year 5.

The entity estimates the fair value of the SARs at the end of each year in which a liability exists as shown below. The intrinsic values of the SARs at the date of exercise (which equal the cash paid out) at the end of years 3, 4 and 5 are also shown below.

Year	Fair value	Intrinsic value
	CU	CU
1	14.40	
2	15.50	
3	18.20	15.00
4	21.40	20.00
5		25.00

The entity will recognise the cost of this award as follows:

Year	Calculation of liability	Calculation of cash paid	Liability (CU)	Cash paid (CU)	Expense for period (CU)*
1	405 employees × 100 SARs × CU14.40 × 1/3		194,400	-	194,400
2	400 employees × 100 SARs × CU15.50 × 2/3		413,333	-	218,933
3	253 employees × 100 SARs × CU18.20	150 employees × 100 SARs × CU15.00	460,460	225,000	272,127
4	113 employees × 100 SARs × CU21.40	140 employees × 100 SARs × CU20.00	241,820	280,000	61,360
5	-	113 employees × 100 SARs × CU25.00	-	282,500	40,680

* Liability at end of period + cash paid in period - liability at start of period

The accounting treatment for cash-settled transactions is therefore (despite some similarities in the methodology) significantly different from that for equity-settled transactions. An important practical issue is that, for a cash-settled transaction, the entity must determine the fair value at each reporting date and not merely at grant date (and at the date of any subsequent modification or settlement) as would be the case for equity-settled transactions.

As Illustration 9-2 shows, it is not generally necessary, although arguably required by IFRS 2, to determine the fair value of a cash-settled transaction at grant date, at least to determine the expense under IFRS 2. However, for entities subject to IAS 33 *Earnings per Share*, the grant date fair value may be required in order to make the disclosures required by that standard - see Chapter 33.

We discuss in more detail in sections 9.3.2.A to 9.3.2.E below the following aspects of the accounting treatment of cash-settled transactions:

- Determining the vesting period (see section 9.3.2.A below)
- Periodic allocation of cost (see section 9.3.2.B below)
- Treatment of non-market vesting conditions (see section 9.3.2.C below)
- Treatment of market conditions and non-vesting conditions (see section 9.3.2.D below)
- Treatment of modification, cancellation and settlement (see section 9.3.2.E below)

9.3.2.A Determining the vesting period

The rules for determining vesting periods are the same as those applicable to equity-settled transactions, as discussed in sections 6.1 to 6.4 above. Where an award vests immediately, IFRS 2 creates a presumption that, in the absence of evidence to the contrary, the award is in respect of services that have already been rendered, and must therefore be expensed in full at grant date. [IFRS 2.32].

Where cash-settled awards are made subject to vesting conditions (as in many cases they will be, particularly where payments to employees are concerned), IFRS 2 creates a presumption that they are a payment for services to be received in the future, during the 'vesting period', with the transaction being recognised during that period, as demonstrated in Illustration 9-2 above. [IFRS 2.32].

9.3.2.B Periodic allocation of cost

IFRS 2 states that the required treatment for cash-settled transactions is simply to measure the fair value of the liability at each reporting date, [IFRS 2.30], which might suggest that the full fair value, and not just a time-apportioned part of it, must be recognised at each reporting date - as would be the case for any liability that is a financial instrument and measured at fair value under IFRS 9.

However, the standard goes on to clarify that the liability is to be measured at an amount that reflects 'the extent to which employees have rendered service to date', and the cost is to be recognised 'as the employees render service'. [IFRS 2.32, IFRS 2.33]. This, together with IG Examples 12-12A in IFRS 2 (the substance of which is reproduced as Illustrations 9-2 above and 9-3 below), indicates that a spreading approach is to be adopted.

For cash-settled awards vesting in instalments (sometimes referred to as 'graded' vesting), we believe that the requirements of the standard illustrated in IFRS 2.IG11, whereby each instalment is treated as a separate award, would be required to be followed similarly as to equity-settled awards (see section 6.2.2 above). This results in multiple separate awards having been granted with different vesting periods. As for all cash-settled share-based payment transactions the fair value for each instalment will be determined at each reporting date and at the date of settlement. On a cumulative basis, the amount ultimately recognised for goods or services received as consideration for the cash-settled awards will be equal to the cash that is paid. [IFRS 2.32, IFRS 2.33, IFRS 2.33D].

How we see it

We believe, for cash-settled share-based payment transactions vesting in instalments, the requirement of the standard illustrated in IFRS 2.IG11 would be required to be followed with the associated cost recognised over the different vesting periods.

9.3.2.C Non-market vesting conditions

IFRS 2 clarifies how performance vesting conditions and non-vesting conditions must be treated in the measurement of cash-settled share-based payment transactions. In this section we consider non-market performance conditions; market conditions and non-vesting conditions are discussed in section 9.3.2.D below.

The standard makes clear that:

- Vesting conditions (other than market conditions) must not be taken into account in estimating the fair value of a cash-settled share-based payment. Instead, as for equity-settled share-based payment transactions, such conditions must be taken into account by adjusting the number of awards included in the measurement of the liability arising from the cash-settled share-based payment transaction.
- The amount recognised for the goods or services received during the vesting period must be based on the entity's best estimate of the number of awards expected to vest. This estimate must be revised, if necessary, if subsequent information indicates that the number of awards expected to vest differs from previous estimates. On the vesting date, the entity must revise the estimate to equal the number of awards that ultimately vested.
- On a cumulative basis, the amount ultimately recognised for goods or services received as consideration for the cash-settled share-based payment will be equal to the cash that is paid. [IFRS 2.33A, IFRS 2.33B, IFRS 2.33D].

IG Example 12A of the implementation guidance accompanying IFRS 2 illustrates the accounting treatment of a cash-settled award with a non-market performance condition. [IFRS 2.IG Example 12A]. This example forms the basis of Illustration 9-3 below and supplements the Illustration of a service condition in IG Example 12 (broadly reproduced as Illustration 9-2 above).

Illustration 9-3: Cash-settled transaction with service condition and non-market performance condition

An entity grants 100 cash-settled share appreciation rights (SARs) to each of its 500 employees, on condition that the employees remain in its employment for the next three years and the entity reaches a revenue target (CU1 billion in sales) by the end of year 3. The entity expects all employees to remain in employment for the full three years.

At the end of year 1, the entity expects that the revenue target will not be achieved by the end of year 3. During year 2, the entity's revenue increased significantly and it is expected that the revenue will continue to grow. Consequently, at the end of year 2, the entity expects that the revenue target will be achieved by the end of year 3.

At the end of year 3, the revenue target is achieved and 150 employees exercise their SARs. Another 150 employees exercise their SARs at the end of year 4 and the remaining 200 exercise their SARs at the end of year 5.

Using an option pricing model, the entity estimates the fair value of the SARs, ignoring the revenue target performance condition and the employment service condition, at the end of each year until all of the cash-settled share-based payments are settled. At the end of year 3, all of the SARs vest. The following table shows the estimated fair value of the SARs at the end of each year and the intrinsic values of the SARs at the date of exercise (which equal the cash paid out).

Year	Fair value	Intrinsic value
	CU	CU
1	14.40	
2	15.50	
3	18.20	15.00
4	21.40	20.00
5	25.00	25.00

The entity will recognise a total expense and cash payment of CU1,025,000 as follows:

Year	Calculation of liability	Calculation of cash paid	Liability (CU)	Cash paid (CU)	Expense for period (CU)*
1	SARs are not expected to vest: no expense is recognised.		-	-	-
2	SARs are expected to vest: 500 employees × 100 SARs × CU15.50 × 2/3		516,667	-	516,667
3	((500 - 150) employees × 100 SARs × CU18.20 × 3/3) - 516,667	150 employees × 100 SARs × CU15.00	637,000	225,000	345,333
4	((350 - 150) employees × 100 SARs × CU21.40) - 637,000	150 employees × 100 SARs × CU20.00	428,000	300,000	91,000
5	((200 - 200) employees × 100 SARs × CU25.00) - 428,000	200 employees × 100 SARs × CU25.00	-	500,000	72,000

* Liability at end of period + cash paid in period - liability at start of period

9.3.2.D Market conditions and non-vesting conditions

IFRS 2 clarifies that market conditions and non-vesting conditions must be taken into account when estimating the fair value of a cash-settled share-based payment when it is initially measured and at each remeasurement date until settlement. [IFRS 2.33C]. There will be no ultimate cost for a cash-settled award where a market condition or non-vesting condition is not satisfied as any liability would be reversed. The cumulative amount recognised will be equal to the cash paid. [IFRS 2.33D]. This is different from the accounting model for equity-settled transactions with market conditions or non-vesting conditions, which can result in a cost being recognised for awards subject to a market or non-vesting condition that is not satisfied (see sections 6.3 and 6.4 above).

9.3.2.E Modification, cancellation and settlement

IFRS 2 includes guidance for modifications that change the classification of a share-based payment transaction from cash-settled to equity-settled (see section 9.4 below). Apart from this, IFRS 2 provides no specific guidance on modification, cancellation and settlement of cash-settled awards. However, as cash-settled awards are accounted for using a full fair value model no such guidance is needed. It is clear that:

- Where an award is modified, the liability recognised at and after the point of modification will be based on its new fair value, with the effect of any movement in the liability recognised immediately.
- Where an award is cancelled the liability will be derecognised, with a credit immediately recognised in profit or loss.
- Where an award is settled, the liability will be derecognised, and any gain or loss on settlement immediately recognised in profit or loss.

How we see it

As noted above, IFRS 2 provides no specific guidance on modification, cancellation and settlement of cash-settled awards. In our view, as cash-settled awards are accounted for using a full fair value model no such guidance is needed, the accounting set out above would apply.

9.4 Modification of award from equity-settled to cash-settled or from cash-settled to equity-settled

An entity will sometimes modify the terms of an award in order to change the manner of settlement. In other words, an award that at grant date was equity-settled is modified so as to become cash-settled, or *vice versa*.

IFRS 2 provides no explicit guidance for modifications that change an award from being equity-settled to being cash-settled. As part of the discussions relating to the June 2016 amended guidance for modifications from cash-settled to equity-settled, the IASB considered, but rejected, suggestions that additional examples be added to the implementation guidance to illustrate other types of modification, including equity-settled to cash-settled (see further discussion in section 9.4.1 below).

In order to develop the suggested accounting approaches discussed in section 9.4.1 below we have used the provisions of IFRS 2 in respect of:

- The modification of equity-settled awards during the vesting period (see section 7.3 above).
- The addition of a cash-settlement alternative to an equity-settled award after grant date, as illustrated by IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 below).
- The settlement of equity-settled awards in cash (see section 7.4 above).

As noted in section 10.2.3 below, the accounting in this section also applies where an entity with a choice of settlement in equity or cash switches between settlement methods.

9.4.1 Equity-settled award modified to cash-settled award

This section focuses on accounting for a change of settlement method rather than on the accounting treatment of other modifications to an equity-settled award that might be made at the same time as the change of settlement method (see section 7.3 above).

Drawing on the principles within the guidance referred to in section 9.4 above, we suggest that entities generally select one of the two approaches discussed below to account for the modification of an award from equity-settled to cash-settled during the vesting period. The first approach is based more closely on the IFRS 2 treatment for the modification of an equity-settled award (see section 7.3 above) and the second on that for the repurchase or settlement in cash of an equity instrument (see section 7.4 above).

Both approaches take into account IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 below) which shows the recognition of an expense when the cash-settlement alternative is remeasured in the period following modification, in addition to an expense for the full grant date fair value of the equity-settled arrangement. Although this Example reflects a choice of settlement by the counterparty, rather than the elimination of a method of settlement (as is the case in a modification from equity-settlement to cash-settlement), we believe that an analogy may be drawn between the two situations because the addition of a cash alternative for the counterparty effectively results in the award being treated as cash-settled from the date of modification.

The two approaches are discussed in more detail below and demonstrated in Illustration 9-4.

How we see it

In our view, when an equity-settled award is modified to a cash-settled award during the vesting period, in the absence of clear guidance in IFRS 2, either approach as set out in detail below is acceptable but the choice of approach must be applied consistently to all such modifications.

Both approaches require the recognition, as a minimum, of an IFRS 2 expense which comprises the following elements:

- The grant date fair value of the original equity-settled award (see section 7.3 above)
- Any incremental fair value arising from the modification of that award (see section 7.1 above)
- Any remeasurement of the liability between its fair value at the modification date and the amount finally settled (see section 10.1.4 below)

Over the vesting period as a whole, both approaches result in the same total IFRS 2 expense and the same liability/cash settlement amount. Under both approaches, the net overall difference between the expense and the cash settlement amount is an adjustment to equity. However, the timing of recognition of any incremental fair value arising on modification will differ under the two approaches, as explained below.

Approach 1

- At the date of modification, a liability is recognised based on the fair value of the cash-settled award as at that date and the extent to which the vesting period has expired.
- The entire corresponding debit is taken to equity. Any incremental fair value of the cash-settled award over that of the equity-settled award as at the modification date will be expensed over the period from the date of modification to the date of settlement of the cash-settled award (i.e., no expense is recognised at the date of modification).
- The total fair value of the cash-settled award is remeasured through profit or loss on an ongoing basis between the date of modification and the date of settlement.

As Approach 1 is based on the accounting treatment for a modification of an equity-settled award, no incremental fair value is recognised as an expense at the modification date. This means that, in cases where the fair value of the modified award is higher at the date of modification than that of the original award, the reduction in equity at the date of modification will be higher than the proportionate fair value at that date of the original equity-settled award. This situation reverses over the remainder of the vesting period when an expense (and corresponding credit to equity) will be recognised for the incremental fair value of the modified award. [IFRS 2.27, IFRS 2.B42, IFRS 2.B43].

Approach 2

- As for Approach 1, at the date of modification a liability is recognised based on the fair value of the cash-settled award as at that date and the extent to which the vesting period has expired.
- Unlike Approach 1, the corresponding debit is taken to equity only to the extent of the fair value of the original equity-settled award as at the date of modification. Any incremental fair value of the cash-settled award over the equity-settled award as at the modification date is expensed immediately on modification to the extent that the vesting period has expired. The remainder of any incremental value is expensed over the period from the date of modification to the date of settlement.
- As for Approach 1, the total fair value of the cash-settled award is remeasured through profit or loss on an ongoing basis between the date of modification and the date of settlement.

Approach 2 is based on the accounting treatment for the repurchase of an equity instrument where a reduction in equity up to the fair value of the equity instrument is recognised as at the date of repurchase with any incremental fair value of the repurchase arrangement being treated as an expense. [IFRS 2.28, IFRS 2.29]. Whilst Approach 2 avoids the potential problem of an immediate reduction in equity in excess of the fair value of the equity-settled award, its settlement approach could be seen as diverging from the basic IFRS 2 treatment for the modification of an equity-settled award where none of the incremental fair value arising on a modification is expensed at the date of modification.

As noted at the start of this section, the two approaches outlined above are based on the specific principles referred to in section 9.4 above. In the absence of clear guidance in the standard, other interpretations of the appropriate expense and equity adjustment are also possible, although these will sometimes result in a higher expense through profit or loss than the two approaches above. For example, in relation to the cash-settled award, the approaches outlined above expense only the difference between the final settlement amount and the full fair value of the liability at the modification date, with the remainder adjusted through equity. An alternative view follows the accounting treatment for cash-settled awards which would lead to the recognition of an expense for the entire remeasurement of the liability from the amount recognised for a part-vested award at modification date to the amount finally settled.

As noted in section 9.4 above, the IASB decided that existing implementation guidance in IFRS 2 could be applied by analogy to other types of modification. As an example of this, it states that IG Example 9 illustrates a grant of shares to which a cash settlement alternative is subsequently added. [IFRS 2.BC237K].

The approach in IG Example 9 has been considered within our two suggested accounting approaches and is also discussed further in the context of Illustration 9-4 below.

Illustration 9-4: Modification of equity-settled award to cash-settled award

A Modified award with same fair value as original award

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of CU500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, but its terms are otherwise unchanged. The fair value at that date of both alternatives is CU150. The liability is actually settled for CU180 at the end of year 4.

	Approach 1			Approach 2		
	Expense CU	Equity CU	Liability CU	Expense CU	Equity CU	Liability CU
Years 1-2	250	(250)	-	250	(250)	-
Modification date (beginning of year 3)	-	75	(75)	-	75	(75)
Years 3-4	280	(175)	(105)	280	(175)	(105)
Totals	530	(350)	(180)	530	(350)	(180)

During years 1 and 2 the entity recognises a cumulative expense of CU250, being the proportion of the grant date fair value of the equity-settled award of CU500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of CU75 ($\text{CU150} \times 2/4$ - see section 9.3.2 above). The full amount of this liability is recognised as a reduction in equity under both approaches as there is no difference between the fair value of the original and modified awards as at the modification date.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (CU250, being $\text{CU500} \times 2/4$), as would occur in an immediate settlement (see section 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of CU105 in the fair value of the liability (CU180 - CU75). During this period, it also recognises employee costs totalling CU280, being the remaining grant date fair value of CU250 (CU500 total less CU250 expensed prior to modification) plus the post-modification remeasurement of the liability of CU30 (CU180 - CU150). The balance of CU175 is credited to equity.

In total the entity recognises an expense of CU530, being the original grant date fair value of the equity-settled award of CU500 plus the post-modification remeasurement of the liability of CU30. This adjustment of CU30 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 and Illustration 10-2 below).

In Scenario A the modification date fair value is lower than the grant date fair value. Scenario E below considers a situation where the awards have the same fair value as at the date of modification, but this fair value is higher than the original grant date fair value of the equity-settled award.

B Modified award with greater fair value than original award

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of CU500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, with other modifications meaning that the new award has a higher fair value than the original award. At that date, the fair value of the original award is CU150, but that of the cash-settled replacement award is CU170. The liability is actually settled for CU200 at the end of year 4.

	Approach 1			Approach 2		
	Expense CU	Equity CU	Liability CU	Expense CU	Equity CU	Liability CU
Years 1-2	250	(250)	-	250	(250)	-
Modification date (beginning of year 3)	-	85	(85)	10	75	(85)
Years 3-4	300	(185)	(115)	290	(175)	(115)
Totals	550	(350)	(200)	550	(350)	(200)

During years 1 and 2 the entity recognises a cumulative expense of CU250, being the proportion of the grant date fair value of the equity-settled award of CU500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of CU85 ($\text{CU170} \times 2/4$ - see section 9.3.2 above). Under Approach 1 the difference between the fair value of the original equity-settled award and the modified award (CU20 in total) is not recognised immediately as an expense but is spread over the remainder of the vesting period (i.e., starting from the date of modification). The liability of CU85 is therefore recognised as a reduction in equity. Under Approach 2, the difference between the fair value of the original equity-settled award and the modified award is expensed immediately to the extent that the vesting period has already expired ($\text{CU20} \times 2/4$) with the remainder being expensed in the post-modification period.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (CU250, being $\text{CU500} \times 2/4$) as would occur in an immediate settlement (see section 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of CU115 in the fair value of the liability (CU200 - CU85). During this period, under Approach 1 it also recognises employee costs totalling CU300, being the remaining grant date fair value of CU250 (CU500 total less CU250 expensed prior to modification) plus the incremental modification fair value of CU20 (CU170 - CU150) plus the remeasurement of the liability of CU30 (CU200 - CU170) between modification date and settlement date. The balance of CU185 is credited to equity. For Approach 2, the expense and the credit to equity during this period are CU10 less than under Approach 1 because a proportionate amount of the incremental fair value was expensed immediately at the modification date.

In total the entity recognises an expense of CU550, being the original grant date fair value of the equity-settled award of CU500 plus the incremental fair value of CU20 arising on modification of the award plus the post-modification remeasurement of the liability of CU30. This remeasurement adjustment of CU30 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 and Illustration 10-2 below).

C Modified award with lower fair value than original award

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of CU500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, with other modifications meaning that the new award has a lower fair value than the original award. At that date, the fair value of the original award is CU150, but that of the cash-settled replacement award is CU130. The liability is actually settled for CU180 at the end of year 4.

	Approach 1			Approach 2		
	Expense CU	Equity CU	Liability CU	Expense CU	Equity CU	Liability CU
Years 1-2	250	(250)	-	250	(250)	-
Modification date (beginning of year 3)	-	65	(65)	-	65	(65)
Years 3-4	300	(185)	(115)	300	(185)	(115)
Totals	550	(370)	(180)	550	(370)	(180)

During years 1 and 2 the entity recognises a cumulative expense of CU250, being the proportion of the grant date fair value of the equity-settled award of CU500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of CU65 ($\text{CU130} \times 2/4$) (see section 9.3.2 above). The full amount of this liability is recognised as a reduction in equity under both approaches as the fair value of the modified award is lower than that of the original award. No gain is recognised for the reduction in fair value consistent with the general principle in IFRS 2 that the cost recognised for an equity-settled award must be at least the grant date fair value of the award.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (CU250, being $\text{CU500} \times 2/4$) as would occur in an immediate settlement (see section 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of CU115 in the fair value of the liability (CU180 - CU65). During this period, it also recognises employee costs totalling CU300, being the remaining grant date fair value of CU250 (CU500 total less CU250 expensed prior to modification) plus the remeasurement of the liability of CU50 (CU180 - CU130) between modification date and settlement date. The balance of CU185 is credited to equity.

In total the entity recognises an expense of CU550, being the original grant date fair value of the equity-settled award of CU500 plus the post-modification remeasurement of the liability of CU50. This adjustment of CU50 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 and Illustration 10-2 below).

Whilst the overall liability in Scenario C is the same as that in Scenario A above, the total expense and overall net credit to equity are higher even though the cash-settled award had a lower fair value at the modification date than that in Scenario A. This might appear illogical but is consistent with the approach in IG Example 9 and the requirement to recognise, as a minimum, the grant date fair value of the original equity-settled award together with any post-modification change in the fair value of the liability.

D Modified award with greater fair value than original award but settled for less than modification date fair value

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of CU500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, with other modifications meaning that the new award has a higher fair value than the original award. At that date, the fair value of the original award is CU150, but that of the cash-settled replacement award is CU170. The liability is actually settled for CU125 at the end of year 4.

	Approach 1			Approach 2		
	Expense CU	Equity CU	Liability CU	Expense CU	Equity CU	Liability CU
Years 1-2	250	(250)	-	250	(250)	-
Modification date (beginning of year 3)	-	85	(85)	10	75	(85)
Years 3-4	225	(185)	(40)	215	(175)	(40)
Totals	475	(350)	(125)	475	(350)	(125)

During years 1 and 2 the entity recognises a cumulative expense of CU250, being the proportion of the grant date fair value of the equity-settled award of CU500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of CU85 ($CU170 \times 2/4$) (see section 9.3.2 above). Under Approach 1 the difference between the fair value of the original equity-settled award and the modified award (CU20 in total) is not recognised immediately as an expense but is spread over the remainder of the vesting period (i.e., starting from the date of modification). The liability of CU85 is therefore recognised as a reduction in equity. Under Approach 2, the difference between the fair value of the original equity-settled award and the modified award is expensed immediately to the extent that the vesting period has already expired ($CU20 \times 2/4$) with the remainder being expensed in the post-modification period.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (CU250, being $CU500 \times 2/4$) as would occur in an immediate settlement (see section 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises an increase of CU40 in the fair value of the liability (CU125 - CU85). During this period, under Approach 1 it also recognises employee costs totalling CU225, being the remaining grant date fair value of CU250 (CU500 total less CU250 expensed prior to modification) plus the incremental modification fair value of CU20 less a reduction of CU45 (CU170 - CU125) in the fair value of the liability since modification date. The balance of CU185 is credited to equity. For Approach 2, the expense and the credit to equity during this period are CU10 less than under Approach 1 because a proportionate amount of the incremental fair value was expensed immediately at the modification date.

In total the entity recognises an expense of CU475, being the original grant date fair value of the equity-settled award of CU500 plus the incremental fair value of CU20 arising on modification of the award less the post-modification remeasurement of the liability of CU45. This remeasurement adjustment of CU45 is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 and Illustration 10-2 below).

E Modified award with same fair value as original award but where modification date fair value is higher than original grant date fair value

At the beginning of year 1 an entity granted an equity-settled award, with a fair value at that date of CU500, and vesting if the employee is still in service at the end of year 4. At the beginning of year 3, the award is modified so as to become cash-settled, but its terms are otherwise unchanged. The fair value of the award at that date on both an equity-settled basis and a cash-settled basis is CU800. The liability is actually settled for CU700 at the end of year 4.

	Approach 1			Approach 2		
	Expense	Equity	Liability	Expense	Equity	Liability
	CU	CU	CU	CU	CU	CU
Years 1-2	250	(250)	-	250	(250)	-
Modification date (beginning of year 3)	-	400	(400)	-	400	(400)
Years 3-4	300	-	(300)	300	-	(300)
Totals	550	150	(700)	550	150	(700)

During years 1 and 2 the entity recognises a cumulative expense of CU250, being the proportion of the grant date fair value of the equity-settled award of CU500 attributable to 2/4 of the vesting period.

At modification date (beginning of year 3), it is necessary to recognise a liability of CU400 ($\text{CU}800 \times 2/4$ - see section 9.3.2 above). The full amount of this liability is recognised as a reduction in equity under both approaches as there is no difference between the fair value of the original and modified awards as at the modification date.

As the award is continuing, there is no acceleration at the modification date of the as yet unrecognised amount of the grant date fair value of the original award (CU250, being $\text{CU}500 \times 2/4$), as would occur in an immediate settlement (see section 7.4 above).

During years 3 and 4 (the period from modification to settlement date), the entity recognises a net increase of CU300 in the fair value of the liability (CU700 - CU400). During this period it also recognises employee costs totalling CU300, being the remaining modification date fair value of the cash-settled award ($\text{CU}800 \times 2/4$) plus the post-modification remeasurement of the liability of CU(100) (CU800 - CU700).

In total the entity recognises an expense of CU550. This expense reflects three components: firstly, half of the grant date fair value of the original equity-settled award and secondly, half of the modification date fair value of the cash-settled award. As the award had increased in value between grant date and modification date, the requirement of IFRS 2.27 to recognise, as a minimum, the original grant date fair value of the equity-settled award (CU250 for the portion of the vesting period prior to modification) has been met. The third component of the overall expense, in accordance with the requirements for cash-settled share-based payments, is the CU(100) remeasurement of the liability between modification and settlement. In our view, this is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 and Illustration 10-2 below).

Some take the view that the approach in IG Example 9 would lead to a total expense of CU400 in the Illustration above, rather than CU550 (being the original grant date fair value of CU500 plus the remeasurement of the liability of CU(100) in the period following the modification). The difference of CU150 would be debited to equity in the two years following modification. In other words, in recognising an expense for the cash-settled award during the vesting period after the modification date, no account is taken of the fact that the fair value of the arrangement increased between the original grant date and the modification date.

IG Example 9 illustrates a situation where there is a decrease in the fair value between original grant date and modification date. As a result, that Example expenses the grant date fair value of the original equity-settled award (plus the remeasurement of the liability) in order to meet the minimum expense requirements of IFRS 2.27.

How we see it

In a situation such as that outlined in Scenario E above, it does not seem appropriate, in our view, to limit the post-modification expense for the cash-settled award to an amount based on the original grant date fair value of the equity-settled award (CU150) rather than applying cash-settled accounting to the element of the award for which services are delivered in years 3 and 4 and recognising a corresponding expense of CU300. Therefore, in our view, recognition of a total expense of CU550 as noted above is consistent with the approach taken in IG Example 9 in the implementation guidance to IFRS 2 (see section 10.1.4 below and Illustration 10-2 below).

9.4.2 Cash-settled award modified to equity-settled award

IFRS 2 provides guidance in situations where the terms and conditions of a cash-settled award are modified so that it becomes equity-settled. Appendix B to IFRS 2 states that if a cash-settled transaction is modified so that it becomes equity-settled, the transaction will be accounted for as such from the date of the modification and specifically:

- The equity-settled share-based payment transaction is measured by reference to the modification date fair value of the equity instruments granted at that date.
- The equity-settled share-based payment transaction is recognised in equity on the modification date to the extent to which goods or services have been received.
- The liability for the cash-settled share-based payment transaction as at the modification date is derecognised on that date.
- Any difference between the carrying amount of the liability derecognised and the amount recognised in equity on the modification date is recognised immediately in profit or loss. [IFRS 2.B44A].

If the vesting period is extended or shortened as a result of the modification, the modified vesting period is reflected in applying the requirements above. The standard also clarifies that these requirements apply even if the modification takes place after the vesting period. [IFRS 2.B44B].

The standard further clarifies that the above requirements apply if a cash-settled share-based payment is cancelled or settled (other than by forfeiture when vesting conditions are not satisfied) and equity instruments are designated as a replacement for the cancelled or settled share-based payment. In order to qualify as a replacement, the equity instruments must be designated as such on the grant date. [IFRS 2.B44C].

The IASB notes in the Basis for Conclusions that the immediate recognition in profit or loss of any difference between the derecognised liability and the amount recognised in equity is consistent with how cash-settled share-based payments are measured in accordance with IFRS 2.30. It also observes that the approach is consistent with the requirements for the extinguishment of a financial liability (fully or partially by the issue of equity instruments) in IFRS 9 and in IFRIC 19 *Extinguishing Financial Liabilities with Equity Instruments*. [IFRS 2.BC237H].

IG Example 12C in the implementation guidance of IFRS 2 illustrates the above guidance and forms the basis of Illustration 9-5 below. [IFRS 2.IG Example 12C].

Illustration 9-5: Modification of cash-settled award to equity-settled award

At the beginning of year 1 an entity grants 100 cash-settled share appreciation rights (SARs) to each of 100 employees on condition that they remain in the entity's service for four years.

At the end of year 1 each SAR has an estimated fair value of CU10 and at the end of year 2 CU12.

At the end of year 2 the entity cancels the SARs and, in their place, grants 100 share options to each employee on condition that each remains in service for the next two years, i.e., the original service period is unchanged. At the date of grant, the fair value of each share option is CU13.20. All of the employees are expected to meet the service condition.

In years 1 and 2 the entity recognises a cash-settled share-based payment expense of CU25,000 and CU35,000 respectively, based on the fair value of the SARs at each reporting date and the extent to which the vesting period has been completed. At the modification date, the requirements of paragraph B44A are applied as follows:

Modification date (end of year 2)

Dr	Liability	CU60,000	
Dr	Profit or loss	CU6,000	
	Cr	Equity	CU66,000

The entity compares the fair value of the equity award, measured as at the date of modification, of CU66,000 ($CU132,000 \times 2/4$) with the fair value of the liability for the cash-settled award of CU60,000 ($CU120,000 \times 2/4$) at the same date. The difference of CU6,000 is recognised immediately in profit or loss.

The remainder of the equity-settled share-based payment, as measured at the modification date, is recognised in profit or loss during years 3 and 4 i.e., an expense of CU33,000 in each of the two years.

10 Transactions with equity and cash alternatives

It is common for share-based payment transactions (particularly those with employees) to provide either the entity or the counterparty with the choice of settling the transaction either in shares (or other equity instruments) or in cash (or other assets). The general principle of IFRS 2 is that a transaction with a cash alternative, or the components of that transaction, must be accounted for:

- (a) As a cash-settled transaction if, and to the extent that, the entity has incurred a liability to settle in cash or other assets.

Or

- (b) As an equity-settled transaction if, and to the extent that, no such liability has been incurred. [IFRS 2.34].

More detailed guidance is provided as to how that general principle must be applied to transactions:

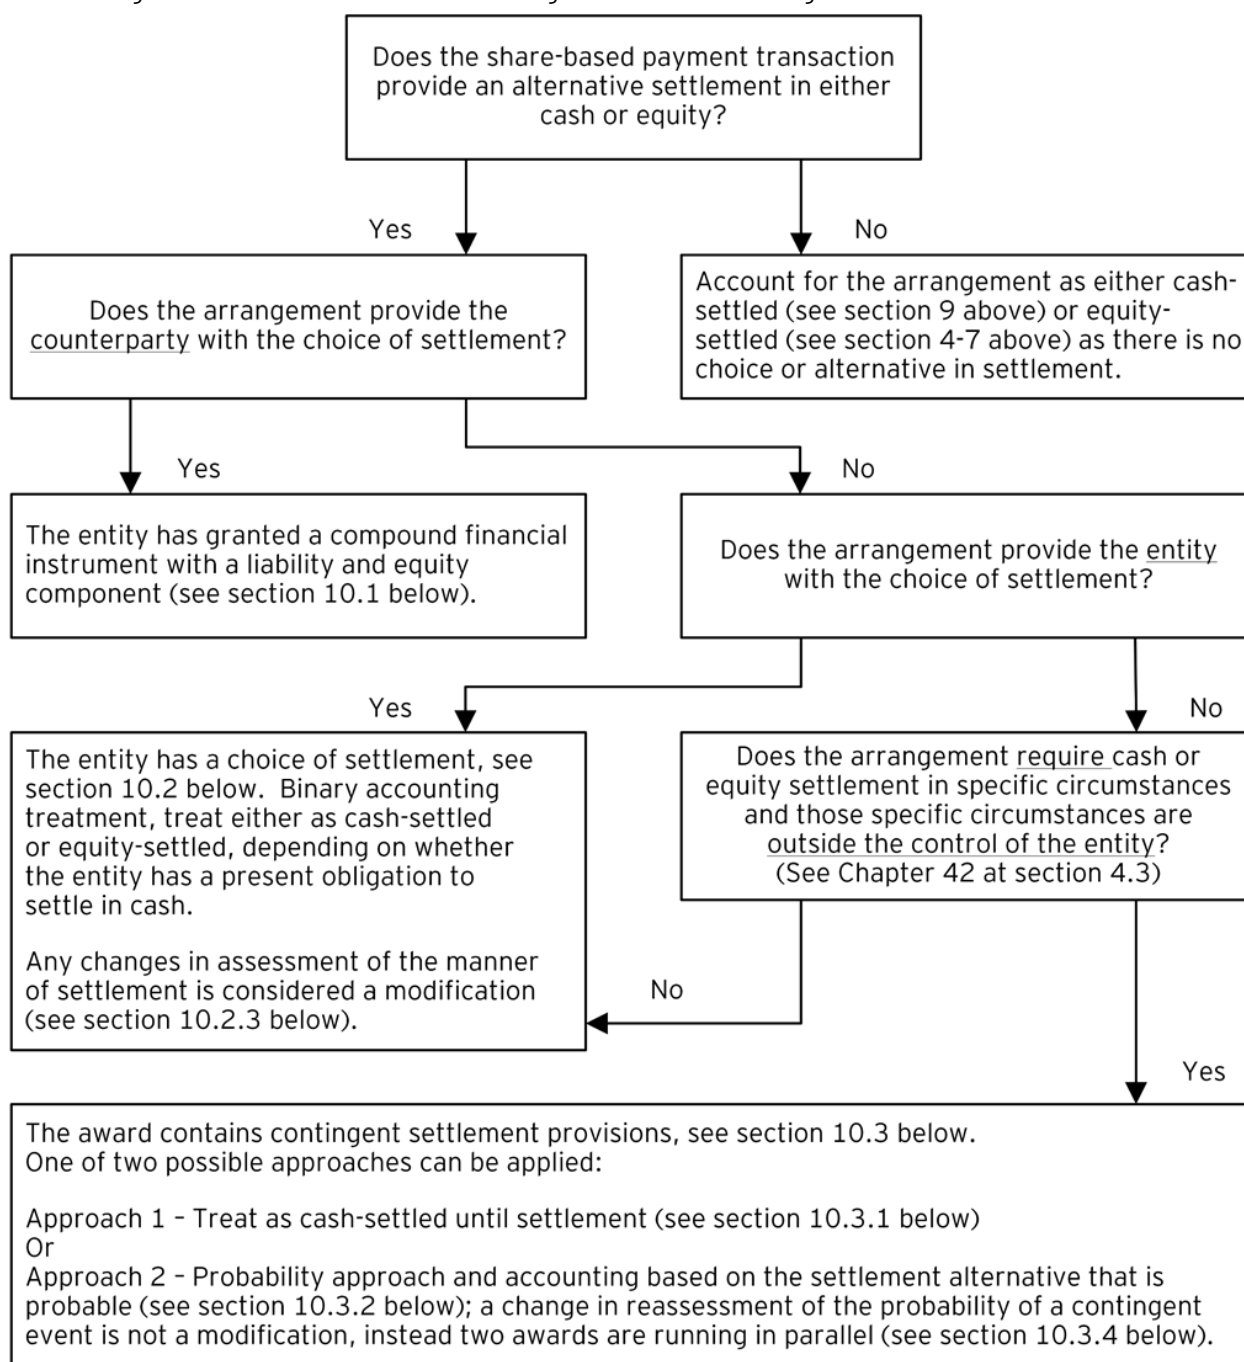

- Where the counterparty has choice of settlement (see section 10.1 below)
- Where the entity has choice of settlement (see section 10.2 below)

Some specific types of arrangement that include cash and equity alternatives, either as a matter of choice or depending on the outcome of certain events are covered elsewhere in this chapter, as outlined below.

A common type of arrangement seen in practice is the 'matching' award or deferred bonus arrangement where an employee is offered a share award or a cash alternative to 'match' a share award or a cash bonus earned during an initial period. This type of arrangement is addressed in section 15.1 below.

Rather than providing either the entity or the counterparty with a choice between settlement in equity or in cash, some transactions offer no choice but instead require an arrangement that will generally be equity-settled to be settled in cash in certain specific and limited circumstances (awards with contingent cash settlement). There will also be situations where there is contingent settlement in equity of an award that is otherwise cash-settled. These types of arrangement are considered in more detail in section 10.3 below.

The following flow chart illustrates how to navigate to the accounting in this section:

Some awards offer an equity alternative and a cash alternative where the cash alternative is not based on the price or value of the equity instruments. These arrangements are considered in section 10.4 below.

10.1 Transactions where the counterparty has choice of settlement in equity or in cash

Where the counterparty has the right to elect for settlement in either shares or cash, IFRS 2 regards the transaction as a compound transaction to which split accounting must be applied. The general principle is that the transaction must be analysed into a liability component (the counterparty's right to demand settlement in cash) and an equity component (the counterparty's right to demand settlement in shares). [IFRS 2.35]. Once split, the two components are accounted for separately. The methodology of split accounting required by IFRS 2 is somewhat different from that required by IAS 32 for issuers of other compound instruments (see Chapter 43).

A practical issue is that, where a transaction gives the counterparty a choice of settlement, it will be necessary to establish a fair value for the liability component both at grant date and at each subsequent reporting date until settlement. By contrast, in the case of transactions that can be settled in cash only, a fair value is not generally required at grant date for IFRS 2 accounting purposes, but a fair value is required at each subsequent reporting date until settlement (see section 9 above). However, for entities subject to IAS 33, the grant date fair value is required in order to make the disclosures required by that standard - see Chapter 33.

We consider in more detail in sections 10.1.1 to 10.1.3 below the accounting treatment required by IFRS 2 for transactions where the counterparty has a settlement choice. In addition, the following specific situations are discussed:

- The addition of a cash-settlement alternative after the grant date (see section 10.1.4 below)
- Arrangements where the counterparty is given a choice to cover more or less remote contingencies e.g., restrictions or limits on the issue of shares in a particular jurisdiction (see section 10.1.5 below)
- The issue of convertible bonds in return for goods or services (see section 10.1.6 below)

10.1.1 Transactions in which the fair value is measured directly

Transactions with non-employees are normally measured by reference to the fair value of goods and services supplied at service date (i.e., the date at which the goods or services are supplied) - see sections 4 and 5 above.

Accordingly, where an entity enters into such a transaction where the counterparty has choice of settlement, it determines the fair value of the liability component at service date. The equity component is the difference between the fair value (at service date) of the goods or services received and the fair value of the liability component. [IFRS 2.35].

10.1.2 Transactions in which the fair value is measured indirectly - including transactions with employees

All other transactions, including those with employees, are measured by reference to the fair value of the instruments issued at 'measurement date', being grant date in the case of transactions with employees and service date in the case of transactions with non-employees - see sections 4.1 and 5.1 above. [IFRS 2 Appendix A].

The fair value must take into account the terms and conditions on which the rights to cash or equity instruments were issued. [IFRS 2.36]. IFRS 2 does not elaborate further on this, but we assume that the IASB intends a reporting entity to apply:

- As regards the equity component of the transaction, the provisions of IFRS 2 relating to the impact of terms and conditions on the valuation of equity-settled transactions (see sections 4 to 6 above).
- As regards the liability component of the transaction, the provisions of IFRS 2 relating to the impact of terms and conditions on the valuation of cash-settled transactions (see section 9.3 above).

The entity must first measure the fair value of the liability component and then that of the equity component. The fair value of the equity component must be reduced to take into account the fact that the counterparty must forfeit the right to receive cash in order to receive shares. The sum of the two components is the fair value of the whole compound instrument. [IFRS 2.37]. IG Example 13 in IFRS 2 (the substance of which is reproduced as Illustration 10-1 below) suggests that this may be done by establishing the fair value of the equity alternative and subtracting from it the fair value of the liability component. This approach may be appropriate in a straightforward situation involving ordinary shares and cash, as illustrated in the Example in the implementation guidance, but will not necessarily be appropriate in more complex situations that include, for example, the likelihood of options being exercised.

How we see it

Where options are granted, the approach in IG Example 13, of subtracting the fair value of the liability component from the fair value of the equity alternative, will not necessarily be appropriate in more complex situations.

In many share-based payment transactions with a choice of settlement, the value to the counterparty of the share and cash alternatives is equal. The counterparty will have the choice between (say) 1,000 shares or the cash value of 1,000 shares. This will mean that the fair value of the liability component is equal to that of the transaction as a whole, so that the fair value of the equity component is zero. In other words, the transaction is accounted for as if it were a cash-settled transaction.

However, in some jurisdictions it is not uncommon, particularly in transactions with employees, for the equity-settlement alternative to have more value (as in Illustration 10-1 below). For example, an employee might be able to choose at vesting between the cash value of 1,000 shares immediately or 2,000 shares (often subject to further conditions such as a minimum holding period, or a further service period). In such cases the equity component will have an independent value. [IFRS 2.37]. Such schemes are discussed in more detail in Illustrations 15-4 and 15-5 in section 15.1 below.

10.1.3 Accounting treatment

10.1.3.A During vesting period

Having established a fair value for the liability and equity components as set out in sections 10.1.1 and 10.1.2 above, the entity accounts for the liability component according to the rules for cash-settled transactions (see section 9 above) and for the equity component according to the rules for equity-settled transactions (see sections 4 to 8 above). [IFRS 2.38].

Illustration 10-1 below demonstrates the accounting treatment for a transaction with an employee (as summarised in section 10.1.2 above) where the equity component has a fair value independent of the liability component.

Illustration 10-1: Award with employee choice of settlement with different fair values for cash-settlement and equity-settlement

An entity grants to an employee an award with the right to choose settlement in either:

- 1,000 phantom shares, i.e., a right to a cash payment equal to the value of 1,000 shares.
- Or
- 1,200 shares.

Vesting is conditional upon the completion of three years' service. If the employee chooses the share alternative, the shares must be held for three years after vesting date.

At grant date, the entity estimates that the fair value of the share alternative, after taking into account the effects of the post-vesting transfer restrictions, is CU48 per share. The fair value of the cash alternative is estimated as:

	CU
Grant date	50
Year 1	52
Year 2	55
Year 3	60

The grant date fair value of the equity alternative is CU57,600 (1,200 shares × CU48). The grant date fair value of the cash alternative is CU50,000 (1,000 phantom shares × CU50). Therefore the fair value of the equity component excluding the right to receive cash is CU7,600 (CU57,600 - CU50,000). The entity recognises a cost based on the following amounts.

Equity component				Liability component		
Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for year (CU)	Calculation of cumulative expense	Cumulative expense (CU)	Expense for year (CU)
1	CU7,600 × 1/3	2,533	2,533	1,000 phantoms × CU52 × 1/3	17,333	17,333
2	CU7,600 × 2/3	5,066	2,533	1,000 phantoms × CU55 × 2/3	36,667	19,334
3	CU7,600	7,600	2,534	1,000 phantoms × CU60	60,000	23,333

This generates the following accounting entries.

Year 1

Dr	Profit or loss (employment costs)	CU19,866	
	Cr Liability		CU17,333
	Cr Equity		CU2,533

Year 2

Dr	Profit or loss (employment costs)	CU21,867	
	Cr Liability		CU19,334
	Cr Equity		CU2,533

Year 3

Dr	Profit or loss (employment costs)	CU25,867	
	Cr Liability		CU23,333
	Cr Equity		CU2,534

The above Illustration is based on IG Example 13 in IFRS 2, in which the share price at each reporting date is treated as the fair value of the cash alternative. As discussed more fully in section 9 above, the fair value of a cash award is not necessarily exactly the same as the share price as it will depend on the terms and conditions of the award (see section 9.3.2 above). Accordingly, in adapting IG Example 13 as Illustration 10-1 above, we have deliberately described the numbers used in respect of the liability component as 'fair value' and not as the 'share price'. [IFRS 2.IG Example 13].

Illustration 10-1 also ignores the fact that transactions of this type often have different vesting periods for the two settlement alternatives. For instance, the employee might have been offered:

(a) The cash equivalent of 1,000 shares in three years' time subject to performance conditions.

Or

(b) Subject to the performance criteria in (a) above being met over three years, 3,000 shares after a further two years' service.

IFRS 2 offers no guidance as to how such transactions are to be accounted for. Presumably, however, the equity component would be recognised over a five-year period and the liability component over a three year period. This is considered further in the discussion of 'matching' share awards in section 15.1 below.

How we see it

Where the equity component vesting period differs from the cash component vesting period in a share-based payment transaction, in our view, each component would be recognised over the vesting period specific to that component.

10.1.3.B Settlement

At the date of settlement, the liability component is restated to fair value through profit or loss. If the counterparty elects for settlement in equity, the restated liability is transferred to equity as consideration for the equity instruments issued. If the liability is settled in cash, the cash is obviously applied to reduce the liability. [IFRS 2.39, IFRS 2.40]. In other words, if the transaction in Illustration 10-1 above had been settled in shares the accounting entry would have been:

Dr	Liability*	CU60,000	
	Cr Equity†		CU60,000

* There is no need to remeasure the liability in this case as it has already been stated at fair value at vesting date, which is the same as settlement date.

† The precise allocation of this amount within equity, and its impact on distributable reserves, will depend on a number of factors, including jurisdictional legal requirements, which are not discussed here.

If the transaction had been settled in cash the entry would simply have been:

Dr	Liability	CU60,000	
	Cr Cash		CU60,000

If the transaction is settled in cash, any amount taken to equity during the vesting period (CU7,600 in Illustration 10-1 above) is not adjusted. However, the entity may transfer it from one component of equity to another (see section 4.2 above). [IFRS 2.40].

10.1.4 Transactions with cash-settlement alternative for employee introduced after grant date

Such transactions are not specifically addressed in the main body of IFRS 2. However, IG Example 9 in the implementation guidance does address this issue, in the context of the rules for the modification of awards (discussed in sections 7.3 and 9.4 above). The substance of this example is reproduced as Illustration 10-2 below. [IFRS 2.IG Example 9].

Illustration 10-2: Award with employee cash-settlement alternative introduced after grant

At the beginning of year 1, the entity grants 10,000 shares with a fair value of CU33 per share to a senior executive, conditional upon the completion of three years' service. By the end of year 2, the fair value of the award has dropped to CU25 per share. At that date, the entity adds a cash alternative to the grant, whereby the executive can choose whether to receive 10,000 shares or cash equal to the value of 10,000 shares on vesting date. The share price is CU22 on vesting. The implementation guidance to IFRS 2 proposes the following approach.

For the first two years, the entity would recognise an expense of CU110,000 per year, (representing 10,000 shares \times CU33 \times 1/3), giving rise to the cumulative accounting entry by the end of year 2:

Dr	Profit or loss (employee costs)	CU220,000	
	Cr	Equity	CU220,000

The addition of a cash alternative at the end of year 2 constitutes a modification of the award, but does not increase the fair value of the award at the date of modification, which under either settlement alternative is CU250,000 (10,000 shares \times CU25), excluding the effect of the non-market vesting condition as required by IFRS 2.

The fact that the employee now has the right to be paid in cash requires the 'split accounting' treatment set out in section 10.1.2 above. Because of the requirement, under the rules for modification of awards (see section 7.3 above), to recognise at least the grant date fair value of the original award, a minimum fair value of CU330,000 has to be recognised over the vesting period.

At the modification date, a liability of CU166,667 (representing 2/3 of the CU250,000 fair value of the liability component at modification date) is recognised as a transfer from equity to liabilities, the entry being:

Dr	Equity	CU166,667	
	Cr	Liability	CU166,667

In year 3 an expense of CU110,000 is recognised as the final portion of the original grant date fair value. In addition to this, the liability is remeasured from its modification date value of CU250,000 (CU25 \times 10,000 shares) to its settlement date value of CU220,000 (CU22 \times 10,000 shares) resulting in a credit of CU30,000 to profit or loss. This results in the following accounting entry for the expense in year 3:

Dr	Profit or loss	CU80,000*	
	Cr	Liability	CU53,333†
	Cr	Equity	CU26,667‡

* $((10,000 \text{ shares} \times \text{CU33} \times 3/3) - (\text{CU220,000} \text{ expensed to date}))$ less the remeasurement of CU30,000.

† Carried forward liability CU220,000 (10,000 shares \times year 3 fair value CU22) less the brought forward liability CU166,667.

‡ Balancing figure.

The implementation guidance to IFRS 2 analyses the CU300,000 total expense over the three years as the grant date fair value of the award (CU330,000) less the movement in the fair value of the liability alternative (CU30,000, being the fair value of CU250,000 at the end of year 2 less the fair value of CU220,000 at vesting).

IG Example 9 only illustrates a situation where the grant date fair value of the equity-settled award exceeds the modification date fair value of both the equity and cash alternatives and the settlement date value of the cash alternative. In Illustration 9-4 in section 9.4.1 above we consider alternative scenarios, including one where the modification date fair value exceeds the grant date fair value.

10.1.5 'Backstop' cash settlement rights

Some schemes may provide cash settlement rights to the holder so as to cover more or less remote contingencies. For example, an employee whose nationality and/or country of permanent residence is different from the jurisdiction of the reporting entity may be offered the option of cash settlement in case unforeseen future events make the transfer of equity from the entity's jurisdiction, or the holding or trading of it in the employee's country, inconvenient or impossible.

If the terms of the award provide the employee with a general right of cash-settlement, IFRS 2 requires the award to be treated as cash-settled. This is the case even if the right of cash settlement is extremely unlikely to be exercised (e.g., because it would give rise to adverse tax consequences for the employee as compared with equity settlement). If, however, the right to cash-settlement is exercisable only in specific circumstances, a more detailed analysis may be required (see section 10.3 below).

10.1.6 Convertible bonds issued to acquire goods or services

In some jurisdictions entities issue convertible bonds to employees or other counterparties in exchange for goods or services. When this occurs, the bond will generally be accounted for under IFRS 2 rather than IAS 32 since it falls within the scope of IFRS 2 as a transaction "in which the entity receives or acquires goods or services and the terms of the arrangement provide either the entity or the supplier of those goods or services with a choice of whether the entity settles the transaction in cash (or other assets) or by issuing equity instruments" (see sections 2.2.1 and 2.2.2 above). [IFRS 2.2(c)].

As noted in section 10.1 above, the methodology for splitting such an instrument into its liability and equity components under IFRS 2 differs from that under IAS 32. Moreover, under IAS 32 a convertible instrument is (broadly) recognised at fair value on the date of issue, whereas under IFRS 2 the fair value is accrued over time if the arrangement includes the rendering of services after the date of grant.

It is therefore possible that, if an entity has issued to employees convertible bonds that have also been issued in the market, the accounting treatment of the bonds issued to employees will differ significantly from that of the bonds issued in the market.

Where a convertible instrument is issued to an employee, the IFRS 2 expense will be based on the fair value of the instrument. However, if an entity issues a convertible instrument to a non-employee in return for an asset, for example a property, the entity will initially recognise a liability component at fair value and an equity component based on the difference between the fair value of the property and the fair value of the liability component. [IFRS 2.35].

How we see it

Where an entity issues a convertible instrument to acquire property and the fair value of the property is lower than the fair value of the instrument as a whole then, in our view, the entity is required to recognise the shortfall in accordance with the requirements of IFRS 2 for unidentified goods or services. In the case of the acquisition of an asset, it is possible that this additional debit could be capitalised as part of the cost of the asset under IAS 16 *Property, Plant and Equipment* - but in other cases it would be expensed.

After the initial IFRS 2 accounting outlined above, the question arises as to whether the subsequent accounting for the convertible instrument must be in accordance with IFRS 2 or IFRS 9.

How we see it

In our view, the convertible instrument generally continues to be accounted for under IFRS 2 until shares or cash are delivered to the counterparty. However, if the vested convertible instrument were freely transferable or tradeable prior to conversion or settlement then a switch to IFRS 9 might be appropriate following transfer to a different counterparty (if considered practical to apply) - see also the discussion in section 2.2.2.E above.

10.2 Transactions where the entity has choice of settlement in equity or in cash

The accounting treatment for transactions where the entity has choice of settlement is quite different from transactions where the counterparty has choice of settlement, in that:

- Where the counterparty has choice of settlement, a liability component and an equity component are identified (see section 10.1 above).
- Where the entity has choice of settlement, the accounting treatment is binary - in other words the whole transaction is treated either as cash-settled or as equity-settled, depending on whether or not the entity has a present obligation to settle in cash, [IFRS 2.41], determined according to the criteria discussed in section 10.2.1 below.

10.2.1 Transactions treated as cash-settled

IFRS 2 requires a transaction to be treated as a liability (and accounted for using the rules for cash-settled transactions discussed in section 9 above) if:

- (a) The choice of settlement has no commercial substance (for example, because the entity is legally prohibited from issuing shares).
- (b) The entity has a past practice or stated policy of settling in cash.

Or

- (c) The entity generally settles in cash whenever the counterparty asks for cash settlement. [IFRS 2.41, IFRS 2.42].

These criteria are fundamentally different from those in IAS 32 for derivatives over own shares (which is what cash-settled share-based payment transactions are) not within the scope of IFRS 2. IAS 32 rejects an approach based on past practice or intention and broadly requires all derivatives over own equity that could result in an exchange by the reporting entity of anything other than a fixed number of shares for a fixed amount of cash to be treated as giving rise to a financial instrument (see Chapter 43).

An important practical effect of the IFRS 2 criteria is that some schemes that may appear at first sight to be equity-settled may in fact have to be treated as cash-settled. For example, if an entity has consistently adopted a policy of granting *ex gratia* cash compensation to all those deemed to be 'good' leavers (or all 'good' leavers of certain seniority) in respect of partially vested share options, such a scheme may well be treated as cash-settled for the purposes of IFRS 2 to the extent to which there are expected to be such 'good' leavers during the vesting period. 'Good leaver' arrangements are also discussed in section 5.3.9 above.

Another common example is that an entity may have a global share scheme with an entity option for cash settlement which it always exercises in respect of awards to employees in jurisdictions where it is difficult or illegal to hold shares in the parent. Such a scheme must be treated as a cash-settled scheme in respect of those jurisdictions. However, in our view, it would be appropriate to account for the scheme in other jurisdictions as equity-settled (provided of course that none of the criteria in (a) to (c) above applied in those jurisdictions).

How we see it

Where an entity has a global share scheme, classification of awards to employees must be based on whether the entity has a present obligation to settle in cash, which could be different for different jurisdictions, resulting in some of the awards accounted for as cash-settled and the remaining as equity-settled.

Where an entity has accounted for a transaction as cash-settled, IFRS 2 gives no specific guidance as to the accounting treatment on settlement, but it is clear from other provisions of IFRS 2 that the liability must be remeasured to fair value at settlement date and:

- If cash-settlement occurs, the cash paid is applied to reduce the liability.
- If equity-settlement occurs, the liability is transferred into equity (see section 10.1.3.B above).

10.2.1.A Entity choice has no substance due to economic or other compulsion for cash settlement (including unlisted entity awards with a presumption of cash settlement)

Some awards may nominally give the reporting entity the choice of settling in cash or equity, while in practice giving rise to an economic compulsion to settle only in cash. In addition to the examples mentioned in section 10.2.1 above, this will often be the case where an entity that is a subsidiary or owned by a small number of individuals, such as members of the same family, grants options to employees. In such cases there will normally be a very strong presumption that the entity will settle in cash in order to avoid diluting the existing owners' interests. Similarly, where the entity is not listed, there is little real benefit for an employee in receiving a share that cannot be realised except when another shareholder wishes to buy it or there is a change in ownership of the business as a whole.

How we see it

In our view, such schemes are generally most appropriately accounted for as cash-settled schemes from inception. In any event, once the scheme has been operating for a while, it is likely that there will be a past practice of cash settlement such that the scheme is required to be treated as a liability under the general provisions of IFRS 2 summarised above.

A similar conclusion is often reached even where the terms of the agreement do not appear to offer the entity a choice of settling the award in cash but it has established a constructive obligation or a past practice of so doing (see section 9.2.1 above).

10.2.2 Transactions treated as equity-settled

A transaction not meeting the criteria in section 10.2.1 above to be treated as cash-settled is required to be accounted for as an equity-settled transaction using the rules for such transactions discussed in sections 4 to 8 above. [IFRS 2.43].

However, when the transaction is settled the following approach is adopted:

- If the entity chooses to settle in cash, the cash payment is accounted for as the repurchase of an equity interest, i.e., as a deduction from equity, except as noted in (c) below.
- If the entity chooses to settle by issuing equity instruments, no further accounting is required (other than a transfer from one component of equity to another, if necessary), except as noted in (c) below.
- If the entity chooses the settlement alternative with the higher fair value, as at the date of settlement, the entity recognises an additional expense for the excess value given, i.e., the difference between the cash paid and the fair value of the equity instruments that would otherwise have been issued, or the difference between the fair value of the equity instruments issued and the amount of cash that would otherwise have been paid, whichever is applicable. [IFRS 2.43].

This is demonstrated in Illustrations 10-3 and 10-4 below.

Illustration 10-3: Settlement of transaction treated as equity-settled where fair value of cash settlement exceeds fair value of equity settlement

An entity has accounted for a share-based payment transaction where it has the choice of settlement as an equity-settled transaction, and has recognised a cumulative expense of CU1,000 based on the fair value at grant date.

At settlement date the fair value of the equity-settlement option is CU1,700 and that of the cash-settlement option CU2,000. If the entity settles in equity, no further accounting entry is required by IFRS 2. However, either at the entity's discretion or in compliance with local legal requirements, there may be a transfer within equity of the CU1,000 credited to equity during the vesting period.

If the entity settles in cash, the entity must recognise an additional expense of CU300, being the difference between the fair value of the equity-settlement option (CU1,700) and that of the cash-settlement option (CU2,000). The accounting entry is:

Dr	Profit or loss (employee costs)	CU300	
Dr	Equity	CU1,700	
	Cr	Cash	CU2,000

Illustration 10-4: Settlement of transaction treated as equity-settled where fair value of equity settlement exceeds fair value of cash settlement

As in Illustration 10-3, an entity has accounted for a share-based payment transaction where it has the choice of settlement as an equity-settled transaction, and has recognised a cumulative expense of CU1,000 based on the fair value at grant date.

In this case, however, at settlement date the fair value of the equity-settlement option is CU2,000 and that of the cash-settlement option CU1,700. If the entity chooses to settle in equity, it must recognise an additional expense of CU300, being the difference between fair value of the equity-settlement option (CU2,000) and that of the cash-settlement option (CU1,700). The accounting entry is:

Dr	Profit or loss (employee costs)	CU300	
	Cr	Equity	CU300

No further accounting entry is required by IFRS 2. However, either at the entity's discretion or in compliance with local legal requirements, there may be a transfer within equity of the CU1,300 credited during the vesting period and on settlement.

If the entity settles in cash, no extra expense is recognised, and the accounting entry is:

Dr	Equity	CU1,700	
	Cr	Cash	CU1,700

It can be seen in this case that, if the transaction is settled in equity, an additional expense is recognised. If, however, the transaction had simply been an equity-settled transaction (i.e., with no cash alternative), there would have been no additional expense on settlement and the cumulative expense would have been only CU1,000 based on the fair value at grant date.

10.2.3 Change in entity's settlement policy or intention leading to change in classification of award after grant date

IFRS 2 does not specify whether a transaction where the entity has a choice of settlement in equity or cash has to be assessed as equity-settled or cash-settled only at the inception of the transaction or also at each reporting date until it is settled.

However, in describing the accounting treatment IFRS 2 states several times that the accounting depends on whether the entity '*has a present obligation to settle in cash*' (our emphasis added). In our view, this suggests that IFRS 2 intends the position to be reviewed at each reporting date and not just considered at the inception of the transaction.

IFRS 2 does not specify how to account for a change in classification resulting from a change in the entity's policy or intention. In our view, the most appropriate treatment is to account for such a change as if it were a modification of the manner of settlement of the award (see section 9.4 above). Where the entity is able to choose the manner of settlement, the substance of the situation is the same as a decision to modify the manner of settlement of an award which does not already give the entity a choice. These situations are distinct from those where the manner of settlement depends on the outcome of a contingent event outside the entity's control (see section 10.3 below).

How we see it

As noted above, where the entity is able to choose the manner of settlement, we believe an entity continuously reviews at each reporting date whether the entity '*has a present obligation to settle in cash*'. Where there is a change in classification resulting from a change in the entity's policy or intention, the most appropriate treatment is to account for such a change as if it were a modification of the manner of settlement of the award (see section 9.4 above).

10.3 Awards requiring cash or equity settlement in specific circumstances (awards with contingent cash or contingent equity settlement)

This section is written with a focus on awards with contingent cash settlement. However, similar considerations will apply in a situation where it is the settlement in equity that depends on the outcome of circumstances outside the control of the entity or both the entity and the counterparty.

Rather than giving either the entity or the counterparty a general right to choose between equity- or cash-settlement, some awards require cash settlement in certain specific and limited circumstances but otherwise will be equity-settled. These arrangements are referred to by IAS 32 as contingent settlement provisions and are driven by the occurrence or non-occurrence of specific outcomes rather than by choice (see Chapter 43). In the absence of specific guidance in IFRS 2, questions then arise as to whether such an award must be accounted for as equity-settled or cash-settled and whether this must be re-assessed on an ongoing basis during the vesting period. This is a subject that has been considered by both the IFRS IC and the IASB and their discussions are considered further in section 10.3.5 below.

In the sections below we consider:

- Two different approaches to the assessment of awards with contingent cash settlement (see sections 10.3.1 to 10.3.2 below).
- Awards that require cash settlement on a change of control (see section 10.3.3 below).
- The accounting treatment for changes in the manner of settlement where the award is contingent on future events (see sections 10.3.4 and 10.3.5 below).

How we see it

In our view, in the absence of specific guidance in IFRS 2, the two different approaches set out in sections 10.3.1 and 10.3.2 below could be applied to awards which offer no choice in settlement but instead require cash settlement in certain specific and limited circumstances (i.e., awards with contingent cash settlement).

Equally, similar considerations will apply to awards which offer no choice in settlement but instead require equity settlement in certain specific and limited circumstances (i.e., awards with contingent equity settlement).

10.3.1 Approach 1 - Treat as cash-settled if contingency is outside entity's control

One approach might be to observe that the underlying principle that determines whether an award is accounted for as equity-settled or cash-settled under IFRS 2 appears to be whether the reporting entity can unilaterally avoid cash-settlement (see sections 10.1 and 10.2 above). Under this approach, any award where the counterparty has a right to cash-settlement is always treated as a liability, irrespective of the probability of cash-settlement, since there is nothing that the entity could do to prevent cash-settlement. By contrast, an award where the choice of settlement rests with the entity is accounted for as a liability only where the entity's own actions have effectively put it in a position where it has no real choice but to settle in cash.

Applying this approach, it is first of all necessary to consider whether the event that requires cash-settlement is one over which the entity has control. If the event, however unlikely, is outside the entity's control, then under this approach the award should be treated as cash-settled. However, if the event is within the entity's control, the award should be treated as cash-settled only if the entity has a liability by reference to the criteria summarised in sections 10.1 and 10.2 above.

Whilst, in our view, this is an acceptable accounting approach, it does not seem entirely satisfactory. For example, in a number of jurisdictions, it is common for an equity-settled share-based payment award to contain a provision to the effect that, if the employee dies in service, the entity will pay to the employee's estate the fair value of the award in cash. The analysis above would lead to the conclusion that the award must be classified as cash-settled, on the basis that it is beyond the entity's control whether or not an employee dies in service. This seems a somewhat far-fetched conclusion, and is moreover inconsistent with the accounting treatment that the entity would apply to any other death-in-service benefit under IAS 19. IAS 19 would generally require the entity to recognise a liability for such a benefit based on an actuarial estimate (see Chapter 31), rather than on a presumption that the entire workforce will die in service.

10.3.2 Approach 2 - Treat as cash-settled if contingency is outside entity's control and probable

It was presumably considerations such as those above that led the FASB to provide guidance for options or similar awards that are cash-settled in certain circumstances. ASC 718 states that a cash settlement feature that can be exercised only upon the occurrence of a contingent event that is outside the employee's control does not give rise to a liability until it becomes probable that that event will occur.²⁸

In our view, an approach based on the probability of a contingent event that is outside the control of both the counterparty and the entity is also acceptable under IFRS accounting standards and is frequently applied in practice. The implied rationale (by reference to IFRS literature) is that:

- IFRS 2 clearly notes a number of inconsistencies between IFRS 2 and IAS 32 (see section 1.4.1 above) and so there is no requirement to follow IAS 32 in respect of contingent cash settlement arrangements.
- It is therefore appropriate to have regard to the principles of IAS 37 in determining whether an uncertain future event gives rise to a liability. IAS 37 requires a liability to be recognised only when it is probable (i.e., more likely than not) to occur (see Chapter 27).

The impact of Approach 1 and Approach 2 can be illustrated by reference to an award that requires cash-settlement in the event of a change of control of the entity (see section 10.3.3 below).

10.3.3 Application of Approach 1 and Approach 2 to awards requiring cash settlement on a change of control

It is not uncommon for the terms of an award to provide for compulsory cash-settlement by the entity if there is a change of control of the reporting entity. Such a provision ensures that there is no need for any separate negotiations to buy out all employee options, so as to avoid non-controlling interests arising in the acquired entity when equity-settled awards are settled after the change of control.

The question of whether or not a change of control is within the control of the entity is a matter that has been the subject of much discussion in the context of determining the classification of certain financial instruments by their issuer, and is considered more fully in Chapter 43.

If the facts and circumstances of a particular case indicate that a change of control is within the entity's control, the conclusion under either Approach 1 or Approach 2 above would be that the award must be treated as cash-settled only if the entity has a liability by reference to the criteria summarised in section 10.2.1 above.

If, however, the change of control is not considered to be within the control of the reporting entity, the conclusion will vary depending on whether Approach 1 or Approach 2 is followed. Under Approach 1, an award requiring settlement in cash on a change of control outside the control of the entity would be treated as cash-settled, however unlikely the change of control may be. Under Approach 2 however, an award requiring settlement in cash on a change of control outside the control of the entity would be treated as cash-settled only if a change of control were probable.

A difficulty with Approach 2 is that it introduces rather bizarre inconsistencies in the accounting treatment for awards when the relative probability of their outcome is considered. As noted in section 10.1.5 above, an award that gives the counterparty an absolute right to cash-settlement is accounted for as a liability, however unlikely it is that the counterparty will exercise that right. Thus, under this approach, the entity could find itself in the situation where it treats:

- As a liability: an award with an unrestricted right to cash-settlement for the counterparty, where the probability of the counterparty exercising that right is less than 1%.
- But, as equity: an award that requires cash settlement in the event of a change of control which is assessed as having a 49% probability of occurring.

How we see it

In our view, an entity could adopt either of these accounting treatments (Approach 1 or Approach 2) as set out in sections 10.3.1 and 10.3.2 above, but must do so consistently and state its policy for accounting for such transactions if material having regard to the IASB's discussions in section 10.3.5 below.

28 ASC 718 - *Compensation - Stock Compensation* (formerly FAS123(R), *Share-Based Payment*), FASB, para. 718-10-25-11.

In selecting an accounting policy, an entity must however be aware of the IASB's discussions on whether an approach based on the 'probable' outcome be applied or whether an approach based on the accounting treatment for a compound instrument be used (see section 10.3.5 below).

There is further discussion in section 15.4 below of awards that vest or are exercisable on a flotation or change of control, including the question of whether a cash-settlement obligation rests with the entity itself or with other parties involved in the change of control (see section 15.4.6 below).

10.3.4 Accounting for change in manner of settlement where award is contingent on future events outside the control of the entity and the counterparty

When, under Approach 2 above, the manner of settlement of an award changes solely as a consequence of a re-assessment of the probability of a contingent event, there is neither settlement of the award nor modification of its original terms (see section 10.3.4.A below for discussion of awards that have also been modified). The terms of the award are such that there have been two potential outcomes, one equity-settled and one cash-settled, running in parallel since grant date. It is as if, in effect, the entity has simultaneously issued two awards, only one of which will vest.

At each reporting date the entity is required to assess which outcome is more likely and account for the award on an equity- or cash-settled basis accordingly.

How we see it

In our view, any adjustments arising from a switch between the cumulative amount for the cash-settled award and the cumulative amount for the equity-settled award is required to be taken to profit or loss in the current period. This is similar to the approach for an award with multiple independent vesting conditions (see section 6.3.6 above).

When applying an approach where the two outcomes have both been part of the arrangement from grant date, an entity measures the fair value of the equity-settled award only at the original grant date and there is no remeasurement of the equity-settled award on reassessment of the settlement method. As the cash-settled award would be remeasured on an ongoing basis, a switch in the manner of settlement during the period until the shares vest or the award is settled in cash could give rise to significant volatility in the cumulative expense. At the date of vesting or settlement, however, the cumulative expense will equate to either the grant date fair value of the equity-settled approach or the settlement value of the cash-settled approach depending on whether or not the contingent event has happened.

The situation discussed in this section (i.e., an arrangement with two potential outcomes from grant date because the manner of settlement is not within the control of either the entity or the counterparty) is not the same as an award where the manner of settlement is entirely within the entity's control. Where the entity has such control and therefore a choice of settlement, a change in the manner of settlement is treated as a modification with a potential catch-up adjustment through equity (see sections 9.4 and 10.2.3 above).

As noted in section 10.3.5 below, discussions by the IFRS IC indicated a preference for treating an award as equity-settled or cash-settled in its entirety, based on the probable outcome, rather than as a compound instrument, but subsequent discussions by the IASB were divided.

10.3.4.A Distinction between re-assessment of settlement method and modification of terms of award

Some awards include arrangements for contingent cash-settlement if an event outside the control of the entity and the counterparty, such as some forms of exit, has not happened within a certain timescale. During the initial period of such an arrangement there might be an expectation that the exit (or other event) will take place. In this case, the award would be treated as equity-settled using an approach based on the probability of this outcome, as outlined in section 10.3.4 above. However, if it is decided, close to the end of the period during which equity-settlement would apply, to modify the terms of the award so that this period is extended, the entity needs to re-assess the arrangement on both its original and modified terms.

It might therefore be the case that cash-settlement under the original terms of the award becomes the more likely outcome for a short time and that the entity has to switch the award from an equity-settled to a cash-settled basis in line with the guidance in section 10.3.4 above. If a modification is then made to extend the period during which the award can be equity-settled and hence the settlement in cash once again becomes less likely, the entity is required to then switch again to an equity-settled basis of accounting using modification accounting (see section 9.4.2 above).

10.3.5 Manner of settlement contingent on future events: discussions by the IASB and the IFRS IC

Following an earlier request to the IFRS IC for clarification on how share-based payment transactions must be classified and measured if the manner of settlement is contingent on either:

- A future event that is outside the control of both the entity and the counterparty
- Or

- A future event that is within the control of the counterparty

The IASB agreed that transactions in which the manner of settlement is contingent on future events should be considered together with other issues relating to IFRS 2 (see section 3.4 above).²⁹

Prior to discussion by the IASB, the IFRS IC discussed the matter again in May 2013, noting that IFRS 2.34 requires an entity to account on a cash-settled basis if, and to the extent that, the entity has incurred a liability to settle in cash or other assets. However, it was further noted that IFRS 2 only provides guidance where the entity or the counterparty has a choice of settlement and not where the manner of settlement is contingent on a future event that is outside the control of both parties. The IFRS IC also observed that it was unclear which other guidance within IFRS accounting standards and the *Conceptual Framework* would provide the best analogy to this situation. It was concluded that there was significant diversity in practice.³⁰

In September 2013, the IFRS IC noted that the results of additional outreach indicated that share-based payment transactions in which the manner of settlement is contingent on a future event within the control of the counterparty (but not the entity) are not significantly widespread and so the IFRS IC decided not to add this element of the original submission to its agenda.³¹

The IFRS IC also returned to the question of accounting when the manner of settlement is contingent on a future event that is outside the control of both the entity and the counterparty. It was noted that such arrangements are settled either in cash or in equity instruments in their entirety and that neither party to the arrangement has control over the manner of settlement. Accordingly, the IFRS IC observed that the share-based payment should be classified as either equity-settled or cash-settled in its entirety depending on which outcome is probable.

The IFRS IC also discussed the accounting for a change in classification of the transaction arising from a change in the more likely settlement method. A majority of the IFRS IC thought that there should be a cumulative adjustment recorded at the time of the change of classification, in such a way that the cumulative cost would be the same as if the change of classification had occurred at the inception of the arrangement (see section 10.3.4 above). The IFRS IC decided to recommend that the IASB make a narrow-scope amendment to IFRS 2 based on the approach above.³²

The IASB discussed these recommendations in February 2014. Some IASB members expressed concern over use of a 'probable' approach for deciding the classification of a share-based payment. They took the view that such share-based payment transactions were similar to those in which the counterparty has a choice of settlement method because the entity does not have the unconditional right to avoid delivering cash or other assets. Therefore, they considered that such arrangements should be accounted for, by analogy, in accordance with the compound instrument approach set out in IFRS 2.35-40, noting that this would also be consistent with the requirements for contingent settlement provisions in IAS 32.³³

The topic was discussed again by the IASB in April 2014 when, notwithstanding the diversity in practice, the Board decided not to propose an amendment to IFRS 2 for this issue. Some IASB members were concerned that the suggested amendment would introduce a principle for distinguishing between a liability and equity in IFRS 2 that would be inconsistent with the requirements of IAS 32 and also noted that the definition of a liability was being discussed as part of the *Conceptual Framework* project (see Chapter 2).³⁴

The IASB revised the *Conceptual Framework* in 2018 without addressing the above-mentioned issue; the boundary between liabilities and equity has been explored by the IASB in its research project on *Financial Instruments with Characteristics of Equity*, with an Exposure Draft issued in November 2023 (see section 1.4.1 above). Until such time as any revised guidance is issued, we expect Approach 1 or Approach 2, outlined in sections 10.3.1 and 10.3.2 above, to continue to be applied.

10.4 Cash settlement alternative where cash sum is not based on share price or value

Some awards may provide a cash-settlement alternative that is not based on the share price. For example, an employee might be offered a choice between 500 shares or CU1,000,000 on the vesting of an award. Whilst an award of CU1,000,000, if considered in isolation, would obviously not be a share-based payment transaction, it nevertheless falls within the scope of IFRS 2, rather than - say - IAS 19, if it is offered as an alternative to a transaction that is within the scope of IFRS 2. The Basis for Conclusions on IFRS 2 states that the cash alternative may be fixed or variable and, if variable, may be determinable in a manner that is related, or unrelated, to the price of the entity's shares. [IFRS 2.BC256].

11 Replacement share-based payment awards issued in a business combination

11.1 Background

It is frequently the case that an entity (A) acquires another (B) which, at the time of the business combination, has outstanding employee share options or other share-based awards. If no action were taken by A, employees of B would be entitled, once any vesting conditions had been satisfied, to shares in B. This is not a very satisfactory outcome for either party: A now has non-controlling (minority) shareholders in subsidiary B, which was previously wholly-owned, and the employees of B are the owners of unmarketable shares in an effectively wholly-owned subsidiary.

The obvious solution, adopted in the majority of cases, is for some mechanism to be put in place such that the employees of B end up holding shares in the new parent A. This can be achieved, for example, by:

- A granting options over its own shares to the employees of B in exchange for the surrender of the employees' options over the shares of B.
- Or
- Changing the terms of the options so that they are over a special class of shares in B which are mandatorily convertible into shares of A.

This raises the question of how such a substitution transaction is required to be accounted for in the consolidated financial statements of A (the treatment in the single entity financial statements of B is discussed in section 11.4 below).

IFRS 3 addresses the accounting treatment required in a business combination where an acquirer:

- Replaces acquiree awards on a mandatory basis (see section 11.2.1 below)
- Replaces acquiree awards on a voluntary basis, even if the acquiree awards would not expire as a consequence of the business combination (see section 11.2.2 below)
- Does not replace acquiree awards (see section 11.3 below)

Section 11 relates only to business combinations. Share-based payment arrangements in the context of group reorganisations are addressed in section 12.8 below.

11.2 Replacement awards in business combinations accounted for under IFRS 3

A more comprehensive discussion of the requirements of IFRS 3 may be found in Chapter 10.

IFRS 3 requires an acquirer to measure a liability or an equity instrument related to the replacement of an acquiree's share-based payment awards in accordance with IFRS 2, rather than in accordance with the general principles of IFRS 3. References to the 'fair value' of an award in the following discussion therefore mean the fair value determined under IFRS 2, for which IFRS 3 uses the term 'market-based measure'. The fair value measurement is to be made as at the acquisition date determined in accordance with IFRS 3.

[IFRS 3.30].

IFRS 3 notes that a transaction entered into by or on behalf of the acquirer or primarily for the benefit of the acquirer or the combined entity, rather than that of the acquiree (or its former owners) before the combination, is likely to be a transaction separate from the business combination itself. This includes a transaction that remunerates employees or former owners of the acquiree for future services. [IFRS 3.52]. Target entities will therefore need to consider carefully whether any modifications to existing share-based payment arrangements in the period leading up to the business combination are straightforward modifications by the target entity for its own benefit or that of its owners at the time (and hence fully within the scope of IFRS 2) or whether the changes need to be assessed under the guidance in IFRS 3 because they are for the benefit of the acquirer or the combined entity. The indicators in IFRS 3.B50 are required to be used to determine when the modification must be measured and recognised. [IFRS 3.B50].

The Application Guidance in Appendix B to IFRS 3 and the illustrative examples accompanying the standard explain how the general principle of paragraph 52 is to be applied to replacement share-based payment transactions. Essentially, however, IFRS 3 appears to view an exchange of share options or other share-based payment awards in conjunction with a business combination as a form of modification (see section 7.3 above). [IFRS 3.B56].

11.2.1 Awards that the acquirer is 'obliged' to replace

Where the acquirer is 'obliged' to replace the acquiree awards (see below), either all or a portion of the fair value of the acquirer's replacement awards forms part of the consideration transferred in the business combination. [IFRS 3.B56].

IFRS 3 regards the acquirer as 'obliged' to replace the acquiree awards if the acquiree or its employees have the ability to enforce replacement, for example if replacement is required by:

- The terms of the acquisition agreement.
 - The terms of the acquiree's awards.
- Or
- Applicable laws or regulations. [IFRS 3.B56].

The required treatment of replacement awards may be summarised as follows:

- (a) At the date of acquisition, the fair values of the replacement award and the original award are determined in accordance with IFRS 2.
- (b) The amount of the replacement award attributable to pre-combination service (and therefore included as part of the consideration transferred for the business) is determined by multiplying the fair value of the original award by the ratio of the vesting period completed, as at the date of the business combination, to the greater of:
 - The total vesting period, as determined at the date of the business combination (being the period required to satisfy all vesting conditions, including conditions added to, or removed from, the original award by the replacement award).

And

 - The original vesting period.
- (c) Any excess of the fair value of the replacement award over the amount determined in (b) above is recognised as a post-combination remuneration expense, in accordance with the normal principles of IFRS 2 (see sections 3 to 7 above). [IFRS 3.B57, IFRS 3.B59].

The requirements summarised in (a) to (c) above have the effect that any excess of the fair value of the replacement award over the original award is recognised as a post-combination remuneration expense. The requirement in (b) above has the effect that, if the replacement award requires service in the period after the business combination, an IFRS 2 cost is recognised in the post-combination period, even if the acquiree award being replaced had fully vested at the date of acquisition. It also has the effect that if a replacement award requires no service in the post-combination period, but the acquiree award being replaced would have done so, a cost must be recognised in the post-combination period. [IFRS 3.B59].

How we see it

There is no specific guidance in IFRS 3 on how and when to recognise the post-combination remuneration expense in the consolidated financial statements of the acquirer. In our view, the expense is recognised over the post-combination vesting period of the replacement award in accordance with the general principles of IFRS 2 (see sections 6.2 to 6.4 above).

The portions of the replacement award attributable to pre- and post-combination service calculated in (b) and (c) above are calculated, under the normal principles of IFRS 2, based on the best estimate of the number of awards expected to vest (or to be treated as vesting by IFRS 2). Rather than being treated as adjustments to the consideration for the business combination, any changes in estimates or forfeitures occurring after the acquisition date are reflected in remuneration cost for the period in which the changes occur in accordance with the normal principles of IFRS 2. Similarly, the effects of other post-acquisition events, such as modifications or the outcome of performance conditions, are accounted for in accordance with IFRS 2 as part of the determination of the remuneration expense for the period in which such events occur. [IFRS 3.B60]. The application of these requirements is discussed in more detail in section 11.2.3 below.

The requirements above to split an award into pre-combination and post-combination portions apply equally to equity-settled and cash-settled replacement awards. All changes after the acquisition date in the fair value of cash-settled replacements awards and their tax effects (recognised in accordance with IAS 12 *Income Taxes*) are recognised in the post-combination financial statements when the changes occur.

[IFRS 3.B61, IFRS 3.62].

How we see it

IFRS 3 does not specify where in the income statement any changes in the pre-combination element of a cash-settled award is to be reflected and, in the absence of clear guidance, an entity will need to consider whether this is remuneration expense or whether it is closer to a change in a liability for contingent consideration.

The treatment of the income tax effects of replacement share-based payment transactions in a business combination is discussed further in Chapter 29.

11.2.1.A Illustrative examples of awards that the acquirer is 'obliged' to replace

IFRS 3 provides some examples in support of the written guidance summarised above, the substance of which is reproduced as Illustrations 11-1 to 11-4 below. [IFRS 3.IE61-71]. These deal with the following scenarios.

Is post-combination service required for the replacement award?	Has the acquiree award being replaced vested before the combination?	Example
Not required	Vested	11-1
Not required	Not vested	11-2
Required	Vested	11-3
Required	Not vested	11-4

In all the examples, it is assumed that the replacement award is equity-settled.

Illustration 11-1: Replacement award requiring no post-combination service replacing vested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of CU1.1 million for awards of Entity B with a fair value at the acquisition date of CU1.0 million. No post-combination services are required for the replacement awards and Entity B's employees had rendered all of the required service for the acquiree awards as of the acquisition date.

The amount attributable to pre-combination service, and therefore included in the consideration transferred in the business combination, is the fair value of Entity B's awards at the acquisition date (CU1.0 million). The amount attributable to post-combination service is CU0.1 million, the difference between the total value of the replacement awards (CU1.1 million) and the portion attributable to pre-combination service (CU1.0 million). Because no post-combination service is required for the replacement awards, Entity A immediately recognises CU0.1 million as remuneration cost in its post-combination financial statements.

Illustration 11-2: Replacement award requiring no post-combination service replacing unvested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of CU1.0 million for awards of Entity B also with a fair value at the acquisition date of CU1.0 million. When originally granted, the awards of Entity B had a vesting period of four years and, as of the acquisition date, the employees of Entity B had rendered two years' service. The replacement award vests in full immediately.

The portion of the fair value of the replacement awards attributable to pre-combination services is the fair value of the award of Entity B being replaced (CU1 million) multiplied by the ratio of the pre-combination vesting period (two years) to the greater of the total vesting period (now two years) and the original vesting period of Entity B's award (four years). Thus, CU0.5 million ($CU1.0 \text{ million} \times 2/4 \text{ years}$) is attributable to pre-combination service and therefore included in the consideration transferred for the acquiree. The remaining CU0.5 million is attributable to post-combination service, but, because no post-combination service is required for the replacement award to vest, Entity A recognises the entire CU0.5 million immediately as remuneration cost in the post-combination financial statements.

Illustration 11-3: Replacement award requiring post-combination service replacing vested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of CU1.0 million for awards of Entity B also with a fair value at the acquisition date of CU1.0 million. The replacement awards require one year of post-combination service. The awards of Entity B being replaced had a vesting period of four years. As of the acquisition date, employees of Entity B holding unexercised vested awards had rendered a total of seven years of service since the grant date.

Even though the Entity B employees have already rendered all of the service for their original awards, Entity A attributes a portion of the replacement award to post-combination remuneration cost, because the replacement awards require one year of post-combination service. The total vesting period is five years - the vesting period for the original Entity B award completed before the acquisition date (four years) plus the vesting period for the replacement award (one year). The fact that the employees have rendered seven years of service in total in the pre-combination period is not relevant to the calculation because only four years of that service were necessary in order to earn the original award.

The portion attributable to pre-combination services equals the fair value of the award of Entity B being replaced (CU1 million) multiplied by the ratio of the pre-combination vesting period (four years) to the total vesting period (five years). Thus, CU0.8 million ($\text{CU1.0 million} \times 4/5 \text{ years}$) is attributed to the pre-combination vesting period and therefore included in the consideration transferred in the business combination. The remaining CU0.2 million is attributed to the post-combination vesting period and is recognised as remuneration cost in Entity A's post-combination financial statements in accordance with IFRS 2, over the remaining one-year vesting period.

Illustration 11-4: Replacement award requiring post-combination service replacing unvested acquiree award

Entity A acquires Entity B and issues replacement awards with a fair value at the acquisition date of CU1.0 million for awards of Entity B also with a fair value at the acquisition date of CU1.0 million. The replacement awards require one year of post-combination service. When originally granted, the awards of Entity B being replaced had a vesting period of four years and, as of the acquisition date, the employees had rendered two years' service.

The replacement awards require one year of post-combination service. Because employees have already rendered two years of service, the total vesting period is three years. The portion attributable to pre-combination services equals the fair value of the award of Entity B being replaced (CU1 million) multiplied by the ratio of the pre-combination vesting period (two years) to the greater of the total vesting period (three years) or the original vesting period of Entity B's award (four years). Thus, CU0.5 million ($\text{CU1.0 million} \times 2/4 \text{ years}$) is attributable to pre-combination service and therefore included in the consideration transferred for the acquiree. The remaining CU0.5 million is attributable to post-combination service and therefore recognised as remuneration cost in Entity A's post-combination financial statements, over the remaining one-year vesting period.

11.2.2 Acquiree awards that the acquirer is not 'obliged' to replace

IFRS 3 notes that, in some situations, acquiree awards may expire as a consequence of a business combination. In such a situation, the acquirer might decide to replace those awards even though it is not obliged to do so. It might also be the case that the acquirer decides voluntarily to replace awards that would not expire and which it is not otherwise obliged to replace.

Under IFRS 3 there is no difference in the basic approach to accounting for a replacement award that the acquirer is obliged to make and one that it makes on a voluntary basis (i.e., the approach is as set out in section 11.2.1 above). In other words, the accounting is based on the fair value of the replacement award at the date of acquisition, with an apportionment of that amount between the cost of acquisition and post-acquisition employment expense.

This approach would equally apply in a reverse acquisition by the accounting acquirer, absent any legal modification to the terms of the accounting acquiree's awards; it is as if the accounting acquiree's awards have been exchanged for a share-based payment award of the accounting acquirer. The fair value of accounting acquiree's share-based payment awards at the acquisition date is apportioned between the cost of the business combination and remuneration cost in the post-combination financial statements, i.e., the approach is as set out in section 11.2.1 above (see Chapter 10). [IFRS 2.5, IFRS 3.52(b)].

However, in situations where the acquiree awards would expire as a consequence of the business combination if they were not voluntarily replaced by the acquirer, none of the fair value of the replacement awards is treated as part of the consideration transferred for the business (and therefore included in the computation of goodwill), but the full amount is instead recognised as a remuneration cost in the post-combination financial statements. The IASB explains that this is because the new award by the acquirer can only be for future services to be provided by the employee as the acquirer has no obligation to the employee in respect of past services. [IFRS 3.B56, IFRS 3.BC311B].

11.2.3 Accounting for changes in vesting assumptions after the acquisition date

Whilst the requirements outlined in section 11.2.1 above to reflect changes in assumptions relating to the post-acquisition portion of an award through post-combination remuneration appear consistent with the general principles of IFRS 2 and IFRS 3, the application of the requirements to the pre-combination portion is less straightforward.

Paragraph B60 of IFRS 3 appears to require all changes to both the pre- and post-combination portions of the award to be reflected in post-combination remuneration expense. [IFRS 3.B60]. This could lead to significant volatility in post-combination profit or loss as a consequence of forfeitures, or other changes in estimates, relating to awards accounted for as part of the consideration for the business combination.

A second approach relies on a combination of paragraphs B60 and B63(d). Whilst paragraph B60 is clear that no adjustment can be made to the purchase consideration, paragraph B63(d) refers to IFRS 2 providing “guidance on subsequent measurement and accounting for *the portion of replacement share-based payment awards ... that is attributable to employees’ future services*” (emphasis added). [IFRS 3.B60, IFRS 3.B63(d)]. Supporters of this view therefore argue that the remeasurement requirements of paragraph B60 apply only to the portion of the replacement award that is attributed to future service and that the award is required to be split into two parts:

- A pre-combination element that is treated as if it were vested at the acquisition date and then accounted for in the same way as other contingent consideration settled in equity.
- A post-combination portion that is treated as a new award and reflects only the employees’ post-combination service.

A third approach is based on the guidance in IFRS 3.B59 which states that “the acquirer attributes any excess of the market-based measure of the replacement award over the market-based measure of the acquiree award to post-combination service and recognises that excess as remuneration cost in the post-combination financial statements”. [IFRS 3.B59]. As for the second approach above, the pre-combination element is considered to be fixed and cannot be reversed. However, any subsequent changes in assumptions that give rise to an incremental expense over the amount recognised as pre-combination service must be recognised as part of the post-combination remuneration expense.

Whilst the second and third approaches above are more consistent with the general requirement under IFRS 2 that vested awards must not be adjusted, the first approach, based on paragraph B60, is arguably the most obvious reading of IFRS 3.

How we see it

In the absence of clear guidance in the standard, we believe that an entity could make an accounting policy choice between the three approaches noted above, but once chosen, the policy must be applied consistently.

The three approaches are demonstrated in Illustration 11-5 below.

Illustration 11-5: Accounting for post-acquisition changes in estimates relating to replacement awards

Entity A grants an award of 1,000 shares to each of two employees. The award will vest after three years provided the employees remain in service. At the end of year 2, Entity A is acquired by Entity B which replaces the award with one over its own shares but otherwise on the same terms. The fair value of each share at the date of acquisition is CU1. At this date, Entity B estimates that one of the two employees will leave employment before the end of the remaining one-year service period.

At the date of acquisition, Entity B recognises CU667 ($1 \text{ employee} \times 1,000 \text{ shares} \times \text{CU1} \times 2/3$) as part of the consideration for the business combination and expects to recognise a further CU333 as an expense through post-acquisition profit or loss ($1 \times 1,000 \times \text{CU1} \times 1/3$).

However, if the estimates made as at the date of the acquisition prove to be inaccurate and either both employees leave employment during year 3, or both remain in employment until the vesting date, there are three alternative approaches to the accounting as explained above:

- Approach 1 - all changes in estimates are reflected in post-acquisition profit or loss (drawing on IFRS 3.B60).
- Approach 2 - changes to the estimates that affect the amount recognised as part of the purchase consideration are not adjusted for and changes affecting the post-acquisition assumptions are adjusted through post-acquisition profit or loss (drawing on IFRS 3.B63(d)).
- Approach 3 - the amount attributable to pre-combination service, and treated as part of the business combination, is fixed and cannot be reversed. However, any changes in assumptions that give rise to an additional cumulative expense are reflected through post-acquisition profit or loss (drawing on IFRS 3.B59).

Using the fact pattern above, and assuming that both employees leave employment in the post-acquisition period, the three alternative approaches would give rise to the following entries in accounting for the forfeitures:

- Approach 1 - a credit of CU667 to post-acquisition profit or loss to reflect the reversal of the amount charged to the business combination. In addition to this, any additional expense that had been recognised in the post-acquisition period would be reversed.
- Approaches 2 and 3 - the reversal through post-acquisition profit or loss of any additional expense that had been recognised in the post-acquisition period.

If, instead, both employees remained in employment in the post-acquisition period and both awards vested, the three alternative approaches would give rise to the following entries:

- Approach 1 - an expense of CU1,333 through post-acquisition profit or loss to reflect the remaining CU333 fair value of the award to the employee who was expected to remain in service plus CU1,000 for the award to the employee who was not expected to remain in service.
- Approach 2 - an expense of CU666 ($2 \times \text{CU333}$) through post-acquisition profit or loss for the remaining $\frac{1}{3}$ of the acquisition date fair value of the two awards. There is no adjustment to the business combination or to post-acquisition profit or loss for the CU667 pre-acquisition element of the award that, as at the acquisition date, was not expected to vest.
- Approach 3 - an expense of CU1,333 through post-acquisition profit or loss to reflect the remaining CU333 fair value of the award to the employee who was expected to remain in service plus CU1,000 for the award to the employee who was not expected to remain in service.

11.3 Acquiree award not replaced by acquirer

It may occasionally happen that the acquirer does not replace awards of the acquiree at the time of the acquisition. This might be the case where, for example, the acquired subsidiary is only partly-owned and is itself listed.

IFRS 3 distinguishes between vested and unvested share-based payment transactions of the acquiree that are outstanding at the date of the business combination but which the acquirer chooses not to replace.

If vested, the outstanding acquiree share-based payment transactions are treated by the acquirer as part of the non-controlling interest in the acquiree and measured at their IFRS 2 fair value at the date of acquisition.

If unvested, the outstanding share-based payment transactions are fair valued in accordance with IFRS 2 as if the acquisition date were the grant date. The fair value must be allocated to the non-controlling interest in the acquiree on the basis of the ratio of the portion of the vesting period completed to the greater of:

- The total vesting period
- And
- The original vesting period of the share-based payment transactions

The balance is treated as a post-combination remuneration expense in accordance with the general principles of IFRS 2. [IFRS 3.B62A, IFRS 3.B62B]. Forfeitures in the post-combination period will need to be assessed in accordance with the approaches set out in section 11.2.3 above.

11.4 Financial statements of the acquired entity

The replacement of an award based on the acquiree's equity with one based on the acquirer's equity is, from the perspective of the acquired entity, a cancellation and replacement, to be accounted for in accordance with the general principles of IFRS 2 for such transactions (see section 7.4 above). However, in addition to considerations about whether this is accounted for as a separate cancellation and new grant or as a modification of the original terms, the acquiree needs to take into account its new status as a subsidiary of the acquirer.

If the acquirer is responsible for settling the award in its own equity with the acquiree's employees, the acquiree will continue to account for the award on an equity-settled basis. If, however, the acquiree is responsible for settling the award with shares of the acquirer, then the acquiree would have to switch from an equity-settled basis of accounting to a cash-settled basis of accounting (see sections 2.2.2.A and 9.4.1 above). *[IFRS 2.43B, IFRS 2.B52(b), IFRS 2.B55]*.

Even if the acquiree continues to account for the award on an equity-settled basis, the share-based payment expense recorded in the consolidated financial statements (based on fair value at the date of the business combination) will generally not be the same as that in the financial statements of the acquired entity (based on fair value at the date of original grant plus any incremental value granted at the date of acquisition, if modification accounting is applied). The exact timing of the recognition of the expense in the financial statements of the acquired entity after the date of cancellation and replacement will depend on its interpretation of the requirements of IFRS 2 for the cancellation and replacement of options (see Illustration 7-12 in section 7.4.4.B above).

12 Group share schemes

In this section we consider various aspects of share-based payment arrangements operated within a group and involving several legal entities. The focus of the section is on the accounting by the various parties involved and includes several comprehensive illustrative examples. The main areas covered are as follows:

- Typical features of a group share scheme (see section 12.1 below).
- A summary of the accounting treatment of group share schemes (see section 12.2 below).
- Employee benefit trusts ('EBTs') and similar vehicles (see section 12.3 below).
- An example of a group share scheme (based on an equity-settled award satisfied by a market purchase of shares) illustrating the accounting by the different entities involved (see section 12.4 below).
- An example of a group share scheme (based on an equity-settled award satisfied by a fresh issue of shares) illustrating the accounting by the different entities involved (see section 12.5 below).
- An example of a group cash-settled transaction where the award is settled by an entity other than the one receiving goods or services (see section 12.6 below).
- The accounting treatment when an employee transfers between group entities (see section 12.7 below).
- Group reorganisations (see section 12.8 below).

Whilst associates and joint arrangements accounted for as joint ventures do not meet the definition of group entities, there will sometimes be share-based payment arrangements that involve the investor or venturer and the employees of its associate or joint venture. These arrangements are discussed in section 12.9 below.

12.1 Typical features of a group share scheme

In this section we use the term 'share scheme' to encompass any transaction falling within the scope of IFRS 2, whether accounted for as equity-settled or cash-settled.

It is common practice for a group to operate a single share scheme covering several subsidiaries. Depending on the commercial needs of the entity, the scheme might cover all group entities, all group entities in a particular country or all employees of a particular grade throughout a number of subsidiaries. The precise terms and structures of group share schemes are so varied that it is rare to find two completely identical arrangements. From an accounting perspective, however, group share schemes can generally be reduced to a basic prototype, as described below, which will serve as the basis of the discussion.

A group scheme typically involves transactions by several legal entities:

- The parent, over whose shares awards are granted.
- The subsidiary employing an employee who has been granted an award ('the employing subsidiary').
- The trust that administers the scheme. Such trusts are known by various names in different jurisdictions, but, for the sake of convenience, in this section we will use the term 'EBT' ('employee benefit trust') to cover all such vehicles by whatever name they are actually known. The accounting treatment of transactions with EBTs is discussed in section 12.3 below.

In practice, it might not always be a simple assessment to determine which entity is receiving an employee's services and which entity is responsible for settling the award. For example, the scheme may be directed by a group employee services entity or an individual might be a director of the parent as well as providing services to other operating entities within the group.

Where an employee services company is involved, it will be necessary to evaluate the precise group arrangements in order to decide whether that entity is, in substance, the employer or whether the entity or entities to which it makes a recharge for an individual's services must be treated as the employer(s). It will also often be the case that the services company is simply administering the arrangements on behalf of the parent entity.

How we see it

Where an individual provides services to more than one group entity, an assessment will need to be made as to which entity or entities are receiving the individual's services in return for the award (e.g., the employee service company or the entity or entities the service company makes a charge for an individual's services). This will depend on the precise facts and circumstances of a particular situation.

A share-based award is often granted to an employee by the parent, or a group employee services entity, which will in turn have an option exercisable against the EBT for the shares that it may be required to deliver to the employee. Less commonly, the trustees of the EBT make awards to the employees and enter into reciprocal arrangements with the parent.

If the parent takes the view that it will satisfy any awards using existing shares it will often seek to fix the cash cost of the award by arranging for the EBT to purchase in the market, on the day that the award is made, sufficient shares to satisfy all or part of the award. This purchase will be funded by external borrowings, a loan from the parent, a contribution from the employing subsidiary, or some combination. The cash received from the employee on exercise of the option can be used by the EBT to repay any borrowings.

If the parent takes the view that it will satisfy the options with a fresh issue of shares, these will be issued to the EBT, either:

- (a) At the date on which the employee exercises his option (in which case the EBT will subscribe for the new shares using the cash received from the employee together with any non-refundable contribution made by the employing subsidiary - see below). Such arrangements are generally referred to as 'simultaneous funding'.
- (b) At some earlier date (in which case the EBT will subscribe for the new shares using external borrowings, a loan from the parent or a contribution from the employing subsidiary, or some combination. The cash received from the employee on exercise of the option may then be used by the EBT to repay any borrowings). Such arrangements are generally referred to as 'pre-funding'.

Or

- (c) Some shares will be issued before the exercise date as in (b) above, and the balance on the exercise date as in (a) above.

As noted in (a) above, the employing subsidiary often makes a non-refundable contribution to the EBT in connection with the scheme, so as to ensure that employing subsidiaries bear an appropriate share of the overall cost of a group-wide share scheme.

12.2 Accounting treatment of group share schemes - summary

12.2.1 Background

From a financial reporting perspective, it is generally necessary to consider the accounting treatment in:

- The group's consolidated financial statements
- The parent's separate financial statements
- The employing subsidiary's financial statements

We make the assumption throughout section 12 that the subsidiary is directly owned by the parent company. In practice, there will often be one or more intermediate holding companies between the ultimate parent and the subsidiary. The intermediate parent company generally will not be the entity granting the award, receiving the goods or services or responsible for settling the award. Therefore, under IFRS 2, we believe that there is no requirement for the intermediate company to account for the award in its separate or individual financial statements (although it might choose to recognise an increase in its investment in the subsidiary and a corresponding capital contribution from the ultimate parent in order for the transaction to be reflected throughout the chain of companies).

The accounting entries to be made in the various financial statements will broadly vary according to:

- Whether the award is satisfied using shares purchased in the market or a fresh issue of shares.
- Whether any charge is made to the employing subsidiary for the cost of awards to its employees.
- Whether an employee benefit trust (EBT) is involved. The accounting treatment of transactions undertaken with and by EBTs is discussed in more detail in section 12.3 below.
- The tax consequences of the award. However, for the purposes of the discussion and illustrative examples below, tax effects are ignored, since these will vary significantly by jurisdiction. A more general discussion of the tax effects of share-based payment transactions may be found in section 14 below and in Chapter 29.

How we see it

As noted above, we believe there is no requirement under IFRS 2 for the intermediate company to account for the award in its separate or individual financial statements as it generally will not be the entity granting the award, receiving the goods or services or responsible for settling the award.

12.2.2 Scope of IFRS 2 for group share schemes

By virtue of the definition of 'share-based payment transaction' (see sections 2.2.1 and 2.2.2.A above), a group share-based payment transaction is in the scope of IFRS 2 for:

- The consolidated financial statements of the group (the accounting for which follows the general principles set out in sections 3 to 10 above).
- The separate or individual financial statements of the entity in the group that receives goods or services (see section 12.2.3 below).
- The separate or individual financial statements of the entity in the group (if different from that receiving the goods or services) that settles the transaction with the counterparty. This entity will typically, but not necessarily, be the parent (see section 12.2.4 below).

IFRS 2 provides further guidance on the application of its general principles to:

- Transactions settled in the equity of the entity, or in the equity of its parent (see section 12.2.5 below).
- Cash-settled transactions settled by a group entity other than the entity receiving the goods or services (see section 12.2.6 below).

In section 2.2.2.A above we consider seven scenarios commonly found in practice and outline the approach required by IFRS 2 in the consolidated and separate or individual financial statements of group entities depending on whether the award is settled in cash or shares and which entity grants the award, has the obligation to settle the award and receives the goods or services.

It is common practice in a group share scheme to require each participating entity in the group to pay a charge, either to the parent or to an EBT, in respect of the cost of awards made under the scheme to employees of that entity. This is generally done either as part of the group's cash-management strategy, or in order to obtain tax relief under applicable local legislation. The amount charged could in principle be at the discretion of the group, but is often based on either the fair value of the award at grant date or the fair value at vesting, in the case of an award of free shares, or exercise, in the case of an award of options.

IFRS 2 does not directly address the accounting treatment of such intragroup management charges and other recharge arrangements, which is discussed further in section 12.2.7 below. [IFRS 2.B45, IFRS 2.B46].

Worked examples illustrating how these various principles translate into accounting entries are given in sections 12.4 to 12.6 below.

12.2.3 Entity receiving goods or services

The entity in a group receiving goods or services in a share-based payment transaction determines whether the transaction must be accounted for, in its separate or individual financial statements, as equity-settled or cash-settled. It does this by assessing the nature of the awards granted and its own rights and obligations. [IFRS 2.43A].

The entity accounts for the transaction as equity-settled when either the awards granted are the entity's own equity instruments, or the entity has no obligation to settle the share-based payment transaction. Otherwise, the entity accounts for the transaction as cash-settled. Where the transaction is accounted for as equity-settled it is remeasured after grant date only to the extent permitted or required by IFRS 2 for equity-settled transactions generally, as discussed in sections 3 to 7 above. [IFRS 2.43B].

IFRS 2 notes that a possible consequence of these requirements is that the amount recognised by the entity may differ from the amount recognised by the consolidated group or by another group entity settling the share-based payment transaction. [IFRS 2.43A]. This is discussed further in section 12.6 below.

The cost recognised by the entity receiving goods or services is always calculated according to the principles set out above, regardless of any intragroup recharging arrangement. [IFRS 2.43D, IFRS 2.B45]. The accounting for such arrangements is discussed in section 12.2.7 below.

12.2.4 Entity settling the transaction

A group entity which settles a share-based payment transaction in which another group entity receives goods or services accounts for the transaction as an equity-settled share-based payment transaction only if it is settled in the settling entity's own equity instruments. Otherwise, the transaction is accounted for as cash-settled. [IFRS 2.43C].

IFRS 2 specifies only the credit entry - the classification of the transaction as equity- or cash-settled, and its measurement. IFRS 2 does not specify the debit entry, which is therefore subject to the general requirement of IFRS 2 that a share-based payment transaction must normally be treated as an expense, unless there is the basis for another treatment under other IFRS accounting standards (see section 3 above).

In our view, the settling entity is not always required to treat the transaction as an expense:

- Where the settling entity is a parent (direct or indirect) of the entity receiving the goods or services and is accounting for the transaction as equity-settled, it will generally account for the settlement under IAS 27 *Separate Financial Statements*, as an addition to the cost of its investment in the employing subsidiary (or of that holding company of the employing subsidiary which is the settling entity's directly-held subsidiary). [IFRS 2.B45]. It may then be necessary to review the carrying value of that investment to ensure that it is not impaired.
- Where the settling entity is a parent (direct or indirect) of the entity receiving the goods or services and is accounting for the transaction as cash-settled (whereas the subsidiary will be accounting for the transaction as equity-settled), in our view it has an accounting policy choice for the treatment of the remeasurement of the cash-settled liability. Either:
 - It accounts for the entire award as part of the contribution to the subsidiary and therefore as an addition to the cost of its investment in the employing subsidiary (or of that holding company of the employing subsidiary which is the settling entity's directly-held subsidiary).
 - Or
 - After the initial capitalisation of the grant date fair value of the liability, it remeasures the liability through profit or loss.

Whichever policy is chosen, it may then be necessary to review the carrying value of the investment to ensure that it is not impaired.

- In other cases (i.e., where the settling entity is a subsidiary (direct or indirect) or fellow subsidiary of the entity receiving the goods or services), the settlement is treated as a distribution, and charged it directly to equity. Whether or not such a settlement is a legal distribution is a matter of law in the jurisdiction concerned.

How we see it

As noted above, the debit entry depends on the classification of the award and which entity is settling the award in the group; parent or another entity. If the settling entity is the parent of the entity receiving the goods or services; in an equity-settled transaction - the debit is recognised as an addition to the cost of investment, in a cash-settled transaction - there is an accounting policy choice for the treatment of the remeasurement of the cash-settled liability.

If the settling entity is not the parent (i.e., direct or indirect subsidiary or fellow subsidiary, of the entity receiving the goods or services), the settlement is treated as a distribution, and charged directly to equity.

We adopt the approach of full capitalisation by the parent entity in the worked examples set out in sections 12.4 to 12.6 below.

12.2.5 Transactions settled in equity of the entity or its parent

12.2.5.A Awards settled in equity of subsidiary

Where a subsidiary grants an award to its employees and settles it in its own equity, the subsidiary accounts for the award as equity-settled.

The parent accounts for the award as equity-settled in its consolidated financial statements. In its separate financial statements, the parent is not required by IFRS 2 to account for the award. In both cases, the transaction may have implications for other aspects of the financial statements, since its settlement results in the partial disposal of the subsidiary (see Chapter 8).

Where the parent is responsible for settling the award, it accounts for the transaction as equity-settled in its consolidated financial statements. In its separate financial statements, however, it accounts for the award as cash-settled, since it is settled not in its own equity, but in the equity of the subsidiary. From the perspective of the parent's separate financial statements, the equity of a subsidiary is a financial asset. *[IFRS 2.B50].*

12.2.5.B Awards settled in equity of the parent

Where the parent grants an award directly to the employees of a subsidiary and settles it in its own equity, the subsidiary accounts for the award as equity-settled, with a corresponding increase in equity as a contribution from the parent. *[IFRS 2.B53].*

The parent accounts for the award as equity-settled in both its consolidated and separate financial statements. *[IFRS 2.B54].*

Where a subsidiary grants an award of equity in its parent to its employees and settles the award itself, it accounts for the award as cash-settled, since it is settled not in its own equity, but in the equity of its parent. From the perspective of the subsidiary's separate or individual financial statements, the equity of the parent is a financial asset. *[IFRS 2.B55].*

This requirement potentially represents something of a compliance burden. For the purposes of the parent's consolidated financial statements the fair value of the award needs to be calculated once, at grant date. For the purposes of the subsidiary's financial statements, however, IFRS 2 requires the award to be accounted for as cash-settled, with the fair value recalculated at each reporting date.

It is, however, important to note that IFRS 2 requires this accounting treatment only for a subsidiary that 'grants' such an award. *[IFRS 2.B52, IFRS 2.B53, IFRS 2.B55].* In some jurisdictions it is normal for grants of share awards to be made by the parent, or an employee service company or EBT, rather than by the subsidiary, although the subsidiary may well make recommendations to the grantor of the award as to which of its employees should benefit.

In those cases, the fact that the subsidiary may communicate the award to the employee does not necessarily mean that the subsidiary itself has granted the award. It may simply be notifying the employee of an award granted by another group entity and which the other group company has the obligation to settle. In that case the subsidiary must apply the normal requirement of IFRS 2 to account for the award as equity-settled.

12.2.6 Cash-settled transactions not settled by the entity receiving goods or services

IFRS 2 considers arrangements in which the parent has an obligation to make cash payments to the employees of a subsidiary linked to the price of either:

- The subsidiary's equity instruments
- Or
- The parent's equity instruments

In both cases, the subsidiary has no obligation to settle the transaction and therefore accounts for the transaction as equity-settled, recognising a corresponding credit in equity as a contribution from its parent.

The subsidiary then subsequently remeasures the cost of the transaction only for any changes resulting from non-market vesting conditions not being met in accordance with the normal provisions of IFRS 2 discussed in sections 3 to 6 above. IFRS 2 points out that this will differ from the measurement of the transaction as cash-settled in the consolidated financial statements of the group. *[IFRS 2.B56, IFRS 2.B57].*

In both cases, the parent has an obligation to settle the transaction in cash. Accordingly, the parent accounts for the transaction as cash-settled in both its consolidated and separate financial statements. *[IFRS 2.B58].*

The requirement for the subsidiary to measure the transaction as equity-settled is somewhat controversial. The essential rationale for requiring the subsidiary to record the cost of a share-based payment transaction settled by its parent is to reflect that the subsidiary is effectively receiving a capital contribution from its parent.

The IASB specifically considered whether it would be more appropriate to measure that contribution by reference to the cash actually paid by the parent, but concluded that the approach adopted in IFRS 2 better reflects the perspective of the subsidiary as a separate reporting entity. An accounting treatment based on the cash paid by the parent would, in the IASB's view, reflect the perspective of the parent rather than that of the subsidiary. *[IFRS 2.BC268H-268K].*

12.2.7 Intragroup recharges and management charges

As noted in section 12.2.3 above, the cost recognised by a subsidiary receiving goods or services in a share-based payment transaction among group entities is based on the principles in paragraph 43B regardless of intergroup recharge arrangements. [IFRS 2.43D]. In addition, as noted in section 12.2.2 above, IFRS 2 does not deal specifically with the accounting treatment of intragroup recharges and management charges that may be levied within the group on the subsidiary that receives goods or services, the consideration for which is equity instruments or cash provided by another group entity.

The timing of the recognition of intercompany recharges was considered by the IFRS IC in 2013 (see section 12.2.7.A below).

The accounting requirements of IFRS 2 for group share schemes derive from IFRIC 11 (now incorporated within IFRS 2 see section 1.2 above), which was based on an exposure draft (D17) published in 2005.

D17 proposed that any such payment made by a subsidiary is charged directly to equity, on the basis that it represents a return of the capital contribution recorded as the credit to equity required by IFRS 2 (see sections 12.2.3 and 12.2.6 above) up to the amount of that contribution, and a distribution thereafter.³⁵

How we see it

In our view, whilst IFRS 2 as currently drafted does not explicitly require the accounting set out in D17 for the subsidiary, this is likely to be the more appropriate analysis for most cases where the amount of the recharge or management charge to a subsidiary is directly related to the value of the share-based payment transaction. Indeed, the only alternative, 'mechanically' speaking, would be to charge the relevant amount to profit or loss. This would result in a double charge (once for the IFRS 2 charge, and again for the management charge or recharge) which we consider not only less desirable for most entities, but also less appropriate in cases where the amounts are directly related.

In the Illustrations in sections 12.4 to 12.6 below, we apply the treatment originally proposed in D17 to any payments made by the subsidiary for participation in the group scheme.

Many intragroup recharge arrangements are based directly on the value of the underlying share-based payment - typically at grant date, vesting date or exercise date. In other cases, a more general management charge might be levied that reflects not just share-based payments but also a number of other arrangements or services provided to the subsidiary by the parent. Where there is a more general management charge of this kind, we believe that it is more appropriate for the subsidiary to recognise a double charge to profit or loss (once for the IFRS 2 charge, and again for the management charge) rather than debiting the management charge to equity as would be the case for a direct recharge.

IFRS 2 also does not address how the parent must account for a recharge or management charge received. In our view, to the extent that the receipt represents a return of a capital contribution made to the subsidiary, the parent may choose whether to credit:

- The carrying amount of its investment in the subsidiary
- Or
- Profit or loss (with a corresponding impairment review of the investment)

Even if part of the recharge received is credited to the carrying amount of the investment, any amount received in excess of the capital contribution previously debited to the investment in subsidiary must be accounted for as a distribution from the subsidiary and credited to the income statement of the parent. Where applicable, the Illustrations in sections 12.4 to 12.6 below show the entire amount as a credit to the income statement of the parent rather than part of the recharge being treated as a credit to the parent's investment in its subsidiary.

The treatment of a distribution from a subsidiary in the separate financial statements of a parent is more generally discussed in Chapter 9.

How we see it

In the absence of guidance in IFRS 2 on accounting by the parent for a recharge or management charge received, in our view, to the extent that the receipt represents a return of a capital contribution made to the subsidiary, the parent could choose whether to credit the carrying amount of its investment in subsidiary (up to the capital contribution previously debited to the carrying amount of investment) with the excess recognised in profit or loss or the full receipt recognised in profit or loss.

³⁵ D17 -IFRS 2 - Group and Treasury Share Transactions, IASB, 2005, para. IE5.

A further issue that arises in practice is the timing of recognition of the recharge by the parties to the arrangement. The treatment adopted might depend to some extent on the precise terms and whether there are contractual arrangements in place, but two approaches generally result in practice:

- To account for the recharge when it is actually levied or paid (which is consistent with accounting for a distribution).
- Or
- To accrue the recharge over the life of the award or the recharge agreement even if, as is commonly the case, the actual recharge is only made at vesting or exercise date.

An entity must choose the more appropriate treatment for its particular circumstances. The first approach is often the more appropriate in a group context where recharge arrangements might be rather informal and therefore not binding until such time as a payment is made. It is also consistent with the overall recognition of the arrangement through equity. The second approach, which is likely to be the more appropriate approach when a liability is considered to exist in advance of the payment date, is closer in some respects to the accounting treatment of a provision or financial liability but, unlike the requirements of IAS 37 or IFRS 9, reflects changes in the recognised amount through equity rather than profit or loss and builds up the recharge liability over the life of the award rather than recognising the liability in full when a present obligation has been identified.

Whichever accounting treatment is adopted, any adjustments to the amount to be recognised as a recharge, whether arising from a change in the IFRS 2 expense or other changes, must be recognised in the current period and previous periods must not be restated.

How we see it

In the absence of guidance in IFRS 2 on the timing of recognition of the recharge, in our view, an entity chooses the most appropriate treatment for its particular circumstances based on the guidance set out above, i.e., account for the charge when levied/paid or accrue the recharge over the life of the award.

Where applicable, the Illustrations in sections 12.4 to 12.6 below demonstrate the first of the two treatments outlined above and recognise the recharge only when it becomes payable at the date of exercise.

12.2.7.A Timing of recognition of intercompany recharges: discussion by the IFRS IC

In January 2013 the IFRS IC discussed whether a subsidiary's liability to pay to its parent the settlement value of share-based payments made by the parent to the subsidiary's employees should be recognised by the subsidiary from the grant date of the award or only at the date of settlement of the award.

While outreach conducted by the IFRS IC suggested that there is diversity in practice (as indicated in section 12.2.7 above), the IFRS IC concluded in May 2013 that the topic could not be restricted to recharges relating to share-based payments and therefore decided not to add this issue to its agenda.³⁶

³⁶ [IFRIC Update](#), May 2013, available on the IFRS Foundation's website.

12.3 Employee benefit trusts ('EBTs') and similar arrangements

12.3.1 Background

For some time, entities have established trusts and similar arrangements for the benefit of employees. These are known by various names in different jurisdictions, but, for the sake of convenience, in this section we will use the term 'EBT' ('employee benefit trust') to cover all such vehicles by whatever name they are actually known.

The commercial purposes of using such vehicles vary from employer to employer, and from jurisdiction to jurisdiction, but may include the following:

- An EBT, in order to achieve its purpose, needs to hold shares that have either been issued to it by the entity or been bought by the EBT on the open market. In some jurisdictions, the direct holding of shares in an entity by the entity itself is unlawful.
- In the case of longer-term benefits the use of an EBT may 'ring fence' the assets set aside for the benefit of employees in case of the insolvency of the entity.
- The use of an EBT may be necessary in order to achieve a favourable tax treatment for the entity or the employees, or both.

The detailed features of an EBT will again vary from entity to entity, and from jurisdiction to jurisdiction, but typical features often include the following:

- The EBT provides a warehouse for the shares of the sponsoring entity, for example by acquiring and holding shares that are to be sold or transferred to employees in the future. The trustees may purchase the shares with finance provided by the sponsoring entity (by way of cash contributions or loans), or by a third-party bank loan, or by a combination of the two. Loans from the entity are usually interest-free. In other cases, the EBT may subscribe directly for shares issued by the sponsoring entity or acquire shares in the market.
- Where the EBT borrows from a third party, the sponsoring entity will usually guarantee the loan, i.e., it will be responsible for any shortfall if the EBT's assets are insufficient to meet its debt repayment obligations. The entity will also generally make regular contributions to the EBT to enable the EBT to meet its interest payments, i.e., to make good any shortfall between the dividend income of the EBT (if any) and the interest payable. As part of this arrangement the trustees may waive their right to dividends on the shares held by the EBT.
- Shares held by the EBT are distributed to employees through an employee share scheme. There are many different arrangements - these may include:
 - The purchase of shares by employees when exercising their share options under a share option scheme.
 - The purchase of shares by the trustees of an approved profit-sharing scheme for allocation to employees under the rules of the scheme.

Or

 - The transfer of shares to employees under some other incentive scheme.
- The trustees of an EBT may have a legal duty to act at all times in accordance with the interests of the beneficiaries under the EBT. However, most EBTs (particularly those established as a means of remunerating employees) are specifically designed so as to serve the purposes of the sponsoring entity, and to ensure that there will be minimal risk of any conflict arising between the duties of the trustees and the interest of the entity.

12.3.2 Accounting for EBTs

Historically, transactions involving EBTs were accounted for according to their legal form. In other words, any cash gifted or lent to the EBT was simply treated as, respectively, an expense or a loan in the financial statements of the employing entity.

However, this treatment gradually came to be challenged, not least by some tax authorities who began to question whether it was appropriate to allow a corporate tax deduction for the 'expense' of putting money into an EBT which in some cases might remain in the EBT for some considerable time (or even be lent back to the entity) before being actually passed on to employees. Thus, the issue came onto the agenda of the national standard setters.

The accounting solution proposed by some national standard setters, such as those in the United States and the United Kingdom, was to require a reporting entity to account for an EBT as an extension of the entity. The basis for this treatment was essentially that, as noted in section 12.3.1 above, EBTs are specifically designed to serve the purposes of the sponsoring entity, and to ensure that there will be minimal risk of any conflict arising between the duties of the trustees and the interest of the entity, suggesting that they are under the *de facto* control of the entity.

Unlike the approach required by some national standard setters, IFRS accounting standards does not mandate the treatment of an EBT as an extension of the sponsoring entity in that entity's separate financial statements and the accounting treatment in the separate entity is therefore less clear under IFRS (see section 12.3.4 below). If an entity does not treat the EBT as an extension of itself in its own financial statements it will need to assess for its consolidated IFRS financial statements whether the EBT is required to be consolidated as a separate vehicle. This assessment will be based on the control criteria set out in IFRS 10, as discussed in more detail in Chapter 7. However, in summary, the entity will need to decide whether:

- It has power over the EBT.
- It has exposure, or rights, to variable returns from its involvement with the EBT.
- It has the ability to use its power over the EBT to affect the amount of the sponsoring entity's returns.

Paragraphs BC70 to BC74 of the Basis for Conclusions on IFRS 2 are clearly written on the assumption that the trust referred to in paragraph BC70 is being included in the financial statements of the reporting entity. This suggests that the IASB regards the consolidation of such vehicles as normal practice. [IFRS 2.BC70-74].

In addition to a decision as to whether it is appropriate to consolidate an EBT, reporting entities also need to make an assessment as to the level within a group at which the EBT must be consolidated i.e., whether the EBT is controlled by a sponsoring entity at a sub-group level or whether just by the ultimate parent entity. In many cases, an EBT holding shares in the ultimate parent entity will be considered to be under the control of that entity but there will be exceptions in some group scenarios. The discussion below generally assumes that the reporting entity is the sponsoring entity of the EBT and consolidates an EBT holding the reporting entity's own shares.

Consolidation of an EBT will have the following broad consequences for the consolidated financial statements of the reporting entity:

- Until such time as the entity's own shares held by the EBT vest unconditionally in employees (e.g., as the result of the vesting of an award of ordinary shares, or the exercise of a vested option over ordinary shares):
 - Any consideration paid for the shares must be deducted in arriving at shareholders' equity in accordance with IAS 32 (see Chapter 43).
 - The shares are required to be treated as if they were treasury shares when calculating earnings per share under IAS 33 (see Chapter 33).
- Other assets and liabilities (including borrowings) of the EBT must be recognised as assets and liabilities in the consolidated financial statements of the sponsoring entity.
- No gain or loss is recognised in profit or loss on the purchase, sale, issue or cancellation of the entity's own shares, as required by IAS 32. Although not explicitly required by IFRS accounting standards, we suggest that entities show consideration paid or received for the purchase or sale of the entity's own shares in an EBT separately from other purchases and sales of the entity's own shares in the reconciliation of movements in shareholders' equity. This may be particularly relevant for entities in jurisdictions that distinguish between 'true' treasury shares (i.e., those legally held by the issuing entity) and those accounted for as such under IFRS (such as those held by an EBT).
- Any dividend income arising on own shares must be excluded in arriving at profit before tax and deducted from the aggregate of dividends paid and proposed. In our view, the deduction must be disclosed if material.
- Finance costs and any administration expenses must be charged as they accrue and not as funding payments are made to the EBT.

How we see it

As noted above, IFRS accounting standards does not mandate the treatment of an EBT as an extension of the sponsoring entity in the entity's financial statements and the accounting treatment in the separate entity is therefore less clear under IFRS accounting standards (see section 12.3.4 below). If an entity does not treat the EBT as an extension of itself in its own financial statements, it will need to assess for its consolidated IFRS financial statements whether the EBT is required to be consolidated as a separate vehicle. Whichever approach is used, it must be applied consistently.

The discussion above, and in the remainder of section 12, focuses on arrangements where the EBT holds unallocated shares of the reporting entity and/or shares that have been allocated to employees in connection with share awards but where the awards have not yet vested unconditionally. There will also be situations in practice in which an EBT reaches the stage where, or is designed so that, it only holds shares to which employees have full entitlement (i.e., the shares are fully vested). In this situation the shares are beneficially owned and controlled by the individual employees but might remain in trust for tax or other reasons in the period following vesting. Where an EBT does not hold any unvested shares and there are no other assets or liabilities in the EBT over which the entity continues to exercise control, there will be nothing left in the EBT to be consolidated.

12.3.3 Illustrative Examples - awards satisfied by shares purchased by, or issued to, an EBT

The following Illustrations assume that the EBT is consolidated in accordance with IFRS 10 and show the interaction of the requirements of IFRS 10 with those of IFRS 2. Illustration 12-1 demonstrates the treatment where an award is satisfied using shares previously purchased in the market. Illustration 12-2 demonstrates the treatment where freshly issued shares are used.

Illustration 12-1: Interaction of IFRS 10, IAS 32 and IFRS 2 (market purchase)

On 1 January in year 1, the EBT of ABC plc made a market purchase of 100,000 shares of ABC plc at CU2.50 per share. These were the only ABC shares held by the EBT at that date.

On 1 May in the same year, ABC granted executives options over between 300,000 and 500,000 shares at CU2.70 per share, which will vest at the end of year 1, the number vesting depending on various performance criteria. It is determined that the cost to be recognised in respect of this award under IFRS 2 is CU0.15 per share.

Four months later, on 1 September, the EBT made a further market purchase of 300,000 shares at CU2.65 per share.

At the end of year 1, options vested over 350,000 shares and were exercised immediately.

The accounting entries for the above transaction required by IFRS 10, IAS 32 and IFRS 2 in the consolidated financial statements of ABC would be as set out below. It should be noted that all these pronouncements require various entries to be recorded in 'equity'. Thus, some variation may be found in practice as to the precise characterisation of the reserves, depending on local legal requirements and other 'traditions' in national GAAP which are retained to the extent that they do not conflict with IFRS accounting standards.

1 January

Dr	Own shares (equity)	CU250,000	
	Cr	Cash	CU250,000

To record purchase of 100,000 CU1 shares at CU2.50/share

1 May - 31 December

Dr	Profit or loss	CU52,500	
	Cr	Equity [†]	CU52,500

To record cost of vested 350,000 options at CU0.15/option

1 September

Dr	Own shares (equity)	CU795,000	
	Cr	Cash	CU795,000

To record purchase of 300,000 CU1 shares at CU2.65/share

31 December

Dr	Cash	CU945,000	
	Cr	Equity ^{†1}	CU945,000

Receipt of proceeds on exercise of 350,000 options at CU2.70/share

Dr	Equity [†]	CU914,375	
	Cr	Own shares (equity) ²	CU914,375

Release of shares from EBT to employees

- 1 This reflects the fact that the entity's resources have increased as a result of a transaction with an owner, which gives rise to no gain or loss and is therefore credited direct to equity.
- 2 It is necessary to transfer the cost of the shares 'reissued' by the EBT out of own shares, as the deduction for own shares would otherwise be overstated. The total cost of the pool of 400,000 shares immediately before vesting was CU1,045,000 (CU250,000 purchased on 1 January and CU795,000 purchased on 1 September), representing an average cost per share of CU2.6125. $CU2.6125 \times 350,000 \text{ shares} = CU914,375$.

† We recommend that, subject to any local legal restrictions, these amounts all be accounted for in the same component of equity.

Illustration 12-1 shows the importance of keeping the accounting treatment required by IAS 32 for the cost of the shares completely separate from that for the cost of the award required by IFRS 2. In cash terms, ABC has made a 'profit' of CU30,625, since it purchased 350,000 shares with a weighted average cost of CU914,375 and issued them to the executives for CU945,000. However, this 'profit' is accounted for entirely within equity, whereas a calculated IFRS 2 cost of CU52,500 is recognised in profit or loss.

Illustration 12-2: Interaction of IFRS 10, IAS 32 and IFRS 2 (fresh issue of shares)

On 1 January in year 1, the EBT of ABC plc subscribed for 100,000 CU1 shares of ABC plc at CU2.50 per share, paid for in cash provided by ABC by way of loan to the EBT. Under local law, these proceeds must be credited to the share capital account up to the par value of the shares issued, with any excess taken to a share premium account (additional paid-in capital). These were the only ABC shares held by the EBT at that date.

On 1 May in the same year, ABC granted executives options over between 300,000 and 500,000 shares at CU2.70 per share, which will vest at the end of year 1, the number vesting depending on various performance criteria. It is determined that the cost to be recognised in respect of this award is CU0.15 per share.

Four months later, on 1 September, the EBT subscribed for a further 300,000 shares at CU2.65 per share, again paid for in cash provided by ABC by way of loan to the EBT.

At the end of year 1, options vested over 350,000 shares and were exercised immediately.

The accounting entries for the above transaction required by IFRS 10, IAS 32 and IFRS 2 in the consolidated financial statements of ABC would be as set out below. It should be noted that all these pronouncements require various entries to be recorded in 'equity'. Thus, some variation may be found in practice as to the precise characterisation of the reserves, depending on local legal requirements and other 'traditions' in national GAAP which are retained to the extent that they do not conflict with IFRS accounting standards.

1 January

Dr	Equity ^{†1}	CU250,000	
	Cr	Share capital	CU100,000
	Cr	Share premium	CU150,000

To record issue of 100,000 CU1 shares to EBT at CU2.50/share

1 May - 31 December

Dr	Profit or loss	CU52,500	
	Cr	Equity [†]	CU52,500

To record cost of vested 350,000 options at CU0.15/option

1 September

Dr	Equity ^{†1}	CU795,000	
	Cr	Share capital	CU300,000
	Cr	Share premium	CU495,000

To record issue of 300,000 CU1 shares at CU2.65/share

31 December

Dr	Cash	CU945,000	
	Cr	Equity ^{2†}	CU945,000

Receipt of proceeds on exercise of 350,000 options at CU2.70/share

- 1 This entry is required to reconcile the requirement of local law to record an issue of shares with the fact that, in reality, there has been no increase in the resources of the reporting entity. All that has happened is that one member of the reporting group (the EBT) has transferred cash to another (the parent entity). In our view, this amount should not necessarily be accounted for within any 'Own shares reserve' in equity if such a reserve is generally restricted to shares acquired from third parties.
- 2 This reflects the fact that the entity's resources have increased as a result of a transaction with an owner, which gives rise to no gain or loss and is therefore credited direct to equity.
- † We recommend that, subject to any local legal restrictions, these amounts all be accounted for in the same component of equity.

How we see it

As noted above, the debit to equity in note 1 on the issue of shares, must not be recognised within 'Own share reserve' in equity if such a reserve is restricted to shares acquired from third parties.

12.3.4 Separate financial statements of sponsoring entity

As noted in section 12.3.2 above, in contrast to some national GAAPs, where an EBT is treated as a direct extension of the parent or other sponsoring entity, such that the assets and liabilities of the EBT are included in both the separate financial statements of the sponsoring entity and the group consolidated financial statements, under IFRS accounting standards the accounting model is *prima facie* to treat the EBT as a separate group entity.

This means that the separate financial statements of the sponsoring entity must show transactions and balances with the EBT rather than the transactions, assets and liabilities of the EBT. This raises some accounting problems, for some of which IFRS accounting standards are not entirely clear, as demonstrated by Illustration 12-3 below. This has led the IFRS IC and others to discuss whether the 'separate entity' approach to accounting for EBTs is appropriate (see further discussion below).

Illustration 12-3: EBTs in separate financial statements of sponsoring entity

An entity lends its EBT CU1 million which the EBT uses to make a market purchase of 200,000 shares in the entity. In the separate financial statements of the EBT the shares will be shown as an asset. In the consolidated financial statements, the shares will be accounted for as treasury shares, by deduction from equity.

In the separate financial statements of the entity, on the basis that the EBT is a separate entity, like any other subsidiary, the normal accounting entry would be:

Dr	Loan to EBT	CU1,000,000	
	Cr	Cash	CU1,000,000

The obvious issue with this approach is that it is, in economic substance, treating the shares held by the EBT (represented by the loan to the EBT) as an asset of the entity, whereas, if they were held directly by the entity, they would have to be accounted for as treasury shares, by deduction from equity. If the share price falls such that the EBT has no means of repaying the full CU1,000,000, *prima facie* this gives rise to an impairment of the CU1,000,000 loan. Again, however, this seems in effect to be recognising a loss on own equity.

Suppose now that employees are granted options over the shares. The options have an exercise price of zero and a value under IFRS 2 of CU1,200,000. The entity will therefore book an expense of CU1,200,000 under IFRS 2. When the options are exercised, the shares are delivered to employees. At that point the CU1,000,000 loan to the EBT clearly becomes irrecoverable (as it has no assets), and must be impaired, with an expense recognised in profit or loss. However, to recognise an impairment of the loan as well as the CU1,200,000 IFRS 2 charge could result in a form of double counting, when the substance of the transaction is that the EBT delivers 200,000 shares as settlement for the loan.

How we see it

To avoid a form of double counting (i.e., loan impairment and IFRS 2 charge), some suggest that a solution to this problem is to say that the entity has effectively bought a gross-settled call option over its own shares from the EBT, whereby it can require the EBT to deliver 200,000 shares in return for a waiver of its CU1,000,000 loan.

The accounting for the settlement of the call over the shares is as for any other gross-settled purchased call option over own equity under IAS 32 see Chapter 43, specifically Illustration 11-4 Purchased call option on own shares, example C Gross settlement.

Dr	Own shares (deduction from equity)	CU1,000,000	
	Cr	Loan to EBT	CU1,000,000

When the shares are delivered to employees (some milliseconds later), the entry is:

Dr	Other component of equity	CU1,000,000	
	Cr	Own shares (deduction from equity)	CU1,000,000

Depending on the particular facts and circumstances of the arrangement between the sponsoring entity and the EBT, other accounting treatments may also be appropriate.

At its meetings in May and July 2006, the IFRS IC discussed whether the EBT should be treated as an extension of the sponsoring entity, such as a branch, or as a separate entity. The IFRS IC decided to explore how specific transactions between the sponsor and the EBT should be treated in the sponsor's separate or individual financial statements and whether transactions between the EBT and the sponsor's employees should be attributed to the sponsor.

Interestingly, the IFRS IC fell short of dismissing the 'extension of the parent company' approach and has not since revisited this topic other than to re-confirm in March 2011 that it had not become aware of additional concerns or of diversity in practice and hence it did not think it necessary for this to be considered for the IASB's agenda.

How we see it

In our view, whilst any requirement to consolidate EBTs under IFRS 10 could be argued to give a clear steer towards treating the EBT as a separate entity, until there is any final clarification of this issue, it appears acceptable to treat an EBT as an extension of the sponsoring entity in that entity's separate financial statements. This treatment would result in outcomes essentially the same as those in Illustrations 12-1 and 12-2 above, while avoiding the issues highlighted in Illustration 12-3 above.

12.3.5 Financial statements of the EBT

The EBT may be required to prepare financial statements in accordance with requirements imposed by local law or by its own trust deed. The form and content of such financial statements are beyond the scope of this chapter.

12.4 Illustrative example of group share scheme - equity-settled award satisfied by market purchase of shares

The discussion in sections 12.4.1 to 12.4.3 below is based on Illustration 12-4 and addresses the accounting treatment for three distinct aspects of a group share scheme - a share-based payment arrangement involving group entities (see section 12.2 above), the use of an EBT (see section 12.3 above) and a group recharge arrangement (see section 12.2.7 above).

This illustrative example treats the recharge by the parent to the subsidiary as an income statement credit in the individual accounts of the parent and recognises the recharge when it is paid. In some situations, entities might consider it appropriate to apply alternative accounting treatments (see section 12.2.7 above).

Illustration 12-4: Group share scheme (market purchase of shares)

On 1 July 20X1 an employee of S Limited, a subsidiary of the H plc group, is awarded options under the H group share scheme over 3,000 shares in H plc at CU1.50 each, exercisable between 1 July 20X4 and 1 July 20X7, subject to a service condition and certain performance criteria being met in the three years ending 30 June 20X4.

H plc is the grantor of the award, and has the obligation to settle it. On 1 January 20X2, in connection with the award, the H plc group EBT purchases 3,000 shares at the then prevailing market price of CU2.00 each, funded by a loan from H plc. On exercise of the option, S Limited is required to pay the differential between the purchase price of the shares and the exercise price of the option (CU0.50 per share) to the EBT.

For the purposes of IFRS 2, the options are considered to have a fair value at grant date of CU1 per option. Throughout the vesting period of the option, H takes the view that the award will vest in full.

The option is exercised on 1 September 20X6, at which point the EBT uses the option proceeds, together with the payment by S Limited, to repay the loan from H plc.

H plc and its subsidiaries have a 31 December year end.

12.4.1 Consolidated financial statements

So far as the consolidated financial statements are concerned, the transactions to be accounted for are:

- The purchase of the shares by the EBT and their eventual transfer to the employee.
- The cost of the award.

Transactions between H plc or S Limited and the EBT are ignored since, in this illustrative example, the EBT is consolidated (see section 12.3 above). The accounting entries required are set out below. As in other examples in this chapter, where an entry is shown as being made to equity the precise allocation to a particular component of equity will be a matter for local legislation and, possibly, local accounting 'tradition', to the extent that this is not incompatible with IFRS accounting standards.

Y/e 31 December 20X1

Dr	Profit or loss (employee costs)*	CU500	
	Cr Equity		CU500

1 January 20X2

Dr	Own shares (equity)	CU6,000	
	Cr Cash		CU6,000

Y/e 31 December 20X2

Dr	Profit or loss (employee costs)*	CU1,000	
	Cr Equity		CU1,000

Y/e 31 December 20X3

Dr	Profit or loss (employee costs)*	CU1,000	
	Cr Equity		CU1,000

Y/e 31 December 20X4

Dr	Profit or loss (employee costs)*	CU500	
	Cr Equity		CU500

1 September 20X6

Dr	Cash (option proceeds)†	CU4,500	
Dr	Equity‡	CU1,500	
	Cr Own shares (equity)**		CU6,000

* Total cost CU3,000 (3000 options × CU1) spread over 36 months. Charge for period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options are granted to a group of individuals, or with variable performance criteria, the annual charge will be based on a continually revised cumulative charge (see further discussion in sections 6.1 to 6.4 above).

† 3,000 options at CU1.50 each.

- ‡ This reflects the fact that the overall effect of the transaction for the group *in cash terms* has been a 'loss' of CU1,500 (CU6,000 original cost of shares less CU4,500 option proceeds received). However, under IFRS accounting standards this is an equity transaction, not an expense.
- ** CU6,000 cost of own shares purchased on 1 January 20X2 now transferred to the employee. In practice, it is more likely that the appropriate amount to be transferred would be based on the weighted average price of shares held by the EBT at the date of exercise, as in Illustration 12-1 in section 12.3.3 above. In such a case there would be a corresponding adjustment to the debit to equity marked with ‡ above.

12.4.2 Parent

The accounting by the parent will depend on how the EBT is treated (i.e., whether it is accounted for as a separate entity or as an extension of the parent - see section 12.3 above for guidance). The parent must apply the accounting set out in the appropriate section below:

- EBT treated as separate entity (see section 12.4.2.A below).
- EBT treated as extension of parent (see section 12.4.2.B below).

We also discuss, in section 12.4.2.C below, the accounting implications if the parent, rather than - as in Illustration 12-4 - a subsidiary, is the employing entity.

12.4.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments to the employees of the subsidiary (see section 12.2.4 above). However, as discussed in section 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records its transactions with the EBT and the purchase of shares.

This gives rise to the following entries:

Y/e 31 December 20X1

Dr	Investment in subsidiary*	CU500	
	Cr Equity		CU500

1 January 20X2

Dr	Loan to EBT	CU6,000	
	Cr Cash		CU6,000

Y/e 31 December 20X2

Dr	Investment in subsidiary*	CU1,000	
	Cr Equity		CU1,000

Y/e 31 December 20X3

Dr	Investment in subsidiary*	CU1,000	
	Cr Equity		CU1,000

Y/e 31 December 20X4

Dr	Investment in subsidiary*	CU500	
	Cr Equity		CU500

1 September 20X6

Dr	Cash	CU6,000	
	Cr Loan to EBT		CU6,000

- * Total increase in investment CU3,000 (3000 shares × CU1 fair value of each option) recognised over 36 months. Increase during period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion in sections 6.1 to 6.4 above).

12.4.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of the parent

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments to the employees of the subsidiary (see section 12.2.4 above). However, as discussed in section 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records the transactions of the EBT and the purchase of shares.

This gives rise to the following entries:

Y/e 31 December 20X1

Dr	Investment in subsidiary*	CU500	
	Cr	Equity	CU500

1 January 20X2

Dr	Own shares (equity)	CU6,000	
	Cr	Cash	CU6,000

Y/e 31 December 20X2

Dr	Investment in subsidiary*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X3

Dr	Investment in subsidiary*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X4

Dr	Investment in subsidiary*	CU500	
	Cr	Equity	CU500

1 September 20X6

Dr	Cash [†]	CU6,000	
Dr	Equity [‡]	CU1,500	
	Cr	Profit or loss [§]	CU1,500
	Cr	Own shares** (equity)	CU6,000

- * Total increase in investment CU3,000 (3000 shares × CU1 fair value of each option) spread over 36 months. Increase during period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion in sections 6.1 to 6.4 above).

† CU4,500 option exercise proceeds from employee plus CU1,500 contribution from S Limited.

‡ This is essentially a balancing figure representing the fact that the entity is distributing own shares with an original cost of CU6,000, but has treated CU1,500 of the CU6,000 of the cash it has received as income (see § below) rather than as payment for the shares.

- § The CU1,500 contribution by the subsidiary to the EBT has been treated as a distribution from the subsidiary (see section 12.2.7 above) and recorded in profit or loss. It might then be necessary to consider whether, as a result of this payment, the investment in the subsidiary had become impaired (see Chapter 9). As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.
- ** CU6,000 cost of own shares purchased on 1 January 20X2 now transferred to employee. In practice, it is more likely that the appropriate amount to be transferred would be based on the weighted average price of shares held by the EBT at the date of exercise, as in Illustration 12-1 in section 12.3.3 above.

12.4.2.C Parent company as employing entity

If, in Illustration 12-4, the employing entity were the parent rather than the subsidiary, it would record an expense under IFRS 2. It would also normally waive CU1,500 of its CU6,000 loan to the EBT (i.e., the shortfall between the original loan and the CU4,500 option proceeds received from the employee).

If the EBT is treated as an extension of the parent, the accounting entries for the parent would be the same as those for the group, as set out in section 12.4.1 above.

If the EBT is treated as a separate entity, the accounting entries might be as follows:

Y/e 31 December 20X1

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

1 January 20X2

Dr	Loan to EBT	CU6,000	
	Cr	Cash	CU6,000

Y/e 31 December 20X2

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X3

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X4

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

1 September 20X6

Dr	Own shares (Equity) [†]	CU1,500	
Dr	Cash	CU4,500	
	Cr	Loan to EBT	CU6,000
Dr	Equity	CU1,500	
	Cr	Own shares (Equity)	CU1,500

- * Total cost CU3,000 (3000 options × CU1) spread over 36 months. Charge for period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in sections 6.1 to 6.4 above).
- † This takes the approach of treating the parent as having a gross-settled purchased call option over its own equity (see Illustration 12-3 in section 12.3.4 above), under which it can acquire 3,000 own shares from the EBT for the consideration of the waiver of CU1,500 of the original CU6,000 loan. The CU4,500 cash inflow represents the CU4,500 option exercise proceeds received by the EBT from the employee, which is then used to pay the balance of the original CU6,000 loan.

12.4.3 Employing subsidiary

The employing subsidiary is required to account for the IFRS 2 expense and the contribution to the EBT on exercise of the award. This gives rise to the accounting entries set out below. The entries to reflect the IFRS 2 expense are required by IFRS 2 (see section 12.2.3 above). The contribution to the EBT is treated as a distribution (see section 12.2.7 above).

Y/e 31 December 20X1

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

Y/e 31 December 20X2

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X3

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X4

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

1 September 20X6

Dr	Equity†	CU1,500	
	Cr	Cash	CU1,500

* Total cost CU3,000 (3000 options × CU1) spread over 36 months. Charge for period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in sections 6.1 to 6.4 above).

† This is treated as a reduction of whatever component of equity was credited with the CU3,000 quasi-contribution from the parent in the accounting entries above.

12.5 Illustrative example of group share scheme - equity-settled award satisfied by fresh issue of shares

Such schemes raise slightly different accounting issues. Again, these are most easily illustrated by way of an example. The discussion in sections 12.5.1 to 12.5.3 below is based on Illustration 12-5. As with Illustration 12-4 in section 12.4 above, this section addresses the accounting treatment for three distinct aspects of a group share scheme - a share-based payment arrangement involving group entities (see section 12.2 above), the use of an EBT (see section 12.3 above) and a group recharge arrangement (see section 12.2.7 above).

This illustrative example treats the recharge by the parent to the subsidiary as an income statement credit in the individual accounts of the parent and recognises the recharge when it is paid. In some situations, entities might consider it appropriate to apply alternative accounting treatments (see section 12.2.7 above).

Illustration 12-5: Group share scheme (fresh issue of shares)

On 1 July 20X1 an employee of S Limited, a subsidiary of the H plc group, is awarded options under the H group share scheme over 3,000 shares in H plc at CU1.50 each, exercisable between 1 July 20X4 and 1 July 20X7, subject to a service condition and certain performance criteria being met in the three years ending 30 June 20X4. The fair value of the options on 1 July 20X1 is CU1 each.

H plc grants the award and has the obligation to settle it.

When preparing accounts during the vesting period H plc and its subsidiaries assume that the award will vest in full. The options are finally exercised on 1 September 20X6, at which point H plc issues 3,000 new shares to the EBT at the then current market price of CU3.50 for CU10,500. The EBT funds the purchase using the CU4,500 option proceeds received from the employee together with CU6,000 contributed by S Limited, effectively representing the fair value of the options at exercise date ($3,000 \times [\text{CU}3.50 - \text{CU}1.50]$).

H plc and its subsidiaries have a 31 December year end.

12.5.1 Consolidated financial statements

The consolidated financial statements need to deal with:

- The charge required by IFRS 2 in respect of the award.
- The issue of shares.

Transactions between H plc or S Limited and the EBT are ignored since, in this illustrative example, the EBT is consolidated (see section 12.3 above). The accounting entries required are set out below. As in other examples in this chapter, where an entry is shown as being made to equity, the precise allocation to a particular component of equity will be a matter for local legislation and, possibly, local accounting 'tradition', to the extent that this is not incompatible with IFRS accounting standards.

Y/e 31 December 20X1

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

Y/e 31 December 20X2

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X3

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X4

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

1 September 20X6

Dr	Cash	CU4,500	
	Cr	Equity†	CU4,500

* Total cost CU3,000 (3000 options \times CU1) spread over 36 months. Charge for period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in sections 6.1 to 6.4 above).

† From the point of view of the consolidated group, the issue of shares results in an increase in net assets of only CU4,500 (i.e., the exercise price received from the employee), since the CU6,000 contribution from the employing subsidiary to the EBT is an intragroup transaction. However, it may be that, in certain jurisdictions, the entity is required to increase its share capital and share premium (additional paid in capital) accounts by the CU10,500 legal consideration for the issue of shares. In that case, this entry would be expanded as below, which effectively treats the CU6,000 consideration provided from within the group as a bonus issue.

1 September 20X6

Dr	Cash	CU4,500	
Dr	Other equity	CU6,000	
	Cr	Share capital/premium	CU10,500

12.5.2 Parent

The accounting by the parent will depend on how the EBT is treated (i.e., whether it is accounted for as a separate entity or as an extension of the parent - see section 12.3 above for guidance). The parent must apply the accounting set out in the appropriate section below:

- EBT treated as separate entity (see section 12.5.2.A below).
- EBT treated as extension of parent (see section 12.5.2.B below).

We also discuss, in section 12.5.2.C below, the accounting implications if the parent, rather than - as in Illustration 12-5 - a subsidiary, is the employing entity.

12.5.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments, via its EBT, to the employees of the subsidiary (see section 12.2.4 above). However, as discussed in section 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records its transactions with the EBT and the issue of shares.

Y/e 31 December 20X1

	Cr	Equity	CU500

1 September 20X6

Dr	Cash [†]	CU10,500	
	Cr	Share capital/premium	CU10,500

* Total increase in investment CU3,000 (3000 shares × CU1 fair value of each option), recognised over 36 months. Increase in period to December 20X1 is $6/36 \times \text{CU3,000} = \text{CU500}$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion in sections 6.1 to 6.4 above).

† CU10,500 from EBT (which has received CU4,500 option exercise proceeds from employee plus CU6,000 contribution from the subsidiary).

12.5.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of parent

The parent accounts for the share-based payment transaction under IFRS 2 as an equity-settled transaction, since the parent settles the award by delivering its own equity instruments, via its EBT, to the employees of the subsidiary (see section 12.2.4 above). However, as discussed in section 12.2.4 above, instead of recording a cost, as in its consolidated financial statements, the parent records an increase in the carrying value of its investment in subsidiary. It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

In addition to accounting for the share-based payment transaction, the parent records the transactions of the EBT and the issue of shares.

Dr	Cash [†]	CU10,500	
Dr	Equity [‡]	CU6,000	
	Cr Profit or loss ^{**}		CU6,000
	Cr Share capital/premium		CU10,500

* Total increase in investment CU3,000 (3000 shares × CU1 fair value of each option) spread over 36 months. Increase during period to December 20X1 is $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual adjustment would be based on a continually revised cumulative adjustment (see further discussion in sections 6.1 to 6.4 above).

† CU4,500 option exercise proceeds from employee plus CU6,000 contribution from the subsidiary.

‡ This assumes that local law requires the entity to record share capital and share premium (additional paid-in capital) of CU10,500, as in section 12.5.2.A above. However, IFRS accounting standards *prima facie* requires the CU6,000 cash received by the EBT from the subsidiary to be treated as income (see ** below) rather than as part of the proceeds of the issue of shares. In order, in effect, to reconcile these conflicting analyses, CU6,000 of the CU10,500 required by law to be capitalised as share capital and share premium has been treated as an appropriation out of other equity.

** The CU6,000 contribution by the subsidiary to the EBT has been treated as a distribution from the subsidiary (see section 12.2.7 above) and recorded in profit or loss. It might then be necessary to consider whether, as a result of this payment, the investment in the subsidiary had become impaired (see Chapter 9). As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this Example. Any impairment charge would be recorded in profit or loss.

12.5.2.C Parent as employing entity

If, in Illustration 12-5, the employing entity were the parent rather than the subsidiary, it would clearly have to record an expense under IFRS 2. It would also have to fund the CU6,000 shortfall between the option exercise proceeds of CU4,500 and the CU10,500 issue proceeds of the shares.

If the EBT is treated as an extension of the parent, the accounting entries for the parent would be the same as those for the group, as set out in section 12.5.1 above.

How we see it

In our view, the treatment in section 12.5.1 above could also be appropriate where the EBT is treated as a separate entity and the parent is the employing entity.

The issue of shares requires the parent company to fund the EBT with CU6,000 which immediately returns it to the parent, along with the CU4,500 received from the employee, in exchange for an issue of shares. Whilst this 'circulation' of the CU6,000 might have some significance for legal purposes it is, economically speaking, a non-transaction that could be ignored for accounting purposes under IFRS accounting standards. It might, however, be relevant, under local law, to the amount of equity shown as share capital and share premium (additional paid-in capital), in which case the expanded entry in section 12.5.1 above would be appropriate.

Where, however, the EBT is treated as a separate entity, and the cash used to subscribe for the shares arises from a prior transaction, such as an earlier loan to the EBT, matters are more complicated. Suppose that, during the life of the award under discussion, the company were to advance CU50,000 to the EBT for general funding purposes. At that point it would clearly record the entry:

Dr	Loan to EBT	CU50,000	
	Cr	Cash	CU50,000

Suppose that, on exercise of the option, the EBT were to use some of that cash to fund the parent's 'top up' for the share issue. This effectively impairs the loan by CU6,000 and leaves a 'missing debit' indicated by '?' in the journal below:

Dr	Cash	CU10,500	
Dr	?	CU6,000	
	Cr	Loan to EBT	CU6,000
	Cr	Share capital/premium	CU10,500

This looks very much like an impairment loss on the loan required to be reported in profit or loss. On the other hand, it does not resemble a loss in any conventional sense. This suggests that another analysis may be possible.

Illustration 12-3 in section 12.3.4 above addresses the situation where an EBT is pre-funded to enable it to buy the reporting entity's own shares in the market, and those shares are finally delivered to the entity for distribution to employees. Illustration 12-3 suggests that this could be construed as the execution of a gross-settled purchased call option by the entity.

If that analogy is extended, the present situation could be construed as comprising a back-to-back: gross-settled purchased call option (whereby the entity can require the EBT to provide 3,000 shares in return for waiver of CU6,000 of its outstanding loan to the EBT), which triggers the exercise of; a gross-settled written call option (whereby the EBT can require the entity to issue 3,000 fresh shares for CU10,500 to the EBT, so that it can satisfy its obligations to the entity under the purchased call).

If these two call options are accounted for under IAS 32 (see Chapter 43), the write-off of the loan to the EBT can be effectively charged to equity, as follows:

Dr	Cash	CU10,500	
	Cr	Share capital/premium	CU10,500

Exercise by EBT of written call

Dr	Own shares (Equity)	CU6,000	
	Cr	Loan to EBT	CU6,000

Exercise by entity of purchased call

Dr	Equity (other)	CU6,000	
	Cr	Own shares (Equity)	CU6,000

Exercise by EBT of written call

How we see it

As noted above, the two call options accounted for together effectively result in the write-off of the loan to the EBT being recognised in equity.

12.5.3 Employing subsidiary

The employing subsidiary is required to account for the IFRS 2 expense and the contribution to the EBT on exercise of the award. This gives rise to the accounting entries set out below. The entries to reflect the IFRS 2 expense are required by IFRS 2 (see section 12.2.3 above). The contribution to the EBT is treated as a distribution (see section 12.2.7 above).

Y/e 31 December 20X1

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

Y/e 31 December 20X2

Dr	Profit or loss*	CU1,000	
	Cr	Equity	CU1,000

Y/e 31 December 20X3

Dr	Profit or loss*	CU1,000

Y/e 31 December 20X4

Dr	Profit or loss*	CU500	
	Cr	Equity	CU500

1 September 20X6

Dr	Equity†	CU6,000	
	Cr	Cash	CU6,000

* Total cost CU3,000 (3000 options × CU1) spread over 36 months. Charge for period to December 20X1 $6/36 \times \text{CU}3,000 = \text{CU}500$, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in sections 6.1 to 6.4 above).

† CU3,000 of this payment is treated as a reduction of whatever component of equity was credited with the CU3,000 quasi-contribution from the parent in the accounting entries above. The remaining CU3,000 would be treated as a distribution and charged to any appropriate component of equity.

12.6 Illustrative example - cash-settled transaction not settled by the entity receiving goods or services

The discussion in sections 12.6.1 to 12.6.3 below is based on Illustration 12-6.

Illustration 12-6: Cash-settled scheme not settled by receiving entity

On 1 July 20X1 an employee of S Limited, a subsidiary of the H plc group, is awarded a right, exercisable between 1 July 20X4 and 1 July 20X7, to receive cash equivalent to the value of 3,000 shares in H plc at the date on which the right is exercised. Exercise of the right is subject to a service condition and certain performance criteria being met in the three years ending 30 June 20X4. The cash will be paid to the employee not by S, but by H. Throughout the vesting period of the award, H and S take the view that it will vest in full.

The award does in fact vest, and the right is exercised on 1 September 20X6.

The fair value of the award (per share-equivalent) at various relevant dates is as follows:

Date	Fair value
	CU
1.7.20X1	1.50
31.12.20X1	1.80
31.12.20X2	2.70
31.12.20X3	2.40
31.12.20X4	2.90
31.12.20X5	3.30
1.9.20X6	3.50

If the award had been equity-settled (i.e., the employee had instead been granted a right to 3,000 free shares), the grant date fair value of the award would have been CU1.50 per share.

H plc and its subsidiaries have a 31 December year end.

12.6.1 Consolidated financial statements

The group has entered into a cash-settled transaction which is accounted for using the methodology discussed in section 9.3 above. This gives rise to the following accounting entries:

Y/e 31 December 20X1

Dr	Profit or loss*	CU900	
	Cr	Liability	CU900

Y/e 31 December 20X2

Dr	Profit or loss*	CU3,150	
	Cr	Liability	CU3,150

Y/e 31 December 20X3

Dr	Profit or loss*	CU1,950	
	Cr	Liability	CU1,950

Y/e 31 December 20X4

Dr	Profit or loss*	CU2,700	
	Cr	Liability	CU2,700

Y/e 31 December 20X5

Dr	Profit or loss*	CU1,200	
	Cr	Liability	CU1,200

Y/e 31 December 20X6

Dr	Profit or loss*	CU600	
	Cr	Liability	CU600

1 September 20X6

Dr	Liability	CU10,500	
	Cr	Cash	CU10,500

- * Charge for period to 31 December 20X1 is $6/36 \times 3000 \times \text{CU}1.80$ [reporting date fair value] = CU900. Charge for year ended 31 December 20X2 is $18/36 \times 3000 \times \text{CU}2.70 = \text{CU}4,050$ less CU900 charged in 20X1 = CU3,150 and so on (refer to Illustration 9-2 in section 9.3.2 above). In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in section 9 above).

12.6.2 Parent

The parent accounts for the share-based payment transaction under IFRS 2 as a cash-settled transaction, since the parent settles the award by delivering cash to the employees of the subsidiary (see section 12.2.4 above).

How we see it

As discussed in section 12.2.4 above, instead of recording a cost, consistent with the consolidated financial statements, the parent treats the debit entry (including, as a matter of accounting policy choice, any remeasurement of the liability) as an increase in the carrying value of its investment in subsidiary.

It might then be necessary to consider whether the ever-increasing investment in subsidiary is supportable or is in fact impaired. As this is a matter to be determined in the light of specific facts and circumstances, it is not considered in this example. Any impairment charge would be recorded in profit or loss.

This would result in the following accounting entries.

Y/e 31 December 20X1

Dr	Investment in subsidiary*	CU900	
	Cr	Liability	CU900

Y/e 31 December 20X2

Dr	Investment in subsidiary*	CU3,150	
	Cr	Liability	CU3,150

Y/e 31 December 20X3

Dr	Investment in subsidiary*	CU1,950	
	Cr	Liability	CU1,950

Y/e 31 December 20X4

Dr	Investment in subsidiary*	CU2,700	
	Cr	Liability	CU2,700

Y/e 31 December 20X5

Dr	Investment in subsidiary*	CU1,200	
	Cr	Liability	CU1,200

Y/e 31 December 20X6

Dr	Investment in subsidiary*	CU600	
	Cr	Liability	CU600

1 September 20X6

Dr	Liability	CU10,500	
	Cr	Cash	CU10,500

- * Increase in investment to 31 December 20X1 is $6/36 \times 3000 \times \text{CU}1.80$ [reporting date fair value] = CU900. Increase for year ended 31 December 20X2 is $18/36 \times 3000 \times \text{CU}2.70 = \text{CU}4,050$ less CU900 charged in 20X1 = CU3,150 and so on (refer to Illustration 9-2 in section 9.3.2 above). In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in section 9 above).

Where the parent entity was also the employing entity (and therefore receiving goods or services), it would apply the same accounting treatment in its separate financial statements as in its consolidated financial statements (see section 12.6.1 above).

12.6.3 Employing subsidiary

The employing subsidiary accounts for the transaction as equity-settled, since it receives services, but incurs no obligation to its employees (see sections 12.2.3 and 12.2.6 above). This gives rise to the following accounting entries.

Y/e 31 December 20X1

Dr	Profit or loss*	CU750	
	Cr Equity		CU750

Y/e 31 December 20X2

Dr	Profit or loss*	CU1,500	
	Cr Equity		CU1,500

Y/e 31 December 20X3

Dr	Profit or loss*	CU1,500	
	Cr Equity		CU1,500

Y/e 31 December 20X4

Dr	Profit or loss*	CU750	
	Cr Equity		CU750

* Charge for period to 31 December 20X1 is $6/36 \times 3000 \times \text{CU}1.50$ [grant date fair value] = CU750, and so on. In practice, where options were granted to a group of individuals, or with variable performance criteria, the annual charge would be based on a continually revised cumulative charge (see further discussion in sections 6.1 to 6.4 above).

The effect of this treatment is that, while the group ultimately records a cost of CU10,500, the subsidiary records a cost of only CU4,500.

However, there may be cases where the subsidiary records a higher cost than the group. This would happen if, for example:

- The award vests, but the share price has fallen since grant date, so that the value of the award at vesting (as reflected in the consolidated financial statements) is lower than the value at grant (as reflected in the subsidiary's financial statements).
- Or
- The award does not actually vest because of a failure to meet a market condition and/or a non-vesting condition (so that the cost is nil in the consolidated financial statements) but is treated by IFRS 2 as vesting in the subsidiary's financial statements, because it is accounted for as equity-settled (see sections 6.3 and 6.4 above).

12.7 Employee transferring between group entities

It is not uncommon for an employee to be granted an equity-settled share-based payment award while in the employment of one subsidiary in the group, but to transfer to another subsidiary in the group before the award is vested, but with the entitlement to the award being unchanged.

In such cases, each subsidiary measures the services received from the employee by reference to the fair value of the equity instruments at the date those rights to equity instruments were originally granted, and the proportion of the vesting period served by the employee with each subsidiary. [IFRS 2.B59]. In other words, for an award with a three-year vesting period granted to an employee of subsidiary A, who transfers to subsidiary B at the end of year 2, subsidiary A will (cumulatively) record an expense of 2/3, and subsidiary B 1/3, of the fair value at grant date. However, any subsidiary required to account for the transaction as cash-settled in accordance with the general principles discussed in section 12.2 above accounts for its portion of the grant date fair value and also for any changes in the fair value of the award during the period of employment with that subsidiary. [IFRS 2.B60].

After transferring between group entities, an employee may fail to satisfy a vesting condition other than a market condition, for example by leaving the employment of the group. In this situation each subsidiary adjusts the amount previously recognised in respect of the services received from the employee in accordance with the general principles of IFRS 2 (see sections 6.1 to 6.4 above). [IFRS 2.B61]. This imposes upon the original employing entity the rather curious burden of tracking the service record of its former employees, where the accounting impact is expected to be significant.

12.8 Group reorganisations

Following a group reorganisation, such as the insertion of a new parent entity above an existing group, share-based payment arrangements with employees are often amended or replaced so that they relate to the shares of the new parent. Group reorganisations of entities under common control are not within the scope of IFRS 3 and so the requirements set out in section 11 above are not directly applicable.

In some cases, the terms and conditions of a share-based payment arrangement will contain provisions relating to restructuring transactions (see section 5.3.8.A above) so that the application of any changes is not necessarily considered to be a modification in IFRS 2 terms. Where no such provision is made, the situation is less clear-cut.

How we see it

In our view, in the consolidated financial statements, such changes to share-based payments would generally be construed as a cancellation and replacement to which modification accounting could be applied (see section 7.4.4 above). However, in most cases, the changes made to the share-based payment awards following a group reorganisation are likely to be such that there is no incremental fair value arising from the cancellation and replacement, the intention being simply to replace like with like.

A subsidiary receiving the services of employees but with no obligation to settle the amended award would continue to apply equity-settled accounting in its own financial statements and, as for the consolidated financial statements, would strictly account for the changes as a cancellation and replacement of the original award. The accounting consequences would be more complicated if the subsidiary itself had an obligation to settle the award in the shares of its new parent, when previously it had had to settle in its own shares, as this would mean a change from equity-settled to cash-settled accounting (see section 9.4 above). However, we would expect this to be a rare occurrence in practice (see section 12.2.5.B above in relation to the grantor of an award in a situation involving parent and subsidiary entities).

The new parent entity becomes a party to the share-based payment arrangements for the first time and, assuming it has no employees of its own but is considered to have granted and to have the obligation to settle the awards, needs to account for the awards to the employees of its subsidiaries (see sections 12.2.4 and 12.2.5 above). The requirements of IFRS 2 in this situation are unclear and one could argue:

- Either that this is a new award by the parent and so must be valued as at the date of the new award.
Or
- In accordance with the general principle that there is no overall change as a consequence of a reorganisation of entities under common control, that the parent must use the same (original grant date) fair value as the subsidiary.

How we see it

In our view, where a new parent entity becomes party to the share-based payment arrangement either approach, as set out above, is acceptable provided it is applied consistently.

12.9 Share-based payments to employees of joint ventures or associates

The majority of share-based payment transactions with employees involve payments to employees of the reporting entity or of another entity in the same group. Occasionally, however, share-based payments may be made to employees of significant investees of the reporting entity such as joint ventures or associates. For example, if one party to a joint venture is a quoted entity and the other not, it might be commercially appropriate for the quoted venturer to offer payments based on its quoted shares to employees of the joint venture, while the unquoted party contributes to the venture in other ways.

Such arrangements raise some questions of interpretation of IFRS 2, as demonstrated by Illustration 12-7 below. References to an associate in the Illustration and discussions below must be read as also referring to a joint venture.

Illustration 12-7: Share-based payment to employees of associate

At the beginning of year 1, an entity grants an award of free shares with a fair value at that date of CU600,000 to employees of its 40% associate. The shares vest over a three-year period. It is assumed throughout the vesting period of the award that it will vest in full, which is in fact the case.

12.9.1 Financial statements of the associate or joint venture

For the financial statements of the associate, the transaction does not strictly fall within the scope of IFRS 2. In order for a transaction to be in the scope of IFRS 2 for a reporting entity, it must be settled in the equity of the entity itself, or that of another member of the same group. A group comprises a parent and its subsidiaries (see Chapter 7), and does not include associates.

How we see it

Where the investor grants an award of its own equity instruments to employees of its associate, we believe that it would be appropriate for the associate to account for the transaction as if it did fall within the scope of IFRS 2 by applying the 'GAAP hierarchy' in IAS 8 (see Chapter 3). The investor has effectively made a capital contribution to the associate (in the form of the investor's own equity), no less than if it made a capital contribution in cash which was then used to pay employees of the associate.

If the investor in the associate had instead granted an award settled in the equity of the associate, the transaction would have been in the scope of IFRS 2 for the associate, as being the grant of an award over the equity of the reporting entity by a shareholder of that entity (see section 2.2.2.A above).

If the award is, or is treated as being, within the scope of IFRS 2 for the associate, the following entries are recorded:

Year 1

Dr	Employee costs [†]	CU200,000	
	Cr	Equity	CU200,000

Year 2

Dr	Employee costs	CU200,000	
	Cr	Equity	CU200,000

Year 3

Dr	Employee costs	CU200,000	
	Cr	Equity	CU200,000

[†] Grant date fair value of award CU600,000 × 1/3. The credit to equity represents a capital contribution from the investor.

12.9.2 Consolidated financial statements of the investor

The investor has entered into a share-based payment transaction since it has granted an award over its equity to third parties (the employees of the associates) in exchange for their services to a significant investee entity. However, employees of an associate are not employees of a group entity and are therefore not employees of the investor's group.

The issue for IFRS 2 purposes is, therefore, whether the award must be regarded as being made to persons providing similar services to employees (and therefore measured at grant date) or to persons other than employees or those providing similar services to employees (and therefore measured at service date) - see sections 5.2 to 5.4 above.

In our view, it is more appropriate to regard such awards as made to persons providing similar services to employees and therefore measured at grant date.

There are then, we believe, two possible approaches to the accounting. In our view, in the absence of clear guidance in the standard, an entity must choose the more appropriate approach based on the specific circumstances.

In any event, the investor's consolidated financial statements must show a credit to equity of CU200,000 a year over the vesting period. The accounting issue is the analysis of the corresponding debit.

It seems clear that the investor must as a minimum recognise an annual cost of CU80,000 (40% of CU200,000), as part of its 'one-line' share of the result of the associate. The issue then is whether it must account for the remaining CU120,000 as a further cost or as an increase in the cost of its investment in its associate.

The argument for treating the CU120,000 as an expense is that the associate will either have recorded nothing or, as set out in section 12.9.1 above, an entry that results in no net increase in the equity of the associate. Therefore, there has been no increase in the investor's share of the net assets of the associate, and there is no basis for the investor to record an increase in its investment. This is broadly the approach required under US GAAP (although US GAAP requires the associate itself to recognise the expense and a corresponding capital contribution applying the grant date measurement model of ASC 718).

It may be possible to conclude in some situations that the CU120,000 is an increase in the cost of the investment in associate. IAS 28 *Investments in Associates and Joint Ventures* - defines the equity method of accounting as (emphasis added):

"a method of accounting whereby the investment is *initially recognised at cost and adjusted thereafter* for the post-acquisition change in the investor's share of the investee's net assets". [IAS 28.3].

For example, there may be cases where another shareholder has made, or undertaken to make, contributions to the associate that are not reflected in its recognised net assets (such as an undertaking to provide knowhow or undertake mineral exploration).

Where an entity takes the view that the CU120,000 is an increase in the cost of its investment, it is essential to ensure that the resulting carrying value of the investment is sustainable. This may be the case if, for example:

- The fair value of the investment in the associate exceeds its carrying amount.
- Or
- The investor has agreed to enter into the transaction while another major shareholder has agreed to bear equivalent costs.

In other circumstances, the carrying amount of the investment may not be sustainable, and the investor may need to recognise an impairment of its investment in accordance with IAS 36 (see Chapter 21).

How we see it

In summary, as discussed above, the investor has entered into a share-based payment transaction. The measurement date of the award, in our view, is based on the grant date model, on the basis the award is made to 'persons providing similar services to employees'.

It is clear that the investor as a minimum, recognises 40% of the charge in its 'one-line' share of the result of the associate. There are two possible approaches in accounting for the additional expense (e.g., in Illustration 12-7, the additional 60% of the cost), either as an expense to profit or loss or an increase in the cost of its investment in the associate. An entity is required to choose the most appropriate approach based on the specific circumstances.

12.9.3 Separate financial statements of the investor

The discussion below assumes that the investor accounts for its investment in the associate at cost in its separate financial statements (see Chapter 9).

The issues here are much the same as in section 12.9.2 above. The investor has clearly entered into a share-based payment transaction since it has granted an award over its equity to third parties (the employees of the associates) in exchange for their services to a significant investee entity. As in section 12.9.2 above, we believe that this is most appropriately characterised as a transaction with persons providing similar services to employees and therefore measured at its grant date fair value.

In any event, the investor's separate financial statements must show a credit to equity of CU200,000 a year over the vesting period but, as in section 12.9.2 above, the analysis of the debit entry is more complex.

How we see it

In our view, the accounting considerations discussed in section 12.9.2 above, for the measurement date are much the same for the separate financial statements of the investor. In addition, the debit entry is more complex as discussed in section 12.9.2 above.

13 Disclosures

IFRS 2 requires three main groups of disclosures, explaining:

- The nature and extent of share-based payment arrangements (see section 13.1 below)
- The valuation of share-based payment arrangements (see section 13.2 below)
- The impact on the financial statements of share-based payment transactions (see section 13.3 below)

All of the disclosure requirements of IFRS 2 are subject to the overriding materiality considerations of IAS 1 (see Chapter 3). However, depending on the identity of the counterparty and whether, for example, the individual is a member of key management, it will be necessary to assess whether an arrangement is material by nature even if it is immaterial in monetary terms.

In May 2024, the IASB issued IFRS 19 *Subsidiaries without Public Accountability: Disclosures*, which allows eligible entities to elect to apply IFRS 19's reduced disclosure requirements while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. The application of IFRS 19 is optional and becomes effective for reporting periods beginning on or after 1 January 2027, with early application permitted (see Chapter 4). Therefore, if IFRS 19 is applied, an entity provides the reduced disclosures set out under the heading "IFRS 2 Share-based Payment" in IFRS 19.31-34 rather than those in IFRS 2. [IFRS 19.31, IFRS 19.32, IFRS 19.33, IFRS 2.34]

13.1 Nature and extent of share-based payment arrangements

IFRS 2 includes the following disclosure requirements to enable users of the financial statements to understand the nature and extent of share-based payment arrangements that existed during the period: [IFRS 2.44, IFRS 2.45]

Extract from IFRS 2

- 44 An entity shall disclose information that enables users of the financial statements to understand the nature and extent of share-based payment arrangements that existed during the period.**
- 45 To give effect to the principle in paragraph 44, the entity shall disclose at least the following:**
- (a) a description of each type of share-based payment arrangement that existed at any time during the period, including the general terms and conditions of each arrangement, such as vesting requirements, the maximum term of options granted, and the method of settlement (eg whether in cash or equity). An entity with substantially similar types of share-based payment arrangements may aggregate this information, unless separate disclosure of each arrangement is necessary to satisfy the principle in paragraph 44.
 - (b) the number and weighted average exercise prices of share options for each of the following groups of options:
 - (i) outstanding at the beginning of the period;
 - (ii) granted during the period;
 - (iii) forfeited during the period;
 - (iv) exercised during the period;
 - (v) expired during the period;
 - (vi) outstanding at the end of the period; and
 - (vii) exercisable at the end of the period.
 - (c) for share options exercised during the period, the weighted average share price at the date of exercise. If options were exercised on a regular basis throughout the period, the entity may instead disclose the weighted average share price during the period.
 - (d) for share options outstanding at the end of the period, the range of exercise prices and weighted average remaining contractual life. If the range of exercise prices is wide, the outstanding options shall be divided into ranges that are meaningful for assessing the number and timing of additional shares that may be issued and the cash that may be received upon exercise of those options.

How we see it

The reconciliation in (b) above, in our view, reflects all changes in the number of equity instruments outstanding. The reconciliation includes not just awards with a grant date during the period, but also includes subsequent additions to earlier grants e.g., options or shares added to the award in recognition of dividends declared during the period (where this is part of the original terms of the award), and changes to the number of equity instruments as a result of demergers, share splits or consolidations and other similar changes.

In addition, as drafted, the requirements in (b) to (d) of IFRS 2.45 above appear to apply only to share options. However, since there is little distinction in IFRS 2 between the treatment of an option with a zero exercise price and the award of a free share, in our view the disclosures are not to be restricted to awards of options.

13.2 Valuation of share-based payment arrangements

IFRS 2 includes the following disclosure requirements to enable users of the financial statements to understand how fair value was determined during the period: [IFRS 2.46, IFRS 2.47, IFRS 2.48, IFRS 2.49]

Extract from IFRS 2

- 46 An entity shall disclose information that enables users of the financial statements to understand how the fair value of the goods or services received, or the fair value of the equity instruments granted, during the period was determined.**
- 47** If the entity has measured the fair value of goods or services received as consideration for equity instruments of the entity indirectly, by reference to the fair value of the equity instruments granted to give effect to the principle in paragraph 46, the entity shall disclose at least the following:
- (a) for share options granted during the period, the weighted average fair value of those options at the measurement date and information on how that fair value was measured, including:
 - (i) the option pricing model used and the inputs to that model, including the weighted average share price, exercise price, expected volatility, option life, expected dividends, the risk-free interest rate and any other inputs to the model, including the method used and the assumptions made to incorporate the effects of expected early exercise;
 - (ii) how expected volatility was determined, including an explanation of the extent to which expected volatility was based on historical volatility; and
 - (iii) whether and how any other features of the option grant were incorporated into the measurement of fair value, such as a market condition.
 - (b) for other equity instruments granted during the period (ie other than share options), the number and weighted average fair value of those equity instruments at the measurement date, and information on how that fair value was measured, including:
 - (i) if fair value was not measured on the basis of an observable market price, how it was determined;
 - (ii) whether and how expected dividends were incorporated into the measurement of fair value; and
 - (iii) whether and how any other features of the equity instruments granted were incorporated into the measurement of fair value.
 - (c) for share-based payment arrangements that were modified during the period:
 - (i) an explanation of those modifications;
 - (ii) the incremental fair value granted (as a result of those modifications); and
 - (iii) information on how the incremental fair value granted was measured, consistently with the requirements set out in (a) and (b) above, where applicable.
- 48** If the entity has measured directly the fair value of goods or services received during the period, the entity shall disclose how that fair value was determined, eg whether fair value was measured at a market price for those goods or services.
- 49** If the entity has rebutted the presumption in paragraph 13, it shall disclose that fact, and give an explanation of why the presumption was rebutted.

How we see it

As drafted, paragraph 46, and some of the detailed disclosures above in IFRS 2, appears to apply only to equity-settled transactions. However, it would be anomalous if detailed disclosures were required about the valuation of an award to be settled in shares, but not one to be settled in cash. In our view, therefore, the disclosures apply both to equity-settled and to cash-settled transactions.

These requirements can be seen to some extent as an anti-avoidance measure. It would not be surprising if the IASB had concerns that entities might seek to minimise the impact of IFRS 2 by using unduly pessimistic assumptions that result in a low fair value for share-based payment transactions, and the disclosures above seem designed to deter entities from doing so. However, these disclosures give information about other commercially sensitive matters. For example, (a)(i) above effectively requires disclosure of future dividend policy for a longer period than is generally covered by such forecasts. Entities may need to consider the impact on investors and analysts of dividend yield assumptions disclosed under IFRS 2.

How we see it

In our view, it is important for entities, in making these disclosures, to ensure that any assumptions disclosed, particularly those relating to future performance, are consistent with those used in other areas of financial reporting that rely on estimates of future events, such as the impairment of property, plant and equipment, intangible assets and goodwill, income taxes (recovery of deferred tax assets out of future profits) and pensions and other post-retirement benefits.

As discussed in section 5.4 above, IFRS 2 creates a rebuttable presumption that, for an equity-settled transaction with a counterparty other than an employee, the fair value of goods and services received provides the more reliable basis for assessing the fair value of the transaction. Where the entity has rebutted this presumption, the disclosure required by IFRS 2.49 must be provided.

13.3 Impact of share-based payment transactions on financial statements

IFRS 2 includes the following disclosure requirements to enable users of the financial statements to understand the impact of share-based payment transactions on the financial statements: [IFRS 2.50, IFRS 2.51, IFRS 2.52]

Extract from IFRS 2

- 50** An entity shall disclose information that enables users of the financial statements to understand the effect of share-based payment transactions on the entity's profit or loss for the period and on its financial position.
- 51** To give effect to the principle in paragraph 50, the entity shall disclose at least the following:
- (a) the total expense recognised for the period arising from share-based payment transactions in which the goods or services received did not qualify for recognition as assets and hence were recognised immediately as an expense, including separate disclosure of that portion of the total expense that arises from transactions accounted for as equity-settled share-based payment transactions;
 - (b) for liabilities arising from share-based payment transactions:
 - (i) the total carrying amount at the end of the period; and
 - (ii) the total intrinsic value at the end of the period of liabilities for which the counterparty's right to cash or other assets had vested by the end of the period (eg vested share appreciation rights).
- 52** If the information required to be disclosed by this Standard does not satisfy the principles in paragraphs 44, 46 and 50, the entity shall disclose such additional information as is necessary to satisfy them. For example, if an entity has classified any share-based payment transactions as equity-settled in accordance with paragraph 33F, the entity shall disclose an estimate of the amount that it expects to transfer to the tax authority to settle the employee's tax obligation when it is necessary to inform users about the future cash flow effects associated with the share-based payment arrangement.

The disclosures section of IFRS 2 has a final paragraph requiring an entity to disclose additional information about its share-based payments if the information requirements set out above and in sections 13.1 and 13.2 above are insufficient to meet the general disclosure principles of the standard. [IFRS 2.52].

As an example of such additional disclosure, IFRS 2 says that if an entity has classified any share-based payment transactions as equity-settled when there is a net settlement feature for withholding tax obligations (see section 14.3.1 below), it must disclose the estimated future payment to the tax authority when it is necessary to inform users of the financial statements about the future cash flow effects of a share-based payment arrangement. [IFRS 2.52].

13.4 Example of IFRS 2 disclosures

An example of many of the disclosures required by IFRS 2 may be found in the financial statements of Aviva plc for the year ended 31 December 2023.

Practical example 13-1: Aviva plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

3. IFRS Financial Statements [extract]

Notes to the consolidated financial statements [extract]

33 – Group’s share plans

This note describes various equity compensation plans operated by the Group, and shows how the Group values the options and awards of shares in the Company.

(a) Description of the plans

The Group maintains a number of active share option and award plans and schemes across all markets (the Group’s share plans). All employees are eligible for share plans and the plans offered are as follows:

Plan	Description
(i) Savings-related options	<p>These are options granted under the tax-advantaged Save As You Earn (SAYE) share option scheme in the UK and Irish revenue-approved SAYE share option scheme in Ireland. The SAYE allows eligible employees to acquire options over the Company’s shares at a discount of up to 20% of their market value at the date of grant.</p> <p>Options are normally exercisable during the six month period following either the third or fifth anniversary of the start of the relevant savings contract. Seven year contracts were offered prior to 2012. Savings contracts are subject to the statutory savings limits of £500 per month in the UK and €500 per month in Ireland. A limit of £250 per month was applied to contracts in the UK prior to 2016.</p>
(ii) Aviva long-term incentive plan awards	These awards have been made under the Aviva Long-Term Incentive Plan 2011 (LTIP), and are described in section (b) below and in the directors’ remuneration report.
(iii) Aviva annual bonus plan awards	These awards have been made under the Aviva Annual Bonus Plan 2011 (ABP), and are described in section (b) below and in the directors’ remuneration report.
(iv) Aviva recruitment and retention share plan awards	These are conditional awards granted under the Aviva Recruitment and Retention Share Award Plan (RRSAP) in relation to the recruitment or retention of senior managers excluding executive directors. The awards vest in tranches on various dates and vesting is conditional upon the participant being employed by the Group on the vesting date and not having served notice of resignation. Some awards can be subject to performance conditions. If a participant’s employment is terminated due to resignation or dismissal, any tranche of the award which has vested within the 12 months prior to the termination date will be subject to clawback and any unvested tranches of the award will lapse in full.
(v) Aviva Investors deferred share award plan awards	These awards have been made under the Aviva Investors Deferred Share Award Plan (AI DSAP), where employees can choose to have the deferred element of their bonus deferred into awards over Aviva shares. The awards vest in three equal tranches on the second, third and fourth year following the year of grant.
(vi) Various all employee share plans	<p>The Company maintains a number of active stock option and share award voluntary schemes:</p> <p>a) The global matching share plan</p> <p>b) Aviva Group employee share ownership scheme</p>

No new Aviva plc ordinary shares will be issued to satisfy awards made under plans (iv), (v), (vi b).

(b) Outstanding options

The following table summarises information about options outstanding at 31 December:

Range of exercise prices	2023				2022	
	Outstanding options number	Weighted average remaining contractual life years	Weighted average exercise price pence	Outstanding options number	Weighted average remaining contractual life years	Weighted average exercise price pence
£2.20 – £3.16	35,089,530	2.65	260.47	32,596,283	2	227.63
£3.17 – £3.67	9,043,614	2.40	333.38	10,898,433	3	333.46
£3.68 – £4.19	138,673	0.41	387.16	470,831	1	393.31

(c) Movements in the year

A summary of the status of the option and share plans as at 31 December 2023 and 2022, and changes during the years ended on those dates, is shown below.

	2023			2022		
	Options number	Weighted average exercise price years	Awards number	Options number	Weighted average exercise price years	Awards number
Outstanding at 1 January	43,965,547	255.64	40,030,981	47,801,150	251.00	40,303,963
Granted during the year	17,123,614	298.00	17,236,818	6,369,795	336.00	18,158,925
Exercised during the year	(13,599,458)	233.58	(16,024,769)	(6,238,086)	298.73	(11,416,602)
Forfeited during the year	(2,624,572)	301.08	(4,446,240)	(2,801,326)	259.10	(7,015,305)
Cancelled during the year	(299,957)	257.82	—	(713,427)	238.30	—
Expired during the year	(293,357)	305.61	—	(452,559)	308.98	—
Outstanding at 31 December	44,271,817	275.76	36,796,790	43,965,547	255.64	40,030,981
Exercisable at 31 December	6,917,910	222.99	—	2,676,882	278.95	—

(d) Expense charged to the income statement

The total expense recognised for the year arising from equity compensation plans was as follows:

	2023 £m	2022 £m
Equity-settled expense	(61)	(58)

(e) Fair value of options and awards

The weighted average fair values of options and awards granted during the year, estimated by using the Binomial option pricing model and Monte Carlo Simulation model, were £0.86 and £3.75 (2022: £0.84 and £3.95) respectively.

(i) Share options

The fair value of the options was estimated on the date of grant, based on the following weighted average assumptions:

Weighted average assumption	2023	2022
Share price	376p	388p
Exercise price	298p	336p
Expected volatility	32.13 %	31.76%
Expected life	4.11 years	4.08 years
Expected dividend yield	8.47 %	6.44%
Risk-free interest rate	4.41 %	4.23%

The expected volatility used was based on the historical volatility of the share price over a period equivalent to the expected life of the option prior to its date of grant. The risk-free interest rate was based on the yields available on UK government bonds as at the date of grant. The bonds chosen were those with a similar remaining term to the expected life of the options. 13,599,458 options were exercised during the year (2022: 6,238,086).

(ii) Share awards

The fair value of the awards was estimated on the date of grant based on the following weighted average assumptions:

Weighted average assumption	2023	2022
Share price	393p	404p
Expected volatility ¹	33 %	33%
Expected volatility of comparator companies' share price ¹	30 %	35%
Correlation between Aviva and comparator competitors' share price ¹	55 %	51%
Expected life ¹	3.00 years	3.00 years
Expected dividend yield	0.00 %	0.00%
Risk-free interest rate ¹	3.32 %	1.49%

1. For awards with market-based performance conditions only

How we see it

Depending on the precise regulatory requirements of a particular jurisdiction, it might be possible to meet some of the IFRS 2 disclosure requirements by means of a cross-reference between the financial statements and other parts of an annual report published together with the financial statements, such as a management commentary or statutory remuneration report (as in the case of Aviva plc above). However, even where such an approach is permissible, care needs to be taken to ensure that any such cross-reference is clear and specific and that all of the relevant IFRS 2 requirements have been addressed as these requirements vary depending on when an award was granted. For example, detailed fair value information for an equity-settled award is generally required only in the year of grant (and as comparative information in the following period(s)), whereas the conditions attached to an award are required to be disclosed in every period in which that award is outstanding.

14 Taxes related to share-based payment transactions

14.1 Income tax deductions for the entity

In many jurisdictions entities are entitled to receive income tax deductions for share-based payment transactions. In many, if not most, cases the tax deduction is given for a cost different to that recorded under IFRS 2. For example, some jurisdictions give a tax deduction for the fair or intrinsic value of the award at the date of exercise; others may give a tax deduction for amounts charged to a subsidiary by its parent, or by a trust controlled by the parent, in respect of the cost of group awards to the employees of that subsidiary. In either case, both the amount and timing of the expense for tax purposes will be different from the amount and timing of the expense required by IFRS 2.

The particular issues raised by share-based payment transactions are addressed in IAS 12 and discussed further in Chapter 29.

14.2 Employment taxes of the employer

It is frequently the case that an employing entity is required to pay employment taxes or social security contributions on share options and other share-based payment transactions with employees, just as if the employees had received cash remuneration. This raises the question of how such taxes must be accounted for.

14.2.1 Applicable standard

The choice of accounting method does not affect the total expense ultimately recognised (which must always be the tax actually paid), but rather its allocation to different accounting periods. IFRS accounting standards are unclear as to which standard must be applied in accounting for such employment taxes. Some consider that such taxes are most appropriately accounted for under IAS 37 (see section 14.2.1.A below), others favour IFRS 2 (see section 14.2.1.B below) or IAS 19 (see section 14.2.1.C below).

How we see it

A reporting entity therefore chooses what it considers an appropriate policy, either applying IAS 37, IFRS 2 or IAS 19, for employment taxes in its particular circumstances.

Such taxes do not fall within the scope of IFRS 9 since, like income taxes, they are not contractual liabilities (see Chapter 41).

14.2.1.A IAS 37

Some consider that, for the reasons set out in sections 14.2.1.B and 14.2.1.C below, employment taxes of the employer do not fall within the scope of IFRS 2 or of IAS 19. Accordingly, since the amount ultimately payable is uncertain, the most appropriate standard to apply is IAS 37.

Where IAS 37 is applied, the entity will recognise a provision for the employment tax in accordance with IFRIC 21 *Levies*, which requires identification of the activity that triggers the payment, as identified by the legislation (see Chapter 27). However, there is some room for discussion as to what constitutes the activity that triggers the payment. Is it:

- The granting of the award
- The consumption of services received from employees
- The event (typically exercise) that gives rise to a real tax liability

Or

- The vesting of the award

Entities applying IAS 37 need therefore to consider the appropriate treatment of employment taxes in light of IFRIC 21. In November 2024, the IASB published Exposure Draft, *Provisions-Targeted Improvements Proposed amendments to IAS 37*. One aspect of the IASB's proposed amendments aims to clarify the requirements for the present obligation criterion, and to change the timing of the recognition of some provisions, in particular, levies. At the time of writing, the IASB is considering stakeholder feedback on the proposals, for further discussions on the proposals see Chapter 27.

14.2.1.B IFRS 2

Some argue that, since the employment taxes are a payment of an amount of cash typically directly linked to the share price, they must be accounted for as a cash-settled share-based payment transaction under IFRS 2. This would require the taxes to be measured at each reporting date at fair value, multiplied by the expired vesting period of the award to which they relate (see section 9.3.1 above).

A difficulty with this analysis is that IFRS 2 defines a cash-settled share-based payment transaction as one in which the entity incurs a liability to the "supplier of ... goods or services". The liability for such employment taxes is clearly due to the tax authorities, not to the supplier of goods and services (i.e., the employee). Some who support the application of IFRS 2 accept that IFRS 2 is not directly applicable but argue that it is nevertheless the most appropriate standard to apply under the 'GAAP hierarchy' in IAS 8 (see Chapter 3). The objective of IFRS 2 (see section 2.1 above) states that the standard is intended to apply to "expenses associated with transactions in which share options are granted to employees". [IFRS 2.1]. However, the standard contains no explicit provisions relevant to this objective.

14.2.1.C IAS 19

Some argue that such payments are more appropriately accounted for under IAS 19 (see Chapter 31) especially when the taxes are social security contribution, as such contributions benefit the employee indirectly on retirement. Again, the difficulty is that IAS 19 defines employee benefits as "all forms of consideration given by an entity in exchange for service rendered by employees or for the termination of employment" [IAS 19.8] which would appear to rule out payments to the tax authority, but for the fact that IAS 19 refers to social security contributions as a component part of short-term employee benefits. [IAS 19.9(a)]. However, many share-based payment transactions would, if they were within the scope of IAS 19, be classified as long-term benefits. That brings the added complication that IAS 19 would require the employment taxes due on long-term benefits to be accounted for, like the benefits themselves, using the projected unit credit method, which seems an unduly complex approach in the circumstances.

In some situations, the entity may require employees to discharge any liability for employment taxes. The accounting issues raised by such arrangements are discussed in sections 14.2.2 and 14.3 below.

14.2.2 Recovery of employer's taxes from employees

As discussed in section 14.2 above, in some jurisdictions employers are required to pay employment taxes on share-based payment transactions. This detracts from one of the key attractions for an employer of a share-based payment transaction, namely that it entails no cash cost. This is particularly the case where the tax payable is based on the fair value of the award at vesting, meaning that the employer's liability is potentially unlimited.

Accordingly, employers liable to such taxes will sometimes make it a condition of receiving a share-based award that the employee bear all or some of the employer's cash cost of any related employment taxes. This may be done in a number of ways, including:

- Direct payment to the entity
- Authorising the entity to deduct the relevant amount from the employee's salary
- Surrendering as many shares to the entity as have a fair value equal to the tax liability

The accounting treatment of arrangements where the recovery of the employer's tax cost from the employee is made through surrendering of a number of shares with an equivalent value is similar to that discussed in section 14.3 below for the recovery of the employee's taxes.

Where the scheme requires direct cash reimbursement by employees of the cost of the employer's taxes, different considerations apply, as demonstrated by Illustration 14-1 below.

Illustration 14-1: Recovery of employment tax on share-based payment from employee

At the beginning of year 1, an entity granted an executive an award of free shares with a fair value of CU100,000 on condition that the executive remain in employment for three years. In the jurisdiction concerned, an employment tax at the rate of 12% is payable by the employer when the shares vest, based on their fair value at the date of vesting. As a condition of obtaining the shares on vesting, the executive is required to pay cash equal to the tax liability to the employer.

When the shares vest at the end of year 3, their fair value is CU300,000, on which employment taxes of CU36,000 are due. The executive pays this amount to the entity.

In our view, this arrangement can be construed in one of two ways, with somewhat different accounting outcomes:

- View 1: The executive's obligation to make whole the employer's tax liability means that this is, economically, not an award of free shares, but an option to acquire the shares for an exercise price equivalent to 12% of their market value at the date of exercise. The employer's tax liability is a separate transaction.
- View 2: The executive's obligation to make whole the employer's tax liability is accounted for as such, separately from the share-based payment transaction.

How we see it

In our view, either approach could be adopted, so long as it is applied consistently as a matter of accounting policy. View 1 treats the reimbursement as an exercise price and the employer's tax liability is a separate transaction. View 2 treats the reimbursement separately from the IFRS 2 charge. See below the accounting impact under both views.

The essential differences between View 1 and View 2, as illustrated below, are that:

- Under View 1 the reimbursement received from the employee is credited to equity, whereas under View 2 it is credited to profit or loss.
- And
- Under View 1, the IFRS 2 charge is lower than under View 2 reflecting the fact that under View 1 the award is construed as an option, not an award of free shares.

View 1 Reimbursement treated as exercise price

On this analysis, the award is construed as an option to acquire shares with an exercise price of 12% of the fair value, at vesting, of the shares. The grant date fair value of the award construed as an option is CU88,000. The entity would process the following accounting entries (on a cumulative basis).

Dr	Employee costs*	CU88,000	
	Cr Equity		CU88,000
Dr	Employee costs†	CU36,000	
	Cr Cash		CU36,000
Dr	Cash§	CU36,000	
	Cr Equity		CU36,000

* IFRS 2 charge.

† Employment taxes (12% of CU300,000).

§ The receipt of cash from the employee to reimburse the tax is treated as the receipt of the exercise price for an option and credited to equity.

View 2 Reimbursement treated separately from the IFRS 2 charge

On this analysis, the award is construed as an award of free shares, with a grant date fair value of CU100,000. The reimbursement is accounted for as such, giving rise to a credit to profit or loss. The entity would process the following accounting entries (on a cumulative basis).

Dr	Employee costs*	CU100,000	
	Cr Equity		CU100,000
Dr	Employee costs†	CU36,000	
	Cr Cash		CU36,000
Dr	Cash§	CU36,000	
	Cr Employee costs		CU36,000

* IFRS 2 charge.

† Employment taxes (12% of CU300,000).

§ The receipt of cash from the employee to reimburse the tax is treated as a reduction in employee costs.

It will be seen that View 1 results in a total employee expense of CU124,000, while View 2 results in a total employee expense of CU100,000.

14.2.3 Holding of own shares to 'hedge' employment tax liabilities

As noted in section 14.2 above, an award of shares or options to an employee may also give rise to an employment tax liability for the employer, often related to the fair value of the award when it vests or, in the case of an option, is exercised. Employers may hold their own shares in order to hedge this liability (in an economic sense, if not under the criteria in IFRS 9 - see section 2.2.4.H above), and later sell as many shares as are needed to raise proceeds equal to the tax liability.

These are two separate transactions. The purchase and sale of own shares are treasury share transactions accounted for in accordance with IAS 32 (see Chapter 43). The accounting treatment of the employment tax liability is discussed in section 14.2.1 above.

14.3 Sale or surrender of shares by employee to meet employee's tax liability ('sell to cover' and 'net settlement')

In some jurisdictions, an award of shares or options to an employee gives rise to a personal tax liability for the employee, often related to the fair value of the award when it vests or, in the case of an option, is exercised. In order to meet this tax liability, employees may wish to sell or surrender as many shares as are needed to raise proceeds equal to the tax liability (sometimes described respectively as 'sell to cover' or 'net settlement').

This in itself does not, in our view, require the scheme to be considered as cash-settled, any more than if the employee wished to liquidate the shares in order to buy a car or undertake home improvements. However, if the manner in which the cash is passed to, or realised for, the employee gives rise to a legal or constructive obligation for the employer, then the scheme might well be cash-settled (see sections 9.2.2 to 9.2.4 above), to the extent of any such obligation.

In some jurisdictions where employees must pay income tax on share awards, the tax is initially collected from (and is a legal liability of) the employer, but with eventual recourse by the tax authorities to the employee for tax not collected from the employer. Such tax collection arrangements mean that even an equity-settled award results in a cash cost for the employer for the income tax.

In such a situation, the employer may require the employee, as a condition of taking delivery of any shares earned, to indemnify the entity against the tax liability, for example by:

- Direct payment to the entity.
- Authorising the entity to deduct the relevant amount from the employee's salary.
- Surrendering as many shares to the entity as have a fair value equal to the tax liability.

How we see it

If the entity requires the employee to surrender the relevant number of shares, in our view it is appropriate to treat the scheme as cash-settled to the extent of the indemnified amount, unless the criteria to account for the arrangement as equity-settled under the limited exception in IFRS 2 are met (see further below). This view relating to the general requirements of IFRS 2 was confirmed by the IASB in its discussions relating to the introduction of the exception into the standard.

IFRS 2 contains a limited exception to the general requirement to consider whether a net-settled arrangement needs to be split into equity-settled and cash-settled portions. An entity is required to account for net-settled arrangements meeting certain specified criteria as equity-settled in their entirety. However, the exception is narrow in scope and the requirement to assess whether an arrangement has an equity-settled element and a cash-settled element continues to be relevant in many cases. The exception is discussed and illustrated further in section 14.3.1 below.

The following Illustration shows the application of IFRS 2 to an arrangement where the exception does not apply and so the entity has to separate the transaction into two elements.

Illustration 14-2: Surrendering of vested shares by employee to indemnify liability of entity to pay employee's tax liability (net settlement where IFRS 2 exception does not apply)

An entity operates in a jurisdiction where the personal tax rate is 40%, and free shares are taxed at their fair value on vesting. The entity grants an award of 100 free shares with a grant date fair value of CU3 each. The fair value at vesting date is CU5, so that the employee's tax liability (required to be discharged in the first instance by the employer) is CU200 (40% of CU500). The award is to be satisfied using treasury shares with an original cost of CU2.50 per share. Tax law or regulation does not require the entity to withhold an amount for the employee's tax obligation (see Illustration 14-3 below for a demonstration of that situation).

The terms of the agreement between the entity and the employee specify that the employee must surrender the 40 shares needed to settle the tax liability. In our view the substance of the transaction is that, at grant date, the entity is making an award of only 60 shares (with a grant date fair value of CU3 each) and is bearing the cost of the employment tax itself. On this analysis, the entity will have recorded the following entries by the end of the vesting period:

Dr	Employee costs(based on 60 shares at grant date fair value)	CU180	
	Cr	Equity	CU180

Dr	Employee costs (based on 40% of vesting date value)	CU200	
	Cr	Employment tax liability	CU200

The award is then satisfied by delivery of 60 treasury shares (with a cost of CU2.50 each) to the employee:

Dr	Equity	CU150	
	Cr	Treasury shares	CU150

The entity might well then sell the 40 shares 'surrendered' by the employee in order to raise the cash to pay the tax, but this would be accounted for as an increase in equity on the reissue of treasury shares, not as income (see section 14.2.3 above).

If, instead of being required to surrender shares, the employee has a free choice as to how to indemnify the employer, the employer will have recorded the following entries by the end of the vesting period:

Dr	Employee costs(based on 100 shares at grant date fair value)	CU300	
	Cr	Equity	CU300

Dr	Receivable from employee (based on 40% of vesting date value)	CU200	
	Cr	Employment tax liability	CU200

The award is then satisfied by delivery of shares to the employee, and the employee indicates that he wishes to surrender 40 shares to discharge his obligation to the employer under the indemnity arrangement. The entity then receives 40 shares from the employee in settlement of the CU200 receivable from him.

In practice, this would almost certainly be effected as a net delivery of 60 shares, but in principle there are two transactions, a release of 100 treasury shares, with a cost of CU2.50 each, to the employee:

Dr	Equity	CU250	
	Cr	Treasury shares	CU250

and the re-acquisition of 40 of those shares at CU5 each from the employee:

Dr	Treasury shares	CU200	
	Cr	Receivable from employee	CU200

The entity then settles the tax liability:

Dr	Employment tax liability	CU200	
	Cr	Cash	CU200

Even in this case, however, some might take the view that the substance of the arrangement is that the employee has the right to put 40 shares to the employer, and accordingly 40% of the award must be accounted for as cash-settled, resulting in essentially the same accounting as when the employee is required to surrender 40 shares, as set out above. An entity must therefore make a careful assessment of the appropriate accounting treatment based on the terms of a particular arrangement.

14.3.1 Share-based payments with a net settlement feature for withholding tax obligations (net settlement where IFRS 2 exception applies)

IFRS 2 contains an exception for specific types of share-based payment transaction with a net settlement feature.

Extract from IFRS 2

- 33E Tax laws or regulations may oblige an entity to withhold an amount for an employee's tax obligation associated with a share-based payment and transfer that amount, normally in cash, to the tax authority on the employee's behalf. To fulfil this obligation, the terms of the share-based payment arrangement may permit or require the entity to withhold the number of equity instruments equal to the monetary value of the employee's tax obligation from the total number of equity instruments that otherwise would have been issued to the employee upon exercise (or vesting) of the share-based payment (ie the share-based payment arrangement has a 'net settlement feature').
- 33F As an exception to the requirements in paragraph 34, the transaction described in paragraph 33E shall be classified in its entirety as an equity-settled share-based payment transaction if it would have been so classified in the absence of the net settlement feature.

The exception was introduced as a result of discussions by the IFRS IC about the classification of a share-based payment transaction in which an entity withholds a specified portion of shares that would otherwise be issued to the counterparty at the date of exercise or vesting. The shares are withheld in return for the entity settling the counterparty's tax liability relating to the share-based payment. The question asked was whether the portion of the share-based payment that is withheld should be classified as cash-settled or equity-settled in a situation where, in the absence of the net settlement feature, the award would be treated in its entirety as equity-settled?

The exception to the usual requirements of the standard (which are set out in section 14.3 above) is narrow in scope and applies only in situations where there is a statutory withholding obligation. [IFRS 2.33E].

If a transaction meeting the criteria in IFRS 2.33E, would have been classified entirely as equity-settled were it not for this net settlement feature, then the exception in IFRS 2 applies and the transaction is accounted for as equity-settled in its entirety (rather than being divided into an equity-settled portion and a cash-settled portion as discussed in section 14.3 above). [IFRS 2.33F, IFRS 2.BC255G, IFRS 2.BC255H, IFRS 2.BC255I].

How we see it

In some circumstances an entity may have a statutory obligation to withhold an amount for an employee's minimum tax rate which is lower than the employee's actual tax obligation, however the entity withholds shares to settle the employee's tax obligation at a higher rate (i.e. the tax rate expected to apply to the employee). In our view, the exception still applies, so long as the fair value of the shares withheld at net settlement does not exceed the payment for the employee's tax obligation associated with the share-based payment and the transaction would have been classified entirely as equity-settled were it not for the net settlement feature.

An entity applying the exception has to account for the withholding of shares to fund the payment to the tax authority as a deduction from equity (in accordance with IFRS 2.29). However, the deduction from equity may only be made up to the fair value at the net settlement date of the shares to be withheld. [IFRS 2.33G]. If the payment exceeds this fair value, the excess is expensed through profit or loss.

Where the entity withholds any equity instruments in excess of the employee's tax obligation associated with the share-based payment (i.e., the entity withholds an amount of shares that exceeds the monetary value of the employee's tax obligation), then the excess shares must be accounted for as a cash-settled share-based payment when this amount is paid in cash (or other assets) to the employee. [IFRS 2.33H(b)]. In other words, such shares are treated as a separate cash-settled share-based payment and fully recognised as an expense (rather than as a deduction from equity) as at the date of settlement.

To illustrate the application of the exception, the IASB has added an example to the implementation guidance accompanying IFRS 2. [IFRS 2.IG Example 12B]. The substance of this example is reproduced as Illustration 14-3 below.

An entity applying the exception will also need to consider whether additional disclosures are needed in respect of the future cash payment to the tax authorities (see section 13.3 above). [IFRS 2.52].

The IASB notes in the Basis for Conclusions on IFRS 2 that the exception is designed to alleviate the operational difficulties, and any associated undue cost, encountered by entities when they are required, under the requirements of IFRS 2, to divide a share-based payment transaction into an equity-settled element and a cash-settled element (see section 14.3 above). [IFRS 2.BC255J].

The IASB made it very clear during its discussions that the exception only addresses the narrow situation where the net settlement arrangement is designed to meet an entity's obligation under tax laws or regulations to withhold a certain amount to meet the counterparty's tax obligation associated with the share-based payment and transfer that amount in cash to the taxation authorities. This point has been incorporated into IFRS 2 as follows:

"The exception in paragraph 33F does not apply to:

- (a) a share-based payment arrangement with a net settlement feature for which there is no obligation on the entity under tax laws or regulations to withhold an amount for an employee's tax obligation associated with that share-based payment ...". [IFRS 2.33H(a)].

Other types of arrangements that are very frequently seen in practice might appear similar in substance to the legal or regulatory obligation covered by the exception. For example, as discussed and illustrated in section 14.3 above, the terms of a share-based payment arrangement between an entity and an employee might require the employee to forfeit sufficient shares to meet the tax liability or the employee might have some choice over whether or not shares are withheld and/or directly sold in order to raise cash to settle the tax liability. However, unless the arrangements for net settlement are put in place to meet the entity's obligation under tax laws or regulations as described above, the exception will not apply. Therefore, careful analysis of such arrangements continues to be necessary to determine whether part of the award must be treated as cash-settled or whether the exception applies and the entire arrangement must therefore be treated as equity-settled.

Illustration 14-3: Share-based payment transactions with a net settlement feature for withholding tax obligations (application of IFRS 2 exception)

At the beginning of year 1 an entity grants an award of 100 shares to an employee. The award is conditional upon the completion of four years' service which the employee is expected to achieve.

The employee's tax obligation of 40% is based on the fair value of the shares at vesting date. Tax law in the entity's jurisdiction requires the entity to withhold an amount for an employee's tax obligation associated with a share-based payment and transfer that amount in cash to the tax authority on behalf of the employee.

The terms and conditions of the share-based payment arrangement require the entity to withhold shares from the settlement of the award to the employee in order to settle the employee's tax obligation. Accordingly, the entity settles the transaction on a net basis by withholding the number of shares with a fair value equal to the monetary value of the employee's tax obligation and issuing the remaining shares to the employee at the end of the vesting period.

The fair value at grant date is CU2 per share and at the end of year 4 is CU10 per share.

The fair value of the shares on the vesting date (end of year 4) is CU1,000 ($100 \times \text{CU}10$) and therefore the employee's tax obligation is CU400 ($100 \times \text{CU}10 \times 40\%$). Accordingly, on the vesting date, the entity issues 60 shares to the employee, withholds 40 shares from the employee and pays CU400 (the fair value of the shares withheld) in cash to the tax authority on the employee's behalf. In effect, it is as if the entity issued 100 vested shares to the employee and then repurchased 40 of them at fair value.

Accounting during the vesting period and on recognition and settlement of the tax obligation

Over the four-year vesting period, the entity recognises a cumulative IFRS 2 expense of CU200 (CU50 per annum) with a corresponding credit to equity. This is calculated as 100 shares \times CU2 grant date fair value.

Dr	Employee costs	CU200	
	Cr	Equity	CU200

At the date of vesting the tax liability is recognised and subsequently paid:

Dr	Equity	CU400	
	Cr	Tax liability	CU400

Dr	Tax liability	CU400	
	Cr	Cash	CU400

The example in the implementation guidance also notes that the entity must consider disclosing at each reporting date an estimate of the expected tax payment (see section 13.3 above).

15 Other practical issues

We discuss below the following aspects of the practical application of IFRS 2:

- Matching share awards (including deferred bonuses delivered in shares) (see section 15.1 below)
- Loans to employees to purchase shares (limited recourse and full recourse loans) (see section 15.2 below)
- Awards entitled to dividends or dividend equivalents during the vesting period (see section 15.3 below)
- Awards vesting or exercisable on an exit event or change of control (flotation, trade sale etc.) (see section 15.4 below)
- Arrangements under South African black economic empowerment ('BEE') legislation and similar arrangements (see section 15.5 below)
- Shares used as a currency of payment (see section 15.6 below)

15.1 Matching share awards (including deferred bonuses delivered in shares)

As noted in the discussion in section 10.1.2 above, the rules in IFRS 2 for awards where there is a choice of equity- or cash-settlement do not fully address awards where the equity and cash alternatives may have significantly different fair values and vesting periods. In some jurisdictions, a popular type of scheme giving rise to such issues is a matching share award. This section will generally refer to matching share awards but arrangements to defer bonus payments for later settlement in shares (without a matching element) raise a number of similar issues.

Under a matching share award, the starting point is usually that an employee is awarded a bonus for a one-year performance period. At the end of that period, the employee may then be either required or permitted to take all or part of that bonus in shares rather than cash. To the extent that the employee takes shares rather than cash, the employing entity may then be required or permitted to make a 'matching' award of an equal number of shares (or a multiple or fraction of that number). The matching award will typically vest over a longer period.

How we see it

Whilst such schemes can appear superficially similar, the accounting analysis under IFRS 2 could vary significantly, according to whether:

- The employee has a choice, or is required, to take some of the 'base' bonus in shares and whether any such shares have to be retained by the employee in order for the matching shares to vest.
And/Or
- The employer has a choice, or is required, to match any shares taken by the employee.

Illustrations 15-1 to 15-5 below set out an analysis of the five basic variants of such schemes, as summarised in the following matrix.

Employee's taking shares required or discretionary?	Employer's matching required or discretionary?	Example
Required	Required	15-1
Required	Discretionary	15-2
Discretionary	No provision for matching award	15-3
Discretionary	Required	15-4
Discretionary	Discretionary	15-5

A requirement for the employee to retain a base shareholding for the duration of the matching arrangement is a non-vesting condition and this is considered at the end of this section (following Illustration 15-5).

Illustration 15-1: Mandatory investment by employee of cash bonus into shares with mandatory matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay CU1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be required to invest the remaining 50% in as many shares as are worth CU500 at the beginning of year 2. Thus, if the share price were CU2.50, the employee would receive CU500 cash and 200 shares. These shares are fully vested.

If this first award is achieved, the entity is required to award an equal number of additional shares ('matching shares') - in this Illustration 200 shares - conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

Annual bonus

The 50% of the bonus paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 31). The 50% of the annual bonus settled in shares is an equity-settled share-based payment transaction within the scope of IFRS 2, since there is no discretion over the manner of settlement. The measurement date for this element of the bonus is 1 January in year 1 and the vesting period is year 1, since all vesting conditions have been met by the end of that year. Notwithstanding that the two legs of the award strictly fall within the scope of two different IFRS accounting standards, the practical effect will be to charge an expense over the course of year 1.

Matching shares

The terms of the award of 200 matching shares have the effect that the entity has committed, as at the beginning of year 1, to award shares with a value of CU500 as at the beginning of year 2, subject to satisfaction of:

- A performance condition relating to year 1
- A three-year service condition (years 1 to 3)

Those terms are understood by all parties at the beginning of year 1, which is therefore the measurement date. The fact that the matching award is not formally made until the beginning of year 2 is not relevant, since there has been a binding commitment to make the award, on terms understood both by the entity and the employee, since the beginning of year 1 (see section 5.3 above).

The vesting period is the three-year period to the end of year 3. As at the end of year 1 only one of the vesting conditions (i.e., the performance condition) has been met. The further vesting condition (i.e., the service condition) is not met until the end of year 3.

The discussion in section 8.10 above is relevant to the valuation of the equity elements of the award.

Illustration 15-2: Mandatory investment by employee of cash bonus into shares with discretionary matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay CU1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be required to invest the remaining 50% in as many shares as are worth CU500 at the beginning of year 2. Thus, if the share price were CU2.50, the employee would receive CU500 cash and 200 shares. These shares are fully vested.

If this first award is achieved, the entity has the discretion, but not the obligation, to award an equal number of additional shares ('matching shares') - in this case 200 shares - conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

Annual bonus

The 50% of the bonus paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 31). The 50% of the annual bonus settled in shares is an equity-settled share-based payment transaction within the scope of IFRS 2, since there is no discretion over the manner of settlement. The measurement date for this element of the bonus is 1 January in year 1 and the vesting period is year 1, since all vesting conditions have been met by the end of that year. Notwithstanding that the two legs of the award strictly fall within the scope of two different IFRS accounting standards, the practical effect will be to charge an expense over the course of year 1.

Matching shares

In our view, it is necessary to consider whether the entity's discretion is real or not, this being a matter for judgement in the light of individual facts and circumstances.

In some cases, the entity's discretion to make awards may have little real substance. For example, the awards may simply be documented as 'discretionary' for tax and other reasons. It may also be that the entity has consistently made matching awards to all eligible employees (or all members of a particular class of eligible employees), so that it has no realistic alternative but to make matching awards if it wants to maintain good staff relations. In such cases, it may be helpful to consider what the accounting for the 'matching' award would be if it were a pure cash award falling within the scope of IAS 19: [IAS 19.21]

Extract from IAS 19

- 21 An entity may have no legal obligation to pay a bonus. Nevertheless, in some cases, an entity has a practice of paying bonuses. In such cases, the entity has a constructive obligation because the entity has no realistic alternative but to pay the bonus. The measurement of the constructive obligation reflects the possibility that some employees may leave without receiving a bonus.

This is discussed further in Chapter 31.

In making the determination of whether a constructive obligation would exist under IAS 19, it would be necessary to consider past data (e.g., the number of employees who have received matching awards having received the original award).

How we see it

If it is concluded that the entity does not have a constructive obligation to make a matching award, the accounting treatment would follow the legal form of the transaction. In this view, the grant date (and therefore measurement date) would be 1 January in year 2, and the vesting period the two years from the beginning of year 2 to the end of year 3.

If it is concluded that the entity does have a constructive obligation to make a matching award, the effect is that the matching award of shares is equivalent to the mandatory matching award in Illustration 15-1 above, and is therefore to be accounted for in the same way - i.e., the measurement date is 1 January in year 1 and the vesting period is the three year period to the end of year 3.

The discussion in section 8.10 above is relevant to the valuation of the matching equity award.

Illustration 15-3: Discretionary investment by employee of cash bonus into shares with no matching award

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay CU1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be permitted, but not required, to invest the remaining 50% in as many shares as are worth CU500 at the beginning of year 2. Thus, if the share price were CU2.50, the employee could choose to receive either (a) CU1,000 or (b) CU500 cash and 200 shares. Any shares received are fully vested.

The 50% of the bonus automatically paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 31).

The 50% of the bonus that may be invested in shares falls within the scope of IFRS 2 as a share-based payment transaction in which the terms of the arrangement provide the counterparty with the choice of settlement. This is the case even though the value of the alternative award is always CU500 and does not depend on the share price (see section 10.4 above).

The measurement date of the award is 1 January in year 1 and the vesting period is year 1. The methodology set out in IFRS 2 for awards where the counterparty has a choice of settlement would lead to recognition over the vesting period of a liability component of CU500 and an equity component of zero (see section 10.1.2 above). If in fact the employee took shares at vesting, the CU500 liability would be transferred to equity.

Illustration 15-4: Discretionary investment by employee of cash bonus into shares with mandatory matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay CU1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be permitted, but not required, to invest the remaining 50% in as many shares as are worth CU500 at the beginning of year 2. Thus, if the share price were CU2.50, the employee could choose to receive either (a) CU1,000 or (b) CU500 cash and 200 shares.

If the employee elects to reinvest the bonus in shares, the shares are not fully vested unless the employee remains in service until the end of year 3. However, if the employee elects to receive 50% of the bonus in shares, the entity is required to award an equal number of additional shares ('matching shares'), in this case 200 shares, also conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

The 50% of the bonus automatically paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 31).

The 50% of the bonus that may be invested in shares falls within the scope of IFRS 2 as a share-based payment transaction in which the terms of the arrangement provide the counterparty with the choice of settlement. This is the case even though the value of the alternative award is always CU500 and does not depend on the share price (see section 10.4 above).

The mandatory nature of the matching shares means that the award is a share-based payment transaction, entered into at the beginning of year 1 (and therefore measured as at that date), in which the terms of the arrangement provide the counterparty with a choice of settlement between:

- At the beginning of year 2: cash of CU500, subject to service and performance during year 1.
- Or
- At the end of year 3: shares with a value of CU1,000 as at the beginning of year 2, subject to:
 - (i) Performance in year 1.
 - And
 - (ii) Service during years 1 to 3.

The equity component as calculated in accordance with IFRS 2 will have a value in excess of zero (see section 10.1.2 above). The measurement date of the equity component is the beginning of year 1. However, as discussed in section 10.1.3.A above, IFRS 2 does not specify how to deal with a transaction where the counterparty has the choice of equity- or cash-settlement but the liability and equity components have different vesting periods. In our view it is appropriate to recognise the liability and equity components independently over their different vesting periods, i.e., in this case:

- For the liability component (i.e., the fair value of the cash alternative), during year 1.
- For the equity component (i.e., the excess of the total fair value of the award over the fair value of the cash alternative), during the three-year period to the end of year 3.

Thus, at the end of year 1, the entity will have recorded an IFRS 2 expense together with a corresponding:

- Liability for the cost of the portion of the annual award that the employee may take in cash or equity (the liability component referred to above).
- Credit to equity, for one-third of the cost of the matching award (the equity component referred to above).

If the employee decides to take shares, the entity would simply transfer the amount recorded as a liability to equity and recognise the remaining cost of the matching shares over the following two years.

If, however, the employee elects to take cash, the position is more complicated. Clearly, the main accounting entry is to reduce the liability, with a corresponding reduction in cash, when the liability is settled. However, this raises the question of what is to be done with the one-third cost of the matching award already recognised in equity and the remaining, as yet unrecognised, two-thirds cost.

An election by the employee for cash at the end of year 1 must be treated as a cancellation of the matching award, due to the employee's failure to fulfil a non-vesting condition (i.e., not taking the cash alternative) for the matching award - see sections 3.2 and 6.4 above. Therefore, the one-third cost that had already been expensed would not be reversed and the remaining two-thirds of the matching award not yet recognised would be recognised immediately, resulting in an expense for an award that does not actually crystallise.

How we see it

To summarise the above, in our view, it is appropriate to recognise the liability and equity components independently over their different vesting periods.

If the employee decides to take shares, the entity would simply transfer the amount recorded as a liability to equity and recognise the remaining cost of the matching shares over the remaining vesting period for the equity component.

If the employee elects to take the cash, this is treated as a cancellation of the matching award, due to failure to fulfil a non-vesting condition.

The analysis above assumes that the equity award either vests or is cancelled because the employee decides to take the cash award. An alternative outcome would be that the employee chooses the equity-settled award but then fails to meet the three-year service condition attached to that award. This would result in forfeiture of the equity-settled award and the reversal of any expense previously recognised for the equity component. However, this raises a question about the treatment of the amount for the cash component that was credited to equity when the employee chose the equity award rather than the cash award. In our view, there are two alternative approaches:

- The employee's decision to invest 50% of the bonus into the share award is similar to the employee making a non-refundable deposit for the shares and so it is appropriate to leave this amount in equity and not reverse it through profit or loss as part of the forfeiture accounting for the equity award.
- The reclassification of CU500 from liability to equity is part of the consideration for the forfeited equity instruments and relates to past service rendered in connection with the equity component of the award and so it is appropriate to reverse this amount through profit or loss as part of the forfeiture.

How we see it

As noted above, where an employee fails to meet the service condition attached to the equity-settled component of the award, this results in a forfeiture of that component. There are two alternative approaches in accounting for the cash component previously credited to equity at the date of forfeiture. Either approach noted above is acceptable but must be applied consistently.

Illustration 15-5: Discretionary investment by employee of cash bonus into shares with discretionary matching award by employer

At the beginning of year 1 an employee is told that he is to participate in a bonus scheme which will pay CU1,000 if certain performance criteria are met by the end of year 1 and he remains in service. The bonus will be paid at the beginning of year 2. 50% will be paid in cash and the employee will be permitted, but not required, to invest the remaining 50% in as many shares as are worth CU500 at the beginning of year 2. Thus, if the share price were CU2.50, the employee could choose to receive either (a) CU1,000 or (b) CU500 cash and 200 shares. Any shares received under this part of the arrangement are fully vested.

If the employee elects to receive shares, the entity has the discretion, but not the obligation, to award additional shares ('matching shares') - in this case 200 shares - conditional upon the employee remaining in service until the end of year 3. The award of any matching shares will be made at the beginning of year 2.

The 50% of the bonus automatically paid in cash is outside the scope of IFRS 2 and within that of IAS 19 (see Chapter 31).

The 50% of the bonus that may be invested in shares falls within the scope of IFRS 2 as a share-based payment transaction in which the terms of the arrangement provide the counterparty with the choice of settlement.

This is the case even though the value of the alternative award is always CU500 and does not depend on the share price (see section 10.4 above).

How we see it

In our view, it is necessary, as discussed in Illustration 15-2 above, to consider whether the entity's discretion to make an award of matching shares is real or not, this being a matter for judgement in the light of individual facts and circumstances.

In addition, the accounting considerations relating to the employee choosing to take the cash or equity component discussed in Illustration 15-4 above are relevant to this Illustration 15-5, as discussed below.

If it is determined that the entity is effectively obliged to match any share award taken by the employee, then the award must be analysed as giving the employee the choice of settlement between:

- At the beginning of year 2: cash of CU500, subject to service and performance during year 1
- Or
- At the beginning of year 2 shares with a value of CU500 as at that date, subject to service and performance during year 1; and, at the end of year 3: the same number of shares again subject to (i) performance during year 1 and (ii) service during the three-year period to the end of year 3.

In this case the grant date (and therefore measurement date) of all the equity awards would be taken as the beginning of year 1. As regards the award due to vest at the beginning of year 2, this would be split into its equity and liability components, and in this case the equity component would have a value of zero (since the two components are essentially worth the same amount of CU500). Thus, the entity would accrue a liability during year 1. The matching share award would be expensed over the three-year period to the end of year 3.

Thus, at the end of year 1, the entity will have recorded an IFRS 2 expense together with a corresponding:

- Liability for the cost of the portion of the annual award that the employee may take in cash or equity (the liability component).
- And
- Credit to equity for one-third of the cost of the matching award (the equity component).

If the employee decides to take shares at the beginning of year 2, the entity would simply transfer the amount recorded as a liability to equity and recognise the remaining cost of the matching shares over the following two years.

If, however, the employee elects to take cash, the position is more complicated. Clearly, the main accounting entry is to reduce the liability, with a corresponding reduction in cash, when the liability is settled. However, this raises the question of what is to be done with the one-third cost of the matching award already recognised in equity and the remaining, as yet unrecognised, two-thirds cost.

As in Illustration 15-4 above, an election by the employee for cash at the end of year 1 must be treated as a cancellation of the matching award, due to the employee's failure to fulfil a non-vesting condition (i.e., not taking the cash alternative) for the matching award - see sections 3.2 and 6.4 above. Therefore, the one-third cost that had already been expensed would not be reversed and the remaining two-thirds of the matching award not yet recognised would be recognised immediately, resulting in an expense for an award that does not actually crystallise.

If it is concluded that the entity has genuine discretion to make a matching award, the analysis is somewhat different.

The portion of the annual award that may be taken in shares must be analysed as giving the employee the choice, at the beginning of year 2, between cash of CU500 and shares worth CU500 (the number of shares being determined by reference to the share price at that date). This would be split into its equity and liability components, and in this case the equity component would have a value of zero (since the two components are essentially worth the same). Thus, the entity would accrue a liability during year 1. If the employee elected to receive shares, this liability would be transferred to equity.

Any matching share award would be treated as being granted on, and measured as at, the beginning of year 2. The cost would be recognised over the two-year period from the beginning of year 2 to the end of year 3.

The discussion in section 8.10 above is relevant to the valuation of the matching equity award.

Illustration 15-4 above discusses the accounting treatment in a situation where the employee fails to meet the service condition.

If, as is often the case in practice, the employee had to retain his original holding of shares and complete a further period of service in order for the matching award to vest, the requirement to retain the original shares would be treated as a non-vesting condition and taken into account in the grant date fair value of the matching award (see section 6.4 above). Failure to meet this non-vesting condition, by disposing of the shares whilst remaining in employment during the matching period, would be treated as a cancellation of the matching award as holding the shares is a condition within the employee's control (see section 6.4.3 above).

15.2 Loans to employees to purchase shares (limited recourse and full recourse loans)

In some jurisdictions, share awards to employees are made by means of so-called 'limited recourse loan' schemes. The detailed terms of such schemes vary, but typical features include the following:

- The entity makes an interest-free loan to the employee which is immediately used to acquire shares to the value of the loan on behalf of the employee.
- The shares may be held by the entity, or a trust controlled by it (see section 12.3 above), until the loan is repaid.
- The employee is entitled to dividends, except that these are treated as paying off some of the outstanding loan.
- Within a given period (say, five years) the employee must either have paid off the outstanding balance of the loan, at which point the shares are delivered to the employee, or surrendered the shares. Surrender of the shares by the employee is treated as discharging any outstanding amount on the loan, irrespective of the value of the shares.

The effect of such an arrangement is equivalent to an option exercisable within five years with an exercise price per share equal to the share price at grant date less total dividends since grant date - a view reinforced by the IFRS IC.³⁷ There is no real loan at the initial stage. The entity has no right to receive cash or another financial asset, since the loan can be settled by the employee returning the (fixed) amount of equity 'purchased' at grant date.

³⁷ [IFRIC Update](#), November 2005, available on the IFRS Foundation's website.

Indeed, the only true cash flow in the entire transaction is any amount paid at the final stage if the employee chooses to acquire the shares at that point. The fact that the exercise price is a factor of the share price at grant date and dividends paid between grant date and the date of repayment of the 'loan' is simply an issue for the valuation of the option.

The arrangement is valued using an option-pricing model and the fair value is based on the employee's implicit right to buy the shares at a future date rather than being the share price at grant date (the face value of the loan).

The loan arrangement might have a defined period during which the employee must remain in service (five years in the Illustration above) and during which there might also be performance conditions to be met. Where this is the case, the IFRS 2 expense will be recognised by the entity over this period. However, where, as is frequently the case, such an award is subject to no future service or performance condition, i.e., the 'option' is, in effect, immediately exercisable by the employee should he choose to settle the 'loan', IFRS 2 requires the cost to be recognised in full at grant date (see section 6.1 above).

How we see it

As noted above, an arrangement with a limited recourse loan to the shares is equivalent to a share option provided to employees.

Where the limited recourse loan arrangement requires no future service or performance condition to be met by the employee, in effect, the 'option' is immediately exercisable, and the IFRS 2 expense is recognised in full at grant date. If the arrangement requires the employee to be in service that may include performance conditions to be met, the IFRS 2 expense is recognised over that period.

There are also some arrangements where the loan to the employee to acquire the shares is a full recourse loan (i.e., it cannot be discharged simply by surrendering the shares and there can be recourse to other assets of the employee). However, the amount repayable on the loan is reduced not only by dividends paid on the shares, but also by the achievement of performance targets, such as the achievement of a given level of earnings.

The appropriate analysis of such awards is more difficult, as they could be viewed in two ways:

- Either the employer has made a loan (which the employee has chosen to use to buy a share), accounted for under IFRS 9, and has then entered into a performance-related cash bonus arrangement with the employee, accounted for under IAS 19.
- Or
- The transaction is a share option where the exercise price varies according to the satisfaction of performance conditions and the amount of dividends on the shares, accounted for under IFRS 2.

The different analyses give rise to potentially significantly different expenses. This will particularly be the case where one of the conditions for mitigation of the amount repayable on the loan is linked to the price of the employer's equity. As this is a market condition, the effect of accounting for the arrangement under IFRS 2 may be that an expense is recognised in circumstances where no expense would be recognised under IAS 19.

Such awards need to be carefully analysed, in the light of their particular facts and circumstances, in order to determine the appropriate treatment. Factors that could suggest that IFRS 2 is the more relevant standard would, in our view, include:

- The employee can use the loan only to acquire shares.
- The employee cannot trade the shares until the loan is discharged.
- Or
- The entity has a practice of accepting (e.g., from leavers) surrender of the shares as full discharge for the amount outstanding on the loan and does not pursue any shortfall between the fair value of the shares and the amount owed by the employee. This would tend to indicate that, in substance, the loan is not truly full recourse.

How we see it

As noted above, a loan arrangement subject to full recourse requires careful analysis of the particular facts and circumstances to determine which is the appropriate standard to apply; IFRS 9 and IAS 19 or IFRS 2, considering the factors noted above.

15.3 Awards entitled to dividends or dividend equivalents during the vesting period

Some awards entitle the holder to receive dividends on unvested shares (or dividend equivalents on options) during the vesting period.

For example, in some jurisdictions, entities make awards of shares that are regarded as fully vested for the purposes of tax legislation (typically because the employee enjoys the full voting and dividend rights of the shares), but not for accounting purposes (typically because the shares are subject to forfeiture if a certain minimum service period is not achieved). In practice, the shares concerned are often held by an EBT until the potential forfeiture period has expired.

Another variant of such an award that is sometimes seen is where an entity grants an employee an option to acquire shares in the entity which can be exercised immediately. However, if the employee exercises the option but leaves within a certain minimum period from the grant date, he is required to sell back the share to the entity (typically either at the original exercise price, or the lower of that price or the market value of the share at the time of the buy-back - see also the discussions in section 15.4.5 below).

Such awards do not fully vest for the purposes of IFRS 2 until the potential forfeiture or buy-back period has expired. The cost of such awards must therefore be recognised over this period.

This raises the question of the accounting treatment of any dividends paid to employees during the vesting period, either as a charge to profit or loss as employee costs or a return on an equity instrument.

Conceptually, it could be argued that such dividends cannot be dividends for financial reporting purposes since the equity instruments to which they relate are not yet regarded as issued for financial reporting purposes. One consequence of this, is that shares subject to such an award are excluded from the number of ordinary shares outstanding for the purposes of calculating EPS in accordance with IAS 33. These dividend entitlements would, however they are accounted for, constitute a reduction in earnings available to ordinary shareholders when applying IAS 33 (which is discussed in Chapter 33). As it is argued that equity instruments to which the dividends relate are not yet regarded as issued for financial reporting purposes, this would lead to the conclusion that dividends paid in the vesting period are required to be charged to profit or loss as an employment cost.

However, the charge to be made for the award under IFRS 2 will already take account of the fact that the recipient is entitled to receive dividends during the vesting period. If the recipient is not entitled to receive dividends during the vesting period a discount would be reflected in the fair value of the award; if the recipient is entitled to dividends, no such adjustment is made (see section 8.5.4 above). Thus, it could be argued that also to charge profit or loss with the dividends paid is a form of double counting. Moreover, whilst the relevant shares may not have been fully issued for financial reporting purposes, the basic IFRS 2 accounting does build up an amount in equity over the vesting period. It could therefore be argued that - conceptually, if not legally - any dividend paid relates not to an issued share, but rather to the equity instrument represented by the cumulative amount that has been recorded for the award as a credit to equity, and can therefore appropriately be shown as a deduction from equity.

The argument above is valid only to the extent that the credit to equity represents awards that are expected to vest. It cannot apply to dividends paid to employees whose awards are either known not to have vested or treated as expected not to vest when applying IFRS 2 (since there is no credit to equity for these awards).

How we see it

When employees are entitled to dividends paid during the vesting period and reflected in the fair value of the award, we believe that the most appropriate approach is to analyse the dividends paid so that, by the date of vesting, cumulative dividends paid on awards treated by IFRS 2 as vested are deducted from equity and those paid on awards treated by IFRS 2 as unvested are charged to profit or loss. The allocation for periods prior to vesting is to be based on a best estimate of the final outcome, as demonstrated by Illustration 15-6 below.

Illustration 15-6: Award with rights to receive (and retain) dividends during vesting period

An entity grants 100 free shares to each of its 500 employees. The shares are treated as fully vested for legal and tax purposes, so that the employees are eligible to receive any dividends paid. However, the shares will be forfeited if the employee leaves within three years of the award being made. Accordingly, for the purposes of IFRS 2, vesting is conditional upon the employee working for the entity over the next three years. The entity estimates that the fair value of each share (including the right to receive dividends during the IFRS 2 vesting period) is CU15. Employees are entitled to retain any dividend received even if the award does not vest.

20 employees leave during the first year, and the entity's best estimate at the end of year 1 is that 75 employees will have left before the end of the vesting period. During the second year, a further 22 employees leave, and the entity revises its estimate of total employee departures over the vesting period from 75 to 60. During the third year, a further 15 employees leave. Hence, a total of 57 employees (20 + 22 + 15) forfeit their rights to the shares during the three-year period, and a total of 44,300 shares (443 employees × 100 shares per employee) finally vest.

The entity pays dividends of CU1 per share in year 1, CU1.20 per share in year 2, and CU1.50 in year 3.

Under IFRS 2, the entity will recognise the following amounts during the vesting period for services received as consideration for the shares.

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	100 shares × 425 employees × CU15 × 1/3	212,500	212,500
2	100 shares × 440 employees × CU15 × 2/3	440,000	227,500
3	100 shares × 443 × CU15 × 3/3	664,500	224,500

On the assumption that all employees who leave during a period do so on the last day of that period (and thus receive dividends paid in that period), in our view the dividends paid on the shares must be accounted for as follows:

Year 1

Dr	Profit or loss (employee costs) ¹	CU7,500	
Dr	Equity ¹	CU42,500	
	Cr	Cash ²	CU50,000

Year 2

Dr	Profit or loss (employee costs) ³	CU3,300	
Dr	Equity ³	CU54,300	
	Cr	Cash ⁴	CU57,600

Year 3

Dr	Profit or loss (employee costs) ⁵	CU1,590	
Dr	Equity ⁵	CU67,110	
	Cr	Cash ⁶	CU68,700

- 20 employees have left and a further 55 are anticipated to leave. Dividends paid to those employees (100 shares × 75 employees × CU1 = CU7,500) are therefore recognised as an expense. Dividends paid to other employees are recognised as a reduction in equity.
- 100 shares × 500 employees × CU1.
- 22 further employees have left and a further 18 are anticipated to leave. The cumulative expense for dividends paid to leavers and anticipated leavers must therefore be CU10,800 (100 shares × 20 employees × CU1 = CU2,000 for leavers in year 1 + 100 shares × 40 employees × [CU1 + CU1.20] for leavers and anticipated leavers in year 2 = CU8,800). CU7,500 was charged in year 1, so the charge for year 2 must be CU10,800 - CU7,500 = CU3,300. This could also have been calculated as charge for leavers and expected leavers in current year CU4,800 (100 shares × 40 [22 + 18] employees × CU1.20) less reversal of expense in year 1 for reduction in anticipated final number of leavers CU1,500 (100 shares × 15 [75 - 60] employees × CU1.00). Dividends paid to other employees are recognised as a reduction in equity.
- 100 shares × 480 employees in employment at start of year × CU1.20.

- 5 15 further employees have left. The cumulative expense for dividends paid to leavers must therefore be CU12,390 (CU2,000 for leavers in year 1 (see section 3 above) + 100 shares × 22 employees × [CU1 + CU1.20] = CU4,840 for leavers in year 2 + 100 shares × 15 employees × [CU1 + CU1.20 + CU1.50] = CU5,550 for leavers in year 3). A cumulative expense of CU10,800 (see section 3 above) was recognised by the end of year 2, so the charge for year 3 must be CU12,390 - CU10,800 = CU1,590. This could also have been calculated as charge for leavers in current year CU2,250 (100 shares × 15 employees × CU1.50) less reversal of expense in years 1 and 2 for reduction in final number of leavers as against estimate at end of year 2 CU660 (100 shares × 3 [60 - 57] employees × [CU1.00 + CU1.20]). Dividends paid to other employees are recognised as a reduction in equity.
- 6 100 shares × 458 employees in employment at start of year × CU1.50.

15.4 Awards vesting or exercisable on an exit event or change of control (flotation, trade sale etc.)

Entities frequently issue awards connected to a significant event such as a flotation, trade sale or other change of control of the business. It may be that an award that would otherwise be equity-settled automatically becomes cash-settled if such an event crystallises and the entity has no choice as to the method of settlement (as discussed in section 10.3 above).

However, it may also be the case that an award vests only on such an event, which raises various issues of interpretation, as discussed below.

The sections below must be read together with the more general discussions elsewhere in this chapter (as referred to in the narrative below) on topics such as grant date, vesting period, vesting and non-vesting conditions and classification as equity-settled or cash-settled. References to flotation are required to be read as also including other exit events.

15.4.1 Grant date

Sometimes such awards are structured so that they will vest on flotation or so that they will vest on flotation subject to further approval at that time. For awards in the first category, grant date as defined in IFRS 2 will be the date on which the award is first communicated to employees (subject to the normal requirements of IFRS 2 relating to a shared understanding, offer and acceptance, as discussed in section 5.3 above). For awards in the second category, grant date will be at or around the date of flotation, when the required further approval is given.

This means that the IFRS 2 cost of awards subject to final approval at flotation will generally be significantly higher than that of awards that do not require such approval. Moreover, as discussed further in section 5.3.2 above, it may well be the case that employees begin rendering service for such awards before grant date (e.g., from the date on which the entity communicates its intention to make the award in principle). In that case, the entity would need to make an initial estimate of the value of the award for the purpose of recognising an expense from the date services have been provided, and continually re-assess that value up until the actual IFRS 2 grant date. As with any award dependent on a non-market vesting condition, an expense would be recognised only to the extent that the award is considered likely to vest. The classification of a requirement to float as a non-market vesting condition is discussed further in section 15.4.3 below.

15.4.2 Vesting period

Many awards that vest on flotation have a time limit - in other words, the award lapses if flotation has not occurred on or before a given future date. In principle, as discussed in section 6.2.3 above, when an award has a variable vesting period due to a non-market performance condition, the reporting entity is required to make a best estimate of the likely vesting period at each reporting date and calculate the IFRS 2 expense on the basis of that best estimate, with the final cumulative charge based on the grant date fair value of the actual outcome. Such an approach appears to be taking account of a non-market performance condition in determining the fair value of an award where an award has a variable vesting period, contrary to the basic principle of paragraph 19 of IFRS 2. However, it is not the vesting conditions that are being taken into account per se, but the fact that the varying vesting periods will give rise to different lives for the award. That said, the impact of the time value of the different lives on the fair value of the award will, in many cases, be insignificant and it will therefore be a matter of judgement as to how precisely an entity switches from one fair value to another.

In practice, the likely timing of a future flotation is notoriously difficult to assess months, let alone years, in advance. In such cases, it would generally be acceptable simply to recognise the cost over the full potential vesting period until there is real clarity that a shorter period may be more appropriate. However, in making the assessment of the likelihood of vesting, it is important to take the company's circumstances into account. The likelihood of an exit event in the short- to medium-term is perhaps greater for a company owned by private equity investors seeking a return on their investment than for a long-established family-owned company considering a flotation.

It is worth noting that once an exit event becomes likely, the IFRS 2 expense will in some cases need to be recognised over a shorter vesting period than was originally envisaged as the probability of the exit event occurring will form the basis at the reporting date of the estimate of the number of awards expected to vest (see also the discussion in sections 6.2 and 7.6 above).

How we see it

To summarise the above, when an award has a variable vesting period due to a non-market performance condition, the reporting entity makes a best estimate of the likely vesting period at each reporting date and calculates the IFRS 2 charge on the basis of that best estimate, with the final cumulative expense based on the grant date fair value of the actual outcome. Judgement would need to be applied and it is important to take the company's circumstances into account, as the likelihood of an exit event in the short- to medium-term is perhaps greater for a company owned by private equity investors seeking a return on their investment than for a long-established family-owned company considering a flotation. In addition to determining the vesting period, judgement would also be needed to determine the likelihood of vesting. Once the exit event becomes likely, the IFRS 2 expense may need to be recognised over a shorter vesting period than was originally envisaged as the probability of the exit event occurring will form the basis at the reporting date of the estimate of the number of awards expected to vest.

FASB differences

The above contrasts with the US GAAP approach where, in practice, an exit event that is a change in control or an initial public offering is only recognised when it occurs. In a situation where a change in control or an initial public offering occurs shortly after the reporting date, it is therefore possible that the expense will need to be recognised in an earlier period under IFRS accounting standards than under US GAAP.

15.4.3 Is flotation or sale a vesting condition or a non-vesting condition?

There was debate in the past about whether a requirement for a flotation or sale to occur in order for an award to vest was a vesting condition or a non-vesting condition. The argument for it being a non-vesting condition was that flotation or sale may occur irrespective of the performance of the entity. The counter-argument was essentially that the price achieved on flotation or sale, which typically affects the ultimate value of the award (see section 15.4.4 below), reflects the performance of the entity and is therefore a non-market performance condition (provided there is an associated service condition - see further below).

As part of its wider project on vesting and non-vesting conditions, the IFRS IC reached a tentative decision in July 2010 that a condition requiring an initial public offering (IPO) or a change of control should be deemed to be a performance vesting condition rather than a non-vesting condition. This was subsequently reflected in general terms through the IASB's amendments to the definition of a performance condition in the *Annual Improvements to IFRSs 2010-2012 Cycle* (see sections 3.1 and 3.2 above). The amendments were intended, *inter alia*, to make clear that a requirement for flotation or sale (with an associated service condition) is a performance condition rather than a non-vesting condition on the basis that the flotation or sale condition is by reference to the entity's own operations.

How we see it

The amendments to IFRS 2 also made it clear that a performance target period cannot extend beyond the end of the associated service period in order for the definition of a performance vesting condition to be met (see section 3.2.2 above). Therefore, the flotation or sale condition will be treated as a non-vesting condition, rather than as a vesting condition, if the service period is not at least as long as the duration of the flotation or sale condition.

It is possible that in a share-based payment transaction a flotation or sale condition can be both a performance vesting condition and a non-vesting condition in an award that vests in instalments, 'graded vesting' (see section 6.2.2 above). Where the share-based payment transaction vests in instalments and the service period is not at least as long as the duration of the flotation or sale condition, that condition will be treated as a non-vesting condition (see section 3.2 above). In contrast, when the service condition is the same duration as the flotation and sale condition, that condition will be treated as non-market performance condition (see section 3.1 above), this is demonstrated in Illustration 15-7 below:

Illustration 15-7: Award vesting in instalments with a flotation or sale condition

An entity issues an award to employees at the beginning of year 1 with gradual vesting over five years. The award will vest 20% in each year of service over the five-year period. In addition to the service condition there is a flotation or sale condition that must be met at the end of year 5. As discussed in section 6.2.2 above, the award that vests in instalments will be treated as five different tranches because each tranche has a different vesting period with different fair values. The flotation or sale condition will be a non-vesting condition and factored in the grant date fair value of tranches 1 to 4 as the service period is not as long as the duration of the flotation or sale condition. However, for tranche 5, the service and performance conditions are for the same duration, therefore the flotation or sale condition will be treated as a non-market performance condition and not factored into the grant date fair value but factored into the number of awards that will vest for tranche 5.

The impact of treating the flotation or sale condition differently, results in an expense being recognised for the first four tranches regardless of the flotation or sale condition being met, so long as the service condition is met, as the likelihood of not meeting the flotation or sale condition is factored into the grant date fair value. In contrast for tranche 5 if the flotation or service condition is not met but the service condition is met, no expense will be recognised as the non-market performance condition has not been met.

The flotation or sale condition even though is deemed to relate to the entity's own operations and therefore generally classified as a performance condition, it will sometimes be concluded that fulfilment of the condition is outside the control of both the entity and the counterparty. The settlement of an award in equity or cash might depend on the outcome of the condition i.e., there might be either cash- or equity-settlement that is entirely contingent on the exit event. Such contingent arrangements are discussed in section 10.3 above.

15.4.4 Awards requiring achievement of a minimum price on flotation or sale

Some awards with a condition dependent on flotation (or another similar event) vest only if a minimum price per share is achieved. For example, an entity might grant all its employees share options, the vesting of which is conditional upon a flotation or sale of the shares at a price of at least CU5 per share within five years, and the employee still being in employment at the time of the flotation or sale.

Taken alone, the requirement for a flotation or sale to occur is a non-market performance condition (see further below and in section 15.4.3 above). However, if a minimum market price has to be achieved, the question arises as to whether, in addition to the service requirement, such an award comprises:

- A single market condition (i.e., float or sell within five years at a share price of at least CU5)
- Or
- Two conditions:
 - A market condition (share price at time of flotation or sale of at least CU5)
 - And
 - A non-market performance condition (flotation or sale achieved within five years)

The significance of this is the issue discussed in section 6.3 above, namely that an expense must always be recognised for all awards with a market condition, if all the non-market vesting conditions are satisfied, even if the market condition is not. In either case, however, there is a market condition which needs to be factored into the valuation of the award.

If the view is that 'flotation or sale at CU5 within five years' is a single market condition, the entity will recognise an expense for the award for all employees still in service at the end of the five-year period, since the sole non-market vesting condition (i.e., service) will have been met. Note that this assumes that the full five-year period is considered the most likely vesting period at grant date (see sections 6.3.4 and 15.4.2 above).

If, on the other hand, the view is that 'flotation or sale within five years' and 'flotation or sale share price CU5' are two separate conditions, and no flotation or sale occurs, no expense will be recognised since the performance element of the non-market vesting condition (i.e., 'flotation or sale within five years') has not been satisfied. However, even on this second analysis, if a sale or flotation is achieved at a price less than CU5, an expense must be recognised, even though the award does not truly vest, since the non-market condition (i.e., 'flotation or sale within five years' with its associated service requirement) will have been met.

How we see it

In our view, the appropriate analysis in the example above is to regard 'flotation or sale within five years' and 'flotation or sale share price CU5' as two separate conditions.

The example above assumes that there is a service condition equal in duration to the other conditions attached to the award and hence the analysis above only considers vesting conditions. If the fact pattern were such that there was no service condition, or a service condition that was of a shorter duration than the other conditions, then those conditions would need to be treated as non-vesting conditions rather than as performance vesting conditions (see sections 3.1 and 3.2 above and Illustration 15-7 above).

15.4.5 Awards 'purchased for fair value'

As noted in section 2.2.4.D above, entities that are contemplating a flotation or trade sale may invite employees to subscribe for shares (often a special class of share) for a relatively nominal amount. In the event of a flotation or trade sale occurring, these shares may be sold or will be redeemable at a substantial premium. It is often argued that the initial subscription price paid represents the fair value of the share at the time, given the inherent high uncertainty as to whether a flotation or trade sale will in fact occur.

The premium paid on the shares in the event of a flotation or trade sale will typically be calculated in part by reference to the price achieved. The question therefore arises as to whether such arrangements fall within the scope of IFRS 2. It might be argued for example that, as the employee paid full fair value for the arrangement at issue, there has been no share-based payment and, accordingly, the instrument must be accounted for under IAS 32 and IFRS 9.

How we see it

In our view, in order to determine whether the arrangement, or a portion thereof, falls within the scope of IFRS 2, it is necessary to consider whether the arrangement has features that would not be expected in 'normal' equity transactions - in particular, a requirement for the holder of the shares to remain in employment until flotation or sale and/or individual buyback arrangements. If this is the case, regardless of the amount subscribed, the terms suggest that the shares are being awarded in connection with, and in return for, employee services and hence that the arrangement is within the scope of IFRS 2. This means that, even if the share-based payment transaction has no material fair value once the subscription price has been taken into account (and therefore gives rise to no IFRS 2 expense), it will be necessary to make the disclosures required by IFRS 2.

Moreover, even if the amount paid by the employees can be demonstrated to be fair value for tax or other purposes, that amount would not necessarily constitute fair value under IFRS 2. Specifically, a 'true' fair value would take into account non-market vesting conditions (such as a requirement for the employee to remain in employment until flotation or a trade sale occurs). However, a valuation for IFRS 2 purposes would not take such conditions into account (see sections 5.5 and 6.2.1.A above) and would therefore typically be higher than the 'true' fair value.

Where the arrangement relates to a special class of share rather than ordinary equity shares, the underlying shares might well be classified as a liability rather than as equity under IAS 32. However, if the redemption amount to be settled is linked to the flotation price of the 'real' equity, the arrangement will be a cash-settled share-based payment transaction under IFRS 2 (see section 2.2.4.A above).

It is common in such situations for the cost of satisfying any obligations to the special shareholders to be borne by shareholders rather than by the entity itself. This raises a number of further issues, which are discussed in section 2.2.2.A above and in section 15.4.6 below.

The approach outlined in this section, i.e., that there will generally be no IFRS 2 share-based payment transaction expense to recognise when the counterparty subscribes for a share at fair value, is the approach most commonly applied in practice by entities applying IFRS accounting standards. In this type of arrangement, the subscription price, or market value if lower, is often refundable to employees who leave employment before the shares vest.

How we see it

Where the subscription price, or market value if lower, is refundable to employees who leave employment before the shares vest, the amounts paid by the counterparty for the shares are generally classified as a liability by the entity until such time as the shares finally vest (at which point the cash paid will be treated as the proceeds of issuing shares).

FASB differences

The above, is not the only approach seen in practice. US GAAP, for example, requires in certain circumstances the recognition of an expense (representing the amount potentially at risk) in cases where an employee subscribes for a share at fair value but risks forfeiting some, or all, of the price paid for that share, together with any subsequent increases in value, should he fail to fulfil the service condition.

How we see it

In our view, in the absence of specific guidance, the recognition of such an expense when applying US GAAP for the amount risked by the employee is not a requirement based on IFRS 2 as currently drafted.

15.4.6 'Drag along' and 'tag along' rights

An award might be structured to allow management of an entity to acquire a special class of equity at fair value (as in section 15.4.5 above), but (in contrast to section 15.4.5 above) with no redemption right on an exit event. However, rights are given:

- To any buyer of the 'normal' equity also to buy the special shares (sometimes called a 'drag along' right).
- To a holder of the special shares to require any buyer of the 'normal' equity also to buy the special shares (sometimes called a 'tag along' right).

Such schemes are particularly found in entities where the 'normal' equity is held by a provider of venture capital, which will generally be looking for an exit in the medium term.

It may well be that, under the scheme, the entity itself is required to facilitate the operation of the drag along or tag along rights, which may involve the entity collecting the proceeds from the buyer and passing them on to the holder of the special shares.

This raises the issue of whether such an arrangement is equity-settled or cash-settled. The fact that, in certain circumstances, the entity is required to deliver cash to the holder of a share suggests that the arrangement is an award requiring cash settlement in specific circumstances, the treatment of which is discussed in section 10.3 above.

However, if the terms of the award are such that the entity is obliged to pass on cash to the holder of the share only if, and to the extent that, proceeds are received from an external buyer, in our view, the arrangement may be economically no different to the broker settlement arrangements typically entered into by listed entities, as discussed in section 9.2.4 above. This could allow the arrangement to be regarded as equity-settled because the entity's only involvement as a principal is in the initial delivery of shares to employees, provided that consideration is given to all the factors (discussed in section 9.2.4 above) that could suggest that the scheme is more appropriately regarded as cash-settled.

In making such an assessment, care needs to be taken to ensure that the precise facts of the arrangement are considered. For example, a transaction where the entity has some discretion over the amount of proceeds attributable to each class of shareholder might indicate that it is inappropriate to treat the entity simply as an agent in the cash payment arrangement. It might also be relevant to consider the extent to which, under relevant local law, the proceeds received can be 'ring fenced' so as not to be available to settle other liabilities of the entity.

It is also the case that arrangements that result in employees obtaining similar amounts of cash can be interpreted very differently under IFRS 2 depending on how the arrangement is structured and whether, for example:

- The entity is required to pay its employees cash on an exit (having perhaps held shares itself via a trust and those shares having been subject to 'drag along' rights).
- Or
- The employees themselves have held the right to equity shares on a restricted basis with vesting - and 'drag along' rights - taking effect on a change of control and the employees receiving cash for their shares.

How we see it

For 'drag along' and 'tag along' rights, if for example, there is no discretion over the amount of proceeds attributable to each class of shareholder and the entity is obliged to pass on cash received from the external buyer to the holder of the shares, in our view, the arrangement is economically no different to the broker settlement arrangements typically entered into by listed entities, as discussed in section 9.2.4 above. This could allow the arrangement to be regarded as equity-settled as the entity's only involvement as principal is in the initial delivery of the shares.

The appropriate accounting treatment in such cases requires a significant amount of judgement based on the precise facts and circumstances.

15.5 South African black economic empowerment ('BEE') and similar arrangements

15.5.1 Economic empowerment arrangements

As part of general economic reforms in many developing countries (such as South Africa), national governments have put in place policies to address socio-economic inequalities. These arrangements encourage the economic empowerment of historically disadvantaged individuals and communities through various ownership schemes. Beneficiaries of these economic empowerment schemes, i.e., economic empowerment partners, may range from individuals, communities or employees. As a result of having empowered certain individuals, the reporting entity is often able to claim 'economic empowerment credentials', thus allowing the reporting entity greater business opportunities. While local regulation may stipulate the ownership thresholds, the way this is to be achieved is generally not stipulated. Therefore, it is important to note that the design of schemes will differ from jurisdiction to jurisdiction, and many schemes will change over time. Each scheme is unique in terms of the contractual relationships that it creates.

Generally, the way to achieve these regulation thresholds is by transferring share ownership of the entity through share ownership vehicles to targeted beneficiaries. This section focuses specifically on Black Economic Empowerment (BEE) transactions as they have been applied in South Africa which involves the transfer of equity instruments, or interests in equity instruments, to historically disadvantaged individuals. However, the principles can equally be applied in other economic empowerment schemes with similar structures.

These arrangements have raised a number of practical issues of interpretation which led to the scope of IFRS 2 being extended to include transactions where the consideration received appears less than the consideration given, as discussed further in section 2.2.2.C above.

15.5.2 Receipt of goods or services

As noted in section 2.2.2.C above, the goods or services received from economic empowerment partners or entities controlled by them in return for the equity instruments may, or may not, be specifically identifiable. This is elaborated on in the guidance issued by the South African Institute of Chartered Accountants (SAICA).³⁸

The SAICA guide reaches the consensus that IFRS 2 applies to the accounting for BEE transactions where the fair value of cash and other assets received is less than the fair value of equity instruments granted to the economic empowerment partner, i.e., to the BEE credentials.

³⁸ SAICA Financial Reporting Guide 2 - Accounting for Black Economic Empowerment (BEE) Transactions, Accounting Practices Committee (APC) of SAICA, December 2012.

Some have sought to argue that, in the context of South African BEE credentials, these result in the recognition of an intangible asset rather than an expense. In order to be recognised as an asset, an entity must have control over the resource as a result of a past event. Paragraphs 13 and 16 of IAS 38 *Intangible Assets* indicate that control over an intangible asset may be evidenced in two ways:

- As legal rights that are enforceable by law
- Or
- As exchange transactions for the same or similar non-contractual customer relationships

In South African BEE transactions, a contract is usually entered into with an economic empowerment partner that may include a contractual lock-in period or a clause that only allows the transfer of such equity instruments to another economic empowerment partner, usually with the lock-in provision also transferred to the buyer. However, the contract does not provide the entity with legal rights that give it the power to obtain the future economic benefits arising from the economic empowerment transaction, nor the ability to restrict the access of others to those benefits. Therefore, economic empowerment credentials do not qualify for recognition of intangible assets and the difference between the fair value of the award and the consideration received is expensed.

How we see it

Economic empowerment credentials do not generally qualify for recognition of intangible assets and the difference between the fair value of the award and the consideration received is expensed.

This is consistent with guidance issued by SAICA in respect of South African BEE credentials. A similar thought process could be necessary in other jurisdictions where local standard setters have not opined on whether a recognisable intangible asset has been created, or not. Although these credentials could create competitive advantages for entities, they will often fail the recognition criteria of IAS 38. This is due to the absence of legal rights that give an entity power to obtain the future economic benefits arising from the economic empowerment transaction and an inability to restrict the access of others to those benefits i.e., an entity is typically unable to demonstrate control over the economic empowerment credentials.

15.5.3 The substance of equity instruments issued as part of the economic empowerment transactions

Economic empowerment deals are typically complex, and their specific structures and terms can vary considerably. All terms and conditions must be carefully analysed when determining the type of equity instruments granted and whether such instruments fall within the scope of IFRS 2.

However, in practice they do exhibit certain features with some regularity, as discussed below. Typically, economic empowerment arrangements have involved the transfer of equity instruments to:

- Empowerment companies controlled by economic empowerment qualifying individuals
- Economic empowerment qualifying employees of the reporting entity
- Or
- Beneficiaries in the economic empowerment qualifying communities in which the entity operates

The arrangements generally lock the parties in for a minimum specified period and if they want to withdraw, they are restricted to selling their interest only to others with similar qualifying economic empowerment credentials with the buyer's consent, usually with the lock-in provision also transferred to the buyer.

The premise of economic empowerment transactions is to transfer ordinary shares in an entity to the empowerment partner. The equity interest, together with the voting rights, allows for the empowerment partner to participate in the economic decisions made by the entity as would any other shareholder. However, the structure of the transaction and the rights attached of the shares need to be considered carefully to understand what risks and rewards the empowerment partner is exposed to.

Where the reporting entity facilitates the transaction and assists the economic empowerment partner by providing notional funding or non-recourse loans, these factors would need to be appropriately considered in the accounting for such schemes. Accordingly, where the financing provided by the entity to obtain the shares is non-recourse in nature, the arrangement is equivalent to a share option provided (see section 15.2 above) and it would be appropriate to account for it as such.

Another example of facilitating economic empowerment transactions involves the creation of a trust, with the economic empowerment partner holding beneficial rights in the trust, which in turn holds equity instruments of the reporting entity (or a member of its group). The awards made by the trust to the economic empowerment partner may be in the form of:

- The equity instruments originally transferred to the trust
 - Units in the trust itself, usually with a value linked to the value of the equity instruments of the reporting entity originally transferred to the trust
- Or
- Payments made from the proceeds (dividends received, sale of equity instruments etc.) that the trust generates

The accounting issues arising from such schemes include:

- The nature of the trust and whether it meets the criteria for consolidation by the reporting entity. The consequence of the consolidation assessment is important when determining the impact of the transaction in the group accounts. For example, where the trust is not consolidated, the transfer of equity instruments to the trust crystallises an IFRS 2 charge on transfer, to the extent that the consideration paid is less than the fair value of shares issued. However, if the trust is consolidated, the receipt of equity instruments from the reporting entity to the trust is an intra-group transaction and therefore does not give rise to a charge under IFRS 2 in the group consolidated financial statements. The equity instruments held by the trust are instead treated as treasury shares in the group.
- Where the trust is an employee share trust, determining the nature of any distributions made to the employees, could be another issue that arises. For instance, where employees are entitled to receive equity shares in the entity (through the employee trust) or an amount derived from the value of the entity's share, IFRS 2 will be applicable. In other cases, where employees receive a *pro rata* payment based on the amount of cash available in the employee trust, the distribution needs to be analysed as to whether this constitutes a cash-settled share-based payment or a payment that could be within the scope of IAS 19. See section 5.3.6 above, for guidance on awards over a fixed pool of shares (including 'last man standing' arrangements) and section 12.3 above for the accounting of employee benefit trusts ('EBT's) and similar arrangements.
- Whether there is an impact on non-controlling interest. IFRS accounting standards does not provide specific guidance on the recognition and measurement of non-controlling interest arising from such transactions. How to account for non-controlling interest will be largely driven by the substance of the transaction and whether the economic empowerment partner (i.e., the non-controlling interest) has a 'present access to ownership benefits' as a result of a contractual arrangement (see Chapter 8).
- Whether any charge arises under IFRS 2 and, if so, the grant date and therefore, under a grant date model, the amount of the charge.
- Whether awards are equity-settled or cash-settled.

A third example of facilitating an economic empowerment transaction, which is often used when making equity awards to a community, is to make use of a trust as the operating vehicle and appoint trustees to make the awards. These schemes are similar to those above as it provides for a transfer of shares to the trust together with any associated financing. To this end, whether the trust meets the criteria for consolidation must also be considered. Typically, dividends received by the trust are first applied to servicing the financing and the residual is then awarded to the community by the trustees. Often these trusts are perpetual in nature and contain restrictions to prevent the disposal of any of the shares it holds in the entity. When considering the returns received by the community as the empowerment partner, it is clear that they participate in, or part of, the discretionary dividends paid by the entity to the trust. However, the restrictions placed on disposing the shares prevent any capital gain or loss exposure to the empowerment partner. In substance, this is similar to a discretionary annual community social investment being made by the entity to the community, together with the necessary voting rights being exercised by the trustees on behalf of the community. The substance of the transaction is such that the trust is entitled to a dividend stream in respect of the shares held in the trust. Careful consideration needs to be given to the rights of the empowerment parties, where the trust does not have the rights to dispose of the shares.

How we see it

Before one can apply IFRS 2, understanding the substance of the transaction is critical to assess the appropriate accounting thereof. This would involve an analysis of the rights and restrictions attached to the shares issued to the empowerment beneficiary, the funding provided and an analysis of the substance of the transaction in accounting for the arrangement by the entity. This could be different to the legal form that is employed by the entity to achieve its empowerment status.

15.6 Shares used as a currency of payment

Settlement of share-based payment arrangements can take many forms, and in some instances the market value of shares is used as currency to settle the share-based payment transaction. IFRS 2 contains little guidance on how to measure such arrangements. Awards of equity instruments to a fixed monetary value, as discussed above in section 8.10, is one example where the market value of the equity instrument at vesting date is used as a currency to settle an award to a fixed value. An award issued to employees of a subsidiary or business unit which is settled by reference to the fair value of shares in another group entity is another example where the market value of shares is used as a currency to settle the share-based payment transaction (see discussion below).

15.6.1 Awards assessed on the market value of a subsidiary or business unit and settled by reference to the fair value of shares in the parent entity

Some entities implement share-based remuneration schemes which aim to reward employees by reference to the 'market' value of the equity of the business unit for which they work as long as service conditions are met. This could arise where the Group considers the parent's share price to be a somewhat blunt instrument for measuring the performance of the employees of a particular subsidiary or business unit. Indeed, it is not difficult to imagine situations in which a particular subsidiary might perform well but the parent's share price might be dragged down by other factors, or conversely where the parent's share price might rise notwithstanding poor results for that subsidiary. The detail of such schemes varies, but they generally take the form as follows:

- At grant date, the employee is awarded a (real or notional) holding in the equity of the employing subsidiary, the market value of which is measured at grant date and the listed parent will convert the market value of those subsidiary shares at vesting date, into equal value of parent shares to settle the award (scenario 1).
- Or
- The employee is granted an award of as many shares of the listed parent as have a value, at a specified future date (often at, or shortly after, the end of the vesting period but sometimes at a later date), equal to the increase over the vesting period in the market value of the employee's (notional) holding in the equity of the employing subsidiary, otherwise known as share-settled share appreciation rights (akin to an option granted to the employee that is settled in the parent's shares) (scenario 2).

In the two scenarios above, the parent's shares are used as a currency to settle an arrangement with the subsidiary employees that is not dependent on the parent's share price. The share price of the parent's shares is used to determine the number of parent shares that will be issued on settlement. Put another way, the parent's share price (either at grant date or subsequently) does not affect the measurement of the award (see section 8.10 above).

After grant date, IFRS 2 requires remeasurement of an equity-settled share-based payment transaction only for changes in the service condition being met and other non-market vesting conditions. There is no remeasurement after grant date for market conditions and non-vesting conditions. Therefore, an important feature in accounting for the awards in the scenarios outlined above is to assess, whether the basis on which the subsidiary's equity is valued truly yields a market price (or value) to determine the type of performance conditions attached to the awards.

If the basis on which the subsidiary's equity is valued yields a 'market value', the awards in the two scenarios are considered as containing only a service condition, and those awards would not be considered as containing a non-market vesting condition or market condition (there is no specific target share price to be achieved). The awards are measured at grant date using valuation inputs related to the subsidiary's share price and are not remeasured. The fair value at vesting date is used as a conversion feature to determine the number of parent shares to be received as an exit mechanism, and the employee is receiving 'value for value'. The expense recognised is only adjusted for the failure to meet vesting conditions other than market conditions (e.g., service conditions).

If the 'market value' of the subsidiary is based on a constant formula (e.g., an EBITDA multiple), an assessment is required whether that formula provides a good surrogate for the market value of the subsidiary on an ongoing basis (see section 2.2.4.F above). If deemed not to provide a good surrogate for the market value, the awards outlined in the scenarios above could then be considered as containing a non-market vesting condition as the constant formula used by the subsidiary will result in variable number of shares that will vest based on the performance of that entity (see section 3.1 above). This would then result in an expense recognised that is revised at each reporting date consistent with the accounting for non-market vesting conditions. If the formula used to determine the number of parent's shares to be delivered can be determined sometime after the employee has satisfied the service vesting condition, then that formula driven condition would be treated as a non-vesting condition (see section 3.2 above). In contrast to the approach used to measure the non-market vesting condition, the non-vesting condition is taken into account in estimating the fair value of the award granted and not subsequently remeasured. The expense recognised is only adjusted for the failure to meet vesting conditions other than market conditions (e.g., service conditions).

How we see it

As noted above, where the parent's shares are used as a currency to settle a share-based payment arrangement with subsidiary employees based on the subsidiary equity instrument value in the scenarios above, the measurement of the award is not affected by the parent's share price. The arrangement is not dependent on the parent's share price.

However, an important feature in accounting for the awards in the scenarios outlined above is to assess whether the basis on which the subsidiary's equity is valued truly yields a market price (or value) to determine the type of performance conditions attached to the awards and whether the awards contain non-vesting conditions.

16 First-time adoption and transitional provisions

16.1 First-time adoption provisions

The requirements of IFRS 1 *First-time Adoption of International Financial Reporting Standards*, in relation to share-based payment arrangements are discussed in Chapter 6. However, one provision may remain relevant for entities that have already adopted IFRS accounting standards and would no longer generally be considered 'first-time adopters'.

IFRS 1 does not require an entity to account for equity-settled transactions:

- Granted on or before 7 November 2002
- Or
- Granted after 7 November 2002 but vested before the later of the date of transition to IFRS accounting standards and 1 January 2005

However, where such an award is modified, cancelled or settled, the rules regarding modification, cancellation and settlement (see section 7 above) apply in full unless the modification occurred before the date of transition to IFRS accounting standards. [IFRS 1.D2]. The intention of this provision is to prevent an entity from avoiding the recognition of a cost for a new award by structuring it as a modification to an earlier award not in the scope of IFRS 2.

There is slight ambiguity on this point in the wording of IFRS 1, paragraph D2 of which refers only to the modification of such awards. However, paragraph D2 also requires an entity to apply 'paragraphs 26-29' of IFRS 2 to 'modified' awards.

How we see it

Paragraphs 26-29 of IFRS 2 deal not only with modification but also with cancellation and settlement, and indeed paragraphs 28 and 29 are not relevant to modification at all. This makes it clear, in our view, that the IASB intended IFRS 1 to be applied not only to the modification but also to the cancellation and settlement of such awards.

Appendix B - Defined terms

Extract from IFRS 2

Appendix A Defined terms

This appendix is an integral part of the IFRS.

cash-settled share-based payment transaction	A share-based payment transaction in which the entity acquires goods or services by incurring a liability to transfer cash or other assets to the supplier of those goods or services for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity.
employees and others providing similar services	Individuals who render personal services to the entity and either (a) the individuals are regarded as employees for legal or tax purposes, (b) the individuals work for the entity under its direction in the same way as individuals who are regarded as employees for legal or tax purposes, or (c) the services rendered are similar to those rendered by employees. For example, the term encompasses all management personnel, ie those persons having authority and responsibility for planning, directing and controlling the activities of the entity, including non-executive directors.
equity instrument	A contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. ⁵
equity instrument granted	The right (conditional or unconditional) to an equity instrument of the entity conferred by the entity on another party, under a share-based payment arrangement .
equity-settled share-based payment transaction	A share-based payment transaction in which the entity (a) receives goods or services as consideration for its own equity instruments (including shares or share options), or (b) receives goods or services but has no obligation to settle the transaction with the supplier.
fair value	The amount for which an asset could be exchanged, a liability settled, or an equity instrument granted could be exchanged, between knowledgeable, willing parties in an arm's length transaction.
grant date	The date at which the entity and another party (including an employee) agree to a share-based payment arrangement , being when the entity and the counterparty have a shared understanding of the terms and conditions of the arrangement. At grant date the entity confers on the counterparty the right to cash, other assets, or equity instruments of the entity, provided the specified vesting conditions , if any, are met. If that agreement is subject to an approval process (for example, by shareholders), grant date is the date when that approval is obtained.
intrinsic value	The difference between the fair value of the shares to which the counterparty has the (conditional or unconditional) right to subscribe or which it has the right to receive, and the price (if any) the counterparty is (or will be) required to pay for those shares. For example, a share option with an exercise price of CU15, ⁶ on a share with a fair value of CU20, has an intrinsic value of CU5.
market condition	A performance condition upon which the exercise price, vesting or exercisability of an equity instrument depends that is related to the market price (or value) of the entity's equity instruments (or the equity instruments of another entity in the same group), such as: (a) attaining a specified share price or a specified amount of intrinsic value of a share option ; or

	<p>(b) achieving a specified target that is based on the market price (or value) of the entity's equity instruments (or the equity instruments of another entity in the same group) relative to an index of market prices of equity instruments of other entities.</p> <p>A market condition requires the counterparty to complete a specified period of service (ie a service condition); the service requirement can be explicit or implicit.</p>
measurement date	<p>The date at which the fair value of the equity instruments granted is measured for the purposes of this IFRS. For transactions with employees and others providing similar services, the measurement date is grant date. For transactions with parties other than employees (and those providing similar services), the measurement date is the date the entity obtains the goods or the counterparty renders service.</p>
performance condition	<p>A vesting condition that requires:</p> <ul style="list-style-type: none"> (a) the counterparty to complete a specified period of service (ie a service condition); the service requirement can be explicit or implicit; and (b) specified performance target(s) to be met while the counterparty is rendering the service required in (a). <p>The period of achieving the performance target(s):</p> <ul style="list-style-type: none"> (a) shall not extend beyond the end of the service period; and (b) may start before the service period on the condition that the commencement date of the performance target is not substantially before the commencement of the service period. <p>A performance target is defined by reference to:</p> <ul style="list-style-type: none"> (a) the entity's own operations (or activities) or the operations or activities of another entity in the same group (ie a non-market condition); or (b) the price (or value) of the entity's equity instruments or the equity instruments of another entity in the same group (including shares and share options) (ie a market condition). <p>A performance target might relate either to the performance of the entity as a whole or to some part of the entity (or part of the group), such as a division or an individual employee.</p>
reload feature	<p>A feature that provides for an automatic grant of additional share options whenever the option holder exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price.</p>
reload option	<p>A new share option granted when a share is used to satisfy the exercise price of a previous share option.</p>
service condition	<p>A vesting condition that requires the counterparty to complete a specified period of service during which services are provided to the entity. If the counterparty, regardless of the reason, ceases to provide service during the vesting period, it has failed to satisfy the condition. A service condition does not require a performance target to be met.</p>
share-based payment arrangement	<p>An agreement between the entity (or another group⁷ entity or any shareholder of any group entity) and another party (including an employee) that entitles the other party to receive</p> <ul style="list-style-type: none"> (a) cash or other assets of the entity for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity, or (b) equity instruments (including shares or share options) of the entity or another group entity, <p>provided the specified vesting conditions, if any, are met.</p>
share-based payment transaction	<p>A transaction in which the entity</p>

	<p>(a) receives goods or services from the supplier of those goods or services (including an employee) in a share-based payment arrangement, or</p> <p>(b) incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity receives those goods or services.</p>
share option	A contract that gives the holder the right, but not the obligation, to subscribe to the entity's shares at a fixed or determinable price for a specified period of time.
vest	To become an entitlement. Under a share-based payment arrangement , a counterparty's right to receive cash, other assets or equity instruments of the entity vests when the counterparty's entitlement is no longer conditional on the satisfaction of any vesting conditions .
vesting condition	A condition that determines whether the entity receives the services that entitle the counterparty to receive cash, other assets or equity instruments of the entity, under a share-based payment arrangement . A vesting condition is either a service condition or a performance condition .
vesting period	The period during which all the specified vesting conditions of a share-based payment arrangement are to be satisfied.
5	The <i>Conceptual Framework for Financial Reporting</i> issued in 2018 defines a liability as a present obligation of the entity to transfer an economic resource as a result of past events.
6	In this appendix, monetary amounts are denominated in 'currency units (CU)'.
7	A 'group' is defined in Appendix A of IFRS 10 <i>Consolidated Financial Statements</i> as 'a parent and its subsidiaries' from the perspective of the reporting entity's ultimate parent.

Chapter 31

Employee benefits

Contents

Overview	2818
1 Introduction	2819
2 Objective and scope of IAS 19	2820
2.1 Objective	2820
2.2 Scope	2820
2.2.1 General scope requirements of IAS 19	2820
2.2.2 Employee benefits settled by a shareholder or another group entity	2822
3 Pensions and other post-employment benefits - Defined contribution and defined benefit plans	2823
3.1 The distinction between defined contribution plans and defined benefit plans	2823
3.2 Insured benefits	2824
3.3 Multi-employer plans	2826
3.3.1 Multi-employer plans other than plans sharing risks between entities under common control	2826
3.3.1.A The treatment of multi-employer plans	2826
3.3.1.B What to do when 'sufficient information' becomes available	2827
3.3.1.C Withdrawal from or winding up of a multi-employer scheme	2827
3.3.2 Defined benefit plans sharing risks between entities under common control	2827
3.4 State plans	2829
3.5 Plans that would be defined contribution plans but for the existence of a minimum return guarantee	2829
3.6 Death-in-service benefits	2830
4 Defined contribution plans	2833
4.1 General accounting requirements	2833
4.2 Defined contribution plans with vesting conditions	2833
5 Defined benefit plans - General	2834
6 Defined benefit plans - Plan assets	2835
6.1 Definition of plan assets	2835
6.2 Measurement of plan assets	2835
6.3 Qualifying insurance policies	2836
6.4 Reimbursement rights	2836
6.5 Contributions to defined benefit funds	2836
6.6 Longevity swaps	2836

7	Defined benefit plans - Plan liabilities	2838
7.1	Legal and constructive obligations	2838
7.2	Contributions by employees and third parties	2839
7.3	Actuarial methodology	2842
7.4	Attributing benefit to years of service	2843
7.5	Actuarial assumptions	2848
7.6	Discount rate	2850
7.6.1	High quality corporate bonds	2851
7.6.2	No deep market	2852
7.7	Frequency of valuations	2852
8	Defined benefit plans - Treatment of the plan surplus or deficit in the statement of financial position	2854
8.1	Net defined benefit liability (asset)	2854
8.2	Restriction of assets to their recoverable amounts	2854
8.2.1	IFRIC Interpretation 14 - general requirements concerning the limit on a defined benefit asset	2855
8.2.2	Economic benefits available as reduced future contributions when there are no minimum funding requirements for future service	2856
8.2.3	IFRIC Interpretation 14 - the effect of a minimum funding requirement on the economic benefit available as a reduction in future contributions	2856
8.2.4	IFRIC Interpretation 14 - when a minimum funding requirement may give rise to a liability	2859
8.2.5	Pension funding payments contingent on future events within the control of the entity	2861
9	Defined benefit plans - Presentation of the net defined benefit liability (asset)	2862
10	Defined benefit plans - Treatment in profit or loss and other comprehensive income	2863
10.1	Service cost	2863
10.2	Changes in a defined benefit plan	2864
10.2.1	Past service cost	2864
10.2.2	Acquisition of a qualifying insurance policy	2865
10.2.3	Settlements	2865
10.3	Net interest on the net defined benefit liability (asset)	2867
10.4	Remeasurements	2867
10.4.1	Actuarial gains and losses	2868
10.4.2	The return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset)	2868
11	Defined benefit plans - Costs of administering employee benefit plans	2869
12	Short-term employee benefits	2870
12.1	General recognition criteria for short-term employee benefits	2870
12.2	Short-term paid absences	2870
12.2.1	Accumulating absences	2870
12.2.2	Non-accumulating paid absences	2871
12.3	Profit-sharing and bonus plans	2871
12.3.1	Present legal or constructive obligation	2871
12.3.2	Reliable estimate of provision	2872
12.3.3	Statutory profit-sharing based on taxable profit	2872

13 Long-term employee benefits other than post-employment benefits	2873
13.1 Meaning of other long-term employee benefits	2873
13.2 Recognition and measurement	2873
13.2.1 Attribution to years of service	2873
13.2.2 Long-term disability benefit	2874
13.2.3 Long-term benefits contingent on a future event	2874
14 Termination benefits	2875
14.1 Statutory termination indemnities	2875
14.2 Recognition	2876
14.3 Measurement	2876

15.2.4.A Plans accounted for as defined benefit plans	2887
15.2.4.B Plans accounted for as defined contribution plans	2887
15.2.5 Defined benefit plans that share risks between entities under common control	2887
15.2.5.A Plans accounted for as defined benefit plans	2887
15.2.5.B Plans accounted for as defined contribution plans	2887
15.2.6 Disclosure requirements in other IFRS accounting standards	2889
15.3 Other employee benefits	2889
Appendix A - Index of Illustrations	2890
Appendix B - Defined terms	2891

Overview

Employee benefits typically form a very significant part of any entity's costs and can take many and varied forms. Accordingly, IFRS devotes considerable attention to them in two separate standards IFRS 2 *Share-based Payment* and IAS 19 *Employee Benefits*. IFRS 2 is discussed in Chapter 30. All other employee benefits are dealt with in IAS 19.

IAS 19 prescribes the accounting and disclosure for employee benefits, requiring a liability to be recognised as services are provided in exchange for employee benefits to be paid in the future and an expense when the entity consumes the economic benefit arising from these services. It addresses all forms of consideration (other than share-based payments) which are given by an employer in exchange for services rendered or on termination of employment. These include short-term employee benefits, long-term employee benefits, post-employment benefits and termination benefits.

Many issues raised in accounting for employee benefits can be straightforward, such as the allocation of wages paid to an accounting period and are generally dealt with by IAS 19 accordingly. In contrast, accounting for the costs of post-employment and other long-term benefits in the financial statements of employers presents a more difficult challenge. The amounts involved are large, the timescale is long, the estimation process is complex and involves many areas of uncertainty which have to be made the subject of assumptions. Furthermore, the complexities for an IFRS accounting standard are multiplied by the wide variety of arrangements found in different jurisdictions.

Although the standard does not prescribe a step-by-step approach, as seen in other standards, the following approach is recommended:

- (1) Identify all employee benefits to ensure that none are overlooked and as a consequence remain unaccounted for.
- (2) Employee benefits must then be classified into the different categories proposed by the standard, such as short-term benefits, other long-term benefits, termination benefits, defined contribution plans and defined benefit plans.
- (3) All terms and conditions of the arrangement need to be considered, which could also include local laws and regulations or a constructive obligation beyond the formal terms of the plan.
- (4) Internal control process will be needed to develop the estimates required and review the results of actuarial computations.
- (5) Relevant disclosures will need to be determined, applying the materiality principle as appropriate.

What you need to know

- Classification of arrangements might require judgement and the classification could have a significant impact on the resultant accounting.
- The application of IAS 19 can be complicated and require significant estimates to be made annually or at interim reporting dates over many years. See section 7 below.
- Judgements might need to be made around various requirements of the standard, such as the date of modification or settlement of a plan.
- There can be significant assets or liabilities which need to be recognised on the statements of financial position from the recognition of defined benefit pension deficits or surpluses, and these might be very volatile.
- IFRIC 14 *The Limit on a Defined Benefit Asset, Minimum Funding Requirements and their Interaction* might result in the restriction of surpluses or the recognition of additional liabilities. See section 8.2 below.
- Complexities arise due to the wide variety of arrangements and laws found in different jurisdictions.

1 Introduction

This chapter deals with IAS 19 as published in June 2011 and most recently amended in February 2018. The chapter also deals with IFRIC 14 which was published in July 2007 and subsequently amended in November 2009 to address prepayments of future minimum funding requirement contributions.

2 Objective and scope of IAS 19

2.1 Objective

IAS 19 sets out its objective as follows: [IAS 19.1]

Extract from IAS 19

Objective

- | | |
|---|--|
| 1 | <p>The objective of this Standard is to prescribe the accounting and disclosure for employee benefits. The Standard requires an entity to recognise:</p> <ul style="list-style-type: none"> (a) a liability when an employee has provided service in exchange for employee benefits to be paid in the future; and (b) an expense when the entity consumes the economic benefit arising from service provided by an employee in exchange for employee benefits. |
|---|--|

This provides the overarching principle of the standard. Driven by the focus on assets and liabilities in the IASB's *Conceptual Framework* (which is discussed in Chapter 2), it approaches the issues from the perspective of the statement of financial position of the entity. By accounting for the cost of providing employee benefits from the perspective of the employer, rather than from that of the employee, there are possible accounting consequences. For example, the timing of a settlement will be from the perspective of the employer.

2.2 Scope

The general scope of the standard is dealt with in section 2.2.1 below. The issue of employee benefits settled not by the employing entity but by a shareholder or other member of a group is discussed in section 2.2.2 below. As discussed in Chapter 10, contingent payments to selling shareholders in a business combination may be accounted for as remuneration dependent on the nature of the arrangement. Where accounted for as remuneration they will fall under the scope of IAS 19 (or IFRS 2 if they represent a share-based payment transaction).

2.2.1 General scope requirements of IAS 19

As its name suggests, IAS 19 is not confined to pensions and other post-retirement benefits, but rather addresses all forms of consideration (apart from share-based payments which are dealt with by IFRS 2 and discussed in Chapter 30) given by an employer in exchange for service rendered by employees or for the termination of employment. [IAS 19.2, IAS 19.8]. In particular, in addition to post-retirement employee benefits it includes: [IAS 19.5]

- (a) Short-term benefits, including wages and salaries, paid annual leave, bonuses, benefits in kind, etc. The accounting treatment of these is discussed in section 12 below.
 - (b) Other long-term benefits, such as long-service leave, long-term disability benefits, long-term bonuses, etc. These are to be accounted for in a similar, but not identical, way to post-retirement benefits by using actuarial techniques and are discussed in section 13 below.
- And
- (c) Termination benefits. These are to be provided for and expensed when the employer becomes committed to the redundancy plan, on a similar basis to that required by IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* for provisions generally, and are discussed in section 14 below.

The standard addresses only the accounting by employers and excludes from its scope reporting by employee benefit plans themselves. These are dealt with in IAS 26 *Accounting and Reporting by Retirement Benefit Plans*. [IAS 19.3]. The specialist nature of these requirements puts them beyond the scope of this book.

The standard makes clear it applies widely and in particular to benefits:

- (a) Provided to all employees (whether full-time, part-time, permanent, temporary or casual staff and specifically including directors and other management personnel). [IAS 19.7].
- (b) However settled, including payments in cash or goods or services, whether paid directly to employees, their spouses, children or other dependants or any other party (such as insurance companies). [IAS 19.6].

And

- (c) However provided, including:

- (i) Under formal plans or other formal agreements between an entity and individual employees, groups of employees or their representatives.
- (ii) Under legislative requirements, or through industry arrangements, whereby entities are required to contribute to national, state, industry or other multi-employer plans.

Or

- (iii) By those informal practices that give rise to a constructive obligation, that is where the entity has no realistic alternative but to pay employee benefits. An example of a constructive obligation is where a change in the entity's informal practices would cause unacceptable damage to its relationship with employees. [IAS 19.4].

The standard does not define the term 'employee'. However, it is clear from the reference in (a) above to 'full-time, part-time, permanent, casual or temporary' staff and specifically including directors and other management personnel that the term is intended to apply widely. In particular, it is not necessary for there to be a contract of employment in order for an individual to be considered an employee for IAS 19 purposes, other indicators must also be considered such as:

- The individual is considered an employee for tax purposes.
- Services must be performed by a particular individual who has no discretion to arrange for someone else to perform them.
- Services must be performed at a location specified by the entity.
- There is a large amount of oversight and direction by the entity.
- Necessary tools, equipment and materials are provided by the entity.
- Individuals are paid on a time basis, rather than a project/fixed price basis.

And

- Individuals receive benefits of a nature typical for employees (e.g., paid holidays, paid sick leave, post-retirement benefits, or death and disability benefits).

How we see it

Although the standard does not define the term 'employee' we believe it applies to anyone who is in substance an employee which will be a matter of judgement in light of all the facts and circumstances.

Careful consideration is required to determine which standard applies in specific circumstances, and it is possible that a single arrangement could have elements of both an employee benefit and a share-based payment. An example of benefits which could be under the scope of either IAS 19 or IFRS 2 includes a cash bonus dependent on share performance (see Chapter 30). Cash settled awards based on an entity's enterprise value would be under the scope of IAS 19 if the enterprise value used in the calculation did not represent the fair value of the entity's equity instruments (see Chapter 30). Cash bonuses could also be within the scope of both IAS 19 and IFRS 2 if they require a mandatory investment of part of the bonus into shares (see Chapter 30). The cash element paid would fall within the scope of IAS 19, whereas any bonus which results in a required or discretionary investment in shares would come under the scope of IFRS 2. Each element of a bonus would be under the scope of one of these standards, but not both standards.

2.2.2 Employee benefits settled by a shareholder or another group entity

In some circumstances, employee benefits could be settled by a party other than the entity to which services were rendered by employees. Examples would include a shareholder or another entity in a group of entities under common control.

Except for accounting for defined benefit plans under common control IAS 19 is silent on whether, and if so how, an entity receiving employee services in this way must account for them. IFRS 2, on the other hand, devotes quite some detail to this topic for employee services within its scope.

An entity could make reference to the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* (discussed in Chapter 3) when deciding on an accounting policy under IAS 19.

How we see it

Accordingly, in developing an accounting policy the provisions of IFRS 2 could be applied by analogy to transactions within the scope of IAS 19. That accounting policy should be applied consistently to similar transactions.

The relevant requirements of IFRS 2 are discussed in Chapter 30.

3 Pensions and other post-employment benefits - Defined contribution and defined benefit plans

3.1 The distinction between defined contribution plans and defined benefit plans

IAS 19 draws an important distinction between defined contribution plans and defined benefit plans. The determination is made based on the economic substance of the plan as derived from its principal terms and conditions. [IAS 19.27]. The approach it takes is to define defined contribution plans, with the defined benefit plans being the default category. The relevant terms defined by the standard are as follows: [IAS 19.8]

Extract from IAS 19

8 The following terms are used in this Standard with the meanings specified:

...

Post-employment benefits are employee benefits (other than termination benefits and short-term employee benefits) that are payable after the completion of employment.

Post-employment benefit plans are formal or informal arrangements under which an entity provides post-employment benefits for one or more employees.

Defined contribution plans are post-employment benefit plans under which an entity pays fixed contributions into a separate entity (a fund) and will have no legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits relating to employee service in the current and prior periods.

Defined benefit plans are post-employment benefit plans other than defined contribution plans.

...

IAS 19 applies to all post-employment benefits (whether or not they involve the establishment of a separate entity to receive contributions and pay benefits) which include, for example, retirement benefits such as pensions, and post-employment life assurance or medical care. [IAS 19.26]. A less common benefit is the provision of services.

Under defined benefit plans the employer's obligation is not limited to the amount that it agrees to contribute to the fund. Rather, the employer is obliged (legally or constructively) to provide the agreed benefits to current and former employees. Examples of defined benefit schemes given by IAS 19 are: [IAS 19.29]

- (a) Plans where the benefit formula is not linked solely to the amount of contributions and requires the entity to provide further contributions if assets are insufficient to meet the benefits in the plan formula.
 - (b) Guarantees, either directly or indirectly through a plan, of a specified return on contributions.
- And
- (c) Those informal practices that give rise to a constructive obligation, such as a history of increasing benefits for former employees to keep pace with inflation even where there is no legal obligation to do so.

The most significant difference between defined contribution and defined benefit plans is that, under defined benefit plans, some actuarial risk or investment risk (or both) falls, in substance, on the employer. This means that if actuarial or investment experience is worse than expected, the employer's obligation may be increased. [IAS 19.30]. Consequently, because the employer is in substance underwriting the actuarial and investment risks associated with the plan, the expense recognised for a defined benefit plan is not necessarily the amount of the contribution due for the period. [IAS 19.56]. Conversely, under defined contribution plans the benefits received by the employee are determined by the amount of contributions paid (either by the employer, the employee or both) to the benefit plan or insurance company, together with investment returns, and hence actuarial and investment risk fall in substance on the employee. [IAS 19.28].

In 2019 the IFRS IC received a request concerning the classification of a post-employment benefit plan that is administered by a third party. The only relevant terms and conditions in the request were that:

- The entity has an obligation to pay fixed annual contributions into the plan. The entity has determined that it will have no legal or constructive obligation to pay further contributions into the plan if it does not hold sufficient assets to pay all employee benefits relating to employee service in current and prior periods.
- And
- The entity is entitled to a potential discount on its annual contributions if the ratio of plan assets to plan liabilities exceeds a set level.

The IFRS IC was asked to consider whether the existence of a right to a potential discount would result in classification as a defined benefit plan under IAS 19. The IFRS IC concluded that based on the fact pattern provided in the request the existence of a right to a potential discount would not in itself result in the classification as a defined benefit plan. However, they re-iterated the importance of assessing all the relevant terms and conditions of a plan, as well as any informal practices that might give rise to a constructive obligation, in the classification of a plan. The IFRS IC also concluded that the requirements of IAS 19 provide an adequate basis for an entity to determine the classification of a post-employment benefit plan as a defined contribution plan or a defined benefit plan and decided not to add this matter to its standard-setting agenda.¹

The IFRS IC reached this conclusion through consideration of the definition of a defined contribution plan, which requires:

- Contributions to be fixed with no further legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits. [IAS 19.8].
- That this does not exclude the upside potential where the cost to the entity could be less than expected. [IAS 19.BC29].

And

- The fact that in a defined contribution scheme the actuarial risk falls in substance on the employee. [IAS 19.28, IAS 19.30].

The classification of plans such as those described in the fact pattern submitted will require careful consideration of all the facts and circumstances to determine whether actuarial risk has remained with the employer and a defined benefit classification is appropriate. An entity must also consider whether any significant judgements made in this determination must be disclosed in accordance with IAS 1 *Presentation of Financial Statements*. [IAS 1.122].

3.2 Insured benefits

One factor that can complicate making the distinction between defined benefit and defined contribution plans is the use of external insurers. IAS 19 recognises that some employers could fund their post-employment benefit plans by paying insurance premiums and observes that the benefits insured need not have a direct or automatic relationship with the entity's obligation for employee benefits. However, it makes clear that post-employment benefit plans involving insurance contracts are subject to the same distinction between accounting and funding as other funded plans. [IAS 19.47].

Where insurance premiums are paid to fund post-employment benefits, the employer must treat the plan as a defined contribution plan unless it has (either directly or indirectly through the plan) a legal or constructive obligation to:

- (a) Pay the employee benefits directly when they fall due.

Or

- (b) Pay further amounts if the insurer does not pay all future employee benefits relating to employee service in the current and prior periods.

If the employer has retained such a legal or constructive obligation it must treat the plan as a defined benefit plan. [IAS 19.46]. In setting out how to apply defined benefit accounting, however, the standard refers to slightly different criteria to determine whether a legal or constructive obligation is retained. Rather than referring to 'either directly or indirectly through the plan', IAS 19.48 refers to "the entity (either directly, indirectly through the plan, *through the mechanism for setting future premiums or through a related party relationship with the insurer*) retains a legal or constructive obligation" (emphasis added). [IAS 19.48].

How we see it

Our view is that the additional text "through the mechanism for setting future premiums or through a related party relationship with the insurer" in IAS 19.48 must be applied to IAS 19.46, further clarifying the situations in which insured benefits must be treated as defined benefit plans.

In cases where such obligations are retained by the employer, it recognises its rights under a 'qualifying insurance policy' as a plan asset and recognises other insurance policies as reimbursement rights. [IAS 19.48]. Plan assets are discussed in section 6 below.

¹ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

By way of final clarification, the standard notes that where an insurance policy is in the name of a specified plan participant or a group of plan participants and the employer does not have any legal or constructive obligation to cover any loss on the policy, the employer has no obligation to pay benefits to the employees and the insurer has sole responsibility for paying the benefits. In that case, the payment of fixed premiums under such contracts is, in substance, the settlement of the employee benefit obligation, rather than an investment to meet the obligation. Consequently, the employer no longer has an asset or a liability. Accordingly, it must treat the payments as contributions to a defined contribution plan. [IAS 19.49]. The important point here is that employee entitlements will be of a defined benefit nature unless the employer has no obligation whatsoever to pay them were insurance to fail or otherwise be insufficient.

The analysis of insured plans given in the standard, which is described above, along with the definition of defined benefit and defined contribution plans seems comprehensive at first glance. However, there will be circumstances where the distinction might not be so apparent and careful analysis could be required. For example, it is possible that an employer buys insurance on a regular basis (say annually), retaining no further obligation in respect of the benefits insured, but has an obligation (legal or constructive) to keep doing so in the future. In such a scenario, the employer could be exposed to future actuarial variances reflected in a variable cost of purchasing the required insurance in future years (for example, due to changing mortality estimates by the insurer).

Another scenario would be where each year the employee earns an entitlement to a pension of (say) 2% of that year's salary (i.e., current as opposed to final) and the employer purchases each year an annuity contract to commence on the date of retirement.

In our view, the standard is not entirely clear as to the nature of such an arrangement.

On the one hand, it could be argued that it is a defined contribution plan because the definition of defined contribution plans is met when:

- 'Fixed' payments are paid to a separate fund.
- And
- The employer is not obliged to pay further amounts if the fund has insufficient assets to pay the benefits relating to employee service in the current and prior periods.

Further, as noted above the standard considers the payment of 'fixed' premiums to purchase insurance specific to an employee (or group thereof) with no retention of risk in respect of the insured benefits to be a defined contribution arrangement.

On the other hand, it could be argued that this is a defined benefit plan on the grounds that:

- The premiums of future years are not 'fixed' in any meaningful sense (certainly not in the same way as an intention simply to pay a one-off contribution of a given % of salary).
- The standard acknowledges that one factor that can mean insured arrangements are defined benefit in nature is when the employer retains an obligation indirectly through the mechanism for setting future premiums. [IAS 19.48].
- And
- The standard observes that under defined benefit plans "... actuarial risk (that benefits will cost more than expected) and investment risk fall, in substance, on the entity. If actuarial or investment experience are worse than expected, the entity's obligation may be increased". [IAS 19.30].

Much would seem to depend on just what 'fixed' means in such circumstances.

How we see it

Where an employer buys insurance to fund post-employment benefits on a regular basis (say annually) retaining no further obligation in respect of the benefits insured, but has an obligation (legal or constructive) to keep doing so in the future, the employer could be exposed to future actuarial variances reflected in a variable cost of purchasing the required insurance in future years.

Although not expressly addressed by the standard, in our view such arrangements will very likely be defined benefit in nature, albeit with regular (and perhaps only partial) settlement and, if so, must be accounted for as such. This is because the employer has retained actuarial risks by committing to pay whatever it takes in future years to secure the requisite insurance.

See section 3.1 above for further discussion on 'fixed' contributions. Naturally, for any schemes that are determined to be defined benefit plans, the next step would be to see whether the frequent settlement renders the output of the two accounting models materially the same. That would depend, *inter alia*, on the attribution of the benefit to years of service and the impact of an unwinding discount.

The wide variety of possible arrangements in practice mean that careful consideration of individual circumstances will be required to determine the true substance of such arrangements.

3.3 Multi-employer plans

3.3.1 Multi-employer plans other than plans sharing risks between entities under common control

3.3.1.A The treatment of multi-employer plans

Multi-employer plans, other than state plans (see section 3.4 below), under IAS 19 are defined contribution plans or defined benefit plans that:

- (a) Pool assets contributed by various entities that are not under common control.
And
- (b) Use those assets to provide benefits to employees of more than one entity, on the basis that contribution and benefit levels are determined without regard to the identity of the entity that employs the employees. [IAS 19.8].

Accordingly, they exclude group administration plans, which simply pool the assets of more than one employer, for investment purposes and the reduction of administrative and investment costs but keep the claims of different employers segregated for the sole benefit of their own employees. The standard observes that group administration plans pose no particular accounting problems because information is readily available to treat them in the same way as any other single employer plan and because they do not expose the participating employers to actuarial risks associated with the current and former employees of other entities. Accordingly, the standard requires group administration plans to be classified as defined contribution plans or defined benefit plans in accordance with the terms of the plan (including any constructive obligation that goes beyond the formal terms). [IAS 19.38].

The standard gives a description of one example of a multi-employer scheme as follows:

- (a) The plan is financed on a pay-as-you-go basis: contributions are set at a level that is expected to be sufficient to pay the benefits falling due in the same period; and future benefits earned during the current period will be paid out of future contributions.
And
- (b) Employees' benefits are determined by the length of their service and the participating entities have no realistic means of withdrawing from the plan without paying a contribution for the benefits earned by employees up to the date of withdrawal. Such a plan creates actuarial risk for the entity: if the ultimate cost of benefits already earned at the end of the reporting period is more than expected, it will be necessary for the entity either to increase its contributions or persuade employees to accept a reduction in benefits. Therefore, such a plan is a defined benefit plan. [IAS 19.35].

A multi-employer plan must be classified as either a defined contribution plan or a defined benefit plan in accordance with its terms in the normal way (see section 3.1 above). [IAS 19.32]. If a multi-employer plan is classified as a defined benefit plan, IAS 19 requires that the employer account for its proportionate share of the defined benefit obligation, plan assets and costs associated with the plan in the same way as for any other defined benefit plan (see sections 5 to 11 below). [IAS 19.33, IAS 19.36].

The standard does, however, contain a practical exemption if insufficient information is available to use defined benefit accounting. This could be the case, for example, where:

- (a) The entity does not have access to information about the plan that satisfies the requirements of the standard.
Or
- (b) The plan exposes the participating entities to actuarial risks associated with the current and former employees of other entities, with the result that there is no consistent and reliable basis for allocating the obligation, plan assets and cost to individual entities participating in the plan. [IAS 19.36].

In such circumstances, an entity must account for the plan as if it were a defined contribution plan and make the disclosures set out in section 15.2.4 below. [IAS 19.34, IAS 19.36].

The standard notes that there may be a contractual agreement between the multi-employer plan and its participants that determines how the surplus in the plan will be distributed to the participants (or the deficit funded). In these circumstances, an entity participating in such a plan, and accounting for it as a defined contribution plan (as described above), must recognise the asset or liability arising from the contractual agreement and the resulting income or expense in profit or loss. [IAS 19.37]. The standard illustrates this with an example of an entity participating in a multi-employer defined benefit plan which it accounts for as a defined contribution plan because no IAS 19 valuations are prepared. A non-IAS 19 funding valuation shows a deficit of CU100 million in the plan. A contractual schedule of contributions has been agreed with the participating employers in the plan that will eliminate the deficit over the next five years. The entity's total contributions to eliminate the deficit under the contract are CU8 million. IAS 19 requires the entity to recognise immediately a liability for the contributions adjusted for the time value of money and an equal expense in profit or loss [IAS 19.37 Example illustrating paragraph 37]. The important point here is that the standard makes clear that 'defined contribution accounting' is not the same as cash accounting. Extra payments to make good a deficit must be provided for immediately when they are contracted for.

3.3.1.B What to do when 'sufficient information' becomes available

As discussed above, IAS 19 requires a multi-employer defined benefit plan to be treated for accounting purposes as a defined contribution plan when insufficient information is available to apply defined benefit accounting. The standard does not address the accounting treatment required when that situation changes because sufficient information becomes available in a period. Two possible approaches present themselves:

(a) An immediate charge/credit to profit or loss equal to the deficit/surplus.

Or

(b) An actuarial gain or loss recognised on other comprehensive income.

Arguments in favour of (a) would be that for accounting purposes the scheme was a defined contribution scheme. Accordingly, starting defined benefit accounting is akin to introducing a new scheme. The defined benefit obligation recognised is essentially a past service cost. In addition, as discussed in section 3.3.1.A above, the standard clarifies that while defined contribution accounting is being applied an asset or liability must be recognised where there is a contractual arrangement to share a surplus or fund a deficit. The receipt of full information could be considered to represent such an arrangement and hence require full recognition in the statement of financial position with an equivalent entry in profit or loss.

Arguments for (b) would be that the scheme has not changed and that defined contribution accounting was a proxy (and best available estimate) for what the defined benefit accounting should have been. Accordingly, any change to that estimate due to the emergence of new information is an actuarial variance which is recognised in other comprehensive income.

How we see it

Given the ambiguity of the standard either approach, detailed above, is acceptable in determining an accounting policy if applied consistently to similar facts and circumstances.

3.3.1.C Withdrawal from or winding up of a multi-employer scheme

IAS 19 requires the application of IAS 37 to determine when to recognise and how to measure a liability relating to the withdrawal from, or winding-up of, a multi-employer scheme. [IAS 19.39].

3.3.2 Defined benefit plans sharing risks between entities under common control

IAS 19 provides that defined benefit plans that share risks between various entities under common control, for example a parent and its subsidiaries, are not multi-employer plans. [IAS 19.40].

The test, described earlier, for allowing a defined benefit multi-employer plan to be accounted for as a defined contribution plan is that insufficient information is available. By completely excluding entities that are under common control from the definition of multi-employer plans the standard is essentially saying that for these employers, sufficient information is deemed always to be available - at least for the plan as a whole. The standard requires an entity participating in such a plan to obtain information about the plan as a whole measured in accordance with IAS 19 on the basis of assumptions that apply to the plan as a whole. [IAS 19.41]. Whilst a subsidiary might not be in a position to demand such information (any more than participants in schemes described in section 3.3.1.A above), the standard is essentially saying that the parent must make the information available if it wants the subsidiary to be able to comply with IAS 19.

The standard then goes on to specify the accounting treatment to be applied in the individual financial statements of the participating entities. The standard states: [IAS 19.41]

Extract from IAS 19

- 41 ... If there is a contractual agreement or stated policy for charging to individual group entities the net defined benefit cost for the plan as a whole measured in accordance with this Standard, the entity shall, in its separate or individual financial statements, recognise the net defined benefit cost so charged. If there is no such agreement or policy, the net defined benefit cost shall be recognised in the separate or individual financial statements of the group entity that is legally the sponsoring employer for the plan. The other group entities shall, in their separate or individual financial statements, recognise a cost equal to their contribution payable for the period.

This seems to raise more questions than it answers. For example, it provides no clarity on what is meant by:

- The “net defined benefit cost ... measured in accordance with this Standard” (IAS 19). In particular, are actuarial gains and losses part of this ‘net cost’?
- An entity that “is legally the sponsoring employer for the plan”. The pan-jurisdictional scope of IFRS makes such a determination particularly difficult. Furthermore, it suggests that there is only one such legal sponsor - which might not be the case in practice.

A further difficulty with these provisions of the standard is whether it is ever likely in practice that entities would be charged an amount based on the “defined benefit cost measured in accordance with this Standard” (IAS 19). Naturally, situations vary not just across, but also within, individual jurisdictions.

Some further insight as to the IASB’s intentions can be found in the Basis for Conclusions to the standard. [IAS 19.BC48, IAS 19.BC49].

Extract from IAS 19

- BC48 The Board noted that, if there were a contractual agreement or stated policy on charging the net defined benefit cost to group entities, that agreement or policy would determine the cost for each entity. If there is no such contractual agreement or stated policy, the entity that is the sponsoring employer bears the risk relating to the plan by default. The Board therefore concluded that a group plan should be allocated to the individual entities within a group in accordance with any contractual agreement or stated policy. If there is no such agreement or policy, the net defined benefit cost is allocated to the sponsoring employer. The other group entities recognise a cost equal to any contribution collected by the sponsoring employer.
- BC49 This approach has the advantages of (a) all group entities recognising the cost they have to bear for the defined benefit promise and (b) being simple to apply.

This analysis is particularly noteworthy in these respects:

- (a) There is no mention of amounts charged being measured in accordance with IAS 19. Indeed, the third sentence refers to any such agreement or stated policy.
 - (b) The focus is not on ‘amounts charged’ but rather an ‘allocation’ of the scheme across entities.
 - (c) References are to a ‘sponsoring employer’ crucially not a legally sponsoring employer. The term is slightly clarified by the explanation that a sponsoring employer is one that by default bears the ‘risks relating to the plan’.
- And
- (d) The discussion of employers other than the sponsoring employer is explicitly by reference to ‘amounts collected’.

Given the ambiguities in the standard, for entities applying IFRS accounting standards at an individual company level, there could well be divergent treatments in practice.

The standard makes clear that, for each individual group entity, participation in such a plan is a related party transaction. Accordingly, the disclosures set out in section 15.2.5 below are required. [IAS 19.42].

3.4 State plans

IAS 19 observes that state plans are established by legislation to cover all entities (or all entities in a particular category, for example a specific industry) and are operated by national or local government or by another body (for example an autonomous agency created specifically for this purpose) which is not subject to control or influence by the reporting entity. [IAS 19.44]. The standard requires that state plans be accounted for in the same way as for a multi-employer plan (see section 3.3.1 above). [IAS 19.43]. It goes on to note that it is characteristic of many state plans that:

- They are funded on a pay-as-you-go basis with contributions set at a level that is expected to be sufficient to pay the required benefits falling due in the same period.

And

- Future benefits earned during the current period will be paid out of future contributions.

Nevertheless, in most state plans, the entity has no legal or constructive obligation to pay those future benefits: its only obligation is to pay the contributions as they fall due and if the entity ceases to employ members of the state plan, it will have no obligation to pay the benefits earned by its own employees in previous years. For this reason, the standard considers that state plans are normally defined contribution plans. However, in cases when a state plan is a defined benefit plan, IAS 19 requires it to be treated as such as a multi-employer plan. [IAS 19.45].

Some plans established by an entity provide both compulsory benefits which substitute for benefits that would otherwise be covered under a state plan and additional voluntary benefits. IAS 19 clarifies that such plans are not state plans. [IAS 19.44].

3.5 Plans that would be defined contribution plans but for the existence of a minimum return guarantee

It is common in some jurisdictions for the employer to make contributions to a defined contribution post-employment benefit plan and to guarantee a minimum level of return on the assets in which the contributions are invested. In other words, the employee enjoys upside risk on the investments but has some level of protection from downside risk.

The existence of such a guarantee means the arrangement fails to meet the definition of a defined contribution plan (see section 3.1 above) and accordingly is a defined benefit plan. Indeed, the standard is explicit, as it uses plans which guarantee a specified return on contributions as an example of a defined benefit arrangement. [IAS 19.29(b)]. The somewhat more difficult issue is how exactly to apply defined benefit accounting to such an arrangement, as this would require projecting forward future salary increases and investment returns and discounting these amounts at corporate bond rates. Although this approach is required by the standard, some consider it to be inappropriate in such circumstances. This issue was debated by the IFRS IC, which published a draft interpretation on 8 July 2004 entitled D9 - *Employee Benefit Plans with a Promised Return on Contributions or Notional Contributions*. The approach taken in D9 was to distinguish two different types of benefits:

- (a) A benefit of contributions or notional contributions plus a guarantee of a fixed return (in other words, benefits which can be estimated without having to make an estimate of future asset returns).

And

- (b) A benefit that depends on future asset returns.

For benefits under (a) above, it was proposed that the defined benefit methodology in IAS 19 be applied as normal. In summary, that meant:

- Calculating the benefit to be paid in the future by projecting forward the contributions or notional contributions at the guaranteed fixed rate of return.
- Allocating the benefit to periods of service.
- Discounting the benefits allocated to the current and prior periods at the rate specified in IAS 19 to arrive at the plan liability, current service cost and net interest.

And

- Recognising any remeasurements in accordance with the entity's accounting policy (note that there is no longer an accounting policy choice under IAS 19 and remeasurements must be recorded in other comprehensive income).

For benefits covered by (b) above, it was proposed that the plan liability must be measured at the fair value, at the end of the reporting period, of the assets upon which the benefit is specified (whether plan assets or notional assets). No projection forward of the benefits would be made, and discounting of the benefit would not therefore be required.

D9 suggested that plans with a combination of a guaranteed fixed return and a benefit that depends on future asset returns must be accounted for by analysing the benefits into a fixed component and a variable component. The defined benefit asset or liability that would arise from the fixed component alone would be measured and recognised as described above. The defined benefit asset (or liability) that would arise from the variable component alone would then be calculated as described above and compared to the fixed component. An additional plan liability would be recognised to the extent that the asset (or liability) calculated for the variable component is smaller (or greater) than the asset (or liability) recognised in respect of the fixed component.

In August 2005, the IFRS IC however announced the withdrawal of D9, observing the following: “The staff found the fixed/variable and modified fixed/variable approaches inadequate to give a faithful representation of the entity’s obligation for more complex benefit structures. They believed that some aspects of the fixed/variable approach in D9 were not fully consistent with IAS 19. ... The staff ... recommended that the correct treatment for D9 plans should be determined as part of an IASB project.”

The IFRS IC was asked in 2012 whether the revisions to IAS 19 in 2011 affect the accounting for these types of employee benefits and concluded they do not.²

The IFRS IC re-opened its examination of the subject and spent some time considering the issue. In May 2014, it decided not to proceed with the issue, stating the following: “In the Interpretations Committee’s view, developing accounting requirements for these plans would be better addressed by a broader consideration of accounting for employee benefits, potentially through the research agenda of the IASB. The Interpretations Committee acknowledged that reducing diversity in practice in the short term would be beneficial. However, because of the difficulties encountered in progressing the issues, the Interpretations Committee decided to remove the project from its agenda. The Interpretations Committee notes the importance of this issue because of the increasing use of these plans. Consequently, the Interpretations Committee would welcome progress on the IASB’s research project on post-employment benefits”.³

In February 2018, the Board announced a research project on pension benefits that depend on asset returns, however the IASB has currently discontinued any work with respect to IAS 19.

3.6 Death-in-service benefits

The provision of death-in-service benefits is a common part of employment packages (either as part of a defined benefit plan or on a standalone basis). We think it is regrettable that IAS 19 provides no guidance on how to account for such benefits, particularly as E54 (the exposure draft preceding an earlier version of IAS 19) devoted considerable attention to the issue.⁴ The basis for conclusion to IAS 19 explains the removal of the guidance as follows: [IAS 19.BC253]

Extract from IAS 19

Other long-term employee benefits

Death-in-service benefits

BC253 E54 proposed guidance on cases where death-in-service benefits are not insured externally and are not provided through a post-employment benefit plan. IASC concluded that such cases will be rare. Accordingly, IASC deleted the guidance on death-in-service benefits.

This seems to miss the point - E54 also gave guidance on cases where the benefits are externally insured and where they are provided in conjunction with another post-employment benefit plan which entitles the member to either a death in service benefit or a post-employment benefit. In our view, the proposals in E54 had merit, and it is worth reproducing them here.

² [IFRIC Update](#), September 2012, available on the IFRS Foundation’s website.

³ [IFRIC Update](#), May 2014, available on the IFRS Foundation’s website.

⁴ Exposure Draft, E54 *Employee Benefits*, IASC, October 1996, paras. 17-21.

“An enterprise should recognise the cost of death-in-service benefits ... as follows:

- (a) in the case of benefits insured or re-insured with third parties, in the period in respect of which the related insurance premiums are payable; and
- (b) in the case of benefits not insured or re-insured with third parties, to the extent that deaths have occurred before the end of the reporting period.

“However, in the case of death-in-service benefits provided through a post-employment benefit plan, an enterprise should recognise the cost of those benefits by including their present value in the post-employment benefit obligation.

“If an enterprise re-insures a commitment to provide death-in-service benefits, it acquires a right (to receive payments if an employee dies in service) in exchange for an obligation to pay the premiums.

“Where an enterprise provides death-in-service benefits directly, rather than through a post-employment benefit plan, the enterprise has a future commitment to provide death-in-service coverage in exchange for employee service in those same future periods (in the same way that the enterprise has a future commitment to pay salaries if the employee renders service in those periods). That future commitment is not a present obligation and does not justify recognition of a liability. Therefore, an obligation arises only to the extent that a death has already occurred by the end of the reporting period.

“If death-in-service benefits are provided through a pension plan (or other post-employment plan) which also provides post-employment benefits to the same employee(s), the measurement of the obligation reflects both the probability of a reduction in future pension payments through death in service and the present value of the death-in-service benefits (see [E-54’s discussion of mutual compatibility of actuarial assumptions]).

“Death-in-service benefits differ from post-employment life insurance because post-employment life insurance creates an obligation as the employee renders services in exchange for that benefit; an enterprise accounts for that obligation in accordance with [the requirements for defined benefit plans]. Life insurance benefits that are payable regardless of whether the employee remains in service comprise two components: a death-in-service benefit and a post-employment benefit. An enterprise accounts for the two components separately.”

In particular, an appropriate approach could be that:

- Death-in-service benefits provided as part of a defined benefit post-employment plan are factored into the actuarial valuation. In this case any insurance cover must be accounted for in accordance with the normal rules of IAS 19 (see section 6 below). An important point here is that insurance policies for death-in-service benefits typically cover only one year, and hence will have a low or negligible fair value. As a result, it will not be the case that the insurance asset is equal and opposite to the defined benefit obligation.
 - Other death-in-service benefits which are externally insured are accounted for by expensing the premiums as they become payable.
- And
- Other death-in-service benefits which are not externally insured are provided for as deaths in service occur.

The first bullet is particularly important. The measure of the post-employment benefit (like a pension) will be reduced to take account of expected deaths in service. Accordingly, it would be inappropriate to ignore the death in service payments that would be made. The question that arises is how exactly to include those expected payments. This raises the same issue as for long-term disability benefits (discussed in section 13.2.2 below), i.e., what to do with the debit entry. However, IAS 19 has no explicit special treatment for death-in-service benefits comparable to that for disability benefits. Given the absence of specific guidance, the requirement is to apply the projected unit credit method to death in service benefits. As the benefit is fully vested, an argument could be made that the expected benefit must be accrued fully (on a discounted basis). Another approach would be to build up the credit entry in the statement of financial position over the period to the expected date of death.

An alternative approach could be to view death-in-service benefits as being similar to disability benefits. Proponents of this view would argue that the recognition requirements for disability benefits (discussed in section 13.2.2 below) could also be applied to death-in-service.

In January 2008, the IFRS IC published its agenda decision explaining why it decided not to put death-in-service benefits onto its agenda.⁵ In the view of the IFRS IC, “divergence in this area was unlikely to be significant. In addition, any further guidance that it could issue would be application guidance on the use of the Projected Unit Credit Method”. The second reason seems more credible than the first.

As part of its analysis, the ‘rejection notice’ sets out some of the IFRS IC’s views on the subject. It observes the following:

- (a) In some situations, IAS 19 requires these benefits to be attributed to periods of service using the Projected Unit Credit Method.
- (b) IAS 19 requires attribution of the cost of the benefits until the date when further service by the employee will lead to no material amount of further benefits under the plan, other than from further salary increases.
- (c) The anticipated date of death would be the date at which no material amount of further benefit would arise from the plan.
And
- (d) Using different mortality assumptions for a defined benefit pension plan and an associated death-in-service benefit would not comply with the requirement of IAS 19 to use actuarial assumptions that are mutually compatible.

Points (a) to (c) above support the analysis that a provision must be built up gradually from the commencement of employment to the expected date of death. They also suggest that making an analogy to the specific rules in the standard on disability might not be appropriate. In addition, point (c) is simply re-iterating a clear requirement of the standard. The above agenda decision of the IFRS IC is not as helpful as we would have liked. The use of the phrase ‘in some situations’ in point (a) above leaves uncertain just what those circumstances could be. In September 2007, the IFRS IC published a tentative agenda decision which said “If these benefits are provided as part of a defined benefit plan, IAS 19 requires them to be attributed to periods of service using the Projected Unit Credit Method”.⁶ At the following meeting the IFRS IC discussed the comment letters received which noted that it could be argued that such attribution would be required only if the benefits were dependent on the period of service. No decision was reached on the final wording of the rejection notice because “IFRIC ... was unable to agree on wording for its agenda decision”.⁷

How we see it

Given the lack of explicit guidance on death-in-service benefits in IAS 19 itself and given the IFRS IC’s decision not to address the matter, it seems likely that practice will be mixed.

⁷ [IASB Update](#), November 2007, available on the IFRS Foundation’s website.

4 Defined contribution plans

4.1 General accounting requirements

Accounting for defined contribution plans (see section 3 above) is straightforward under IAS 19 because, as the standard observes, the reporting entity's obligation for each period is determined by the amounts to be contributed for that period. Consequently, no actuarial assumptions are required to be made to measure the obligation or the expense and there is no possibility of any actuarial gain or loss to the reporting entity. Moreover, the obligations are measured on an undiscounted basis, except where they are not expected to be settled wholly before twelve months after the end of the period in which the employees render the related service. [IAS 19.50]. Where discounting is required, the discount rate must be determined in the same way as for defined benefit plans, which is discussed in section 7.6 below. [IAS 19.52]. In general, though, it would seem unlikely for a defined contribution scheme to be structured with such a long delay between the employee service and the employer contribution.

IAS 19 requires that, when an employee has rendered service during a period, the employer must recognise the contribution payable to a defined contribution plan in exchange for that service:

- (a) As a liability (accrued expense), after deducting any contribution already paid. If the contribution already paid exceeds the contribution due for service before the end of the reporting period, the excess must be recognised as an asset (prepaid expense) to the extent that the prepayment will lead to, for example, a reduction in future payments or a cash refund.

And

- (b) As an expense, unless another IFRS accounting standard requires or permits its capitalisation. [IAS 19.51].

As discussed in section 3.3.1.A above, IAS 19 requires multi-employer defined benefit plans to be accounted for as defined contribution plans in certain circumstances. The standard makes clear that contractual arrangements to make contributions to fund a deficit must be fully provided for (on a discounted basis) even if they are to be paid over an extended period. [IAS 19.37].

4.2 Defined contribution plans with vesting conditions

In February 2011, the IFRS IC received a request seeking clarification on the effect that vesting conditions have on the accounting for defined contribution plans. The IFRS IC was asked whether contributions to such plans must be recognised as an expense in the period for which they are paid or over the vesting period. In the examples given in the submission, the employee's failure to meet a vesting condition could result in the refund of contributions to, or reductions in future contributions by, the employer.

The IFRS IC decided not to add the issue to its agenda, noting that there is no significant diversity in practice in respect of the effect that vesting conditions have on the accounting for defined contribution post-employment benefit plans, nor does it expect significant diversity in practice to emerge in the future.

Explaining its decision, the IFRS IC observed that "each contribution to a defined contribution plan is to be recognised as an expense or recognised as a liability (accrued expense) over the period of service that obliges the employer to pay this contribution to the defined contribution plan. This period of service is distinguished from the period of service that entitles an employee to receive the benefit from the defined contribution plan (i.e., the vesting period), although both periods may be coincident in some circumstances. Refunds are recognised as an asset and as income when the entity/employer becomes entitled to the refunds, e.g., when the employee fails to meet the vesting condition".⁸

⁸ [IFRIC Update](#), May 2011, available on the IFRS Foundation's website.

5 Defined benefit plans - General

The standard notes that accounting for defined benefit plans is complex because actuarial assumptions are required to measure both the obligation and the expense, and there is a possibility of actuarial gains and losses. Moreover, the obligations are measured on a discounted basis because they may be settled many years after the employees render the related service. [IAS 19.55]. Also, IAS 19 makes clear that it applies not just to unfunded obligations of employers but also to funded plans. The details of pension scheme arrangements vary widely from jurisdiction to jurisdiction and, indeed, within them. Frequently though, they involve some entity or fund, separate from the employer, to which contributions are made by the employer (and sometimes employees) and from which benefits are paid. Typically, the employer (through either legal or constructive obligations) essentially underwrites the fund in the event that the assets in the fund are insufficient to pay the required benefits. This is the key feature which means such an arrangement is a defined benefit plan (see section 3 above). [IAS 19.56].

In addition to specifying accounting and disclosure requirements, IAS 19 summarises the steps necessary in accounting for a defined benefit plan, to be applied separately to each separate plan, as follows:

- (a) Determining the deficit or surplus by:
 - (i) Using an actuarial technique, the projected unit credit method, to make a reliable estimate of the ultimate cost to the entity of the benefit that employees have earned in return for their service in the current and prior periods. This requires an entity to determine how much benefit is attributable to the current and prior periods and to make estimates (actuarial assumptions) about demographic variables (such as employee turnover and mortality) and financial variables (such as future increases in salaries and medical costs) that will affect the cost of the benefit. See section 7.3 below. As noted in section 7.7 below, a valuation is required on an annual basis, or possibly more frequently where interim reports are prepared.
 - (ii) Discounting that benefit in order to determine the present value of the defined benefit obligation and the current service cost. See section 7.6 below.

And

 - (iii) Deducting the fair value of any plan assets from the present value of the defined benefit obligation. See section 6.2 below.
- (b) Determining the amount of the net defined benefit liability (asset) as the amount of the deficit or surplus determined in (a), adjusted for any effect of limiting a net defined benefit asset to the asset ceiling with sufficient regularity that the amounts recognised in the financial statements do not differ materially from the amounts that would be determined at the end of the reporting period. See sections 6.2, 7.7 and 8.2 below.
- (c) Determining amounts to be recognised in profit or loss:
 - (i) Current service cost. See section 10.1 below.
 - (ii) Any past service cost and gain or loss on settlement. See sections 10.2.1 and 10.2.3 below.
 - (iii) Net interest on the net defined benefit liability (asset). See section 10.3 below.

And
- (d) Determining the remeasurements of the net defined benefit liability (asset), to be recognised in other comprehensive income, comprising:
 - (i) Actuarial gains and losses. See section 10.4.1 below.
 - (ii) Return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset). See section 10.4.2 below.

And

 - (iii) Any change in the effect of the asset ceiling, excluding amounts included in net interest on the net defined benefit liability (asset). See section 8.2 below. [IAS 19.57].

Retirement benefits will often be very significant in the context of an employer's financial statements. Therefore, the standard encourages, but does not require involvement of a qualified actuary in the measurement of all material post-employment benefit obligations. [IAS 19.59]. However, the standard acknowledges that in some circumstances estimates, averages and computational shortcuts may provide a reliable approximation. [IAS 19.60]. These steps are discussed in further detail in the sections 7.5 and 7.6 below.

In addition, careful consideration of the disclosures will be required to ensure that the disclosure objective of the standard (see section 15.2 below) has been met.

6 Defined benefit plans - Plan assets

6.1 Definition of plan assets

IAS 19 provides the following definitions relating to plan assets: [IAS 19.8, IAS 19.114]

Extract from IAS 19

8 The following terms are used in this Standard with the meanings specified:

...

Plan assets comprise:

- (a) assets held by a long-term employee benefit fund; and
- (b) qualifying insurance policies.

Assets held by a long-term employee benefit fund are assets (other than non-transferable financial instruments issued by the reporting entity) that:

- (a) are held by an entity (a fund) that is legally separate from the reporting entity and exists solely to pay or fund employee benefits; and
- (b) are available to be used only to pay or fund employee benefits, are not available to the reporting entity's own creditors (even in bankruptcy), and cannot be returned to the reporting entity, unless either:
 - (i) the remaining assets of the fund are sufficient to meet all the related employee benefit obligations of the plan or the reporting entity; or
 - (ii) the assets are returned to the reporting entity to reimburse it for employee benefits already paid.

A qualifying insurance policy is an insurance policy¹ issued by an insurer that is not a related party (as defined in IAS 24 *Related Party Disclosures*) of the reporting entity, if the proceeds of the policy:

- (a) can be used only to pay or fund employee benefits under a defined benefit plan; and
- (b) are not available to the reporting entity's own creditors (even in bankruptcy) and cannot be paid to the reporting entity, unless either:
 - (i) the proceeds represent surplus assets that are not needed for the policy to meet all the related employee benefit obligations; or
 - (ii) the proceeds are returned to the reporting entity to reimburse it for employee benefits already paid.

114 Plan assets exclude unpaid contributions due from the reporting entity to the fund, as well as any non-transferable financial instruments issued by the entity and held by the fund. Plan assets are reduced by any liabilities of the fund that do not relate to employee benefits, for example, trade and other payables and liabilities resulting from derivative financial instruments.

¹ A qualifying insurance policy is not necessarily an insurance contract, as defined in IFRS 17 *Insurance Contracts*.

Whilst non-transferable financial instruments issued by the employer are excluded from the definition of plan assets, plans can, and do, own transferable instruments issued by the employer (such as listed shares and bonds) and these would qualify as plan assets.

A footnote to the definition indicates that a qualifying insurance policy is not necessarily an insurance contract as defined in IFRS 17 *Insurance Contracts* (see Chapter 51).

6.2 Measurement of plan assets

IAS 19 requires plan assets to be measured at their fair value, [IAS 19.113], which is defined as "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date". [IAS 19.8]. This is the same definition as is used in IFRS 13 *Fair Value Measurement* (see Chapter 15). To comply with the requirements of paragraph 58 of the standard we would expect that the fair value of plan assets is measured at each reporting date, especially where fair values are volatile.

The fair value of any plan assets is deducted from the present value of the defined benefit obligation in determining the deficit or surplus - see section 8 below. [IAS 19.113].

6.3 Qualifying insurance policies

Where plan assets include qualifying insurance policies that exactly match the amount and timing of some or all of the benefits payable under the plan, the fair value of those insurance policies is deemed to be the present value of the related obligations, subject to any reductions required if the amounts receivable under the insurance policies are not recoverable in full. [IAS 19.115].

6.4 Reimbursement rights

Some employers could have in place arrangements to fund defined benefit obligations which do not meet the definition of qualifying insurance policies above but which do provide for another party to reimburse some or all of the expenditure required to settle a defined benefit obligation. In such a case, the expected receipts under the arrangement are not classified as plan assets under IAS 19 (and hence they are not presented as part of a net pension asset/liability - see section 8 below). Instead, the employer must recognise its right to reimbursement as a separate asset, but only when it is virtually certain that another party will reimburse some or all of the expenditure required to settle a defined benefit obligation. The asset must be measured at fair value and, in all other respects, it must be treated in the same way as a plan asset. In particular, changes in fair value are disaggregated and accounted for in the same way as plan assets - see section 10 below. In profit or loss, the expense relating to a defined benefit plan could be presented net of the amount recognised for a reimbursement. [IAS 19.116, IAS 19.117, IAS 19.118].

As is the case for qualifying insurance policies, for reimbursement rights that exactly match the amount and timing of some or all of the benefits payable fair value is determined as the present value of the related obligation, subject to any reduction required if the reimbursement is not recoverable in full. [IAS 19.119].

6.5 Contributions to defined benefit funds

Contributions to defined benefit plans under IAS 19 are a movement between line items in the statement of financial position - the reduction in cash for the employer being reflected by an increase in the plan assets. Perhaps because of this straightforward accounting, the standard provides no guidance on contributions, which it implicitly deals with as always being in the form of cash.

Although contributions are very commonly in cash, there is no reason why an employer could not contribute any other assets to a defined benefit plan and that raises the question of how to account for the disposal - particularly so, since from the point of transfer the assets will be measured at fair value under IAS 19.

How we see it

In our view, a transfer of a non-cash asset to a defined benefit plan must be treated as a disposal, with proceeds equal to the fair value of the asset.

That would give rise to gains and losses in profit or loss (unless the asset in question was already carried at fair value) and, for certain assets (such as debt instruments held at fair value through other comprehensive income), the reclassification into profit or loss of amounts previously recognised in other comprehensive income.

Where a company makes contributions to a post-employment benefit fund on behalf of its employees, those cash outflows are part of the compensation for employment services and would be classified as operating cash flows as they are derived from the principal-revenue-producing activities of the entity (see Chapter 36).

6.6 Longevity swaps

A longevity swap transfers, from a pension scheme to an external party, the risk of members living longer (or shorter) than expected.

The IFRS IC was asked in August 2014 to clarify the measurement of longevity swaps held by an entity's defined benefit plan, and in particular discussed whether an entity must:

- (a) Account for a longevity swap as a single instrument and measure its fair value as part of plan assets (discussed in section 6.2 above) with changes in fair value being recorded in other comprehensive income.
- Or
- (b) Split longevity swaps into two components.

The two components in (b) would be a 'fixed leg' and a 'variable leg'. As the variable leg exactly matches some or all of the defined benefit obligation it would represent a qualifying insurance policy and be measured at the present value of the related obligation (discussed in section 6.3 above). The fixed leg comprises a series of fixed payments to be made in return for the receipt of the variable leg receipts. In other words, a longevity swap could be considered to be economically equivalent to the purchase of qualifying insurance (commonly called a 'buy-in') but with the premium paid over a period of time rather than at inception.

The likely effect of disaggregating a longevity swap in this way would be to recognise a remeasurement loss at inception very similar to that for a buy-in. Conversely, considering the swap as a single instrument measured at fair value would likely have no initial effect as typically its fair value would be zero (that is, a premium neither received nor paid).

If the two legs were to be considered separately, an appropriate accounting policy would need to be applied to the fixed leg. Two possibilities were discussed by the IFRS IC as follows. The fixed leg would initially be measured at fair value with subsequent accounting either:

- If treated as part of plan assets, at fair value with interest reported in profit or loss and other changes being included in other comprehensive income (discussed in section 6.2 above).
- Or
- If treated as a financial liability, at amortised cost using the effective interest rate method with interest recognised in profit and loss and no other remeasurements.

The IFRS IC noted that when such transactions take place, the predominant practice is to account for a longevity swap as a single instrument and measure it at fair value as part of plan assets.

The IFRS IC decided not to add this issue to its agenda as it did not expect diversity to develop in the application of IAS 19.⁹

How we see it

Given that the IFRS IC decided not to add this to its agenda we believe that either of the accounting options detailed above would be acceptable. An entity should develop an accounting policy after consideration of these options and apply this consistently where there are similar facts and circumstances.

⁹ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

7 Defined benefit plans - Plan liabilities

7.1 Legal and constructive obligations

IAS 19 refers to the liabilities of defined benefit plans as the present value of defined benefit obligations, which it defines as "... the present value, without deducting any plan assets, of expected future payments required to settle the obligation resulting from employee service in the current and prior periods". [IAS 19.8].

The obligations must include not only the benefits set out in the plan, but also any constructive obligations that arise from the employer's informal practices which go beyond the formal plan terms, and must where relevant include an estimate of expected future salary increases (taking into account inflation, seniority, promotion and other relevant factors, such as supply and demand in the employment market). [IAS 19.61, IAS 19.87, IAS 19.88, IAS 19.89, IAS 19.90].

A constructive obligation exists where a change in the employer's informal practices would cause unacceptable damage to its relationship with employees and which therefore leaves the employer with no realistic alternative but to pay those employee benefits. [IAS 19.61]. As can be seen from the above it is very similar to the meaning of the term as used in IAS 37 where it is defined as follows: [IAS 37.10]

Extract from IAS 37

10 The following terms are used in this Standard with the meanings specified:

...

A **constructive obligation** is an obligation that derives from an entity's actions where:

- (a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and
- (b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities.

...

The standard refers to constructive obligations throughout and determining whether a constructive obligation exists will often require judgement and careful consideration of the facts and circumstances, including, but not limited to, any internal communication both from the employer as well as from employee representatives (e.g., trade unions within the company).

However, IAS 19 goes on to add a further nuance. The standard observes that it is usually difficult to cancel a retirement benefit plan (without payment) whilst still retaining staff, and in light of this it requires that reporting entities assume (in the absence of evidence to the contrary) any currently promised benefits will continue for the remaining working lives of employees. [IAS 19.62]. Absent any contrary evidence, such as the entity no longer being able to fund the plan, this observation appears reasonable.

An employer's obligations (legal or constructive) could also extend to making changes to benefits in the future. The standard requires all such effects to be built into the computation of the obligation and gives the following examples of what they might comprise:

- (a) The entity has a history of increasing benefits, for example, to mitigate the effects of inflation, and no indication that this practice will change in the future.
- (b) The entity is obliged, either by the formal terms of the plan (or a further constructive obligation) or by legislation to use any surplus in the plan for the benefit of plan participants.

Or

- (c) Benefits vary in response to a performance target or other criteria. For example, the terms of the plan could state that it will pay reduced benefits or require additional contributions from employees if the plan assets are insufficient. The measurement of the obligation reflects the best estimate of the effect of target or other criteria. [IAS 19.88]. As noted in section 7.3 below, the IFRS IC has discussed how a performance target could affect the measurement of the defined benefit obligation.

By contrast, any other future changes in the obligation (i.e., where no legal or constructive obligation previously existed) will be reflected in future current service costs, future past service costs or both (discussed in section 10.1 below). [IAS 19.89].

IAS 19 also deals with the situation where the level of defined benefits payable by a scheme varies with the level of state benefits. When this is the case a best estimate of any changes in state benefit must be factored into the actuarial computations only if they are enacted by the end of the reporting period or are predictable based on past history or other evidence. [IAS 19.87, IAS 19.95].

Some defined benefit plans limit the contributions that an entity is required to pay. The ultimate cost of the benefits takes account of the effect of a limit on contributions. The effect of a limit on contributions is determined over the shorter of the estimated life of the entity and the estimated life of the plan. [IAS 19.91].

It is sometimes the case where the plan rules include an automatic exit event, where the entity's involvement in the plan will cease, which cannot be unilaterally avoided by the entity. On occurrence of the exit event, the entity will extinguish its obligation under the plan by the payment of an agreed amount through giving up plan assets. We believe the consequences of this must be included within the calculation of the defined benefit obligation as the best estimate of the ultimate cost to the company, and that this should not be treated as a settlement. For example, an entity is a participant in a multi-employer scheme but will exit that scheme when its last member ceases to be active (such as through retirement) and the scheme is closed to new members, the calculation of the defined benefit obligation would include cash flows paid to members until the expected exit event plus any transfer of assets at the date of the exit event as required under the plan rules. This is similar to the situation discussed in section 10.2.3 below, where an agreement for a settlement is entered into prior to the year end, but the transaction completes post year end. Where the agreement is binding the impact would be reflected in the calculation of any loss on settlement recorded.

7.2 Contributions by employees and third parties

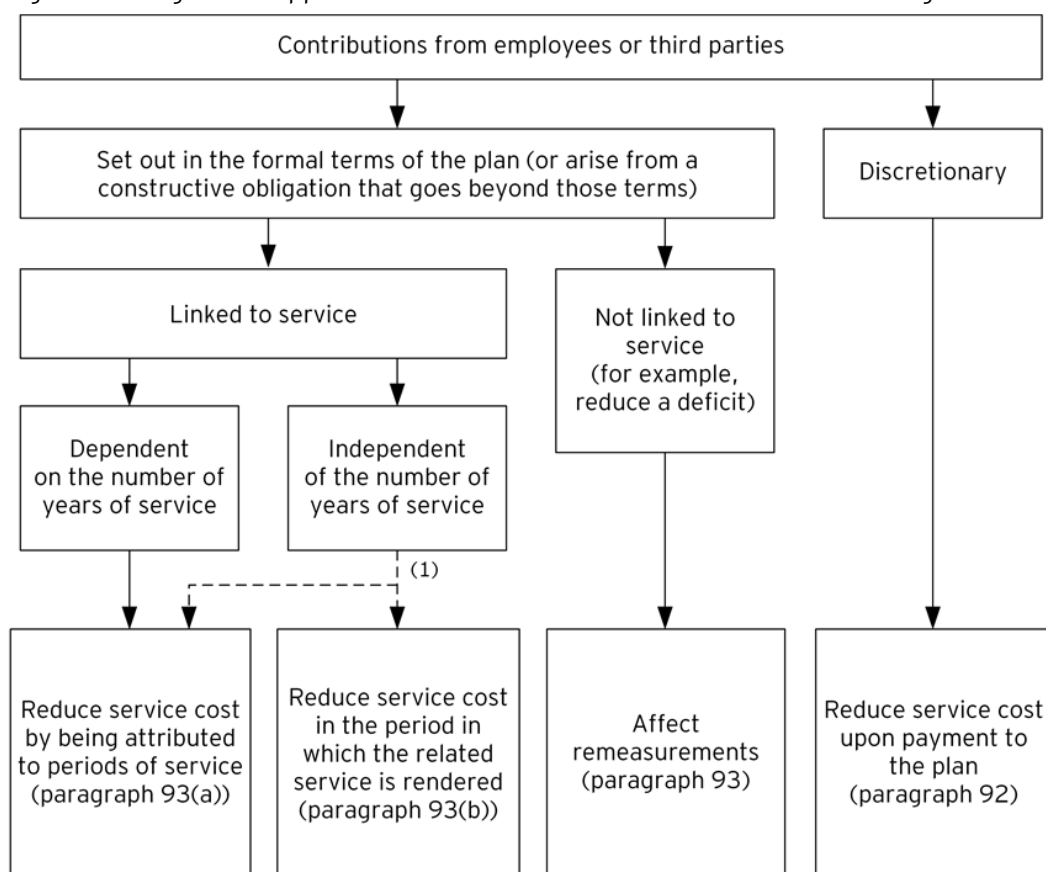

The standard notes that some defined benefit plans require employees or third parties to contribute to the cost of the plan. Contributions by employees reduce the cost of the benefits to the entity. The standard requires an entity to 'consider' whether third-party contributions reduce the cost of the benefits to the entity or are a reimbursement right (discussed in section 6.4 above). Contributions by employees or third parties are either set out in the formal terms of the plan (or arise from a constructive obligation that goes beyond those terms) or are discretionary. IAS 19 requires discretionary contributions by employees or third parties to be accounted for as a reduction in service cost when they are paid to the plan. [IAS 19.92].

The standard draws a distinction between non-discretionary contributions from employees or third parties set out in the formal terms of the plan which are 'linked to service' and those which are not. Such contributions not dependent upon years of service reduce remeasurements of the net defined benefit liability (asset). An example given by the standard is if the contributions are required to reduce a deficit arising from losses on plan assets or actuarial losses. [IAS 19.93].

For contributions which are linked to service, the standard states that they reduce the service cost as follows:

- If the amount of the contributions is dependent on the number of years of service (e.g., contributions that increase with years of service), they must be attributed to periods of service using the same attribution method required for the gross benefit (i.e., either using the plan's contribution formula or on a straight-line basis - see section 7.4 below).
- Or
- If the amount of the contributions is independent of the number of years of service (e.g., contributions that are a fixed percentage of salary), they are permitted to be recognised as a reduction of the service cost in the period in which the related service is rendered. Examples of contributions that are independent of the number of years of service include those that are a fixed percentage of the employee's salary, a fixed amount throughout the service period or dependent on the employee's age. [IAS 19.93].

Application guidance is given in Appendix A to the standard in the form of the following flow chart.

(1) This dotted arrow means that an entity is permitted to choose either accounting

Regrettably, the standard does not explain the 'mechanics' of an attribution which is required where contributions are linked to service.

In particular, it is unclear how to treat employee contributions made over the service period. As shown in Illustration 7-2 in section 7.3 below, the projected unit credit method requires the net benefit to be expressed as a single net sum as at the date of retirement. Illustration 7-2 illustrates post-employment benefit payments being discounted to their present value as at the retirement date using the IAS 19 discount rate (discussed in section 7.6 below). On the same principle, therefore, employee contributions made over the period of employment would logically need to be inflated to be expressed in the 'time value' as at retirement. However, IAS 19 does not indicate what rate must be used for this purpose.

We note, in this regard, that when the IFRS IC discussed the matter in November 2012, it considered a Staff Paper which touched on the matter. The numerical examples appended to the paper expressed the 'future value' of in-service employee contributions as at the date of retirement using the IAS 19 discount rate.¹⁰ The content of the third example in this Staff Paper is reflected in the Illustration set out below. This example pre-dates the amendments to IAS 19 in respect of employee contributions and therefore, it is assumed, that under the current standard the entity has made an accounting policy choice to attribute contributions to periods of service, even though contributions are independent of the number of years of service.

10 [IASB Staff Paper 9B](#): Project: *Narrow scope amendments to IAS 19 Employee Benefits*, Paper topic: *Measurement of the net DBO for post-employment benefit plans with employee contributions*, IASB meeting, February 2013, Appendix A. Available on the IFRS Foundation's website.

Illustration 7-1: Defined benefit plan with employee contributions, where the discount rate is higher than the salary growth rate

A lump sum benefit is payable on termination of service and equal to 1% of final salary for each year of service. The salary in year 1 is CU10,000 and is assumed to increase at 7% (compound) each year. The discount rate used is 10% per year.

Employees are required to contribute 0.5% of salary each year, on the last day of the year.

Year	1	2	3	4	5	Total
	CU	CU	CU	CU	CU	CU
Salary	10,000	10,700	11,449	12,250	13,108

<i>To reflect employee contributions</i>			

The standard notes that changes in employee or third-party contributions dependent on number of years of service result in:

- (a) Current and past service cost if the changes are not set out in the formal terms of the plan and do not arise from a constructive obligation.
- Or
- (b) Actuarial gains and losses if the changes in contributions are set out in the formal terms of the plan or arise from a constructive obligation. [IAS 19.94].

7.3 Actuarial methodology

IAS 19 notes that the ultimate cost of a defined benefit plan may be influenced by many variables, such as final salaries, employee turnover and mortality, employee contributions and medical cost trends. The ultimate cost of the plan is uncertain and this uncertainty is likely to persist over a long period of time. In order to measure the present value of the post-employment benefit obligations and the related current service cost, it is necessary:

- To apply an actuarial valuation method.
 - To attribute benefit to periods of service.
- And
- To make actuarial assumptions. [IAS 19.66].

These steps are discussed in the following sections.

Plan obligations are measured using the projected unit credit method, [IAS 19.67], (sometimes known as the accrued benefit method pro-rated on service or as the benefit/years of service method). This method sees each period of service as giving rise to an additional unit of benefit entitlement and measures each unit separately to build up the final obligation. [IAS 19.68]. This actuarial method also determines the current service cost and any past service cost. [IAS 19.67]. IAS 19 provides a simple example of what this entails as follows: [IAS 19.68]

Illustration 7-2: The projected unit credit method

A lump sum benefit is payable on termination of service and equal to 1% of final salary for each year of service. The salary in year 1 is 10,000 and is assumed to increase at 7% (compound) each year. The discount rate used is 10% per year. The following table shows how the obligation builds up for an employee who is expected to leave at the end of year 5, assuming that there are no changes in actuarial assumptions. For simplicity, this example ignores the additional adjustment needed to reflect the probability that the employee may leave the entity at an earlier or later date.

Year	1	2	3	4	5
	CU	CU	CU	CU	CU
Benefit attributed to:					
▪ Prior years	-	131	262	393	524
▪ Current year (1% of final salary)	131	131	131	131	131
▪ Current and prior years	131	262	393	524	655

Opening obligation	-	89	196	324	476
Interest at 10%	-	9	20	33	48
Current service cost	89	98	108	119	131
Closing obligation	<u>89</u>	<u>196</u>	<u>324</u>	<u>476</u>	<u>655</u>

Notes:

- The opening obligation is the present value of benefit attributed to prior years.
- The current service cost is the present value of benefit attributed to the current year.
- The closing obligation is the present value of benefit attributed to current and prior years.

As can be seen in this simple example, the projected unit credit method produces a figure for current service cost and interest cost (and, although not illustrated here, would where appropriate produce a figure for past service cost). These cost components are discussed in section 10 below.

This example from the standard contains no underlying workings or proofs. The most useful would be as follows:

Final salary at year 5 (CU10,000 compounded at 7%) $\text{CU}10,000 \times (1 + 0.07)^4 = \text{CU}13,100$

1% of final salary attributed to each year $\text{CU}131$

Expected final benefit $5 \text{ years} \times 1\% \times \text{CU}131,000 = \text{CU}655$

Current service cost, being present value of CU131 discounted at 10%: e.g.

Year 1 $\text{CU}131 \times (1 + 0.1)^{-4} = \text{CU}89$

Year 2 $\text{CU}131 \times (1 + 0.1)^{-3} = \text{CU}98$

Closing obligation, being years served multiplied by present value of CU131: e.g.

Year 3 $3 \text{ years} \times \text{CU}131 \times (1 + 0.1)^{-2} = \text{CU}324$

In January 2008, the IFRS IC published an agenda decision in response to a request to clarify the measurement of the defined benefit obligation when pension promises are based on achieving specific performance targets. These performance targets could relate to various forms of pension promises ranging from performance bonuses to more complex arrangements relating to additional sponsor contributions or years of deemed service. The IFRS IC noted that paragraph 73 of IAS 19 states that “Actuarial assumptions are the entity’s best estimates of the variables that will determine the ultimate cost of providing post-employment benefits” and therefore performance targets must be included within the determination of the benefit. The IFRS IC also noted that paragraph 67 of IAS 19 requires benefits to be attributed to periods of service according to the benefit formula, unless an employee’s service in later years will lead to a materially high level of benefit than in earlier years. The effect of performance hurdles on attribution of benefits must also be considered. Given the requirements in IAS 19 the IFRS IC did not expect diversity in practice and decided not to add this to their agenda.¹¹ [IAS 19.67, IAS 19.73].

7.4 Attributing benefit to years of service

The projected unit credit method requires benefits to be attributed to the current period (in order to determine current service cost) and the current and prior periods (in order to determine the present value of defined benefit obligations).

IAS 19 requires benefits to be attributed to the periods in which the obligation to provide post-employment benefits arises. That is when employees render services in return for post-employment benefits which an entity expects to pay in future reporting periods. The standard takes the view that actuarial techniques allow an entity to measure that obligation with sufficient reliability to justify recognition of a liability. [IAS 19.71].

¹¹ [IFRIC Update](#), January 2008, available on the IFRS Foundation’s website.

The standard also explains that employee service gives rise to an obligation under a defined benefit plan even if the benefits are conditional on future employment (in other words they are not vested). [IAS 19.70]. Employee service before the vesting date is considered to give rise to a constructive obligation because, at each successive period end, the amount of future service that an employee will have to render before becoming entitled to the benefit is reduced. In measuring its defined benefit obligation, an entity must consider the probability that some employees might not satisfy any vesting requirements. Similarly, although certain post-employment benefits, such as post-employment medical benefits, become payable only if a specified event occurs when an employee is no longer employed, an obligation is considered to be created when the employee renders service that will provide entitlement to the benefit if the specified event occurs. The probability that the specified event will occur affects the measurement of the obligation but does not determine whether for accounting purposes the obligation exists. [IAS 19.72].

In applying the projected unit credit method, IAS 19 normally requires benefits to be attributed to periods of service under the plan's 'benefit formula'. For example, in some schemes the benefit vests over time as service is provided, regardless of continued service in future periods. In these arrangements, an employee has some benefit vested whenever employment ceases, even if payment is made at a later date.

Accordingly, the attribution of those benefits to periods of service is a straightforward matter and will match the period of employment (i.e., attribution commences on the hire date and ceases on the date that the participant leaves employment).

If, however, an employee's service in later years will lead to a materially higher level of benefit, the benefit must be attributed on a straight-line basis from:

- (a) The date when service by the employee first leads to benefits under the plan.
Until
- (b) The date when further service by the employee will lead to no material amount of further benefits under the plan, other than from further salary increases. [IAS 19.70].

The requirements above apply the overarching principle of the standard, which is described as the 'objective' of IAS 19: [IAS 19.1]

Extract from IAS 19

Objective

- 1 The objective of this Standard is to prescribe the accounting and disclosure for employee benefits. The Standard requires an entity to recognise:
 - (a) a liability when an employee has provided service in exchange for employee benefits to be paid in the future; and
 - (b) an expense when the entity consumes the economic benefit arising from service provided by an employee in exchange for employee benefits.

As an example, some schemes have what some refer to as 'cliff vesting' where there is a requirement to be in employment at a certain age or on the occurrence of a certain future event in order for any entitlement to vest. For an arrangement like this it is necessary to determine the period over which the benefits must be recognised. The requirement to accrue benefits until 'further service by the employee will lead to no material amount of further benefits' effectively means that attribution must continue until the vesting date. Indeed, it would not be appropriate to have full provision for a benefit which has not yet vested - attribution must continue until the benefit has vested as this is the point at which 'further service by the employee will lead to no material amount of further benefits'.

The standard considers that this requirement is necessary because the employee's service throughout the entire period will ultimately lead to benefit at that higher level. [IAS 19.73].

Once the date until when benefits must be attributed is determined, the next step is to determine the point from which 'service by the employees first leads to benefits under the plan'.

This is a factual matter to be determined in light of all the facts and circumstances.

For example, a scheme could require the participant to be in service at a certain age and also to have rendered a certain number of years of service to the employer. In this situation, some judgement might be required in determining when the period of attribution begins. This is illustrated by Scenario 6 in Illustration 7-3 below where the benefit vests at the age of 55 provided 20 years' service have also been provided. The start of attribution is determined, in this example, by counting back 20 years from the vesting date.

IAS 19 illustrates the attribution of benefits to service periods with a number of worked examples as follows: [IAS 19.71, IAS 19.72, IAS 19.73, IAS 19.74]

Illustration 7-3: Attributing benefits to years of service

- 1) *A defined benefit plan provides a lump-sum benefit of CU100 payable on retirement for each year of service.*
A benefit of CU100 is attributed to each year. The current service cost is the present value of CU100. The present value of the defined benefit obligation is the present value of CU100, multiplied by the number of years of service up to the end of the reporting period.
If the benefit is payable immediately when the employee leaves the entity, the current service cost and the present value of the defined benefit obligation reflect the date at which the employee is expected to leave. Thus, because of the effect of discounting, they are less than the amounts that would be determined if the employee left at the end of the reporting period.
- 2) *A plan provides a monthly pension of 0.2% of final salary for each year of service. The pension is payable from the age of 65.*
Benefit equal to the present value, at the expected retirement date, of a monthly pension of 0.2% of the estimated final salary payable from the expected retirement date until the expected date of death is attributed to each year of service. The current service cost is the present value of that benefit for the current year of service. The present value of the defined benefit obligation is the present value of monthly pension payments of 0.2% of final salary, multiplied by the number of years of service up to the end of the reporting period. The current service cost and the present value of the defined benefit obligation are discounted because pension payments begin at the age of 65.
- 3) *A plan pays a benefit of CU100 for each year of service. The benefits vest after ten years of service.*
A benefit of CU100 is attributed to each year. In each of the first ten years, the current service cost and the present value of the obligation reflect the probability that the employee may not complete ten years of service.
- 4) *A plan pays a benefit of CU100 for each year of service, excluding service before the age of 25. The benefits vest immediately.*
No benefit is attributed to service before the age of 25 because service before that date does not lead to benefits (conditional or unconditional). A benefit of CU100 is attributed to each subsequent year.
- 5) *A plan pays a lump-sum benefit of CU1,000 that vests after ten years of service. The plan provides no further benefit for subsequent service.*
A benefit of CU100 (CU1,000 divided by ten) is attributed to each of the first ten years. The current service cost in each of the first ten years reflects the probability that the employee may not complete ten years of service. No benefit is attributed to subsequent years.
- 6) *A plan pays a lump-sum retirement benefit of CU2,000 to all employees who are still employed at the age of 55 after twenty years of service, or who are still employed at the age of 65, regardless of their length of service.*
For employees who join before the age of 35, service first leads to benefits under the plan at the age of 35 (an employee could leave at the age of 30 and return at the age of 33, with no effect on the amount or timing of benefits). Those benefits are conditional on further service. Also, service beyond the age of 55 will lead to no material amount of further benefits. For these employees, the entity attributes benefit of CU100 (CU2,000 divided by twenty) to each year from the age of 35 to the age of 55.
For employees who join between the ages of 35 and 45, service beyond twenty years will lead to no material amount of further benefits. For these employees, the entity attributes benefit of CU100 (CU2,000 divided by twenty) to each of the first twenty years.
For an employee who joins at the age of 55, service beyond ten years will lead to no material amount of further benefits. For this employee, the entity attributes benefit of CU200 (CU2,000 divided by ten) to each of the first ten years.
For all employees, the current service cost and the present value of the obligation reflect the probability that the employee may not complete the necessary period of service.
- 7) *A post-employment medical plan reimburses 40% of an employee's post-employment medical costs if the employee leaves after more than ten and less than twenty years of service and 50% of those costs if the employee leaves after twenty or more years of service.*
Under the plan's benefit formula, the entity attributes 4% of the present value of the expected medical costs (40% divided by ten) to each of the first ten years and 1% (10% divided by ten) to each of the second ten years. The current service cost in each year reflects the probability that the employee may not complete the necessary period of service to earn part or all of the benefits. For employees expected to leave within ten years, no benefit is attributed.

- 8) *A post-employment medical plan reimburses 10% of an employee's post-employment medical costs if the employee leaves after more than ten and less than twenty years of service and 50% of those costs if the employee leaves after twenty or more years of service.*

Service in later years will lead to a materially higher level of benefit than in earlier years. Therefore, for employees expected to leave after twenty or more years, the entity attributes benefit on a straight-line basis (see section 7.3 above). Service beyond twenty years will lead to no material amount of further benefits. Therefore, the benefit attributed to each of the first twenty years is 2.5% of the present value of the expected medical costs (50% divided by twenty).

For employees expected to leave between ten and twenty years, the benefit attributed to each of the first ten years is 1% of the present value of the expected medical costs. For these employees, no benefit is attributed to service between the end of the tenth year and the estimated date of leaving.

For employees expected to leave within ten years, no benefit is attributed.

- 9) *Employees are entitled to a benefit of 3% of final salary for each year of service before the age of 55.*

Benefit of 3% of estimated final salary is attributed to each year up to the age of 55. This is the date when further service by the employee will lead to no material amount of further benefits under the plan. No benefit is attributed to service after that age.

The following points of note are brought out in the above:

- The scenarios in 3 and 5 are economically identical and are attributed to years of service accordingly. In each case benefits only vest after ten years, however an obligation is to be built up over that period rather than at the end.
- Scenario 6 above (example 2 in the standard) is the basis for an Agenda Decision by the IFRS IC (see below). As part of its deliberations, the IFRS IC considered and rejected an argument that the last part of that example was inconsistent with its first part. In the IFRS IC's view, the plan's benefit formula in the first part of the example (i.e., for employees who join before the age of 35) in effect specifies both: (i) the date when service by the employee first leads to benefits under the plan (when an employee reaches the age of 35); and (ii) the date when further service by the employee will lead to no material amount of further benefits under the plan (when an employee reaches the age of 55). Accordingly, this example concludes that the entity uses those dates when attributing benefit to periods of service for an employee who joins before the age of 35. The plan's benefit formula for the last part of the example specifies only that the retirement benefit is conditional on the employee being employed at the age of 65 (i.e., the date when further service by the employee will lead to no material amount of further benefits under the plan). However, it does not specify when service by the employee first leads to benefits under the plan. Although that benefit is provided at retirement, it is provided in exchange for services rendered before the age of 65. The IFRS IC concluded that, in the absence of the plan's benefit formula specifying when service by the employee first leads to benefits under the plan, the example concludes that the benefits are provided in exchange for services from the age of 55 (the entire period of service).¹²
- Scenario 8 illustrates that accruing a 10% benefit over a period of 20 years of service which jumps to 50% once 20 years have been completed is an example of service in later years leading to a materially higher level of benefit. Accordingly, the obligation is to be built-up on a straight-line basis over 20 years.
- Regarding scenario 9, the standard explains that where the amount of a benefit is a constant proportion of final salary for each year of service, future salary increases will affect the amount required to settle the obligation that exists for service before the end of the reporting period, but do not create an additional obligation. Therefore:
 - (a) For the purpose of allocating benefits to years of service, salary increases are not considered to lead to further benefits, even though the amount of the benefits is dependent on final salary.
 - And
 - (b) The amount of benefit attributed to each period must be a constant proportion of the salary to which the benefit is linked. [IAS 19.74].

¹² [IFRIC Update](#), December 2020, available on the IFRS Foundation's website.

In May 2021 the IFRS IC issued an Agenda Decision¹³ following a request about the periods of service to which an entity attributes benefit for a particular defined benefit plan. In the particular fact pattern discussed:

- Employees are entitled to a retirement benefit only when they reach the age of 62 and are employed by the entity at that date.
- The amount of the benefit is one month of final salary for each year of service before the age of 62.
- The retirement benefit is capped at 16 years of service (the maximum amount of retirement benefit an employee would be entitled to is 16 months of final salary).

And

- The retirement benefit is calculated using only the number of consequent years of employee service immediately before retirement.

The IFRS IC observed that each year of service between the ages of 46 and 62 leads to further benefits as service rendered in each of these years reduces the amount of future service that the employee will need to render before becoming entitled to the retirement benefit; and an employee will receive no material amount of further benefits from the age of 62 regardless of their age when joining the entity. Therefore, the entity attributes benefits only until the age of 62.

The IFRS IC concluded, for the benefit plan illustrated above, that the entity attributes retirement benefits to each year from the age of 46 to the age of 62 rather than from the hiring date, or from the date of employment until the age of 62 if employment commences after the age of 46.

In reaching its conclusion, the IFRS IC noted that IAS 19.70 specified the principle for attributing benefits to periods of service and IAS 19.71 to 74 of the standard include the requirements that specify how an entity must apply that principle. Paragraph 71 of IAS 19 requires an entity to attribute the benefit to periods in which the obligation to provide post-employment benefit arises. This paragraph also specifies that the obligation arises as the employees render services in return for post-employment benefits that an entity expects to pay in future reporting periods. Employee service before any vesting date gives rise to a constructive obligation, in accordance with IAS 19.72, as at the end of each successive reporting period the amount of future service that an employee will have to render before becoming entitled to the benefit is reduced. Paragraph 73 of IAS 19 specifies that an entity's obligation increases until the date when further service will lead to no material amount of further benefits under the plan.

When finalising its decision, the IFRS IC did not agree with some of the comments received that, in the fact pattern raised in the submission, it is also acceptable to start attributing benefits when the employee first provides service on the basis that although an employee joining at age 22 will need to provide service for 40 years (if the retirement age is 62) to earn the same level of benefits as an employee joining at 46, each year of service provided by that employee reduces the amount of future service that the employee will have to render before becoming entitled to the post-employment benefit. In the IFRS IC's view, its analysis and conclusions are consistent with Scenario 2 following IAS 19.73 (scenario 6 in Illustration 7-3 above), which illustrates an analogous fact pattern in the first part of the example (i.e., a retirement benefit payable to employees still employed at the age of 55 after 20 years of service). Scenario 2 is part of the standard, it does not accompany the standard. When specifying how an entity accounts for that analogous fact pattern, Scenario 2 does not permit or require the entity to attribute benefit over the entire period of employment for employees who join before the age of 35. On this basis, the IFRS IC concluded that reaching a different conclusion to that example would add or change the requirements in the standard.

The Agenda Decision addresses plans with the four characteristics listed above, regardless of the nature of the benefits (e.g., medical plans, retirement indemnities, or other benefits). Amongst these, the condition that benefits only cliff vest if the employee is still employed when reaching a certain age does not seem to be common, except in certain jurisdictions where this could be a general feature for many post-employment benefits plans (e.g., in France) or only for some of them.

¹³ [IFRIC Update](#), April 2021, available on the IFRS Foundation's website.

7.5 Actuarial assumptions

The long timescales and numerous uncertainties involved in estimating obligations for post-employment benefits require many assumptions to be made when applying the projected unit credit method. These are termed 'actuarial assumptions' and comprise:

- (a) Demographic assumptions about the future characteristics of current and former employees (and their dependants) who are eligible for benefits and deal with matters such as:
 - (i) Mortality, both during and after employment.
 - (ii) Rates of employee turnover, disability and early retirement.
 - (iii) The proportion of plan members with dependants who will be eligible for benefits.
 - (iv) The proportion of plan members who will select each form of payment option under the plan terms, (for example, a plan could offer participants a choice between a lump-sum cash payment, annuities and instalments over a defined period and these alternatives could have a significantly different impact on the measurement of the defined benefit obligation).

And

- (v) Claim rates under medical plans.

And

- (b) Financial assumptions, dealing with items such as:
 - (i) The discount rate.
 - (ii) Future salary and benefit levels, excluding the cost of benefits that will be met by the employees.
 - (iii) In the case of medical benefits, future medical costs, including claim handling costs, which the standard describes as costs that will be incurred in processing and resolving claims, including legal and adjuster's fees.

And

- (iv) Taxes payable by the plan on contributions relating to service before the reporting date or on benefits resulting from that service. [IAS 19.76].

The requirements of IAS 19 in this regard are set out below, with the exception of the discount rate which is discussed in section 7.6 below.

In periods of rising inflation this may have a significant impact on the measurement of the defined benefit obligation as this will often be linked to future salary increases, future benefit increases and future medical costs due to either contractual or constructive obligations (for example through a history of benefit payments to former employees being based on inflation even though there is no legal obligation to do so). Payment options selected by employees on retirement may also change where annuities are linked to fixed annual increases which become lower than expected inflation.

The standard requires that actuarial assumptions be unbiased (that is, neither imprudent nor excessively conservative), mutually compatible and represent the employer's best estimates of the variables that will determine the ultimate cost of providing post-employment benefits. [IAS 19.75, IAS 19.76, IAS 19.77]. Actuarial assumptions are mutually compatible if they reflect the economic relationships between factors such as inflation, rates of salary increase and discount rates. For example, all assumptions which depend on a particular inflation level (such as assumptions about interest rates and salary and benefit increases) in any given future period must assume the same inflation level in that period. [IAS 19.78].

The financial assumptions must be based on market expectations at the end of the reporting period, for the period over which the obligations are to be settled. [IAS 19.80].

The standard requires that a defined benefit obligation be measured on a basis that reflects:

- (a) The benefits set out in the terms of the plan (or resulting from any constructive obligation that goes beyond those terms) at the end of the reporting period.
 - (b) Any estimated future salary increases that affect the benefits payable.
 - (c) The effect of any limit on the employer's share of the cost of the future benefits.
- And
- (d) Contributions from employees or third parties that reduce the ultimate cost to the entity of those benefits. [IAS 19.87].

Regarding mortality, the standard requires assumptions to be a best estimate of the mortality of plan members both during and after employment. [IAS 19.81]. In particular, expected changes in mortality must be considered, for example by modifying standard mortality tables with estimates of mortality improvements. [IAS 19.82].

Assumptions about medical costs must take account of inflation as well as specific changes in medical costs (including technological advances, changes in health care utilisation or delivery patterns, and changes in the health status of plan participants). [IAS 19.96, IAS 19.97]. The standard provides a quite detailed discussion of the factors that must be taken into account in making actuarial assumptions about medical costs, in particular:

- (a) Measuring post-employment medical benefits requires assumptions about the level and frequency of future claims, and the cost of meeting them. An employer must make such estimates based on its own experience, supplemented where necessary by historical data from other sources (such as other entities, insurance companies and medical providers). [IAS 19.97].
- (b) The level and frequency of claims is particularly sensitive to the age, health status and sex of the claimants, and may also be sensitive to their geographical location. This means that any historical data used for estimating future claims need to be adjusted to the extent that the demographic mix of the plan participants differs from that of the population used as the basis for the historical data. Historical data must also be adjusted if there is reliable evidence that historical trends will not continue. [IAS 19.98].

And

- (c) Estimates of future medical costs must take account of any contributions that claimants are required to make based on the terms (whether formal or constructive) of the plan at the end of the reporting period. The treatment of contributions by employees and third parties is discussed in section 7.2 above.

Clearly, the application of actuarial techniques to compute plan obligations is a complex task, and it seems likely that few entities would seek to prepare valuations without the advice of qualified actuaries. However, IAS 19 only encourages, but does not require that an entity take actuarial advice. [IAS 19.59].

However sophisticated actuarial projections could be, reality will (apart from the most simple scenarios) always diverge from assumptions. This means that when a surplus or deficit is estimated, it will almost certainly be different from the predicted value based on the last valuation. These differences are termed actuarial gains and losses. The standard observes that actuarial gains and losses result from increases or decreases in the present value of a defined benefit obligation because of changes in actuarial assumptions and experience adjustments (see section 10.4.1 below). Causes of actuarial gains and losses could include, for example:

- (a) Unexpectedly high or low rates of employee turnover, early retirement or mortality or of increases in salaries, benefits (if the formal or constructive terms of a plan provide for inflationary benefit increases) or medical costs.
- (b) Differences between the actual return on plan assets and amounts included as part of net interest in profit or loss.
- (c) The effect of changes to assumptions concerning benefit payment options. Often an important example of this is the choice between an annuity and a lump sum payment as the various options are generally not actuarially equivalent (e.g., a lump sum payment will generally be less costly for the entity).
- (d) The effect of changes in estimates of future employee turnover, early retirement or mortality or of increases in salaries, benefits (if the formal or constructive terms of a plan provide for inflationary benefit increases) or medical costs.

And

- (e) The effect of changes in the discount rate. [IAS 19.128, IAS 19.111].

Actuarial gains and losses are discussed further in section 10.4.1 below.

7.6 Discount rate

Due to the long timescales involved, post-employment benefit obligations are discounted. The whole obligation must be discounted, even if part of it is expected to be settled within twelve months of the end of the reporting period. [IAS 19.69]. The standard requires that the discount rate reflect the time value of money but not the actuarial or investment risk. Furthermore, the discount rate must not reflect the entity-specific credit risk borne by the entity's creditors, nor must it reflect the risk that future experience may differ from actuarial assumptions. [IAS 19.84]. The discount rate must reflect the estimated timing of benefit payments. For example, an appropriate rate could be quite different for a payment due in, say, ten years as opposed to one due in twenty. The standard observes that in practice, an acceptable answer can be obtained by applying a single weighted average discount rate that reflects the estimated timing and amount of benefit payments and the currency in which the benefits are to be paid. [IAS 19.85]. The standard does not preclude the use of a more granular approach in discounting cash flows at different periods along the yield curve. Nor does it preclude the use of different discount rates for different classes of participant in the interest of achieving a more precise measure of the defined benefit obligation than the computational shortcut which is allowed by the standard. An example of where discount rates could vary by class or participant is where there are both active and pensioner members, discount rates will vary by each of these classes purely as a result of their ages and the resultant timing of outflows associated to these classes. Whether it is acceptable to use the weighted average discount rate or a more granular approach is an entity's judgement which must be applied consistently. However, we would not expect an entity that elects to use the granular approach premised on it being a more precise measure to move back to the weighted average approach in subsequent periods.

The standard requires that actuarial assumptions, including discount rates be unbiased. [IAS 19.83]. A subpopulation of high quality corporate bonds (see section 7.6.1 below) used to derive a discount rate would only result in an unbiased assumption if the selection from the population of bonds was not skewed. For example, the exclusion of bonds from a population outside two standard deviations of the mean (both at the higher end and the lower end) would not result in an unbiased selection of the discount rate. However, if the entity were to exclude, say, bonds with the lowest 40% and the highest 10% yields, or bonds with a yield below the median, these methods would produce biased results.

IAS 19 also stipulates that the discount rate (and other financial assumptions) must be determined in nominal (stated) terms, unless estimates in real (inflation-adjusted) terms are more reliable, for example, in a hyperinflationary economy (see Chapter 17 for a discussion of IAS 29 *Financial Reporting in Hyperinflationary Economies*), or where the benefit is index-linked and there is a deep market in index-linked bonds of the same currency and term. [IAS 19.79].

The basic part of this requirement - that a nominal rate be used - is consistent with the definition of the present value of a defined benefit obligation in that it must be "... the present value ... of expected future payments required to settle the obligation ..." (see section 7.1 above). In other words, as the future cash flows are stated at the actual amounts expected to be paid, the rate used to discount them must reflect that and not be adjusted to remove the effects of expected inflation. In contrast, the reference to the use of index-linked bonds seems to allow taking account of inflation through the discount rate (which would require expressing cash flows in current prices). This approach seems to be in conflict with the definition of the obligation. However, in practice few index-linked corporate bonds exist (so it could be quite rare to have a deep market in them) and a more reliable approach could often be to take account of inflation via the projected cash flows.

The IFRS IC in July 2013 discussed whether the rate must be pre- or post-tax. It observed that the discount rate used to calculate a defined benefit obligation must be a pre-tax discount rate and decided not to add this issue to its agenda.¹⁴

Negative interest rates have been experienced in the past and at the time it was believed that these would be a temporary phenomenon, restricted to relatively short-term rates for certain government debt and deposits. This phenomenon has, however, not been short-lived with negative yields on government bonds seen in several countries and in some high quality corporate bonds. Discount rates are applied in various IFRS accounting standards. In the context of IAS 19 specifically, the standard does not contain a zero percent floor and negative discount rates should be used.

¹⁴ [IFRIC Update](#), July 2013, available on the IFRS Foundation's website.

7.6.1 High quality corporate bonds

The rate used must be determined ‘by reference to’ the yield (at the end of the reporting period) on high quality corporate bonds of currency and term consistent with the liabilities. For currencies in which there is no deep market in such bonds, the yields on government bonds must be used instead (see section 7.6.2 below). [IAS 19.83].

How we see it

IAS 19 does not explain what is meant by the term ‘high quality’. In practice it is considered to mean either: bonds rated AA, bonds rated AA or higher by Standard and Poor’s, or an equivalent rating from another rating agency, which in our view is consistent with the requirements of the standard.

The requirement that the rate be determined ‘by reference to’ high quality bond rates is an important one. The standard gives an example of this in the context of the availability of bonds with sufficiently long maturities. It notes that in some cases, there may be no deep market in bonds with a sufficiently long maturity to match the estimated maturity of all the benefit payments. In such cases, the standard requires the use of current market rates of the appropriate term to discount shorter-term payments, and estimation of the rate for longer maturities by extrapolating current market rates along the yield curve. In practice extrapolation is appropriate when longer maturities result in too few observable bonds for the rates derived from these to be meaningful. It goes on to observe that the total present value of a defined benefit obligation is unlikely to be particularly sensitive to the discount rate applied to the portion of benefits that is payable beyond the final maturity of the available corporate or government bonds. [IAS 19.86].

In November 2013, the IFRS IC was asked whether corporate bonds with a rating lower than ‘AA’ can be considered to be ‘high quality corporate bonds’ (HQCB).

The IFRS IC decided not to add the item to its agenda as issuing additional guidance or changing the requirements would be too broad for it to achieve in an efficient manner. The IFRS IC recommended that the IASB should address the issue as part of its research project on discount rates.¹⁵ The IFRS IC reported this conclusion to the IASB at its December 2013 meeting. The IASB noted that no further work is currently planned on the issue of determining the discount rate for post-employment benefit obligations.¹⁶

The key observations of the IFRS IC were as follows:

- IAS 19 does not specify how to determine the market yields on HQCB, and in particular what grade of bonds must be designated as high quality.
- That ‘high quality’ as used in IAS 19 reflects an absolute concept of credit quality and not a concept of credit quality that is relative to a given population of corporate bonds, which would be the case, for example, if the paragraph used the term ‘the highest quality’. Consequently, the concept of high quality must not change over time. Accordingly, a reduction in the number of HQCB must not result in a change to the concept of high quality. The IFRS IC does not expect that an entity’s methods and techniques used for determining the discount rate so as to reflect the yields on HQCB will change significantly from period to period.
- IAS 19 already contains requirements if the market in HQCB is no longer deep or if the market remains deep overall, but there is an insufficient number of HQCB beyond a certain maturity.

And

- Typically, the discount rate will be a significant actuarial assumption to be disclosed with sensitivity analyses under IAS 19.

As required by IAS 1 (see Chapter 3), disclosure is required of the estimates that management has made in determining the carrying amounts of assets and liabilities and that have the most significant effect on the amounts recognised in the financial statements. Typically, the identification of the HQCB population used as a basis to determine the discount rate requires the use of estimates, which could often have a significant effect on the entity’s financial statements.

In some countries ratings agencies could provide both a local rating and a global rating. As noted above the concept of ‘high quality’ is an absolute notion and therefore global ratings must be used to determine whether high quality corporate bonds exist in a currency.

¹⁶ [IASB Update](#), December 2013, available on the IFRS Foundation’s website.

7.6.2 No deep market

In currencies where there is no deep market in high quality corporate bonds, the market yields (at the end of the reporting period) on government bonds shall be used. [IAS 19.83]. This paragraph was amended by the Annual Improvements 2012-2014 Cycle replacing the reference to countries with a reference to currencies where there is no deep market in high quality corporate bonds. This amendment was issued to clarify, in particular, that for IAS 19 purposes the euro zone is considered in its entirety.

In June 2017, the IFRS IC considered a question on how an entity determines the rate to be used to discount post-employment benefit obligations in a country (in this case Ecuador) which has adopted another currency as its official or legal currency (in this case the US dollar). The entity's post-employment benefit obligation is denominated in US dollars. The submitter also confirmed that there was no deep market for high quality bonds denominated in US dollars in the country in which it operates (Ecuador).

The question asked by the submitter was whether in this situation the entity must consider the depth of the market in high quality corporate bonds denominated in US dollars in other markets or countries in which those bonds are issued. They also asked whether the entity can use market yields on bonds denominated in US dollars issued by the Ecuadorian government, or whether it is required to use market yields on bonds denominated in US dollars issued by a government in another market or country.

The IFRS IC observed that applying IAS 19.83 (see section 7.6.1 above) requires that:

- An entity with post-employment benefit obligations denominated in a particular currency assesses the depth of the market in high quality corporate bonds denominated in that currency, and does not limit this assessment to the market of country in which it operates.
- If there is a deep market in high quality corporate bonds denominated in that currency, the discount rate is determined by reference to market yields on high quality corporate bonds at the end of the reporting period.
- If there is no deep market in high quality corporate bonds in that currency, the entity determines the discount rate using market yields on government bonds denominated in that currency.

And

- The entity applies judgement to determine the appropriate population of high quality corporate bonds or government bonds to reference when determining the discount rate. The currency and term of the bonds must be consistent with the currency and estimated term of the post-employment benefit obligations.

The IFRS IC noted that the discount rate does not reflect the expected return on plan assets; the Basis for Conclusions on IAS 19 confirms that the measurement of the obligation must be independent of the measurement of any plan assets held by the plan. [IAS 19.BC130].

The IFRS IC also considered the interaction between the matters discussed above and the requirement that actuarial assumptions be mutually compatible (see section 7.5 above). [IAS 19.75]. The IFRS IC concluded that it is not possible to assess whether, and to what extent, a discount rate derived by applying the specific requirements of IAS 19 is compatible with other actuarial assumptions and that the specific requirements of IAS 19 must be applied when determining the discount rate.

The overall conclusion of the IFRS IC was that the requirements in IAS 19 provide an adequate basis for the determination of a discount rate in the circumstances described above. Consequently, the IFRS IC decided not to add this matter to its agenda.

7.7 Frequency of valuations

IAS 19 requires that the present value of defined benefit obligations, and the fair value of plan assets, must be determined frequently enough to ensure that the amounts recognised in the financial statements do not differ materially from the amounts that would be determined at the end of the reporting period. [IAS 19.58].

An argument could be launched that, without a full valuation as at the end of the reporting period to compare with, it cannot be possible to know whether any less precise approach is materially different.

However, it is reasonably clear that the intention of the standard is not necessarily to require full actuarial updates as at the reporting date. This is because the standard goes on to observe that for practical reasons a detailed valuation could be carried out before the end of the reporting period and that if such amounts determined before the end of the reporting period are used, they must be updated to take account of any material transactions or changes in circumstances up to the end of the reporting period. [IAS 19.59]. Much could depend on what is considered to be a 'material change', however it is expressly to include changes in market prices (hence requiring asset values to be those at the end of the reporting period) and interest rates, as well as financial actuarial assumptions. [IAS 19.59, IAS 19.80].

In this regard, it is also worth noting the observation in the standard: [IAS 19.60]

Extract from IAS 19

60 In some cases, estimates, averages and computational short cuts may provide a reliable approximation of the detailed computations illustrated in this Standard.

It must be remembered, though, that it is the amounts in the financial statements which must not differ materially from what they would be based on a valuation at the end of the reporting period. For funded schemes, the net surplus or deficit is usually the difference between two very large figures - plan assets and plan liabilities. Such a net item is inevitably highly sensitive, in percentage terms, to a given percentage change in the gross amounts.

In summary, a detailed valuation will be required on an annual basis, but not necessarily as at the end of the reporting period. However, a valuation undertaken other than as at the end of the reporting period will need to be updated as at the end of the reporting period to reflect at least changes in observable market data, such as asset values and discount rates. The need for updates in respect of other elements of the valuation will depend on individual circumstances.

As discussed in Chapter 37, an updated valuation will be required for interim reporting as a result of the following:

- A significant change in the corporate bond rate used to discount the defined benefit obligation.
- Significant changes in the fair value of plan assets.
- Significant changes in actuarial assumptions, including those linked to economic factors such as inflation (which may in turn impact other actuarial assumptions such as the amount of lump sum benefits expected to be taken).
- One-off events such as a plan amendment, curtailment or the purchase of a qualifying insurance policy.

8 Defined benefit plans - Treatment of the plan surplus or deficit in the statement of financial position

8.1 Net defined benefit liability (asset)

IAS 19 defines the net defined benefit liability or asset as the deficit or surplus in the plan adjusted for any effect of the asset ceiling (see section 8.2 below).

The deficit or surplus is the present value of the defined benefit obligation (see section 7 above) less the fair value of the plan assets (if any) (see section 6 above).

The standard requires that the net defined benefit liability (asset) be recognised in the statement of financial position at each reporting period. [IAS 19.63].

8.2 Restriction of assets to their recoverable amounts

The net defined benefit balance determined under IAS 19 could be an asset. The standard asserts that an asset may arise (that is, an asset measured on the basis of IAS 19) where a defined benefit plan has been 'over-funded' or when actuarial gains have arisen. The standard justifies the recognition of an asset in such cases because:

- (a) The entity controls a resource, which is the ability to use the surplus to generate future benefits.
- (b) That control is a result of past events (contributions paid by the entity and service rendered by the employee).

And

- (c) Future economic benefits are available to the entity in the form of a reduction in future contributions or a cash refund, either directly to the entity or indirectly to another plan in deficit; the present value of those benefits is described as the asset ceiling. [IAS 19.8, IAS 19.65].

In practice, pension plans tend to be funded on a significantly more prudent basis than would be the case if a surplus or deficit was measured in accordance with IAS 19. In particular, the discount rate used for funding purposes is typically lower than the rate required by the standard. For this reason, an IAS 19 valuation could produce a surplus, when for funding purposes there is a deficit. A surplus may also arise in economic conditions where discount rates are increased, and therefore the defined benefit obligation decreased, without a corresponding impact on the fair value of plan assets.

When there is an IAS 19 surplus in a defined benefit plan, the standard requires the net asset recognised to be restricted to the lower of the surplus in the plan and the asset ceiling discounted using the same discount rate used for determining the defined benefit obligation (see section 7.6 above). [IAS 19.8, IAS 19.64, IFRIC 14.1].

Any adjustment required by the ceiling test is accounted for in other comprehensive income (see section 10.4 below).

This limitation has proved quite problematic in practice and as a result was considered by the IFRS IC, initially in the context of statutory minimum funding requirements (MFR). This resulted in the publication, in July 2007, of IFRIC 14. Whilst dealing with the interaction of the asset ceiling with MFR, IFRIC 14 also deals more generally with the restriction of an asset on recoverability grounds. [IFRIC 14.1, IFRIC 14.2, IFRIC 14.3, IFRIC 14.6]. Subsequently, IFRIC 14 was amended to deal with pre-paid MFR - see section 8.2.3 below.

The IFRS IC notes that MFR exist in many countries and normally stipulate a minimum amount or level of contribution that must be made to a plan over a given period. Therefore, a minimum funding requirement may limit an entity's ability to reduce future contributions. [IFRIC 14.2].

In addition, the limit on the measurement of a defined benefit asset may cause a minimum funding requirement to be onerous. Normally, a requirement to make contributions to a plan would not affect the measurement of the defined benefit asset or liability. This is because the contributions, once paid, will become plan assets and so the additional net liability is nil. However, a minimum funding requirement may give rise to a liability if the required contributions will not be available to the entity once they have been paid. [IFRIC 14.3].

The issues addressed by IFRIC 14 are: [IFRIC 14.6]

- When refunds or reductions in future contributions must be regarded as available in accordance with the definition of the asset ceiling (discussed in sections 8.2.1 and 8.2.2 below).
- How a minimum funding requirement might affect the availability of reductions in future contributions (discussed in section 8.2.3 below).

And

- When a minimum funding requirement might give rise to a liability (discussed in section 8.2.4 below).

8.2.1 IFRIC Interpretation 14 - general requirements concerning the limit on a defined benefit asset

IFRIC 14 clarifies that economic benefits, in the form of refunds or reduced future contributions, are available if they can be realised by the entity at some point during the life of the plan or when the plan liabilities are settled. In particular, such economic benefits may be available even if they are not realisable immediately at the end of the reporting period. [IFRIC 14.8].

Furthermore, the benefit available does not depend on how the entity intends to use the surplus. The entity must determine the maximum economic benefit that is available from refunds, reductions in future contributions or a combination of both. However, economic benefits must not be recognised from a combination of refunds and reductions in future contributions based on assumptions that are mutually exclusive. [IFRIC 14.9]. Perhaps unnecessarily, the interpretation requires the availability of a refund or a reduction in future contributions to be determined in accordance with the terms and conditions of the plan and any statutory requirements in the jurisdiction of the plan. [IFRIC 14.7].

The interpretation observes that an unconditional right to a refund can exist whatever the funding level of a plan at the end of the reporting period. The interpretation further states that benefits are available as a refund only if the entity has an unconditional right to a refund:

- (a) During the life of the plan, without assuming that the plan liabilities must be settled in order to obtain the refund.

Or

- (b) Assuming the gradual settlement of the plan liabilities over time until all members have left the plan.

Or

- (c) Assuming the full settlement of the plan liabilities in a single event (i.e., as a plan wind-up).

However, if the right to a refund of a surplus depends on the occurrence or non-occurrence of one or more uncertain future events not wholly within an entity's control, the entity does not have an unconditional right and must not recognise an asset. [IFRIC 14.11, IFRIC 14.12].

The economic benefit available as a refund must be measured as the amount of the surplus at the end of the reporting period (being the fair value of the plan assets less the present value of the defined benefit obligation) that the entity has a right to receive as a refund, less any associated costs. For example, if a refund would be subject to a tax other than income tax of the reporting entity, it must be measured net of the tax. [IFRIC 14.13]. Tax on defined benefit pension plans is discussed further in Chapter 29.

In measuring the amount of a refund available when the plan is wound up (point (c) above), the costs to the plan of settling the plan liabilities and making the refund must be included. For example, a deduction must be made for professional fees if these are paid by the plan rather than the entity, and the costs of any insurance premiums that may be required to secure the liability on wind-up. [IFRIC 14.14].

It is usually the case that the trustees of a pension fund are independent of the entity. Trustees could have a variety of powers to influence a surplus in a plan. For example:

- Setting the investment strategy whereby assets with lower risk and lower return would erode a surplus over time; or the purchase of assets in the form of insurance policies matching all or some of the cash outflows of the plan.

Or

- Full or partial settlement of liabilities; or the improvement of benefits under the plan.

IFRIC 14 makes it clear that for future benefit improvements made by the employer and actuarial gains and losses, the existence of an asset at the end of the reporting period is not affected by possible future changes to the amount of the surplus. If future events occur that change the amount of the surplus, their effects are recognised when they occur. [IFRIC 14.BC10].

The interpretation is also clear that if the right to a refund of a surplus depends on the occurrence or non-occurrence of one or more uncertain future events that are not wholly within an entity's control, the entity does not have an unconditional right and must not recognise a surplus. [IFRIC 14.11, IFRIC 14.12].

However, neither IAS 19 nor IFRIC 14 address the question of whether the entity's right to a refund of a surplus which depends on the occurrence or non-occurrence of uncertain future events means that no surplus should be recognised in any scenario where trustees have the power to 'spend' a surplus.

It is worth noting that in June 2018 the IASB published an exposure draft of proposed amendments to IAS 19 and IFRIC 14 which addressed whether other parties' (for example pension trustees) power to enhance benefits for plan members or wind up a plan affected the availability of a refund.

This exposure draft was issued as a response to two requests to the IFRS IC, suggesting that there is diversity in practice in this area. In the Basis for Conclusions on the exposure draft the IASB noted that IFRIC 14.BC10 had not specifically addressed the circumstances in which trustees have such unconditional powers. The exposure draft proposed that the amount of the surplus that the entity recognised as an asset on the basis of a future refund must not include amounts that other parties can use for other purposes that affect the benefits for plan members, for example by enhancing those benefits without the entity's consent. In February 2022, the IASB decided to remove this project from its work plan after concluding that the prospects for progress were limited.¹⁷

How we see it

Pending any change to the standard, we believe entities have an accounting policy choice, as to how unconditional rights by trustees to 'spend' any current surplus are taken into account in the recognition of any existing IAS 19 surplus, to be applied consistently to similar facts and circumstances, and disclosed where material.

If the amount of a refund is determined as the full amount or a proportion of the surplus, rather than a fixed amount, an entity should make no adjustment for the time value of money, even if the refund is realisable only at a future date. [IFRIC 14.15].

8.2.2 Economic benefits available as reduced future contributions when there are no minimum funding requirements for future service

IFRIC 14 addresses separately cases where there are minimum funding requirements relating to benefits to be awarded in future periods in exchange for services to be rendered in those periods, and cases where there are no such funding requirements.

This section deals with the situation where there are no such funding requirements. The implications of future service minimum funding requirements are discussed in section 8.2.3 below.

IFRIC 14 requires that the economic benefit available by way of reduced future contributions be determined as the future service cost to the entity for each period over the shorter of the expected life of the plan and the expected life of the entity. The future service cost to the entity excludes amounts that will be borne by employees. [IFRIC 14.16].

Future service costs should be determined using assumptions consistent with those used to determine the defined benefit obligation and with the situation that exists at the end of the reporting period as determined by IAS 19. Accordingly, no future changes to the benefits to be provided by a plan should be assumed until the plan is amended, and a stable workforce in the future should be assumed unless the entity makes a reduction in the number of employees covered by the plan. In the latter case, the assumption about the future workforce should include the reduction. The present value of the future service cost should be determined using the same discount rate as that used in the calculation of the defined benefit obligation (discount rates are discussed in section 7.6 above). [IFRIC 14.17].

8.2.3 IFRIC Interpretation 14 - the effect of a minimum funding requirement on the economic benefit available as a reduction in future contributions

IFRIC 14 defines minimum funding requirements as "any requirements to fund a post-employment or other long-term defined benefit plan". [IFRIC 14.5]. This is clearly quite a wide definition encompassing more than just statutory regimes.

17 [IASB Update](#), February 2022, available on the IFRS Foundation's website.

Some minimum funding arrangements require periodic reappraisal (for example, every three years). Should such an arrangement cover a longer period, all payments over this longer period constitute the minimum funding requirement, not just the three years until the next reappraisal. In its March 2015 meeting the IFRS IC, following a request for clarification, discussed whether an entity should assume that the minimum funding requirement for contributions to cover future services (see below) would continue over the estimated life of the pension plan. In its July 2015 agenda decision, the IFRS IC noted that the entity should assume a continuation of existing funding principles because:¹⁸

- For any factors not specified by the minimum funding basis (for example, the period to continue the plan is not specified by the existing funding principles), the assumptions for determining future service costs and those used to estimate the future minimum funding requirement contributions for future service must be consistent. This is because the Interpretation requires an entity to use assumptions that are consistent with those used to determine the defined benefit obligation and with the situation that exists at the end of the reporting period. [IFRIC 14.17, IFRIC 14.21].
- The estimate should not include changes to the funding principles to determine contributions for future service, if such changes require future negotiations with pension trustees. [IFRIC 14.21, IFRIC 14.BC30].

The Interpretation requires any minimum funding requirement at a given date to be analysed into contributions that are required to cover: [IFRIC 14.18]

- (a) Any existing shortfall for past service on the minimum funding basis. These contributions do not affect future contributions for future service. However, they may give rise to a liability under IFRIC 14 (see section 8.2.4 below). [IFRIC 14.19].

And

- (b) Future service.

If there is a minimum funding requirement for contributions relating to future service, the economic benefit available as a reduction in future contributions is the sum of: [IFRIC 14.20]

- (a) Any amount that reduces future minimum funding requirement contributions for future service because the entity made a pre-payment (that is, it paid the amount before being required to do so).

And

- (b) The estimated future service cost in each period (as discussed in section 8.2.2 above) less the estimated minimum funding requirement contributions that would be required for future service in those periods if there were no pre-payment as described in (a).

The future minimum funding contributions required in respect of future service should be calculated:

- Taking into account the effect of any existing surplus on the minimum funding requirement basis but excluding the pre-payment discussed in (a) immediately above.
- Using assumptions consistent with the minimum funding requirement basis. For any factors not specified by the minimum funding requirement, the assumptions used should be consistent with those used to determine the defined benefit obligation and with the situation that exists at the end of the reporting period as determined by IAS 19.
- Including any changes expected as a result of the entity paying the minimum contributions when they are due.

And

- Excluding the effect of expected changes in the terms and conditions of the minimum funding basis that are not substantively enacted or contractually agreed at the end of the reporting period.

[IFRIC 14.21].

If the future minimum funding contribution required in respect of future service exceeds the future IAS 19 service cost in any given period, the present value of that excess reduces the amount of the asset available as a reduction in future contributions. However, the amount of the asset available as a reduction in future contributions can never be less than zero. [IFRIC 14.22].

The mechanics of the above requirements are illustrated in the following two examples based on the illustrative examples accompanying IFRIC 14. [IFRIC 14.IE9-IE27]. Illustration 8-1 also illustrates the requirement in certain circumstances to recognise an additional liability for future MFR payments in respect of past service (discussed in section 8.2.4 below).

18 [IFRIC Update](#), July 2015, available on the IFRS Foundation's website.

Illustration 8-1: Deficit-clearing future minimum funding requirements when refunds are not available

An entity has a funding level on the minimum funding requirement basis (which is measured on a different basis from that required under IAS 19) of 95% in Plan C. Under the minimum funding requirements, the entity is required to pay contributions to increase the funding level to 100% over the next three years. The contributions are required to make good the deficit on the minimum funding requirement basis (shortfall) and to cover future service.

Plan C also has an IAS 19 surplus at the end of the reporting period of CU50m, which cannot be refunded to the entity under any circumstances. There are no unrecognised amounts.

The nominal amounts of the minimum funding contribution requirements in respect of the shortfall and the future IAS 19 service cost for the next three years are set out below.

	Total minimum funding contribution requirement	Minimum contributions required to make good the shortfall	Minimum contributions required to cover future accrual
Year	CU m	CU m	CU m
1	135	120	15
2	125	112	13
3	115	104	11

The entity's present obligation in respect of services already received includes the contributions required to make good the shortfall but does not include the minimum contributions required to cover future service.

The present value of the entity's obligation, assuming a discount rate of 6% per year, is approximately CU300m, calculated as follows:

$$\text{CU120m} \div (1.06) + \text{CU112m} \div (1.06)^2 + \text{CU104m} \div (1.06)^3$$

When these contributions are paid into the plan, the IAS 19 surplus (i.e., the fair value of assets less the present value of the defined benefit obligation) would, other things being equal, increase from CU50m to CU350m. However, the surplus is not refundable although an asset may be available as a future contribution reduction.

As noted above, the economic benefit available as a reduction in future contributions is the present value of:

- The future service cost in each year to the entity
- Less
- Any minimum funding contribution requirements in respect of the future accrual of benefits in that year over the expected life of the plan.

The amounts available as a future contribution reduction are set out below.

	IAS 19 service cost	Minimum contributions required to cover future accrual	Amount available as contribution reduction
Year	CU m	CU m	CU m
1	13	15	(2)
2	13	13	0
3	13	11	2
4+	13	9	4

Assuming a discount rate of 6%, the economic benefit available as a future contribution reduction is therefore equal to:

$$\text{CU}(2)\text{m} \div (1.06) + \text{CU}0\text{m} \div (1.06)^2 + \text{CU}2\text{m} \div (1.06)^3 + \text{CU}4\text{m} \div (1.06)^4 + \text{CU}4\text{m} \div (1.06)^5 + \text{CU}4\text{m} \div (1.06)^6 \dots = \text{CU}56\text{m}.$$

The asset available from future contribution reductions is accordingly limited to CU56m.

As discussed in section 8.2.4 below, IFRIC 14 requires the entity to recognise a liability to the extent that the additional contributions payable will not be fully available. Therefore, the effect of the asset ceiling is to reduce the defined benefit asset by CU294m (CU50m + CU300m - CU56m).

As discussed in section 10.4 below, the effect of the asset ceiling is part of remeasurements and the CU294m is recognised immediately in other comprehensive income and the entity recognises a net liability of CU244m. No other liability is recognised in respect of the obligation to make contributions to fund the minimum funding shortfall.

When the contributions of CU300m are paid into the plan, the net asset will become CU56m (CU300m - CU244m).

Illustration 8-2: Effect of a prepayment when a minimum funding requirement exceeds the expected future service charge

An entity is required to fund Plan D so that no deficit arises on the minimum funding basis. The entity is required to pay minimum funding requirement contributions to cover the service cost in each period determined on the minimum funding basis.

Plan D has an IAS 19 surplus of CU35 at the beginning of 20X7. This example assumes that the discount rate is 0%, and that the plan cannot refund the surplus to the entity under any circumstances but can use the surplus for reductions of future contributions.

The minimum contributions required to cover future service are CU15 for each of the next five years. The expected IAS 19 service cost is CU10 in each year.

The entity makes a prepayment of CU30 at the beginning of 20X7 in respect of years 20X7 and 20X8, increasing its surplus at the beginning of 20X7 to CU65. That prepayment reduces the future contributions it expects to make in the following two years, as follows:

Minimum funding requirement contribution:			
	IAS 19 service cost	Before pre-payment	After pre-payment
Year	CU	CU	CU
20X7	10	15	0
20X8	10	15	0
20X9	10	15	15
20X0	10	15	15
20X1	10	15	15
Total	50	75	45

At the beginning of 20X7, the economic benefit available as a reduction in future contributions is the sum of:

- CU30, being the prepayment of the minimum funding requirement contributions.
And
- Nil. The estimated minimum funding requirement contributions required for future service would be CU75 if there was no prepayment. Those contributions exceed the estimated future service cost (CU50); therefore, the entity cannot use any part of the surplus of CU35.

Assuming a discount rate of 0%, the present value of the economic benefit available as a reduction in future contributions is equal to CU30. Accordingly, the entity recognises an asset of CU30 (because this is lower than the IAS 19 surplus of CU65).

Two points worth noting in Illustration 8-2 above are as follows. The first is that, if IFRIC 14 did not allow the recognition of such prepayments, the full surplus of CU65 would have been written off. The second is that, in the fact pattern of the question, it is unnecessary to know that the surplus before the prepayment was CU35. This is because any surplus (other than the prepayment of MFR) would not be recognised because refunds are not available and future MFR exceeds future service costs.

8.2.4 IFRIC Interpretation 14 - when a minimum funding requirement may give rise to a liability

If there is an obligation under a minimum funding requirement to pay contributions to cover an existing shortfall on the minimum funding basis in respect of services already received, the entity should determine whether the contributions payable will be available as a refund or reduction in future contributions after they are paid into the plan. [IFRIC 14.23]. Recovery through reduced future contributions is discussed in sections 8.2.2 and 8.2.3 above.

If a surplus is recoverable by way of a refund (see section 8.2.1 above), a minimum funding requirement to cover a shortfall in respect of past services will neither restrict an IAS 19 asset nor trigger the recognition of a liability as it will be recoverable with any refund. IFRIC 14 illustrates this by way of an example upon which the following is based. [IFRIC 14.IE1, IFRIC 14.IE2].

Illustration 8-3: Effect of the minimum funding requirement when there is an IAS 19 surplus and the minimum funding contributions payable are fully refundable to the entity

An entity has a funding level on the minimum funding requirement basis (which is measured on a different basis from that required under IAS 19) of 82% in Plan A. Under the minimum funding requirements, the entity is required to increase the funding level to 95% immediately. As a result, the entity has a statutory obligation at the end of the reporting period to contribute CU200m to Plan A immediately. The plan rules permit a full refund of any surplus to the entity at the end of the life of the plan. The year-end valuations for Plan A are set out below.

	CU m
Fair value of assets	1,200
Present value of defined benefit obligation under IAS 19	(1,100)
Surplus	100
Defined benefit asset (before consideration of the minimum funding requirement)	100

Payment of the contributions of CU200m will increase the IAS 19 surplus from CU100m to CU300m. Under the rules of the plan this amount will be fully refundable to the entity with no associated costs. Therefore, no liability is recognised for the obligation to pay the contributions and the net defined benefit asset will be recognised at CU100m.

To the extent that the contributions payable will not be available after they are paid into the plan, a liability should be recognised when the obligation arises. The liability should reduce the net defined benefit asset or increase the net defined benefit liability so that no gain or loss is expected to result from the effect of the asset ceiling when the contributions are paid. [IFRIC 14.24].

IFRIC 14 illustrates this by way of an example upon which the following is based. [IFRIC 14.IE3-8].

Illustration 8-4: Effect of a minimum funding requirement when there is an IAS 19 deficit and the minimum funding contributions payable would not be fully available

An entity has a funding level on the minimum funding requirement basis (which is measured on a different basis from that required under IAS 19) of 77% in Plan B. Under the minimum funding requirements, the entity is required to increase the funding level to 100% immediately. As a result, the entity has a statutory obligation at the end of the reporting period to pay additional contributions of CU300m to Plan B. The plan rules permit a maximum refund of 60% of the IAS 19 surplus to the entity and the entity is not permitted to reduce its contributions below a specified level which happens to equal the IAS 19 service cost. The year-end valuations for Plan B are set out below.

	CU m
Fair value of assets	1,000
Present value of defined benefit obligation under IAS 19	(1,100)
Deficit	(100)

The payment of CU300m would change the IAS 19 deficit of CU100m to a surplus of CU200m. Of this CU200m, 60% (CU120m) is refundable. Therefore, of the contributions of CU300m, CU100m eliminates the IAS 19 deficit and CU120m (60% of CU200m) is available as an economic benefit. The remaining CU80m (40% of CU200m) of the contributions paid is not available to the entity. As discussed above, IFRIC 14 requires the entity to recognise a liability to the extent that the additional contributions payable are not available to it. Accordingly, the net defined benefit liability is CU180m, comprising the deficit of CU100m plus the additional liability of CU80m with CU80m also being recognised in other comprehensive income. No other liability is recognised in respect of the statutory obligation to pay contributions of CU300m. When the contributions of CU300m are paid, the net asset will be CU120m. If the entity were required to achieve a 100% funding position at some point in the future, but not immediately, the present value of its contributions over this period would be used in the calculation above.

8.2.5 Pension funding payments contingent on future events within the control of the entity

As entities begin to consider moving away, in part at least, from deficit funding contributions which are fixed payments at fixed dates (which are clearly deficit clearing minimum funding requirements) to contributions contingent on future events, what constitutes a minimum funding requirement becomes more important, especially where it is concluded that an IAS 19 surplus is not recoverable. The definition of plan assets is discussed in section 6.1 above and minimum funding requirements are discussed in section 8.2.3 above. Where a surplus is not recoverable, under the asset ceiling:

- An instrument recognised as a plan asset would be written off.
And
- An arrangement which, whilst not being a plan asset, is considered a minimum funding requirement, would be provided for under IFRIC 14.

However, an arrangement which is considered neither a plan asset nor a minimum funding requirement would not be accounted for until payments are made. An example of such a situation is a requirement to make a contribution to a plan at some multiple of any dividends paid within a specified period. Such a right to receive a contribution in these circumstances may or may not meet the definition of a plan asset depending on its precise terms (in particular, whether the right is a 'transferable' one).

In this situation, a funding payment only happens as a result of an action within the control of the entity. Accordingly, such an obligation on a stand-alone basis would not be considered a financial liability under IAS 32 *Financial Instruments: Presentation* (see Chapter 41).

This leads to the key consideration of what accounting treatment to apply to a binding agreement requiring the making of payments to a plan only if the entity undertakes a separate transaction which is wholly within its control:

- If the corresponding entitlement of the plan does not meet the definition of a plan asset (for example, if it is non-transferable).
And
- It is considered not to be a minimum funding requirement (as it is contingent on the actions of the entity).

Two possibilities present themselves, which would have quite different accounting consequences.

One view could be that these contingent contributions would meet the definition of a minimum funding requirement. IAS 19 is based on the best estimates of ultimate cashflows and it is unequivocal that cashflows used to calculate the defined benefit obligation include the effect of at least some actions which are within the control of the entity. Most obviously, both continued employment and pay increases are within the control of the employer and are estimated to determine the defined benefit obligation and service cost (see section 7.5 above). Therefore, if the defined benefit obligation reflects a best estimate of future actions within the control of the entity, an argument could be made that a similar approach could be taken to funding payments. If it is believed that contingent contributions meet the definition of a minimum funding requirement, any accounting consequences of them would be recognised at the inception of the agreement. Under this view the entity would need to make a best estimate of the amount and timing of any future contributions, and determine whether an additional liability arises under IFRIC 14 where these would not be recoverable (see section 8.2.4 above).

An alternative view that contingent funding is not a minimum funding requirement could be formed by analogy to IAS 32 or IAS 37. A cash payment which the entity could avoid would not generally be accounted for as a financial liability under IAS 32. It could be argued that it would therefore not be encompassed within the phrase 'any requirement to fund'. Under this analysis the definition of a plan asset (see section 6.1 above) becomes particularly important. A transferable instrument would be a plan asset, and would be written off under the asset ceiling mechanism if it is not considered recoverable under IFRIC 14. A non-transferable instrument would not meet the definition of a plan asset. If such an instrument was not considered a minimum funding requirement (because it could be avoided by the entity) it would not be accounted for until a payment were made.

If analogy were made to IAS 37, the presence of a constructive obligation could trigger recognition of a liability in respect of irrecoverable minimum funding payments at the moment it becomes probable that an outflow of resources will be required to settle the obligation and it can be estimated reliably.

How we see it

In developing an accounting policy an entity should consider the views above and apply judgement based on the individual facts and circumstances.

9 Defined benefit plans - Presentation of the net defined benefit liability (asset)

Neither IAS 19 nor IAS 1¹⁹ specifies where in the statement of financial position a net asset or net liability in respect of a defined benefit plan should be presented, nor whether such balances should be shown separately on the face of the statement of financial position or only in the notes - this is left to the discretion of the reporting entity subject to the general requirements of IAS 1 discussed in Chapter 3. If the format of the statement of financial position distinguishes current assets and liabilities from non-current ones, the question arises as to whether this split needs also to be made for pension balances. IAS 19 does not specify whether such a split should be made, on the grounds that it may sometimes be arbitrary.

[IAS 19.133, IAS 19.BC200].

Employers with more than one plan could find that some are in surplus while others are in deficit. IAS 19 contains offset criteria closely modelled on those in IAS 32. [IAS 19.132]. An asset relating to one plan could only be offset against a liability relating to another plan when there is a legally enforceable right to use a surplus in one plan to settle obligations under the other plan, and the employer intends to settle the obligations on a net basis or realise the surplus and settle the obligation simultaneously. [IAS 19.131]. It seems unlikely that these offset criteria would be met in practice.

19 IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

10 Defined benefit plans - Treatment in profit or loss and other comprehensive income

IAS 19 identifies three components of annual pension cost as follows:

- (a) Service cost (see section 10.1 below)
- (b) Net interest on the net defined benefit liability (asset) (see section 10.3 below)

And

- (c) Remeasurements of the net defined benefit liability (see section 10.4 below) [IAS 19.120]

Of these, (a) and (b) are recognised in profit or loss and (c) is recognised in other comprehensive income. This is unless another standard requires or permits the costs to be included in the cost of an asset, for example IAS 2 *Inventories* and IAS 16 *Property, Plant and Equipment*. Where the post-employment benefit costs are included in the cost of an asset the appropriate proportion of all the above items must be included. [IAS 19.121]. There is no guidance in the standard as to what an 'appropriate' proportion of these items might be, although both IAS 2 (see Chapter 23) and IAS 16 (see Chapter 19) are clear that only those costs which are directly attributable to the asset qualify for capitalisation. It is not necessarily the case that the appropriate proportion will be the same for all of the components and judgement will be required in determining how much of each item can meaningfully be said to relate to the production of an asset.

Remeasurements recognised in other comprehensive income should not be reclassified to profit and loss in a subsequent period. The standard notes that those amounts may be transferred within equity. [IAS 19.122].

The standard states that it does not specify how an entity should present service cost and net interest on the net defined benefit liability or asset. The presentation of these components in the profit and loss account are accounted for in accordance with IAS 1 (see Chapter 3) and could either be included in one line or split between lines in the income statement according to its nature. [IAS 19.134]. For example, the net interest could be presented in the income statement along with other finance items. IFRS 18, once effective, will require that net interest on a defined benefit liability (or asset) be classified in the financing category in the income statement. [IFRS 18.59(b), IFRS 18.B53]. See Chapter 4 for more details on the new requirements in IFRS 18.

10.1 Service cost

Service cost comprises:

- (a) Current service cost - the increase in the present value of the defined benefit obligation resulting from employee service in the current period.
- (b) Past service cost - the change in the present value of the defined benefit obligation for employee service in prior periods, resulting from a plan amendment (the introduction or withdrawal of, or changes to, a defined benefit plan) or a curtailment (a significant reduction by the entity in the number of employees covered by a plan).

And

- (c) Any gain or loss on settlement - the difference, at the date of settlement, between the present value of the defined benefit obligation being settled and the settlement price, including any plan assets transferred and any payments made directly by the entity in connection with the settlement. [IAS 19.8, IAS 19.109]. The gain or loss is recognised when the settlement occurs. [IAS 19.110].

The current service cost should be determined using the projected unit credit method. [IAS 19.67]. The basic computation is illustrated in Illustration 7-2 in section 7.3 above.

There is no need to distinguish between past service cost resulting from a plan amendment, past service cost resulting from a curtailment and a gain or loss on settlement if these transactions occur together. In some cases, a plan amendment occurs before a settlement, such as when an entity changes the benefits under the plan and settles the amended benefits later. In those cases, an entity recognises past service cost before any gain or loss on settlement. [IAS 19.8, IAS 19.100].

A settlement occurs together with a plan amendment and curtailment if a plan is terminated with the result that the obligation is settled and the plan ceases to exist. However, the termination of a plan is not a settlement if the plan is replaced by a new plan that offers benefits that are, in substance, the same. [IAS 19.101].

10.2 Changes in a defined benefit plan

Accounting for past service costs (plan amendments or curtailments) and settlements are discussed in sections 10.2.1 and 10.2.3 below, respectively. The acquisition of a qualifying insurance policy not directly connected with a settlement is discussed in section 10.2.2 below. Each of these sections detail where any gain or loss arising is recorded which will either be in the profit and loss account or other comprehensive income.

In summary, when determining the effect of such a transaction, the net defined benefit liability (asset) should be remeasured using up to date values for plan assets and actuarial assumptions before and after the event to determine the effect of it. [IAS 19.99].

Any past service cost or gain or loss on settlement should be recognised and measured without considering the effect of the asset ceiling (see section 8.2 above). The effect of the asset ceiling should then be determined after the plan amendment, curtailment or settlement with any change in that effect, excluding amounts included in net interest, recognised in other comprehensive income. [IAS 19.101A].

Current service cost should ordinarily be determined using actuarial assumptions as at the start of the reporting period. However, as discussed in section 10.2.1 below, a plan amendment, curtailment or settlement during a reporting period will require remeasurement of the net defined benefit liability (asset). In such cases the current service cost for the remainder of the period, that is, after the plan amendment, curtailment or settlement, should be calculated using the actuarial assumptions used for the remeasurement. [IAS 19.122A].

The point in time at which a plan amendment occurs will often be a matter of fact based on the legal entitlements of plan members. Judgement could be required, based on individual facts and circumstances, particularly if the benefits concerned constitute constructive, as opposed to legal, obligations (see section 7.1 above).

Sometimes benefit plans are amended in such a way as to allow members a choice, for a limited period, between two or more benefit arrangements. In such cases, a plan amendment occurs (and a positive or negative past service cost will be recognised) on the date at which the new arrangement comes into existence (legally or constructively) and not at the later date by which members are required to make their choice. This could mean that the initial accounting for the plan amendment will require estimates to be made of the choices which members will make. However, if it is known, at the time the relevant financial statements are prepared, what choices members have made (for example, because the 'window' for making selections closes before the financial statements are authorised for issue) this definitive data would remove the need for estimation. Any subsequent changes in estimates in the following years resulting from the confirmation process would be a change in estimate and recognised as a remeasurement gain or loss.

10.2.1 Past service cost

Past service cost is the change in the present value of the defined benefit obligation for employee service in prior periods resulting from a plan amendment or curtailment. [IAS 19.8, IAS 19.102].

Past service costs should be recognised at the earlier of the date when:

- (a) The plan amendment or curtailment occurs.

And

- (b) The entity recognises related restructuring costs in accordance with IAS 37 (discussed in Chapter 27).

[IAS 19.8, IAS 19.103].

A plan amendment occurs when an entity introduces, or withdraws, a defined benefit plan or changes the benefits payable under an existing defined benefit plan. [IAS 19.8, IAS 19.104].

In November 2007, the IFRS IC discussed whether changes to a defined benefit plan as a result of government action must also be accounted for as a plan amendment. The IFRS IC noted that "the accounting for changes arising from government actions should be the same as for changes made by an employer." The IFRS IC also acknowledged that, "in some circumstances, it might be difficult to determine whether the change affects either actuarial assumptions or benefits payable and noted that judgement is required".²⁰

A curtailment occurs when an entity significantly reduces the number of employees covered by a plan. A curtailment may arise from an isolated event, such as the closing of a plant, discontinuance of an operation or termination or suspension of a plan. [IAS 19.8, IAS 19.105].

²⁰ [IFRIC Update](#), November 2007, available on the IFRS Foundation's website.

In determining whether a curtailment has occurred an entity should consider both quantitative factors (such as the reduction of the number of employees as a percentage of the total number of employees) and qualitative factors (such as whether a division has been closed). If a reduction in the number of employees is judged significant then a curtailment should be recognised. [IAS 19.BC162].

The timing of the recognition of a plan amendment or curtailment which is not triggered by a restructuring will require judgement and depend on facts and circumstances, and their interaction with the constructive obligation requirements in the standard. [IAS 19.BC158].

Past service cost may be either positive (when benefits are introduced or changed so that the present value of the defined benefit obligation increases) or negative (when benefits are withdrawn or changed so that the present value of the defined benefit obligation decreases). [IAS 19.8, IAS 19.106].

Where an entity reduces benefits payable under an existing defined benefit plan and, at the same time, increases other benefits payable under the plan for the same employees, the entity treats the change as a single net change. [IAS 19.8, IAS 19.107].

Past service cost excludes:

- (a) The effect of differences between actual and previously assumed salary increases on the obligation to pay benefits for service in prior years (there is no past service cost because actuarial assumptions allow for projected salaries, accordingly the effect of any such difference is an actuarial gain or loss - see section 7.5 above).
 - (b) Under- and over-estimates of discretionary pension increases when an entity has a constructive obligation to grant such increases (there is no past service cost because actuarial assumptions allow for such increases, accordingly the effect of any such under- or over-estimate is an actuarial gain or loss - see section 7.5 above).
 - (c) Estimates of benefit improvements that result from actuarial gains or from the return on plan assets that have been recognised in the financial statements if the entity is obliged, by either the formal terms of a plan (or a constructive obligation that goes beyond those terms) or legislation, to use any surplus in the plan for the benefit of plan participants, even if the benefit increase has not yet been formally awarded (the resulting increase in the obligation is an actuarial loss and not past service cost, see section 7.5 above).
- And
- (d) The increase in vested benefits (that is, those not conditional on future employment) when, in the absence of new or improved benefits, employees complete vesting requirements (there is no past service cost because the estimated cost of benefits was recognised as current service cost as the service was rendered, accordingly the effect of any such increase is an actuarial gain or loss, see section 7.5 above). [IAS 19.108].

10.2.2 Acquisition of a qualifying insurance policy

IAS 19 observes that an employer could acquire an insurance policy to fund some or all of the employee benefits relating to employee service in the current and prior periods. The acquisition of such a policy is not a settlement if the employer retains a legal or constructive obligation to pay further amounts if the insurer does not pay the employee benefits specified in the insurance policy (often referred to as a buy-in). [IAS 19.112]. However, the acquisition of an insurance policy will mean an entity has an asset which needs to be measured at fair value. As discussed in section 6.3 above, certain insurance policies are valued at an amount equal to the present value of the defined benefit obligation which they match. The cost of buying such a policy will typically greatly exceed its subsequent carrying amount. This loss is seen as an actuarial loss as it results from exchanging one plan asset for another, which is recognised in other comprehensive income, unless in substance the acquisition of the qualifying insurance policy is a settlement of the plan (see section 10.2.3 below).

10.2.3 Settlements

IAS 19 defines a settlement as a transaction that eliminates all further legal or constructive obligations for part or all of the benefits provided under a defined benefit plan, other than a payment of benefits to, or on behalf of, employees that is set out in the terms of the plan and included in the actuarial assumptions. [IAS 19.8].

In other words, settlement occurs at the point of absolute risk extinguishment, for part or all of the employer obligations. The date on which absolute risk extinguishment occurs may require judgement and depend on facts and circumstances. The IFRS IC noted in their meeting in May 2008 that options covered by an existing plan, such as lump sum payments on retirement, are covered by actuarial assumptions and are not treated as settlements.²¹

21 [IFRIC Update](#), May 2008, available on the IFRS Foundation's website.

For example, a one-off transfer of significant employer obligations under the plan to an insurance company through the purchase of an insurance policy (often referred to as a buy-out) is a settlement; a lump sum cash payment, under the terms of the plan, to plan participants in exchange for their rights to receive specified post-employment benefits is not. [IAS 19.111].

The interaction between the asset ceiling and past service cost or a gain or loss on settlement is discussed further in section 10.2.1 above.

As noted in section 10.1 above the gain or loss on settlement forms part of the service cost and is recognised in profit or loss.

Any transactions in advance of the legal date of a settlement would also need to be considered. For example, an entity could enter into a binding commitment to settle a defined benefit obligation in the future with an insurance company, which as at the year-end date is beyond recall, but legally risk only transfers to the insurer after the year end. In this situation, the loss on settlement must be recognised at the point of commitment. However, the defined benefit obligation and related assets will remain on the statement of financial position until legal settlement occurs. As discussed in section 7.1 above an automatic exit event which is included within the plan rules and could not be avoided by the entity would also be taken into account as part of the measurement of the defined benefit obligation.

How we see it

The derecognition of a defined benefit obligation must only occur on absolute risk extinguishment. However an unavoidable commitment to do so may exist prior to that date, and that commitment and any resulting gain or loss will need to be accounted for.

The following extract from InterContinental Hotels Group PLC illustrates a buy-in which has occurred in one financial period, followed by a buy-out in the following financial period. As the policy was structured so as to enable the plan to move to a buy-out, and the intention was to proceed on that basis, the buy-in transaction was accounted for as a settlement with the loss arising recorded in the income statement.

Practical example 10-1: InterContinental Hotels Group PLC (2014)

United Kingdom

Annual Report and Form 20-F 2014 [extract]

Notes to the Group Financial Statements [extract]

25. Retirement benefits

UK

Historically UK retirement and death in service benefits have been provided for eligible employees in the UK principally by the InterContinental Hotels UK Pension Plan, which has both defined benefit and defined contribution sections. The defined benefit section was subject to a buy-in transaction on 15 August 2013 whereby the assets of the plan were invested in a bulk purchase annuity policy with the insurer Rothersey Life under which the benefits payable to defined benefit members became fully insured. On 31 October 2014, the plan completed the move to a full buy-out of the defined benefit section, following which Rothersey Life has become fully and directly responsible for the pension obligations. On completion of the buy-out, the defined benefit assets (comprising the Rothersey Life insurance policy) and matching defined benefit liabilities were derecognised from the Group statement of financial position. *The buy-out transaction*

...

In respect of the defined benefit plans, the amounts recognised in the Group income statement, in administrative expenses, are:

	Pension plans												
	UK						Post-employment benefits						Total
	2014 \$m	2013 \$m	2012 \$m	2014 \$m	2013 \$m	2012 \$m	2014 \$m	2013 \$m	2012 \$m	2014 \$m	2013 \$m	2012 \$m	
Current service cost	-	2	5	1	1	1	-	-	-	1	3	6	
Past service cost	-	-	-	-	1	-	-	-	-	-	1	-	
Net interest expense	2	-	1	3	3	3	1	1	1	6	4	5	
Administration costs	3	1	1	-	1	1	-	-	-	3	2	2	
Operating profit before exceptional items	5	3	7	4	6	5	1	1	1	10	10	13	
Exceptional items:													
Settlement cost	6	147	-	-	-	-	-	-	-	6	147	-	
	11	150	7	4	6	5	1	1	1	16	157	13	

: settlement cost in 2013 resulted from the buy-in transaction described on the previous page and comprised a past service cost of n relating to additional benefits secured by the transaction, the \$137m difference between the cost of the insurance policy and the counting value of the liabilities secured and transaction costs of \$5m. As the policy was structured to enable the plan to move to a -out and the intention was to proceed on that basis, the buy-in transaction was accounted for as a settlement with the loss arising ordered in the income statement. The full buy-out was completed on 31 October 2014.

...

10.3 Net interest on the net defined benefit liability (asset)

Net interest on the net defined benefit liability (asset) is the change during the period in the net defined benefit liability (asset) that arises from the passage of time. [IAS 19.8]. It is determined by multiplying the net defined benefit liability (asset) by the discount rate (see section 7.6 above which also discusses the use of a more granular approach to determining the discount rate) taking into account any changes in the net defined benefit liability (asset) during the period resulting from contributions or benefit payments.

[IAS 19.123, IAS 19.123A].

Unless there are certain plan changes in the period, the discount rate used for the whole period is that determined at the start of the reporting period. However, if the net defined benefit liability (asset) is remeasured to determine a past service cost, or a gain or loss on settlement the net interest for the remainder of the reporting period is determined using: [IAS 19.123A]

- (a) The net defined benefit liability (asset) reflecting the benefits offered after the plan amendment, curtailment or settlement.

And

- (b) The discount rate used to remeasure the net defined benefit liability (asset).

Accounting for defined benefit schemes in interim financial statements is discussed in Chapter 37.

As the net item in the statement of financial position is comprised of up to three separate components (the defined benefit obligation, plan assets and the asset ceiling), the net interest is made up of interest unwinding on each of these components. [IAS 19.124]. Although, computationally, the net interest is so composed, for the purposes of presentation in profit or loss it is a single net amount.

Interest on plan assets calculated as described above will not, other than by coincidence, be the same as the actual return on plan assets. The difference is a remeasurement recognised in other comprehensive income (see section 10.4.2 below). If the net plan liability (asset) is remeasured as a result of a plan amendment, curtailment or settlement the entity shall determine interest income for the remainder of the annual reporting period after the plan amendment, curtailment or settlement using the plan assets used to remeasure the net defined benefit liability (asset). In performing this calculation, the entity shall also take into account any changes in the plan assets held during the period resulting from contributions or benefit payments. [IAS 19.125].

Similarly, the difference in the asset ceiling between the start and end of the period is unlikely to equal the interest on this component described above. An entity shall determine the effect of the asset ceiling at the start of the annual reporting period. However, if an entity remeasures the net defined benefit liability (asset) as a result of a plan amendment, curtailment or settlement, the entity shall determine interest on the effect of the asset ceiling for the remainder of the annual reporting period after the plan amendment, curtailment or settlement taking into account any change in the effect of the asset ceiling as discussed in section 10.2 above. The difference between the total change in the effect of the asset ceiling and the interest effect is accounted for as a remeasurement in other comprehensive income. [IAS 19.126].

10.4 Remeasurements

Remeasurements of the net defined benefit liability (asset) comprise:

- (a) Actuarial gains and losses
 - (b) The return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset)
- And
- (c) Any change in the effect of the asset ceiling (see section 8.2 above), excluding amounts included in net interest on the net defined benefit liability (asset) [IAS 19.8, IAS 19.127]

10.4.1 Actuarial gains and losses

Actuarial gains and losses are changes in the present value of the defined benefit obligation resulting from: experience adjustments (the effects of differences between the previous actuarial assumptions and what has actually occurred); and the effects of changes in actuarial assumptions. [IAS 19.8]. These can result, for example, from:

- (a) Unexpectedly high or low rates of: employee turnover, early retirement, mortality, increases in salaries or benefits, or medical costs (if the formal or constructive terms of the plan provide for inflationary benefits).
- (b) The effect of changes to assumptions concerning benefit payment options.
- (c) The effect of changes in estimates of future employee turnover, early retirement or mortality or of increases in salaries, benefits (if the formal or constructive terms of the plan provide for inflationary benefit increases) or medical costs.

And

- (d) The effect of changes in the discount rate. [IAS 19.128].

Actuarial gains and losses do not include changes in the present value of the defined benefit obligation because of the introduction, amendment, curtailment or settlement of the defined benefit plan, or changes to the benefits payable under the defined benefit plan. Such changes result in past service cost or gains or losses on settlement (see sections 10.2.1 and 10.2.3 above). [IAS 19.129].

10.4.2 The return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset)

The return on plan assets is interest, dividends and other income derived from the plan assets, together with realised and unrealised gains on the assets, less:

- Any costs of managing plan assets.
- And
- Any tax payable by the plan itself, other than tax included in the actuarial assumptions used to measure the present value of the defined benefit obligation. [IAS 19.8].

Other administration costs are not deducted from the return on plan assets, as discussed further in section 11 below. [IAS 19.130].

11 Defined benefit plans - Costs of administering employee benefit plans

Some employee benefit plans incur costs as part of delivering employee benefits. The costs are generally more significant for post-retirement benefits such as pensions. Examples of costs include actuarial valuations, government levies, audits and the costs of managing any plan assets.

IAS 19 deals with some costs, as discussed below, but is silent on others.

The following costs are required to be factored into the measurement of the defined benefit obligation as part of the actuarial assumptions (see section 7.5 above):

- In the case of medical benefits, future medical costs, including claim handling costs (i.e., the costs that will be incurred in processing and resolving claims, including legal and adjuster's fees).

And

- Taxes payable by the plan on contributions relating to service before the reporting date or on benefits resulting from that service. [IAS 19.76(b)].

The following costs (and no others) are deducted from the return on plan assets (see section 10.4.2 above):

- The costs of managing the plan assets.

And

- Any tax payable by the plan itself, other than tax included in the actuarial assumptions used to measure the defined benefit obligation. [IAS 19.130].

As discussed in section 10.3 above, net interest on the net liability or asset is reported in the income statement. This is a wholly computed amount which is uninfluenced by actual asset returns; the difference between actual asset returns and the credit element of the net interest amount forms part of remeasurements reported in other comprehensive income.

So, although not expressed in these terms, costs of administering plan assets and the tax mentioned above are reported in other comprehensive income.

The standard is silent on the treatment of any other costs of administering employee benefit plans. However, the Basis for Conclusions on IAS 19 contains the following: "the Board decided that an entity should recognise administration costs when the administration services are provided. This practical expedient avoids the need to attribute costs between current and past service and future service". [IAS 19.BC127]. The Board may well have taken that decision, however it was not articulated in the practical expedient in the standard.

How we see it

In our view, recognising administration costs when the administration services are provided is an acceptable way to account for costs not dealt with in the standard. However other approaches could be acceptable, for example, in relation to closed schemes as discussed below. Once an accounting policy has been determined it must be applied consistently to similar facts and circumstances.

Entities need, in compliance with IAS 8, to develop an accounting policy in light of the standard not dealing with these costs. However, IAS 1 is clear that such costs would not be reported in other comprehensive income. [IAS 1.88].

One alternative to simple accruals accounting as costs are incurred could be relevant to closed plans, where employees are no longer exchanging services for defined benefits. In this situation, it is clear that any and all future costs of administering the plan relate to past periods and no attribution is necessary. An entity with such an arrangement could select a policy of full provision of all costs of 'running-off' the plan (apart from those specifically dealt with by the standard) which should be applied consistently to similar facts and circumstances.

12 Short-term employee benefits

Short-term employee benefits are employee benefits (other than termination benefits) that are expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees render the related service. [IAS 19.8].

The standard states that reclassification is not necessary if an entity's expectation of the timing of settlement changes temporarily. However, if the characteristics of the benefit change (such as a change from a non-accumulating benefit to an accumulating benefit) or if a change in expectations of the timing of settlement is not temporary, then the entity considers whether the benefit still meets the definition of short-term employee benefits. [IAS 19.10].

They can include:

- Wages, salaries and social security contributions
- Paid annual leave and paid sick leave
- Profit-sharing and bonuses
- And
- Non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) for current employees [IAS 19.9]

12.1 General recognition criteria for short-term employee benefits

An entity should recognise the undiscounted amount of short-term benefits attributable to services that have been rendered in the period as an expense, unless another IFRS accounting standard requires or permits the benefits to be included in the cost of an asset. This could particularly be the case under IAS 2 (see Chapter 23), IAS 16 (see Chapter 19) and IAS 38 *Intangible Assets* (see Chapter 18). Any difference between the amount of cost recognised and cash payments made should be treated as a liability or prepayment as appropriate. [IAS 19.11]. There are further requirements in respect of short-term paid absences and profit-sharing and bonus plans as detailed below. Cost is not defined in IAS 19 and therefore the accounting for such benefits could vary depending on any other standards involved in the recognition of the transaction.

12.2 Short-term paid absences

These include absences for vacation (holiday), sickness and short-term disability, maternity or paternity leave, jury service and military service. These can either be accumulating or non-accumulating absences. [IAS 19.14]. Accumulating absences are those that can be carried forward and used in future periods if the entitlement in the current period is not used in full. They can be either vesting entitlements (which entitle employees to a cash payment in lieu of absences not taken on leaving the entity) or non-vesting entitlements (where no cash compensation is payable). Non-accumulating absences are those where there is no entitlement to carry forward unused days. An obligation arises as employees render service that increases their entitlement to future paid absences. [IAS 19.15].

12.2.1 Accumulating absences

The cost of accumulating paid absences should be recognised when employees render the service that increases their entitlement to future paid absences. No distinction should be made between the recognition of vesting and non-vesting entitlements (see section 12.2 above), on the basis that the liability arises as services are rendered in both cases. However, the measurement of non-vesting entitlements should take into account the possibility of employees leaving before receiving them. [IAS 19.15].

The cost of accumulating paid absences should be measured as the additional amount that the entity expects to pay as a result of the unused entitlement that has accumulated at the end of the reporting period. [IAS 19.16]. In the case of unused paid sick leave, provision should be made only to the extent that it is expected that employees will use the sick leave in subsequent periods. The standard observes that in many cases, it may not be necessary to make detailed computations to estimate that there is no material obligation for unused paid absences. For example, IAS 19 considers it unlikely that a sick leave obligation will be material unless there is a formal or informal understanding that unused paid sick leave may be taken as paid vacation. [IAS 19.17].

The standard provides an example to illustrate the requirements for accumulating paid absences upon which the following is based: [IAS 19.17]

Illustration 12-1: Accumulating paid absences

An entity has 100 employees, who are each entitled to five working days of paid sick leave for each year. Unused sick leave may be carried forward for one calendar year. Sick leave is taken first out of the current year's entitlement and then out of any balance brought forward from the previous year (a LIFO basis). At 31 December 20X9, the average unused entitlement is two days per employee. The entity expects, based on past experience which is expected to continue, that 92 employees will take no more than five days of paid sick leave in 20X0 and that the remaining eight employees will take an average of six and a half days each.

The entity expects that it will pay an additional 12 days of sick pay as a result of the unused entitlement that has accumulated at 31 December 20X9 (one and a half days each, for eight employees). Therefore, the entity recognises a liability equal to 12 days of sick pay.

12.2.2 Non-accumulating paid absences

The cost of non-accumulating absences should be recognised as and when they arise, on the basis that the entitlement is not directly linked to the service rendered by employees in the period. This is commonly the case for sick pay (to the extent that unused past entitlement cannot be carried forward), maternity or paternity leave, furlough periods and paid absences for jury service or military service. [IAS 19.13(b), IAS 19.18].

12.3 Profit-sharing and bonus plans

An entity should recognise the expected cost of profit-sharing and bonus payments when and only when:

- The entity has a present legal or constructive obligation to make such payments as a result of past events.
- And
- A reliable estimate of the obligation can be made. [IAS 19.19].

The above are discussed in turn in sections 12.3.1 and 12.3.2 below. Statutory profit-sharing arrangements based on taxable profit are discussed in section 12.3.3 below.

12.3.1 Present legal or constructive obligation

A present obligation exists when, and only when, the entity has no realistic alternative but to make the payments. [IAS 19.19]. IAS 19 clarifies that where a profit-sharing plan is subject to a loyalty period (i.e., a period during which employees must remain with the entity in order to receive their share), a constructive obligation is created as employees render service that increases the amount to be paid if they remain in service until the end of the specified period. However, the possibility of employees leaving during the loyalty period should be taken into account in measuring the cost of the plan. [IAS 19.20]. The standard illustrates the approach as follows:

Illustration 12-2: Profit sharing and bonus plans

A profit-sharing plan requires an entity to pay a specified proportion of its net profit for the year to employees who serve throughout the year. If no employees leave during the year, the total profit-sharing payments for the year will be 3% of profit. The entity estimates that staff turnover will reduce the payments to 2.5% of profit.

The entity recognises a liability and an expense of 2.5% of profit.

It is worth noting that in the scenario above, when an entity prepares its accounts for the year it will no longer be uncertain whether all eligible employees become entitled to the bonus, as that is determined at the year-end. That means the reduction in the accrual from 3% to 2.5% should be an observable fact, not an 'estimate'.

The standard also states that where an entity has a practice of paying bonuses it has a constructive obligation to pay a bonus, even though there could be no legal obligation for it to do so. Again, however, in measuring the cost, the possibility of employees leaving before receiving a bonus should be taken into account. [IAS 19.21].

12.3.2 Reliable estimate of provision

A reliable estimate of a legal or constructive obligation under a profit-sharing or bonus plan can be made when and only when:

- The formal terms of the plan contain a formula for determining the amount of the benefit.
 - The entity determines the amounts to be paid before the financial statements are authorised for issue.
- Or
- Past practice gives clear evidence of the amount of the entity's constructive obligation. [IAS 19.22].

It is worth noting that the paragraph above from IAS 19 deals only with the measurement of the provision and not the point of recognition which is discussed in section 12.3.1 above.

IAS 19 states that an obligation under a profit-sharing or bonus plan must be accounted for as an expense and not a distribution of profit, since it results from employee service and not from a transaction with owners. [IAS 19.23].

Where profit-sharing and bonus payments are not expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees render the related service, they should be accounted for as other long-term employee benefits (see section 13 below). [IAS 19.24].

12.3.3 Statutory profit-sharing based on taxable profit

In November 2010, the IFRS IC was asked to clarify how to account for a particular statutory employee benefit whereby 10% of taxable profit is shared with employees. In particular, the request sought clarification as to whether analogy could be made to IAS 12 *Income Taxes* to account for temporary differences between accounting and taxable profit which would reverse in the future.

The IFRS IC thought that such an approach was not acceptable. It decided not to add the item to its agenda stating "The Committee noted that the statutory employee profit-sharing arrangement described in the request should be accounted for in accordance with IAS 19, and that IAS 19 provides sufficient guidance on amounts that should be recognised and measured, with the result that significantly divergent interpretations are not expected in practice. Consequently, the Committee decided not to add this issue to its agenda".²²

²² [IFRIC Update](#), November 2010, available on the IFRS Foundation's website.

13 Long-term employee benefits other than post-employment benefits

13.1 Meaning of other long-term employee benefits

These are all employee benefits other than post-employment benefits and termination benefits. [IAS 19.8]. They include the following if not expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees rendered the related service:

- Long-term paid absences such as long-service or sabbatical leave
- Jubilee or other long-service benefits
- Long-term disability benefits
- Profit-sharing and bonuses
- And
- Deferred remuneration [IAS 19.153]

13.2 Recognition and measurement

For such benefits IAS 19 requires a simplified version of the accounting treatment required in respect of defined benefit plans (which is discussed in detail in section 5 above). The amount recognised as a liability for other long-term employee benefits should be the net total, at the end of the reporting period, of the present value of the defined benefit obligation and the fair value of plan assets (if any) out of which the obligations are to be settled directly. The net total of the following amounts should be recognised in profit or loss, except to the extent that another IFRS accounting standard requires or permits their inclusion in the cost of an asset:

- (a) Service cost
- (b) Net interest on the net defined benefit liability (asset)
- And
- (c) Remeasurements of the net defined benefit liability (asset)

In other words, all assets, liabilities, income and expenditure relating to such benefits should be accounted for in the same way, and subject to the same restrictions on the recognition of assets and income, as those relating to a defined benefit pension plan (see sections 8.1 and 8.2 above), except that remeasurements are recognised in profit or loss. [IAS 19.155, IAS 19.156].

The standard explains the use of this simplified approach by asserting that the measurement of other long-term employee benefits is not usually subject to the same degree of uncertainty as that of post-employment benefits. [IAS 19.154].

An illustration of the methodology to calculate the defined benefit obligation, service and interest costs is given in Illustration 7-2 in section 7.3 above.

13.2.1 Attribution to years of service

Long-term employee benefit arrangements will typically have conditions attached to secure their vesting. For example, employee bonuses are now commonly linked to vesting conditions which mean that they will not be settled wholly within 12 months after the period in which the employee renders the related service. In this case, the liability should be calculated using the projected unit credit method and spread on a straight-line basis over the full vesting period. For example, a bonus granted to an employee on 1 January 20X1 which is based on the employees' performance in 20X1 but is not payable until February 20X4 and is conditional on the employee remaining in service until 31 December 20X3 will have a vesting period from 1 January 20X1 to 31 December 20X3 and the liability will be spread on a straight line basis over this three year period.

The IFRS IC also received questions concerning early retirement bonuses where bonus payments are given in exchange for a 50% reduction in working hours which are conditional on the employee completing a required service period when employment is terminated. The IFRS IC concluded that as the bonus payments were conditional upon the completion of service over a specified period this indicated that the benefits were provided in exchange for that service and should be attributed over this period of service (and were not a termination benefit).²³

23 [IFRIC Update](#), November 2011, available on the IFRS Foundation's website.

It is not always clear how the attribution of long-term benefits to the years of service over which they are earned should be performed.

Consider an award made at the start of the year for a fixed cash payment. A third of the payment vests on each of the first, second and third anniversaries of the grant for employees still employed at each vesting date.

One interpretation would be that the 'benefit formula' attributes a third of the award to each year and that each of the three income statements will bear one third of the expense.

An alternative view is that there are three distinct awards with the same grant date, but with durations of one, two and three years. This pattern of vesting is sometimes described as 'graded vesting' and is discussed, in relation to share-based payments, in Chapter 30 and illustrated in Illustration 6-5.

How we see it

In our view an entity has an accounting policy choice, as discussed above, to attributing long-term benefits to the years of service over which they are earned to be applied consistently to similar facts and circumstances.

13.2.2 Long-term disability benefit

Where long-term disability benefit depends on the length of service of the employee, an obligation arises as the employee renders service, which is measured according to the probability that payment will be required and the length of time for which payment is expected to be made. If, however, the level of benefit is the same for all disabled employees regardless of years of service, the expected cost is recognised only when an event causing disability occurs. [IAS 19.157].

13.2.3 Long-term benefits contingent on a future event

It could be the case that a long-term benefit becomes payable only on the occurrence of an uncertain future event, for example an initial public offering of an entity's shares (IPO) or an exit event, financial KPI's such as revenue or non-financial KPI's such as the number of new customers or retail outlets opened in a period. Such events are binary in nature and would result in payment either to no employees with entitlements under the plan or to all such employees.

As discussed in section 13.2 above, the projected unit credit method is applied to long-term employee benefits, [IAS 19.154], however the key question that arises is whether the accounting should reflect the single best estimate of the outcome; or, the expected value - that is, a weighted average of possible outcomes. Paragraph 72 of IAS 19 states that "the probability that the specified event will occur affects the measurement of the obligation, but does not determine whether the obligation exists". This sets out the requirement that probability affects measurement. The manner in which probability affects measurement is dealt with in IAS 19.76 which requires actuarial assumptions to be a best estimate of the ultimate cost of providing benefits. [IAS 19.76].

How we see it

We believe that the best estimate of the outcome of an uncertain event must be used when accounting for long-term employee benefits where the outcome is binary.

Therefore, if the future event on which the long-term benefit is contingent is not probable the liability should be measured at nil. When the contingent event is or becomes probable (that is, more likely than not) the actuarial assumption used in applying the projected unit credit method should reflect the full benefits which would be payable upon the occurrence of the event. The result of revising the actuarial assumptions will result in a remeasurement gain or loss being recognised in profit and loss in the year of the change. For example consider a long-term employee benefit vesting over a five year period in which the liability was measured based on the projected unit credit method at the end of the first and second year as the contingent event was determined to be probable. If the contingent event becomes no longer probable during the third year, then the liability at the end of year three will be nil and the previous liability recognised in years one and two will be released to the profit and loss account. For example, consider a long-term benefit contingent on a future event such as an IPO, where an employee will receive a payment if (and only if) the employer entity becomes listed on a stock exchange within five years. In each of the first two years it was considered probable that the listing would take place in five years from the granting of the benefit and the benefit be paid on that date. Accordingly, the liability was measured using the projected unit credit method at the end of the first and second year with the discounted present value of 20% of the payment attributed to each year for service provided by the employee. If the listing becomes no longer probable during the third year, then the liability at the end of year three will be nil and the previous liability recognised in years one and two will be released to the profit and loss account.

14 Termination benefits

Termination benefits are employee benefits payable as a result of either:

- An entity's decision to terminate an employee's employment before the normal retirement date.
Or
- An employee's decision to accept an offer of benefits in exchange for the termination of employment.
[IAS 19.8].

They are accounted for differently from other employee benefits because the event that gives rise to an obligation for them is the termination of employment rather than the rendering of service by the employee.
[IAS 19.159].

Termination benefits do not include employee benefits resulting from termination of employment at the request of the employee without an entity's offer, or as a result of mandatory retirement requirements, because those benefits are post-employment benefits. Some entities provide a lower level of benefit for termination of employment at the request of the employee (in substance, a post-employment benefit) than for termination of employment at the request of the entity. Only the difference between the benefit provided for termination of employment at the request of the employee and a higher benefit provided at the request of the entity is a termination benefit. [IAS 19.160]. Accordingly, employee benefits that are payable regardless of the reason for the employee's departure are accounted for as post-employment benefits. Any additional benefit payable as a result of termination at the request of the entity over the benefits payable as a result of termination at the request of the employee is accounted for as a termination benefit.

The form of the employee benefit does not determine whether it is provided in exchange for service or in exchange for termination of the employee's employment. Termination benefits are typically lump sum payments, but sometimes also include:

- Enhancement of post-employment benefits, either indirectly through an employee benefit plan or directly.
And
- Salary until the end of a specified notice period if the employee renders no further service that provides economic benefits to the entity. [IAS 19.161].

Indicators that an employee benefit is provided in exchange for services include the following:

- The benefit is conditional on future service being provided (including benefits that increase if further service is provided).
And
- The benefit is provided in accordance with the terms of an employee benefit plan. [IAS 19.162].

Some termination benefits are provided in accordance with the terms of an existing employee benefit plan. For example, they may be specified by statute, employment contract or union agreement, or may be implied as a result of the employer's past practice of providing similar benefits. As another example, if an entity makes an offer of benefits available for more than a short period, or there is more than a short period between the offer and the expected date of actual termination, an entity should consider whether it has established a new employee benefit plan and hence whether the benefits offered under that plan are termination benefits or post-employment benefits. Employee benefits provided in accordance with the terms of an employee benefit plan are termination benefits if they both result from an entity's decision to terminate an employee's employment and are not conditional on future service being provided. [IAS 19.163]. Benefits payable to incentivise employees to remain in service with the entity until the end of the termination period (referred to as stay bonuses) are not termination benefits because they are dependent on service being provided. These would be accounted for as either a short-term or long-term employee benefit as appropriate (see sections 12 and 13 above).

14.1 Statutory termination indemnities

Some employee benefits are provided regardless of the reason for the employee's departure. The payment of such benefits is certain (subject to any vesting or minimum service requirements) but the timing of their payment is uncertain. Although such benefits are described in some jurisdictions as termination indemnities or termination gratuities, they are post-employment benefits rather than termination benefits, and an entity accounts for them as post-employment benefits. [IAS 19.164].

14.2 Recognition

An entity should recognise termination benefits as a liability and an expense at the earlier of the following dates:

- When it can no longer withdraw the offer of those benefits.
And
- When it recognises costs for a restructuring that is within the scope of IAS 37 and involves the payment of termination benefits (discussed in Chapter 27). [IAS 19.165].

For termination benefits payable as a result of an employee's decision to accept an offer of benefits in exchange for the termination of employment, the time when an entity can no longer withdraw the offer of termination benefits is the earlier of:

- When the employee accepts the offer.
And
- When a restriction (e.g., a legal, regulatory or contractual requirement or other restriction) on the entity's ability to withdraw the offer takes effect. This would be when the offer is made if the restriction existed at the time of the offer. [IAS 19.166].

For termination benefits payable as a result of an entity's decision to terminate an employee's employment, the entity can no longer withdraw the offer when the entity has communicated to the affected employees a plan of termination meeting all of the following criteria:

- Actions required to complete the plan indicate that it is unlikely that significant changes to the plan will be made.
- The plan identifies the number of employees whose employment is to be terminated, their job classifications or functions and their locations (but the plan need not identify each individual employee) and the expected completion date.
And
- The plan establishes the termination benefits that employees will receive in sufficient detail that employees can determine the type and amount of benefits they will receive were their employment to be terminated. [IAS 19.167].

The standard notes that when an entity recognises termination benefits, it may also have to account for a plan amendment or a curtailment of other employee benefits (discussed in section 10.2.1 above). [IAS 19.168].

14.3 Measurement

IAS 19 requires that on initial recognition and subsequent remeasurement, termination benefits should be measured in accordance with the nature of the employee benefit. If the termination benefits are an enhancement to post-employment benefits, the entity applies the requirements for post-employment benefits. Otherwise:

- If the termination benefits are expected to be settled wholly before twelve months after the end of the annual reporting period in which the termination benefit is recognised, the requirements for short-term employee benefits should be applied (discussed in section 12 above).
And
- If the termination benefits are not expected to be settled wholly before twelve months after the end of the annual reporting period, the requirements for other long-term employee benefits should be applied (discussed in section 13 above). [IAS 19.169].

Because termination benefits are not provided in exchange for service, the standard notes that its rules relating to the attribution of the benefit to periods of service (discussed in section 7.4 above) are not relevant. [IAS 19.170].

IAS 19 illustrates the accounting for termination benefits with an example.

Illustration 14-1: Termination benefits

Background

As a result of a recent acquisition, an entity plans to close a factory in ten months and, at that time, terminate the employment of all of the remaining employees at the factory. Because the entity needs the expertise of the employees at the factory to complete some contracts, it announces a plan of termination as follows.

Each employee who stays and renders service until the closure of the factory will receive on the termination date a cash payment of CU30,000. Employees leaving before closure of the factory will receive CU10,000.

There are 120 employees at the factory. At the time of announcing the plan, the entity expects 20 of them to leave before closure. Therefore, the total expected cash outflows under the plan are CU3,200,000 (i.e., $20 \times \text{CU}10,000 + 100 \times \text{CU}30,000$). As required by the standard, the entity accounts for benefits provided in exchange for termination of employment as termination benefits and accounts for benefits provided in exchange for services as short-term employee benefits.

Termination benefits

The benefit provided in exchange for termination of employment is CU10,000. This is the amount that an entity would have to pay for terminating the employment regardless of whether the employees stay and render service until closure of the factory or they leave before closure. Even though the employees can leave before closure, the termination of all employees' employment is a result of the entity's decision to close the factory and terminate their employment (i.e., all employees will leave employment when the factory closes). Therefore the entity recognises a liability of CU1,200,000 (i.e., $120 \times \text{CU}10,000$) for the termination benefits provided in accordance with the employee benefit plan at the earlier of when the plan of termination is announced and when the entity recognises the restructuring costs associated with the closure of the factory.

Benefits provided in exchange for service

The incremental benefits that employees will receive if they provide services for the full ten-month period are in exchange for services provided over that period. The entity accounts for them as short-term employee benefits because the entity expects to settle them before twelve months after the end of the annual reporting period. In this example, discounting is not required, so an expense of CU200,000 (i.e., $\text{CU}2,000,000 \div 10$) is recognised in each month during the service period of ten months, with a corresponding increase in the carrying amount of the liability.

15 Disclosure requirements

In addition to the disclosures required by IAS 19, consideration should also be given to the disclosures required in IAS 1 to disclose:

- Significant accounting policies (especially where there is more than one acceptable policy).
And
- Any significant judgements made by management in applying the accounting policies.
As well as
- Significant sources of uncertainty. [IAS 1.117, IAS 1.122, IAS 1.125].

15.1 Defined contribution plans

IAS 19 requires the disclosure of the expense recognised for defined contribution plans. It also notes that IAS 24 *Related Party Disclosures* requires disclosure of the contributions in respect of key management personnel. [IAS 19.53, IAS 19.54].

15.2 Defined benefit plans

The standard has a disclosure objective, as set out below, along with considerations in order to meet this objective. The result of this is likely to lead to extensive disclosures in relation to material defined benefit plans.

The standard requires an entity to disclose information that:

- (a) Explains the characteristics of its defined benefit plans and risks associated with them.
- (b) Identifies and explains the amounts in its financial statements arising from its defined benefit plans.
And
- (c) Describes how its defined benefit plans may affect the amount, timing and uncertainty of the entity's future cash flows. [IAS 19.135].

To achieve the above, the standard sets out a long and detailed list of narrative and numerical disclosures that could be necessary in order for the entity to meet the objective in IAS 19.135 (considered further below).

An example of a disclosure that is not specifically listed in IAS 19, which may be required to meet the disclosure objective of the standard is the remeasurement gain or loss arising on the acquisition of a qualifying insurance policy (or buy-in arrangement) which has been recognised on other comprehensive income. The extract from RSA Insurance below gives an example of such disclosure.

Practical example 15-1: RSA Insurance Group Limited (2023)

United Kingdom

Consolidated financial statements for the year ended 31 December 2023**Notes to the consolidated financial statements [extract]****29. Employee future Benefits [extract] [extract]****29.6 Purchase of annuity buy-in insurance contracts**

On 27 February 2023 the Trustees of the Group's two major UK DB pension plans (the UK plans) entered into an agreement with PIC, a specialist insurer of defined benefit pension plans, to purchase buy-ins, as part of its de-risking strategy. The buy-in agreement transferred the remaining economic and demographic risks associated with these plans to PIC and removed the volatility in relation to these plans from the Group's Consolidated statement of financial position. The main risk that the Group retains is counterparty risk, with market risk on the assets that were remaining in the UK plans at the transaction date now largely removed as described below.

At the transaction date, the UK plans transferred the majority of their plan assets and an upfront contribution of £481m to PIC. Of the total buy-in premium of £6,307m, an amount of £550m was deferred and has now been largely re-paid through the sale of certain less liquid assets that were initially retained by the UK plans but were liquidated by the end of 2023. During 2023, the UK plans paid £457m of the deferred annuity premium. The Group has committed to the UK plans to fund any shortfall in the deferred annuity premium obligation resulting from the liquidation of the assets. In addition, the UK plans retained longevity swaps that were already in place. Refer to *Asset and longevity swaps* below for more details.

The buy-ins comprised various contracts which were considered in aggregate as one single contract because they form a structure designed to collectively match the exact amount and timing of all the benefits payable by the UK plans. The Group was not legally relieved of the primary responsibility for the obligation, and the benefit payments continue to be payable by the UK plans. The contracts provide the option to convert the buy-ins into individual policies which would transfer the UK plan assets and obligation to PIC (known as a buy-out). While this course of action may be considered in the future, a separate decision would be required, and certain significant conditions would need to be met before any buy-out could be executed. Consequently, the transaction was considered a buy-in as opposed to a buy-out under IAS 19. As a result, an initial actuarial loss of £727m net of tax was recognised in OCI during 2023. The fair value of annuity buy-in insurance contracts subsequently fluctuates based on changes in the value of the associated DB obligation.

The buy-in transaction was funded through the injection of share capital from the Group's immediate parent company, 2283485 Alberta Limited of £480m (note 20. Share capital).

...

The Board also noted that entities must comply with the general materiality requirements of IAS 1 (discussed in Chapter 3), including the requirement to disclose additional information if necessary, and that the financial statements need not contain disclosures that are not material. [IAS 19.BC209].

One of the Board's objectives in regard to disclosure was to ensure that financial statements provide relevant information that is not obscured by excessive detail. [IAS 19.BC207].

These references to excessive detail and non-disclosure of immaterial items confirm that entities must apply judgement to determine the appropriate level of detail to be provided rather than giving everything set out in the standard.

To meet the objectives above, the standard requires consideration of all the following:

- (a) The level of detail necessary to satisfy the disclosure requirements.
- (b) How much emphasis to place on each of the various requirements.
- (c) How much aggregation or disaggregation to undertake.

And

- (d) Whether users of financial statements need additional information to evaluate the quantitative information disclosed. [IAS 19.136].

If the disclosures provided in accordance with the requirements of IAS 19 and other IFRS accounting standards are insufficient to meet the objectives above, an entity should disclose additional information necessary to meet those objectives. For example, an entity may present an analysis of the present value of the defined benefit obligation that distinguishes the nature, characteristics and risks of the obligation. Such a disclosure could distinguish:

- (a) Between amounts owing to active members, deferred members, and pensioners.
- (b) Between vested benefits and accrued but not vested benefits.

And

- (c) Between conditional benefits, amounts attributable to future salary increases and other benefits.

[IAS 19.137].

An assessment should be made as to whether all or some disclosures should be disaggregated to distinguish plans or groups of plans with materially different risks. For example, an entity may disaggregate disclosure about plans showing one or more of the following features:

- (a) Different geographical locations
- (b) Different characteristics such as flat salary pension plans, final salary pension plans or post-employment medical plans
- (c) Different regulatory environments
- (d) Different reporting segments
- And
- (e) Different funding arrangements (e.g., wholly unfunded, wholly funded or partly funded) [IAS 19.138]

15.2.1 Characteristics of defined benefit plans and risks associated with them

IAS 19 requires disclosure of:

- (a) Information about the characteristics of its defined benefit plans, including:
 - (i) The nature of the benefits provided by the plan (e.g., final salary defined benefit plan or contribution-based plan with guarantee).
 - (ii) A description of the regulatory framework in which the plan operates, for example the level of any minimum funding requirements, and any effect of the regulatory framework on the plan, such as the asset ceiling.
 - And
 - (iii) A description of any other entity's responsibilities for the governance of the plan, for example responsibilities of trustees or of board members of the plan.
- (b) A description of the risks to which the plan exposes the entity, focused on any unusual, entity-specific or plan-specific risks, and of any significant concentrations of risk. For example, if plan assets are invested primarily in one class of investments, e.g., property, the plan may expose the entity to a concentration of property market risk.
- And
- (c) A description of any plan amendments, curtailments and settlements. [IAS 19.139].

15.2.2 Explanation of amounts in the financial statements

The disclosures should provide a reconciliation from the opening balance to the closing balance for each of the following, if applicable:

- (a) The net defined benefit liability (asset), showing separate reconciliations for:
 - (i) Plan assets.
 - (ii) The present value of the defined benefit obligation.
 - And
 - (iii) The effect of the asset ceiling.
 - And
- (b) Any reimbursement rights. If there are reimbursement rights a description of the relationship between them and the related obligation should be given. [IAS 19.140].

Each reconciliation listed in (a) and (b) above should show each of the following, if applicable:

- (a) Current service cost
- (b) Interest income or expense (see section 10.3 above)
- (c) Remeasurements of the net defined benefit liability (asset), showing separately:
 - (i) The return on plan assets, excluding amounts included in interest in (b) above
 - (ii) Actuarial gains and losses arising from changes in demographic assumptions
 - (iii) Actuarial gains and losses arising from changes in financial assumptions
 - And
 - (iv) Changes in the effect of limiting a net defined benefit asset to the asset ceiling, excluding amounts included in interest in (b). There should also be disclosure of how the maximum economic benefit available was determined, i.e., whether those benefits would be in the form of refunds, reductions in future contributions or a combination of both
- (d) Past service cost and gains and losses arising from settlements. Past service cost and gains and losses arising from settlements need not be distinguished if they occur together (see section 10.2 above)

- (e) The effect of changes in foreign exchange rates
- (f) Contributions to the plan, showing separately those by the employer and by plan participants
- (g) Payments from the plan, showing separately the amount paid in respect of any settlements
- And
- (h) The effects of business combinations and disposals [IAS 19.141]

The following extracts from Deutsche Bank Aktiengesellschaft and BT Group plc show how they have presented the above reconciliations (the former being a group with pension obligations in different countries). In each case the company has considered the requirements of IAS 19.136(a) to provide the level of detail necessary to satisfy the disclosure requirements.

At 31 March 2022	54,937	(56,080)	(1,143)

^a Primarily reflects the impact on the liabilities of actual inflation being higher than assumed at the prior reporting date. There has been a broadly equivalent benefit to inflation-linked assets from higher inflation.

...

Whenever the information is material, the fair value of the plan assets should be disaggregated into classes that distinguish the nature and risks of those assets, subdividing each class of plan asset into those that have a quoted market price in an active market (as defined in IFRS 13, see Chapter 15) and those that do not. For example, and considering the level of detail of disclosure, aggregation and emphasis discussed in section 15.2 above, an entity could distinguish between:

- (a) Cash and cash equivalents
- (b) Equity instruments (segregated by industry type, company size, geography etc.)
- (c) Debt instruments (segregated by type of issuer, credit quality, geography etc.)
- (d) Real estate (segregated by geography etc.)
- (e) Derivatives (segregated by type of underlying risk in the contract, for example, interest rate contracts, foreign exchange contracts, equity contracts, credit contracts, longevity swaps etc.)
- (f) Investment funds (segregated by type of fund)
- (g) Asset-backed securities
- And
- (h) Structured debt [IAS 19.142]

The fair value of an entity's own transferable financial instruments held as plan assets, and the fair value of plan assets that are property occupied by, or other assets used by, the entity should be disclosed. [IAS 19.143]. The following extracts from UBS Group AG and Deutsche Lufthansa Aktiengesellschaft illustrate how the plan assets could be disaggregated.

Total	13,805	2,152	15,957	100.0	16,679	1,831	18,510	100.0

¹⁾ Mixed funds include equities and interest-bearing securities.

²⁾ Other investments include, in particular, alternative investments such as hedge funds, commodities and private equity funds.

An entity should disclose the significant actuarial assumptions used to determine the present value of the defined benefit obligation. Such disclosure should be in absolute terms (e.g., as an absolute percentage, and not just as a margin between different percentages and other variables). When an entity provides disclosures in total for a grouping of plans, it should provide such disclosures in the form of weighted averages or relatively narrow ranges. [IAS 19.144].

The following disclosure from Deutsche Bank Aktiengesellschaft illustrates how the significant actuarial assumptions could be disclosed.

Practical example 15-6: Deutsche Bank Aktiengesellschaft (2022)

United Kingdom

Annual Report 2022 [extract]

Additional Notes [extract]

Note 33: Employee Benefits [extract]

Post-employment Benefit Plans [extract]

Actuarial Methodology and Assumptions [extract]

The key actuarial assumptions applied in determining the defined benefit obligations at December 31 are presented below in the form of weighted averages.

	Dec 31, 2022				Dec 31, 2021			
	Germany	UK	U.S. ¹	Other	Germany	UK	U.S. ¹	Other
Discount rate (in %)	3.80%	4.77%	5.34%	3.99%	1.10%	1.86%	2.73%	1.92%
Rate of price inflation (in %)	2.62%	3.71%	2.20%	2.16%	2.19%	3.73%	2.30%	1.88%
Rate of nominal increase in future compensation levels (in %)	2.81%	3.71%	2.30%	3.14%	2.42%	4.23%	2.40%	2.69%
Rate of nominal increase for pensions in payment (in %)	2.97%	3.32%	2.20%	0.85%	2.10%	3.49%	2.30%	1.05%
Assumed life expectancy at age 65								
For a male aged 65 at measurement date	21.3	23.6	22.0	22.0	21.3	23.5	21.9	22.0
For a female aged 65 at measurement date	23.6	25.4	23.4	24.1	23.5	25.1	23.3	24.0
For a male aged 45 at measurement date	22.6	24.9	23.3	23.5	22.6	24.6	23.3	23.4
For a female aged 45 at measurement date	24.7	26.7	24.8	25.5	24.6	26.5	24.7	25.4
Mortality tables applied								
	Modified Richttafeln Heubeck 2018G	SAPS (S3) Light/ Very Light with CMI 2021 projections	PRI-2012 with MP-2021 projection	Country specific tables	Modified Richttafeln Heubeck 2018G	SAPS (S3) Light/ Very Light with CMI 2020 projections	PRI-2012 with MP-2021 projection	Country specific tables

¹ Cash balance interest crediting rate in line with the 30-year US government bond yield.

For the Group's most significant pension plans in the key countries, the discount rate used at each measurement date is set based on a high quality corporate bond yield curve, which is derived using a bond universe sourced from reputable third-party market data providers, and reflects the timing, amount and currency of the future expected benefit payments for the respective plan. In the second quarter 2022, a recalibration of the discount curve for defined benefit plans was applied to the Eurozone curve in order to better align to market data which resulted in a benefit recognized in Other Comprehensive Income of € 310 million.

The price inflation assumptions in the Eurozone and the United Kingdom are set with reference to market measures of inflation based on inflation swap rates in those markets at each measurement date. For other countries, the price inflation assumptions are typically based on long term forecasts by Consensus Economics Inc.

The assumptions for the increases in future compensation levels and for increases to pensions in payment are developed separately for each plan, where relevant. Each is set based on the price inflation assumption and reflecting the Group's reward structure or policies in each market, as well as relevant local statutory and plan-specific requirements.

Among other assumptions, mortality assumptions can be significant in measuring the Group's obligations under its defined benefit plans. These assumptions have been set in accordance with current best estimate in the respective countries. Future potential improvements in longevity have been considered and included where appropriate. Due to the long-term nature of mortality assumptions and lack of clarity over the longer term impacts of the pandemic on health outcomes, there has been no specific allowance for the impact of COVID-19 in any region, other than for recent experience which was captured as part of the annual valuation process.

...

15.2.3 Amount, timing and uncertainty of future cash flows

An entity should disclose:

- (a) A sensitivity analysis for each significant actuarial assumption as of the end of the reporting period, showing how the defined benefit obligation would have been affected by changes in the relevant actuarial assumption that were reasonably possible at that date.
- (b) The methods and assumptions used in preparing the sensitivity analyses required by (a) and the limitations of those methods.

And

- (c) Changes from the previous period in the methods and assumptions used in preparing the sensitivity analyses, and the reasons for such changes. [IAS 19.145].

In determining whether an actuarial assumption is significant an entity will need to make a judgement based on the impact of the assumption on the measurement of the defined benefit obligation and the possible range of assumptions. Whether an actuarial assumption is considered to be significant may also change over time due to external macro-economic factors such as inflation rates, and also as a result of changes to the membership composition of the scheme or as a result of a plan amendment.

The following disclosure from BAE Systems plc illustrates the disclosure of sensitivity analysis from changes in the actuarial assumptions as at 31 December 2022.

Practical example 15-7: BAE Systems plc (2022)

United Kingdom

Annual Report 2022 [extract]

Notes to the consolidated financial statements [extract]

Note 25: Post-employment benefits [extract]

IAS 19 accounting [extract]

Sensitivity analysis

The sensitivity information has been derived using scenario analysis from the actuarial assumptions as at 31 December 2022 and keeping all other assumptions as set out on page 271.

The pension schemes hold a number of unquoted pooled investment vehicles, which are investments in private markets. These are valued based on latest available valuation reports, and as noted on page 223, these valuations are subject to estimation uncertainty as their valuation techniques incorporate a number of assumptions, including those associated with the COVID-19 pandemic and the impact of climate change. Should these funds' actual valuations at 31 December 2022 be on average 2% different to those assumed, this would result in a £0.2bn (2021 £0.2bn) change in the valuation of the assets.

Financial assumptions

The estimated impact of changes in the discount rate and inflation assumptions on the defined benefit pension obligation, together with the estimated impact on scheme assets, is shown in the table below. The estimated impact on scheme assets takes into account the Group's risk management activities in respect of interest rate and inflation risk. The sensitivity analysis on the defined benefit obligation is measured on an IAS 19 accounting basis and, therefore, does not reflect the natural hedging in the discount rate used for funding valuation purposes.

	Decrease/(increase) in pension obligation ¹ £bn	(Decrease)/increase in scheme assets ¹ £bn
Discount rate:		
0.5 percentage point increase/decrease	1.4/(1.5)	(1.2)/1.4
1.0 percentage point increase/decrease	2.6/(3.2)	(2.3)/2.9
2.0 percentage point increase/decrease	4.7/(7.2)	(4.3)/6.6
3.0 percentage point increase/decrease	6.5/(12.4)	(5.9)/11.4

1. Before allocation to equity accounted investments and deduction of withholding tax.

	(Increase)/decrease in pension obligation ¹ £bn	Increase/(decrease) in scheme assets ¹ £bn
Inflation:		
0.1 percentage point increase/decrease	(0.2)/0.2	0.1/(0.1)
0.5 percentage point increase/decrease	(0.8)/0.8	0.7/(0.6)
1.0 percentage point increase/decrease	(1.5)/1.5	1.4/(1.1)

1. Before allocation to equity accounted investments and deduction of withholding tax.

Demographic assumptions

Changes in the life expectancy assumption, including the benefit of longevity swap arrangements (see longevity risk on page 270), would have the following effect on the total net IAS 19 surplus:

	(Decrease)/increase in net surplus ¹ £bn
Life expectancy:	
One-year increase/decrease	(0.8)/0.7

1. Before allocation to equity accounted investments and deduction of withholding tax.

A description should be given of any asset-liability matching strategies used by the plan or the entity, including the use of annuities and other techniques, such as longevity swaps, to manage risk. [IAS 19.146]. To provide an indication of the effect of the defined benefit plan on the entity's future cash flows, an entity should disclose:

- (a) A description of any funding arrangements and funding policies that affect future contributions.
- (b) The expected contributions to the plan for the next annual reporting period.

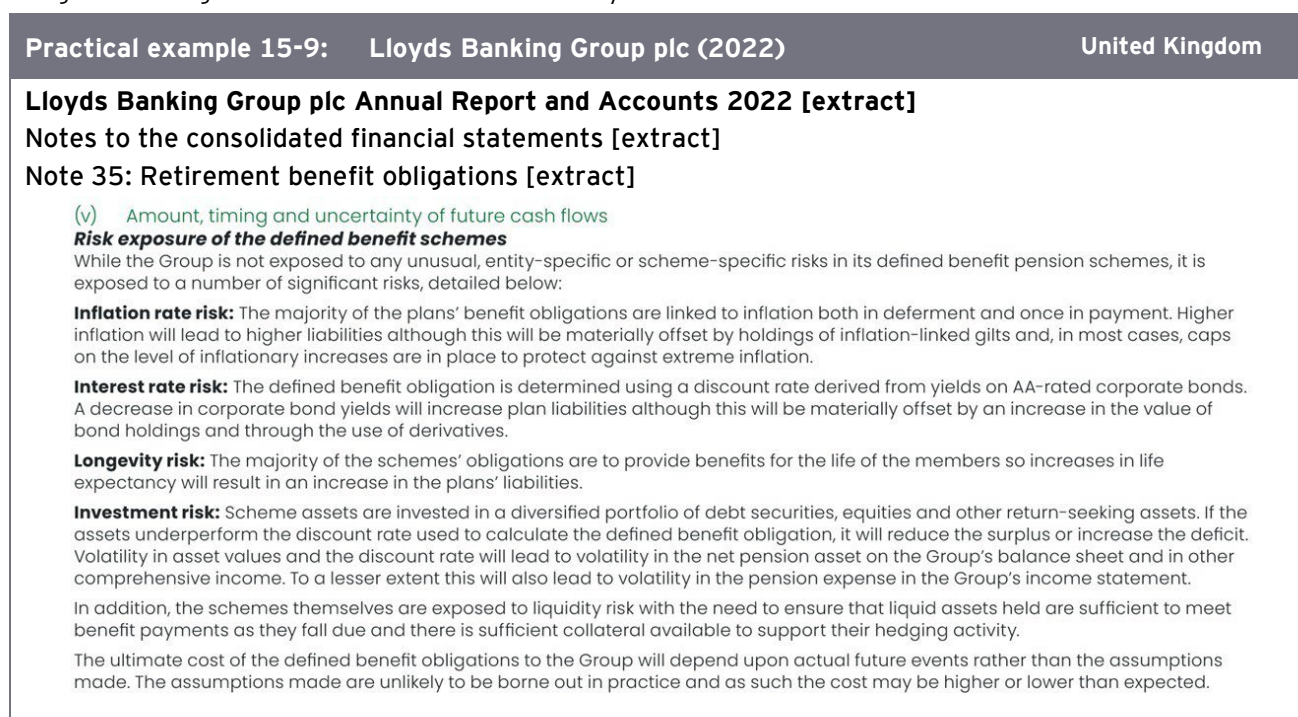

And

- (c) Information about the maturity profile of the defined benefit obligation. This will include the weighted average duration of the defined benefit obligation and may include other information about the distribution of the timing of benefit payments, such as a maturity analysis of the benefit payments. [IAS 19.147].

The following extract from Aviva plc illustrates the maturity profile of the defined benefit obligation.

And the following disclosure from Lloyds Banking Group plc illustrates how the group believes that risk is mitigated through the investment choices made by the trustees.

15.2.4 Multi-employer plans

If an entity participates in a multi-employer defined benefit plan, different disclosures are required depending upon how the arrangement is accounted for. These are discussed below.

15.2.4.A Plans accounted for as defined benefit plans

If an entity participates in a multi-employer defined benefit plan and accounts for it as such, it should make all the required disclosures discussed above. In addition, it should disclose:

- (a) A description of the funding arrangements, including the method used to determine the entity's rate of contributions and any minimum funding requirements.
- (b) A description of the extent to which the entity can be liable to the plan for other entities' obligations under the terms and conditions of the multi-employer plan.
- (c) A description of any agreed allocation of a deficit or surplus on:
 - (i) Wind-up of the plan
 - Or
 - (ii) The entity's withdrawal from the plan [IAS 19.148]

15.2.4.B Plans accounted for as defined contribution plans

If an entity accounts for a multi-employer defined benefit plan as if it were a defined contribution plan, it should disclose the following, in addition to the information required by section 15.2.4.A above and instead of the disclosures normally required for defined benefits and discussed in sections 15.2 to 15.2.3 above:

- (a) The fact that the plan is a defined benefit plan.
- (b) The reason why sufficient information is not available to enable the entity to account for the plan as a defined benefit plan.
- (c) The expected contributions to the plan for the next annual reporting period.
- (d) Information about any deficit or surplus in the plan that may affect the amount of future contributions, including the basis used to determine that deficit or surplus and the implications, if any, for the entity.
And
- (e) An indication of the level of participation of the entity in the plan compared with other participating entities. Examples of measures that might provide such an indication include the entity's proportion of the total contributions to the plan or the entity's proportion of the total number of active members, retired members, and former members entitled to benefits, if that information is available. [IAS 19.148].

15.2.5 Defined benefit plans that share risks between entities under common control

If an entity participates in a defined benefit plan that shares risks between entities under common control, the entity should disclose:

- (a) The contractual agreement or stated policy for charging the net defined benefit cost or the fact that there is no such policy.
And
- (b) The policy for determining the contribution to be paid by the entity. [IAS 19.149].

Further disclosures are required depending upon how the arrangement is accounted for. These are discussed below.

15.2.5.A Plans accounted for as defined benefit plans

If an entity participates in a defined benefit plan that shares risks between entities under common control and accounts for an allocation of the net defined benefit cost, it should also disclose all the information about the plan as a whole set out in sections 15.2 to 15.2.3 above. [IAS 19.149].

15.2.5.B Plans accounted for as defined contribution plans

If an entity participates in a defined benefit plan that shares risks between entities under common control and accounts for the net contribution payable for the period, it should also disclose the information set out below. [IAS 19.149].

The standard requires disclosure of information that: *[IAS 19.135]*

- (a) Explains the characteristics of its defined benefit plans and risks associated with them.
 - (b) Identifies and explains the amounts in its financial statements arising from its defined benefit plans.
- And
- (c) Describes how its defined benefit plans may affect the amount, timing and uncertainty of the entity's future cash flows.

To meet the objectives above, the standard requires consideration of all the following:

- (a) The level of detail necessary to satisfy the disclosure requirements.
 - (b) How much emphasis to place on each of the various requirements.
 - (c) How much aggregation or disaggregation to undertake.
- And
- (d) Whether users of financial statements need additional information to evaluate the quantitative information disclosed. *[IAS 19.136].*

If the disclosures provided in accordance with the requirements in IAS 19 and other IFRS accounting standards are insufficient to meet the objectives above, an entity should disclose additional information necessary to meet those objectives. For example, an entity may present an analysis of the present value of the defined benefit obligation that distinguishes the nature, characteristics and risks of the obligation. Such a disclosure could distinguish:

- (a) Between amounts owing to active members, deferred members, and pensioners.
 - (b) Between vested benefits and accrued but not vested benefits.
- And
- (c) Between conditional benefits, amounts attributable to future salary increases and other benefits. *[IAS 19.137].*

IAS 19 requires disclosure of: *[IAS 19.139]*

- (a) Information about the characteristics of its defined benefit plans, including:
 - (i) The nature of the benefits provided by the plan (e.g., final salary defined benefit plan or contribution-based plan with guarantee).
 - (ii) A description of the regulatory framework in which the plan operates, for example the level of any minimum funding requirements, and any effect of the regulatory framework on the plan, such as the asset ceiling.

And

 - (iii) A description of any other entity's responsibilities for the governance of the plan, for example responsibilities of trustees or of board members of the plan.
 - (b) A description of the risks to which the plan exposes the entity, focused on any unusual, entity-specific or plan-specific risks, and of any significant concentrations of risk. For example, if plan assets are invested primarily in one class of investments, e.g., property, the plan may expose the entity to a concentration of property market risk.
- And
- (c) A description of any plan amendments, curtailments and settlements.

The fair value of the plan assets should be disaggregated into classes that distinguish the nature and risks of those assets, subdividing each class of plan asset into those that have a quoted market price in an active market (as defined in IFRS 13, discussed in Chapter 15) and those that do not. For example, and considering the level of detail of disclosure, aggregation and emphasis discussed in section 15.2 above, an entity could distinguish between:

- (a) Cash and cash equivalents
 - (b) Equity instruments (segregated by industry type, company size, geography etc.)
 - (c) Debt instruments (segregated by type of issuer, credit quality, geography etc.)
 - (d) Real estate (segregated by geography etc.)
 - (e) Derivatives (segregated by type of underlying risk in the contract, for example, interest rate contracts, foreign exchange contracts, equity contracts, credit contracts, longevity swaps etc.)
 - (f) Investment funds (segregated by type of fund)
 - (g) Asset-backed securities
- And
- (h) Structured debt *[IAS 19.142]*

The fair value of the entity's own transferable financial instruments held as plan assets, and the fair value of plan assets that are property occupied by, or other assets used by, the entity should be disclosed. [IAS 19.143].

An entity should disclose the significant actuarial assumptions used to determine the present value of the defined benefit obligation. Such disclosure should be in absolute terms (e.g., as an absolute percentage, and not just as a margin between different percentages and other variables). When an entity provides disclosures in total for a grouping of plans, it shall provide such disclosures in the form of weighted averages or relatively narrow ranges.

To provide an indication of the effect of the defined benefit plan on the entity's future cash flows, an entity should disclose: [IAS 19.147]

- (a) A description of any funding arrangements and funding policy that affect future contributions.

And

- (b) The expected contributions to the plan for the next annual reporting period.

The information described above and in section 15.2.5.A above must be presented in the entity's own accounts. The rest of the information discussed in this section could be disclosed by cross-reference to disclosures in another group entity's financial statements if:

- (a) That group entity's financial statements separately identify and disclose the information required about the plan.

And

- (b) That group entity's financial statements are available to users of the financial statements on the same terms as the financial statements of the entity and at the same time as, or earlier than, the financial statements of the entity. [IAS 19.150].

15.2.6 Disclosure requirements in other IFRS accounting standards

IFRIC 14 does not introduce any new disclosure requirements. However, it suggests that any restrictions on the current realisability of the surplus or a description of the basis used to determine the amount of the economic benefit available (see section 8.2 above), could require disclosure under the provisions in IAS 1 about key sources of estimation uncertainty. [IFRIC 14.10]. These requirements are discussed in Chapter 3.

Where required by IAS 24 an entity discloses information about:

- (a) Related party transactions with post-employment benefit plans

And

- (b) Post-employment benefits for key management personnel [IAS 19.151]

Where required by IAS 37 an entity discloses information about contingent liabilities arising from post-employment benefit obligations. [IAS 19.152].

15.3 Other employee benefits

IAS 19 has no specific disclosure requirements in respect of other types of employee benefits within its scope (i.e., short-term employee benefits, long-term employee benefits other than post-employment benefits and termination benefits) but contains reminders that:

- IAS 24 requires disclosure of employee benefits for key management personnel (see Chapter 35).

And

- IAS 1 requires disclosure of employee benefits expense. [IAS 19.25, IAS 19.158, IAS 19.171].

Appendix B - Defined terms

Extract from IFRS accounting standards - Definitions

actuarial gains and losses	<p><i>Actuarial gains and losses</i> are changes in the present value of the defined benefit obligation resulting from:</p> <ul style="list-style-type: none"> (a) experience adjustments (the effects of differences between the previous actuarial assumptions and what has actually occurred); and (b) the effects of changes in actuarial assumptions. [IAS 19.8].
asset ceiling	<p>The <i>asset ceiling</i> is the present value of any economic benefits available in the form of refunds from the plan or reductions in future contributions to the plan. [IAS 19.8].</p>
assets held by a long-term employee benefit fund	<p><i>Assets held by a long-term employee benefit fund</i> are assets (other than non-transferable financial instruments issued by the reporting entity) that:</p> <ul style="list-style-type: none"> (a) are held by an entity (a fund) that is legally separate from the reporting entity and exists solely to pay or fund employee benefits; and (b) are available to be used only to pay or fund employee benefits, are not available to the reporting entity's own creditors (even in bankruptcy), and cannot be returned to the reporting entity, unless either: <ul style="list-style-type: none"> (i) the remaining assets of the fund are sufficient to meet all the related employee benefit obligations of the plan or the reporting entity; or (ii) the assets are returned to the reporting entity to reimburse it for employee benefits already paid. [IAS 19.8].
deficit or surplus	<p>The <i>deficit or surplus</i> is:</p> <ul style="list-style-type: none"> (a) the present value of the defined benefit obligation less (b) the fair value of plan assets (if any). [IAS 19.8].
defined benefit plans	<p><i>Defined benefit plans</i> are post-employment benefit plans other than defined contribution plans. [IAS 19.8].</p>
defined contribution plans	<p><i>Defined contribution plans</i> are post-employment benefit plans under which an entity pays fixed contributions into a separate entity (a fund) and will have no legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits relating to employee service in the current and prior periods. [IAS 19.8].</p>
employee benefits	<p><i>Employee benefits</i> are all forms of consideration given by an entity in exchange for service rendered by employees or for the termination of employment. [IAS 19.8].</p>
fair value	<p><i>Fair value</i> is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 <i>Fair Value Measurement</i>.) [IAS 19.8].</p>
multi-employer plans	<p><i>Multi-employer plans</i> are defined contribution plans (other than state plans) or defined benefit plans (other than state plans) that:</p> <ul style="list-style-type: none"> (a) pool the assets contributed by various entities that are not under common control; and (b) use those assets to provide benefits to employees of more than one entity, on the basis that contribution and benefit levels are determined without regard to the identity of the entity that employs the employees. [IAS 19.8].

net defined benefit liability	The <i>net defined benefit liability</i> (asset) is the deficit or surplus, adjusted for any effect of limiting a net defined benefit asset to the asset ceiling. [IAS 19.8].
net interest on the net defined benefit liability (asset)	<i>Net interest on the net defined benefit liability</i> (asset) is the change during the period in the net defined benefit liability (asset) that arises from the passage of time. [IAS 19.8].
other long-term employee benefits	<i>Other long-term employee benefits</i> are all employee benefits other than short-term employee benefits, post-employment benefits and termination benefits. [IAS 19.8].
plan assets	<i>Plan assets</i> comprise: (a) assets held by a long-term employee benefit fund; and (b) qualifying insurance policies. [IAS 19.8].
post-employment benefit plans	<i>Post-employment benefit plans</i> are formal or informal arrangements under which an entity provides post-employment benefits for one or more employees. [IAS 19.8].
post-employment benefits	<i>Post-employment benefits</i> are employee benefits (other than termination benefits and short-term employee benefits) that are payable after the completion of employment. [IAS 19.8].
present value of a defined benefit obligation	The <i>present value of a defined benefit obligation</i> is the present value, without deducting any plan assets, of expected future payments required to settle the obligation resulting from employee service in the current and prior periods. [IAS 19.8].
remeasurements of the net defined benefit liability (asset)	<i>Remeasurements of the net defined benefit liability</i> (asset) comprise: (a) actuarial gains and losses; (b) the return on plan assets, excluding amounts included in net interest on the net defined benefit liability (asset); and (c) any change in the effect of the asset ceiling, excluding amounts included in net interest on the net defined benefit liability (asset). [IAS 19.8].
short-term employee benefits	<i>Short-term employee benefits</i> are employee benefits (other than termination benefits) that are expected to be settled wholly before twelve months after the end of the annual reporting period in which the employees render the related service. [IAS 19.8].
termination benefits	<i>Termination benefits</i> are employee benefits provided in exchange for the termination of an employee's employment as a result of either: (a) an entity's decision to terminate an employee's employment before the normal retirement date; or (b) an employee's decision to accept an offer of benefits in exchange for the termination of employment. [IAS 19.8].
qualifying insurance policy	A <i>qualifying insurance policy</i> is an insurance policy ¹ issued by an insurer that is not a related party (as defined in IAS 24 <i>Related Party Disclosures</i>) of the reporting entity, if the proceeds of the policy: (a) can be used only to pay or fund employee benefits under a defined benefit plan; and (b) are not available to the reporting entity's own creditors (even in bankruptcy) and cannot be paid to the reporting entity, unless either: (i) the proceeds represent surplus assets that are not needed for the policy to meet all the related employee benefit obligations; or (ii) the proceeds are returned to the reporting entity to reimburse it for employee benefits already paid. [IAS 19.8].

return on plan assets	<p>The <i>return on plan assets</i> is interest, dividends and other income derived from the plan assets, together with realised and unrealised gains or losses on the plan assets, less:</p> <ul style="list-style-type: none"> (a) any costs of managing plan assets; and (b) any tax payable by the plan itself, other than tax included in the actuarial assumptions used to measure the present value of the defined benefit obligation. [IAS 19.8].
service cost	<p>Service cost comprises:</p> <ul style="list-style-type: none"> (a) <i>current service cost</i>, which is the increase in the present value of the defined benefit obligation resulting from employee service in the current period; (b) <i>past service cost</i>, which is the change in the present value of the defined benefit obligation for employee service in prior periods, resulting from a plan amendment (the introduction or withdrawal of, or changes to, a defined benefit plan) or a curtailment (a significant reduction by the entity in the number of employees covered by a plan); and (c) any gain or loss on settlement. [IAS 19.8].
settlement	<p>A <i>settlement</i> is a transaction that eliminates all further legal or constructive obligations for part or all of the benefits provided under a defined benefit plan, other than a payment of benefits to, or on behalf of, employees that is set out in the terms of the plan and included in the actuarial assumptions. [IAS 19.8].</p>

1 A qualifying insurance policy is not necessarily an insurance contract, as defined in IFRS 17 *Insurance Contracts*.

Overview

This chapter addresses the requirements for segment reporting under IFRS 8 *Operating segments*.

IFRS 8 is a disclosure standard. It specifies the way an entity must report information about its operating segments in its financial statements.

Segment reporting is required only for companies whose debt or equity instruments are traded in a public market, or that are in the process of filing financial statements or file financial statements with a securities regulator. Such segment reporting is based on an entity's internal reporting to the chief operating decision maker (sometimes referred to as 'CODM'). An entity is first required to determine its operating segments. If the qualitative criteria specified in IFRS 8 apply, these operating segments may be aggregated into larger segments. The entity would then apply the standard's quantitative criteria to determine the reportable segments.

IFRS 8 distinguishes between required disclosures that apply to the identified reportable segments and entity-wide disclosures. Segment disclosure requirements include general information on segments identified for reporting and quantitative information on reported segment profit or loss and the basis for measurement, as well as information about segment revenues, assets, liabilities and other material items with reconciliation to the corresponding amounts in the financial statements. Entity-wide disclosures apply to all entities, including those with a single operating segment, and cover certain information about products and services, geographical areas and major customers. The measures disclosed shall be consistent with entity's internal reporting.

Irrespective of whether an entity is in scope of IFRS 8 or not, its determination of operating segments is always relevant to the goodwill impairment test performed in line with IAS 36 *Impairment of Assets*, since an operating segment determined in accordance with IFRS 8 is the maximum level to which goodwill can be allocated for impairment testing purposes.

What you need to know

- Segment information is often key information to readers of an entity's IFRS financial statements.
- IFRS 8 adopts the management reporting approach to identifying and reporting operating segments.
- Determining reportable segments and related disclosures may require significant judgement.
- Segment amounts to be disclosed shall be the measures which are reported internally. They may differ from IFRS amounts reported elsewhere in the financial statements.
- An operating segment determined in accordance with IFRS 8 is the maximum level to which goodwill can be allocated for impairment testing purposes under IAS 36. IFRS 8 is therefore relevant also for entities which do not have to report segment information.

1 Introduction

1.1 Background

IFRS 8 was published in November 2006. The standard has been mandatory since 2009. [IFRS 8.35].

In March 2021, in its request for information for the third agenda consultation, the IASB included Operating Segments as a potential project to be considered in its project planning.¹ Based on the feedback received on that agenda consultation, the IASB decided to put Operating Segments on the reserve list of projects for which capacity must be available to address it. If the IASB decides to proceed with the project, the management approach would not be reconsidered.²

IFRS 8 and its US GAAP counterpart are not fully converged. Any differences between the IFRS and US GAAP guidance on this topic are not addressed in this chapter. For more information refer to EY's US GAAP/IFRS accounting differences identifier tool.³ [IFRS 8.BC60].

1.2 The basic approach of IFRS 8

IFRS 8 is a disclosure standard. It specifies the way an entity must report information about its operating segments in complete financial statements. Under IAS 34 *Interim Financial Reporting*, an entity must report selected information about its operating segments in condensed interim financial statements (see Chapter 37).

The standard is based on so-called the management approach, i.e., the information provided regularly to the chief operating decision maker. The process of identifying operating segments for external reporting purposes begins with the information used by the entity's chief operating decision maker to assess performance and to make decisions about future allocations of resources. [IFRS 8.5].

In determining the segments to report on and the disclosures required to be reported, IFRS 8 effectively requires an entity to follow the sequence of steps illustrated below:

There is no 'competitive harm' exemption in IFRS 8 from the requirement to disclose segment information, or components of such information, for example on the grounds of commercial sensitivity, confidentiality or being otherwise detrimental to the entity's competitive position. [IFRS 8.BC43, IFRS 8.BC44, IFRS 8.BC45]. (See section 5.8 below).

1.3 Interaction with IAS 36

The process for determining operating segments as described in section 3 below is important not only to entities applying IFRS 8 for external reporting purposes, but also to entities implementing the requirements of IAS 36 for testing goodwill for impairment. As such, the way that operating segments are defined and determined under IFRS 8 can affect the financial statements of entities to which the disclosure requirements in IFRS 8 do not apply, such as those without traded equity or debt. This is because IAS 36, applicable to all entities (i.e., whether in scope of IFRS 8 or not), states that goodwill cannot be allocated to a cash-generating unit or group of cash-generating units (CGUs) that is larger than an operating segment before aggregation (as determined in section 3.2.1 below). [IAS 36.80(b)]. See Chapter 21.

1.4 Disclosures required by IFRS 15

IFRS 15 *Revenue from Contracts with Customers* requires entities to disclose disaggregated revenue information to illustrate how the nature, amount, timing and uncertainty about revenue and cash flows are affected by economic factors. [IFRS 15.114]. If an entity applies IFRS 8, it is also required to disclose 'sufficient information' to explain the relationship between the disaggregated revenue information and revenue information that is disclosed for each reportable segment. [IFRS 15.115]. IFRS 15 also acknowledges that information meeting its requirements might have already been provided under another standard, in which case it is not required to be duplicated. [IFRS 15.112].

Many entities may choose to combine the IFRS 15 disclosures of disaggregated revenue with their segment information in the notes to the financial statements. However, the segment disclosures required by IFRS 8 are made by reference to the information provided to the entity's chief operating decision maker and may not be sufficiently disaggregated to achieve the disclosure objectives of IFRS 15. In addition, the information used for segment reporting may be based on non-GAAP information rather than measured in accordance with IFRS 15. [IFRS 15.BC340].

The requirements of IFRS 15 in this regard are discussed in Chapter 28.

1.5 Terms used in IFRS 8

The following terms are used in IFRS 8 with the meanings specified:

Term	Meaning
Operating segment	Operating segment refers to a component of an entity (a) That engages in business activities from which it may earn revenues and incur expenses (including revenues and expenses relating to transactions with other components of the same entity). (b) Whose operating results are regularly reviewed by the entity's chief operating decision maker to make decisions about resources to be allocated to the segment and assess its performance. And (c) For which discrete financial information is available. [IFRS 8.5, IFRS 8 Appendix A].
Chief operating decision maker (CODM)	CODM is described in the standard as a function of allocating resources to and assessing the performance of the operating segments of an entity. This is not necessarily a manager with a specific title, but can be an entity's chief executive officer, chief operating officer, a group of executive directors or others. [IFRS 8.7].
Segment manager	The term "segment manager" refers to a function of being directly accountable to and maintaining regular contact with the chief operating decision maker to discuss operating activities, financial results, forecasts, or plans for the segment. [IFRS 8.9].
Reportable segment	An operating segment or a group of two or more operating segments determined to be eligible for aggregation in accordance with IFRS 8.12; and which exceeds the quantitative thresholds in IFRS 8.13. [IFRS 8.11].
Aggregation criteria	Two or more operating segments may be aggregated into a single operating segment if aggregation is consistent with the core principle of IFRS 8, they have similar economic characteristics, such as long-term average gross margins, and are similar in respect of the five qualitative characteristics set out in the standard. [IFRS 8.12]
Quantitative thresholds	Information about an operating segment that meets any of the following criteria: a) Its reported revenue, including both sales to external customers and intersegment sales or transfers, is 10% or more of combined revenue, internal and external, of all operating segments. (b) Its reported profit or loss is, in absolute terms, 10% or more of the greater of, in absolute amount: (i) The combined profit of all operating segments that did not report a loss And (ii) The combined reported loss of all operating segments that reported a loss Or (c) Its assets are 10% or more of the combined assets of all operating segments. [IFRS 8.13].

1.6 Transitional provisions

There are no special arrangements for entities applying IFRS 8 for the first time, with the standard requiring comparative information to be restated. Only where the necessary information is both unavailable and incapable of being developed without excessive cost is an entity exempt from full restatement.

[IFRS 8.36]. Accordingly, an entity must ensure that internal reporting systems can provide the information needed to meet the disclosure requirements of IFRS 8 for all periods presented in its financial statements.

2 Objective and scope of IFRS 8

2.1 Objective

Extract from IFRS 8

Core principle

- 1** An entity shall disclose information to enable users of its financial statements to evaluate the nature and financial effects of the business activities in which it engages and the economic environments in which it operates.

The objective of IFRS 8 is expressed as a 'core principle'. [IFRS 8.1]. This core principle sets out the disclosure objective of the standard, which must be considered in making the judgements needed to determine the required disclosures under the standard, e.g., when aggregating operating segments or when dealing with a matrix organisation.

2.2 Scope of IFRS 8

Extract from IFRS 8

- 2** This IFRS shall apply to:
- (a) the separate or individual financial statements of an entity:
 - (i) whose debt or equity instruments are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets), or
 - (ii) that files, or is in the process of filing, its financial statements with a securities commission or other regulatory organisation for the purpose of issuing any class of instruments in a public market; and
 - (b) the consolidated financial statements of a group with a parent:
 - (i) whose debt or equity instruments are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets), or
 - (ii) that files, or is in the process of filing, the consolidated financial statements with a securities commission or other regulatory organisation for the purpose of issuing any class of instruments in a public market.

[IFRS 8.2].

In the case of consolidated financial statements, the above test is applied to the parent entity alone. [IFRS 8.2(b)]. Therefore, IFRS 8 does not apply to a group headed by a parent that has no listed financial instruments, even if the group includes a subsidiary that has any of its equity or debt instruments traded in a public market. [IFRS 8.BC23]. The scope of IAS 33 *Earnings per Share* is similarly defined in this regard. [IAS 33.2].

A subsidiary with publicly traded debt or equity instruments would be required to provide segment information under IFRS 8 in its own financial statements from its perspective as a reporting entity.

Entities without public accountability may apply IFRS 19 *Subsidiaries without public accountability: Disclosures*. IFRS 19 disclosures exclude IFRS 8. Therefore, if an entity that applies IFRS 19 elects to apply IFRS 8, that entity would be required to apply all the relevant disclosure requirement in that standard. See Chapter 4 for further details on the requirements of IFRS 19.

2.2.1 The meaning of 'traded in a public market'

The standard describes a 'public market' as including a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets, [IFRS 8.2], but does not define what would make some markets 'public' and others not.

How we see it

In our view, a market is 'public' when buyers and sellers (market participants) can transact with one another (directly; through agents; or in a secondary market) at a price determined in that market. A public market does not exist when the buyers and sellers can transact only with the entity itself (or an agent acting on its behalf). The requirement for an entity to list its securities on a stock exchange is not the sole factor determining whether the entity is in the scope of IFRS 8. Its securities must be traded in a public market meeting the criteria noted above.

Such 'public markets' would include exchange markets, dealer markets, brokered markets, and principal-to-principal markets as described in IFRS 13 *Fair Value Measurement* and listed in that standard as examples of markets in which fair value inputs might be observable (see Chapter 15).

Illustration 2-1: The meaning of 'public market' in the context of a fund

Many investment funds are listed on a public stock exchange for informational purposes, in particular to facilitate the valuation of portfolios by investors or because it is a requirement for the fund to be listed on a public stock exchange to make it eligible for investment by entities that are required to invest only in listed securities. However, despite such a listing, subscriptions and redemptions are handled by a fund administrator or a transfer agent (acting on behalf of the fund) and no transactions are undertaken on the public stock exchange. In addition, the prices for those transactions are determined by the fund agreement, such as based on the fund's net asset value, rather than the price quoted on the public stock exchange and determined by supply and demand.

A 'public market' is a different and more restrictive term than the terms 'to the public' and 'public accountability'. In March 2010, the IFRS IC addressed an agenda request that asked to extend the scope of IFRS 8 to all entities that issue instruments 'to the public' (whether or not in a 'public market'). Although the IFRS IC did not interpret the term 'public market', they nevertheless made a clear distinction between the terms 'to the public' and 'public market', with the term 'to the public' being considered to have a broader scope. Therefore, even though a fund can issue instruments to the public (or redeem from the public), this does not result in the fund being subject to a public market unless market participants could freely transact with one another, at a price set by the market.

How we see it

In our view, considering the distinction made by IFRS IC between 'a public market' and 'to the public' discussed in the Illustration above, the debt or equity instruments of such entities are not traded in a public market and so the entity would not fall within the scope of IFRS 8. Nevertheless, regulators can mandate that funds provide segment information, or funds can voluntarily disclose segment information and not describe them as segment information under IFRS 8.

2.2.2 Consolidated financial statements presented with those of the parent

When both the consolidated financial statements and the parent's separate or individual financial statements are contained in the same financial report, segment information is only required in the consolidated financial statements. [IFRS 8.4].

2.2.3 Entities providing segment information on a voluntary basis

Entities for which IFRS 8 is not mandatory might still want to provide information about their business activities, for example about sales by segment, without triggering the need to comply fully with the standard. The Board concluded that this would be acceptable, provided that such disclosure is not referred to as 'segment information'. [IFRS 8.BC22]. Consequently, entities giving information about segments on a voluntary basis cannot describe that information as 'segment information' unless it has been prepared in compliance with IFRS 8. [IFRS 8.3].

3 Identifying a single set of operating segments

IFRS 8 adopts a 'bottom up' approach to determining the level of detail required for segment reporting in the notes to the financial statements. It requires the entity's revenue earning activities to be divided into operating segments (based on the same components used by management to run the business) and only allows that information to be aggregated for reporting purposes if specific criteria are met. This process can involve considerable judgement, as it may not always be immediately clear what components of an entity are operating segments for the purposes of the standard or which layer of the entity's organisational structure represents the level at which those activities are managed. This is particularly the case when management information is presented in a number of different ways (for example by product, by geographical market and by legal entity) or where management structures distinguish operational, strategic and oversight responsibilities.

Notwithstanding these difficulties, the requirement is to identify a single set of components as constituting the entity's operating segments. [IFRS 8.8].

3.1 Definition of an operating segment

Extract from IFRS 8

Appendix A Defined terms

This appendix is an integral part of the IFRS

operating segment	An operating segment is a component of an entity:
	(a) that engages in business activities from which it may earn revenues and incur expenses (including revenues and expenses relating to transactions with other components of the same entity),
	(b) whose operating results are regularly reviewed by the entity's chief operating decision maker to make decisions about resources to be allocated to the segment and assess its performance, and
	(c) for which discrete financial information is available.

[IFRS 8 Appendix A].

This definition in IFRS 8 means the determination of an entity's operating segments starts with the smallest components of the business for which information about profit is regularly reviewed by the entity's chief operating decision maker.

3.1.1 Revenue earning business activities

A significant feature of an operating segment is the potential for revenue generation rather than actually earning revenues in the reporting period.

Accordingly, a start-up operation can be treated as an operating segment while it has yet to earn revenues. [IFRS 8.5].

However, not every part of an entity is necessarily an operating segment. For example, a corporate headquarters or a functional department (such as a centralised data processing centre) that either does not earn revenues or for which revenues are only incidental to the activities of the entity would not be an operating segment for the purposes of IFRS 8. Similarly, an entity's post-employment benefit plans would not be regarded as operating segments. [IFRS 8.6].

3.1.2 'Chief operating decision maker' and 'segment manager'

Arguably the most important judgement made in implementing IFRS 8 relates to the identification of the entity's chief operating decision maker. The nature of what is ultimately disclosed in the financial statements about operating segments and the level of detail (or segmentation) required is directly related to the information regularly provided to the chief operating decision maker.

References in the standard to ‘chief operating decision maker’ are to the function of allocating resources and assessing performance of the operating segments and not to a manager with a specific title. Often the chief operating decision maker of an entity is its chief executive officer or chief operating officer (i.e., an individual), but the term could refer equally to a group of executive directors or others charged with that role. [IFRS 8.7]. The existence of a group of senior executives does not in itself result in the group being identified as a CODM if a single individual (for instance, the chief executive officer), based on the governance structure of the entity, was able to override the decisions taken by the group.

In Practical example 3-1 below, the Go-Ahead Group plc identifies its Group Chief Executive as the chief operating decision maker:

Practical example 3-1: The Go-Ahead Group plc (2022)	United Kingdom
Annual report and Accounts [extract] Notes to the consolidated financial statements [extract] 4. Segmental analysis [extract] <p>For management purposes, the Group is organised into four reportable segments: Regional Bus, London & International Bus, UK Rail, and International Rail. Operating segments are reported to the chief operating decision maker, considered to be the Group Chief Executive, on a periodic basis for the purposes of resource allocation and assessment of segmental performance. Segments are organised based on the long-term economic characteristics as well as the similar nature of the business activities and are reported as follows:</p> <p style="text-align: center;">...</p>	

Frequently asked questions

Question 3-1: Could the CODM include non-executive persons?

The determination of chief operating decision maker will not be the same for all entities applying IFRS 8 and will depend upon the particular facts and circumstances applying to each entity, including the entity’s governance structure. However, in stating that the term could apply to a group of executive directors or others, [IFRS 8.7], the standard is clear that the function of CODM is an executive role. The IFRS IC confirmed this view in 2011. While it observed that in practice the functions of CODM are sometimes carried out by multiple persons and that all such persons involved in those activities would be part of the CODM group, the Committee noted that the CODM would not normally include non-executive directors.⁴ For example, an entity may have a single board of executive and non-executive directors which reviews the performance of individual business units, makes decisions about the operating budgets for those businesses and reviews significant applications for investment. In that case, the full board could be identified as the chief operating decision maker. However, if the entity also has a subcommittee of executive directors or another grouping of key management personnel (sometimes referred to as an ‘operational board’), this smaller group of executives would be identified as the chief operating decision maker.

Essentially, the chief operating decision maker is found at the most senior executive decision-making level of an organisation and as such must be distinguished from higher levels of management fulfilling primarily an oversight or approval role and who, to reflect their non-executive function, are provided information at a more aggregated level as a matter of course. For example, in some jurisdictions, supervisory bodies may be part of an entity’s governance structure and be entrusted with significant oversight responsibilities. This role may give the supervisory body significant veto rights and rights of approval. However, that supervision will not typically represent the level of decision-making implicit in the notion of the CODM.

⁴ [IFRIC Update](#), July 2011, available on the IFRS Foundation’s website.

In Practical example 3-2 below, AstraZeneca PLC identifies the Senior Executive Team (SET) as the CODM:

Practical example 3-2: AstraZeneca PLC (2023)	United Kingdom
Annual Report and Form 20-F Information 2023 [extract] Financial Statements [extract] Consolidated Statements [extract] Notes to the Group Financial Statements [extract] 6 Segment information [extract]	
<p>2 The identification of the Chief Operating Decision Maker (CODM) and the nature and extent of the financial information reviewed by the CODM:</p> <p>The SET, established and chaired by the CEO, is the vehicle through which the CEO exercises the authority delegated to him from the Board for the management, development and performance of AstraZeneca as a whole. It is considered that the SET is AstraZeneca's Chief Operating Decision Making body (as defined by IFRS 8). The operation of the SET is principally driven by the management of the Commercial operations, R&D, manufacturing and supply and enabling functions. All significant operating decisions are undertaken by the SET. While members of the SET have responsibility for implementation of decisions in their respective areas, operating decision making is at SET level as a whole. Where necessary, these are implemented through cross-functional sub-committees that consider the Group-wide impact of a new decision. For example, product launch decisions would be initially considered by the SET and, on approval, passed to an appropriate sub team for implementation. The ability of the enterprise to develop, produce, deliver and commercialise a wide range of pharmaceutical products are central to the SET decision-making process.</p> <p>In assessing performance, the SET reviews financial information on an integrated basis for the Group as a whole, substantially in the form of, and on the same basis as, the Group's IFRS Financial Statements. The high upfront cost of discovering and developing new products, coupled with the relatively insignificant and stable unit cost of production, means that there is not the clear link that exists in many manufacturing businesses between the revenue generated on an individual product sale and the associated cost and hence margin generated on a product. Consequently, the profitability of individual drugs or classes of drugs is not considered a key measure of performance for the business and is not monitored by the SET. The focus of additional financial information reviewed is at brand sales and Gross Margin level within specific geographies. Expenditure analysis is completed for the science units, operations and enabling functions; there is no allocation of these centrally managed Group costs to the individual product or brands. The bonus of SET members' continues to be derived from the Group scorecard outcome as discussed in our Directors' Remuneration Report.</p>	

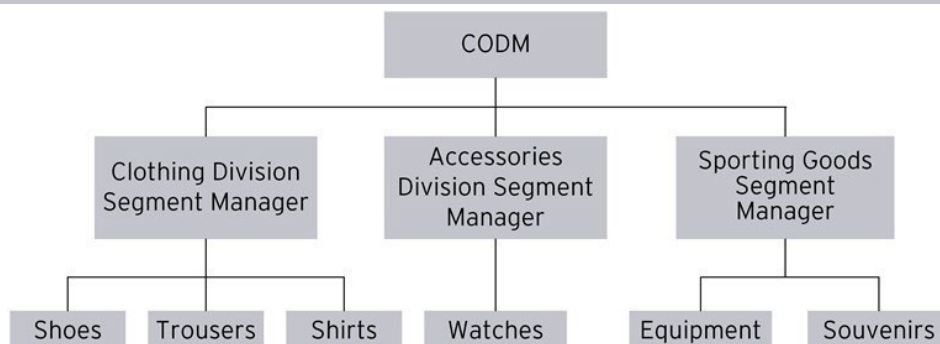

Another important distinction to be made is between chief operating decision maker and the function of 'segment manager'. The segment manager is "directly accountable to and maintains regular contact with the chief operating decision maker to discuss operating activities, financial results, forecasts or plans for the segment. (...) The chief operating decision maker may also fulfil the role of segment manager for some operating segments. And a single segment manager may be responsible for more than one operating segment". [IFRS 8.9]. For example, if the CODM is a group of executives, members of that group may fulfil the role of segment manager for certain components of the entity.

Considerations of how components of the entity are managed are relevant to the identification of an entity's operating segments and not to how they might be reported in the financial statements. Accordingly, separate operating segments which otherwise meet the definition in section 3.1 above are not aggregated into single reportable operating segments simply because they have a common segment manager. The standard is clear that such segments are only aggregated into reportable operating segments if they exhibit similar long-term economic characteristics and are similar in respect of the qualitative criteria set out in section 3.2.1 below. [IFRS 8.12]. In addition, because the oversight role of the CODM is separate from the operational role of the segment manager, it is possible that an entity could regard an investee accounted for by the equity method as an operating segment (see section 3.1.5 below).

How we see it

In our view, judgement is required in practice to determine whether the component(s) for which a segment manager is held responsible represents one or more operating segments. For example, if targets are set by the CODM for the entire area of one segment manager's responsibility and the remuneration of that segment manager is based on the achievement of those targets, on an aggregated basis, this could support a determination that the area of responsibility is one operating segment in the absence of other evidence indicating that the CODM reviews the results of these components separately. Equally, whilst IFRS 8 states that segment managers will generally exist, their existence is an important indicator for identifying operating segments, but not a necessary condition. The key determinant is based on the activity of the CODM with respect to the internally reported results of that component.

A common situation in practice is that detailed financial information is provided or available to the chief operating decision maker on a regular basis about various levels of management and operational activity within an entity. In these circumstances, the interplay between the three criteria embedded in the definition of an operating segment (see section 3.1 above) becomes very important, as the existence of more detailed internal reporting could otherwise lead to a determination that there are more operating segments. If the three criteria apply to more than one set of components of an entity, but there is only one set that has segment managers, generally the set of components with segment managers constitutes the operating segments. [IFRS 8.8].

Illustration 3-1: Identifying operating segments - CODM and segment manager

The diagram above sets out the internal reporting structure of Entity A. Assume that six operating units (Shoes, Trousers, Shirts, Watches, Equipment and Souvenirs) are grouped into three divisions (Clothing, Accessories and Sporting Goods), each of which has a divisional manager who reports directly to the CODM. Even though the CODM receives discrete financial information for the six components, the company must assess how the CODM makes key operating decisions and at what level those decisions are made.

The company determines that operating decisions are made at the division level by the CODM. For example, marketing strategies are determined by the CODM for each division, and each divisional manager is responsible for deploying that strategy at the component level. Also, quarterly financial information is presented to the Board of directors and investors at the division level, which is consistent with the level at which the CODM makes decisions. In addition, the entity determines the following:

- Budgets and forecasts are prepared at the division level, and the CODM reviews budget-to-actual variances at that level on a monthly basis.
- The divisional managers are compensated in accordance with the company's bonus plan, which sets targets for each division.

In this case, the company concludes that while the CODM receives financial information for the components, performance is assessed and resources are allocated at the division level and therefore the three divisions are the operating segments.

Proper application of the requirements of IFRS 8 requires a clear understanding of what information is given to the chief operating decision maker and how the CODM uses that information, in conjunction with the segment managers. In the above example, the fact that the CODM receives detailed financial information about activities below the divisional level could raise doubts about the determination that the divisions represent the entity's operating segments, rather than the business units. In these circumstances, entities would be required to demonstrate that:

- The more detailed information is not used by the CODM to assess performance and allocate resources.
- Segment managers operate only at the divisional level and are not, in effect, managers for each of the business units in their division. As noted above, components otherwise meeting the characteristics of an operating segment under IFRS 8 are not combined simply because they share a segment manager.

It might be evident from the records of the discussions between segment managers and the CODM that results are monitored at divisional rather than at business unit level. It might equally be clear from the records of board meetings that more detailed information is not referred to by the CODM in its deliberations. However, there is evidence that when regulators and other enforcement agencies assess the quality of an entity's compliance with IFRS 8, they adopt the presumption that the CODM uses whatever detailed information is provided to him/her on a regular basis for decision-making and assessment purposes.

3.1.3 Availability of discrete financial information

As noted above, a component of an entity can only be regarded as an operating segment if discrete financial information is available about that component. [IFRS 8.5(c)]. This requirement relates solely to the existence of discrete information that allows the chief operating decision maker to make decisions about the allocation of resources and to assess the performance of that component.

Accordingly, a component of an entity is still regarded as an operating segment, if the only information available relates to the profitability of that component. Such information would be sufficient for the chief operating decision maker to review its operating results, assess performance and make decisions about resource allocation. [IFRS 8.5(b)]. Financial information does not become useless by the lack of, for example, a separate statement of financial position or a separate statement of cash flows for that component.

However, considering the requirement in IFRS 8 that the CODM for its assessment must review “operating profits”, it would be unlikely that a component of an entity could be regarded as an operating segment solely because the chief operating decision maker receives information about revenue from that component. Without a measure of the component’s operating results, it would be difficult to make meaningful assessments of the effect of allocating more or less resource to that activity. As such, information on revenue alone would have limited value in decision making. Therefore, the search for an entity’s operating segments starts with the smallest components of the business for which a measure of profitability is provided to the entity’s CODM. [IFRS 8.5(b)].

3.1.4 When a single set of components is not immediately apparent

For many entities, the search for operating segments is concluded after applying the three criteria listed in section 3.1 above.

However, in cases where a single set of operating segments cannot be identified clearly by applying the above criteria (for example in an entity where its business activities are reported internally and assessed in a variety of ways), IFRS 8 states that other factors must be considered, including the nature of the business activities of each component, the existence of a manager responsible for it, and the information presented to the board of directors. [IFRS 8.8]. Therefore, if an entity’s activities are reported internally in a number of different ways, each with their own set of business components as defined above, but there is only one set to which segment managers are assigned, then that will comprise the operating segments to report in the financial statements for IFRS 8 purposes. [IFRS 8.9]. For example, if an entity’s board of directors manages its business using information on revenues and costs analysed both by product grouping as well as by geographical market, but the management structure operates only on geographical lines, then the financial statements would include segmental information on a geographical basis.

A single set of operating segments must be identified, even where two or more sets of components of an entity are managed in a matrix structure, for example, where financial information is available and performance is assessed and segment managers assigned not only on the basis of product and service lines worldwide, but also by geographical area irrespective of products and service lines. In that situation the choice of a single set of components is a matter of judgement, made by reference to the core principle of the standard as set out in section 2.1 above. [IFRS 8.10].

3.1.5 An equity accounted investment can be an operating segment

The definition of an operating segment focuses on the review of its operating results by the entity’s chief operating decision maker and the assessment of its performance and the allocation of resources to it by the CODM. [IFRS 8.5(b)]. This raises the question of whether the reporting entity needs to have control over the activities conducted in what otherwise would meet the definition of an operating segment, or whether it is sufficient that the CODM reviews its results and this review influences decisions about investment in those activities.

How we see it

In our view, when applying the above definition of an operating segment, control over the activities in which the entity is investing is not a requirement.

The core principle of IFRS 8 requires the disclosure of information relating to the business activities in which an entity engages and the economic environments in which it operates. No restriction is imposed according to the manner of that engagement, just the way in which the CODM makes decisions about allocating resources and assesses its performance.

For example, an equity method investee (i.e., associate or joint venture) could be considered an operating segment if it meets the criteria in IFRS 8. The CODM may regularly review the operating results and performance of an equity method investee for the purposes of making additional investments or advances, evaluating financial performance or evaluating whether to retain its investment. The CODM is not required to be responsible for making decisions at the investee operating level that affect the investee’s operations and performance in order for it to be identified as an operating segment. Furthermore, the definition of an operating segment does not require that the revenue generating activities of the investee are included in the entity’s revenue as reported in the IFRS financial statements. Segment performance could be measured by reference to the amounts included in the entity’s IFRS financial statements or equally by reference to the financial information prepared by the investee itself. Any difference between the measures used by the CODM and the accounting treatment under IFRS would be reported as a reconciling item in the entity’s disclosures under IFRS 8 (see section 5.6 below).

This view is consistent with the disclosure requirements of IFRS 8, which require the entity's share of the profits and losses of equity accounted associates and joint ventures and the amount of investment in equity accounted investees to be presented, if those amounts are included in the measures reviewed by the CODM of segment profit or loss and segment assets respectively (see sections 5.3 and 5.4 below). [IFRS 8.23(g), IFRS 8.24(a)].

HOCHTIEF Aktiengesellschaft presents its significant equity-method investee Albertis Investment as a separate reportable segment:

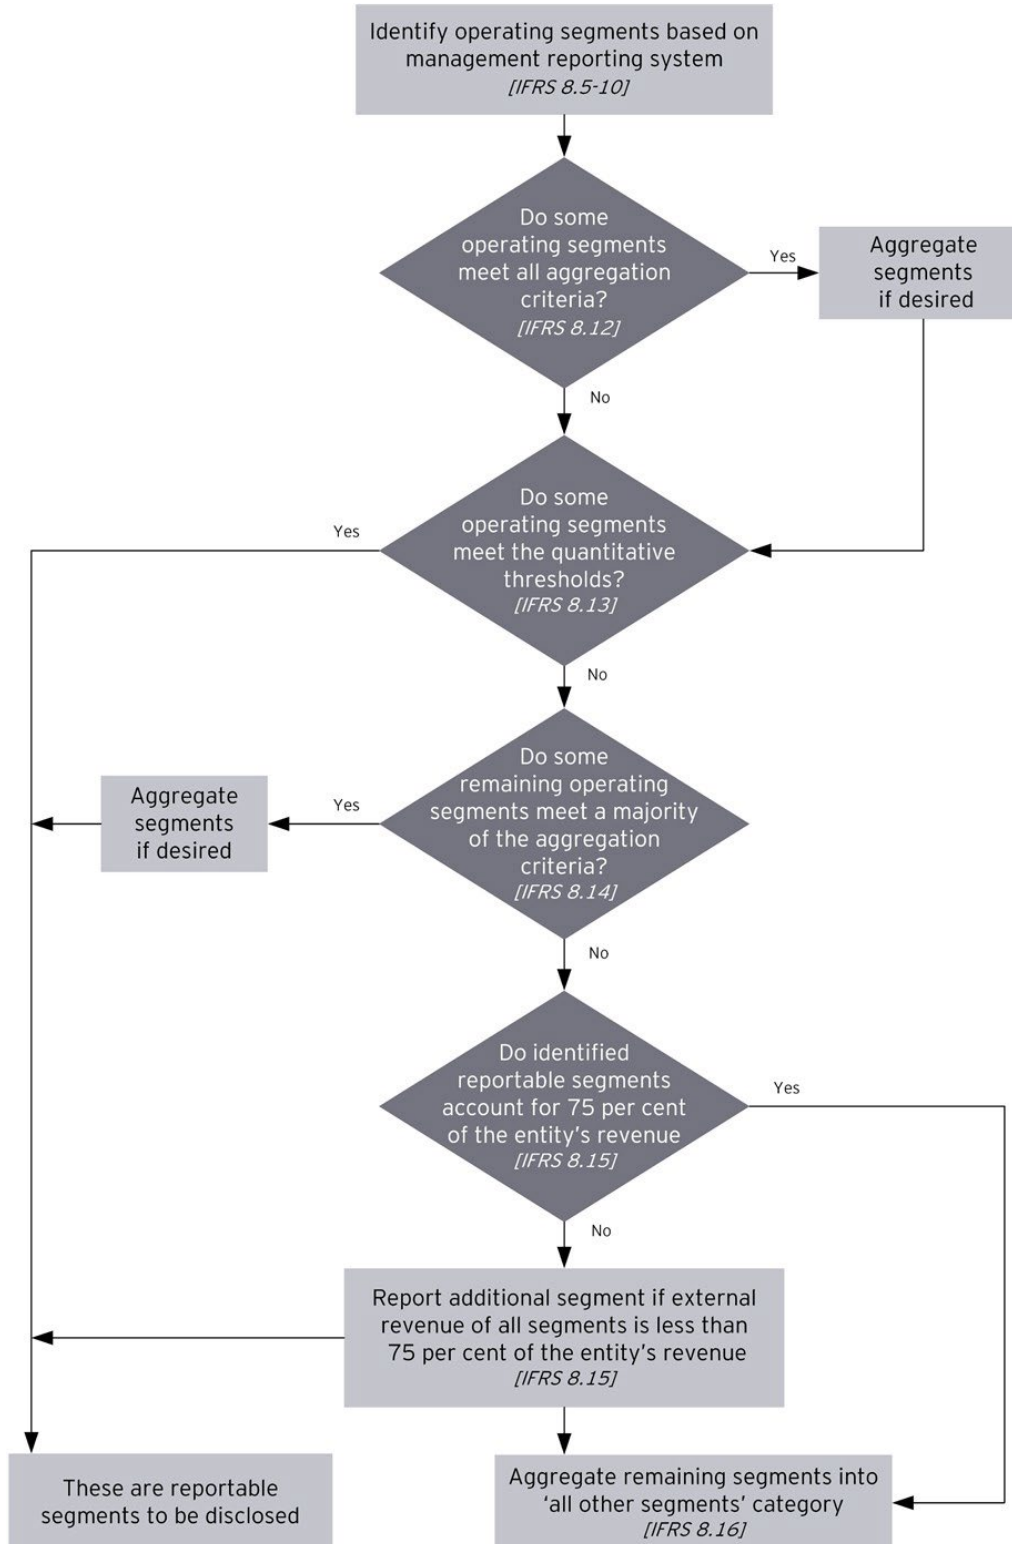

Practical example 3-3: HOCHTIEF Aktiengesellschaft (2022)	Germany
<p>Group report 2022 [extract]</p> <p>Notes to the Consolidated Financial Statements [extract]</p> <p>HOCHTIEF's structure reflects the operating focus of the business as well as the Group's presence in key national and international regions and markets. Segmental reporting in the HOCHTIEF Group is based on the Group's divisional operations. The breakdown mirrors the Group's internal reporting systems.</p> <p>The Group's reportable segments (divisions) are as follows:</p> <p>HOCHTIEF Americas encompasses the construction management and construction activities of operational units in the USA and Canada;</p> <p style="text-align: center;">...</p> <p>HOCHTIEF Asia Pacific pools the construction, services, and PPP activities in the Asia-Pacific region and, among other things, includes the investment in Thiess, which was fully consolidated as a subsidiary until last December and has since been accounted for in the Consolidated Financial Statements using the equity method;</p> <p>HOCHTIEF Europe brings together the core business in Europe as well as selected other regions and designs, develops, builds, operates, and manages real estate and infrastructure (PPP);</p> <p>Abertis Investment comprises the investment in Spanish toll road operator Abertis Infraestructuras, S.A.</p> <p style="text-align: center;">...</p>	

3.2 Identifying externally reportable segments

Having identified a single set of internal operating segments, the standard describes how reportable segments are determined. As a minimum, an entity must separately disclose information on reportable segments above a certain size (see section 3.2.2 below). In addition, a previously identified reportable segment continues to be disclosed separately in the current period if management judges it to be of continuing significance, even if it no longer satisfies the quantitative thresholds. [IFRS 8.17].

Thereafter, an entity is only compelled to give information on other segments (either individually or in certain circumstances on a combined basis) if the unallocated element is too large (see section 3.2.4 below).

The implementation guidance to IFRS 8 includes a diagram illustrating how to apply the main provisions of the standard for identifying reportable segments, which is reproduced below:

As indicated in the implementation guidance, the diagram is a visual supplement to IFRS 8. It should not be interpreted as altering or adding to any requirements of IFRS 8 nor should it be regarded as a substitute for its requirements. [IFRS 8.IG7].

IFRS 8 does not permit the omission of segment information when management believes that its disclosure is commercially sensitive or potentially detrimental to the entity's competitive position. If the criteria for separate disclosure described in sections 3.2.2 and 3.2.4 below are met, an entity is required to give information on that operating segment in the financial statements. The IASB considered both a general 'competitive harm' exemption and a 'comply or explain' basis for disclosure and rejected both. [IFRS 8.BC43, IFRS 8.BC44, IFRS 8.BC45].

3.2.1 Aggregation criteria - aggregating internally reported operating segments into single reportable operating segments

Under IFRS 8, an entity is required both to determine its operating segments and report operating segment financial information in accordance with the management approach. However, reporting separate information about every operating segment that the CODM reviews separately may not enhance the financial statement user's understanding of the business, particularly when two or more of the operating segments are so similar that they 'can be expected to have the same future prospects.' [IFRS 8.BC Appendix A 73].

Regardless of size, two or more of identified operating segments may be aggregated applying the following guidance: [IFRS 8.12]

Extract from IFRS 8

- 12 Operating segments often exhibit similar long-term financial performance if they have similar economic characteristics. For example, similar long-term average gross margins for two operating segments would be expected if their economic characteristics were similar. Two or more operating segments may be aggregated into a single operating segment if aggregation is consistent with the core principle of this IFRS, the segments have similar economic characteristics, and the segments are similar in each of the following respects:
- (a) the nature of the products and services;
 - (b) the nature of the production processes;
 - (c) the type or class of customer for their products and services;
 - (d) the methods used to distribute their products or provide their services; and
 - (e) if applicable, the nature of the regulatory environment, for example, banking, insurance or public utilities.

At this stage in the process, only segments which are similar in *all* the above respects can be aggregated into single reportable segments, which can require judgement.

Each of the following criteria must be met for aggregation to be permitted:

- The aggregation is consistent with the core principle of IFRS 8.
- The operating segments have similar economic characteristics.
- The operating segments are similar in all of the five qualitative characteristics, including the nature of the products and services, the nature of the production processes, the type or class of customer for their products and services, the methods used to distribute their products or provide their services and, if applicable, the nature of the regulatory environment.

Reasonable judgement with a thorough understanding of the entity's specific facts and circumstances is required in applying these criteria.

Further aggregation can only be achieved for segments which do not merit separate disclosure by virtue of their size (see section 3.2.2 below).

The fact that certain operating segments have been selected by management as a separately reportable component of activities in the business would suggest that there are good commercial reasons why their performance is monitored separately by the CODM and, therefore, might usefully be reported separately to users of the financial statements. It is only when those components exhibit similar economic characteristics that their aggregation will not compromise the entity's ability to achieve the core principle of IFRS 8, to disclose information that is useful to users of its financial statements. [IFRS 8.BC32].

How we see it

In our view, there is a certain presumption inherent in any standard on segment reporting that investors would prefer information on a more disaggregated basis. As a result, it may be questioned whether it is consistent with the objective and basic principles of IFRS 8 for a company to report just one reportable segment or a limited number of reportable segments, especially if such reportable segments are inconsistent with an entity's basic organisational structure. Companies that choose to aggregate operating segments must be prepared to explain why an operating segment is important enough to be individually reported to the CODM, but similar enough to other segments to be aggregated when reported to investors.

3.2.1.A Consistency with core principle

Aggregation must be consistent with the objective and basic principles of IFRS 8, which are to help users better understand the entity's performance and assess its prospects for future net cash flows. Aggregation is appropriate only when the operating segments are so similar that presenting the information separately would not significantly add to an investor's understanding of the future prospects of the company and its operating segments. Although the identification of operating segments is based on the management approach, the aggregation of operating segments should be viewed from the perspective of investors.

3.2.1.B Economic characteristics

Operating segments must have similar economic characteristics to be aggregated. While IFRS 8 includes long-term gross margin as an example of similar economic characteristics, if the CODM uses a different measure of profit or loss (e.g., EBITDA) to assess performance and allocate resources to each operating segment, that measure of profit or loss must also be considered when assessing whether operating segments possess similar economic characteristics. [IFRS 8.12]. In addition, if other economic measures are provided to the CODM, the similarities of those economic measures must also be considered. For example, if the CODM uses sales metrics, return on investment, or other standard industry measures, those metrics may also be relevant in determining economic similarity.

In assessing whether long-term average gross margins (or the appropriate measure of operating performance used by the CODM to assess performance and allocate resources, such as EBITDA) of operating segments are sufficiently similar, companies must look to past and present performance as indicators that segments are expected to again have the same future prospects. In other words, if operating segments do not currently have similar gross margins and sales trends but are expected to have similar long-term average gross margins and sales trends, it may be appropriate to aggregate the two operating segments (provided all other criteria are met). Conversely, if operating segments happen to have similar gross margins or sales trends in a given year but it is not expected that the similar gross margins or sales trends will continue in the future, the operating segments must not be aggregated for the current-year segment disclosures just because current economic measures happen to be similar. It follows that operating segments that have been profitable over the longer term must not be combined with segments that over the longer term have been consistently loss-making.

The following Illustration shows how the management of an entity has interpreted these requirements. However, any judgements to be made will be specific to the entity and the environment in which it operates and in different circumstances some of the characteristics considered will be relatively more or less relevant than others.

Illustration 3-2: Aggregating internally reported operating segments with similar characteristics into a single reportable operating segment

In the information presented to the executive directors, a single-product company has identified seven components of its business that are internally reported operating segments: Africa, Australia and Pacific, France, Germany, Italy, UK and Ireland, and USA. The company dominates its markets in Australia and Pacific and in Germany and consequently enjoys superior operating profits. Its other markets are fragmented, competition is greater and therefore historic and expected margins are lower. Can any segments be aggregated for external reporting purposes?

Management has considered each of the criteria set out in IFRS 8.12 to determine whether the economic characteristics of these separate operating segments are similar, including competitive and operating risks, currency risks and political conditions, as well as current performance and future trading prospects. In these circumstances, management decided that it would not combine operating segments with different underlying currency risks and regulatory environments. That left only France, Germany and Italy as candidates for combination, since they all operate within the Euro zone. However, Germany has not been included in a larger reportable segment because, whilst similar in all other ways, its long-term financial performance is not expected to be comparable to France and Italy, as evidenced by its superior operating profits. On this basis, management decided to aggregate only its operations in France and Italy for external segment reporting purposes.

As can be seen in the above Illustration, operating segments trading in clearly different economic environments (for example, with unrelated functional currencies) must not be aggregated for segment reporting purposes (unless they are so small as to fall within the 'all other segments' category discussed in section 3.2.4 below).

IFRS 8 does not define the term ‘similar’ and does not provide guidance about what is similar for aggregation purposes. As the above discussion indicates, the determination of whether two or more operating segments are similar requires judgement and is dependent on the individual facts and circumstances.

In a response to a submission in 2011, the IFRS IC had acknowledged that IFRS 8 could usefully include further guidance on the meaning of ‘similar economic characteristics’ and the criteria for identifying similar segments listed in (a) to (e) above.⁵ In a move to improve the standard in this area, the IASB decided to enhance the disclosures on the aggregation of segments but not to add any further guidance at that time (see section 5.1.1 below). More recently, the IASB intended to include further examples of similar economic characteristics as result of its Post-implementation Review of IFRS 8. However, it decided not to amend IFRS 8.

3.2.1.C Qualitative characteristics

In assessing whether the aggregation criteria are met, it is important to note that the aggregation criteria are tests, not indicators, of similarity between operating segments. In addition to exhibiting similar economic characteristics, the operating segments must be similar in each (i.e., all) of the following areas for aggregation to be permitted:

(a) *The nature of the products and services.*

Similar products or services generally will have similar purposes or end uses. Thus, they may be subject to similar types and degrees of risk and similar opportunities for growth. We believe that it often will be appropriate to evaluate the similarity of products or services based on the range of activities of the organisation, as shown in the following Illustration:

Illustration 3-3: Aggregation - Similar products and services

When evaluating the similarity of products and services, a highly diversified company that manufactures a variety of consumer products, provides financial services and has a construction business may determine that all of its consumer products are similar. However, an entity that only sells consumer products might determine that not all of its consumer products are similar.

(b) *The nature of the production processes.*

A similar production process might be demonstrated by the sharing of common or interchangeable production facilities, equipment, labour force or service group and by using similar raw materials in the production process. Likewise, similarity in the nature and type of labour or amounts of capital required also may be indicative of a similar production process. The nature of the production process of two different products may be similar, even if the products do not function similarly. Consider the following Illustration:

Illustration 3-4: Aggregation - Similar production process

Assume that Life Co., a life sciences company manufactures various pharmaceutical products for commercial sale. These products include cold medicines and diet pills. Each product is manufactured through the same production process, even though the products have different applications. Both products consist of various chemical compounds that are mixed together in batches to create the end product. Both products undergo quality control testing in order to confirm the efficacy of the product. Both products also use the same manufacturing equipment for parts of the production process. Thus, Life Co. concludes that for the purposes of the segment aggregation criteria, the production processes are similar, despite the differences in the applications of the end products.

(c) *The type or class of customer for their products and services.*

Factors to consider in evaluating whether the type or class of customer are similar include: (1) the region or geography in which the products and services are marketed; (2) the methods used to market the products or services, including the use of a common or interchangeable sales force; and (3) the nature or type of customer including the industries in which the customers may operate. Entities must carefully consider whether this criterion has been met when the products or services of one operating segment are targeted to a different customer base or constitute a material revenue stream. Consider the following Illustration:

⁵ [IFRIC Update](#), September 2011, available on the IFRS Foundation's website.

Illustration 3-5: Aggregation - Type and class of customer

Market Co., a diversified clothing manufacturer has two operating segments, Retail and Wholesale. Retail primarily markets its products to consumers through electronic and print advertising. In contrast, Wholesale principally markets its products through a network of sales representatives who call upon the distributors to purchase the products. In considering the type or class of customer, Market Co. concludes that the type and class of customer are not similar for the two operating segments based upon the distinction between retail and wholesale as well as the primary marketing methods for its products. As such, aggregation of the two operating segments would not be permitted.

- (d) *The methods used to distribute their products or provide their services.*

The determination of whether two methods of distribution are similar will depend on the structure of a particular company. Consider the following Illustration:

Illustration 3-6: Aggregation - Retail outlets and internet distribution

Software Co., a software retailer, has two operating segments: Retail, which distributes its products through retail outlets, and Internet, which distributes its products through a website on the internet. In evaluating whether these operating segments can be aggregated, Software Co., might conclude that the methods to distribute its products are not similar because Retail and Internet distribute products through different distribution channels.

- (e) *If applicable, the nature of the regulatory environment, for example, banking, insurance, or public utilities.*

Entities that operate within certain industries may be subject to regulatory requirements that are promulgated by a government agency. Sometimes two operating segments may produce the same product through the same production process, but because of differences in the class of customer and the regulatory environment, the operating segments must not be aggregated. For example, it may not be appropriate for an entity to aggregate an operating segment that produces a product under government contracts together with an operating segment that produces the same product for commercial purposes.

Some entities are comprised of operating segments that operate within different regulatory environments. We believe that the nature of the regulatory environments in which two or more operating segments operate can be regarded as similar, even if the regulatory bodies are not the same.

3.2.2 Quantitative thresholds - operating segments which are reportable because of their size

IFRS 8 includes a number of quantitative measures for determining whether information on the identified operating segments must be reported separately. Accordingly, an operating segment (or combination of segments meeting the qualitative criteria for aggregation described in section 3.2.1 above) requires separate disclosure if it meets any of the following thresholds: [IFRS 8.13]

Extract from IFRS 8

- | | |
|-----|---|
| 13 | An entity shall report separately information about an operating segment that meets any of the following quantitative thresholds: |
| (a) | Its reported revenue, including both sales to external customers and intersegment sales or transfers, is 10 per cent or more of the combined revenue, internal and external, of all operating segments |
| (b) | The absolute amount of its reported profit or loss is 10 per cent or more of the greater, in absolute terms, of (i) the combined reported profit of all operating segments that did not report a loss and (ii) the combined reported loss of all operating segments that reported a loss. |
| (c) | Its assets are 10 per cent or more of the combined assets of all operating segments. |

The definition of an operating segment includes a component of an entity earning revenues and incurring expenses relating to transactions with other components of the same entity, i.e., numbers in applying the quantitative criteria are prior to any consolidation. [IFRS 8.5]. Therefore, an entity would have to report separately information on an operating segment that exceeds the above criteria, even if that segment earns a majority of its revenues from transactions with other components of the same entity.

Illustration 3-7: Identifying reportable segments using the quantitative thresholds

	Unit 1 CU000	Unit 2 CU000	Unit 3 CU000	Unit 4 CU000	Unit 5 CU000	Unit 6 CU000	Unit 7 CU000	Unit 8 CU000	Unit 9 CU000	Total CU000
Revenue:										
External	34,000	3,000	15,000	30,000	35,000	35,000	77,500	55,500	25,000	310,000
Internal	35,000	34,000	12,500	2,200	-	1,500	7,800	2,300	-	95,300
Total	69,000	37,000	27,500	32,200	35,000	36,500	85,300	57,800	25,000	405,300
Profit/(loss)	21,500	24,500	(4,500)	2,300	10,000	7,500	3,500	35,000	(21,250)	78,550
Assets	12,250	77,800	25,000	24,000	40,000	7,730	145,000	55,000	4,300	391,080

Assuming that none of the operating segments (Units 1 through 9) are eligible for aggregation under the qualitative aggregation criteria set out in section 3.2.1 above, which units are required to be reported as operating segments in the entity's financial statements?

Applying the above quantitative thresholds, Units 1, 2, 5, 7, 8 and 9 must be identified as reportable segments, as follows:

- A unit whose internal and external revenue is 10% or more of the total revenue of all segments is a reportable segment. On this basis, Unit 1 (17%), Unit 7 (21%) and Unit 8 (14%) are reportable segments.
- A unit is a reportable segment if its profit or loss, in absolute terms, is 10% or more of the greater of the combined profits of all profitable segments or the combined losses of all segments in loss. The combined profit of all profitable segments is CU104.3m, which is greater than the total of CU25.75m for segments in loss. On this basis, Unit 1 (21%), Unit 2 (23%), Unit 8 (34%) and the loss-making Unit 9 (20%) are reportable segments.
- A unit is also a reportable segment if the measure of assets reported to the chief operating decision maker is 10% or more of the total reported measure of assets of all segments. On this test, Unit 5 (10%) joins the list of reportable segments, with Unit 2 (20%), Unit 7 (37%) and Unit 8 (14%) having been already identified under other criteria.

In Illustration 3-7 above, Units 1, 2, 5, 7, 8 and 9 are identified as reportable segments under IFRS 8 by virtue of their size. No further aggregation of large segments such as these would be possible unless all of the qualitative criteria set out in section 3.2.1 above are met.

Even if an internally reported operating segment falls below all of the quantitative thresholds, it may still be considered as reportable, and separately disclosed, if management believes information about the segment would be useful to users of the financial statements. [IFRS 8.13].

How we see it

In our view, where information about segment assets is not disclosed under IFRS 8 because it is not provided regularly to the CODM, it would be appropriate to ignore criterion (c) above for determining the reportable segments.

3.2.3 Combining small operating segments into a larger reportable segment

Operating segments which individually fall below the size criteria may be combined with other small operating segments into a single larger reporting segment provided that:

- (a) The operating segments being combined have similar economic characteristics

And

- (b) They share a majority (rather than all) of the criteria listed in section 3.2.1 above [IFRS 8.14]

For the avoidance of doubt, if an entity proposes to combine a small operating segment with one that exceeds any of the quantitative thresholds, they must share all of the criteria described in section 3.2.1 above. The requirement that combining segments must demonstrate similar economic characteristics applies to combinations of both larger and smaller operating segments into reportable segments, without exception.

3.2.4 'All other segments'

At this stage, the entity has been divided into a single set of components based on the elements reported to the chief operating decision maker. Components have been combined where permitted by the standard and the entity has identified a number of individual operating segments or groups of operating segments that are required to be disclosed separately in the financial statements because each exceeds the quantitative thresholds for a reportable segment. The entity may then be left with a number of operating segments which have not been identified as being reportable, as well as other business activities that are not an operating segment or part of an operating segment.

Information about other business activities and operating segments that are not reportable must be combined and disclosed in a separate category for 'all other segments'. [IFRS 8.16]. However, this residual category cannot be too large. If total external revenue for the operating segments already reported separately is less than 75% of the entity's revenue, the entity must identify additional operating segments for external reporting until the 75% target is reached. In this situation, segments would have to be reported separately even if they fall below the quantitative thresholds described in section 3.2.2 above and are not otherwise regarded as being significant. [IFRS 8.15].

There is no requirement to identify as a reportable segment the next largest internally reported operating segment. The choice of additional reporting segments is aimed simply to reach the 75% threshold, as illustrated below.

Illustration 3-8: Reaching the threshold of 75% of external revenue

In Illustration 3-7 above, Units 1, 2, 5, 7, 8 and 9 were identified as reportable segments. The total external revenue attributable to these reportable segments is CU230m. This is only 74.2% of total external revenues and less than the required 75% of total external revenue of CU310m.

The entity is, therefore, required to identify additional segments as reportable segments, even if they do not meet the quantitative thresholds in section 3.2.2 above. Entities that have numerous operating segments often will have latitude in selecting operating segments to meet the 75% test. In this case, Unit 3, with external revenue of CU15m (4.8%), Unit 4's external revenue of CU30m (9.7%) and Unit 6's external revenue of CU35m (11.3%) would each take the total above the required 75%. The entity can choose to present any of these as a reportable segment, leaving the others to be combined to form the item for 'all other segments'.

How we see it

In our view, the 'all other segments' category must be presented separately from other reconciling items. This raises the question whether headquarters, treasury and similar central functions (sometimes referred to as 'corporate items') must be included in 'all other segments' or in the reconciliation. In practice, the headquarters activities and its related accounting effects will not always be allocated to the operating segments for internal reporting purposes. The description of 'all other segments' refers to 'other business activities and operating segments'. It could be argued that central functions are not business activities, but support functions which must be part of the reconciliation. On the other hand, they could be regarded as incidental business activities. There is no guidance to suggest that either presentation is ruled out by the standard.

3.2.5 A 'practical limit' for the number of reported operating segments

IFRS 8 states that there may be a practical limit to the number of separately reportable segments beyond which segment information may become too detailed. Without prescribing such a limit, it suggests that an entity expecting to disclose more than 10 separate reportable segments must consider whether the practical limit has been reached. [IFRS 8.19].

3.2.6 Restatement of segments reported in comparative periods

When the composition of reportable segments changes over time as a result of changes to an entity's internal reporting to the CODM, the prior period segment data that is presented for comparative purposes must be restated to reflect the newly reportable segment (see section 5.7.1 below). This also applies when an operating segment is identified for the first time as a reportable segment in accordance with the thresholds in section 3.2.2 above, regardless of whether it would have satisfied the quantitative thresholds in the prior period. [IFRS 8.18].

Only if the necessary information is not available and the cost to develop it would be excessive, would prior periods not be restated. [IFRS 8.18, IFRS 8.29].

4 Measurement

Extract from IFRS 8

25 The amount of each segment item reported shall be the measure reported to the chief operating decision maker for the purposes of making decisions about allocating resources to the segment and assessing its performance. Adjustments and eliminations made in preparing an entity's financial statements and allocations of revenues, expenses, and gains or losses shall be included in determining reported segment profit or loss only if they are included in the measure of the segment's profit or loss that is used by the chief operating decision maker. Similarly, only those assets and liabilities that are included in the measures of the segment's assets and segment's liabilities that are used by the chief operating decision maker shall be reported for that segment. If amounts are allocated to reported segment profit or loss, assets or liabilities, those amounts shall be allocated on a reasonable basis.

For an entity that does not present IFRS-compliant financial information to its chief operating decision maker, the measurement regime in IFRS 8 means that the amounts disclosed for segment revenue, profit or loss, and (when reported) assets or liabilities could be very different from those reported elsewhere in the financial statements. For example, management might include gains on sale of property, plant and equipment in its measure of segment revenue but not be permitted to do so in its financial statements. [IAS 16.68].

There is no requirement in IFRS 8 for segment information to be prepared in conformity with the accounting policies used to present the financial statements of the consolidated group or entity. IFRS 8 requires amounts reported to be the same as the measures used by the chief operating decision maker for determining resource allocation and for assessing performance. [IFRS 8.25]. This requirement is interpreted strictly. For example, unless adjustments and eliminations made in preparing the financial statements are reflected in the information used by the chief operating decision maker, an entity is prohibited from restating reported segment profit or loss for those adjustments and eliminations. In addition, the standard prohibits any further allocation of revenues, expenses and gains and losses in determining segment profit or loss unless that measure is used by the chief operating decision maker. [IFRS 8.25]. IFRS 8 does not require symmetry between the revenues and expenses included in segment result and the assets and liabilities allocated to segments; it simply requires disclosure of the nature and effect of any asymmetrical allocations to reportable segments, for example when depreciation expense is reflected in segment profit or loss, but the related depreciable assets are not allocated to that segment. [IFRS 8.27(f)]. Only those assets and liabilities taken into account by the chief operating decision maker will be included in assets and liabilities reported for that segment. [IFRS 8.25].

The amounts presented for segment revenue, profit or loss, assets and liabilities need bear no relationship to the amounts reported elsewhere in the financial statements, if the only measure of each that is used by the chief operating decision maker is not prepared in accordance with the entity's accounting policies or even under IFRS. [IFRS 8.26]. However, there is a constraint on this otherwise 'free-for-all', since in those cases where a number of measures of segment profit or loss, assets or liabilities are used by the chief operating decision maker, an entity is required to select for its segment disclosures the measurements that are most consistent with those used in preparing the financial statements. [IFRS 8.26].

When multiple measures of profit or loss are used by the CODM in monitoring operating segments, when complying with this specific requirement, in some jurisdictions the regulator may interpret the provision of the standard as precluding the disclosure of more than one measure of profit or loss, in addition to the one most consistent with the measurements used in preparing the financial statements.

How we see it

In our view, a key judgement that can significantly affect the segment disclosures reported in the financial statements arises when an entity seeks to distinguish information used by the chief operating decision maker for determining resource allocation and for assessing performance from other information and supporting detail which is regularly provided. Whether, for example, it is appropriate to ignore IFRS-compliant measures provided to the chief operating decision maker on the basis that they are not used for determining resource allocation and for assessing performance depends on the facts and circumstances supporting that assertion. Nevertheless, it might be appropriate to apply a rebuttable presumption that management effort is not normally wasted in providing the chief operating decision maker with information that is not used.

5 Information to be disclosed about reportable segments

Extract from IFRS 8

- 20 An entity shall disclose information to enable users of its financial statements to evaluate the nature and financial effects of the business activities in which it engages and the economic environments in which it operates.
- 21 To give effect to the principle in paragraph 20, an entity shall disclose the following for each period for which a statement of comprehensive income is presented:
- (a) general information as described in paragraph 22;
 - (b) information about reported segment profit or loss, including specified revenues and expenses included in reported segment profit or loss, segment assets, segment liabilities and the basis of measurement, as described in paragraphs 23-27; and
 - (c) reconciliations of the totals of segment revenues, reported segment profit or loss, segment assets, segment liabilities and other material segment items to corresponding entity amounts as described in paragraph 28.
- Reconciliations of the amounts in the statement of financial position for reportable segments to the amounts in the entity's statement of financial position are required for each date at which a statement of financial position is presented. Information for prior periods shall be restated as described in paragraphs 29 and 30.

[IFRS 8.20, IFRS 8.21].

These requirements are addressed in more detail below and the information described therein must be given separately for each segment determined to be reportable using the process set out in section 3.2 above. [IFRS 8.11].

As discussed in section 3.1.2 above, the identification of the chief operating decision maker can be a critical judgement in applying IFRS 8 because of its potential effect on what information is considered for disclosure. However, there is no explicit requirement in the standard to disclose the CODM. When in 2011, the IFRS IC and the IASB considered a request to amend the standard to require disclosure, they decided to defer this issue until the completion of the Post-implementation Review of IFRS 8 rather than through an interpretation or annual improvement.⁶

How we see it

In March 2017, the Board issued an ED which proposed that entities disclose the title and description of the role of the individual or group which is identified as the CODM. In our view, while the proposed disclosure requirement was not finally adopted, it would be good practice to disclose the individual or group identified as CODM (see Illustrations in section 3.1.2 above).

5.1 General information about reportable segments

The factors used to identify reportable segments must be described. This would include an explanation of the entity's basis of organisation, for example whether management has chosen to organise the entity by different products and services, by geographical area, by regulatory environment or by applying a combination of factors. [IFRS 8.22(a)].

The description would also indicate whether and how operating segments have been aggregated (see section 5.1.1 below). The general information on reportable segments would include a description of the types of products and services from which each reportable segment derives its revenues. [IFRS 8.22]. The disclosures must also include a description of the sources of the revenue classified in the 'all other segments' category. [IFRS 8.16].

In Practical example 5-1 below, Mercedes-Benz Group AG describes how its activities have been segmented into its principal business activities and specific product lines.

⁶ [IFRIC Update](#), September 2011, available on the IFRS Foundation's website.

Practical example 5-1: Mercedes-Benz Group AG (2022)**Germany****Annual report 2022 [extract]****Notes to the Consolidated Financial Statements [extract]****35. Segment reporting [extract]****Reported segments**

The Group comprises the segments Mercedes-Benz Cars, Mercedes-Benz Vans and Mercedes-Benz Mobility.

...

The vehicle segments develop and manufacture premium and luxury passenger cars and vans. In addition to the Mercedes-Benz brand, the brand portfolio of the Mercedes-Benz Cars segment encompasses the brands Mercedes-AMG, Mercedes-Maybach and Mercedes-EQ. The Mercedes me brand provides access to the digital services of Mercedes-Benz Cars. At Mercedes-Benz Vans, the vans are sold under the Mercedes-Benz brand. Corresponding spare parts and accessories are also sold.

The Mercedes-Benz Mobility segment supports the sales of the Mercedes-Benz Group's vehicle brands worldwide. The product range mostly contains made-to-measure mobility and financial services. These services range from leasing and financing packages for end customers and dealers to insurance solutions, flexible subscription and rental models and fleet management services for business customers, with the latter primarily offered via the Athlon brand. Furthermore, Mercedes-Benz Mobility is active in the area of innovative mobility services.

5.1.1 Disclosure of how operating segments are aggregated

IFRS 8 requires disclosure of the judgements made by management in applying the aggregation criteria in the standard. This includes a brief description of the operating segments that have been aggregated in this way and the economic indicators that were considered in determining that the aggregated operating segments share similar economic characteristics. [IFRS 8.22(aa)]. The aggregation criteria are discussed in section 3.2.1 above.

In Practical example 5-2 below, Vodafone Group Plc describes the composition of its reportable segments. The narrative explains the basis for aggregating countries into those reportable segments.

Practical example 5-2: Vodafone Group Plc (2021)**United Kingdom****Annual report 2021 [extract]****Notes to the consolidated financial statements [extract]****2. Revenue disaggregation and segmental analysis [extract]****Segmental analysis [extract]**

With the exception of Vodacom, which is a legal entity encompassing South Africa and certain other smaller African markets, segment information is primarily provided on the basis of geographic areas, being the basis on which the Group manages its worldwide interests.

The operating segments for Germany, Italy, UK, Spain, and Vodacom are individually material for the Group and are each reporting segments for which certain financial information is provided. The aggregation of smaller operating segments into the Other Europe and Other Markets reporting segments reflects, in the opinion of management, the similar local market economic characteristics and regulatory environments for each of those operating segments as well as the similar products and services sold and comparable classes of customers. In the case of the Other Europe region this largely reflects membership or a close association with the European Union, while the Other Markets segment largely includes developing economies with less stable economic or regulatory environments. Common Functions is a separate reporting segment and comprises activities which are undertaken primarily in central Group entities that do not meet the criteria for aggregation with other reporting segments.

5.2 A measure of segment profit or loss, total assets and total liabilities

For each reportable segment, an entity is required to disclose a measure of profit or loss for each segment. An entity is also required to disclose a measure of total assets and total liabilities for each reportable segment, but only if such amounts are regularly provided to the chief operating decision maker. [IFRS 8.23]. This 'measure' means segment profit or loss and segment assets and liabilities as defined in the information used by the chief operating decision maker.

5.2.1 Other measures of segment performance

Entities typically use not only a measure of profit or loss, but also a combination of different financial and non-financial key performance indicators to assess performance of their operating segments and allocate resources to them. Examples include key measures based on capital invested like return on capital employed (ROCE), free cash flow or orders on hand. Since these are not measures of profit or loss, they would not need to be disclosed. However, the standard does not prohibit their disclosure.

Siemens Aktiengesellschaft includes measures of new orders and free cash flow in its segment information as shown in Practical example 5-3 below.

Practical example 5-3: Siemens Aktiengesellschaft (2022)**Germany****Annual financial report 2022 [extract]****6. Notes to Consolidated Financial Statements [extract]****NOTE 29 Segment information [extract]**

(in millions of €)	Orders		Free cash flow	
	Fiscal year		Fiscal year	
	2022	2021	2022	2021
Digital Industries	25,283	18,427	4,090	3,750
Smart Infrastructure	20,798	16,071	2,203	2,098
Mobility	13,200	12,696	771	898
Siemens Healthineers	25,556	20,320	2,625	3,101
Industrial Business	84,837	67,514	9,689	9,847
Siemens Financial Services	662	697	985	820
Portfolio Companies	3,995	3,516	97	354
Reconciliation to Consolidated Financial Statements	(483)	(353)	(2,533)	(2,642)
Siemens (continuing operations)	89,010	71,374	8,238	8,379

...

Orders

Orders are determined principally as estimated revenue of accepted purchase orders for which enforceable rights and obligations exist as well as subsequent order value changes and adjustments, excluding letters of intent. To determine orders, Siemens considers termination rights and customer's creditworthiness.

As of September 30, 2022, and 2021, order backlog totaled €102 billion and €85 billion (continuing operations); thereof Digital Industries €14 billion and €7 billion, Smart Infrastructure €15 billion and €11 billion, Mobility €36 billion and €36 billion and Siemens Healthineers €34 billion and €27 billion. In fiscal 2023, Siemens expects to convert approximately €45 billion of the September 30, 2022 order backlog into revenue; thereof at Digital Industries approximately €11 billion, Smart Infrastructure approximately €10 billion, Mobility approximately €10 billion and Siemens Healthineers approximately €12 billion.

Free cash flow definition

Free cash flow of the segments constitutes cash flows from operating activities less additions to intangible assets and property, plant and equipment. Except for SFS, it excludes financing interest, except for cases where interest on qualifying assets is capitalized or classified as contract costs; it also excludes income tax as well as certain other payments and proceeds. Free cash flow of SFS includes related financing interest payments and proceeds; income tax payments and proceeds of SFS are excluded. In individual cases, free cash flow of Mobility includes project-specific intercompany financing of long-term projects.

5.3 Disclosure of other elements of revenue, income and expense

The following items must also be disclosed about each reportable segment if the specified amounts are included in the measure of segment profit or loss reviewed by the chief operating decision maker or are otherwise regularly provided in respect of those segments to the chief operating decision maker (even if not included in that measure of segment profit or loss):

- (a) Revenues from external customers
- (b) Revenues from transactions with other operating segments of the same entity
- (c) Interest revenue
- (d) Interest expense
- (e) Depreciation and amortisation
- (f) Material items of income and expense disclosed in accordance with paragraph 97 of IAS 1 *Presentation of Financial Statements* (paragraph IFRS 18.42)
- (g) The entity's interest in the profit or loss of associates and joint ventures accounted for by the equity method
- (h) Income tax expense or income
And
- (i) Material non-cash items other than depreciation and amortisation [IFRS 8.23]

Interest revenue must be reported separately from interest expense for each reportable segment unless a majority of the segment's revenues are from interest and the chief operating decision maker relies primarily on net interest revenue to assess the performance of the segment and make decisions on the allocation of resources to it. In that case, the entity can report net interest revenue or expense for the segment provided that it discloses it has done so. [IFRS 8.23].

It can be seen that whilst IFRS 8 indicates the line items of income or expense or other information that might merit disclosure by segment, what an entity actually reports in its financial statements is determined by the line items used by the chief operating decision maker to define segment profit or loss and segment assets or liabilities, together with the other information otherwise regularly provided to the chief operating decision maker. [IFRS 8.23, IFRS 8.24]. This means that different entities (even those with very similar activities) will make different disclosures, depending on what information is provided to the chief operating decision maker. Indeed, what is disclosed by one entity for each of its reportable segments might vary because, for example, the result of one segment is determined after deducting interest whilst that of other segments is drawn before interest; or because the information provided to the chief operating decision maker about one segment includes equity-accounted associates but for other segments does not. As such the disclosures made by an entity are tailored according to exactly what appears in the information presented to the chief operating decision maker.

In July 2024, the IFRS IC published an agenda decision which discusses how an entity applies the requirements in paragraph 23 of IFRS 8 in making the assessment of which items of segment income and expense are material in the context of the financial statements as a whole and need to be disclosed in the segment reporting note.

The agenda decision addressed two main points:

- The IFRS IC said IFRS 8.23(a)-(i), which requires disclosure of specified segment amounts (e.g., revenues, interest, depreciation and amortization), applies to all amounts included in the measure of segment profit or loss that is reviewed by the chief operating decision maker (CODM). The IFRS IC observed that this is the case even for those amounts that make up the measure, which are themselves, not separately reviewed by, or provided to, the CODM.
- The agenda decision clarifies that IFRS 8.23(f), which requires the disclosure of material items of segment income and expense, applies to all material items of income or expense and not just unusual or non-recurring items. However, IFRS 8.23(f) does not require a complete statement of profit or loss by segment. The overarching concept of materiality in IAS 1 applies to IFRS 8. Therefore, an entity needs to assess whether the segment amount for an item of income or expense is material in its particular circumstances by considering qualitative and quantitative factors. Materiality is assessed in the context of the entity's financial statements as a whole and requires the use of judgement.⁷

The second point introduces the concept of “materiality in the context of the entity's financial statements as a whole”, which involves significant judgement and requires consideration of the nature or magnitude of information—in other words, qualitative or quantitative factors—or both, in assessing whether information about an item of income and expense is material. It implies that a disclosure may be material if assessed as if the segment was a reporting entity on its own, but not material when considering the same disclosure together with the information about other segments and other information about the reporting entity. For instance, as discussed below, an impairment may be relatively more significant at the segment level than at the reporting entity level.

In exercising their judgement, entities need to consider available sources of internal (e.g., management reporting, minutes of board of directors' meetings, etc.) as well as information reported externally (e.g., MD&A, press releases, presentations on earnings calls, prepared communication for shareholders' meetings, etc). For instance, if an entity communicates segment income or expense measures or details of such measures outside the financial statements, consideration must be given as to whether similar disclosures are required in the segment note. This is because the fact that the entity provides such information about segment measures outside the financial statements suggests that it is information that may be relevant to understand the entity's performance as a whole. An example could be a significant increase in employee benefit costs of one segment.

Under IFRS, materiality needs to be assessed both from a quantitative and qualitative perspective. As explained above, for the purpose of segment reporting, it is key to consider materiality in the context of the financial statements as a whole. For example, goodwill impairment may be quantitatively material in the context of a segment, making up a significant amount of the segment profit, while in the context of the financial statements as a whole, it is not, as the segment impairment does not significantly impact the entity's profit or loss. Also, if impairment of goodwill is a material item in the entity's profit or loss, impairment may still only be a material measure in one of the segments, if, for example, the entire impairment was recognised on goodwill allocated to that segment only. In such a case, the impairment will need to be disclosed for that segment. Other examples include personnel costs and cost of sales, which may be some of the largest expenses and key cost drivers for an entity's profitability. For example, entities need to assess whether information about segment personnel costs and/or cost of sales is material, in the context of the financial statements as a whole.

In its 2024 consolidated financial statements, Bouygues SA responded to the abovementioned agenda decision, by adding line items such as purchases used in production, personnel cost, external charges as follows:

⁷ [IFRIC update](#), June 2024, available on the IFRS Foundation's website.

Practical example 5-4: Bouygues SA (2024)**France****2024 UNIVERSAL REGISTRATION DOCUMENT [extract]****6 FINANCIAL STATEMENTS [extract]****6.1 CONSOLIDATED FINANCIAL STATEMENTS [extract]****6.1.6 Notes to the consolidated financial statements [extract]****Note 2 Group accounting policies [extract]****2.2 Basis of preparation of the financial statements [extract]****2.2.1 Changes in accounting standards, rules and policies [extract]**

▪ **IFRS Interpretations Committee – Requirements in paragraph 23 of IFRS 8**

Having received a question about how an entity should apply the requirements in paragraph 23 of IFRS 8 to disclose specified amounts related to segment profit or loss for each reportable segment, the IFRS Interpretations Committee concluded in July 2024 that the principles and requirements in IFRS Accounting Standards provide an adequate basis for an entity to apply the disclosure requirements in paragraph 23 of IFRS 8. Consequently, the Bouygues group has extended its segment information (see Note 17).

Note 17 Segment information [extract]

The segment information below is presented by business segment (CGU): Colas (Transport Infrastructure), Bouygues Construction (Construction), Bouygues Immobilier (Property), Equans (Energies & Services), Bouygues Telecom (Telecoms), TF1 (Media), and “Bouygues SA & other”.

Inter-segment sales are generally conducted on an arm’s length basis.

An analysis of sales by geographical area is provided in Note 12.3. The operating segments used in reporting by business segment are those reviewed by the chief operational decision-maker of the Group, and are not

aggregated. This information is used to allocate resources to operating segments, and to monitor their performance.

Operating segment information is compiled using the same accounting policies as those used in the preparation of the consolidated financial statements, as described in the notes to the financial statements.

The “Bouygues SA & other” segment includes contributions from holding companies and from entities dedicated to the centralised financing of the Group, as well as intragroup contributions.

...

For its 2024 consolidated financial statements, Carlsberg is another example of a company which added items to its 2023 segment reporting, although not referring to the abovementioned agenda decision. The Group added cost of sales, sales and distribution expenses and other expenses to help understand the development of its operating profit before special items:

Practical example 5-5: CARLSBERG A/S (2024)

...

5.4 Additional disclosures relating to segment assets

If any of the following items are either included in the measure of segment assets reviewed by the chief operating decision maker or otherwise regularly provided in respect of those segments (whether included in segment assets or not), an entity must also disclose for each segment:

- (a) The investment in equity-accounted associates and joint ventures.

And

- (b) Total expenditures for additions to non-current assets other than financial instruments, deferred tax assets, post-employment benefit assets and rights arising under insurance contracts. [IFRS 8.24].

5.5 Explanation of the measurements used in segment reporting

As noted in section 4 above, instead of prescribing how an entity must calculate the amounts reported in its segmental disclosures, IFRS 8 requires an entity to explain how its measures of segment profit or loss, segment assets and segment liabilities have been determined. As a minimum, the following information is required:

- (a) The basis of accounting for any transactions between reportable segments.
- (b) If not apparent from the required reconciliations (see section 5.6 below), the nature of any differences between the measurement of total reported segment profit or loss and the entity's profit or loss before income taxes and discontinued operations.
- (c) The nature of any differences between the measurements of total reported segment assets and the entity's assets, if not apparent from the required reconciliations.
- (d) The nature of any differences between the measurements of total reported segment liabilities and the entity's liabilities, if not apparent from the required reconciliations.
- (e) The nature of any changes from prior periods in the measurement methods used to determine segment profit or loss, including the financial effect, if any, of those changes.

And

- (f) The nature and effect of any asymmetrical allocations to reportable segments, such as where depreciation is included in segment profit but the related property, plant and equipment is not included in segment assets. [IFRS 8.27].

The kind of disclosures in (b), (c) and (d) above that are necessary for an understanding of the reported segment information could relate to the accounting policies used, including policies for the allocation of centrally incurred costs in arriving at segment profit or loss and for the allocation of jointly used assets and liabilities in determining segment assets and segment liabilities. [IFRS 8.27]. Other examples might include the use of previous local GAAP numbers, where internal reporting does not reflect the entity's move to IFRS, or the use of budgeted figures, for example when applying budgeted or constant foreign currency rates.

In Practical example 5-6 below, Mercedes-Benz Group AG confirms that segment information is prepared using the same accounting policies as the IFRS financial statements, describes how 'EBIT' is the measure of segment profit or loss and explains how segment assets and liabilities are determined.

Practical example 5-6: Mercedes-Benz Group AG (2023)

Germany

Annual Report 2023 [extract]

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

34. Segment reporting [extract]

...

Internal management and reporting structure

The internal management and reporting structure at the Mercedes-Benz Group is principally based on the accounting policies according to IFRS that are described in Note 1.

The measure of the Group's net profit or loss used by the Mercedes-Benz Group's management and reporting structure is referred to as "EBIT". EBIT comprises gross profit, selling and general administrative expenses, research and non-capitalized development costs, other operating income/expense, and the gains/losses on equity-method investments, as well as other financial income/expense.

...

Segment assets principally comprise all assets. The assets of the Mercedes-Benz Cars and Mercedes-Benz Vans segments exclude income tax assets, assets from defined benefit pension plans and other post-employment benefit plans, and certain financial instruments (including liquidity).

...

In its 2023 financial statements, HOCHTIEF Aktiengesellschaft provided an explanation of the basis of accounting for transactions between reportable segments.

Practical example 5-7: HOCHTIEF Aktiengesellschaft (2023)

Germany

Group Report 2023 [extract]

COMBINED FINANCIAL AND SUSTAINABILITY REPORT [extract]

CONSOLIDATED FINANCIAL STATEMENTS AND NOTES [extract]

Notes to the Consolidated Financial Statements [extract]

35. Segment reporting [extract]

Explanatory notes to the segmental data

Intersegment sales represent revenue generated between divisions. They are transacted on an arm's length basis. External sales mainly comprise performance obligations recognized under the percentage of completion method in the mainstream construction business, construction management, and resource services. The sum of external sales and intersegment sales adds up to total sales for each division.

...

5.6 Reconciliations

Reconciliations are required of all the following:

- (a) The total of revenue from reportable segments to the entity's revenue.
- (b) The total profit or loss for reportable segments to the entity's profit or loss before income taxes and discontinued operations. Where items such as income taxes have been allocated to arrive at segment profit or loss, the reconciliation can be made to the entity's profit or loss after those items.
- (c) If segment assets are reported (see section 5.2 above), the total of the reportable segments' assets to the entity's assets.
- (d) If segment liabilities are reported (see section 5.2 above), the total of reportable segments' liabilities to the entity's liabilities.

And

- (e) For every other material item of information the entity chooses to give in its segment information, the total of each item from all reportable segments to the corresponding amount for the entity. [IFRS 8.28].

In each of the above reconciliations an entity must separately identify and describe all material reconciling items. For example, when reconciling segment profit or loss to the entity's profit or loss before income taxes and discontinued operations, each material adjustment arising from differences in accounting policies would have to be separately identified and described. [IFRS 8.28]. In addition, IFRS 8 requires information about the 'all other segments' category to be shown separately from other reconciling items. [IFRS 8.16].

In its 2023 financial statements, National Australia Bank Limited evaluated the performance of operating segments on the basis of cash earnings. This post-tax measure of the profit or loss of reportable segments is reconciled to the consolidated financial statements as follows:

Practical example 5-8: National Australia Bank Limited (2023)

Australia

Annual Report 2023 [extract]

Financial report [extract]

Notes to the financial statements [extract]

Financial performance [extract]

Overview [extract]

...

The Group evaluates performance on the basis of cash earnings as it better reflects what is considered to be the underlying performance of the Group. Cash earnings is a non-IFRS key financial performance measure used by the Group and the investment community.

Cash earnings is calculated by adjusting statutory net profit from continuing operations for certain non-cash earnings items. Non-cash earnings items are those items which are considered separately when assessing performance and analysing the underlying trends in the business. Cash earnings for the year ended 30 September 2023 has been adjusted for hedging and fair value volatility, amortisation of acquired intangible assets, and certain other items associated with acquisitions, disposals and business closures. Cash earnings does not purport to represent the cash flows, funding or liquidity position of the Group, nor any amount represented on a statement of cash flows.

(1) For the year ended 30 September 2023, the New Zealand liquidity management portfolio of \$18.3 billion of assets is reported within New Zealand Banking. Previously the assets and liabilities together with the related income was reported as part of Corporate and Institutional Banking. Comparative information has not been restated.

(2) Corporate Functions and Other includes eliminations.

(3) Reportable segment assets include inter-company balances which are eliminated within the Corporate Functions and Other segment.

...

5.7 Restatement of previously reported information

Entities may need to change their organisation to respond to their business needs. This may have an effect on the entity's segment reporting. IFRS 8 provides explicit guidance if such a change in the organisation changes the composition of its reportable segments. However, it does not explicitly address any changes that affect reportable segments, such as a change in segment measures. This is discussed further below.

5.7.1 Changes in organisation structure

When an entity changes its organisational structure in a manner that causes a change in the composition of its reportable segments, corresponding amounts for earlier periods must be restated unless the information is not available and the cost to develop it would be excessive. This requirement also applies to the presentation of segment information in respect of interim periods. [IFRS 8.29].

The exemption from restatement on grounds of excessive cost is applied to each individual item of disclosure. [IFRS 8.29]. This means that an entity must restate its comparative information for all the items it can, even if this results in some comparative information not being presented or restated, such as inter-segment revenues. When the composition of reportable segments has changed, an entity must disclose whether the corresponding items of segment information have been restated. [IFRS 8.29].

Where corresponding information is not restated to reflect the new composition of reportable segments, the segment information for the current period must be presented on both the old and the new bases of segmentation. Only if the necessary information were unavailable and the cost of developing it excessive, would an entity not have to show current information on the old basis of segmentation. [IFRS 8.30].

How we see it

In our view, given the importance of comparable segment information in particular in years of changing segmentation, the 'excessive cost' criterion represents a high hurdle to overcome.

If an entity decides to change its organisational structure during the reporting period, this requirement applies equally to interim periods [IFRS 8.29] and the information presented at the reporting date is also restated to reflect the new basis of segmentation,

As illustrated by the following Practical example 5-9 Sanofi changed its segment structure from three segments to two segments and restated the prior year:

Practical example 5-9: Sanofi (2023)	France
<p>2023 FORM 20-F [extract]</p> <p>PART III [extract]</p> <p>Item 18. Financial Statements [extract]</p> <p>2023 Consolidated financial statements [extract]</p> <p>Notes to the Consolidated Financial Statements [extract]</p> <p>D.35. Segment information [extract]</p> <p>As indicated in Note B.26., Sanofi has two operating segments with effect from January 1, 2023: Biopharma and Consumer Healthcare.</p> <p>In 2022, Sanofi reported three operating segments (Pharmaceuticals, Vaccines and Consumer Healthcare). The costs of the global support functions (Corporate Affairs, Finance, People & Culture, Legal, Ethics, Business Integrity & Global Security, Information Solutions & Technology, Sanofi Business Services, etc.), which are mainly managed centrally at group-wide level, were presented within the “Other” category.</p> <p>In 2023, Sanofi reviewed the presentation of its segment information following adjustments to its internal reporting systems in order to reflect (i) progress on the “Play to Win” strategy leading to the creation of the standalone Consumer Healthcare Global Business Unit (GBU) which, in addition to integrated research, development and production functions now also has its own dedicated global support functions (including Finance, People & Culture, Legal, Ethics, Business Integrity & Global Security, Information Solutions & Technology, Global Business Services, etc.); and (ii) organizational changes to Sanofi’s Manufacturing & Supply global function (previously known as Industrial Affairs).</p> <p>Consequently, with effect from January 1, 2023, Sanofi reports two operating segments: Biopharma and Consumer Healthcare.</p> <p>The Biopharma operating segment comprises commercial operations and research, development and production activities relating to the Specialty Care, General Medicines and Vaccines franchises, for all geographical territories. The segment’s results include the costs of global support functions that are not within the managerial responsibility of the Consumer Healthcare GBU.</p> <p>The Consumer Healthcare operating segment comprises commercial operations relating to Consumer Healthcare products, and research, development and production activities and global support functions (as listed above) dedicated to the segment, for all geographical territories. The Consumer Healthcare GBU segment’s results reflect all incurred costs of global support functions attributable to its business.</p> <p>The “Other” category comprises reconciling items, primarily but not limited to (i) gains and losses on centralized foreign exchange risk hedging transactions that cannot be allocated to the operating segments and (ii) gains and losses on retained commitments in respect of previously divested operations.</p>	

D.35.1.2. Business operating income [extract]

...

The table below shows Sanofi's segment results for the years ended December 31, 2023, December 31, 2022 and December 31, 2021:

(€ million)	2023			
	Biopharma	Consumer Healthcare	Other ^(a)	Total Sanofi
Net sales	37,890	5,180	—	43,070
Other revenues	3,322	52	—	3,374
Cost of sales	(12,282)	(1,933)	(1)	(14,216)
Research and development expenses	(6,509)	(219)	—	(6,728)
Selling and general expenses	(8,868)	(1,828)	4	(10,692)
Other operating income and expenses	(2,387)	181	(18)	(2,224)
Share of profit/(loss) from investments accounted for using the equity method	101	21	—	122
Net income attributable to non-controlling interests	(20)	(16)	—	(36)
Business operating income	11,247	1,438	(15)	12,670

(a) This caption reconciles segment financial information to total consolidated financial information.

(€ million)	2022 ^(a)			
	Biopharma	Consumer Healthcare	Other ^(b)	Total Sanofi
Net sales	37,812	5,185	—	42,997
Other revenues	2,330	62	—	2,392
Cost of sales	(11,793)	(1,903)	4	(13,692)
Research and development expenses	(6,503)	(205)	2	(6,706)
Selling and general expenses	(8,736)	(1,761)	5	(10,492)
Other operating income and expenses	(1,679)	148	17	(1,514)
Share of profit/(loss) from investments accounted for using the equity method	76	12	—	88
Net income attributable to non-controlling interests	(17)	(16)	—	(33)
Business operating income	11,490	1,522	28	13,040

(a) 2022 figures have been adjusted to take account of the two new operating segments, Biopharma and Consumer Healthcare, effective from January 1, 2023.

(b) This caption reconciles segment financial information to total consolidated financial information.

...

Segment information may also change as a result of the disposal of an entire reportable segment or a component of it which qualifies under IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* as a discontinued operation. The presentation of discontinued operations is governed by IFRS 5. The requirements of other standards do not apply to discontinued operations, unless they specify disclosures applicable to them. [IFRS 5.5B].

In its 2022 annual report, the Mercedes-Benz Group AG disclosed that certain activities included in discontinued operations are not presented as part of segment reporting.

Practical example 5-10: Mercedes-Benz Group AG (2022)

Germany

Annual report 2022 [extract]

Notes to the Consolidated Financial Statements [extract]

35. Segment reporting [extract]

The segment information relates to continuing operations. The reported segment Daimler Trucks & Buses until spin-off and hive-down of the Daimler commercial vehicle business is included in the discontinued operations in 2021 and is therefore not part of the segment information presented.

...

How we see it

In our view, as a result of the provisions of IFRS 5 discussed above, since IFRS 8 does not refer to discontinued operations, entities are not required to include them in their segment disclosures. This would be the case even if the CODM continued to monitor the discontinued operation until disposal. Nevertheless, an entity would not be prohibited from disclosing such information if it wished, on the basis that the requirements of IFRS 8 relate to the measures reported to the CODM without any adjustments being made in preparing the entity's IFRS financial statements.

5.7.2 Changes in segment measures

As a result of a change in internal reporting, entities may change individual elements of their segment reporting.

When an entity changes any of its segment measures, including the definition of segment profit, or changes the allocation of income, expenses, assets or liabilities to segments, without a change to the composition of its reportable segments, the general principles of IAS 1 for changes in presentation or classification of items apply. Therefore, comparative information would be restated, unless this is impracticable. [IAS 1.41].

In 2020, Vodafone Group Plc changed the segment information to reflect the adoption of IFRS 15 for purposes of internal decision making:

Practical example 5-11: Vodafone Group Plc (2020)

United Kingdom

Annual report 2020 [extract]

Notes to the consolidated financial statements [extract]

2. Revenue disaggregation and segmental analysis [extract]

Segmental analysis [extract]

Segmental information used for internal decision making during the years ended 31 March 2018 and 2019 was on an IAS 18 (pre-IFRS 15) basis. In the year ended 31 March 2020 internal decisions were based upon IFRS 15 financial information and accordingly comparative information for the year ended 31 March 2019 was re-presented. Consequently, segmental information for the year ended 31 March 2018 is presented on an IAS 18 (pre-IFRS 15) basis and information for years ended 31 March 2020 and 2019 is presented on an IFRS 15 basis in accordance with the above revenue recognition policy. See note 32 "IAS 18 basis primary statements" for details of the IAS 18 revenue recognition policy.

The Group's measure of segment profit, adjusted EBITDA, excludes depreciation, amortisation, impairment loss, restructuring costs, loss on disposal of fixed assets, the Group's share of results in associates and joint ventures and other income and expense. A reconciliation of adjusted EBITDA to operating profit is shown below. For a reconciliation of operating profit to profit for the financial year, see the Consolidated income statement on page 141.

	2020 €m	2019 (re-presented) ¹ €m	2018 €m
Adjusted EBITDA	14,881	13,918	14,737
Depreciation, amortisation and loss on disposal of fixed assets	(10,085)	(9,665)	(9,910)
Share of adjusted results in equity accounted associates and joint ventures ²	(241)	(348)	389
Adjusted operating profit	4,555	3,905	5,216
Impairment losses	(1,685)	(3,525)	—
Restructuring costs ²	(720)	(486)	(156)
Amortisation of acquired customer based and brand intangible assets ²	(638)	(583)	(974)
Other income/(expense) ²	2,257	(262)	213
Interest on lease liabilities	330	—	—
Operating profit/(loss)	4,099	(951)	4,299

Notes:

1 The results reflected in this table for the year ended 31 March 2019 were previously disclosed on an IAS 18 basis in the Annual Report for the year ended 31 March 2019 and have been re-presented in the table above on an IFRS 15 basis.

2 Share of results of equity accounted associates and joint ventures presented within the Consolidated income statement includes -€241m (2019: -€348 million, 2018: €389 million) included within Adjusted operating profit, -€25m (2019: -€26 million, 2018: -€9 million) included within Restructuring costs, -€215 million (2019: -€420 million, 2018: -€439 million) included within Amortisation of acquired customer based and brand intangible assets and -€2,024 million which is principally related to Vodafone Idea Limited (2019: -€114 million, 2018: €nil million) included within Other income/(expense).

In 2021, Sanofi made several changes to its segment measures and adjusted the prior period information :

Practical example 5-12: Sanofi (2021)

France

Form 20-F 2021 [extract]

Part III [extract]

Notes to the Consolidated Financial Statements [extract]

D.35. Segment information [extract]

The costs of global support functions (External Affairs, Finance, Human Resources, Legal Affairs, Information Solutions & Technologies, Sanofi Business Services, etc.) are managed centrally at group-wide level. The costs of those functions are presented within the "Other" category. That category also includes other reconciling items such as retained commitments in respect of divested activities.

Following the Capital Markets Day held in February 2021, Sanofi changed the presentation of net sales within the General Medicines franchises and the Consumer Healthcare segment, and also reallocated certain expenses. In particular, IT costs relating to Sanofi's new digital organization – previously allocated to the Pharmaceuticals, Vaccines, and Consumer Healthcare segments – are now included within the "Other" segment. The 2020 segmental results presented below have been amended for comparative purposes in order to reflect those adjustments. Due to a lack of available data and the excessive complexity of the adjustments that would be required (especially to Sanofi's reporting tools), costs for 2019 have not been amended to reflect the changes arising from this new organization.

In accordance with IAS 8, Sanofi has treated the first-time application of the IFRIC agenda decisions on (i) the calculation of provisions for pensions and other post-employment benefits under IAS 19 and (ii) accounting for costs of configuring or customising a supplier's application software in a Software as a Service (SaaS) arrangement as retrospective changes in accounting policy. The impacts of those IFRIC agenda decisions are presented in Note A.2.1.

5.8 Disclosure of commercially sensitive information

The criteria for determining the externally reportable segments, as discussed in section 3.2 above, attempt to define which internally reported operating units can be combined, which must be reported separately and which are included in an unallocated reconciling item. The interaction between these criteria, in particular with the requirement that segments cannot be combined if they exhibit different long-term financial performance, leaves entities open to the risk of having to disclose information that management would be concerned about sharing with competitors, customers, suppliers or employees.

However, IFRS 8 does not permit the omission of segment information when management believes that its disclosure is commercially sensitive or potentially detrimental to the entity's competitive position. Indeed, IAS 1 requires an entity not only to present information in a manner that provides relevant, reliable, comparable and understandable information, but also to provide additional disclosures if compliance with an individual standard is insufficient to enable users to understand the entity's financial position and financial performance. [IAS 1.17]. The only justification for failing to meet these requirements is if disclosure would be so misleading that it would conflict with the objective of financial statements set out in the IASB's *Conceptual Framework*. [IAS 1.19].

Given that the objective of IFRS 8 (see section 2.1 above) is to disclose information to help users of financial statements evaluate the nature and financial effects of the entity's business activities and the economic environments in which it operates, [IFRS 8.1], the possibility discussed above would seem to be remote.

The IASB rejected similar concerns raised by respondents to the exposure draft preceding IFRS 8, noting that entities would be unlikely to suffer competitive harm from the required disclosures since most competitors have sources of detailed information about an entity other than its financial statements. [IFRS 8.BC44]. This concern was raised again by respondents to the post-implementation review. However, the IASB continues to reject such a limitation, because it would provide a means for broad-based non-compliance with the standard.⁸

⁸ [Report and Feedback Statement: Post-implementation Review: IFRS 8 Operating Segments](#), IASB, July 2013, p.19. Available on the IFRS Foundation's website.

6 Entity-wide disclosures for all entities

In addition to disclosing segment information derived from the formats and measurements presented to the chief operating decision maker, IFRS 8 requires certain entity-wide disclosures about products and services, geographical areas, and major customers. The information described below is required even if the entity has only a single reportable segment but need not be repeated if already provided as part of the disclosures on reportable segments set out above. [IFRS 8.31]. The amounts reported about products and services and about geographical areas in these entity-wide disclosures are measured using the same accounting policies and estimates as the entity's financial statements (i.e., IFRS amounts). [IFRS 8.32, IFRS 8.33]. As such, the amounts disclosed in this part of the segment disclosures might well be different from the information already provided in other segment information, which might not be measured in accordance with IFRS accounting standards (see section 4 above).

Exemption from the requirements set out in sections 6.1 and 6.2 below is offered if the necessary information is unavailable and the cost to develop it would be excessive. If disclosure is not made on these grounds, that fact must be stated. [IFRS 8.32, IFRS 8.33]. Some respondents to exposure preceding IFRS 8 expressed concern that the basis of this exemption was inconsistent with the test of impracticability in IAS 1, which makes no allowance for the cost of compliance. [IAS 1.7]. However, the IASB did not see any merit in divergence from FASB ASC Topic 280 in this respect and therefore retained the exemption from disclosure if the necessary information were unavailable and the cost of developing it excessive. [IFRS 8.BC46, IFRS 8.BC47].

This exemption is not available in respect of the disclosures about major customers set out in section 6.3 below.

6.1 Information about products and services

An entity must report revenues from external customers for each product and service or for each group of similar products and services, measuring revenues on the same basis as the entity's financial statements (unless the necessary information is not available and the cost to develop it would be excessive). [IFRS 8.32].

In Practical example 6-1, L'Oréal SA discloses external revenues by business segments as follows:

Practical example 6-1: L'Oréal (2023)

France

2023 UNIVERSAL REGISTRATION DOCUMENT [extract]**5 2023 Consolidated Financial Statements [extract]****5.6 Notes to the Consolidated Financial Statements [extract]****Note 3. Operating items - Segment information [extract]****3.1. Segment information [extract]****3.1.3. Sales by business segment [extract]**

WEIGHT OF NET SALES BY BUSINESS SEGMENT OVER THE THREE PERIODS

€ millions	2023	Growth (%)		2022	2021
		Published data	Excluding exchange effect		
Skincare	16,447.1	7.2%	12.5%	15,344.3	12,982.3
Make-up	8,123.7	5.0%	9.6%	7,738.8	6,626.8
Haircare	6,319.6	9.9%	15.0%	5,750.2	4,880.1
Hair colourants	3,425.6	1.9%	6.4%	3,361.6	3,016.1
Perfumes	5,171.3	13.7%	16.9%	4,546.2	3,511.8
Other	1,695.3	11.6%	20.0%	1,519.5	1,270.6
GROUP	41,182.5	7.6%	12.6%	38,260.6	32,287.6

6.2 Information about geographical areas

IFRS 8 requires disclosure of the following geographical information:

- (a) Revenues from external customers, analysed between amounts attributed to the entity's country of domicile and the total of those attributed to all foreign countries.

And

- (b) Non-current assets other than financial instruments, deferred tax assets, post-employment benefit assets and rights arising under insurance contracts, analysed between assets located in the entity's country of domicile and the total of those located in all foreign countries. [IFRS 8.33].

How we see it

In our view, if revenues from external customers or assets attributed to an individual foreign country are material, separate disclosure of that country's revenues or assets is required. The standard does not indicate what might be regarded as 'material' but given the criteria for a reportable segment and a major customer for reporting purposes (see section 3.2.2 above and section 6.3 below respectively) it would seem appropriate to consider the need for separate disclosure in respect of a foreign country accounting for more than 10% of total external revenues or more than 10% of total non-current assets.

Disclosure of the above information would be required even if the entity's segment reporting is already based on geography and it is determined that individual operating segments include a number of countries. Thus, an entity may need to provide additional information on revenue or non-current assets by country that is not disclosed in the segment information used by the chief operating decision maker.

The basis on which revenues from external customers are attributed to individual countries must be disclosed. Revenues may be attributed to countries based on the location of customers or based on where the products or services are produced. An entity can elect to provide, in addition to the information required above, subtotals of geographical information about groups of countries. [IFRS 8.33]. In Practical example 6-2 below, BAE Systems plc provides this more detailed level of disclosure and goes on to reconcile the measure of total segment assets to the amounts shown on the statement of financial position, even though such a reconciliation is not required for this entity-wide disclosure.

Practical example 6-2: BAE Systems plc (2023)

Notes to the Consolidated financial statements [extract]

20. Geographical analysis of assets

Analysis of non-current assets by geographical location

Asset location	Note	2023 £m	2022 £m
UK		4,877	4,563
Rest of Europe		2,065	1,965
US		10,167	10,719
Kingdom of Saudi Arabia		533	586
Australia		499	518
Rest of Asia and Pacific		8	5
		18,149	18,356
Other investments	13	84	99
Other receivables	14	418	416
Post-employment benefit surpluses	24	804	1,297
Other financial assets	15	227	322
Deferred tax assets	16	609	338
Non-current assets		20,291	20,828

6.3 Information about major customers

IFRS 8 also requires an entity to give disclosures indicating the extent of its reliance on its major customers. If revenues from a single external customer account for 10% or more of the entity's total revenues, the entity must disclose:

- (a) That fact
- (b) The total amount of revenues from each such customer
- And
- (c) The identity of the reportable segment or segments reporting the revenues [IFRS 8.34]

Disclosure of the name of each major customer is not required, nor the amounts of revenue reported in each segment for that customer. [IFRS 8.34]. However, the disclosure must be provided if it relates only to one segment. Sanofi discloses such information in the Practical example below:

Practical example 6-3: Sanofi (2023)	France
2023 FORM 20-F [extract]	
PART III [extract]	
Item 18. Financial Statements [extract]	
2023 Consolidated financial statements [extract]	
Notes to the Consolidated Financial Statements [extract]	
D.34. Disclosures about major customers and credit risk [extract]	
...	
Sales generated by Sanofi with its biggest customers, in particular certain wholesalers in the United States, represented 27% of net sales in 2023. The three largest customers respectively accounted for approximately 11%, 9% and 7% of Sanofi's net sales in 2023 (12%, 8% and 7% in 2022; 10%, 7% and 6% in 2021).	

6.3.1 Customers known to be under common control

For the purposes of the above disclosures, a group of entities known to a reporting entity to be under common control are to be considered a single customer. [IFRS 8.34].

However, judgement is required to assess whether a government (including government agencies and similar bodies whether local, national, or international) and entities known to the reporting entity to be under the control of that government are considered a single customer. The assessment of whether entities must be regarded as a single customer for these purposes must consider the extent of economic integration between those entities. [IFRS 8.34]. The standard does not include any further guidance on the factors relevant to determining the extent of economic integration.

BAE Systems plc identifies revenues from three principal governments.

Practical example 6-4: BAE Systems plc (2023)

United Kingdom

Annual Report 2023 [extract]

Financial statements [extract]

Consolidated financial statements [extract]

Notes to the Consolidated financial statements [extract]

2. Segmental analysis and revenue recognition [extract]

Revenue by major customer

Revenue from the Group's three principal customers, which individually represent over 10% of total revenue, is as follows:

	2023 £m	2022 £m
US Department of Defense	7,518	7,439
UK Ministry of Defence	5,766	4,721
Kingdom of Saudi Arabia Ministry of Defence and Aviation	2,607	2,425

Revenue from the UK Ministry of Defence and the US Department of Defense was generated by the five reporting segments, excluding HQ.
Revenue from the Kingdom of Saudi Arabia Ministry of Defence and Aviation was generated by the Air segment.

This appendix is an integral part of the IFRS

operating segment

An operating segment is a component of an entity:

- (a) that engages in business activities from which it may earn revenues and incur expenses (including revenues and expenses relating to transactions with other components of the same entity),
- (b) whose operating results are regularly reviewed by the entity's chief operating decision maker to make decisions about resources to be allocated to the segment and assess its performance, and
- (c) for which discrete financial information is available.

Overview

This chapter deals with IAS 33 *Earnings per Share*. This accounting standard requires certain entities to disclose earnings per share figures in their financial statements. It also sets out how those figures are to be computed.

IAS 33 requires disclosure of both basic and diluted earnings per share. Where relevant, earnings per share is required separately for continuing operations, for discontinued operations and in total.

Basic and diluted earnings per share are intended to be measures of the interest each of the parent's ordinary shares has in the performance of the entity. Diluted earnings per share also gives effect to dilutive potential ordinary shares outstanding during the reporting period, for example convertible loans, convertible preference shares, share options and warrants, including those arising from share-based payment arrangements.

Earnings used in determining basic earnings per share are an entity's profit or loss attributable to ordinary equity holders. This can differ from an entity's profit or loss, for example, it will not include profit or loss attributable to non-controlling interests and certain adjustments will be necessary in respect of dividends and other payments in respect of preference shares classified as equity. Further adjustments may be required in the calculation of diluted earnings per share.

The standard also sets out requirements for the number of shares to be used in the calculation which will often be different for basic and for diluted earnings per share.

Entities may disclose earnings per share based on other components of comprehensive income, although the number of shares used must be the same as specified by IAS 33 and additional disclosures are required to explain the earnings figure used. Once IFRS 18 *Presentation and Disclosure in Financial Statements* is applied certain restrictions on the presentation of additional per share figures are introduced. In particular: any such amounts must be presented only in the notes; and, the numerator used must be either a line item in the primary statement or a management-defined performance measure.

What you need to know

- IAS 33 applies only to entities with publicly traded ordinary shares (or those in the process of becoming so) and to other entities choosing to present earnings per share.
- The standard sets out requirements for the number of shares to be used in each computation.
- Certain adjustments are required to earnings for the purposes of diluted earnings per share.
- IAS 33 requires disclosure of basic and diluted earnings per share.
- Certain changes come into force once IFRS 18 is applied. This is for periods beginning on or after 1 January 2027 with early adoption permitted.

1 Introduction

Earnings per share (EPS) is one of the most widely quoted statistics in financial analysis. It came into great prominence in the US during the late 1950s and early 1960s due to the widespread use of the price earnings ratio (PE) as a yardstick for investment decisions. As a result, standard setters in some jurisdictions (notably the US and the UK) have had rules on EPS for many years. However, it was not until 1997 that an international accounting standard on the subject was published.

IAS 33 was introduced for accounting periods beginning on or after 1 January 1998. In December 2003, as part of the improvements project, the IASB updated IAS 33 to provide more detailed guidance in some complex areas. There have been no substantive changes since. The requirements of IAS 33 are discussed in sections 2 to 7 below. The standard includes illustrative examples of particular issues and one comprehensive worked example. The illustrative examples are included where relevant in the text of the chapter, whilst the comprehensive worked example is included as an appendix.

1.1 Definitions

IAS 33 defines a number of its terms and these are dealt with in the text of this chapter where appropriate. One term which is particularly pervasive is 'fair value'. This term is defined and explained in IFRS 13 *Fair Value Measurement* and is discussed in Chapter 15. [IAS 33.8]. However, in the context of share-based payments the term fair value has the meaning used in IFRS 2 *Share-based Payment*. The relevance of share-based payment to EPS is discussed in section 6.4.5 below; IFRS 2 is discussed in Chapter 30. [IAS 33.47A].

2 Objective and scope of IAS 33

2.1 Objective

IAS 33 sets out its objective as follows: [IAS 33.1]

Extract from IAS 33

Objective

- 1 The objective of this Standard is to prescribe principles for the determination and presentation of earnings per share, so as to improve performance comparisons between different entities in the same reporting period and between different reporting periods for the same entity. Even though earnings per share data have limitations because of the different accounting policies that may be used for determining 'earnings', a consistently determined denominator enhances financial reporting. The focus of this Standard is on the denominator of the earnings per share calculation.

The standard requires the computation of both basic and diluted EPS, explaining the objective of each as follows:

- The objective of basic earnings per share information is to provide a measure of the interests of each ordinary share of a parent entity in the performance of the entity over the reporting period. [IAS 33.11].
And
- The objective of diluted earnings per share is consistent with that of basic earnings per share - to provide a measure of the interest of each ordinary share in the performance of an entity - while giving effect to all dilutive potential ordinary shares outstanding during the period. [IAS 33.32].

The underlying logic here is that EPS, including diluted EPS, is to be an historical performance measure. This impacts particularly on the reporting of diluted EPS, in steering it away from an alternative purpose: to warn of potential future dilution. Indeed, the tension between these differing objectives is evident in the standard. As discussed more fully in section 6.4.6 below, IAS 33 sets out a very restrictive regime for including certain potentially dilutive shares in the diluted EPS calculation. Yet diluted EPS is only to take account of those potential shares that would dilute earnings from continuing operations (see section 6.3.1 below) which seems to have more of a forward looking 'warning signal' flavour. Discontinued operations are discussed in Chapter 5.

2.2 Scope

IAS 33 applies to:

- (a) The separate or individual financial statements of an entity:
 - (i) Whose ordinary shares or potential ordinary shares are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets)
Or
 - (ii) That files, or is in the process of filing, its financial statements with a securities commission or other regulatory information for the purpose of issuing ordinary shares in a public market
And
- (b) The consolidated financial statements of a group with a parent:
 - (i) Whose ordinary shares or potential ordinary shares are traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets)
Or
 - (ii) That files, or is in the process of filing, its financial statements with a securities commission or other regulatory information for the purpose of issuing ordinary shares in a public market [IAS 33.2]

IAS 33 also applies to any other entity that discloses earnings per share. [IAS 33.3]. Where both the parent's consolidated and separate financial statements are presented, the standard only requires consolidated earnings per share to be given. If the parent chooses to present EPS data based on its separate financial statements, the standard requires that the disclosures be restricted to the face of the parent-only statement of comprehensive income (or separate income statement) and not be included in the consolidated financial statements. [IAS 33.4].

In January 2014, the IASB published IFRS 14 *Regulatory Deferral Accounts*. This standard allows a first-time adopter within its scope to continue to account for regulatory deferral account balances in its first IFRS financial statements in accordance with its previous GAAP when it adopts IFRS. The standard introduces limited changes to some previous GAAP accounting practices for regulatory deferral account balances, which are primarily related to the presentation of these accounts. For entities applying IFRS 14 certain additional EPS disclosures are required. This is discussed in Chapter 6.

3 The basic EPS

IAS 33 requires the computation of basic EPS for the profit or loss (and, if presented, the profit or loss from continuing operations) attributable to ordinary equity holders. [IAS 33.9]. It defines, or rather describes, basic earnings per share in the following manner: [IAS 33.10]

Extract from IAS 33

- 10 Basic earnings per share shall be calculated by dividing profit or loss attributable to ordinary equity holders of the parent entity (the numerator) by the weighted average number of ordinary shares outstanding (the denominator) during the period.

3.1 Earnings

The starting point for determining the earnings figure to be used in the basic EPS calculation (both for total earnings and, if appropriate, earnings from continuing operations) is the net profit or loss for the period attributable to ordinary equity holders of the parent entity. [IAS 33.12]. This will, in accordance with IAS 1 *Presentation of Financial Statements* (and, once IFRS 18 is applied, at the latest for periods beginning on or after 1 January 2027, in accordance with that standard) include all items of income and expense, including, dividends on preference shares classified as liabilities and tax and is stated after the deduction of non-controlling interests. [IAS 33.13, IAS 33.A1]. This is then adjusted for the after-tax amounts of preference dividends, differences arising on the settlement of preference shares, and other similar effects of preference shares classified as equity. [IAS 33.12]. These adjustments are discussed in section 5.2 below.

3.2 Number of shares

An ordinary share is defined as “an equity instrument that is subordinate to all other classes of equity instruments”. [IAS 33.5]. Equity instrument has the same meaning as in IAS 32 *Financial Instruments: Presentation* that is “any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities”. [IAS 33.8, IAS 32.11]. IAS 33 goes on to observe that ordinary shares participate in profit for the period only after other types of share such as preference shares have participated. [IAS 33.6]. The standard also clarifies that there may be more than one class of ordinary share and requires the computation and presentation of EPS for each class that has a different right to share in profit for the period. [IAS 33.6, IAS 33.66]. In practice, it is usually straightforward to determine which instruments are ordinary shares for EPS purposes. The treatment of different classes of shares is discussed in section 5.4 below.

The basic rule in IAS 33 is that all outstanding ordinary shares are brought into the basic EPS computation - time-weighted for changes in the period (changes in ordinary shares are discussed in section 4 below). [IAS 33.19]. There are three exceptions to this:

- Ordinary shares that are issued as partly paid are included in the weighted average as a fraction of a share based on their dividend participation relative to fully paid shares (so if although only partly paid, they ranked equally for dividends they would be included in full). [IAS 33.A15].
- Treasury shares, which are presented in the financial statements as a deduction from equity, are not considered outstanding for EPS purposes for the period they are held in treasury. Although not stated explicitly in the standard itself, this requirement is clearly logical (as although the shares are still legally in issue, they are accounted for as if redeemed) and is illustrated in one of the examples appended to the standard (see Illustration 4-1 in section 4.1 below). [IAS 33.IE2].

And

- Shares that are contingently returnable (that is, subject to recall) are not treated as outstanding until they cease to be subject to recall, and hence are excluded from basic EPS until that time. [IAS 33.24].

The standard contains some specific guidance on when newly issued ordinary shares are to be considered outstanding. In general, shares are to be included from the date consideration is receivable (considered by the standard generally to be the date of their issue), for example: [IAS 33.21]

- Shares issued in exchange for cash are included when cash is receivable
- Shares issued on the voluntary reinvestment of dividends on ordinary or preference shares are included when the dividends are reinvested
- Shares issued as a result of the conversion of a debt instrument to ordinary shares are included as of the date interest ceases accruing
- Shares issued in place of interest or principal on other financial instruments are included as of the date interest ceases accruing

- Shares issued in exchange for the settlement of a liability of the entity are included as of the settlement date
- Shares issued as consideration for the acquisition of an asset other than cash are included as of the date on which the acquisition is recognised
- Shares issued in exchange for the rendering of services to the entity are included as the services are rendered
- Shares that will be issued upon the conversion of a mandatorily convertible instrument are included in the calculation of basic earnings per share from the date the contract is entered into [IAS 33.23]

Most of these provisions are straightforward, however some are worthy of note.

Shares issued in exchange for services will be accounted for in accordance with IFRS 2, with a charge to income matched by a credit to equity. IAS 33 has some guidance on the inclusion of such potential shares in diluted EPS (see section 6.4.5 below); however, there is no further elaboration of the meaning of 'included as the services are rendered'. What seems to be implicit in the phrase is that the shares concerned vest unconditionally as services are rendered. On that basis, clearly it would be appropriate to include shares in basic EPS as entitlement to them vests, notwithstanding that the actual issue of shares may be at a different time. However, a very common form of share-based remuneration involves entitlement to shares vesting at the end of an extended period conditional on future events (typically continued employment and sometimes specific future performance). Such arrangements are clearly conditionally issuable shares and therefore, would be excluded from basic EPS until vesting. Indeed, when discussing employee share schemes in the context of diluted EPS the standard is explicit, as follows. [IAS 33.48].

Extract from IAS 33

- 48 Employee share options with fixed or determinable terms and non-vested ordinary shares are treated as options in the calculation of diluted earnings per share, even though they may be contingent on vesting. They are treated as outstanding on the grant date. Performance-based employee share options are treated as contingently issuable shares because their issue is contingent upon satisfying specified conditions in addition to the passage of time.

Contingently issuable shares are discussed in section 6.4.6 below.

In respect of the final bullet point, the standard does not define what a mandatorily convertible instrument is. One view would be that the requirement to account for the shares in EPS from inception must mean it refers to instruments where the proceeds also are received at inception. On that basis, it would exclude a forward contract for the issue of shares which (as required by the first bullet above) would increase the denominator of basic EPS only from the time the cash is receivable. Similarly, in the reverse situation of a forward contract to redeem ordinary shares the shares would only be removed from basic EPS when the consideration becomes payable. Another view would be that all binding agreements to issue or redeem ordinary shares should be reflected in basic EPS when the entity becomes party to the arrangement. A further possible complexity is the question of whether or not a symmetrical treatment for the issue and redemption of shares should be applied for EPS purposes. Whilst that certainly seems logical, it is not beyond question in all circumstances particularly given the asymmetrical accounting treatment for certain derivatives over own shares required by IAS 32 (discussed in Chapter 43).

More generally, the standard goes on to say the timing of inclusion is determined by the attaching terms and conditions, and also that due consideration must be given to the substance of any contract associated with the issue. [IAS 33.21]. Ordinary shares that are issuable on the satisfaction of certain conditions (contingently issuable shares) are to be included in the calculation of basic EPS only from the date when all necessary conditions have been satisfied; in effect when they are no longer contingent. [IAS 33.24]. This provision is interpreted strictly, as illustrated in Example 7 appended to the standard (see Illustration 6-7 in section 6.4.6.A below). In that example, earnings in a year, by meeting certain thresholds, would trigger the issue of shares. Because it is not certain that the condition is met until the last day of the year (when earnings become known with certainty) the new shares are excluded from basic EPS until the following year. Where shares will be issued at some future date (that is, solely after the passage of time) they are not considered contingently issuable by IAS 33, as the passage of time is a certainty. [IAS 33.24]. In principle, this would seem to mean that they should be included in basic EPS from the agreement date. However, careful consideration of the individual facts and circumstances would be necessary.

The calculation of the basic EPS is often simple but a number of complications can arise; these may be considered under the following two headings:

- (a) Changes in ordinary shares outstanding
- (b) Matters affecting the numerator

These are discussed in the next two sections.

4 Changes in outstanding ordinary shares

Changes in ordinary shares outstanding can occur under a variety of circumstances, the most common of which are dealt with below. Whenever such a change occurs during the accounting period, an adjustment is required to the number of shares in the EPS calculation for that period; furthermore, in certain situations the EPS for previous periods will also have to be recalculated.

4.1 Weighted average number of shares

Implicit in the methodology of IAS 33 is a perceived correlation between the capital of an entity (or rather the income-generating assets it reflects) and earnings. Accordingly, to compute EPS as a performance measure requires adjusting the number of shares in the denominator to reflect any variations in the period to the capital available to generate that period's earnings. The standard observes that using the weighted average number of ordinary shares outstanding during the period reflects the possibility that the amount of shareholders' capital varied during the period as a result of a larger or smaller number of shares being outstanding at any time. The weighted average number of ordinary shares outstanding during the period is the number of ordinary shares outstanding at the beginning of the period, adjusted by the number of ordinary shares bought back or issued during the period multiplied by a time-weighting factor. The time-weighting factor is the number of days that the shares are outstanding as a proportion of the total number of days in the period; IAS 33 notes that a reasonable approximation of the weighted average is adequate in many circumstances. [IAS 33.20]. Computation of a weighted average number of shares is shown in the following Illustration: [IAS 33.IE2]

Illustration 4-1: Calculation of weighted average number of shares

		Shares issued	Treasury shares*	Shares outstanding
1 January 20X2	Balance at beginning of year	2,000	300	1,700
31 May 20X2	Issue of new shares for cash	800	-	2,500
1 December 20X2	Purchase of treasury shares for cash	-	250	2,250
31 December 20X2	Balance at year end	<u>2,800</u>	<u>550</u>	<u>2,250</u>

Calculation of weighted average:

$$(1,700 \times 5/12) + (2,500 \times 6/12) + (2,250 \times 1/12) = 2,146 \text{ shares}$$

Or

$$(1,700 \times 12/12) + (800 \times 7/12) - (250 \times 1/12) = 2,146 \text{ shares}$$

* Treasury shares are equity instruments reacquired and held by the issuing entity itself or by its subsidiaries.

The use of a weighted average number of shares is necessary because the increase in the share capital would have affected earnings only for that portion of the year during which the issue proceeds were available to management for use in the business.

4.2 Purchase and redemption of own shares

An entity may, if it is authorised to do so by its constitution and it complies with any relevant legislation, purchase or otherwise redeem its own shares. Assuming this is done at fair value, then the earnings will be apportioned over the weighted average share capital in issue for the year. This was shown in Illustration 4-1 in section 4.1 above in relation to the purchase of treasury shares. If, on the other hand, the repurchase is at significantly more than market value, then IAS 33 requires adjustments to be made to EPS for periods before buy-back. This is discussed in section 4.3.5 below.

4.3 Changes in ordinary shares without corresponding changes in resources

IAS 33 requires the number of shares used in the calculation to be adjusted (for all periods presented) for any transaction (other than the conversion of potential ordinary shares) that changes the number of shares outstanding without a corresponding change in resources. [IAS 33.26]. This is also to apply when some, but not all, such changes have happened after the year-end but before the approval of the financial statements.

The standard gives the following as examples of changes in the number of ordinary shares without a corresponding change in resources:

- (a) A capitalisation or bonus issue (sometimes referred to as a stock dividend)
- (b) A bonus element in any other issue, for example a bonus element in a rights issue to existing shareholders
- (c) A share split
- (d) A reverse share split (share consolidation) [IAS 33.27]

Another example not mentioned by the standard would be any bonus element in a buy-back, such as a put warrant involving the repurchase of shares at significantly more than their fair value. The adjustments required to EPS for each of these is discussed below.

As noted above, IAS 33 requires retrospective adjustment for all such events that happen in the reporting period. However, it only requires restatement for those in (a), (c) and (d) if they happen after the year-end but before the financial statements are authorised for issue. [IAS 33.64].

4.3.1 Capitalisation, bonus issue, share split and share consolidation

4.3.1.A Capitalisation, bonus issues and share splits

A capitalisation or bonus issue or share split has the effect of increasing the number of shares in issue without any inflow of resources, as further ordinary shares are issued to existing shareholders for no consideration. Consequently, no additional earnings will be expected to accrue as a result of the issue. The additional shares are treated as having been in issue for the whole period and also included in the EPS calculation of all earlier periods presented so as to give a comparable result. For example, on a two-for-one bonus issue, the number of ordinary shares outstanding before the issue is multiplied by three to obtain the new total number of ordinary shares, or by two to obtain the number of additional ordinary shares. [IAS 33.28].

The EPS calculation involving a bonus issue is shown in the following Illustration. [IAS 33.1E3].

Illustration 4-2: A bonus issue

Profit attributable to ordinary equity holders of the parent entity 20X1		CU180
Profit attributable to ordinary equity holders of the parent entity 20X2		CU600
Ordinary shares outstanding until 30 September 20X2		200
Bonus issue 1 October 20X2	2 ordinary shares for each ordinary share outstanding at 30 September 20X2	
	$200 \times 2 =$	400
Basic earnings per share 20X2	$\frac{\text{CU600}}{(200 + 400)} =$	CU1.00
Basic earnings per share 20X1	$\frac{\text{CU180}}{(200 + 400)} =$	CU0.30

Because the bonus issue was without consideration, it is treated as if it had occurred before the beginning of 20X1, the earliest period presented.

4.3.1.B Stock dividends

Stock or scrip dividends refer to the case where an entity offers its shareholders the choice of receiving further fully paid up shares in the company as an alternative to receiving a cash dividend. It could be argued that the dividend foregone represents payment for the shares, usually at fair value, and hence no restatement is appropriate. Alternatively, the shares could be viewed as being, in substance, bonus issues which require the EPS for the earlier period to be adjusted. IAS 33 seems to suggest the latter view, as it notes that capitalisation or bonus issues are sometimes referred to as stock dividends. However, entities often refer to these arrangements as dividend reinvestment plans which suggests the acquisition of new shares for valuable consideration.

This distinction is a factual one. If an entity (say, through proposal and subsequent approval by shareholders) has a legal obligation to pay a dividend in cash or, at the shareholder's option, shares, then the cash payment avoided, if the stock dividend is taken up, is consideration for the shares. This may be equivalent to an issue at fair value or it may contain some bonus element requiring retrospective adjustment of EPS. In practice, the fair value of shares received as a stock dividend alternative may exceed the cash alternative; this is often referred to as an enhanced stock dividend. In these cases, IAS 33 requires a bonus element to be identified, and prior EPS figures restated accordingly. This is essentially the same as adjustments for the bonus element in a rights issue, discussed in section 4.3.3 below.

Furthermore, in this scenario, during the period between the obligation coming into existence and its settlement (in cash or shares) it could be argued to represent a written call option and hence potentially affect diluted EPS (see section 6.4.2.B below).

How we see it

Given that the standard is silent on this aspect of some stock dividends we do not believe that such an approach was intended. In any event, we generally do not believe the effect on diluted EPS would be significant.

Conversely, if the entity issues new shares instead of a dividend it would be a bonus issue requiring full retrospective adjustment to EPS.

4.3.1.C Share consolidations

Occasionally, entities will consolidate their equity share capital into a smaller number of shares. Such a consolidation generally reduces the number of shares outstanding without a corresponding outflow of resources, and this would require an adjustment to the denominator for periods before the consolidation. [IAS 33.29].

4.3.2 Share consolidation with a special dividend

Share consolidations as discussed in section 4.3.1.C above normally do not involve any outflow of funds from the entity. However, entities may return surplus cash to their shareholders by paying special dividends accompanied by a share consolidation, the purpose of which is to maintain the value of each share following the payment of the dividend. This issue is specifically addressed by IAS 33. The normal rule of restating the outstanding number of shares for all periods for a share consolidation is not applied when the overall effect is a share repurchase at fair value because in such cases, the reduction of shares is the result of a corresponding reduction in resources. In such cases, the weighted average number of shares is adjusted for the consolidation from the date the special dividend is recognised. [IAS 33.29].

4.3.3 Rights issue

A rights issue is a popular method through which entities are able to access the capital markets for further capital. Under the terms of such an issue, existing shareholders are given the opportunity to acquire further shares in the entity on a *pro rata* basis to their existing shareholdings.

The 'rights' shares will usually be offered either at the current market price or at a price below that. In the former case, the treatment of the issue for EPS purposes is as discussed in section 4.1 above. However, where the rights price is at a discount to market it is not quite as straightforward, since the issue is equivalent to a bonus issue (see section 4.3.1 above) combined with an issue at full market price. In such cases, IAS 33 requires an adjustment to the number of shares outstanding before the rights issue to reflect the bonus element inherent in it. [IAS 33.26, IAS 33.27].

The bonus element of the rights issue available to all existing shareholders is given by the following adjustment factor, sometimes referred to as the bonus fraction: [IAS 33.A2]

Fair value per share immediately before the exercise of rights

Theoretical ex-rights fair value per share

The fair value per share immediately before the exercise of rights is the actual price at which the shares are quoted inclusive of the right to take up the future shares under the rights issue. Where the rights are to be traded separately from the shares the fair value used is the closing price on the last day on which the shares are traded inclusive of the right. [IAS 33.A2].

The 'ex-rights fair value' is the theoretical price at which the shares would be expected to be quoted, other stock market factors apart, after the rights issue shares have been issued. It is calculated by adding the aggregate fair value of the shares immediately before the exercise of the rights to the proceeds from the exercise, and dividing by the number of shares outstanding after the exercise. [IAS 33.A2]. The EPS calculation involving a rights issue is shown in the following Illustration. [IAS 33.IE4].

Illustration 4-3: Rights issue at less than full market price

	20X0	20X1	20X2
Profit attributable to ordinary equity holders of the parent entity	CU1,100	CU1,500	CU1,800
Shares outstanding before rights issue	500 shares		
Rights issue		One new share for each five outstanding shares (100 new shares total)	
		Exercise price: CU5.00	
		Date of rights issue: 1 January 20X1	
		Last date to exercise rights: 1 March 20X1	
Market price of one ordinary share immediately before exercise on 1 March 20X1	CU11.00		
Reporting date	31 December		
Calculation of theoretical ex-rights value per share			
Fair value of all outstanding shares before the exercise of rights	+	Total amount received from exercise of rights	=
Number of shares outstanding before exercise	+	Number of shares issued in the exercise	
$\frac{(\text{CU}11.00 \times 500 \text{ shares}) + (\text{CU}5.00 \times 100 \text{ shares})}{500 \text{ shares} + 100 \text{ shares}}$			
Theoretical ex-rights value per share = CU10.00			
Calculation of adjustment factor			
Fair value per share before exercise of rights	=	$\frac{\text{CU}11.00}{\text{CU}10.00}$	= 1.10
Theoretical ex-rights value per share			
Calculation of basic earnings per share			
	20X0	20X1	20X2
<i>20X0 basic EPS as originally reported:</i>			
CU1,100 ÷ 500 shares =	CU2.20		
<i>20X0 basic EPS restated for rights issue:</i>			
CU1,100 ÷ (500 shares × 1.1) =	CU2.00		
<i>20X1 basic EPS including effects of rights issue:</i>			
CU1,500			
(500 × 1.1 × 2/12) + (600 × 10/12)		CU2.54	
<i>20X2 basic EPS:</i>			
CU1,800 ÷ 600 shares =			CU3.00

Rather than multiplying the denominator by 11/10ths, the previous year's EPS (and any EPS disclosures in a historical summary) could alternatively be arrived at by multiplying the original EPS by 10/11ths.

During the period that the rights are outstanding they represent, strictly speaking, a written call option over the entity's shares which could have implications for diluted EPS (see section 6.4.2 below).

It is possible that shares could be issued as a result of open offers, placings and other offerings of equity shares not made to existing shareholders, at a discount to the market price. In such cases, it would be necessary to consider whether the issue contained a bonus element, or rather simply reflected differing views on the fair value of the shares. The latter is a more realistic alternative. Accordingly, the shares would be dealt with on a weighted average basis without calculating any bonus element when computing the EPS.

4.3.4 B share schemes

One method by which some entities have returned capital to shareholders is the so-called 'B share scheme'. These schemes involve issuing 'B shares' (usually undated preference shares with low or zero coupons) to existing shareholders, either as a bonus issue or via a share split, following which the ordinary shares are consolidated. The 'B shares' are then repurchased or redeemed for cash and cancelled. The overall effect is intended to be the same as a repurchase of ordinary shares at fair value, and accordingly no retrospective adjustment to EPS is necessary, assuming that the intention is achieved. [IAS 33.29].

4.3.5 Put warrants priced above market value

As noted in section 4.3 above, an example of a change in the number of shares outstanding without a corresponding change in resources not mentioned by the standard would be any bonus element in a buy-back, such as a put warrant involving the repurchase of shares at significantly more than their fair value. The accounting requirements for such instruments are discussed in Chapter 43.

IAS 33 does not give an illustrative calculation for a put warrant at significantly more than fair value, but it does for the more familiar rights issue (which are discussed in section 4.3.3 above). In a rights issue, new shares are issued at a discount to market value, whereas with put warrants shares are bought back at a premium to market value. In both cases, the remaining shares are viewed as being devalued for the purposes of comparing EPS over time. Applying the requirement to adjust EPS when there is a change in the number of shares without a corresponding change in resources would require that put warrants are treated as a reverse rights issue. This would mean calculating a similar 'adjustment factor', and applying it to the number of shares outstanding before the transaction. The difference in the calculation would be that the number of shares issued and the consideration received for them would be replaced by negative amounts representing the number of shares put back to the entity and the amount paid for them.

An illustration of what this might entail is as follows:

Illustration 4-4: Put warrants priced above market value

The following example takes the same scenario as Illustration 4-3 above (a rights issue), altered to illustrate a put warrant scheme. In that example the shares are issued at a discount of CU6.00 to the CU11.00 market price on a one for five basis two months into the year. Reversing this would give a put warrant to sell shares back to the company at a CU6 premium, again on a one for five basis. All other details have been left the same for comparability, although in reality the rising earnings following a rights issue may well become falling earnings after a buy-back. The calculation would then become:

Calculation of theoretical ex-warrant value per share

Fair value of all outstanding shares before the exercise of warrants	-	Total amount paid on exercise of warrants	=
Shares outstanding before exercise	-	Shares cancelled in the exercise	
<hr/>			
(CU11 × 500) - (CU17 × 100)			
500 - 100	=	CU9.50	

Calculation of adjustment factor

Fair value per share before exercise of warrants	=	CU11	=	1.16
Theoretical ex-warrant value per share		CU9.5		

Calculation of basic earnings per share

	20X0	20X1	20X2
<i>20X0 EPS as originally reported:</i>			
CU1,100 ÷ 500 shares =	CU2.20		
<i>20X0 EPS restated for warrants:</i>			
CU1,100 ÷ (500 shares × 1.16) =	CU1.90		
<i>20X1 EPS including effects of warrants:</i>			
CU1,500			
(500 × 1.16 × 2/12) + (400 × 10/12)		CU3.49	
<i>20X2 basic EPS:</i>			
CU1,800 ÷ 400 shares =			CU4.50

Whilst the above seems a sensible interpretation of the requirements, as the procedure is not specified in the standard there may be scope for other interpretations.

4.4 Options exercised during the year

Shares issued as a result of options being exercised are dealt with on a weighted average basis in the basic EPS. [IAS 33.19]. Furthermore, options that have been exercised during the year will also affect diluted EPS calculations. If the options in question would have had a diluting effect on the basic EPS had they been exercised at the beginning of the year, then they will be considered in the diluted EPS calculation as explained in section 6.4.2 below, but on a weighted average basis for the period up to the date of exercise. The exercise of options is a 'conversion of potential ordinary shares'. The standard excludes such conversions from the general requirement (see section 4.3 above) to adjust prior periods' EPS when a change in the number of shares happens without a corresponding change in resources. [IAS 33.26].

4.5 Post balance sheet changes in capital

The EPS figure does not reflect any changes in the capital structure occurring after the reporting period, but before the financial statements are authorised for issue, which was effected for fair value. This is because any proceeds received from the issue were not available for use during the period. However, EPS for all periods presented is required to be adjusted for any bonus element in certain post year-end changes in the number of shares, as discussed in section 4.3 above. When this is done that fact must be disclosed. [IAS 33.64].

4.6 Issue to acquire another business

4.6.1 Acquisitions

As a result of a share issue to acquire another business, funds or other assets will flow into the reporting entity and extra profits will be expected to be generated. When calculating EPS, it is assumed that the shares were issued on the acquisition date (even if the actual date of issue is later), since this will be the date from which the results of the newly acquired business are recognised. [IAS 33.21(f), IAS 33.22].

4.6.2 Reverse acquisitions

Reverse acquisition is the term used to describe a business combination whereby the legal parent entity after the combination is in substance the acquired and not the acquiring entity (discussed in Chapter 10). IAS 33 is silent on the subject; however, an appendix to IFRS 3 *Business Combinations* contains a discussion of the implications for EPS of such transactions. Following a reverse acquisition, the equity structure appearing in the consolidated financial statements will reflect the equity of the legal parent, including the equity instruments issued by it to effect the business combination. [IFRS 3.B25].

For the purposes of calculating the weighted average number of ordinary shares outstanding during the period in which the reverse acquisition occurs:

- (a) The number of ordinary shares outstanding from the beginning of that period to the acquisition date shall be computed on the basis of the weighted average number of ordinary shares of the legal acquiree (accounting acquirer) outstanding during the period multiplied by the exchange ratio established in the merger agreement.
- (b) The number of ordinary shares outstanding from the acquisition date to the end of that period shall be the actual number of ordinary shares of the legal acquirer (the accounting acquiree) outstanding during that period. [IFRS 3.B26].

The basic EPS disclosed for each comparative period before the acquisition date is calculated by dividing the profit or loss of the legal subsidiary attributable to ordinary shareholders in each of those periods by the legal acquiree's historical weighted average number of ordinary shares outstanding multiplied by the exchange ratio established in the acquisition agreement. [IFRS 3.B27].

IFRS 3 presents an illustrative example of a reverse acquisition, including the EPS calculation, see Chapter 10.

4.6.3 Establishment of a new parent undertaking

Where a new parent entity is established by means of a share for share exchange and its consolidated financial statements have been presented as a continuation of the existing group (discussed in Chapter 11), the number of shares taken as being in issue for both the current and preceding periods would be the number of shares issued by the new parent entity. However, EPS calculations for previous periods in the new parent entity's financial statements would have to reflect any changes in the number of outstanding ordinary shares of the former parent entity that may have occurred in those periods, as shown in the Illustration below:

Illustration 4-5: Calculation of EPS where a new holding company is established

Entity A has been established as the newly formed parent entity of Entity B in a one for one share exchange on 30 June 20X2. At that date, Entity B has 1,000,000 CU1 ordinary shares in issue. Previously, on 30 June 20X1 Entity B had issued 200,000 CU1 ordinary shares for cash at full market price. Both entities have a 31 December year-end and the trading results of Entity B are as follows:

	20X2	20X1
	CU	CU
Profit for equity shareholders after taxation	<u>500,000</u>	<u>300,000</u>

The earnings per share calculation of Entity A is shown below:

	20X2	20X1
Number of equity shares	800,000	400,000
	$\times \frac{6}{12} =$	
	1,000,000	500,000
	<u>1,000,000</u>	<u>900,000</u>
EPS	$\frac{500,000}{1,000,000} = \text{CU0.50}$	$\frac{300,000}{900,000} = \text{CU0.33}$

If, in the above example, the share exchange did not take place on a one for one basis, but Entity A issued three shares for every one share held in Entity B, then the number of shares issued by Entity B in 20X1 would have to be apportioned accordingly, before carrying out the weighted average calculation. The earnings per share calculation would, therefore, have been as follows:

	20X2	20X1
Number of equity shares	2,400,000	1,200,000
	$\times \frac{6}{12} =$	
	3,000,000	1,500,000
	<u>3,000,000</u>	<u>2,700,000</u>
EPS	$\frac{500,000}{3,000,000} = \text{CU0.17}$	$\frac{300,000}{2,700,000} = \text{CU0.11}$

5 Matters affecting the numerator

5.1 Earnings

The earnings figure on which the basic EPS calculation is based is the consolidated net profit or loss for the year after: tax, non-controlling interests and after adjusting for returns to preference shareholders that are not already included in net profit (as will be the case for preference shares classified as liabilities under IAS 32).

5.2 Preference dividends

The adjustments to net profit attributable to ordinary shareholders in relation to returns to preference shareholders include:

- The after-tax amount of any preference dividends on non-cumulative preference shares declared in respect of the period. [IAS 33.14(a)].
- The after-tax amount of the preference dividends for cumulative preference shares required for the period, whether or not the dividends have been declared. This does not include the amount of any preference dividends for cumulative preference shares paid or declared during the current period in respect of previous periods. [IAS 33.14(b)].
- Any original issue discount or premium on increasing rate preference shares which is amortised to retained earnings using the effective interest method. Increasing rate preference shares are those that provide: a low initial dividend to compensate an entity for selling them at a discount; or an above-market dividend in later periods to compensate investors for purchasing them at a premium (see Illustration 5-1 below). [IAS 33.15].
- The excess of the fair value of the consideration paid to shareholders over the carrying amount of the preference shares when the shares are repurchased under an entity's tender offer to the holders. As this represents a return to the holders of the shares (and a charge to retained earnings for the entity) it is deducted in calculating profit or loss attributable to ordinary equity holders of the parent entity. [IAS 33.16].
- The excess of the fair value of the ordinary shares or other consideration paid over the fair value of the ordinary shares issuable under the original conversion terms when early conversion of convertible preference shares is induced through favourable changes to the original conversion terms or the payment of additional consideration. This is a return to the preference shareholders, and accordingly is deducted in calculating profit or loss attributable to ordinary equity holders of the parent entity. [IAS 33.17].
- Any excess of the carrying amount of preference shares over the fair value of the consideration paid to settle them. This reflects a gain to the entity and is added in calculating profit or loss attributable to ordinary equity holders. [IAS 33.18].

The computation of EPS involving increasing rate preference shares is shown in the following Illustration. [IAS 33.IE1].

Illustration 5-1: Increasing rate preference shares

Entity D issued non-convertible, non-redeemable class A cumulative preference shares of CU100 par value on 1 January 20X2. The class A preference shares are entitled to a cumulative annual dividend of CU7 per share starting in 20X5. At the time of issue, the market rate dividend yield on the class A preference shares was 7% a year. Thus, Entity D could have expected to receive proceeds of approximately CU100 per class A preference share if the dividend rate of CU7 per share had been in effect at the date of issue.

In consideration of the dividend payment terms, however, the class A preference shares were issued at CU81.63 per share, i.e., at a discount of CU18.37 per share. The issue price can be calculated by taking the present value of CU100, discounted at 7% over a three-year period. Because the shares are classified as equity, the original issue discount is amortised to retained earnings using the effective interest method and treated as a preference dividend for earnings per share purposes. To calculate basic earnings per share, the following imputed dividend per class A preference share is deducted to determine the profit or loss attributable to ordinary equity holders of the parent entity:

Year paid	Carrying amount of class A preference shares 1 January CU	Imputed dividend ¹ CU	Carrying amount of class A preference shares 31 December ² CU	Dividend CU
20X2	81.63	5.71	87.34	-
20X3	87.34	6.12	93.46	-
20X4	93.46	6.54	100.00	-
Thereafter:	100.00	7.00	107.00	(7.00)

¹ At 7% of the carrying amount.

² This is before dividend payment.

5.3 Retrospective adjustments

Where comparative figures have been restated (for example, to correct a material error or as a result of a change in accounting policy), earnings per share for all periods presented must also be restated. [IAS 33.64].

5.4 Participating equity instruments and two class shares

As noted in section 3.2 above, IAS 33 envisages entities having more than one class of ordinary shares and requires the calculation and presentation of EPS for each such class. [IAS 33.66]. Although perhaps not exactly obvious from the definition, some instruments that have a right to participate in profits are viewed by the standard as ordinary shares. The standard observes that the equity of some entities includes:

- (a) Instruments that participate in dividends with ordinary shares according to a predetermined formula (for example, two for one) with, at times, an upper limit on the extent of participation (for example, up to, but not beyond, a specified amount per share).
- (b) A class of ordinary shares with a different dividend rate from that of another class of ordinary shares but without prior or senior rights. [IAS 33.A13].

Whilst category (a) could encompass some participating preference shares (as shown in Illustration 5-2 below), not all participating preference shares would necessarily be treated as ordinary shares for EPS purposes. This is because the participation features of some instruments could mean that they are not subordinate to all other classes of equity instrument. The meaning of ordinary shares for EPS purposes is discussed in section 3.2 above.

To calculate basic (and diluted) earnings per share:

- (a) Profit or loss attributable to ordinary equity holders of the parent entity is adjusted (a profit reduced and a loss increased) by the amount of dividends declared in the period for each class of shares and by the contractual amount of dividends (or interest on participating bonds) that must be paid for the period (for example, unpaid cumulative dividends).
- (b) The remaining profit or loss is allocated to ordinary shares and participating equity instruments to the extent that each instrument shares in earnings as if all of the profit or loss for the period had been distributed. The total profit or loss allocated to each class of equity instrument is determined by adding together the amount allocated for dividends and the amount allocated for a participation feature.

And

- (c) The total amount of profit or loss allocated to each class of equity instrument is divided by the number of outstanding instruments to which the earnings are allocated to determine the earnings per share for the instrument.

For the calculation of diluted earnings per share, all potential ordinary shares assumed to have been issued are included in outstanding ordinary shares. [IAS 33.A14]. This is discussed in section 6.4 below.

Participating equity instruments and two-class ordinary shares are shown with the following Illustration. [IAS 33.IE11].

Illustration 5-2: Participating equity instruments and two-class ordinary shares

Profit attributable to equity holders of the parent entity	CU100,000
Ordinary shares outstanding	10,000
Non-convertible preference shares	6,000
Non-cumulative annual dividend on preference shares (before any dividend is paid on ordinary shares)	CU5.50 per share

After ordinary shares have been paid a dividend of CU2.10 per share, the preference shares participate in any additional dividends on a 20:80 ratio with ordinary shares (i.e., after preference and ordinary shares have been paid dividends of CU5.50 and CU2.10 per share, respectively, preference shares participate in any additional dividends at a rate of one-fourth of the amount paid to ordinary shares on a per-share basis).

Dividends on preference shares paid	CU33,000	(CU5.50 per share)
Dividends on ordinary shares paid	CU21,000	(CU2.10 per share)

Basic earnings per share is calculated as follows:

	CU	CU
Profit attributable to equity holders of the parent entity		100,000
Less dividends paid:		
Preference	33,000	
Ordinary	21,000	
		(54,000)
Undistributed earnings		46,000

Allocation of undistributed earnings:

Allocation per ordinary share = A

Allocation per preference share = B; $B = 1/4 A$

$$(A \times 10,000) + (1/4 A \times 6,000) = \text{CU}46,000$$

$$A = \text{CU}46,000 \div (10,000 + 1,500)$$

$$A = \text{CU}4.00$$

$$B = 1/4 A$$

$$B = \text{CU}1.00$$

Basic per share amounts:

	Preference shares	Ordinary shares
Distributed earnings	CU5.50	CU2.10
Undistributed earnings	CU1.00	CU4.00
Totals	CU6.50	CU6.10

N.B. This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

5.4.1 Tax deductible dividends on participating equity instruments

In June 2017, the IFRS IC published an agenda decision in response to a request to clarify the treatment for EPS purposes of tax deductible dividends on participating equity instruments.¹

The question asked of the IFRS IC was whether, in determining profit attributable to ordinary shareholders in the basic EPS calculation, an entity should reflect the tax benefit that would arise from the hypothetical distribution of profit to participating equity holders.

The IFRS IC concluded that, when calculating basic EPS in the fact pattern described in the submission, an entity adjusts profit or loss attributable to ordinary shareholders for the portion of any tax benefit attributable to those ordinary shareholders. This is because the tax benefit is a direct consequence of the hypothetical distribution of profit to the participating equity holders required by IAS 33 (see section 5.4 above). This accounting treatment is applied regardless of whether an entity would have recognised the tax benefit in equity or in profit or loss.

Because, in its view, the principles and requirements in IAS 33 provide an adequate basis to calculate basic EPS in this scenario, the IFRS IC decided not to add this matter to its standard-setting agenda. In publishing this decision, the IFRS IC indicated its decision to publish an illustrative example as educational material to accompany the agenda decision, although no indication of when it would do so was given.

¹ [IFRIC Update](#), June 2017, available on the IFRS Foundation's website.

5.5 Other bases

It is not uncommon for entities to supplement the EPS figures required by IAS 33 by voluntarily presenting additional amounts per share.

In 2024 the IASB published IFRS 18. This standard made consequential amendments to IAS 33 which will apply once IFRS 18 is applied. This will be for periods beginning on or after 1 January 2027 with early application allowed.

Section 5.5.1 deals with the requirements of IAS 33 before its amendment by IFRS 18; Section 5.5.2 deals with the requirements once IFRS 18 is applied.

5.5.1 The requirements of IAS 33 before its amendment by IFRS 18

For additional earnings per share amounts, the standard requires:

- (a) That the denominator used be that required by IAS 33
- (b) That basic and diluted amounts be disclosed with equal prominence and presented in the notes
- (c) An indication of the basis on which the numerator is determined, including whether amounts per share are before or after tax
- (d) If the numerator is not reported as a line item in the statement of comprehensive income or separate statement of profit or loss, a reconciliation to be provided between it and a line item that is reported in the statement of comprehensive income [IAS 33.73, IAS 33.73A]

In September 2007, the IASB indicated that it intended, as part of the annual improvements project, to modify IAS 33 to prohibit the presentation of alternative EPS figures on the face of the statement of comprehensive income. [IAS 1.BC103]. However, that project was ultimately finalised without addressing this issue. As a result, alternative EPS figures may be (and, in practice, are) presented on the face of the statement of comprehensive income (or separate income statement) as well as in the notes, provided that basic and diluted amounts are similarly disclosed with equal prominence. In 2024 IFRS 18 was published which made amendments to IAS 33 which are discussed at 5.5.2

The prevalence, within the European Union, of reporting alternative EPS measures on the face of the income statement was a matter considered by the European Securities and Markets Authority (ESMA). In April 2018, it published a report entitled *Enforcement and Regulatory Activities of Accounting Enforcers in 2017*.

The report includes (at paragraph 31) the following: "Around 16% of issuers disclosed, in addition to basic and diluted earnings per share, amounts per share using a reported component of the statement of comprehensive income other than required by IAS 33." The document goes on to observe that of these, 54% presented the information "in the notes rather than on the face of the statement".

From this we infer that, of the sample examined by ESMA, approximately half of entities disclosing alternative EPS presented the information on the face of the income statement.

5.5.2 The requirements of IAS 33 after its amendment by IFRS 18

As noted above, once IFRS 18 is applied (for periods beginning on or after 1 January 2027 with early adoption permitted) the revised provisions of IAS 33 will apply. These changes are concerned the voluntary presentation of per share data in addition to that required by IAS 33. Specifically, entities are restricted in what per share figures may be disclosed in the financial statements and also in the location of them, as follows. [IAS 33(2027).73B, IAS 33(2027).73C].

IAS 33 permits entities to disclose in the notes additional amounts per share using a measure of performance as a numerator different from that required by the standard. However, any such numerator is only allowed to be the amount attributable to ordinary equity holders of the parent entity of either: a total or subtotal in the statement of profit or loss or statement of comprehensive income; or a management-defined performance measure as defined in IFRS 18.

The statement of profit or loss and the statement of comprehensive income are discussed in Chapter 4. Management-defined performance measures are discussed in Chapter 4.

If an entity discloses an additional amount per share, it is required to:

- disclose the additional basic and diluted amounts per share with equal prominence
- use in the calculation the weighted average number of ordinary shares determined in accordance with IAS 33
- disclose the additional amount per share only in the notes. That information cannot be presented in the primary financial statements.
- disclose the information required by IFRS 18 for the numerators that are management-defined performance measures (see Chapter 4) [IAS 33(2027).73C, IFRS 18.121, IFRS 18.122, IFRS 18.123, IFRS 18.124, IFRS 18.125]

6 Diluted earnings per share

6.1 The need for diluted EPS

The presentation of basic EPS seeks to show a performance measure, by computing how much profit an entity has earned for each of the shares in issue for the period. Entities often enter into commitments to issue shares in the future which would result in a change in basic EPS. IAS 33 refers to such commitments as potential ordinary shares, which it defines as “a financial instrument or other contract that may entitle its holder to ordinary shares”. [IAS 33.5].

Examples of potential ordinary shares given by IAS 33 are:

- (a) Financial liabilities or equity instruments, including preference shares, that are convertible into ordinary shares.
- (b) Options and warrants (whether accounted for under IAS 32 or IFRS 2).
- (c) Shares that would be issued upon the satisfaction of conditions resulting from contractual arrangements, such as the purchase of a business or other assets. [IAS 33.7].

When potential shares are actually issued, the impact on basic EPS will be two-fold. First, the number of shares in issue will change; second, profits could be affected, for example by lower interest charges or the return made on cash inflows. Scenarios whereby such an adjustment to basic EPS is unfavourable are described by the standard as dilution, defined as “a reduction in earnings per share or an increase in loss per share resulting from the assumption that convertible instruments are converted, that options or warrants are exercised, or that ordinary shares are issued upon the satisfaction of specified conditions”. [IAS 33.5]. This potential fall in EPS is quantified by computing diluted EPS, and as a result:

- (a) Profit or loss attributable to equity holders is increased by the after-tax amount of dividends and interest recognised in the period in respect of the dilutive potential ordinary shares and is adjusted for any other changes in income or expense that would result from the conversion of the dilutive potential ordinary shares.
And
- (b) The weighted average number of ordinary shares outstanding is increased by the weighted average number of additional ordinary shares that would have been outstanding assuming the conversion of all dilutive potential ordinary shares. [IAS 33.32].

6.2 Calculation of diluted EPS

IAS 33 requires a diluted EPS figure to be calculated for the profit or loss attributable to ordinary equity holders of the parent and, if presented, profit or loss from continuing operations attributable to them. [IAS 33.30]. For these purposes, the profit or loss attributable to ordinary equity holders and the weighted average number of shares outstanding is adjusted for the effects of all potential ordinary shares. [IAS 33.31]. In calculating diluted EPS, the number of shares to be used is that used in calculating basic EPS, plus the weighted average number of shares that would be issued on the conversion of all the dilutive potential ordinary shares into ordinary shares. As is the case for outstanding shares in the basic EPS calculation, potential ordinary shares are to be weighted for the period they are outstanding. [IAS 33.36, IAS 33.38].

Accordingly, potential ordinary shares:

- Are deemed to have been converted into ordinary shares at the beginning of the period or, if not in existence at the beginning of the period, the date of their issue [IAS 33.36]
- Which are cancelled or allowed to lapse are included only for the period they are outstanding
And
- Which convert into ordinary shares during the period are included up until the date of conversion (from which point they will be included in the basic EPS) [IAS 33.38]

The number of dilutive potential ordinary shares is to be determined independently for each period presented, and not subsequently revisited. In particular, prior periods' EPS are not restated for changes in assumptions about the conversion of potential shares into shares. IAS 33 also stresses that the number of dilutive potential ordinary shares included in the year-to-date period is not a weighted average of the dilutive potential ordinary shares included in each interim computation. [IAS 33.37, IAS 33.65]. This is illustrated in the comprehensive illustrative example accompanying IAS 33, the substance of which is reproduced in the appendix to this chapter.

6.2.1 Diluted earnings

The earnings figure is that used for basic EPS adjusted to reflect any changes that would arise if the potential shares outstanding in the period were actually issued. Adjustment is to be made for the post-tax effects of:

- (a) Any dividends or other items related to dilutive potential ordinary shares deducted in arriving at the earnings figure used for basic EPS
- (b) Any interest recognised in the period related to dilutive potential ordinary shares
- (c) Any other changes in income or expense that would result from the conversion of the dilutive potential ordinary shares [IAS 33.33]

These adjustments will also include any amounts charged in accordance with the effective interest method prescribed by IFRS 9 *Financial Instruments* as a result of allocating transaction costs, premiums or discounts over the term of the instrument. [IAS 33.34]. Instruments with a choice of settlement method may also require adjustments to the numerator as discussed in section 6.2.2 below.

The standard notes that certain earnings adjustments directly attributable to the instrument could also affect other items of income or expense which will need to be taken into account. For example, the lower interest charge following conversion of convertible debt could lead to higher charges under profit sharing schemes. [IAS 33.35].

No imputed earnings are taken into account in respect of the proceeds to be received on exercise of share options or warrants. The effect of such potential ordinary shares on the diluted EPS is reflected in the computation of the denominator. This is discussed in section 6.4.2 below.

6.2.2 Diluted number of shares

IAS 33 discusses a number of specific types of potential ordinary shares and how they are to be brought into the calculation; these are discussed in section 6.4 below.

More generally, the standard also discusses scenarios where the method of conversion or settlement of potential ordinary shares is at the discretion of one of the parties, as follows:

- (a) The number of shares that would be issued on conversion must be determined from the terms of the potential ordinary shares. When more than one basis of conversion exists, the calculation assumes the most advantageous conversion rate or exercise price from the standpoint of the holder of the potential ordinary shares. [IAS 33.39].
- (b) When an entity has issued a contract that may be settled in shares or cash at its option, it presumes that the contract will be settled in shares. The resulting potential ordinary shares would be included in diluted earnings per share if the effect is dilutive. [IAS 33.58]. When such a contract is presented for accounting purposes as an asset or a liability, or has an equity component and a liability component, the numerator is to be adjusted for any changes in profit or loss that would have resulted during the period if the contract had been classified wholly as an equity instrument. That adjustment is similar to the adjustments discussed in section 6.2.1 above. [IAS 33.59].

And

- (c) For contracts that may be settled in ordinary shares or cash at the holder's option, the more dilutive of cash settlement and share settlement is to be used in calculating diluted earnings per share. [IAS 33.60].

An example of an instrument covered by (b) above is a debt instrument that, on maturity, gives the issuer the unrestricted right to settle the principal amount in cash or in its own ordinary shares (see Illustration 6-3 in section 6.4.1.A below). An example of an instrument covered by (c) is a written put option that gives the holder a choice of settling in ordinary shares or cash. [IAS 33.61].

In our view, the requirements of the standard in (b) and (c) above relating to settlement options are somewhat confused. In particular, they seem to envisage a binary accounting model based on the strict legal form of settlement (cash or shares). However, IAS 32 sets out rules for three different settlement methods - net cash, net shares and gross physical settlement (discussed in Chapter 43). One consequence of the above is that, if taken literally, the numerator is only required to be adjusted to remove items of income or expense arising from a liability when there is a choice of settlement method. However, mandatory net share settlement also gives rise to a liability and income/expense under IAS 32. In our view, any such income statement items need to be removed for diluted EPS purposes.

How we see it

Although not stated explicitly in IAS 33, in our view, the numerator for diluted EPS must be adjusted for any effect in income related to potential ordinary shares subject to mandatory net share settlement.

6.3 Dilutive potential ordinary shares

Only those potential shares whose issue would have a dilutive effect on EPS are brought into the calculation. Potential ordinary shares are ‘antidilutive’ when their conversion to ordinary shares would increase earnings per share or decrease loss per share. [IAS 33.5, IAS 33.43]. The calculation of diluted earnings per share must not assume conversion, exercise, or other issue of potential ordinary shares that would have an antidilutive effect on earnings per share. [IAS 33.43]. The standard gives detailed guidance for determining which potential shares are deemed to be dilutive, and hence brought into the diluted EPS calculation. This guidance covers the element of profit which needs to be diluted to trigger inclusion, and the sequence in which potential shares are tested to establish cumulative dilution. Each is discussed below.

6.3.1 Dilution judged by effect on profits from continuing operations

Potential ordinary shares are only to be treated as dilutive if their conversion to ordinary shares would decrease earnings per share or increase loss per share from continuing operations. The ‘control number’ that this focuses on is therefore the net result from continuing operations, which is the net profit or loss attributable to the parent entity, after deducting items relating to preference shares (see section 5.2 above) and after excluding items relating to discontinued operations. [IAS 33.42]. The same denominator is required to be used to compute diluted EPS from continuing operations and total diluted EPS. Determining which potential shares are to be included by reference to their impact on continuing EPS can produce some slightly curious results for total EPS. For example, it is possible to exclude instruments which would dilute basic EPS (but not continuing EPS), and include items which are antidilutive as regards total profit. This latter point is acknowledged by the standard as follows. [IAS 33.A3].

Extract from IAS 33

Control number

- A3 To illustrate the application of the control number notion described in paragraphs 42 and 43, assume that an entity has profit from continuing operations attributable to the parent entity of CU4,800, a loss from discontinued operations attributable to the parent entity of (CU7,200), a loss attributable to the parent entity of (CU2,400), and 2,000 ordinary shares and 400 potential ordinary shares outstanding. The entity’s basic earnings per share is CU2.40 for continuing operations, (CU3.60) for discontinued operations and (CU1.20) for the loss. The 400 potential ordinary shares are included in the diluted earnings per share calculation because the resulting CU2.00 earnings per share for continuing operations is dilutive, assuming no profit or loss impact of those 400 potential ordinary shares. Because profit from continuing operations attributable to the parent entity is the control number, the entity also includes those 400 potential ordinary shares in the calculation of the other earnings per share amounts, even though the resulting earnings per share amounts are antidilutive to their comparable basic earnings per share amounts, ie the loss per share is less [(CU3.00) per share for the loss from discontinued operations and (CU1.00) per share for the loss].

6.3.2 Dilution judged by the cumulative impact of potential shares

Where an entity has a number of different potential ordinary shares, in deciding whether they are dilutive (and hence reflected in the calculation), each issue or series of potential ordinary shares is to be considered in sequence from the most to the least dilutive. Only those potential shares which produce a cumulative dilution are to be included. This means that some potential shares which would dilute basic EPS if viewed on their own may need to be excluded. This results in a diluted EPS showing the maximum overall dilution of basic EPS. The standard observes that options and warrants are generally included first as they do not affect the numerator in the diluted EPS calculation (but see the discussion in section 6.4.2 below). [IAS 33.44]. The way this is to be done is shown in the following Illustration. [IAS 33.IE9].

Illustration 6-1: Calculation of weighted average number of shares: determining the order in which to include dilutive instruments
Earnings

	CU
Profit from continuing operations attributable to the parent entity	16,400,000
Less dividends on preference shares	<u>(6,400,000)</u>
Profit from continuing operations attributable to ordinary equity holders of the parent entity	10,000,000
Loss from discontinued operations attributable to the parent entity	<u>(4,000,000)</u>
Profit attributable to ordinary equity holders of the parent entity	<u>6,000,000</u>
Ordinary shares outstanding	2,000,000
Average market price of one ordinary share during year	CU75.00

Potential Ordinary Shares

Options	100,000 with exercise price of CU60
Convertible preference shares	800,000 shares with a par value of CU100 entitled to a cumulative dividend of CU8 per share. Each preference share is convertible to two ordinary shares.
5% convertible bonds	Nominal amount CU100,000,000. Each CU1,000 bond is convertible to 20 ordinary shares. There is no amortisation of premium or discount affecting the determination of interest expense.
Tax rate	40%

Increase in Earnings Attributable to Ordinary Equity Holders on Conversion of Potential Ordinary Shares

	Increase in earnings CU	Increase in number of ordinary shares	Earnings per incremental share CU
Options			
Increase in earnings	Nil		
Incremental shares issued for no consideration			
$100,000 \times (\text{CU}75 - \text{CU}60) \div \text{CU}75 =$		20,000	Nil
Convertible preference shares			
Increase in earnings			
$\text{CU}800,000 \times 100 \times 0.08 =$	6,400,000		
Incremental shares			
$2 \times 800,000 =$		1,600,000	4.00
5% convertible bonds			
Increase in earnings			
$\text{CU}100,000,000 \times 0.05 \times (1 - 0.40) =$	3,000,000		
Incremental shares			
$100,000 \times 20 =$		2,000,000	1.50
The order in which to include the dilutive instruments is therefore:			
(1) Options			
(2) 5% convertible bonds			
(3) Convertible preference shares			

Calculation of Diluted Earnings per Share

	Profit from continuing operations attributable to ordinary equity holders of the parent entity (control number)	Ordinary shares	Per share	
	CU		CU	
As reported	10,000,000	2,000,000	5.00	
Options	-	20,000		
	10,000,000	2,020,000	4.95	Dilutive
5% convertible bonds	3,000,000	2,000,000		
	13,000,000	4,020,000	3.23	Dilutive
Convertible preference shares	6,400,000	1,600,000		
	19,400,000	5,620,000	3.45	Antidilutive

Because diluted earnings per share is increased when taking the convertible preference shares into account (from CU3.23 to CU3.45), the convertible preference shares are antidilutive and are ignored in the calculation of diluted earnings per share. Therefore, diluted earnings per share for profit from continuing operations is CU3.23.

	Basic EPS		Diluted EPS	
	CU		CU	
Profit from continuing operations attributable to ordinary equity holders of the parent entity	5.00		3.23	
Loss from discontinued operations attributable to ordinary equity holders of the parent entity	(2.00)	(a)	(0.99)	(b)
Profit attributable to ordinary equity holders of the parent entity	3.00	(c)	2.24	(d)

(a) $(\text{CU}4,000,000) \div 2,000,000 = (\text{CU}2.00)$

(b) $(\text{CU}4,000,000) \div 4,020,000 = (\text{CU}0.99)$

(c) $\text{CU}6,000,000 \div 2,000,000 = \text{CU}3.00$

(d) $(\text{CU}6,000,000 + \text{CU}3,000,000) \div 4,020,000 = \text{CU}2.24$

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

6.4 Particular types of dilutive instruments

6.4.1 Convertible instruments

In order to secure a lower rate of interest, entities sometimes attach benefits to loan stock, debentures or preference shares in the form of conversion rights. These permit the holder to convert his holding in whole or part into equity capital. The right is normally exercisable between specified dates. The ultimate conversion of the instrument will have the following effects:

- (a) There will be an increase in earnings by the amount of the interest (or items relating to preference shares) no longer payable. As interest is normally allowable for tax purposes, the effect on earnings may be net of a tax deduction relating to some or all of the items.

And

- (b) The number of ordinary shares in issue will increase. The diluted EPS is calculated assuming that the instrument is converted into the maximum possible number of shares. [IAS 33.49].

Convertible preference shares will be antidilutive whenever the amount of the dividend on such shares declared in or accumulated for the current period per ordinary share obtainable on conversion exceeds basic earnings per share. Similarly, convertible debt will be antidilutive whenever its interest (net of tax and other changes in income or expense) per ordinary share obtainable on conversion exceeds basic earnings per share. [IAS 33.50].

6.4.1.A Convertible debt

The EPS calculation for convertible bonds is shown in the following Illustration: [IAS 33.IE6]

Illustration 6-2: Treatment of convertible bonds in diluted EPS calculations

Profit attributable to ordinary equity holders of the parent entity	CU1,004
Ordinary shares outstanding	1,000
Basic earnings per share	CU1.00
Convertible bonds	100
Each block of 10 bonds is convertible into three ordinary shares	
Interest expense for the current year relating to the liability component of the convertible bonds	CU10
Current and deferred tax relating to that interest expense	CU4
Note: the interest expense includes amortisation of the discount arising on initial recognition of the liability component (see IAS 32).	
Adjusted profit attributable to ordinary equity holders of the parent entity	CU1,004 + CU10 - CU4 = CU1,010
Number of ordinary shares resulting from conversion of bonds	30
Number of ordinary shares used to calculate diluted earnings per share	1,000 + 30 = 1,030
Diluted earnings per share	CU1,010 ÷ 1,030 = CU0.98

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

As discussed in section 6.2.2 above, the standard also discusses the impact on diluted EPS of different settlement options. As discussed earlier, we believe this must be taken to mean that for diluted EPS purposes earnings are adjusted to remove any items that arose from an instrument being classified as an asset or liability rather than equity.

The standard illustrates settlement options with the following example. [IAS 33.IE8].

Illustration 6-3: Convertible bonds settled in shares or cash at the issuer's option

An entity issues 2,000 convertible bonds at the beginning of Year 1. The bonds have a three-year term, and are issued at par with a face value of CU1,000 per bond, giving total proceeds of CU2,000,000. Interest is payable annually in arrears at a nominal annual interest rate of 6%. Each bond is convertible at any time up to maturity into 250 common shares.

When the bonds are issued, the prevailing market interest rate for similar debt without a conversion option is 9%. At the issue date, the market price of one common share is CU3. Income tax is ignored.

Profit attributable to ordinary equity holders of the parent entity Year 1	CU1,000,000
Ordinary shares outstanding	1,200,000
Convertible bonds outstanding	2,000
Allocation of proceeds of the bond issue:	
Liability component	* CU1,848,122
Equity component	CU151,878
	<u>CU2,000,000</u>

The liability and equity components would be determined in accordance with IAS 32. These amounts are recognised as the initial carrying amounts of the liability and equity components. The amount assigned to the issuer conversion option equity element is an addition to equity and is not adjusted.

* This represents the present value of the principal and interest discounted at 9% - CU2,000,000 payable at the end of three years; CU120,000 payable annually in arrears for three years.

Basic earnings per share Year 1:

$$\frac{\text{CU}1,000,000}{1,200,000} = \text{CU}0.83 \text{ per ordinary share}$$

Diluted earnings per share Year 1:

It is presumed that the issuer will be required to settle the contract by the issue of ordinary shares. The dilutive effect is therefore calculated in accordance with IAS 33.59.

$$\frac{\text{CU}1,000,000 + \text{CU}166,331^{(a)}}{1,200,000 + 500,000^{(b)}} = \text{CU}0.69 \text{ per ordinary share}$$

(a) Profit is adjusted for the accretion of CU166,331 ($\text{CU}1,848,122 \times 9\%$) of the liability because of the passage of time.

(b) 500,000 ordinary shares = 250 ordinary shares \times 2,000 convertible bonds.

6.4.1.B Convertible preference shares

The rules for convertible preference shares are very similar to those detailed above in the case of convertible debt, i.e., dividends and other returns to preference shareholders are added back to earnings used for basic EPS and the maximum number of ordinary shares that could be issued on conversion are included in the calculation.

As discussed in section 5.2 above, one possible return to preference shareholders is a premium payable on redemption or induced early conversion in excess of the original terms. IAS 33 notes that the redemption or induced conversion of convertible preference shares may affect only a portion of the previously outstanding convertible preference shares. In such cases, the standard makes clear that any excess consideration is attributed to those shares that are redeemed or converted for the purpose of determining whether the remaining outstanding preference shares are dilutive. In other words, the shares redeemed or converted are considered separately from those shares that are not redeemed or converted. [IAS 33.51].

6.4.1.C Participating equity instruments and two class shares with conversion rights

The treatment for basic EPS of participating equity instruments and two class shares is discussed in section 5.4 above. When discussing these instruments, the standard observes that when calculating diluted EPS:

- Conversion is assumed for those instruments that are convertible into ordinary shares if the effect is dilutive.
- For those that are not convertible into a class of ordinary shares, profit or loss for the period is allocated to the different classes of shares and participating equity instruments in accordance with their dividend rights or other rights to participate in undistributed earnings. [IAS 33.A14].

What the standard seems to be hinting at here, without directly addressing, is how to present EPS for two or more classes of ordinary shares (say, class A and class B) when one class can convert into another (say, class B can convert into class A). In this scenario, the basic EPS for each class is calculated based on profit entitlement (see section 5.4 above). For diluted EPS it would be necessary to attribute to class A the profits attributed to class B in the basic EPS - if the overall effect were dilutive to class A, conversion is assumed.

6.4.2 Options, warrants and their equivalents**6.4.2.A The numerator**

IAS 33 contains detailed guidance on the treatment for diluted EPS purposes of options, warrants and their equivalents which it defines as “financial instruments that give the holder the right to purchase ordinary shares”. [IAS 33.5]. However, it was largely written before the significant developments in accounting for such instruments (IFRS 2 and IAS 32). As a result, individual facts and circumstances must be considered and judgement is required in some circumstances to address the dilutive effects on EPS.

IAS 33 clearly states that “Options and warrants ... do not affect the numerator of the calculation” [IAS 33.44] and this text was added in 2003 as part of the improvements project, so clearly drafted against the back drop of the impending move to expensing share-based payments and also the (then) recent changes to IAS 32 regarding accounting for derivatives over an entity’s own shares. As regards employee share options in particular, neither IAS 33 (as updated by IFRS 2) nor the worked example appended to it (see Illustration 6-6 in section 6.4.5 below) make reference to removing either some or all the charge when computing diluted EPS. However, this seems to sit somewhat awkwardly (particularly for options outside the scope of IFRS 2) with the general requirement for calculating diluted EPS that earnings be adjusted for the effects of “any other changes in income or expense that would result from the conversion of the dilutive potential ordinary shares”. [IAS 33.33]. Furthermore, IAS 33 explicitly requires an adjustment to the numerator in some circumstances:

- (a) As discussed in section 6.2.2 above, adjustment to the numerator may be required for a contract (which could include options and warrants) that may be settled in ordinary shares or cash at the entity’s option when such a contract is presented for accounting purposes as an asset or a liability, or has an equity component and a liability component. In such a case, the standard requires that “the entity shall adjust the numerator for any changes in profit or loss that would have resulted during the period if the contract had been classified wholly as an equity instrument”. For contracts that may be settled in ordinary shares or cash at the holder’s option, “the more dilutive of cash settlement and share settlement shall be used in calculating diluted earnings per share”. [IAS 33.59, IAS 33.60].
- (b) Where an option agreement requires or permits the tendering of debt in payment of the exercise price (and, if the holder could choose to pay cash, that tendering debt is more advantageous to him) the numerator must be adjusted for the after-tax amount of any such debt assumed to be tendered (see section 6.4.2.E below). [IAS 33.A7].
- (c) Where option proceeds are required to be applied to redeem debt or other instruments of the entity (see section 6.4.2.F below). [IAS 33.A9].

For situations covered by (b) and (c) above the specific requirements of the standard for adjusting the numerator are to be followed. In other circumstances, the interaction of these complex and conflicting requirements with each other and with IFRS 2 and IAS 32 lead to the following requirements when computing the numerator for diluted EPS:

- (a) For instruments accounted for under IAS 32:
 - (i) For a contract classified wholly as an equity instrument, no adjustment to the numerator will be necessary.
And
 - (ii) For a contract not classified wholly as an equity instrument, the numerator is adjusted for any changes in profit or loss that would have resulted if it had been classified wholly as an equity instrument.
- (b) For instruments accounted for under IFRS 2:
 - (i) For those treated as equity-settled, no adjustment is made for the IFRS 2 charge.
And
 - (ii) For those treated as cash-settled, the numerator is adjusted for any changes in profit or loss that would have resulted if the instrument had been classified wholly as an equity instrument.

In respect of (b), part (i) is supported by the IASB's view regarding share-based payments as follows.

[IFRS 2.BC54, IFRS 2.BC55, IFRS 2.BC56, IFRS 2.BC57].

Extract from IFRS 2

'Earnings per share is "hit twice"'

- BC54 Some argue that any cost arising from share-based payment transactions is already recognised in the dilution of earnings per share (EPS). If an expense were recognised in the income statement, EPS would be 'hit twice'.
- BC55 However, the Board noted that this result is appropriate. For example, if the entity paid the employees in cash for their services and the cash was then returned to the entity, as consideration for the issue of share options, the effect on EPS would be the same as issuing those options direct to the employees.
- BC56 The dual effect on EPS simply reflects the two economic events that have occurred: the entity has issued shares or share options, thereby increasing the number of shares included in the EPS calculation-although, in the case of options, only to the extent that the options are regarded as dilutive-and it has also consumed the resources it received for those options, thereby decreasing earnings. This is illustrated by the plant and machinery example mentioned in paragraphs BC42 and BC43. Issuing shares affects the number of shares in the EPS calculation, and the consumption (depreciation) of the asset affects earnings.
- BC57 In summary, the Board concluded that the dual effect on diluted EPS is not double-counting the effects of a share or share option grant-the same effect is not counted twice. Rather, two different effects are each counted once.

As for part (ii) of (b) above, this is the explicit requirement of IAS 33 when the entity can choose cash or share settlement. It is also implicit in the requirement of the standard that for contracts that may be settled in ordinary shares or cash at the holder's option, the more dilutive of cash settlement and share settlement is to be used in calculating diluted earnings per share. This would also explain why IFRS 2 requires the computation of grant date fair values for cash-settled share-based payments when that information is not actually required for accounting purposes (see Chapter 30).

6.4.2.B Written call options

Entities may issue options or warrants which give holders the right to subscribe for shares at fixed prices on specified future dates. If the options or warrants are exercised then:

- (a) The number of shares in issue will be increased
- (b) Funds will flow into the company and these will produce income

For calculating diluted EPS, IAS 33 requires the exercise of all dilutive options and warrants to be assumed. [IAS 33.45]. Options and warrants are considered dilutive when they would result in the issue of ordinary shares for less than the average market price of ordinary shares during the period. The amount of the dilution is taken to be the average market price of ordinary shares during the period minus the issue price. [IAS 33.46].

Under IAS 33, the effects of such potential ordinary shares on the diluted EPS are reflected in the computation of the denominator using a method sometimes called the 'treasury stock method'.

For this purpose, the weighted average number of shares used in calculating the basic EPS is increased, but not by the full number of shares that would be issued on exercise of the instruments. To determine how many additional shares to include in the denominator, the assumed proceeds from these issues are to be treated as having been received in exchange for:

- A certain number of shares at their average market price for the period (i.e., no EPS impact)
And
- The remainder for no consideration (i.e., full dilution) [IAS 33.45, IAS 33.46]

This means that the excess of the total number of potential shares over the number that could be issued at their average market price for the period out of the issue proceeds is included within the denominator; the calculation is illustrated as follows: [IAS 33.IE5]

Illustration 6-4: Effects of share options on diluted earnings per share

Profit attributable to ordinary equity holders of the parent entity for year	CU1,200,000
Weighted average number of ordinary shares outstanding during year	500,000 shares
Average market price of one ordinary share during year	CU20.00
Weighted average number of shares under option during year	100,000 shares
Exercise price for shares under option during year	CU15.00

Calculation of earnings per share

	Earnings	Shares	Per share
Profit attributable to ordinary equity holders of the parent entity for year	CU1,200,000		
Weighted average shares outstanding during year		500,000	
Basic earnings per share			CU2.40
Weighted average number of shares under option		100,000	
Weighted average number of shares that would have been issued at average market price: (100,000 × CU15.00) ÷ CU20.00	*	(75,000)	
Diluted earnings per share	CU1,200,000	525,000	CU2.29

* Earnings have not increased because the total number of shares has increased only by the number of shares (25,000) deemed to have been issued for no consideration.

The number of shares viewed as fairly priced (and hence neither dilutive nor antidilutive) for this purpose is calculated on the basis of the average price of the ordinary shares during the reporting period. [IAS 33.46]. The standard observes that, in theory, calculating an average share price for the period could include every market transaction in the shares. However, it notes that as a practical matter an average (weekly or monthly) will usually be adequate. [IAS 33.A4]. The individual prices to be used are generally the closing market price unless prices fluctuate widely, in which case the average of high and low prices may be more representative. Whatever method is adopted, it is required to be used consistently unless it ceases to yield a representative price. For example, closing prices may have been used consistently in a series of relatively stable periods then a change to high/low average could be appropriate when prices begin to fluctuate more widely. [IAS 33.A5].

The shares would be deemed to have been issued at the beginning of the period or, if later, the date of issue of the warrants or options. Options which are exercised or lapse in the period are included for the portion of the period during which they were outstanding. [IAS 33.36, IAS 33.38].

Although the standard seems to require that the fair value used be the average for the reporting period for all outstanding options or warrants, for instruments issued, lapsed or exercised during the period a credible case could be made for using an average price for that part of the reporting period that the instrument was outstanding. Indeed, this is supported by the comprehensive example included in the standard (see the appendix to this chapter), where in computing the number of warrants to be included in calculating the diluted EPS for the full year, the average price used was not that for the full year, but only for the period that the warrants were outstanding.

One practical problem with this requirement is that the average market price of ordinary shares for the reporting period may not be available. Examples would include an entity only listed for part of the period, or an unlisted entity giving voluntary disclosures. In such cases, estimates of the market price would need to be made.

6.4.2.C Written put options and forward purchase agreements

Contracts that require the entity to repurchase its own shares, such as written put options and forward purchase contracts, are to be reflected in the calculation of diluted earnings per share if the effect is dilutive. If these contracts are 'in the money' during the period (i.e., the exercise or settlement price is above the average market price for that period), IAS 33 requires the potential dilutive effect on EPS to be calculated as follows:

- It is assumed that at the beginning of the period sufficient ordinary shares are issued (at the average market price during the period) to raise proceeds to satisfy the contract.
 - The proceeds from the issue are then assumed to be used to satisfy the contract (i.e., to buy back ordinary shares).
- And
- The incremental ordinary shares (the difference between the number of ordinary shares assumed issued and the number of ordinary shares received from satisfying the contract) is included in the calculation of diluted earnings per share. [IAS 33.63].

The standard illustrates this methodology as follows: [IAS 33.A10]

Extract from IAS 33

Written put options

- A10 To illustrate the application of paragraph 63, assume that an entity has outstanding 120 written put options on its ordinary shares with an exercise price of CU35. The average market price of its ordinary shares for the period is CU28. In calculating diluted earnings per share, the entity assumes that it issued 150 shares at CU28 per share at the beginning of the period to satisfy its put obligation of CU4,200. The difference between the 150 ordinary shares issued and the 120 ordinary shares received from satisfying the put option (30 incremental ordinary shares) is added to the denominator in calculating diluted earnings per share.

6.4.2.D Options over convertible instruments

Although not common, it is possible that an entity grants options or warrants to acquire not ordinary shares directly but other instruments convertible into them (such as convertible preference shares or debt). In this scenario, IAS 33 sets a dual test:

- Exercise is assumed whenever the average prices of both the convertible instrument and the ordinary shares obtainable upon conversion are above the exercise price of the options or warrants.
- But
- Exercise is not assumed unless conversion of similar outstanding convertible instruments, if any, is also assumed. [IAS 33.A6].

6.4.2.E Settlement of option exercise price with debt or other instruments of the entity

The standard notes that options or warrants may permit or require the tendering of debt or other instruments of the entity (or its parent or a subsidiary) in payment of all or a portion of the exercise price. In the calculation of diluted earnings per share, those options or warrants have a dilutive effect if (a) the average market price of the related ordinary shares for the period exceeds the exercise price or (b) the selling price of the instrument to be tendered is below that at which the instrument may be tendered under the option or warrant agreement and the resulting discount establishes an effective exercise price below the market price of the ordinary shares obtainable upon exercise. In the calculation of diluted EPS, those options or warrants are assumed to be exercised and the debt or other instruments assumed to be tendered. If tendering cash is more advantageous to the option or warrant holder and the contract permits it, tendering of cash is assumed. Interest (net of tax) on any debt assumed to be tendered is added back as an adjustment to the numerator. [IAS 33.A7].

Similar treatment is given to preference shares that have similar provisions or to other instruments that have conversion options that permit the investor to pay cash for a more favourable conversion rate. [IAS 33.A8].

6.4.2.F Specified application of option proceeds

IAS 33 observes that the underlying terms of certain options or warrants may require the proceeds received from the exercise of those instruments to be applied to redeem debt or other instruments of the entity (or its parent or a subsidiary). In which case it requires that in “the calculation of diluted earnings per share, those options or warrants are assumed to be exercised and the proceeds applied to purchase the debt at its average market price rather than to purchase ordinary shares. However, the excess proceeds received from the assumed exercise over the amount used for the assumed purchase of debt are considered (i.e., assumed to be used to buy back ordinary shares) in the diluted earnings per share calculation. Interest (net of tax) on any debt assumed to be purchased is added back as an adjustment to the numerator.” [IAS 33.A9].

6.4.3 Purchased options and warrants

IAS 33 states that a holding by an entity of options over its own shares will always be antidilutive because:

- Put options would only be exercised if the exercise price were higher than the market price.
- And
- Call options would only be exercised if the exercise price were lower than the market price.

Accordingly, the standard requires that such instruments are not included in the calculation of diluted EPS. [IAS 33.62].

However, depending upon the settlement mechanism and the share price at the beginning and end of the period, the option could have resulted in a gain being reported (see Chapter 43). It is therefore possible that the removal of any such gain from the numerator could have a greater dilutive effect than the reduction in the denominator and hence render the option dilutive. In that circumstance, the option would be included in the diluted EPS calculation.

6.4.4 Partly paid shares

As noted in section 3.2 above, shares issued in partly paid form are to be included in the basic EPS as a fraction of a share, based on dividend participation. As regards diluted EPS they are to be treated, to the extent that they are not entitled to participate in dividends, as the equivalent of options or warrants. The unpaid balance is assumed to represent proceeds used to purchase ordinary shares. The number of shares included in diluted earnings per share is the difference between the number of shares subscribed and the number of shares assumed to be purchased. [IAS 33.A16]. The mechanics of this treatment are not further spelt out in the standard, but the phrase ‘treated as a fraction of an ordinary share’ is not repeated. Instead, it is ‘the number of shares subscribed’ which the standard says is to be compared to the number assumed purchased to measure dilution. However, ‘the number of shares subscribed’ is not defined. Whilst this could be read to mean that the remaining unpaid consideration is to be treated as the exercise price for options over all of the shares issued in partly paid form, we believe the better interpretation is that the unpaid capital be viewed as the exercise price for options over the proportion of the shares not reflected in the basic EPS. This would mean that if the average share price for the period were the same as the total issue price, then no dilution would be reported. Furthermore, an issue of partly paid shares, say 50% paid with 50% dividend entitlement is economically identical to an issue of half the quantity as fully paid (with full dividend entitlement) and a forward contract for the remaining half. In that scenario, the issued shares would be incorporated into the basic and diluted EPS in full from the date of issue. The forward contract would be included in diluted EPS calculation by comparing the contracted number of shares with the number of shares that could be bought out of proceeds based on the average share price for the period. These economically identical transactions should produce the same diluted EPS - that would be achieved by interpreting ‘the number of shares subscribed’ as the number economically subscribed, i.e., the proportion of part-paid shares not already included in basic EPS.

An illustration of what the calculation would look like is as follows:

Illustration 6-5: Partly paid shares

Capital structure

Issued share capital as at 31 December 20X1:

2,000,000 ordinary shares of CU0.10 each

Issued on 1 January 20X2:

500,000 part paid ordinary shares of CU0.10 each. Full consideration of CU0.50 per share (being fair value at 1 January 20X2) paid up 50% on issue. Dividend participation 50% until fully paid. New shares remain part paid at 31 December 20X2.

Average fair value of one ordinary share for the period CU0.60.

Trading results

Net profit attributable to ordinary shareholders for the year ended 31 December 20X2: CU100,000.

Computation of basic and diluted EPS

	Net profit attributable to ordinary shareholders	Ordinary shares	Per share
	CU	No.	
Fully paid shares		2,000,000	
Partly paid shares (1)		250,000	
Basic EPS	100,000	2,250,000	4.44 CU cents
Dilutive effect of partly paid shares (2)		41,667	
Diluted EPS	100,000	2,291,667	4.36 CU cents

(1) 50% dividend rights for 500,000 shares.

(2) Outstanding consideration of CU125,000 ($500,000 \times \text{CU}0.25$), using fair value of CU0.60 this equates to 208,333 shares, hence the number of dilutive shares deemed issued for free is 41,667 ($250,000 - 208,333$).

The example assumes the fair value of the shares over the year is higher than the issue price, which explains why some extra shares are included in the diluted EPS. If the average fair value remained at the issue price of CU0.50 then no additional shares would be included for diluted EPS.

6.4.5 Share-based payments

Share options and other incentive schemes are a common feature of employee remuneration, and can come in many forms. For diluted EPS purposes, IAS 33 identifies two categories and specifies the diluted EPS treatment for each. The categories are:

- (a) Performance-based employee share options
- (b) Employee share options with fixed or determinable terms and non-vested ordinary shares [IAS 33.48]

Before moving on to the diluted EPS treatment, it is worth noting an issue that arises from the way IAS 33 phrases this categorisation and subsequent guidance.

How we see it

Although not clearly stated in the standard, we believe all schemes must be treated as either category (a) or category (b). Any arrangements where entitlement is subject to future performance would fall into category (a) with category (b) being the default for all other arrangements.

Schemes in the first category are to be treated as contingently issuable shares (see section 6.4.6 below) because their issue is contingent upon satisfying specified conditions in addition to the passage of time. [IAS 33.48].

Those in the second category are to be treated as options (see section 6.4.2 above). They are regarded as outstanding from the grant date, even if they vest, and hence can be realised by the employees, at some later date. [IAS 33.48]. An example would be an unexpired loyalty period. This means that some shares may be included in diluted EPS which never, in fact, get issued to employees because they fail to remain with the company for this period. Furthermore, for share options and other share-based payment arrangements to which IFRS 2 applies, the proceeds figure to be used in calculating the dilution under such schemes will include the fair value (as determined in accordance with IFRS 2) of any goods or services to be supplied to the entity in the future under the arrangement. [IAS 33.47A]. An example illustrating the latter point is as follows: [IAS 33.IE5A]

Illustration 6-6: Determining the exercise price of employee share options

Weighted average number of unvested share options per employee	1,000
Weighted average amount per employee to be recognised over the remainder of the vesting period for employee services to be rendered as consideration for the share options, determined in accordance with IFRS 2	CU1,200.00
Cash exercise price of unvested share options	CU15.00
Calculation of adjusted exercise price	
Fair value of services yet to be rendered per employee:	CU1,200.00
Fair value of services yet to be rendered per option: (CU1,200 ÷ 1,000)	CU1.20
Total exercise price of share options: (CU15.00 + CU1.20)	CU16.20

Whilst the standard requires that the additional deemed proceeds is the fair value of goods or services yet to be received, the example clarifies that it is the IFRS 2 expense yet to be charged to income.

What this requirement seeks to reflect is that for such options the issuer will receive not just the cash proceeds (if any) under the option when it is exercised but also valuable goods and services over its life. This will result in the dilutive effect of the options increasing over time as the deemed proceeds on exercise of the options reduces.

6.4.6 Contingently issuable shares

IAS 33 contains considerable detailed guidance, including a numerical worked example, on contingently issuable shares. Contingently issuable ordinary shares are defined as “ordinary shares issuable for little or no cash or other consideration upon satisfaction of specified conditions in a contingent share agreement.” A contingent share agreement is defined by the standard as “an agreement to issue shares that is dependent on the satisfaction of specified conditions.” [IAS 33.5]. The basic rule is that the number of contingently issuable shares to be included in the diluted EPS calculation is “based on the number of shares that would be issuable if the end of the period were the end of the contingency period”. [IAS 33.52]. This requirement to look at the status of the contingency at the end of the reporting period, rather than to consider the most likely outcome, seems to have the overall result of reducing the amount of dilution disclosed.

The discussions in the standard cover three broad categories: earnings-based contingencies, share price-based contingencies, and other contingencies. These are discussed in turn below.

The number of shares contingently issuable may depend on future earnings and future prices of the ordinary shares. In such cases, the standard makes clear that the number of shares included in the diluted EPS calculation is based on both conditions (i.e., earnings to date and the current market price at the end of the reporting period). In other words, contingently issuable shares are not included in the diluted EPS calculation unless both conditions are met. [IAS 33.55].

6.4.6.A Earnings-based contingencies

The standard discusses the scenario where shares would be issued contingent upon the attainment or maintenance of a specified amount of earnings for a period. In such a case the standard requires that: [IAS 33.53]

Extract from IAS 33

53 ... if that amount has been attained at the end of the reporting period but must be maintained beyond the end of the reporting period for an additional period, then the additional ordinary shares are treated as outstanding, if the effect is dilutive, when calculating diluted earnings per share. In that case, the calculation of diluted earnings per share is based on the number of ordinary shares that would be issued if the amount of earnings at the end of the reporting period were the amount of earnings at the end of the contingency period. ...

As a result, earnings-based contingencies need to be viewed as an absolute cumulative hurdle which either is met or not met at the reporting date. Often, such contingencies may be contractually expressed in terms of annual performance over a number of years, say an average of CU1 million profit per year for three years. In such a scenario, 'the attainment or maintenance of a specified amount of earnings for a period' would mean generating a total of CU3 million of profits. If that is achieved by the end of a reporting period, the shares are outstanding for diluted EPS purposes and included in the computation if the effect is dilutive. It could, perhaps, be argued that the potential shares should be considered outstanding if profits of CU1 million were generated at the end of the first year. However, the requirement that the calculation be 'based on the number of ordinary shares that would be issued if the amount of earnings at the end of the reporting period were the amount of earnings at the end of the contingency period' means that the test must be: would shares be issued if the current earnings of CU1 million were all the profits earned by the end of the three-year contingency period? In this example, the answer is no, as that amount of earnings would fall short of averaging CU1 million per year. The standard then notes that, because earnings may change in a future period, the calculation of basic EPS does not include such contingently issuable shares until the end of the contingency period because not all necessary conditions have been satisfied. [IAS 33.53].

An earnings-based contingency is shown in the following Illustration: [IAS 33.IE7]

Illustration 6-7: Contingently issuable shares

Ordinary shares outstanding during 20X2:	1,000,000 (there were no options, warrants or convertible instruments outstanding during the period)
An agreement related to a recent business combination provides for the issue of additional ordinary shares based on the following conditions:	5,000 additional ordinary shares for each new retail site opened during 20X2 1,000 additional ordinary shares for each CU1,000 of consolidated profit in excess of CU2,000,000 for the year ended 31 December 20X2
Retail sites opened during the year:	One on 1 May 20X2 One on 1 September 20X2
Consolidated year-to-date profit attributable to ordinary equity holders of the parent entity:	CU1,100,000 as of 31 March 20X2 CU2,300,000 as of 30 June 20X2 CU1,900,000 as of 30 September 20X2 (including a CU450,000 loss from a discontinued operation) CU2,900,000 as of 31 December 20X2

Basic earnings per share

	First quarter	Second quarter	Third quarter	Fourth quarter	Full year
Numerator (CU)	1,100,000	1,200,000	(400,000)	1,000,000	2,900,000
Denominator:					
Ordinary shares outstanding	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Retail site contingency	-	3,333 (a)	6,667 (b)	10,000	5,000 (c)
Earnings contingency	-	-	-	-	- (d)
Total shares	<u>1,000,000</u>	<u>1,003,333</u>	<u>1,006,667</u>	<u>1,010,000</u>	<u>1,005,000</u>
Basic earnings per share (CU)	<u>1.10</u>	<u>1.20</u>	<u>(0.40)</u>	<u>0.99</u>	<u>2.89</u>

(a) 5,000 shares \times 2/3

(b) 5,000 shares + (5,000 shares \times 1/3)

(c) (5,000 shares \times 8/12) + (5,000 shares \times 4/12)

(d) The earnings contingency has no effect on basic earnings per share because it is not certain that the condition is satisfied until the end of the contingency period. The effect is negligible for the fourth-quarter and full-year calculations because it is not certain that the condition is met until the last day of the period.

Diluted earnings per share

	First quarter	Second quarter	Third quarter	Fourth quarter	Full year
Numerator (CU)	1,100,000	1,200,000	(400,000)	1,000,000	2,900,000
Denominator:					
Ordinary shares outstanding	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Retail site contingency	-	5,000	10,000	10,000	10,000
Earnings contingency	- (e)	300,000 (f)	- (g)	900,000 (h)	900,000 (h)
Total shares	<u>1,000,000</u>	<u>1,305,000</u>	<u>1,010,000</u>	<u>1,910,000</u>	<u>1,910,000</u>
Diluted earnings per share (CU)	<u>1.10</u>	<u>0.92</u>	<u>(0.40)</u> (i)	<u>0.52</u>	<u>1.52</u>

(e) Year-to-date profits do not exceed CU2,000,000 at 31 March 20X2. The Standard does not permit projecting future earnings levels and including the related contingent shares.

(f) $[(CU2,300,000 - CU2,000,000) \div 1,000] \times 1,000 \text{ shares} = 300,000 \text{ shares}$.

(g) Year-to-date profit is less than CU2,000,000.

(h) $[(CU2,900,000 - CU2,000,000) \div 1,000] \times 1,000 \text{ shares} = 900,000 \text{ shares}$.

(i) Because the loss during the third quarter is attributable to a loss from a discontinued operation, the antidilution rules do not apply. The control number (i.e., profit or loss from continuing operations attributable to the equity holders of the parent entity) is positive. Accordingly, the effect of potential ordinary shares is included in the calculation of diluted earnings per share.

This example from IAS 33 illustrates quarterly financial reporting. However, the principles are the same whether the reporting period is illustrated as three months or one year. The example does illustrate that the earnings target is a cumulative hurdle over the entire contingency period (four reporting periods in the example) rather than including potential shares based on the assumption that the level of quarterly profit would be maintained for the four quarters.

The standard only discusses earnings criteria based on absolute measures; in the example above a cumulative profit in excess of CU2,000,000. In our experience such criteria are rare. In practice, criteria are often phrased in terms of relative performance against an external benchmark. Examples would be earnings growth targets of inflation plus 2% or EPS growth being in the top quartile of a group of competitors. For contingencies such as these it is impossible to establish an absolute target in order to ask whether it is met at the period end. For example, consider the earnings contingency in IAS 33, discussed above, to achieve profits in excess of CU2,000,000 over four quarters. If this instead required the profits to be CU2,000,000 adjusted in line with inflation, it would be impossible to know how many shares would be issued if the cumulative profit at the end of the second quarter of CU2,300,000 were the amount of earnings at the end of the contingency period. Until the end of the year the absolute level of profit required would be unknown; it would be more or less than CU2,000,000 depending on the level of inflation or deflation over the period.

There would seem to be (at least) two different ways of interpreting the requirements of IAS 33 in such a scenario, each resulting in a different diluted EPS figure. One approach would be to consider such criteria as being based on 'a condition other than earnings or market price'. That would mean (as discussed in section 6.4.6.C below) that the number of shares brought into diluted EPS would be based on the status of the condition at the end of the reporting period. [IAS 33.56]. If the target was earnings for the year in excess of CU2,000,000 adjusted in line with inflation and at the end of the second quarter inflation had been 4%, then the target would become CU2,080,000 and hence 220,000 shares would be included for diluted EPS for the second quarter. An alternative approach would be to regard it as an earnings-based contingency and make an assumption as to future inflation over the contingency period. This would allow a cumulative hurdle to be calculated and compared with actual earnings to date. If at the end of the second quarter it was estimated that the annual inflation for the year was 5%, then the target would become CU2,100,000 and hence 200,000 shares would be included for diluted EPS for the second quarter. Given the lack of clarity in the standard, it seems likely that either of the above approaches may be selected in practice.

6.4.6.B Share price-based contingencies

The provisions here are more straightforward. In these cases, if the effect is dilutive, the calculation of diluted EPS is based on the number of shares that would be issued if the market price at the end of the reporting period were the market price at the end of the contingency period. If the condition is based on an average of market prices over a period of time that extends beyond the end of the reporting period, the average for the period of time that has lapsed is used. Again the standard explains that, because the market price may change in a future period, the calculation of basic earnings per share does not include such contingently issuable ordinary shares until the end of the contingency period because not all necessary conditions have been satisfied. [IAS 33.54].

6.4.6.C Other contingencies

The requirement regarding contingencies not driven by earnings or share price is as follows: “assuming that the present status of the condition remains unchanged until the end of the contingency period, the contingently issuable ordinary shares are included in the calculation of diluted earnings per share according to the status at the end of the reporting period.” [IAS 33.56]. The standard illustrates the ‘other contingency’ rules by the example of shares being issued depending upon the opening of a specified number of retail sites, and such a contingency is included in the numerical example in the standard (see Illustration 6-7 in section 6.4.6.A above). As is the case for earnings-based contingencies discussed above, it would seem that such conditions are always deemed to be expressed as a cumulative hurdle which may or may not be met by the end of the reporting period. Accordingly, the required treatment would be the same if the condition had been expressed in terms of achieving a certain average annual level of shop openings.

6.4.7 Potential ordinary shares of investees

A subsidiary, joint venture or associate may issue to parties other than the parent or investors with joint control of, or significant influence over the investee potential ordinary shares that are convertible into either ordinary shares of the subsidiary, joint venture or associate, or ordinary shares of the parent or investors with joint control of, or significant influence over the investee (the reporting entity). If these potential ordinary shares of the subsidiary, joint venture or associate have a dilutive effect on the basic EPS of the reporting entity, they are included in the calculation of diluted earnings per share. [IAS 33.40].

The standard requires that such potential ordinary shares be included in the calculation of diluted EPS as follows:

- (a) Instruments issued by a subsidiary, joint venture or associate that enable their holders to obtain ordinary shares of the subsidiary, joint venture or associate are to be included in calculating the diluted EPS data of the subsidiary, joint venture or associate. Those EPS are then included in the reporting entity’s EPS calculations based on the reporting entity’s holding of the instruments of the subsidiary, joint venture or associate.
- (b) Instruments of a subsidiary, joint venture or associate that are convertible into the reporting entity’s ordinary shares are to be considered among the potential ordinary shares of the reporting entity for the purpose of calculating diluted EPS. Similarly, options or warrants issued by a subsidiary, joint venture or associate to purchase ordinary shares of the reporting entity are considered among the potential ordinary shares of the reporting entity in the calculation of consolidated diluted EPS.

[IAS 33.A11].

For the purpose of determining the EPS effect of instruments issued by a reporting entity that are convertible into ordinary shares of a subsidiary, joint venture or associate, the standard requires that the instruments are assumed to be converted and the numerator (profit or loss attributable to ordinary equity holders of the parent entity) adjusted as necessary in accordance with the normal rules (see section 6.2.1 above). In addition to those adjustments, the numerator is adjusted for any change in the profit or loss recorded by the reporting entity (such as dividend income or equity method income) that is attributable to the increase in the number of ordinary shares of the subsidiary, joint venture or associate outstanding as a result of the assumed conversion. The denominator of the diluted EPS calculation is not affected because the number of ordinary shares of the reporting entity outstanding would not change upon assumed conversion. [IAS 33.A12].

The computation under (a) above is shown in the following Illustration. [IAS 33.IE10].

Illustration 6-8: Warrants issued by a subsidiary

Parent:

Profit attributable to ordinary equity holders of the parent entity	CU12,000 (excluding any earnings of, or dividends paid by, the subsidiary)
Ordinary shares outstanding	10,000
Instruments of subsidiary owned by the parent	800 ordinary shares 30 warrants exercisable to purchase ordinary shares of subsidiary 300 convertible preference shares

Subsidiary:

Profit	CU5,400
Ordinary shares outstanding	1,000
Warrants	150, exercisable to purchase ordinary shares of the subsidiary
Exercise price	CU10
Average market price of one ordinary share	CU20
Convertible preference shares	400, each convertible into one ordinary share
Dividends on preference shares	CU1 per share

No inter-company eliminations or adjustments were necessary except for dividends.

For the purposes of this Illustration, income taxes have been ignored.

Subsidiary's earnings per share

Basic EPS	CU5.00	calculated:	$\frac{\text{CU5,400}^{(a)} - \text{CU400}^{(b)}}{1,000^{(c)}}$
Diluted EPS	CU3.66	calculated:	$\frac{\text{CU5,400}^{(d)}}{1,000 + 75^{(e)} + 400^{(f)}}$

(a) Subsidiary's profit attributable to ordinary equity holders.

(b) Dividends paid by subsidiary on convertible preference shares.

(c) Subsidiary's ordinary shares outstanding.

(d) Subsidiary's profit attributable to ordinary equity holders (CU5,000) increased by CU400 preference dividends for the purpose of calculating diluted earnings per share.

(e) Incremental shares from warrants, calculated: $[(\text{CU20} - \text{CU10}) \div \text{CU20}] \times 150$.

(f) Subsidiary's ordinary shares assumed outstanding from conversion of convertible preference shares, calculated: $400 \text{ convertible preference shares} \times \text{conversion factor of 1}$.

Consolidated earnings per share

Basic EPS	CU1.63	calculated:	$\frac{\text{CU12,000}^{(g)} - \text{CU4,300}^{(h)}}{10,000^{(i)}}$
Diluted EPS	CU1.61	calculated:	$\frac{\text{CU12,000} + \text{CU2,928}^{(j)} + \text{CU55}^{(k)} + \text{CU1,098}^{(l)}}{10,000}$

(g) Parent's profit attributable to ordinary equity holders of the parent entity.

(h) Portion of subsidiary's profit to be included in consolidated basic earnings per share, calculated: $(800 \times \text{CU5.00}) + (300 \times \text{CU1.00})$

(i) Parent's ordinary shares outstanding.

(j) Parent's proportionate interest in subsidiary's earnings attributable to ordinary shares, calculated: $(800 \div 1,000) \times (1,000 \text{ shares} \times \text{CU3.66 per share})$

(k) Parent's proportionate interest in subsidiary's earnings attributable to warrants, calculated: $(30 \div 150) \times (75 \text{ incremental shares} \times \text{CU3.66 per share})$

(l) Parent's proportionate interest in subsidiary's earnings attributable to convertible preference shares, calculated: $(300 \div 400) \times (400 \text{ shares from conversion} \times \text{CU3.66 per share})$

This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32.

6.4.8 Contingently issuable potential ordinary shares

The standard requires contingently issuable potential ordinary shares (other than those covered by a contingent share agreement, such as contingently issuable convertible instruments) to be included in the diluted EPS calculation as follows:

- (a) Determine whether the potential ordinary shares may be assumed to be issuable on the basis of the conditions specified for their issue in accordance with the provisions of the standard for contingent ordinary shares (see section 6.4.6 above).
- (b) If on this basis, those potential ordinary shares are to be reflected in diluted EPS, determine their impact on the calculation of diluted earnings per share by following the provisions of the standard for that type of potential ordinary share.

However, exercise or conversion is not to be assumed for the purpose of calculating diluted earnings per share unless exercise or conversion of similar outstanding potential ordinary shares that are not contingently issuable is assumed. [IAS 33.57].

7 Presentation, restatement and disclosure

7.1 Presentation

As discussed in Chapter 3, IAS 1 requires (and at the latest for periods beginning on or after 1 January 2027, IFRS 18 requires - see chapter 4) that all items of income and expense be presented either:

- (a) In a single statement of profit or loss and comprehensive income
- Or
- (b) In two separate statements:
 - (i) A statement of profit or loss
 - And
 - (ii) A statement, beginning with profit or loss, presenting items of other comprehensive income
[IAS 1.10A]

If the approach in (b) is followed, the separate statement of profit or loss must be displayed immediately before the statement of comprehensive income. [IAS 1.10A].

If (a) is adopted, the EPS presentational requirements below apply to that single statement. If (b) is chosen, the requirements apply to the separate statement of profit or loss only and not the separate statement of comprehensive income. [IAS 33.4A, IAS 33.67A, IAS 33.68A].

IAS 33 requires the presentation of basic and diluted EPS (with equal prominence and even if the amounts are negative - i.e., a loss per share) for each period for which a statement of comprehensive income (or separate income statement) is presented. [IAS 33.66, IAS 33.69]. This is required for the profit or loss attributable to ordinary equity holders for:

- (a) Overall profit
- (b) Profit or loss from continuing operations
- And
- (c) Profit or loss from discontinued operations, if any [IAS 33.66, IAS 33.68]

In the case of (a) and (b), separate figures are required for each class of ordinary shares with a different right to share in profits for the period. The figures for (a) and (b) must be displayed on the face of the statement. [IAS 33.66]. Those for (c) may be either on the face or in the notes. [IAS 33.68]. The standard states that if diluted EPS is given for at least one period it must be given for all periods presented. IAS 33 notes that if basic and diluted EPS are equal, dual presentation can be accomplished in one line in the statement. [IAS 33.67].

Regarding (c), the wording of the standard is not very clear. In particular, if an entity has more than one discontinued operation it does not specify whether separate EPS disclosures are required for each or whether one aggregate figure is needed. The wording leans to the former, as it uses the singular - "An entity that reports a discontinued operation shall disclose the basic and diluted amounts per share for the discontinued operation ...". However, IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* only requires the statement of comprehensive income (or separate income statement) to identify the total result from all discontinued operations. [IFRS 5.33]. The presentation of EPS data in addition to that required by IAS 33 is discussed in section 5.5 above.

7.2 Restatement

IAS 33 contains requirements to restate prior periods' EPS for events that change the number of shares outstanding without a corresponding change in resources. Additionally, it specifies circumstances when EPS is not to be restated.

Basic and diluted EPS for all periods presented is to be adjusted for:

- Events (other than the conversion of potential ordinary shares) which change the number of ordinary shares without a corresponding change in resources (discussed in section 4.3 above) [IAS 33.26, IAS 33.64]
- The effects of errors and adjustments resulting from changes in accounting policies accounted for retrospectively (see section 5.3 above) [IAS 33.64]
- The effects of group reorganisations that are accounted for as a pooling of interests (discussed in section 4.6 above)

No adjustment is to be made:

- To basic or diluted EPS when a share consolidation is combined with a special dividend where the overall commercial effect is that of a share repurchase at fair value (discussed in section 4.3.2 above) [IAS 33.29]
- To previously reported diluted EPS due to changes in the prices of ordinary shares which would have given a different dilutive effect for options and warrants [IAS 33.47]
- To prior period diluted EPS as a result of a contingency period coming to an end without the conditions attaching to contingently issuable shares being met [IAS 33.52]

Or

- To prior period diluted EPS for changes in the assumptions used in the calculations or for the conversion of potential ordinary shares into ordinary shares [IAS 33.65]

7.3 Disclosure

IAS 33 requires disclosure of the following:

- (a) The amounts used as the numerators in calculating basic and diluted EPS, and a reconciliation of those amounts to profit or loss attributable to the parent entity for the period. The reconciliation must include the individual effect of each class of instruments that affects EPS.
- (b) The weighted average number of ordinary shares used as the denominator in calculating basic and diluted earnings per share, and a reconciliation of these denominators to each other. The reconciliation must include the individual effect of each class of instruments that affects EPS.
- (c) Instruments (including contingently issuable shares) that could potentially dilute basic EPS in the future, but were not included in the calculation because they were antidilutive for the period(s) presented.
- (d) A description of ordinary share transactions or potential ordinary share transactions (other than those accounted for in EPS for the year - see section 4.3 above - in which case that fact is to be stated), that occur after the end of the reporting period and that would have changed significantly the number of ordinary shares or potential ordinary shares outstanding at the end of the period if those transactions had occurred before the end of the reporting period. [IAS 33.70].

Examples of transactions in (d) include:

- (a) An issue of shares for cash
- (b) An issue of shares when the proceeds are used to repay debt or preference shares outstanding at the end of the reporting period
- (c) The redemption of ordinary shares outstanding
- (d) The conversion or exercise of potential ordinary shares outstanding at the end of the reporting period into ordinary shares
- (e) An issue of options, warrants, or convertible instruments
- (f) The achievement of conditions that would result in the issue of contingently issuable shares

The standard observes that EPS amounts are not adjusted for such transactions occurring after the reporting period because such transactions do not affect the amount of capital used to produce profit or loss for the period. [IAS 33.71]. Changes in ordinary shares are discussed in section 4 above.

The standard observes that financial instruments and other contracts generating potential ordinary shares may incorporate terms and conditions that affect the measurement of basic and diluted earnings per share. These terms and conditions may determine whether any potential ordinary shares are dilutive and, if so, the effect on the weighted average number of shares outstanding and any consequent adjustments to profit or loss attributable to ordinary equity holders. The disclosure of the terms and conditions of such financial instruments and other contracts is encouraged by IAS 33, if not otherwise required by IFRS 7 *Financial Instruments: Disclosures* (discussed in Chapter 50). [IAS 33.72].

Appendix A – Comprehensive illustrative example

Reproduced below is the comprehensive worked example in IAS 33 of the computation and presentation of EPS. [IAS 33.IE12]. It illustrates four quarters and then the full year, but the principles and calculations would be the same whatever the length of the periods considered.

Extract from IAS 33 Illustrative Examples

Example 12 Calculation and presentation of basic and diluted earnings per share (comprehensive example)²

This example illustrates the quarterly and annual calculations of basic and diluted earnings per share in the year 20X1 for Company A, which has a complex capital structure. The control number is profit or loss from continuing operations attributable to the parent entity. Other facts assumed are as follows:

Average market price of ordinary shares: The average market prices of ordinary shares for the calendar year 20X1 were as follows:

First quarter	CU49
Second quarter	CU60
Third quarter	CU67
Fourth quarter	CU67

The average market price of ordinary shares from 1 July to 1 September 20X1 was CU65.

Ordinary shares: The number of ordinary shares outstanding at the beginning of 20X1 was 5,000,000. On 1 March 20X1, 200,000 ordinary shares were issued for cash.

Convertible bonds: In the last quarter of 20X0, 5 per cent convertible bonds with a principal amount of CU12,000,000 due in 20 years were sold for cash at CU1,000 (par). Interest is payable twice a year, on 1 November and 1 May. Each CU1,000 bond is convertible into 40 ordinary shares. No bonds were converted in 20X0. The entire issue was converted on 1 April 20X1 because the issue was called by Company A.

Convertible preference shares: In the second quarter of 20X0, 800,000 convertible preference shares were issued for assets in a purchase transaction. The quarterly dividend on each convertible preference share is CU0.05, payable at the end of the quarter for shares outstanding at that date. Each share is convertible into one ordinary share. Holders of 600,000 convertible preference shares converted their preference shares into ordinary shares on 1 June 20X1.

Warrants: Warrants to buy 600,000 ordinary shares at CU55 per share for a period of five years were issued on 1 January 20X1. All outstanding warrants were exercised on 1 September 20X1.

Options: Options to buy 1,500,000 ordinary shares at CU75 per share for a period of 10 years were issued on 1 July 20X1. No options were exercised during 20X1 because the exercise price of the options exceeded the market price of the ordinary shares.

Tax rate: The tax rate was 40 per cent for 20X1.

20X1	<i>Profit (loss) from continuing operations attributable to the parent entity^(a)</i>	<i>Profit (loss) attributable to the parent entity</i>
	<u>CU</u>	<u>CU</u>
First quarter	5,000,000	5,000,000
Second quarter	6,500,000	6,500,000
Third quarter	1,000,000	(1,000,000) ^(b)
Fourth quarter	(700,000)	(700,000)
Full year	<u>11,800,000</u>	<u>9,800,000</u>

(a) This is the control number (before adjusting for preference dividends).

(b) Company A had a CU2,000,000 loss (net of tax) from discontinued operations in the third quarter.

2 "This example does not illustrate the classification of the components of convertible financial instruments as liabilities and equity or the classification of related interest and dividends as expenses and equity as required by IAS 32."

First Quarter 20X1

<i>Basic EPS calculation</i>	CU
Profit from continuing operations attributable to the parent entity	5,000,000
Less: preference share dividends	(40,000) ^(a)
Profit attributable to ordinary equity holders of the parent entity	4,960,000

<i>Dates</i>	<i>Shares outstanding</i>	<i>Fraction of period</i>	<i>Weighted- average shares</i>
1 January-28 February	5,000,000	$\frac{2}{3}$	3,333,333
<i>Issue of ordinary shares on 1 March</i>			
1 March-31 March	200,000	$\frac{1}{3}$	1,733,333
Weighted-average shares	5,200,000		5,066,666
Basic EPS			CU0.98

Diluted EPS calculation

Profit attributable to ordinary equity holders of the parent entity		CU4,960,000
Plus: profit impact of assumed conversions		
Preference share dividends	CU40,000 ^(a)	
Interest on 5% convertible bonds	CU90,000 ^(b)	
Effect of assumed conversions		CU130,000
Profit attributable to ordinary equity holders of the parent entity including assumed conversions		CU5,090,000
Weighted-average shares		5,066,666
Plus: incremental shares from assumed conversions		
Warrants	0 ^(c)	
Convertible preference shares	800,000	
5% convertible bonds	480,000	
Dilutive potential ordinary shares		1,280,000
Adjusted weighted-average shares		6,346,666
Diluted EPS		CU0.80

(a) 800,000 shares × CU0.05

(b) (CU12,000,000 × 5%) ÷ 4; less taxes at 40%

(c) The warrants were not assumed to be exercised because they were antidilutive in the period (CU55 [exercise price] > CU49 [average price]).

Second Quarter 20X1

<i>Basic EPS calculation</i>	CU
Profit from continuing operations attributable to the parent entity	6,500,000
Less: preference share dividends	(10,000) ^(a)
Profit attributable to ordinary equity holders of the parent entity	6,490,000

<i>Dates</i>	<i>Shares outstanding</i>	<i>Fraction of period</i>	<i>Weighted- average shares</i>
1 April	5,200,000		
Conversion of 5% bonds on 1 April	480,000		
1 April-31 May	5,680,000	$\frac{2}{3}$	3,786,666
Conversion of preference shares 1 June	600,000		
1 June-30 June	6,280,000	$\frac{1}{3}$	2,093,333
Weighted-average shares			5,880,000
Basic EPS			CU1.10

Diluted EPS calculation

Profit attributable to ordinary equity holders of the parent entity		CU6,490,000
Plus: profit impact of assumed conversions		
Preference share dividends	CU10,000 ^(a)	
Effect of assumed conversions		CU10,000
Profit attributable to ordinary equity holders of the parent entity including assumed conversions		CU6,500,000
Weighted-average shares		5,880,000
Plus: incremental shares from assumed conversions		
Warrants	50,000 ^(b)	
Convertible preference shares	600,000 ^(c)	
Dilutive potential ordinary shares		650,000
Adjusted weighted-average shares		6,530,000
Diluted EPS		CU1.00

(a) 200,000 shares × CU0.05

(b) $CU55 \times 600,000 = CU33,000,000$; $CU33,000,000 \div CU60 = 550,000$; $600,000 - 550,000 = 50,000$ shares OR $[(CU60 - CU55) \div CU60] \times 600,000$ shares = 50,000 shares(c) $(800,000 \text{ shares} \times \frac{2}{3}) + (200,000 \text{ shares} \times \frac{1}{3})$

Third Quarter 20X1

<i>Basic EPS calculation</i>			CU
Profit from continuing operations attributable to the parent entity			1,000,000
Less: preference share dividends			(10,000)
Profit from continuing operations attributable to ordinary equity holders of the parent entity			990,000
Loss from discontinued operations attributable to the parent entity			(2,000,000)
Loss attributable to ordinary equity holders of the parent entity			(1,010,000)
<i>Dates</i>	<i>Shares outstanding</i>	<i>Fraction of period</i>	<i>Weighted- average shares</i>
1 July–31 August	6,280,000	² / ₃	4,186,666
<i>Exercise of warrants on 1 September</i>	<u>600,000</u>		
1 September–30 September	6,880,000	¹ / ₃	2,293,333
Weighted-average shares			6,480,000
<i>Basic EPS</i>			
Profit from continuing operations			CU0.15
Loss from discontinued operations			(CU0.31)
Loss			(CU0.16)
<i>Diluted EPS calculation</i>			
Profit from continuing operations attributable to ordinary equity holders of the parent entity			CU990,000
Plus: profit impact of assumed conversions			
Preference share dividends		CU10,000	
Effect of assumed conversions			CU10,000
Profit from continuing operations attributable to ordinary equity holders of the parent entity including assumed conversions			CU1,000,000
Loss from discontinued operations attributable to the parent entity			(CU2,000,000)
Loss attributable to ordinary equity holders of the parent entity including assumed conversions			(CU1,000,000)
Weighted-average shares			6,480,000
Plus: incremental shares from assumed conversions			
Warrants		61,538 ^(a)	
Convertible preference shares		<u>200,000</u>	
Dilutive potential ordinary shares			261,538
Adjusted weighted-average shares			6,741,538
<i>Diluted EPS</i>			
Profit from continuing operations			CU0.15
Loss from discontinued operations			(CU0.30)
Loss			(CU0.15)

(a) $[(CU65 - CU55) \div CU65] \times 600,000 = 92,308$ shares; $92,308 \times 2/3 = 61,538$ shares

Note: The incremental shares from assumed conversions are included in calculating the diluted per-share amounts for the loss from discontinued operations and loss even though they are antidilutive. This is because the control number (profit from continuing operations attributable to ordinary equity holders of the parent entity, adjusted for preference dividends) was positive (ie profit, rather than loss).

Fourth Quarter 20X1

<i>Basic EPS calculation</i>			CU
Loss from continuing operations attributable to the parent entity			(700,000)
Add: preference share dividends			(10,000)
Loss attributable to ordinary equity holders of the parent entity			(710,000)
<i>Dates</i>	<i>Shares outstanding</i>	<i>Fraction of period</i>	<i>Weighted- average shares</i>
1 October-31 December	6,880,000	$\frac{3}{3}$	6,880,000
Weighted-average shares			6,880,000
<i>Basic and diluted EPS</i>			
Loss attributable to ordinary equity holders of the parent entity			(CU0.10)

Note: The incremental shares from assumed conversions are not included in calculating the diluted per-share amounts because the control number (loss from continuing operations attributable to ordinary equity holders of the parent entity adjusted for preference dividends) was negative (ie a loss, rather than profit).

Full Year 20X1

<i>Basic EPS calculation</i>			CU
Profit from continuing operations attributable to the parent entity			11,800,000
Less: preference share dividends			(70,000)
Profit from continuing operations attributable to ordinary equity holders of the parent entity			11,730,000
Loss from discontinued operations attributable to the parent entity			(2,000,000)
Profit attributable to ordinary equity holders of the parent entity			9,730,000
<i>Dates</i>	<i>Shares outstanding</i>	<i>Fraction of period</i>	<i>Weighted- average shares</i>
1 January-28 February	5,000,000	$\frac{2}{12}$	833,333
<i>Issue of ordinary shares on 1 March</i>	200,000		
1 March-31 March	5,200,000	$\frac{1}{12}$	433,333
<i>Conversion of 5% bonds on 1 April</i>	480,000		
1 April-31 May	5,680,000	$\frac{2}{12}$	946,667
<i>Conversion of preference shares on 1 June</i>	600,000		
1 June-31 August	6,280,000	$\frac{3}{12}$	1,570,000
<i>Exercise of warrants on 1 September</i>	600,000		
1 September-31 December	6,880,000	$\frac{4}{12}$	2,293,333
Weighted-average shares			6,076,667
<i>Basic EPS</i>			
Profit from continuing operations			CU1.93
Loss from discontinued operations			(CU0.33)
Profit			CU1.60

Diluted EPS calculation

Profit from continuing operations attributable to ordinary equity holders of the parent entity		CU11,730,000
Plus: profit impact of assumed conversions		
Preference share dividends	CU70,000	
Interest on 5% convertible bonds	CU90,000 ^(a)	
Effect of assumed conversions		CU160,000
Profit from continuing operations attributable to ordinary equity holders of the parent entity including assumed conversions		CU11,890,000
Loss from discontinued operations attributable to the parent entity		(CU2,000,000)
Profit attributable to ordinary equity holders of the parent entity including assumed conversions		<u>CU9,890,000</u>

Diluted EPS

Profit from continuing operations	CU1.78
Loss from discontinued operations	(CU0.30)
Profit	<u>CU1.48</u>

(a) $(CU12,000,000 \times 5\%) \div 4$; less taxes at 40%.

(b) $[(CU57.125^* - CU55) \div CU57.125] \times 600,000 = 22,320$ shares; $22,320 \times 8/12 = 14,880$ shares*.
The average market price from 1 January 20X1 to 1 September 20X1.

(c) $(800,000 \text{ shares} \times 5/12) + (200,000 \text{ shares} \times 7/12)$.

(d) $480,000 \text{ shares} \times 3/12$.

The following illustrates how Company A might present its earnings per share data in its statement of comprehensive income. Note that the amounts per share for the loss from discontinued operations are not required to be presented in the statement of comprehensive income.

For the year ended 20X1

	<u>CU</u>
Earnings per ordinary share	
Profit from continuing operations	1.93
Loss from discontinued operations	(0.33)
Profit	<u>1.60</u>
Diluted earnings per ordinary share	
Profit from continuing operations	1.78
Loss from discontinued operations	(0.30)
Profit	<u>1.48</u>

The following table includes the quarterly and annual earnings per share data for Company A. The purpose of this table is to illustrate that the sum of the four quarters' earnings per share data will not necessarily equal the annual earnings per share data. The Standard does not require disclosure of this information.

	<i>First quarter</i>	<i>Second quarter</i>	<i>Third quarter</i>	<i>Fourth quarter</i>	<i>Full year</i>
	CU	CU	CU	CU	CU
Basic EPS					
Profit (loss) from continuing operations	0.98	1.10	0.15	(0.10)	1.93
Loss from discontinued operations	-	-	(0.31)	-	(0.33)
Profit (loss)	<u>0.98</u>	<u>1.10</u>	<u>(0.16)</u>	<u>(0.10)</u>	<u>1.60</u>
Diluted EPS					
Profit (loss) from continuing operations	0.80	1.00	0.15	(0.10)	1.78

Appendix C - Defined terms

Extract from IAS 33

- 5 The following terms are used in this Standard with the meanings specified:
- Antidilution* is an increase in earnings per share or a reduction in loss per share resulting from the assumption that convertible instruments are converted, that options or warrants are exercised, or that ordinary shares are issued upon the satisfaction of specified conditions.
- A *contingent share agreement* is an agreement to issue shares that is dependent on the satisfaction of specified conditions.
- Contingently issuable ordinary shares* are ordinary shares issuable for little or no cash or other consideration upon the satisfaction of specified conditions in a contingent share agreement.
- Dilution* is a reduction in earnings per share or an increase in loss per share resulting from the assumption that convertible instruments are converted, that options or warrants are exercised, or that ordinary shares are issued upon the satisfaction of specified conditions.
- Options, warrants and their equivalents* are financial instruments that give the holder the right to purchase ordinary shares.
- An *ordinary share* is an equity instrument that is subordinate to all other classes of equity instruments.
- A *potential ordinary share* is a financial instrument or other contract that may entitle its holder to ordinary shares.
- Put options* on ordinary shares are contracts that give the holder the right to sell ordinary shares at a specified price for a given period.

Overview

IAS 10 *Events after the Reporting Period*¹ sets out the circumstances in which financial statements must be adjusted for events which have happened after the reporting period, the disclosures an entity must give about the date on which the financial statements were authorised for issue, and the required disclosures relating to events after the reporting period.

Events after the reporting period are those events, both favourable and non-favourable, which occur between the last day of the reporting period and the date on which the financial statements are authorised for issue. IAS 10 divides such events into two categories: adjusting and non-adjusting events. Adjusting events provide evidence of conditions which existed at the end of the reporting period and, consequently, an entity is required to adjust the amounts recognised in its financial statements to reflect those events. This may require the recognition of a previously unrecognised item. Conversely, no adjustment is made for non-adjusting events, though disclosure is required for such events, to the extent that the events are material to the financial statements. [IAS 10.21].

IAS 10 does not permit an entity to prepare its financial statements on a going concern basis if events after the reporting period indicate that the going concern assumption is no longer appropriate.

What you need to know

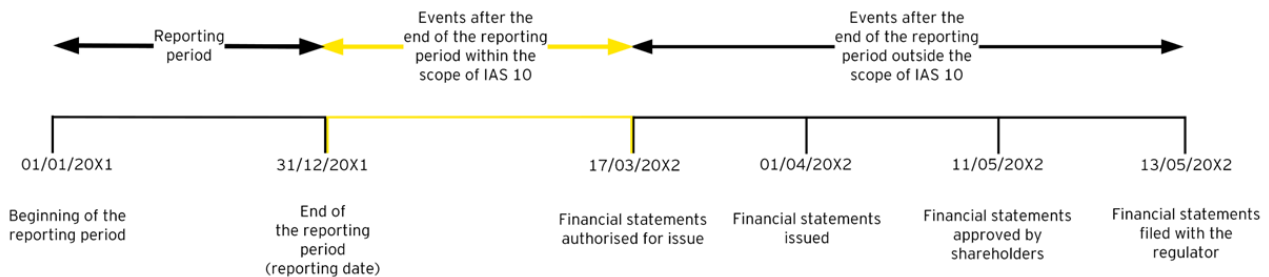

- IAS 10 identifies two types of events after the reporting period: adjusting and non-adjusting.
- Adjusting events are events which provide evidence of conditions which existed at the end of the reporting period; amounts recognised in financial statements are adjusted for such events.
- Non-adjusting events are indicative of conditions which arose after the reporting period, but before the financial statements were authorised for issue; amounts recognised in the financial statements are not adjusted for such events, but those events are required to be disclosed, to the extent material.
- When the going concern basis of accounting becomes inappropriate after the end of the reporting period, an entity is required to change its basis of accounting.

¹ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 *Presentation of Financial Statements* for reporting periods beginning on or after 1 January 2027 (with earlier application permitted), was issued by the IASB in April 2024, which incorporates amendments to paragraphs 13 and 16 of IAS 10, which merely entails replacing references from IAS 1 to the appropriate updated IFRS 18 and IAS 8(2027) *Basis of Preparation of Financial Statements* references. An entity shall apply these amendments when it applies IFRS 18. See Chapter 4 for further details on the new concepts and requirements of IFRS 18. [IAS 10(2027).13, IAS 10(2027).16, IAS 10(2027).23D].

1 Introduction

IAS 10 deals with accounting for, and disclosure of “those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue”. [IAS 10.2, IAS 10.3, IAS 10.7]. This definition includes all events occurring between those dates [IAS 10.7]. The principal issue is determining which of these events are required to be reflected in the financial statements as adjustments, which are material enough to require additional disclosure, and which require neither adjustment nor disclosure.

The following timeline illustrates events after the end of the reporting period that are within the scope of IAS 10 for an entity with a 31 December year-end:

The financial statements of an entity present, among other things, its financial position at the end of the reporting period. Therefore, it is appropriate to adjust the financial statements for all events that offer greater clarity about conditions that existed at the end of the reporting period (reporting date), and which occur prior to the date the financial statements are authorised for issue. The standard, therefore, requires entities to adjust the amounts recognised in the financial statements for ‘adjusting events’, events that provide evidence of conditions that existed at the end of the reporting period. [IAS 10.3(a), IAS 10.8]. By the same reasoning an entity does not recognise in the financial statements those events that relate to conditions that arose after the reporting period (‘non-adjusting events’). However, if non-adjusting events are material (that is, non-disclosure of the event could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements), certain disclosures are required. [IAS 10.3(b), IAS 10.10, IAS 10.21, IAS 1.7, IFRS 18 Appendix A, IAS 8.5, IAS 8(2027).5].

One exception to the general rule for non-adjusting events is when the going concern basis becomes inappropriate. This is always treated as an adjusting event. [IAS 10.1, IAS 10.14, IAS 10.15].

The requirements of IAS 10 and some practical issues resulting from these requirements are dealt with in section 2 and section 3 below, respectively.

Differences between the IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter as the standards are not converged. Therefore, differences between IFRS accounting standards and US GAAP may exist that are not discussed in this chapter.

2 Requirements of IAS 10

2.1 Objective, scope and definitions

Extract from IAS 10

Objective

- 1 The objective of this Standard is to prescribe:
- (a) when an entity should adjust its financial statements for events after the reporting period; and
 - (b) the disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the reporting period.
- The Standard also requires that an entity should not prepare its financial statements on a going concern basis if events after the reporting period indicate that the going concern assumption is not appropriate.

The standard does not permit an entity to prepare its financial statements on a going concern basis if events after the reporting period indicate that the going concern assumption is not appropriate. [IAS 10.1, IAS 10.14]. This requirement is discussed further in section 2.2.2 below. The going concern basis is discussed in Chapter 3.

IAS 10 defines events after the reporting period as “those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue”. [IAS 10.3]. This definition includes events that provide additional evidence about conditions that existed at the end of the reporting period, as well as those that provide evidence of conditions that only existed after the end of the reporting period. The former are adjusting events, the latter are non-adjusting events. [IAS 10.3]. Adjusting and non-adjusting events are discussed further in section 2.1.2 and section 2.1.3 below, respectively.

2.1.1 Date when financial statements are authorised for issue

Given the definition above, the meaning of “the date when the financial statements are authorised for issue” is important. The standard observes that the process for authorising financial statements for issue varies depending upon the management structure, statutory requirements and procedures followed in preparing and finalising the financial statements. [IAS 10.4].

The standard sets out two particular examples of different meanings of ‘authorised for issue’ as follows:

- (a) An entity may be required to submit its financial statements to its shareholders for approval after the financial statements have been issued. In such cases, the financial statements are authorised for issue on the date of issue, not the date when shareholders approve them. [IAS 10.5].
- (b) The management of an entity may be required to issue its financial statements to a supervisory board (made up solely of non-executives) for approval. Such financial statements are authorised for issue when management authorises them for issue to the supervisory board. [IAS 10.6].

These two meanings are shown in the following two illustrations, which are based on the illustrative examples in IAS 10. [IAS 10.5, IAS 10.6].

Illustration 2-1: Financial statements required to be approved by shareholders

The management of an entity completes draft financial statements for the year to 31 December 20X1 on 28 February 20X2. On 17 March 20X2, the board of directors reviews the financial statements and authorises them for issue. The entity announces its profit and certain other financial information on 18 March 20X2. The financial statements are made available to shareholders and others on 1 April 20X2. The shareholders approve the financial statements at their annual meeting on 11 May 20X2 and the approved financial statements are then filed with a regulatory body on 13 May 20X2.

The financial statements are authorised for issue on 17 March 20X2 (date of board authorisation for issue).

Illustration 2-2: Financial statements required to be approved by supervisory board

On 17 March 20X2, the management of an entity authorises for issue to its supervisory board financial statements for the year ended 31 December 20X1. The supervisory board consists solely of non-executives and may include representatives of employees and other outside interests. The supervisory board approves the financial statements on 25 March 20X2. The financial statements are made available to shareholders and others on 1 April 20X2. The shareholders approve the financial statements at their annual meeting on 11 May 20X2 and the financial statements are filed with a regulatory body on 13 May 20X2.

The financial statements are authorised for issue on 17 March 20X2 (date of management authorisation for issue to the supervisory board).

An uncommon, but possible, situation that can occur is that the financial statements are changed after they are authorised for issue to the supervisory board. The following Illustration demonstrates such a situation.

Illustration 2-3: Financial statements required to be approved by supervisory board - changes are made by supervisory board

This Illustration assumes the same facts as in Illustration 2-2 above, except that the supervisory board reviews the financial statements on 25 March 20X2 and proposes changes to certain note disclosures. The management of the entity incorporates the suggested changes and re-authorises those financial statements for issue to the supervisory board on 27 March 20X2. The supervisory board then approves the financial statements on 30 March 20X2.

The financial statements are authorised for issue on 27 March 20X2 (date of management re-authorisation for issue to the supervisory board). The financial statements were originally authorised for issue on 17 March 20X2 but have been amended and re-authorised on 27 March 20X2. This later date supersedes the original date.

As governance structures vary by jurisdiction, entities may be allowed to organise their procedures differently and adjust the financial reporting process accordingly.

An example of a company which is required to submit its financial statements to its shareholders for approval is Holcim Ltd, as illustrated in the following Practical example:

Practical example 2-1: Holcim Ltd (2023) Switzerland**2023 INTEGRATED ANNUAL REPORT [extract]****FINANCIAL INFORMATION [extract]****NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****21. Authorization of the financial statements for issuance**

The consolidated financial statements were authorized for issuance by the Board of Directors of Holcim Ltd on 27 February 2024 and are subject to shareholder approval at the Annual General Meeting of shareholders scheduled for 8 May 2024.

As discussed above, an entity may be required to issue its financial statements to a supervisory board (made up solely of non-executives) for approval. The phrase ‘made up solely of non-executives’ is not defined by the standard, but it is clear from an illustrative example in the standard that it contemplates representatives of employees and other outside interests. The standard also seems to draw a distinction between those responsible for the executive management of an entity (and the preparation of its financial statements) and those in a position of high-level oversight (including reviewing and approving the financial statements). This situation seems to describe the typical two-tier board system seen in some jurisdictions. An example of a company with this structure is Bayer Aktiengesellschaft, as illustrated in the following Practical example.

Practical example 2-2: Bayer Aktiengesellschaft (2023)	Germany
Annual Report 2023 [extract] A/Combined Management Report [extract] 4. Corporate Governance Report [extract] 4.1 Declaration by Corporate Management Pursuant to Sections 289f and 315d of the German Commercial Code [extract]

2.1.1.A Impact of preliminary reporting

The Illustration below discusses the date of authorisation, in situations where the entity releases preliminary information, but not complete financial statements, before the date of the authorisation for issue.

Illustration 2-4: Release of financial information before date of authorisation for issue

The management of an entity completes the primary financial statements for the year to 31 December 20X1 on 21 January 20X2, but has not yet completed the explanatory notes. On 26 January 20X2, the board of directors (which includes management and non-executives) reviews the primary financial statements and authorises them for public media release. The entity announces its profit and certain other financial information on 28 January 20X2. On 11 February 20X2, management issues the financial statements (with full explanatory notes) to the board of directors, which approves the financial statements for filing on 18 February 20X2. The entity files the financial statements with a regulatory body on 21 February 20X2.

The financial statements are authorised for issue on 18 February 20X2 (date the board of directors approves the financial statements for filing).

Illustration 2-4 shows that events after the reporting period include all events up to the date when the financial statements are authorised for issue, even if those events occur after the public announcement of profit or of other selected financial information. [IAS 10.7]. Accordingly, the information in the financial statements might differ from the equivalent information in a preliminary announcement.

2.1.1.B Re-issuing (dual dating) financial statements

IFRS accounting standards do not address whether and how an entity may amend its financial statements after they have been authorised for issue. Generally, such matters are dealt with in local laws or regulations.

If an entity re-issues financial statements (whether to correct an error or to include events that occurred after the financial statements were originally authorised for issue), there is a new date of authorisation for issue. The financial statements must then reflect, up to the new date of authorisation for issue:

- All adjusting events, by updating the amounts recognised in the financial statements
- Non-adjusting events, through additional disclosure

However, in certain circumstances, the re-issuing of previously issued financial statements is required by local regulators, particularly for inclusion in public offering and similar documents. In November 2012, the IFRS IC was asked to clarify the accounting implications of applying IAS 10 when previously issued financial statements are re-issued in connection with an offering document.²

In May 2013, the IFRS IC responded that:

- The scope of IAS 10 is the accounting for, and disclosure of, events after the reporting period and that the objective of this Standard is to prescribe both of the following:
 - (a) When an entity should adjust its financial statements for events after the reporting period
 - (b) The disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the reporting period
- Financial statements prepared in accordance with IAS 10 should reflect all adjusting and non-adjusting events up to the date that the financial statements were authorised for issue.
- IAS 10 does not address the presentation of re-issued financial statements in an offering document when the originally issued financial statements have not been withdrawn, but the re-issued financial statements are provided either as supplementary information or a re-presentation of the original financial statements in an offering document in accordance with regulatory requirements.

The IFRS IC decided not to add this issue to its agenda on the basis of the response above and because the issue arises in multiple jurisdictions, each with particular securities laws and regulations which may dictate the form for re-presentations of financial statements.³

Accordingly, depending on the particular regulatory requirements in a given jurisdiction, there may be variations in how re-issued financial statements are presented.

2.1.2 Adjusting events

Adjusting events are “those that provide evidence of conditions that existed at the end of the reporting period.” [IAS 10.3(a)].

Examples of adjusting events are as follows:

- (a) The settlement after the reporting period of a court case that confirms that the entity had a present obligation at the end of the reporting period. In this situation, an entity adjusts any previously recognised provision related to this court case in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* or recognises a new provision. Mere disclosure of a contingent liability is not sufficient because the settlement provides additional evidence of conditions that existed at the end of the reporting period that would give rise to a provision in accordance with IAS 37 (see Chapter 27).
- (b) The receipt of information after the reporting period indicating that an asset was impaired at the end of the reporting period, or that the amount of a previously recognised impairment loss for that asset needs to be adjusted. For example:
 - (i) The bankruptcy of a customer that occurs after the reporting period usually confirms that the customer was credit-impaired at the end of the reporting period (this is discussed further in section 3.3 below).
 - (ii) The sale of inventories after the reporting period may give evidence about their net realisable value at the end of the reporting period.
- (c) The determination after the reporting period of the cost of assets purchased, or the proceeds from assets sold, before the end of the reporting period.
- (d) The determination after the reporting period of the amount of profit-sharing or bonus payments, if the entity had a present legal or constructive obligation at the end of the reporting period to make such payments as a result of events before that date (see Chapter 31).
- (e) The discovery of fraud or errors that show that the financial statements are incorrect (see section 3.4 below). [IAS 10.9].

² [IFRIC Update](#), November 2012, available on the IFRS Foundation's website.

³ [IFRIC Update](#), May 2013, available on the IFRS Foundation's website.

In addition, IFRIC 23 *Uncertainty over Income Tax Treatments* requires entities to apply IAS 10 to determine whether changes in facts and circumstances or new information after the reporting period gives rise to an adjusting or non-adjusting event for reassessing a judgement or estimate of an uncertain tax position. [IFRIC 23.14, IFRIC 23(2027).14]. An event would be considered adjusting if the change in facts and circumstances or new information after the reporting period provided evidence of conditions that existed at the end of the reporting period (see section 3.5 below).

Another standard which requires an adjustment for certain transactions after the reporting period is IAS 33 *Earnings per Share*. This standard requires an adjustment to earnings per share for certain share transactions after the reporting period (such as bonus issues, share splits or reverse share splits (share consolidations) as discussed in Chapter 33), even though the transactions themselves are non-adjusting events (see section 2.1.3 below). [IAS 10.22(f)].

2.1.3 Non-adjusting events

The standard states that non-adjusting events are “those that are indicative of conditions that arose after the reporting period”. [IAS 10.3(b)].

Examples of non-adjusting events after the reporting period are as follows:

- (a) A major business combination (IFRS 3 *Business Combinations* requires specific disclosures in such cases, see Chapter 10) or disposing of a major subsidiary
- (b) Announcing a plan to discontinue an operation
- (c) Major purchases of assets, classification of assets as held for sale in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*, other disposals of assets, or expropriation of major assets by government (see Chapter 5 for certain disclosures that are required to be made)
- (d) The destruction of a major production plant by a fire
- (e) Announcing, or commencing the implementation of, a major restructuring (discussed in Chapter 27)
- (f) Major ordinary share transactions and potential ordinary share transactions (although as noted in section 2.1.2 above, some transactions in ordinary shares are adjusting events for the purposes of computing earnings per share)
- (g) Abnormally large changes in asset prices or foreign exchange rates
- (h) Changes in tax rates or the enactment or announcement of tax laws that significantly affect current and deferred tax assets and liabilities (discussed in Chapter 29)
- (i) Entry into significant commitments or contingent liabilities, for example, by issuing significant guarantees
- (j) Start of major litigation arising solely out of events that occurred after the reporting period
- (k) A decline in fair value of investments
- (l) A declaration of dividends to holders of equity instruments (as defined in IAS 32 *Financial Instruments: Presentation* discussed in Chapter 43)
- (m) A subsequent refinancing on a long-term basis of a liability classified as current
- (n) A subsequent rectification of a breach of a long-term loan arrangement classified as current
- (o) A subsequent granting by the lender of a period of grace to rectify a breach of a long-term loan arrangement classified as current
- (p) A subsequent settlement of a liability classified as non-current
- (q) A contingent asset becoming virtually certain after the end of the reporting period (discussed in Chapter 27) [IAS 10.11, IAS 10.12, IAS 10.13, IAS 10(2027).13, IAS 10.22, IAS 1.76, IFRS 18.B105, IAS 37.35]

The reference in (a) and (c) above to asset disposals as examples of non-adjusting events is not quite the whole story as these may indicate an impairment of assets, which may be an adjusting event. Such events would be considered an impairment indicator, if they provide additional evidence of conditions which existed at the balance sheet date. In addition, (b) and (e) above regarding announcements of plans to discontinue an operation or to restructure a business, respectively, may also lead to an impairment charge (see Chapter 21).

IFRS 5 makes it clear that the held for sale criteria must be met at the reporting date for a non-current asset (or disposal group) to be classified as held for sale in those financial statements. However, if those criteria are met after the reporting date but before the authorisation of the financial statements for issue, IFRS 5 requires certain additional disclosures (see Chapter 5). [IFRS 5.12].

Information provided under (i) above, will be in addition to the disclosures required by other standards of commitments which exist at the reporting date. For example, IAS 16 *Property, Plant and Equipment* and IAS 38 *Intangible Assets* require commitments for the acquisition of property, plant and equipment and intangible assets to be disclosed (see Chapter 19 and Chapter 18). [IAS 16.74(c), IAS 38.122(e)]. IFRS 16 *Leases* requires a lessee to disclose the amount of its lease commitments for short-term leases if the portfolio of short-term leases to which it is committed at the end of the reporting period is dissimilar to the portfolio of short-term leases for which current period short-term lease expense disclosure is provided (see Chapter 24). [IFRS 16.55].

For declines in fair value of investments, as in (k) above, the standard notes that such declines do not normally relate to the condition of the investments at the end of the reporting period, but reflects circumstances that arose subsequently. Therefore, in those circumstances, the amounts recognised in financial statements for the investments are not adjusted. Similarly, the standard states that an entity does not update the amounts disclosed for the investments as at the end of the reporting period, although it may need to give additional disclosure, if material, as discussed in section 2.3 below. [IAS 10.11].

However, the assertion that a decline in fair value of investments does not normally relate to conditions at the end of the reporting period is similar wording to that used for bankruptcy and the sale of inventories (see section 2.1.2 above). Therefore, it requires an assessment of the circumstances in order to determine which conditions actually existed at the end of the reporting period - although this can be difficult in practice, particularly when fraud is involved (see section 3.4 below).

In addition to the examples of non-adjusting events in IAS 10, IFRIC 23 requires entities to apply IAS 10 to determine whether changes in facts and circumstances or new information after the reporting period gives rise to an adjusting or non-adjusting event when reassessing a judgement or estimate of an uncertain tax position. [IFRIC 23.14, IFRIC 23(2027).14]. An event is only considered non-adjusting if the change in facts and circumstances or new information after the reporting period is indicative of conditions that arose after the reporting period (see section 3.5 below).

The subsequent rectification of a breach in a long-term loan arrangement (n) is not an adjusting event and therefore, does not change the classification of the liability in the statement of financial position from current to non-current (see section 2.3.2 below). [IAS 1.76(b), IFRS 18.B105(b)].

In January 2020, the IASB issued amendments to IAS 1 *Presentation of Financial Statements*⁴, effective for annual reporting periods beginning on or after 1 January 2024, to specify the requirements for classifying liabilities as current or non-current. Paragraph 75A was added to clarify that the classification of a liability is not affected by the likelihood that the entity will exercise its right to defer settlement of the liability for at least twelve months after the reporting date [IAS 1.75A, IFRS 18.B104]. This applies even if settlement has occurred between the end of the reporting period and the date the financial statements are authorised for issue (see Chapter 3). Reflecting these amendments, the subsequent settlement of a liability classified as non-current (p) was also included in the list of events in paragraph 76 of IAS 1 that may require disclosure in accordance with IAS 10 [IAS 1.76(d), IFRS 18.B105(d)]. At the same time, the wording of the other examples of non-adjusting events was also amended to clarify that these events (see (m), (n) and (o) in the list above) refer to liabilities classified as current.

Another example of a non-adjusting event not mentioned by IAS 10 is where a contingent asset becomes virtually certain after the end of the reporting period. If the inflow of economic benefits from a contingent asset has become virtually certain, IAS 37 indicates that the asset and the related income must be recognised in the period in which the change occurs. The requirement to recognise the effect of changing circumstances in the period in which the change occurs extends to the analysis of information available after the end of the reporting period, but before the date when the financial statements are authorised for issue. In contrast to contingent liabilities, adjustments must not be made to reflect the subsequent settlement of a legal claim in favour of the entity, since the period in which the change occurs is after the end of the reporting period. An asset can only be recognised if, the entity can show that, at the end of the reporting period, it was virtually certain that its claim would succeed (see Chapter 27). [IAS 37.35].

4 IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

2.1.3.A Dividend declaration

Extract from IAS 10

Dividends

- | | |
|----|---|
| 12 | If an entity declares dividends to holders of equity instruments (as defined in IAS 32 <i>Financial Instruments: Presentation</i>) after the reporting period, the entity shall not recognise those dividends as a liability at the end of the reporting period. |
| 13 | If dividends are declared after the reporting period but before the financial statements are authorised for issue, the dividends are not recognised as a liability at the end of the reporting period because no obligation exists at that time. Such dividends are disclosed in the notes in accordance with IAS 1 <i>Presentation of Financial Statements</i> . |

In respect of dividend declarations, as in (l) in section 2.1.3 above, dividends are only recognised as a liability if declared by the end of the reporting period. [IAS 10.12, IAS 10.13, IAS 10(2027).13].

As a consequential amendment to IAS 10, the definition of 'declared' in this context was moved to IFRIC 17 *Distributions of Non-cash Assets to Owners*. IFRIC 17 did not change the principle regarding the appropriate timing for the recognition of dividends payable. [IFRIC 17.BC18, IFRIC 17.BC19, IFRIC 17.BC20]. It states that an entity recognises a liability to pay a dividend when the dividend is appropriately authorised and is no longer at the discretion of the entity, which is the date:

- When declaration of the dividend, e.g., by management or the board of directors, is approved by the relevant authority, e.g., the shareholders, if the jurisdiction requires such approval
- Or
- When the dividend is declared, e.g., by management or the board of directors, if the jurisdiction does not require further approval [IFRIC 17.10].

How we see it

In many jurisdictions, the directors may keep discretion to cancel an interim dividend until such time as it is paid. In this case, the interim dividend is not declared (within the meaning described above), and is, therefore, not recognised until paid. Final dividends proposed by directors, in many jurisdictions, are only binding when approved by shareholders in general meeting or by the members passing a written resolution. Therefore, such a final dividend is only recognised as a liability when declared, i.e., approved by the shareholders at the annual general meeting or through the passing of a resolution by the members of an entity.

IAS 10 contains a reminder that an entity discloses dividends, both proposed and declared after the reporting period but before the financial statements are authorised for issue, in the notes to the financial statements in accordance with IAS 1 (see Chapter 3). [IAS 1.137, IFRS 18.132, IAS 10.13, IAS 10(2027).13].

Similar issues arise regarding the declaration of dividends by subsidiaries, associates and other equity investments. Although IAS 10 does not specifically address such items, IFRS 9 *Financial Instruments* requires a shareholder to recognise dividends when the shareholder's right to receive payment is established, it is probable that the economic benefits associated with the dividend will flow to the shareholder and the dividend can be measured reliably (see Chapter 46). [IFRS 9.5.7.1A].

Similarly, IAS 27 *Separate Financial Statements* also contains this general principle in recognising in an entity's separate financial statements those dividends received from subsidiaries, joint ventures or associates when its right to receive the dividend is established (see Chapter 9). [IAS 27.12].

Accordingly, a shareholder does not recognise such dividend income until the period in which the dividend is declared.

2.2 The treatment of adjusting events

2.2.1 Events requiring adjustment to the amounts recognised, or disclosures, in the financial statements

IAS 10 requires that the amounts recognised in the financial statements be adjusted to take account of an adjusting event. [IAS 10.8].

The standard also notes that an entity may receive information after the reporting period about conditions existing at the end of the reporting period relating to disclosures made in the financial statements but not affecting the amounts recognised in them. [IAS 10.20]. In such cases, the standard requires the entity to update the disclosures that relate to those conditions for the new information. [IAS 10.19].

For example, evidence may become available after the reporting period about a contingent liability that existed at the end of the reporting period. In addition to considering whether to recognise or change a provision under IAS 37, IAS 10 requires an entity to update its disclosures about the contingent liability for that evidence. [IAS 10.20].

2.2.2 Events indicating that the going concern basis is not appropriate

If management determines after the reporting period (but before the financial statements are authorised for issue) either that it intends to liquidate the entity or to cease trading, or that it has no realistic alternative but to do so, the financial statements must not be prepared on a going concern basis. [IAS 10.14].

Deterioration in operating results and financial position after the reporting period may indicate a need to consider whether the going concern assumption is still appropriate. If the going concern assumption is no longer appropriate, the standard states that the effect is so pervasive that it results in a fundamental change in the basis of accounting, rather than an adjustment to the amounts recognised within the original basis of accounting. [IAS 10.15]. As discussed in Chapter 3, IFRS accounting standards contains no guidance on this 'fundamental change in the basis of accounting'. Accordingly, entities will need to consider carefully their individual circumstances to arrive at an appropriate basis.

The standard also contains a reminder of the specific disclosure requirements under IAS 1:

- (a) When the financial statements are not prepared on a going concern basis, that fact must be disclosed, together with the basis on which the financial statements have been prepared and the reason why the entity is not regarded as a going concern.
- (b) When management is aware of material uncertainties related to events or conditions that may cast significant doubt upon the entity's ability to continue as a going concern, disclosure of those uncertainties must be made. [IAS 10.16(a), IAS 10(2027).16(a), IAS 10.16(b), IAS 10(2027).16(b), IAS 1.25, IAS 8(2027).6K, IAS 1.26, IAS 8(2027).6L].

While IFRS accounting standards are generally written from the perspective that an entity is a going concern, they are also applicable when another basis of accounting is used to prepare financial statements. Various IFRS accounting standards acknowledge that financial statements may be prepared on either a going concern basis or an alternative basis of accounting. [IAS 1.25, IAS 8(2027).6K, IAS 10.14, CF 3.9]. Such IFRS accounting standards do not specifically exclude the application of IFRS accounting standards when an alternative basis of accounting is used. As a result, financial statements prepared on a 'non-going concern' basis of accounting may be described as complying with IFRS accounting standards as long as that other basis of preparation is sufficiently described. [IAS 1.25, IAS 8(2027).6K]. This is further discussed in Chapter 3. Regarding the requirement in (b) above, the events or conditions requiring disclosure may arise after the reporting period. [IAS 10.16(b), IAS 10(2027).16(b)].

2.3 The treatment of non-adjusting events

IAS 10 prohibits the adjustment of amounts recognised in financial statements to reflect non-adjusting events. [IAS 10.10]. It indicates that if non-adjusting events are material, non-disclosure could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements. Accordingly, an entity must disclose the following for each material category of non-adjusting event:

- (a) The nature of the event
- (b) An estimate of its financial effect, or a statement that such an estimate cannot be made [IAS 10.21]

To illustrate how these requirements have been applied in practice, two Practical examples of disclosure for commonly occurring types of non-adjusting events are given below.

Practical example 2-3 below contains an example of the disclosures required for a business combination (example (a) in section 2.1.3 above). The requirement for the specific disclosures illustrated below is in IFRS 3.B66 (see Chapter 10):

Practical example 2-3: Byggfakta Group Nordic HoldCo AB (publ) (2022) Sweden

Byggfakta Group Annual & Sustainability Report [extract]

Notes to the consolidated financial statements [extract]

NOTE 37 Significant events since the end of the financial year

On 3 April through its subsidiary BCI Central, Byggfakta Group acquired all shares in the American company Pantera Global Technology, Inc. (Pantera). Pantera's offering focuses on procurements in the commercial construction sector.

In 2022, Pantera had sales of approximately MUSD 1.8 with a strong EBITDA margin. Over 80% of the company's total revenue comprises subscription revenue.

On 13 February 2023, approximately 73% of the shares were acquired in the Norwegian company 4Cast Group AS. Through its subsidiaries Prognosesenteret AS in Norway and Prognoscentret AB in Sweden, 4Cast Group is the Nordic leader in market analysis and forecasting for the construction and civil engineering market, and will be consolidated into Byggfakta Group's operating segment, Construction solutions – Nordic.

4Cast Group AS has 48 employees and sales in 2022 of approximately MNOK 86 together with a healthy EBITDA margin. Approximately 70% of the company's total revenue comprises subscription revenue.

The company will be fully consolidated as binding put/call option agreements are in place for the acquisition of the remaining part of the company.

From the acquisition date until 31 December 2023, 4Cast Group is expected to contribute net sales amounting to MSEK 91.

If the acquisition of 4Cast Group had occurred at the start of 2023, the contribution to the Group's net sales would have been MSEK 109. The acquisition is expected to contribute MSEK 11 to Byggfakta Group's operating profit. If the acquisition had occurred at the start of 2023, the contribution to the Group's operating profit would have been MSEK 14.

The surplus values that arose in connection with the acquisition refer to customer relationships and brands. Customer relationships have an estimated useful life of ten years and are amortised over ten years.

Brands are estimated to have indefinite useful lives and are not amortised over time, since they are well established in the industry and business is expected to be conducted under these brands in the foreseeable future.

Goodwill is attributable to synergies and personnel. No part of goodwill will be tax deductible.

The preliminary operating profit for 2023 will include acquisition-related costs of MSEK 3 that will be included in other external expenses in the consolidated statement of comprehensive income and in operating activities in the cash-flow statement for 2023.

MSEK	Preliminary acquisition analysis
Intangible assets	174.9
Other current assets	31.4
Cash and cash equivalents	59.4
Deferred tax	-35.1
Other liabilities	-43.2
Net fair value of acquired assets and assumed liabilities	187.4
Goodwill	299.7
Total purchase consideration	487.1
Unpaid purchase consideration for the remainder of the company	-160.7
Acquisition-related costs	3.3
Cash and cash equivalents in acquired companies	-59.4
Net cash flow from acquisitions of Group companies	270.3

Practical example 2-4 below contains an example of the disclosure of major ordinary share transactions after the reporting period (example (f) in section 2.1.3 above):

Practical example 2-4: NP3 Fastigheter AB (publ) (2022)	Sweden
Annual Report 2022 [extract]	
Notes [extract]	
Note 29 Significant events after the end of the financial year	
In mid-February, a directed new share issue of 2,750,000 ordinary shares was carried out at a price of 230 SEK per share. This provided the company with 632.5 MSEK, which boosts the balance sheet and provides increased flexibility ahead of the loans falling due and provides an opportunity to make value-creating investments in existing properties and new production projects and to act on attractive acquisition opportunities. The new share issue was substantially	oversubscribed and means that the number of shares in the company increases from 92,607,856 shares to 95,357,856 shares, distributed into 57,357,856 ordinary shares and 38,000,000 preference shares. The company's share capital increases from 324,127,496 SEK to 333,752,496 SEK. The new share issue results in dilution of 2.9 percent of the shares and 4.5 percent of the votes in relation to the total number of shares outstanding, or votes after the new share issue, respectively.

It is important to note that the list of examples of non-adjusting events in IAS 10, and summarised in section 2.1.3 above, is not an exhaustive one; IAS 10 requires disclosure of any material non-adjusting event. [IAS 10.21].

2.3.1 Declaration to distribute non-cash assets to owners

When an entity declares a dividend to distribute a non-cash asset to owners after the end of a reporting period but before the financial statements are authorised for issue, IFRIC 17 requires an entity to disclose: [IFRIC 17.17]

- (a) The nature of the asset to be distributed
- (b) The carrying amount of the asset to be distributed as of the end of the reporting period
- (c) The fair value of the asset to be distributed as of the end of the reporting period, if it is different from its carrying amount, and the following information about the method(s) used to measure that fair value:
 - (i) The level of the fair value hierarchy within which the fair value measurement is categorised (Level 1, 2 or 3). [IFRS 13.93(b)].
 - (ii) For fair value measurements categorised within Level 2 and Level 3 of the fair value hierarchy, a description of the valuation technique(s) and the inputs used in the fair value measurement. If there has been a change in valuation technique (e.g., changing from a market approach to an income approach or the use of an additional valuation technique), the entity must disclose that change and the reason(s) for making it. For fair value measurements categorised within Level 3 of the fair value hierarchy, quantitative information about the significant unobservable inputs used in the fair value measurement must be provided. An entity is not required to create quantitative information to comply with this disclosure requirement if quantitative unobservable inputs are not developed by the entity when measuring fair value (e.g., when an entity uses prices from prior transactions or third-party pricing information without adjustment). However, when providing this disclosure, the quantitative unobservable inputs that are significant to the fair value measurement and are reasonably available to the entity must not be ignored. [IFRS 13.93(d)].

- (iii) For fair value measurements categorised within Level 3 of the fair value hierarchy, a description of the valuation processes used by the entity (including, for example, how an entity decides its valuation policies and procedures and analyses changes in fair value measurements from period to period). [IFRS 13.93(g)].
- (iv) If the highest and best use of the non-financial asset differs from its current use, an entity must disclose that fact and why the non-financial asset is being used in a manner that differs from its highest and best use. [IFRS 13.93(i)].

In the case of (c) above, any quantitative disclosures are required to be presented in a tabular format, unless another format is more appropriate. [IFRS 13.99]. Fair value measurement is further discussed in Chapter 15.

2.3.2 Breach of a long-term loan arrangement and its subsequent rectification

When an entity breaches a provision of a long-term loan arrangement on or before the end of the reporting period with the effect that the liability becomes payable on demand, it classifies the liability as current in its statement of financial position (see Chapter 3). [IAS 1.74, IFRS 18.B102]. This may also give rise to going concern uncertainties (see section 2.2.2 above).

It is not uncommon that such covenant breaches are subsequently rectified; however, a subsequent rectification is not an adjusting event and therefore, does not change the classification of the liability in the statement of financial position from current to non-current.

IAS 1 requires disclosure of the following events if they occur between the end of the reporting period and the date the financial statements are authorised for issue:

- Refinancing on a long-term basis of a liability classified as current
- Rectification of a breach of a long-term loan arrangement classified as current
- The granting by the lender of a period of grace to rectify a breach of a long-term loan arrangement classified as current
- Settlement of a liability classified as non-current (see Chapter 3) [IAS 1.76, IFRS 18.B105]

The amendments to IAS 1 issued in January 2020 effective for annual reporting periods beginning on or after 1 January 2024 included clarifications of the above list of subsequent events and added the 'settlement of a liability classified as non-current' to this list (see Chapter 3).

2.4 Other disclosure requirements

The disclosures required in respect of non-adjusting events are discussed in section 2.3 above. As IAS 10 only requires consideration to be given to events that occur up to the date when the financial statements are authorised for issue, it is important for users to know that date, since the financial statements do not reflect events after that date. [IAS 10.18]. Accordingly, IAS 10 requires disclosure of the date the financial statements were authorised for issue. Furthermore, it requires disclosure of who authorised the financial statements for issue and, if the owners of the entity or others have the power to amend them after issue, disclosure of that fact. [IAS 10.17]. In practice, this information can be presented in a number of ways:

- (a) On the face of a primary statement (for example, entities that are required to have the statement of financial position signed could include the information at that point)
- (b) In the note dealing with other IAS 10 disclosures or another note (such as the summary of significant accounting policies)
- (c) In a separate statement such as a statement of directors' responsibilities for the financial statements (that is, outside of the financial statements as permitted in certain jurisdictions)

How we see it

Strictly speaking, this information is required to be presented within the financial statements. So, if (c) above were chosen, either the whole statement of directors' responsibilities would need to be part of the financial statements or the information could be incorporated by way of a cross-reference.

In addition to the IAS 10 disclosure requirements, other standards may require disclosures to be provided about future events, for example, IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*⁵ requires disclosure of the expected impact of new standards that are issued but are not yet effective at the reporting date (see Chapter 3). [IAS 8.30, IAS 8.31].

⁵ The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

3 Practical issues

The standard does address certain practical matters through examples of adjusting and non-adjusting events. For example, the standard asserts that the bankruptcy of a customer that occurs after the reporting period would usually be an adjusting event (see section 2.1.2 above). It also states that a decline in fair value of investments after the reporting period does not normally relate to conditions at the end of the reporting period and therefore, would be a non-adjusting event (see section 2.1.3 above). Judgement of the facts and circumstances is required to determine whether an event that occurs after the reporting period provides evidence about a condition that existed at the end of the reporting period, or whether the condition arose subsequent to the reporting period. The following sections address some commonly encountered practical issues.

3.1 Valuation of inventory

The sale of inventories after the reporting period is normally a good indicator of their net realisable value (NRV) at that date. IAS 10 states that such sales “may give evidence about their net realisable value at the end of the reporting period”. [IAS 10.9(b)(ii)]. However, in some cases, NRV decreases because of conditions that did not exist at the end of the reporting period.

Therefore, it is important to determine why NRV decreased. Did it decrease because of circumstances that existed at the end of the reporting period, which subsequently became known, or did it decrease because of circumstances that arose after the end of the reporting period? A decrease in price is merely a response to changing conditions so it is important to assess the reasons for, and timing of, these changes.

Some examples of changing conditions are as follows:

- (a) Price reductions caused by a sudden increase in cheap imports

Whilst it is arguable that the ‘dumping’ of cheap imports after the reporting period is a condition that arises subsequent to that date, it is more likely that this is a reaction to a condition that already existed such as overproduction in other parts of the world. Thus, it might be more appropriate in such a situation to adjust the value of inventories based on its subsequent NRV.

- (b) Price reductions caused by increased competition

The reasons for price reductions and increased competition do not generally arise overnight but normally occur over a period. For example, a competitor may have built up a competitive advantage by investing in machinery that is more efficient. In these circumstances, it is appropriate for an entity to adjust the valuation of its inventories because this situation existed at the end of the reporting period.

- (c) Price reductions caused by the introduction of an improved competitive product

It is unlikely that a competitor developed and introduced an improved product overnight. Therefore, it is appropriate to adjust the valuation of inventories held at the end of the reporting period to their NRV after that introduction because the entity’s failure to maintain its competitive position in relation to product improvements existed at the end of the reporting period.

Price reductions after the reporting period caused by increased competition are generally evidence of conditions that existed at the end of the reporting period. For certain types of inventory, however, there may be clear evidence of a price at the end of the reporting period. If this is the case, it is inappropriate to adjust the NRV of that inventory to reflect a subsequent decline. An example is inventories for which there is a price on an active commodities market. In addition, inventory may be physically damaged or destroyed after the reporting period (e.g., by fire, flood, or other disaster). In these cases, the entity does not adjust the financial statements. However, the entity may be required to disclose the subsequent decline in NRV of the inventories if the impact is material (see section 2.3 above).

3.2 Over time measurement of progress

Events after the reporting period frequently give evidence about the profitability of contracts with customers, which are in progress at the end of the reporting period and where revenue is recognised over time.

IFRS 15 *Revenue from Contracts with Customers* requires an assessment to be made of the progress towards complete satisfaction of performance obligations satisfied over time (see Chapter 28). [IFRS 15.40]. In such an assessment, consideration must be given to events that occur after the reporting period and a determination must be made as to whether they are adjusting or non-adjusting events for which the financial effect is included in the method used to measure progress over time.

3.3 Insolvency of a debtor and IFRS 9 expected credit losses

The insolvency of a debtor or inability to pay debts usually builds up over a period. IAS 10 states that the bankruptcy of a customer that occurs after the reporting period usually confirms that the customer was credit-impaired (Stage 3 under the IFRS 9 general approach - refer to Chapter 47) at the end of the reporting period. [IAS 10.9(b)(i)]. If, however, there is evidence to show that the insolvency of the debtor resulted solely from an event occurring after the reporting period, then the event is a non-adjusting event. If the impact is material, the entity will be required to disclose the nature and effect of the debtor's default (see section 2.3 above).

Frequently asked questions

Question 3-1: Must an entity incorporate events and forecasts that occur between the reporting date and the date the financial statements are authorised for issue, when applying the impairment requirements of IFRS 9?

In April 2015, the IFRS Transition Resource Group for Impairment of Financial Instruments (ITG)⁶ discussed whether, and if so how, to incorporate events and forecasts that occur between the reporting date and the date the financial statements are authorised for issue, when applying the impairment requirements of IFRS 9 at the reporting date. The ITG noted that if new information becomes available between the reporting date and the date of signing the financial statements, an entity needs to apply judgement, based on the specific facts and circumstances, to determine whether it is an adjusting or non-adjusting event in accordance with IAS 10. This is further discussed in Chapter 47.

3.4 Discovery of fraud after the reporting period

The timing of when fraud is discovered will affect the accounting considerations. When fraud is discovered after the end of the reporting period, but before the financial statements have been authorised for issue, the discovery of fraud is often an adjusting event, i.e., an event that provides evidence of conditions that existed at the reporting date (see section 2.1.2 above). [IAS 10.9]. However, the discovery of fraud may also be a non-adjusting event. For example, for investments the discovery of fraud may affect the fair value of the assets subsequent to the discovery of the fraud, but not their fair values on the reporting date.

When fraud is discovered after the financial statements have been authorised for issue this may indicate prior period errors. Application of the IAS 8 definition of a 'prior period error' (see Chapter 3) in the case of fraud requires the exercise of judgement. Facts and circumstances must be evaluated to determine if the discovery of the fraud resulted from a previous failure to use, or misuse of, reliable information, or from new information that was available at the time the financial statements were authorised for issue and was reasonably expected to have been obtained and taken into account in the preparation of the financial statements. [IAS 8.5, IAS 8(2027).5].

3.5 Changes to estimates of uncertain tax treatments

IFRIC 23 addresses how to reflect uncertainty in accounting for income taxes. It requires an entity to reassess any judgement or estimate relating to an uncertain tax treatment if the facts and circumstances on which the judgement or estimate was based change, or as a result of new information that affects the judgement or estimate. In cases where the change in facts and circumstances or new information occurs after the reporting period, the interpretation requires an entity to apply IAS 10 to determine whether the change gives rise to an adjusting or non-adjusting event, as set out in sections 2.1.2 and 2.1.3 above.

[IFRIC 23.13, IFRIC 23.14, IFRIC 23(2027).14].

⁶ See Chapter 47.

Examples of changes in facts and circumstances or new information that could result in the reassessment of a judgement or estimate required by IFRIC 23 include, but are not limited to, the following:

- (a) Examinations or actions by a taxation authority. For example:
 - (i) Agreement or disagreement by the taxation authority with the tax treatment or a similar tax treatment used by the entity
 - (ii) Information that the taxation authority has agreed or disagreed with a similar tax treatment used by another entity
 - (iii) Information about the amount received or paid to settle a similar tax treatment
- (b) Changes in rules established by a taxation authority
- (c) The expiry of a taxation authority's right to examine or re-examine a tax treatment [IFRIC 23.A2]

A change in rules established by a taxation authority after the reporting period constitutes a non-adjusting event (see section 2.1.3 above). [IAS 10.22(h)]. An entity must apply IAS 10 to determine whether any other change that occurs after a reporting period is an adjusting or non-adjusting event. The requirements of IFRIC 23 are further discussed in Chapter 29.

---------------	--	------

Appendix C - Defined terms

Extract from IAS 10

- 3 The following terms are used in this Standard with the meanings specified:
- Events after the reporting period* are those events, favourable and unfavourable, that occur between the end of the reporting period and the date when the financial statements are authorised for issue. Two types of events can be identified:
- (a) those that provide evidence of conditions that existed at the end of the reporting period (*adjusting events after the reporting period*); and
 - (b) those that are indicative of conditions that arose after the reporting period (*non-adjusting events after the reporting period*).

Overview

This chapter addresses the requirements of IAS 24 *Related Party Disclosures*. IAS 24 defines related party relationships and transactions and sets out the relevant disclosure requirements. It is important to note that the standard does not address the accounting for such items; the transactions themselves are accounted for under the relevant IFRS accounting standard.

The aim of IAS 24 is to ensure that an entity's financial statements contain the disclosures necessary to draw attention to the possibility that its financial position and profit or loss may have been affected by the existence of related parties and by transactions and outstanding balances, including commitments, with such parties. Related parties may enter into transactions and accept or demand terms which unrelated parties would not. It is hard to assess whether a transaction is at fair value between related parties, as it may never have been entered into, had it not been for the related party relationship. As a result, disclosure of any such relationships, transactions, outstanding balances and commitments is important for users of an entity's financial statements to make an assessment of its financial position and profit and loss, as well as the risks and opportunities to which that entity is exposed.

IAS 24 provides a wide-ranging definition of what constitutes a related party; a related party could be a person or an entity that is related to the entity preparing its financial statements (reporting entity) if the person or entity has control, joint control or significant influence over the reporting entity, or is a member of the reporting entity's key management personnel.

A related party transaction is defined in the standard as "a transfer of resources, services or obligations between a reporting entity and a related party, regardless of whether a price is charged". [IAS 24.9]. Should an entity have related party transactions during the periods covered by the financial statements, it must disclose the nature of the related party relationship as well as information about those transactions and outstanding balances, including commitments, necessary for users to understand the potential effect of the relationship on the financial statements.

IAS 24 also requires an entity to disclose key management personnel compensation in total, using categories set out in the standard.

IAS 24 addresses related party disclosures for government-related entities; a reporting entity is exempt from the majority of disclosure requirements in the Standard, if the related party is:

- A government with control, joint control or significant influence over the reporting entity
- Another entity that is a related party because the same government has control, joint control or significant influence over both the reporting entities

However, if this exemption is applied, other disclosures are mandated.

What you need to know

- IAS 24 is a disclosure standard only. Transactions within its scope are accounted for under the relevant IFRS accounting standard.
- A related party is a person or entity which is related to the entity that is preparing its financial statements; IAS 24 provides a wide-ranging definition of what constitutes a related party.
- Information must be disclosed about transactions, outstanding balances and commitments.
- IAS 24 requires disclosure about key management personnel compensation.
- IAS 24 addresses related party disclosures for government-related entities.

1 Introduction

Relationships and transactions between related parties are a normal feature of commerce and business. Many entities carry on their business activities through subsidiaries, joint ventures, and associates and there are inevitably transactions between these parties. The investor, in these circumstances, has the ability to affect the financial and operating policies of the investee, through the presence of control, joint control or significant influence. [IAS 24.5]. It is also common for entities under common control, which are not a group for financial reporting purposes, to transact with each other. The disclosures considered necessary in such circumstances are addressed by IAS 24.

Differences may exist between the IFRS accounting standards and US GAAP guidance on this topic, but these are not addressed in this chapter as the standards are not converged.

1.1 The related party issue

The problems posed by related party relationships and transactions are described in IAS 24 as follows: [IAS 24.6, IAS 24.7]

Extract from IAS 24

- | | |
|---|--|
| 6 | A related party relationship could have an effect on the profit or loss and financial position of an entity. Related parties may enter into transactions that unrelated parties would not. For example, an entity that sells goods to its parent at cost might not sell on those terms to another customer. Also, transactions between related parties may not be made at the same amounts as between unrelated parties. |
| 7 | The profit or loss and financial position of an entity may be affected by a related party relationship even if related party transactions do not occur. The mere existence of the relationship may be sufficient to affect the transactions of the entity with other parties. For example, a subsidiary may terminate relations with a trading partner on acquisition by the parent of a fellow subsidiary engaged in the same activity as the former trading partner. Alternatively, one party may refrain from acting because of the significant influence of another - for example, a subsidiary may be instructed by its parent not to engage in research and development. |

1.2 Possible solutions

1.2.1 Disclosure of related party transactions

In response to the problem posed by related party transactions, IAS 24 requires disclosure of those transactions, rather than an adjustment to the financial statements. IAS 24 is purely a disclosure standard and does not establish any recognition or measurement requirements. Related party transactions are accounted for in accordance with the requirements of the IFRS accounting standard applicable to the transaction. The disclosures required by IAS 24 are in addition to those required by other IFRS accounting standards. For example, a loan to a related party will also be subject to the disclosure requirements of IFRS 7 *Financial Instruments: Disclosures*. This treatment of related party transactions and relationships using disclosure, rather than requiring adjustment, is in line with the requirements of local accounting standards in most jurisdictions.

The purpose of disclosing the information required by IAS 24 is to give users of financial statements knowledge about transactions (for example, whether they are at arm's length/fair value), outstanding balances, including commitments, and relationships with related parties that may affect their assessment of an entity's operations, including assessments of the risks and opportunities facing an entity. [IAS 24.8].

1.2.2 Remeasurement of related party transactions at fair values

An alternative solution to the problems posed by related party relationships and transactions would be to adjust the financial statements by measuring related party transactions as if they occurred with an independent third party and recognise any such transactions at an arm's length price (i.e., fair value). However, although it may be possible to do this, it is often not possible to establish what would have been the terms of any non-arm's length transaction, had it been negotiated on an arm's length basis. This is because, normally, no comparable transactions may have taken place and, in any event, the transaction might never have taken place at all, if it had been negotiated at a different value. See Chapter 9 for a discussion of common control transactions in individual or separate financial statements and Chapter 21 for a discussion of considerations relating to impairment in group situations. As a result of the difficulties outlined above, IAS 24 does not propose the remeasurement of related party transactions at fair values, but only focusses on disclosures.

2 Objective and scope of IAS 24

2.1 Objective and scope

2.1.1 Objective

IAS 24 states that its objective is as follows: [IAS 24.1]

Extract from IAS 24

Objective

- | | |
|---|--|
| 1 | The objective of this Standard is to ensure that an entity's financial statements contain the disclosures necessary to draw attention to the possibility that its financial position and profit or loss may have been affected by the existence of related parties and by transactions and outstanding balances, including commitments, with such parties. |
|---|--|

Accordingly, IAS 24 requires disclosure of related party transactions and outstanding balances, including commitments, together with the names of any parties who control the reporting entity.

2.1.2 Scope

IAS 24 applies in:

- (a) Identifying related party relationships and transactions
- (b) Identifying outstanding balances, including commitments, between an entity and its related parties
- (c) Identifying the circumstances in which disclosure of the items in (a) and (b) is required

And

- (d) Determining the disclosures to be made about those items [IAS 24.2]

IAS 24 explicitly requires disclosure of related party relationships, transactions and outstanding balances, including commitments, in both the consolidated and separate financial statements of a parent or investors with joint control of, or significant influence over, an investee presented in accordance with IFRS 10 *Consolidated Financial Statements* or IAS 27 *Separate Financial Statements*. The standard also applies to individual financial statements. [IAS 24.3].

All entities within a group that prepare their financial statements under IFRS accounting standards must disclose, in those financial statements, related party transactions and outstanding balances with other entities in the group. [IAS 24.4]. There are no disclosure exemptions for subsidiaries, or for parent companies that produce separate financial statements, even where, those separate financial statements are issued with the consolidated financial statements of the group of which they are a part. The IASB considers that the financial statements of an entity that is part of a consolidated group may include the effects of extensive intragroup transactions. Therefore, it concluded that the disclosures required by IAS 24 are essential to understanding the financial position and financial performance of such an entity and should be required for separate financial statements presented in accordance with IAS 27. [IAS 24.BC16]. The IASB also believes that disclosure of intragroup transactions is essential because external users of the financial statements need to be aware of the interrelationships between related parties, including the level of support provided by related parties, to assist in their economic decisions. [IAS 24.BC17].

IAS 24 notes that "intragroup related party transactions and outstanding balances are eliminated in the preparation of consolidated financial statements of the group". [IAS 24.4]. This implies that disclosure of such transactions and balances is not required in the group's consolidated financial statements since, so far as those financial statements are concerned, such items do not exist. This would also apply to the parts of a transaction which have been eliminated when applying equity accounting. However, transactions and balances between an investment entity and those of its subsidiaries, which are held as part of an investment portfolio, are measured at fair value through profit or loss and are not consolidated in accordance with IFRS 10, should be disclosed in the consolidated financial statements. [IAS 24.4].

Some jurisdictions may have local laws and regulations which require specific information to be disclosed about particular related party transactions. These local requirements should be seen as incremental to, and not a substitute for, the disclosure requirements of IAS 24.

3 Defining related parties and related party transactions

A related party is defined as “a person or entity that is related to the entity that is preparing its financial statements” (the ‘reporting entity’). [IAS 24.9]. The definition of related parties is reciprocal. The use of the word ‘party’ means that the disclosure applies to both individuals and to entities. The factors considered in the identification of a related party are consistent, whether the controlling party is a person or an entity. With regard to entities, IAS 24 defines related parties more widely than simply the members of a group (as defined in Appendix A of IFRS 10, i.e., a parent and its subsidiaries - see Chapter 7). The definition includes joint ventures and associates of the parent, joint ventures and associates of a parent’s subsidiary and subsidiaries of an associate or a joint venture.

IAS 24 contains a multi-part definition of ‘related party’ and the following are related parties of the reporting entity:

- Certain persons or a close member of that person’s family (see section 3.1.1 below)
- Entities that are members of the same group (see section 3.1.2 below)
- Entities that are associates or joint ventures (see section 3.1.3 below)
- Entities that are joint ventures of the same third party (see section 3.1.4 below)
- Entities that are joint ventures of a third party and associates of the same third entity (see section 3.1.5 below)
- Post-employment benefit plans (see section 3.1.6 below)
- Entities under control or joint control of certain categories of persons or close members of such a person’s family (see section 3.1.7 below)
- Entities under significant influence of certain categories of persons or close members of such a person’s family (including a person who is a member of a key management personnel of the entity or of a parent of the entity) (see section 3.1.8 below)
- Entities, or any member of the group of which they are a part, that provide key management personnel services (see section 3.1.9 below)
- Government-related entities (see section 3.1.10 below)

The standard emphasises that attention should be directed to the substance of the relationship and not merely the legal form. [IAS 24.10].

A related party transaction is a transfer of resources, services or obligations between a reporting entity and a related party, regardless of whether a price is charged. [IAS 24.9].

3.1 Identification of a related party and related party relationships

3.1.1 Persons or close members of a person’s family that are related parties

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
- A related party* is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the ‘reporting entity’).
- (a) A person or a close member of that person’s family is related to a reporting entity if that person:
- (i) has control or joint control of the reporting entity;
 - (ii) has significant influence over the reporting entity; or
 - (iii) is a member of the key management personnel of the reporting entity or of a parent of the reporting entity.
- (b) ...
- Close members of the family of a person* are those family members who may be expected to influence, or be influenced by, that person in their dealings with the entity and include:
- (a) that person’s children and spouse or domestic partner;
 - (b) children of that person’s spouse or domestic partner; and
 - (c) dependants of that person or that person’s spouse or domestic partner.
- ...

[IAS 24.9].

In May 2015, in response to a request to clarify the definition of a close member of the family of a person, the IFRS IC observed that the definition:

- Is expressed in a principle-based manner and involves the use of judgement to determine whether members of the family of a person (including that person's parents) are related parties or not
- Includes a list of family members that are always considered close members of the family of a person

The IFRS IC further noted that the list of family members that are always considered close members is non-exhaustive and does not preclude other family members from being considered as close members of the family of a person. Consequently, other family members, including parents or grandparents, could qualify as close members of the family depending on the assessment of specific facts and circumstances. The IFRS IC determined that neither an Interpretation nor an amendment to IAS 24 was necessary and therefore, decided not to add this item to its agenda.¹

Relationships involving a person or close family members as investors are shown in the following two illustrations, which are based on illustrative examples published by the IASB, which accompany, but are not part of IAS 24.

Illustration 3-1: Person as investor

Mrs X has an investment in Entity A and Entity B.

For Entity A's financial statements, if Mrs X controls or jointly controls Entity A, Entity B is related to Entity A when Mrs X has control, joint control or significant influence over Entity B or is a member of Entity B's key management personnel.

For Entity B's financial statements, if Mrs X controls or jointly controls Entity A, Entity A is related to Entity B when Mrs X has control, joint control or significant influence over Entity B, or is a member of Entity A's key management personnel.

However, if Mrs X has significant influence, but not control, over both Entity A and Entity B, Entities A and B are not related to each other.

If Mrs X is a member of the key management personnel of both Entity A and Entity B, Entities A and B are not, in the absence of any other indicator of a related party relationship, related to each other (see section 3.3 below).

Illustration 3-2: Close members of the family holding investments

Mr X is the spouse of Mrs X. Mr X has an investment in Entity A and Mrs X has an investment in Entity B.

For Entity A's financial statements, if Mr X controls or jointly controls Entity A, Entity B is related to Entity A when Mrs X has control, joint control or significant influence over Entity B, or is a member of Entity B's management personnel.

For Entity B's financial statements, if Mr X controls or jointly controls Entity A, Entity A is related to Entity B when Mrs X has control, joint control or significant influence over Entity B, or is a member of Entity A's key management personnel.

If Mr X has significant influence (but not control or joint control) over Entity A and Mrs X has significant influence (but not control or joint control) over Entity B, Entities A and B are not related to each other (see section 3.3 below).

If Mr X is a member of the key management personnel of Entity A and Mrs X is a member of the key management personnel of Entity B, Entities A and B are not, in the absence of any other indicator of a related party relationship, related to each other (see section 3.3 below).

¹ [IFRIC Update](#), May 2015, available on the IFRS Foundation's website.

3.1.1.A Control

The definition of 'control' in IAS 24 is a cross-reference to the definition in IFRS 10 - see Chapter 7. IFRS 10 states that "an investor controls an investee when the investor is exposed, or has rights, to variable returns from its involvement with the investee and has the ability to affect those returns through its power over the investee". [IFRS 10 Appendix A].

3.1.1.B Joint control

The definition of 'joint control' in IAS 24 is a cross-reference to the definition in IFRS 11 *Joint Arrangements*. IFRS 11 defines joint control as "the contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control". [IFRS 11 Appendix A].

In the definition of a related party, a joint venture includes subsidiaries of the joint venture. [IAS 24.12]. Therefore, for example, the subsidiary of a joint venture and the investor who has joint control are related to each other.

3.1.1.C Significant influence

The definition of 'significant influence' in IAS 24 is a cross-reference to the definition in IAS 28 *Investments in Associates and Joint Ventures*. IAS 28 defines significant influence as "the power to participate in the financial and operating policy decisions of the investee but is not control or joint control of those policies". [IAS 28.3].

In the definition of a related party, an associate includes subsidiaries of the associate. Therefore, for example, the subsidiary of an associate and the investor who has significant influence over the associate are related to each other. [IAS 24.12].

3.1.1.D Key management personnel

'Key management personnel' are those persons with authority and responsibility for planning, directing and controlling the activities of an entity, directly or indirectly, including any director (whether executive or otherwise) of that entity. [IAS 24.9]. A director of a reporting entity is automatically a member of key management personnel, even if they are not paid for their services by the reporting entity - thus, a director of a subsidiary is still a member of key management personnel of the subsidiary, even if their services are paid for by the parent.

A related party includes all key management personnel of a reporting entity and of a parent of the reporting entity. This means that all key management personnel of all parents (i.e., the immediate parent, any intermediate parent and the ultimate parent) of a reporting entity are related parties of the reporting entity. When the reporting entity's financial statements represent a group, key management personnel of subsidiaries might not be key management personnel of the group if those persons do not have the authority or responsibility for planning, directing and controlling the activities of the group.

Some entities may have more than one level of key management. For example, some entities may have a supervisory board, whose members have responsibilities similar to those of non-executive directors, as well as a board of directors that sets the overall operating strategy.

How we see it

In our view, all members of either board constitute key management personnel, as both levels of management have authority and responsibility for planning, directing and controlling the activities of the entity.

The definition of key management personnel is not restricted to directors. It also includes other individuals with authority and responsibility for planning, directing and controlling the activities of an entity. The main intention of the definition is presumably to ensure that key management personnel are identified because of the role the individual performs for the entity, rather than the job title attributed to the individual. Therefore, transactions with persons with responsibilities similar to those of directors, and the compensation paid to such persons, do not escape disclosure simply because they are not named as directors. For example, in some jurisdictions, a chief financial officer or a chief operating officer may not be directors but could meet the definition of key management personnel. Other examples of the type of persons who are not directors but may meet the definition of key management personnel include a divisional chief executive or a director of a major trading subsidiary of the entity, but not of the entity itself, who nevertheless does have the authority or responsibility for planning, directing and controlling the activities of the reporting entity. A reference to individuals who are not directors in a reporting entity's business review or management commentary might indicate that those persons are considered to be key management personnel.

Key management personnel are normally employees of the reporting entity (or of another entity in the same group). However, the definition does not restrict itself to employees. Therefore, seconded staff and persons engaged under management or outsourcing contracts may also have a level of authority or responsibility such that they are 'key management personnel'.

The definition of key management personnel refers to 'persons'. [IAS 24.9]. In IAS 24, a distinction is made between a 'person' (a human being) and an entity (a company with legal rights and obligations). [IAS 24.9]. In some jurisdictions, the term 'person' includes both a 'corporate person' (an artificial person, created by law, such as a corporation) and a 'natural person' (a human being). Additionally, in some jurisdictions, a corporate entity must by law have the authority and responsibility for planning, directing and controlling the activities of an investment fund for the benefit of the fund's investors in accordance with the fund's constitution and relevant statutes (i.e., the corporate entity is the body acting as key management personnel). Before the clarification in 2013, key management personnel were only referred to as persons and there was no acknowledgement that an entity could constitute key management personnel. To rectify this, IAS 24 now clarifies that if a reporting entity receives key management personnel services from another entity (described as a 'management entity') the disclosure requirements for key management personnel compensation (see section 3.1.9 below) do not apply to the compensation paid or payable by the management entity to the management entity's employees or directors. [IAS 24.17A]. In other words, it is not necessary to look through the management entity and disclose the compensation paid to the individuals performing the role on behalf of the management entity. Instead, amounts incurred for the service fee paid or payable by the reporting entity to the separate management entity for provision of key management personnel services are disclosed. [IAS 24.18A]. As a result of identifying the management entity as a related party of the reporting entity, other transactions with the management entity, such as loans, are also disclosed by the reporting entity.

3.1.2 Entities that are members of the same group

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
- A related party** is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) ...
 - (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) The entity and the reporting entity are members of the same group (which means that each parent, subsidiary and fellow subsidiary is related to the others).
 - (ii) ...

The terms group, parent and subsidiary are defined in IFRS accounting standards as follows:

- A group is "A parent and its subsidiaries."
- A parent is "An entity that controls one or more entities."
- A subsidiary is "An entity that is controlled by another entity." [IFRS 10 Appendix A]

Therefore, all entities controlled by the same ultimate parent are related parties. This would include entities where the reporting entity holds less than a majority of the voting rights, but which are subsidiaries as defined in IFRS 10. Conversely, a group would not include entities where the reporting entity holds a majority of the voting rights but which are not subsidiaries (for example, because the group does not have control), though these could be related parties of the reporting entity as they may fall into other categories of related party, such as associates.

Illustration 3-3: Entities that are members of the same group

Both Entity S and Entity A are subsidiaries of Entity H. Entities H, S and A are all related parties to each other as they are members of the same group.

Related party disclosures will be required in the financial statements of Entity S in respect of transactions with Entities H and A, in the financial statements of Entity A in respect of transactions with Entities H and S and in the separate financial statements of Entity H in respect of transactions with Entities S and A.

3.1.3 Entities that are associates or joint ventures

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

9 The following terms are used in this Standard with the meanings specified:

A related party is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').

(a) ...

(b) An entity is related to a reporting entity if any of the following conditions applies:

(i) ...

(ii) One entity is an associate or joint venture of the other entity (or an associate or joint venture of a member of a group of which the other entity is a member).

(iii) ...

IAS 28 defines an associate as "an entity over which the investor has significant influence". [IAS 28.3].

IFRS 11 defines a joint venture as "a joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement" - see Chapter 13. [IFRS 11 Appendix A].

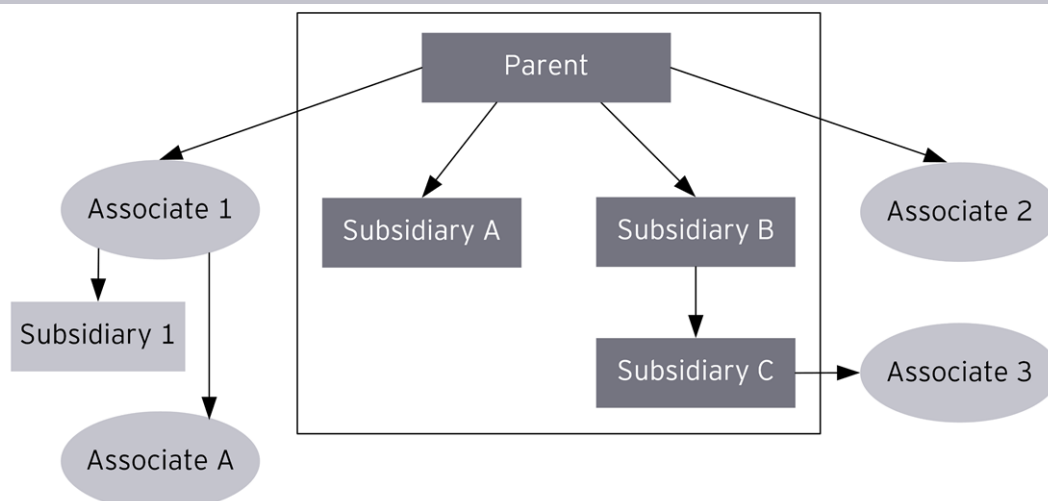

Any entity that a reporting entity determines is an associate under IAS 28 or a joint venture under IFRS 11 is a related party. All associates and joint ventures are related parties, whether they are accounted for under the equity method or by another method. For example, where the investment is accounted for at fair value through profit or loss under IFRS 9 *Financial Instruments* rather than under the equity method, such as investments in associates or joint ventures held by a venture capital organisation, mutual fund, unit trust or similar entity including unit-linked insurance funds, these are still related parties. Likewise, any reporting entity that is an associate or joint venture of another entity must treat that investor entity as a related party.

As noted above, in the definition of a related party, an associate includes subsidiaries of the associate and a joint venture includes subsidiaries of the joint venture. Therefore, for example, an associate's subsidiary and the investor that has significant influence over the associate are related to one another. [IAS 24.12].

The definition also means that an associate of a reporting entity's parent is also a related party of the reporting entity.

However, the definition does not cause investors in a joint venture or an associate to be related to each other (see sections 3 above and 3.3 below). Investors in joint operations (as defined in IFRS 11 - see Chapter 13) are also not related to each other. For the avoidance of doubt, two associates of the same third party are not related to one another (see section 3.1 above).

The application of these requirements is shown in Illustration 3-4 below, which is based on an illustrative example accompanying IAS 24. [IAS 24.IE4]. The example mainly focuses on the application of the requirements to associate entities; for completeness all related parties are identified.

Illustration 3-4: Associates of the reporting entity's group that are related parties***In Parent's separate and consolidated financial statements:***

Subsidiaries A, B, C and Associates 1 (including its subsidiary), 2 and 3 are related parties. Associate A is not a related party.

For Subsidiary A's financial statements:

Parent, Subsidiaries B and C and Associates 1 (including its subsidiary), 2 and 3 are related parties. Associate A is not a related party.

For Subsidiary B's consolidated or separate financial statements:

Parent, Subsidiaries A and C and Associates 1 (including its subsidiary), 2 and 3 are related parties. Associate A is not a related party.

For Subsidiary C's financial statements:

Parent, Subsidiaries A and B and Associates 1 (including its subsidiary), 2 and 3 are related parties. Associate A is not a related party.

For the financial statements of Associates 1 (consolidated or separate), 2 and 3:

Parent and Subsidiaries A, B and C are related parties. Associates 1, 2 and 3 are not related to each other.

In addition:

For the separate financial statements of Associate 1:

Subsidiary 1 and Associate A are also related and for the consolidated financial statements of Associate 1, Associate A is related.

For the financial statements of Subsidiary 1:

Associate 1, Associate A, Parent and Subsidiaries A, B and C are related parties. Associates 2 and 3 are not related parties. This is because there is neither control nor joint control in either leg of the indirect relationships between Associate 1 and Associates 2 and 3.

For the financial statements of Associate A:

Associate 1 and Subsidiary 1 are related. Parent, Subsidiaries A, B and C and Associates 2 and 3 are not related parties, as there are indirect relationships between these entities and no control exists in any leg of those indirect relationships, in respect of Associate A.

3.1.3.A Joint operations

IAS 24 defines 'joint ventures' of the reporting entity as related parties. The definition of a joint venture in IFRS 11 excludes joint operations, so that an investment in a joint operation is not a related party. The exclusion of joint operations is in line with the IASB view that joint operations are part of the reporting entity and therefore, a transaction with a joint operation is either a transaction by the reporting entity with itself or a transaction with the other joint operator which would not be a related party unless it otherwise met the related party definition in IAS 24 for some other reason (e.g., because it was an entity controlled by a member of key management personnel). [IFRS 12.BC52].

3.1.4 Entities that are joint ventures of the same third party

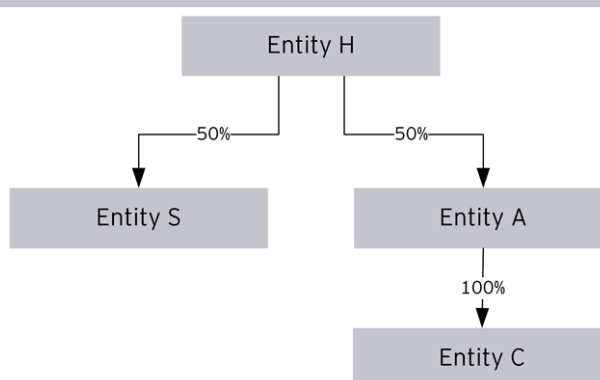

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
 A *related party* is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) ...
 - (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) ...
 - (iii) Both entities are joint ventures of the same third party.
 - (iv) ...

This is illustrated by the following:

Illustration 3-5: Entities that are joint ventures of the same third party

In this Illustration, Entities S and A are joint ventures of Entity H and are therefore related parties of one another. Entity C, as a subsidiary of Entity A, is also a related party of Entity H and Entity S.

If, however, Entities S and A were associates (rather than joint ventures) of the Entity H, then they would not be related parties, as there is no control in either leg of this indirect relationship (see section 3.2 below). The Basis for Conclusions to IAS 24 explains that a distinction was made between joint ventures and associates because the IASB considered that 'significant influence' was not as close a relationship as control or joint control. [IAS 24.BC19(a)].

As noted above, in the definition of a related party, a joint venture includes subsidiaries of the joint venture. Therefore, a joint venture's subsidiary and the investor that has joint control over the joint venture are related parties of one another. [IAS 24.12].

3.1.5 Entities that are joint ventures of a third party and associates of the same third entity

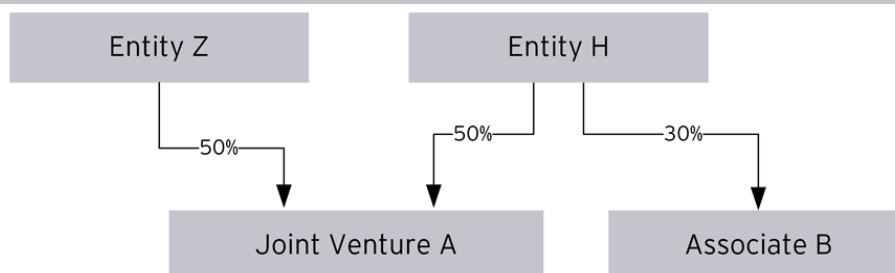

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
 A *related party* is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) ...
 - (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) ...
 - (iv) One entity is a joint venture of a third entity and the other entity is an associate of the third entity.
 - (v) ...

This definition treats joint ventures in a similar manner to subsidiaries as shown in Illustration 3-3 above and therefore, an associate and a joint venture are related parties where they have an investor in common and that investor has control over the one and joint control over the other. This is because joint control exists in one leg of the indirect relationship between the investees. This is illustrated below:

Illustration 3-6: Entities that are joint ventures and associates of the same third entity

Joint Venture A is a joint venture of Entity H and Associate B is an associate of Entity H. Therefore, Joint Venture A and Associate B are related parties.

However, Entities Z and H are not related parties (see sections 3.2 and 3.3 below).

3.1.6 Post-employment benefit plans

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9** The following terms are used in this Standard with the meanings specified:
A related party is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) ...
 - (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) ...
 - (v) The entity is a post-employment benefit plan for the benefit of employees of either the reporting entity or an entity related to the reporting entity. If the reporting entity is itself such a plan, the sponsoring employers are also related to the reporting entity.
 - (vii) ...

The definition is quite wide-ranging and includes post-employment benefit plans of any entity related to the reporting entity. This includes, for example, post-employment benefit plans of an associate or joint venture of the reporting entity or a post-employment benefit plan of an associate of the reporting entity's parent.

The related party relationship would not extend to investment managers of the pension fund, provided that their acting for the fund was the only relationship. Any fees paid by the sponsoring employers (for example, to the investment manager) on behalf of the pension fund would be a related party transaction. 'Sponsoring employers' is not defined in IFRS accounting standards, but is generally taken to mean the entity which has a legal duty to ensure that funds are available in the pension fund when the payment of pensions falls due. Sponsoring employers are also related parties of a post-employment benefit plan.

3.1.7 Entities under control or joint control of certain persons or close members of their family

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
A related party is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) A person or a close member of that person's family is related to a reporting entity if that person:
- (i) has control or joint control of the reporting entity;
 - (ii) has significant influence over the reporting entity; or
 - (iii) is a member of the key management personnel of the reporting entity or of a parent of the reporting entity.
- (b) An entity is related to a reporting entity if any of the following conditions applies:
- (i) ...
 - (vi) The entity is controlled or jointly controlled by a person identified in (a).
 - (vii) ...

This is intended to address situations in which an entity is controlled or jointly controlled by a person or close family member of that person and that person or close family member also controls, jointly controls, has significant influence over, or is a member of key management personnel of, the reporting entity or of a parent of the reporting entity. The situation whereby one company owns another is covered by Illustration 3-3 above. This is illustrated below:

Illustration 3-7: Persons who control an entity and are a member of the key management personnel of another entity

Mrs X has a 100% investment in Entity A and is a member of the key management personnel of Entity S. Entity M has a 100% investment in Entity S.

For Entity S's financial statements, Entity A is related to Entity S because Mrs X controls Entity A and is a member of the key management personnel of Entity S.

For Entity S's financial statements, Entity A would also be related to Entity S if Mrs X is a member of the key management personnel of Entity M and not of Entity S.

This outcome would be the same if Mrs X had joint control over Entity A (if Mrs X only had significant influence over Entity A and not control or joint control then Entities A and S would not be related parties).

For Entity A's financial statements, Entity S is related to Entity A because Mrs X controls Entity A and is a member of Entity S's key management personnel. This outcome would be the same if Mrs X has joint control over Entity A and would also be the same if Mrs X is a member of the key management personnel of Entity M rather than Entity S (see section 3.1.8 below). Note that Entity M would also be a related party of Entity A in this instance.

For Entity M's consolidated financial statements, Entity A is a related party of the Group if Mrs X is a member of the key management personnel of the Group.

For Entity M's separate financial statements, Entity S is a related party. Further, Entity A will be a related party if Mrs X is a member of the key management personnel of Entity M.

3.1.8 Entities under significant influence of certain persons or close members of their family

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
- A related party is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) A person or a close member of that person's family is related to a reporting entity if that person:
 - (i) has control or joint control of the reporting entity;
 - (ii) ...
 - (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) ...
 - (vii) A person identified in (a)(i) has significant influence over the entity or is a member of the key management personnel of the entity (or of a parent of the entity).
 - (viii) ...

This is the reciprocal of 3.1.7 and is illustrated in Illustration 3-7 above.

Entities that are significantly influenced by the same person or close member of that person's family or who simply share the same key management personnel are not related parties in the absence of any control or joint control by those persons (see section 3.3 below).

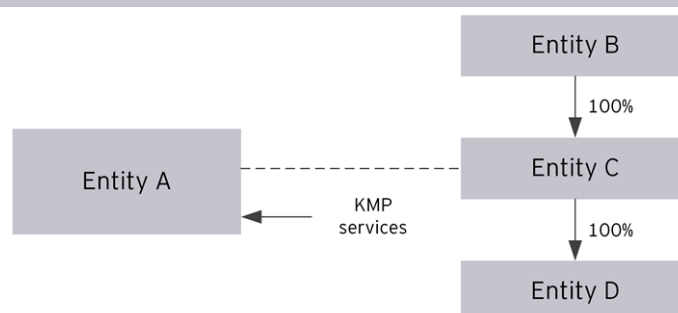

3.1.9 Entities, or any member of the group of which they are a part, that provide key management personnel services

An entity is related to a reporting entity if: [IAS 24.9]

Extract from IAS 24

- 9 The following terms are used in this Standard with the meanings specified:
- A related party is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').
- (a) ...
 - (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) ...
 - (viii) The entity, or any member of a group of which it is a part, provides key management personnel services to the reporting entity or to the parent of the reporting entity.
- ...

This is intended to address situations in which an entity (described as a 'management entity'), or a member of its group, provides key management personnel services to the reporting entity (see sections 4.3 and 5.3 below) and is most commonly seen in the fund management sector. It applies to the provision of key management personnel services by the separate management entity. Staff acting for the management entity that are responsible for planning, directing and controlling the activities of the reporting entity are not considered to be key management personnel of the reporting entity. It is not necessary to look through the management entity to determine natural persons (see section 3.1.1.D above) as key management personnel. [IAS 24.17A].

Illustration 3-8: Entities that provide key management personnel (KMP) services to a reporting entity

Entity C provides key management personnel services to Entity A. For Entity A's financial statements, Entities B, C and D are all related parties.

For the financial statements of Entities B, C and D, there is no related party relationship with Entity A. The related party relationship between the management entity and the reporting entity is not symmetrical. In the absence of any other indicator of a related party relationship, the reporting entity (Entity A) cannot affect the management entity's (Entity C's) activities, financial position or profit or loss.

3.1.10 Government-related entities

A 'government-related entity' is an entity that is controlled, jointly controlled or significantly influenced by a government. [IAS 24.9].

'Government' in this context refers to government, government agencies and similar bodies whether local, national or international. [IAS 24.9]. This is the same as the definition used in IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* - see Chapter 25. The Board decided that it would not provide a more comprehensive definition or additional guidance on how to determine what is meant by 'government'. In the Board's view, a more detailed definition could not capture every conceivable government structure across every jurisdiction. In addition, judgement is required by a reporting entity when applying the definition because every jurisdiction has its own way of organising government-related activities. [IAS 24.BC41]. This implies that there may well be diversity in practice across different jurisdictions in defining what is meant by 'government'. For jurisdictions with multiple levels of government, judgement may be needed about whether parties controlled by different levels of government are related (for example, state versus federal), notwithstanding that both controlling parties are government bodies.

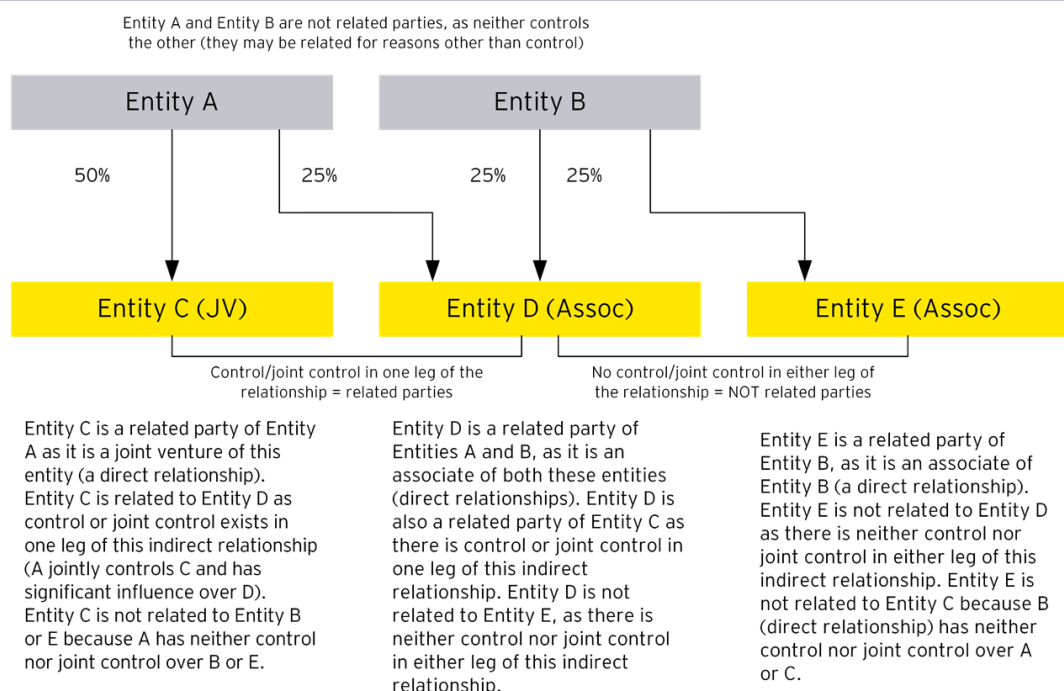

Where an entity is controlled, jointly controlled or significantly influenced by a government, then relationships, transactions and outstanding balances, including commitments, with that government are related party transactions. Similarly, transactions and outstanding balances, including commitments, with other entities controlled, jointly controlled or significantly influenced by that government are related party transactions. Related party transactions with government-related entities are subject to certain disclosure exemptions, with additional disclosure requirements depending on whether the transaction is individually significant or collectively significant and its consequent effect on the financial statements. [IAS 24.26(b)(i), IAS 24.26(b)(ii)]. These are discussed in section 6 below.

3.2 Direct and indirect relationships

As indicated in previous paragraphs, IAS 24 contains a multi-part definition of 'related party' and therefore, the identification of all related parties in large groups can be complex. Moreover, IFRS 10 requires the continuous reassessment of control (see Chapter 7) and for practical reasons, this may be difficult to execute in a timely manner. One possible way to address this complexity is to identify within a group direct and indirect relationships of the reporting entity. A direct relationship is where one entity has either control, joint control or significant influence over another entity (for example, a parent and a subsidiary), whereas an indirect relationship is where two entities may share a common investor, but neither entity has control, joint control or significant influence over the other entity (for example, two subsidiaries in a group).

For direct relationships, if control, joint control or significant influence is present, a related party relationship exists. [IAS 24.9(b)(i), IAS 24.9(b)(ii), IAS 24.9(b)(iii), IAS 24.9(b)(iv)]. However, for indirect relationships, control or joint control must exist in one leg of that indirect relationship for a related party relationship to exist. If only significant influence exists in both legs of the relationship, there is no related party relationship. Thus, two associates with a common investor are related to that investor, but not to each other. [IAS 24.1E7]. This is in contrast to a joint venture and an associate with a common investor, which will be related to each other as joint control exists in one leg of that indirect relationship. [IAS 24.9(b)(iv)]. Two investors with joint control over a joint venture are related to the joint venture, but not to each other. [IAS 24.9(b)(ii), IAS 24.11(b)]. This is because joint control exists with regard to their relationship with the joint venture, but there is no control relationship between the investors. The diagram below illustrates how the concept of control is applied in the context of IAS 24.

Illustration 3-9: The effect of the control concept in IAS 24 for direct and indirect relationships

3.3 Parties that are not related parties

Having included such a detailed definition of related parties, IAS 24 clarifies that the following are not related parties: [IAS 24.11]

Extract from IAS 24

- 11 In the context of this Standard, the following are not related parties:
- two entities simply because they have a director or other member of key management personnel in common or because a member of key management personnel of one entity has significant influence over the other entity.
 - two joint venturers simply because they share joint control of a joint venture.
 - providers of finance,
 - trade unions,
 - public utilities, and
 - departments and agencies of a government that does not control, jointly control or significant influence the reporting entity,

simply by virtue of their normal dealings with an entity (even though they may affect the freedom of action of an entity or participate in its decision-making process).
 - a customer, supplier, franchisor, distributor or general agent with whom an entity transacts a significant volume of business, simply by virtue of the resulting economic dependence.

The list above illustrates the application of the definition of 'related party' in IAS 24. Without the illustrations, there may be a risk of a perception that a related party relationship exists, for example where there is economic dependence on a single customer, but it is important to distinguish between control, as defined in IFRS 10 (see Chapter 7) and applied in IAS 24 and economic dependence, which is not relevant for an assessment of control.

These illustrations are relevant only for the precise situations described and there may be other reasons why a party in the list above is a related party. Consider the following examples:

- A water company that supplies the reporting entity is not a related party if the only link between the two is the supply of water. If, however, the water company is also an associate of the reporting entity, the exclusion does not apply; the two are related parties, and the transactions relating to the supply of water are disclosed if material.
- Two investors in the same entity are not related parties simply because one holds a controlling interest, and the other shareholder (not in the group) holds a non-controlling interest in a subsidiary of the group. Even if the investor holding the non-controlling interest exercises significant influence over the subsidiary, provided it is not otherwise related to the controlling investor, it is not normally a related party of the controlling investor. However, the non-controlling investor might have significant influence over the group if the subsidiary was significant to the group in which case the group, including the controlling investor and the non-controlling investor are related parties.
- Two entities are not related parties simply because they share common key management personnel. However, if the common member of key management personnel exerts control or joint control over one or more of the entities then they are related parties. See sections 3.1.7 and 3.1.8 above.
- An administrator, custodian, broker and fund manager of the same fund are not related parties, to each other or to the fund to which they provide services simply because they each provide services to the fund, even if any of the parties are economically dependent upon the income from such services. However, any such party could meet the definition of 'key management personnel' of the fund if it provides key management personnel services (see section 3.1.9 above). In addition, any shared ownership (e.g., control, joint control, or significant influence) between such parties should be evaluated to determine if the parties are related.

An interest in an unconsolidated structured entity as defined by IFRS 12 *Disclosure of Interests in Other Entities* held by a reporting entity does not make the structured entity a related party to the reporting entity unless it would otherwise meet the definition of a related party (for example, because the structured entity is an associate of the reporting entity).

4 Disclosure of controlling relationships

IAS 24 asserts that, in order to enable users of financial statements to form a view about the effects of related party relationships on an entity, it is appropriate to disclose the related party relationship when control exists, irrespective of whether there have been transactions between the related parties. [IAS 24.14]. Accordingly, IAS 24 requires an entity to disclose:

- The name of its parent and, if different
- The ultimate controlling party

If neither the entity's parent nor the ultimate controlling party produces consolidated financial statements available for public use, the name of the next most senior parent that does so must also be disclosed. [IAS 24.13].

The 'next most senior parent' is the first parent in the group above the immediate parent that produces consolidated financial statements available for public use. [IAS 24.16]. Consequently, in some circumstances, an entity may need to disclose the names of three parents.

Disclosure must be made even if the parent or ultimate controlling party does not prepare financial statements. In the situation when the ultimate controlling party is an individual, rather than an entity, the reporting entity is likely to have to disclose the name of the next most senior parent in addition since the individual undoubtedly does not produce financial statements for public use. IAS 1 requires disclosure of the 'ultimate parent' of the group. [IAS 1.138(c)]. This is not necessarily synonymous with the 'ultimate controlling party' where that party is an individual. This is illustrated below.

Illustration 4-1: Disclosure of parent, ultimate parent and ultimate controlling party

Entity S is controlled by Entity P which in turn is controlled by Entity H which in turn is controlled by Entity Y. Mr A is the controlling party of Entity Y. Entities P and Y do not produce consolidated financial statements available for public use.

The group structure is illustrated as follows:

For Entity S's financial statements:

IAS 24 requires disclosure of Entity P (the parent), Entity H (the next most senior parent that produces consolidated financial statements available for public use) and Mr A (the ultimate controlling party). In addition, IAS 1 requires disclosure of Entity Y (the ultimate parent of the group).

For Entity P's financial statements:

IAS 24 requires disclosure of Entity H (the parent) and Mr A (the ultimate controlling party). In addition, IAS 1 requires disclosure of Entity Y (the ultimate parent of the group).

For Entity H's financial statements:

IAS 24 requires disclosure of Entity Y (the parent) and Mr A (the ultimate controlling party). IAS 1 does not require any additional disclosure.

For Entity Y's financial statements

IAS 24 requires disclosure of Mr A (ultimate controlling party).

The ultimate controlling party could be a group of individuals or entities acting together. IAS 24 is silent on the issue of individuals or entities acting together to exercise joint control. However, IFRS 3 *Business Combinations* states that a group of individuals can be regarded as a controlling party when, as a result of contractual arrangements, they collectively have the power to govern that entity's financial and operating policies so as to obtain benefits from its activities. [IFRS 3.B2]. In such circumstances, these entities or individuals should be identified as the controlling party. However, as discussed in section 3 above, IAS 24 emphasises that attention should be directed to the substance of any related party relationship and not merely the legal form. It is likely that such an informal arrangement would at least give such individuals acting collectively significant influence over the reporting entity and as such, those individuals would be related parties to the reporting entity under IAS 24.

IAS 24 also clarifies that the requirement to disclose related party relationships between a parent and its subsidiaries is in addition to the disclosure requirements of IAS 27 and IFRS 12. [IAS 24.15]. IAS 27 requires a parent's separate financial statements to disclose:

- A list of the significant investments in subsidiaries, joint ventures and associates including the name, place of business (and, if different, country of incorporation)
- Proportion of ownership interest (and if different, proportion of voting power held)
- A description of the method used to account for such investments - see Chapter 9

IFRS 12 requires an entity to disclose information to enable users to understand the composition of a group - see Chapter 14.

4.1 Disclosable transactions

A related party transaction is defined as "a transfer of resources, services or obligations between a reporting entity and a related party, regardless of whether a price is charged." [IAS 24.9]. Read literally, this definition requires many transactions to be disclosed more than once. For example, if an entity buys goods on credit from a related party and pays for them 30 days later, both the original purchase and the final payment represent a 'transfer of resources' 'between a reporting entity and a related party' and, therefore, on a literal reading, are required to be separately disclosed. However, we doubt that this reading is the IASB's intention, and the nature of the disclosures required by IAS 24 seems to support this interpretation.

The definition of a related party transaction implies that transactions are disclosable only for the period in which parties are related. For example, where a reporting entity has disposed of a subsidiary during the reporting period, only transactions with the subsidiary up to the date of disposal are related party transactions in the financial statements of the reporting entity. Similarly, if a person became a member of key management personnel of a reporting entity during a reporting period, no disclosure is required of any remuneration paid to that person before that person's appointment as key management personnel.

Likewise, transactions with a party in the comparative period are not disclosable as related party transactions if in the comparative period that party was not related to the reporting entity. Transactions with a party are not disclosable in the current year if the related party relationship had ceased before the beginning of the current period although, transactions in the comparative period are disclosed.

IAS 24 is unclear whether disclosure of outstanding balances at the reporting date is required in situations where an entity ceases to be a related party during the reporting period. In such situations, one view is that outstanding balances are not disclosable since the entity is not a related party as at the reporting date. A second view is that if the outstanding balances as at the reporting date comprise of amounts related to the transactions when the entities were related, such outstanding balances should be included in related party disclosures.

How we see it

In our view, either view is acceptable. However, if an entity becomes a related party during the year, outstanding balances as at the reporting date, that include amounts related to transactions entered into when the entities were unrelated, are disclosable.

In the case that entities become related after the reporting date, but before the financial statements were authorised for issue, it may be necessary to disclose the relationship, if it is considered by management to be a material non-adjusting event, in accordance with IAS 10 *Events after the Reporting Period* - see Chapter 34. [IAS 10.21].

There is no requirement in IAS 24 to disclose information about related party transactions in one comprehensive note. However, it may be more useful to users of the financial statements to present information this way.

IAS 1 requires that, except where a standard permits otherwise (which IAS 24 does not), comparative information in respect of the previous period must be disclosed for all amounts reported in the current period's financial statements. [IAS 1.38]. This applies to all transactions for which a related party relationship existed in the prior period, but as noted above, does not apply to transactions with a party which only became related in the current period.

4.2 Materiality

In determining whether an entity discloses related party transactions in financial statements, the general concept of materiality is applied. IAS 24 does not refer specifically to materiality since this requirement is in IAS 1, which states that "an entity need not provide a specific disclosure required by an IFRS if the information resulting from that disclosure is not material." [IAS 1.31]. Omissions, misstatements or obscuring of information are material within IAS 1 if "it could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements, which provide financial information about a specific reporting entity. Materiality depends on the nature or magnitude of information, or both. An entity assesses whether information, either individually or in combination with other information, is material in the context of its financial statements taken as a whole." [IAS 1.7].

The nature of the qualitative aspect of materiality in respect of related party transactions is made explicit in the non-mandatory Practice Statement 2 - *Making Materiality Judgements*, issued by the IASB Board in September 2017. [PS 2.48]. The statement lists the involvement of a related party of the entity as an entity-specific qualitative materiality factor of an entity's transaction, other event or condition. It further explains that the presence of a qualitative factor lowers the thresholds for the quantitative assessment and that the more significant the qualitative factors, the lower the quantitative factors will be. *The Conceptual Framework for Financial Reporting*, issued in March 2018, also emphasises that materiality is an entity-specific aspect of relevance, based on nature, magnitude or both and what could be material in a particular situation cannot be predetermined, nor can a uniform quantitative threshold be specified. [CF 2.11].

This qualitative aspect of materiality may have the effect that any related party transaction whose disclosure is considered sensitive (e.g., key management compensation or for tax reasons perhaps) is by definition material because it is expected by the reporting entity to influence a user of the financial statements.

How we see it

It may not be possible to avoid disclosing sensitive related party transactions on the grounds that they are quantitatively immaterial. In addition, a transaction conducted at advantageous terms to either the related party or the reporting entity is more likely to be material than one conducted at arm's length. Since IAS 24 requires disclosure of related party transactions irrespective of whether consideration is received, disclosure cannot be avoided on the argument that, since there is no consideration, the transaction must be immaterial.

4.3 Disclosure of key management personnel compensation

IAS 24 requires disclosure of key management personnel compensation including the amount of outstanding balances, for example, unpaid bonuses and commitments.

There is no requirement in IAS 24 to disclose individual key management personnel compensation. Instead, entities are required to disclose key management personnel compensation in total and for each of the following categories:

- Short-term employee benefits
- Post-employment benefits
- Other long-term benefits
- Termination benefits
- Share-based payment [IAS 24.17]

These disclosures must be provided within the notes to the financial statements even when the same (or perhaps even more detailed) information is presented outside the financial statements. This is supported by Practice Statement 2, which emphasises that publicly available information does not relieve an entity of the obligation to provide material information in its financial statements (paragraph 26 of the Practice Statement). With regard to interim reports, IAS 34 *Interim Financial Reporting* requires the disclosure of related party transactions if those transactions are significant (see Chapter 37). [IAS 34.15B(j)].

IAS 24 (see section 3.1.9 above) clarifies that where an entity obtains key management personnel services from another entity ('management entity') it is not required to apply the requirements above to the compensation paid or payable by the management entity to the management entity's employees or directors. [IAS 24.17A].

4.3.1 Compensation

'Compensation' includes all employee benefits (as defined in IAS 19 *Employee Benefits*) including employee benefits to which IFRS 2 *Share-based Payment* applies. Employee benefits are all forms of consideration given by an entity, or on behalf of the entity, in exchange for services rendered to the entity by the employees. Employee benefits also include such consideration paid on behalf of a parent of the entity in respect of the entity. [IAS 24.9]. Therefore, the compensation disclosed by an entity in its financial statements is that which is for services to that entity, irrespective of whether it is paid by the reporting entity or by another entity or individual on behalf of the reporting entity. Further, the disclosures must include outstanding balances and commitments. Compensation includes: [IAS 24.9]

Extract from IAS 24

9 The following terms are used in this Standard with the meanings specified:

...

Compensation includes ...

- (a) short-term employee benefits, such as wages, salaries and social security contributions, paid annual leave and paid sick leave, profit-sharing and bonuses (if payable within twelve months of the end of the period) and non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) for current employees;
- (b) post-employment benefits such as pensions, other retirement benefits, post-employment life insurance and post-employment medical care;
- (c) other long-term employee benefits, including long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits and, if they are not payable wholly within twelve months after the end of the period, profit-sharing, bonuses and deferred compensation;
- (d) termination benefits; and
- (e) share-based payment.

...

IAS 24 is a disclosure standard only and therefore, does not provide guidance about the basis on which the amount for each of the categories above is determined. As observed in the Basis for Conclusions, the IASB noted that the guidance on compensation in IAS 19 is sufficient to enable an entity to disclose the relevant information, which suggests that the IASB is expecting the compensation amounts to be based on the expense recognised under the relevant standards (IAS 19 or IFRS 2). [IAS 24.BC10]. This is commonly observed practice. It is helpful to remember that the definition of compensation states that "employee benefits are all forms of consideration paid, payable or provided by the entity, or on behalf of the entity, in exchange for services rendered to the entity" [IAS 24.9] and therefore, compensation should be disclosed, even when provided by the parent or another group company. This remains the case in situations when no recharge for the cost of those services is made to the entity to whom the members of key management personnel are providing services; the absence of a management recharge does not negate the fact that employee benefits have been paid or provided on behalf of the entity for services rendered to that entity. In circumstances where a recharge has not been made to a subsidiary, it will usually be possible for management of the subsidiary to obtain information regarding the cost of the services from its parent. In the rare circumstances where this is not practicable, judgement needs to be exercised in order to meet the disclosure objective in IAS 24 (for example, an apportionment might be made).

Issues relating to each of the categories are discussed below.

For an illustrative example of the disclosure of key management personnel compensation, see Practical example 4-1 in section 4.3.9 below.

4.3.2 Short-term employee benefits

As indicated in section 4.3.1 above, short-term employee benefits include wages, salaries and social security contributions, paid annual leave and paid sick leave, profit-sharing and bonuses (if expected to be settled wholly before twelve months after the end of the reporting period). Most of these should not cause difficulty, since the expense for such items under IAS 19 is generally equivalent to the amount payable for the period. The disclosures would also include outstanding balances and commitments.

Non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) must also be included within the amount disclosed for short-term employee benefits. [IAS 24.9]. In some cases, these might have been provided at no direct cost to the entity. In such circumstances, it would appear reasonable to attribute either a value for non-monetary benefits (for example, the attributable tax benefit), so as to describe them quantitatively, or to describe such benefits qualitatively.

4.3.3 Post-employment benefits

As indicated in section 4.3.1 above, these include pensions, other retirement benefits, post-employment life insurance and post-employment medical care. The inclusion of this category confirms that amounts are disclosed while members of key management are providing services. If amounts were only disclosed when the benefits are payable, then in many cases, there would be no disclosure since the individuals would no longer be members of key management. The definition of related party transaction includes 'obligations between a reporting entity and a related party'. This implies that post-employment benefit obligations, including commitments, between the reporting entity and the members of key management during the period covered by the financial statements are disclosed.

For defined contribution plans, it seems appropriate that the amount included is based on the total expense recognised under IAS 19, which is the equivalent of the contributions paid or payable to the plan for service rendered in the period.

The main issue related to defined benefit plans is to determine an appropriate calculation for the disclosable amount for the period. IAS 24 is silent on how the disclosable amount should be determined. One approach would be to determine the disclosable amount based only on the service cost related to those individuals, on the grounds that the other items recognised as an expense under IAS 19 relate more closely to the overall plan than to the individuals. A second approach to determine the disclosable amount would be to include an amount based on all components of the IAS 19 expense recognised in total comprehensive income. The total amounts recognised under IAS 19 for defined benefit plans includes items such as interest, actuarial remeasurement gains and losses and the effects of curtailments and settlements. This approach requires an apportionment of the total expense to the extent that it relates to the individuals concerned. An entity should apply a consistent accounting policy for determining the amounts disclosed.

4.3.4 Other long-term benefits

As indicated in section 4.3.1 above, these include long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits and, if they are not expected to be settled wholly before twelve months after the end of the reporting period, profit sharing, bonuses and deferred compensation. Since the accounting for such items under IAS 19 is on a similar basis to that for post-employment benefits similar issues to those discussed in section 4.3.3 above are applicable.

4.3.5 Termination benefits

These should not cause difficulty, since an entity generally recognises such items, particularly for key management personnel, in line with the recognition criteria included in IAS 19.

4.3.6 Share-based payment transactions

This category includes share options, share awards or cash-settled awards granted in return for service by the members of key management. Such compensation is accounted for under IFRS 2. For equity-settled share-based payment transactions, such as share options or share awards, IFRS 2 broadly requires measurement of their fair value at grant date, and that expense is recognised over the period that employees render services. For cash-settled share-based payment transactions, IFRS 2 requires measurement and recognition based on the cash ultimately paid.

IAS 24 does not specify a basis on which the compensation disclosed should be determined. One basis would be to disclose an amount based on the expense under IFRS 2. This basis could lead to negative compensation being disclosed, for example, as a result of the reversal of a cumulative expense relating to share-based payments whose non-market vesting condition has not been satisfied. In this case, the reporting entity should consider whether additional disclosure is necessary to explain the amount and the change from the prior year. Another basis would be to disclose amounts based on the fair value that the individual received (based on the value of the shares at date of vesting, or at date of exercise of share options or the cash that is ultimately payable) rather than over the period of the service. An entity should adopt a consistent accounting policy for determining the amounts disclosed. In determining an appropriate accounting policy, the entity should also consider consistency with other disclosures related to key management personnel compensation made outside the financial statements.

4.3.7 Reporting entity part of a group

One additional practical difficulty for an entity in a group is that the disclosure of its key management personnel compensation is for the services rendered to the reporting entity. Accordingly, where key management personnel of the reporting entity also provide services to other entities within the group, an apportionment of the compensation is necessary. Likewise, where the reporting entity receives services from key management personnel that are also key management personnel of other entities within the group, the reporting entity may have to impute the compensation received. Such apportionments and allocations require judgement and an assessment of the time commitment involved.

4.3.8 Key management personnel compensated by other entities

A reporting entity also applies the principles set out in section 4.3.7 above to situations in which the other entity is a third party, outside of the group, but is a related party.

4.3.9 Illustrative disclosure of key management personnel compensation

An example of the disclosure of key management personnel compensation can be found in the financial statements of BP p.l.c.

Practical example 4-1: BP p.l.c. (2020)

United Kingdom

Annual Report and Form 20-F 2020 [extract]

Notes on financial statements [extract]

34. Remuneration of senior management and non-executive directors [extract]

Remuneration of directors and senior management

	\$ million		
	2020	2019	2018
Total for all senior management and non-executive directors			
Short-term employee benefits	17	30	25
Pensions and other post-retirement benefits	2	2	2
Share-based payments	52	32	32
Termination benefits	8	—	—
Total	79	64	59

Senior management comprises members of the leadership team, see pages 78-79 for further information.

Short-term employee benefits

These amounts comprise fees and benefits paid to the non-executive chairman and non-executive directors, as well as salary, benefits and cash bonuses for senior management. Deferred annual bonus awards, to be settled in shares, are included in share-based payments.

Pensions and other post-retirement benefits

The amounts represent the estimated cost to the group of providing pensions and other post-retirement benefits to senior management in respect of the current year of service measured in accordance with IAS 19 'Employee Benefits'.

Share-based payments

This is the cost to the group of senior management's participation in share-based payment plans, as measured by the fair value of options and shares granted, accounted for in accordance with IFRS 2 'Share-based Payments'.

Termination benefits

Termination benefits include compensation to senior management for loss of office.

5 Disclosure of other related party transactions, including commitments

IAS 24 requires an entity that has had related party transactions during the periods covered by its financial statements to disclose the nature of the related party relationship as well as information about those transactions and outstanding balances, including commitments, necessary for users to understand the potential effect of the relationship on the financial statements. [IAS 24.18].

5.1 Related party transactions requiring disclosure

IAS 24 gives the following as examples of transactions to be disclosed, if they are with a related party. The list is not intended to be exhaustive:

- Purchases or sales of goods (finished or unfinished)
- Purchases or sales of property and other assets
- Rendering or receiving of services
- Leases
- Transfers of research and development
- Transfers under licence agreements
- Transfers under finance arrangements (including loans and equity contributions in cash or in kind)
- Provisions of guarantees or collateral
- Commitments to do something if a particular event occurs or does not occur in the future, including executory contracts (recognised and unrecognised)

And

- Settlement of liabilities on behalf of the entity or by the entity on behalf of that related party [IAS 24.21]

IAS 24 does not contain any exemptions based on the nature of the transaction. Consequently, related party transactions include transactions such as dividend payments and the issue of shares under rights issues to major shareholders or key management personnel (i.e., those that fall within the definition of related parties), even where they participate on the same basis as other shareholders. Further, not all transactions may need to be disclosed, provided due attention is paid to the qualitative aspects of materiality, discussed in section 4.2 above.

Related party transactions also include transactions with those individuals identified as related parties where their dealings with the entity are in a private capacity, rather than in a business capacity.

Participation by a parent or subsidiary in a defined benefit plan that shares risks between group entities is a transaction between related parties (see Chapter 31). [IAS 24.22].

As indicated in section 4.1 above, disclosure is required irrespective of whether or not consideration is received, which means that IAS 24 applies to gifts of assets or services and to asset swaps. Common examples of such transactions which may occur within a group include the following, though this list is not exhaustive:

- Administration by an entity of another entity within a group (or of its post-employment benefit plan) free of charge
- Transfer of tax assets from one member of a group to another without payment
- Rent-free leases (accommodation) or the loan of assets at no charge
- Guarantees by directors of bank loans to the entity

5.1.1 Aggregation of items of a similar nature

Presumably in order to minimise the volume of disclosures, IAS 24 permits aggregation of items of a similar nature, except when separate disclosure is necessary for an understanding of the effects of the related party transactions on the financial statements of the entity, subject to considerations of materiality - see section 4.2 above. [IAS 24.24]. IAS 24 does not expand on this requirement, but it seems appropriate that, for example, purchases or sales of goods with other subsidiaries within a group can be aggregated, but it may be appropriate to show any purchases or sales of property, plant, and equipment or of intangible assets with such entities as a separate category. However, the level of aggregation is limited by the separate disclosure of transactions with particular categories of related parties (see section 5.2 below).

5.1.2 Commitments

IAS 24 provides no definition of commitments, though definitions relating to commitments are present in other standards. IFRS 12 states that the commitments relating to joint ventures are those that may give rise to a future outflow of cash or other resources, [IFRS 12.B18], and IFRS 9 defines a firm commitment as “a binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates”. [IFRS 9 Appendix A]. However, commitments should be considered more widely than these definitions: a typical example of a disclosable commitment might be the agreement to pay certain benefits to an employee on the termination of employment.

IAS 24 specifically mentions executory contracts (recognised and unrecognised) as commitments requiring disclosure. [IAS 24.21(i)]. Executory contracts are excluded from the scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* unless they are onerous to the reporting entity. An executory contract is a contract under which neither party has performed any of its obligations or both parties have partially performed their obligations to an equal extent. [IAS 37.3]. An example of an executory contract would be a contract to buy an asset at a future date where neither the transfer of the asset nor the payment of consideration has occurred.

The words “commitments to do something if a particular event occurs or does not occur in the future” can potentially have a wide application and does not limit itself to contractual commitments required to be disclosed by other standards.

With respect to the type of transaction to be disclosed, IFRS 12 provides a list of illustrative, but not exhaustive, examples of the type of unrecognised commitments that could relate to joint ventures. Some of these examples could apply equally to other related party arrangements. IFRS 12 clarifies that the commitments required to be disclosed under IAS 24 in respect of joint ventures include an entity’s share of commitments made jointly with other investors with joint control of a joint venture. [IFRS 12.B18].

IFRS 12 provides the following illustrations of commitments relating to joint ventures that would typically be disclosable under IAS 24.18 and could apply equally to other related party arrangements:

- Unrecognised commitments to contribute funding or resources as a result of, for example:
 - The constitution or acquisition agreements of a joint venture (that, for example, require an entity to contribute funds over a specific period)
 - Capital intensive projects undertaken by a joint venture
 - Unconditional purchase obligations, comprising procurement of equipment, inventory or services that an entity is committed to purchasing from, or on behalf of, a joint venture
 - Unrecognised commitments to provide loans or other financial support to a joint venture
 - Unrecognised commitments to contribute resources to a joint venture, such as assets or services
 - Other non-cancellable unrecognised commitments relating to a joint venture
- Unrecognised commitments to acquire another party’s ownership interest (or a portion of that ownership interest) in a joint venture if a particular event occurs or does not occur in the future.

[IFRS 12.B19, IFRS 12.B20].

Provisions of guarantees, which are a form of commitment, require separate disclosure. Disclosure of commitments to purchase property, plant and equipment and intangible assets in aggregate is required separately by IAS 16 *Property, Plant and Equipment* and IAS 38 *Intangible Assets* respectively. [IAS 16.74(c), IAS 38.122(e)].

5.2 Disclosures required for related party transactions, including commitments

The standard states that, at a minimum, the disclosures must include:

- (a) The amount of the transactions
- (b) The amount of outstanding balances, including commitments and:
 - (i) Their terms and conditions, including whether they are secured, and the nature of the consideration to be provided in settlement
 - (ii) Details of any guarantees given or received
- (c) Provisions for doubtful debts related to the amount of outstanding balances
And
- (d) The expense recognised during the period in respect of bad or doubtful debts due from related parties
[IAS 24.18]

The standard gives no exemption from disclosure on the grounds of sensitivity or confidentiality.

The requirement in (b) above could be read literally as requiring outstanding balances and commitments to be amalgamated into a single balance. However, commitments such as executory contracts do not give rise to outstanding balances. In practice, narrative disclosure of the terms and conditions of material commitments will be necessary.

There is no requirement to disclose individually significant transactions. However, as discussed in section 6 below, there is such a requirement for transactions with government-related entities where a reporting entity has decided to apply the disclosure exemption.

The disclosures are required to be made separately for each of the following categories:

- (a) The parent
- (b) Entities with joint control of, or significant influence over, the entity
- (c) Subsidiaries
- (d) Associates
- (e) Joint ventures in which the entity is a joint venturer
- (f) Key management personnel of the entity or its parent
- And
- (g) Other related parties [IAS 24.19]

How we see it

In our view, the references in (a) and (f) above to 'the parent' should be read as including all parents of the entity, i.e., its immediate parent, any intermediate parent and the ultimate parent.

In the context of the financial statements of an entity within a group, it is insufficient to disclose related party transactions for a single category of 'group companies'. Separate categories are required for parent(s), subsidiaries and 'other related parties'.

IAS 24 does not identify the following relationships as a separate category of related party, and therefore, information related to the following relationships would be included within the category 'other related parties':

- Fellow subsidiaries
- Subsidiaries of an investor with significant influence
- Associates of the entity's controlling investor

However, a preparer should consider separate disclosure of transactions with the above related parties if this would provide useful information to users of the entity's financial statements.

The classification of amounts payable to, and receivable from, related parties in the different categories is an extension of the disclosure requirement in IAS 1 for an entity to present information either in the statement of financial position or in the notes. [IAS 1.77]. The categories are extended to provide a more comprehensive analysis of related party balances and apply to related party transactions. [IAS 24.20]. Note that local regulations in different jurisdictions may provide for specific disclosure requirements and these should be considered in addition to the requirements in IAS 24.

IAS 24 emphasises that an entity should not state that related party transactions are on an arm's length basis unless the reporting entity can demonstrate such terms and conditions. [IAS 24.23]. To substantiate that related party transactions are on an arm's length basis an entity would need to demonstrate that a transaction with similar terms and conditions could be obtained from an independent third party.

In 2004, the IFRS IC received a request to supplement the minimum disclosures contained in IAS 24.18. The request asked that the disclosure of, for example, the purpose and economic substance of transactions, the identity of related parties, the extent of management involvement, special risks and the effect of such transactions on the financial statement should be specifically required. The IFRS IC did not take this onto their agenda and this was not reflected in the subsequent revision of IAS 24 in 2009.

The company financial statements of Schroders plc provide the following disclosures of related party relationships with subsidiaries.

Practical example 5-1: Schroders plc (2020)

United Kingdom

Annual Report and Accounts 2020 [extract]

Notes to the accounts [extract]

37. Related party transactions

The Company is not deemed to be controlled or jointly controlled by a party directly or through intermediaries under IFRS. As a result, the related parties of the Company comprise principally subsidiaries, joint ventures and associates, key management personnel, close family members of key management personnel and any entity controlled by those parties.

The Company has determined that key management personnel comprises only the Board of Directors.

Transactions between related parties

Details of transactions between the Company and its subsidiaries, which are related parties of the Company, and transactions between the Company and other related parties, excluding compensation (which is set out in note 31), are disclosed below:

	2020					
	Revenue £m	Expenses £m	Interest receivable £m	Interest payable £m	Amounts owed by related parties £m	Amounts owed to related parties £m
Subsidiaries of the Company	370.9	18.9	4.1	0.1	1,525.0	(12.2)
Key management personnel	0.3	–	–	–	1.0	(30.7)

	2019					
	Revenue £m	Expenses £m	Interest receivable £m	Interest payable £m	Amounts owed by related parties £m	Amounts owed to related parties £m
Subsidiaries of the Company	418.0	18.5	8.5	0.1	1,496.3	(14.7)
Key management personnel	0.3	–	–	(0.1)	–	(46.3)

Transactions with related parties were made at market rates. The amounts outstanding are unsecured and will be settled in cash.

The consolidated financial statements of J Sainsbury plc provide the following disclosures of related party relationships with joint ventures and associates.

Practical example 5-2: J Sainsbury plc (2021)

United Kingdom

Annual Report and Financial Statements 2021 [extract]

Notes to the consolidated financial statements [extract]

43 Related party transactions [extract]

b) Joint ventures and associates

Transactions with joint ventures and associates

For the 52 weeks to 6 March 2021, the Group entered into various transactions with joint ventures and associates as set out below. All transactions with joint ventures and associates are at arms-length.

	2021 £m	2020 £m
Dividends and distributions received	4	141
Disposals of joint ventures	–	(21)
Rental expenses paid	(6)	(14)

Year-end balances arising from transactions with joint ventures and associates

	2021 £m	2020 £m
Payables		
Other payables	(2)	18

The financial statements of British Sky Broadcasting Group plc illustrate the disclosure of transactions with a party controlled by a close family member of key management:

Practical example 5-3:	British Sky Broadcasting Group plc (2014)	United Kingdom
Annual Report 2014 [extract] Notes to the consolidated financial statements [extract] 28. Transactions with related parties and major shareholders [extract] c) Other transactions with related parties A close family member of one Director of the Company runs Freud Communications Limited ("Freud"), which has provided external support to the press and publicity activities of the Group. During the year the Group incurred expenditure amounting to £1 million (2013: £1 million) with Freud. At 30 June 2014 there was £1 million (2013: less than £1 million) due to Freud. ...		

The financial statements of BP p.l.c. illustrate the disclosure of commitments to related parties:

Practical example 5-4:	BP p.l.c. (2020)	United Kingdom
Annual Report and Form 20-F 2020 [extract] Notes on financial statements [extract] 13. Capital commitments Authorized future capital expenditure for property, plant and equipment (excluding right-of-use assets) by group companies for which contracts had been signed at 31 December 2020 amounted to \$8,009 million (2019 \$11,382 million, 2018 \$8,319 million). bp has contracted capital commitments amounting to \$1,087 million (2019 \$77 million, 2018 \$25 million) in relation to joint ventures and \$183 million (2019 \$787 million, 2018 \$1,227 million) in relation to associates. bp's share of contracted capital commitments of joint ventures amounted to \$900 million (2019 \$1,024 million, 2018 \$619 million).		

5.3 Disclosure of expense incurred with management entity

As discussed in section 3.1.9 above, disclosure of amounts incurred by the entity for the provision of key management personnel services by a separate management entity is required. [IAS 24.18A].

6 Disclosures with government-related entities

IAS 24 provides an exemption from the disclosure requirements of IAS 24.18, discussed in section 5.2 above, in relation to related party transactions and outstanding balances, including commitments, with:

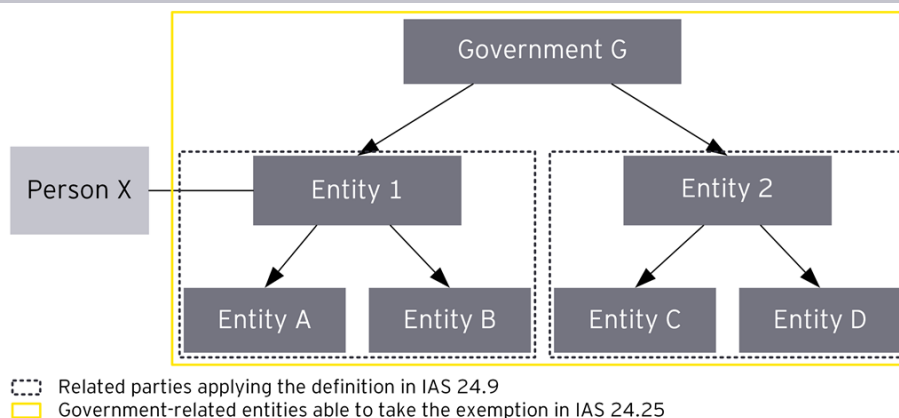

- (a) A government that has control or joint control of, or significant influence over, the reporting entity
And
- (b) Another entity that is a related party because the same government has control or joint control of, or significant influence over, both the reporting entity and the other entity [IAS 24.25]

The effect of this exemption is to treat all entities which are under the direct or indirect control of the same government as related parties and to exempt them from the disclosure requirements of IAS 24.18, though, as can be seen below, this exemption does not alter the definition of a related party relationship.

From the wording of (a) and (b) above, it would be possible to conclude that a reporting entity which is significantly influenced by a government is related to another entity also significantly influenced by the same government. This is not the case. The definition of a related party in IAS 24 does not include entities that are subject to significant influence from the same entity (see sections 3.1 and 3.1.3 above) and the wording in IAS 24.25 cannot add to the definition of a related party.

The application of the disclosure exemption afforded by IAS 24.18 is illustrated in the diagram below, which is based on an illustrative example accompanying IAS 24.

Illustration 6-1: Application of the disclosure exemption for government-related entities

Government G directly controls Entities 1 and 2 and indirectly controls Entities A, B, C and D. Person X is a member of the key management personnel of Entity 1.

Entities 1, A and B are all related because Entity 1 controls both entities. Similarly, Entities 2, C and D are all related because Entity 2 controls both entities. Without the government control, these groups would not be related to each other; however, the government control effectively renders both groups related, because Government G directly controls Entities 1 and 2 and indirectly Entities A, B, C and D. Therefore, the exemption will apply to any entity within these two groups.

For example, for Entity A's financial statements the exemption applies to: (a) transactions with Government G, as this government ultimately controls Entity A; (b) transactions with Entity 1 and Entity B. Entity 1 and Entity B are related parties of entity A because Entity 1 controls Entity A and B, but they are also related because they are ultimately controlled by Government G and (c) transactions with Entities 2, C and D which are related entities because they are controlled by the same government as A, i.e., Government G.

The exemption does not apply to transactions with Person X because Person X is not controlled by Government G.

The use of the disclosure exemption is conditional on the reporting entity making the following disclosures about the transactions and related outstanding balances with the government-related entities:

- (a) The name of the government and the nature of its relationship with the reporting entity (i.e., control, joint control or significant influence).
- (b) The following information in sufficient detail to enable users of the entity's financial statements to understand the effect of related party transactions on its financial statements:
 - (i) The nature and amount of each individually significant transaction.
 - (ii) For other transactions that are collectively, but not individually, significant, a qualitative or quantitative indication of their extent. Types of transactions include those discussed in section 5.1 above. [IAS 24.26].

The wording in paragraph 26 does not explicitly mention ‘commitments’ when referring to ‘related outstanding balances’. However, given that IAS 24 describes a commitment as a subset of outstanding balances, disclosure of individually and collectively significant commitments with government-related entities is likely to be required.

In using its judgement to determine the level of detail to be disclosed in accordance with the requirements in (b) above, a reporting entity considers the closeness of the related party relationship and other factors, including materiality, relevant in establishing the level of significance of the transaction such as whether it is:

- (a) Significant in terms of size
- (b) Carried out on non-market terms
- (c) Outside normal day-to-day business operations, such as the purchase and sale of businesses
- (d) Disclosed to regulatory or supervisory authorities
- (e) Reported to senior management
- (f) Subject to shareholder approval [IAS 24.27]

Disclosure of the nature and amount of each individually significant transaction is not a requirement for other related party transactions (see section 5.2 above). The Board considered that this requirement should not be too onerous for a reporting entity because:

- (a) Individually significant transactions should be a small subset, by number, of total related party transactions
- (b) The reporting entity should know what these transactions are
- (c) Reporting such items on an exceptional basis takes into account cost-benefit considerations [IAS 24.BC45]

The Board also considered that more disclosure of individually significant transactions would better meet the objective of IAS 24 because this approach focuses on transactions that, through their nature or size, are of more interest to users and are more likely to be affected by the related party relationship.

[IAS 24.BC46]. In response to concerns about whether a reporting entity would be able to identify whether the counterparty to such transactions was a government-related entity, the Board concluded that “management will know, or will apply more effort in establishing, who the counterparty to an individually significant transaction is and will have, or be able to obtain, background information on the counterparty”. [IAS 24.BC47, IAS 24.BC48].

Practical example 6-1 below from the financial statements of The Royal Bank of Scotland Group plc illustrates disclosure summarising the types of transactions with government-controlled entities that are related parties and details of an individually material transaction.

Practical example 6-1: The Royal Bank of Scotland Group plc (2019)

United Kingdom

Annual Report and Accounts 2020 [extract]

Notes to the financial statements [extract]

25 Related parties [extract]

UK Government

The UK government through HM Treasury is the ultimate controlling party of NatWest Group plc. The UK government's shareholding is managed by UK Government Investments Limited, a company wholly owned by the UK Government. As a result, the UK government and UK Government controlled bodies are related parties of the Group.

At 31 December 2020, HM Treasury's holding in NatWest Group's ordinary shares was 61.9%.

RBS plc enters into transactions with many of these bodies. Transactions include the payment of: taxes principally UK corporation tax (Note 7) and value added tax; national insurance contributions; local authority rates; and regulatory fees and together with banking transactions such as loans and deposits undertaken in the normal course of banker-customer relationships.

The following are other Illustrations of the type of disclosures required for transactions with government-related entities based on illustrative examples accompanying the standard:

Illustration 6-2: Individually significant transaction carried out on non-market terms

On 15 January 20X2 the company sold a 10-hectare piece of land to an entity controlled by Government G for CU5,000,000. On 31 December 20X2 a plot of land in a similar location, of similar size and with similar characteristics, was sold for CU3,000,000. There had not been any appreciation or depreciation of the land in the intervening period. See Note X for disclosure of government assistance as required by IAS 20.

Illustration 6-3: Individually significant transaction because of size of transaction

In the year ended 31 December 20X2 Government G provided the company with a loan equivalent to 50% of its funding requirement, repayable in quarterly instalments over the next five years. Interest is charged on the loan at a rate of 5%, which is comparable to that charged on the company's external bank loans.

Illustration 6-4: Collectively significant transactions

The company's significant transactions with Government G and other entities controlled, jointly controlled or significantly influenced by Government G are a large portion of its sales of goods and purchases of raw materials [alternatively - about 50% of its sales of goods and services and about 35% of its purchases of raw materials].

The company also benefits from guarantees by Government G of the company's bank borrowing. See Note X of the financial statements for disclosure of government assistance as required by IAS 20.

In Illustration 6-4 above, either a qualitative or a quantitative disclosure is permitted for transactions that are collectively but not individually significant.

Appendix B - Defined terms

Extract from IAS 24

9 The following terms are used in this Standard with the meanings specified:

A related party is a person or entity that is related to the entity that is preparing its financial statements (in this Standard referred to as the 'reporting entity').

- (a) A person or a close member of that person's family is related to a reporting entity if that person:
 - (i) has control or joint control of the reporting entity;
 - (ii) has significant influence over the reporting entity; or
 - (iii) is a member of the key management personnel of the reporting entity or of a parent of the reporting entity.
- (b) An entity is related to a reporting entity if any of the following conditions applies:
 - (i) The entity and the reporting entity are members of the same group (which means that each parent, subsidiary and fellow subsidiary is related to the others).
 - (ii) One entity is an associate or joint venture of the other entity (or an associate or joint venture of a member of a group of which the other entity is a member).
 - (iii) Both entities are joint ventures of the same third party.
 - (iv) One entity is a joint venture of a third entity and the other entity is an associate of the third entity.
 - (v) The entity is a post-employment benefit plan for the benefit of employees of either the reporting entity or an entity related to the reporting entity. If the reporting entity is itself such a plan, the sponsoring employers are also related to the reporting entity.
 - (vi) The entity is controlled or jointly controlled by a person identified in (a).
 - (vii) A person identified in (a)(i) has significant influence over the entity or is a member of the key management personnel of the entity (or of a parent of the entity).
 - (viii) The entity, or any member of a group of which it is a part, provides key management personnel services to the reporting entity or to the parent of the reporting entity.

A related party transaction is a transfer of resources, services or obligations between a reporting entity and a related party, regardless of whether a price is charged.

Close members of the family of a person are those family members who may be expected to influence, or be influenced by, that person in their dealings with the entity and include:

- (a) that person's children and spouse or domestic partner;
- (b) children of that person's spouse or domestic partner; and
- (c) dependants of that person or that person's spouse or domestic partner.

Compensation includes all employee benefits (as defined in IAS 19 *Employee Benefits*) including employee benefits to which IFRS 2 *Share-based Payment* applies. Employee benefits are all forms of consideration paid, payable or provided by the entity, or on behalf of the entity, in exchange for services rendered to the entity. It also includes such consideration paid on behalf of a parent of the entity in respect of the entity. Compensation includes:

- (a) short-term employee benefits, such as wages, salaries and social security contributions, paid annual leave and paid sick leave, profit-sharing and bonuses (if payable within twelve months of the end of the period) and non-monetary benefits (such as medical care, housing, cars and free or subsidised goods or services) for current employees;
- (b) post-employment benefits such as pensions, other retirement benefits, post-employment life insurance and post-employment medical care;

- (c) other long-term employee benefits, including long-service leave or sabbatical leave, jubilee or other long-service benefits, long-term disability benefits and, if they are not payable wholly within twelve months after the end of the period, profit-sharing, bonuses and deferred compensation;
- (d) termination benefits; and
- (e) share-based payment.

Key management personnel are those persons having authority and responsibility for planning, directing and controlling the activities of the entity, directly or indirectly, including any director (whether executive or otherwise) of that entity.

Government refers to government, government agencies and similar bodies whether local, national or international.

A *government-related entity* is an entity that is controlled, jointly controlled or significantly influenced by a government.

The terms 'control' and 'investment entity', 'joint control' and 'significant influence' are defined in IFRS 10, IFRS 11 *Joint Arrangements* and IAS 28 *Investments in Associates and Joint Ventures* respectively and are used in this Standard with the meanings specified in those IFRSs.

	Appendix B - Defined terms	3115

Overview

IAS 7 *Statement of Cash Flows* requires the provision of information about the historical changes in cash and cash equivalents of an entity by means of a statement of cash flows. IAS 7 requires that this statement of cash flows, which is a primary financial statement, classifies cash flows as operating, investing or financing.

This chapter addresses the preparation of the statement of cash flows and the related disclosures required by IAS 7. The chapter addresses the practical issues that frequently arise when attempting to classify cash flows as operating, investing and financing, and includes a number of areas where judgement may be required. The chapter also discusses the definitions of cash and cash equivalents, and the difficulties commonly encountered when applying these definitions.

What you need to know

- IAS 7 requires all entities to prepare a statement of cash flows that reports changes in cash and cash equivalents in the period.
- Cash flows must be classified as operating, investing or financing, having regard to the definitions in IAS 7, in a manner that is most appropriate to the business of the entity.
- Only investments that are held to meet short term cash commitments can be classified as cash equivalents.
- Non-cash transactions must be excluded from the statement of cash flows.
- IAS 7 sets out additional disclosure requirements, including:
 - Information on changes in liabilities arising from financing activities
 - Details of components of cash and cash equivalents and the policy the entity adopts for determining the composition of cash and cash equivalents
 - The amount of significant cash and cash equivalent balances not available for use by the entity

1 Introduction

1.1 Background

IAS 7 is one of the older standards in IFRS accounting standards, having been issued in 1992.

The standard specifies how entities report information about the historical changes in cash and cash equivalents and applies to all entities regardless of their business activities, including financial institutions. Modifications to IAS 7 since it was originally published have been limited resulting in a standard that is much shorter and more succinct than many new and revised IFRS accounting standards. It was last updated in 2023 to require entities to provide disclosures about supply chain financing arrangements.

IAS 7 requires that inflows and outflows of cash and cash equivalents are classified and reported under three different headings being:

- Operating activities
- Investing activities
- Financing activities [IAS 7.10]

The resulting information in the statement of cash flows should provide insight into an entity's ability to generate cash to fund operations, reinvest to maintain or expand operating capacity, repay debt and distribute dividends, and how it manages cash.

The definitions of operating, investing and financing activities in the standard, which are covered in section 1.5 below, provide guidance on how to distinguish the cash flows by activity. The standard is accompanied by a number of illustrative examples. These illustrative examples are referred to, where relevant, throughout this chapter.

1.2 The statement of cash flows as a primary financial statement

The statement of cash flows is a primary financial statement and must be presented with equal prominence to the statement of profit or loss and comprehensive income, the statement of financial position and the statement of changes in equity. [IAS 1.11]. Arguably, it provides some of the most important information in the financial statements, as all entities need cash to run their day-to-day operations, pay their obligations and provide returns to investors, regardless of their particular line of business or geographical location.

This information, when combined with information in the rest of the financial statements, is useful in assessing factors that may affect the entity's liquidity, financial flexibility, profitability, and risk.

The *Conceptual Framework for Financial Reporting* (the Conceptual Framework) highlights the importance of information about cash flows in the reporting period as a means to help users understand a reporting entity's operations, evaluate its financing and investing activities, assess its liquidity or solvency and interpret other information about financial performance. [CF 1.20]. This was rightly noted by the IFRS IC in its July 2014 agenda decision regarding the presentation and content of the condensed statement of cash flows in the interim financial statements according to IAS 34 *Interim Financial Reporting*. The agenda decision¹ noted that even a condensed statement of cash flows should include all information that is relevant in understanding the entity's ability to generate cash flows and the entity's needs to utilise these cash flows. Cash flow information also helps users to assess management's stewardship of the entity's economic resources. The Conceptual Framework guidance is further discussed in Chapter 2.

¹ [IFRIC Update](#), July 2014, available on the IFRS Foundation's website.

1.3 Transparency and consistency of cash flow presentation

In recent years, the statement of cash flows has become an area of scrutiny for investors as well as regulators from a number of jurisdictions, with both classification errors and insufficient disclosures highlighted as key areas of concern.

This is partly because the use of cash flows as a key performance metric in entities' communications to the financial markets has become increasingly common along with, and sometimes even in replacement of, other Key Performance Indicators (KPIs) more focused on the generation of income.

This is also because the definitions of operating, investing and financing activities in IAS 7 are broad and only illustrated by lists of examples which are not exhaustive. Whilst it is tempting to think that a statement of cash flows will be a simple matter of fact with less need for judgement around recognition and measurement of cash flows compared to other areas of the financial statements, the lack of clarity in the standard as to how some cash flows from common transactions are required to be categorised has resulted in diversity amongst preparers. Some common areas where judgement may be required are discussed in sections 3 and 4 below in reference to the definition of cash and cash equivalents and classification.

In addition, the interaction of IAS 7 with new standards such as IFRS 9 *Financial Instruments*, IFRS 15 *Revenue from Contracts with Customers* and IFRS 16 *Leases* has led to further difficulties in applying the standard.

The IFRS IC has received numerous requests for clarification on the requirements of the standard. However, many of these clarifications have never been finalised, leaving preparers and users faced with many practical difficulties, particularly in the application of the classification requirements of the standard.² Some of the most common difficulties are discussed in the remainder of this chapter.

The preparation of a cash flow statement is not merely a mechanical exercise. As a result, investors and regulators have focused on the adequacy of disclosures explaining how the requirements of IAS 7 have been applied. Where the appropriate classification of cash flows in the cash flow statement is not clear from IAS 7 and an entity has therefore applied judgement to determine the appropriate presentation of material items based on the principles of IAS 7, these judgements must be clearly disclosed. This is further discussed in section 4.4 below.

1.4 Future developments

In September 2024, the IASB started a project on the statement of cash flows and related matters in response to the feedback on its Third Agenda Consultation. As part of its initial work, the IASB will consider whether the project should aim to review IAS 7 comprehensively or, instead, to make more targeted improvements.

1.5 Terms used in IAS 7

Extract from IAS 7

- 6 The following terms are used in this Standard with the meanings specified:
- Cash** comprises cash on hand and demand deposits.
 - Cash equivalents** are short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value.
 - Cash flows** are inflows and outflows of cash and cash equivalents.
 - Operating activities** are the principal revenue-producing activities of the entity and other activities that are not investing or financing activities.
 - Investing activities** are the acquisition and disposal of long-term assets and other investments not included in cash equivalents.
 - Financing activities** are activities that result in changes in the size and composition of the contributed equity and borrowings of the entity.

[IAS 7.6].

² [IASB Update](#), April 2013, available on the IFRS Foundation's website.

2 Objective and scope of IAS 7

2.1 Objective

The objective of IAS 7 is to require entities to provide information about changes in cash and cash equivalents in the reporting period in a statement which classifies cash flows from operating, investing and financing activities. The standard aims to give users of financial statements a basis to evaluate the entity's ability to generate cash and cash equivalents and its needs to utilise those cash flows. *[IAS 7 Objective]*.

The standard explains that a statement of cash flows, in combination with the rest of the financial statements, provides information to users to enable them to evaluate the changes in net assets of an entity, its financial structure (including its liquidity and solvency) and its ability to affect the amounts and timing of cash flows to adapt to changing circumstances and opportunities. *[IAS 7.4]*. The historical cash flow information is often used as an indicator of the amount, timing and certainty of future cash flows. It is also useful in examining the relationship between profitability and net cash flow and the impact of changing prices. *[IAS 7.5]*.

2.2 Scope

A statement of cash flows is required to make up a complete set of any financial statements in accordance with IFRS accounting standards. *[IAS 1.10]*. IAS 7 therefore applies to all entities, regardless of size, operations, ownership structure or industry, and includes wholly owned subsidiaries and banks, insurance entities and other financial institutions. There are no exemptions from the requirements of the standard. The standard argues that users of an entity's financial statements are interested in how the entity generates and uses cash and cash equivalents regardless of the nature of its activities and irrespective of whether cash can be viewed as the product of the entity, as may be the case with a financial institution. All entities need cash to conduct their operations, to pay their obligations, and to provide returns to their investors. Accordingly, all entities are required to present a statement of cash flows. *[IAS 7.3]*.

3 Defining cash and cash equivalents

Since the objective of a statement of cash flows is to provide an analysis of changes in cash and cash equivalents, an understanding of the definition of cash and of cash equivalents is essential to its preparation.

A statement of cash flows under IAS 7 excludes movements between items that are cash and cash equivalents because these are components of an entity's cash management, rather than part of its operating, investing and financing activities. [IAS 7.9].

Amounts that fail to meet the definitions of cash and cash equivalents, for example due to restrictions (as in Illustration 3-2 in section 3.2.5 below), cannot be included as part of cash and cash equivalents for the purposes of preparing the statement of cash flows. In the statement of financial position, such amounts must be presented separately from cash and cash equivalents.

Cash flows relating to restricted amounts that fail to meet the definition of cash and cash equivalents would generally meet the definition of investing activities, as they relate to the acquisition or disposal of investments (see section 4.2 below). Cash held in a foreign currency or investments acquired in a currency other than the functional currency of the entity ('foreign currency') are not excluded from qualifying as cash and cash equivalents merely because they are denominated in a foreign currency, provided they meet the other criteria discussed above.

3.1 Cash

Extract from IAS 7

6 The following terms are used in this Standard with the meanings specified:
Cash comprises cash on hand and demand deposits.
 ...

[IAS 7.6].

IAS 7 defines cash as "cash on hand and demand deposits" and includes no other requirements with respect to determining whether an item qualifies as cash. This is in contrast to the definition of cash equivalents which, as explained in section 3.2 below, includes the requirement that cash equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes.

In defining 'cash', IAS 7 does not explain what is meant by 'demand deposits', perhaps because the term is commonly understood as amounts that can be withdrawn on demand, without prior notice being required or a penalty being charged (for example, by an additional fee or forfeiture of interest). In contrast to 'demand deposits', term deposits are discussed in section 3.2.3 below.

In practice, cash may be held by an entity for a specific purpose or may be subject to restrictions on its use, imposed either by the bank, by the entity or by a third party.

The nature of any restriction on use of cash (and cash equivalents - see section 3.2.5 below) must be carefully assessed to determine if the balance still meets the definition of cash in the standard.

3.1.1 Restrictions on the use of cash

In March 2022, the IFRS IC issued an agenda decision³ following a request about whether an entity includes a demand deposit as a component of cash and cash equivalents in its statements of cash flows and financial position when the demand deposit is subject to contractual restrictions on use agreed with a third party.

In the fact pattern described in the request, the entity:

- Holds a demand deposit whose terms and conditions do not prevent the entity from accessing the amounts held in it (that is, were the entity to request any amount from the deposit, it would receive that amount on demand).
- Has a contractual obligation with a third party to keep a specified amount of cash in that separate demand deposit and to use the cash only for specified purposes. If the entity were to use the amounts held in the demand deposit for purposes other than those agreed with the third party, the entity would be in breach of its contractual obligation.

³ [IFRIC Update](#), March 2022, available on the IFRS Foundation's website.

The IFRS IC concluded that

- Restrictions on the use of a demand deposit arising from a contract with a third party do not result in the deposit no longer being cash unless those restrictions change the nature of the deposit in a way that it would no longer meet the definition of cash in IAS 7.
- In the fact pattern described in the request, the contractual restrictions on use of the amounts held in the demand deposit do not change the nature of the deposit - the entity can access those amounts on demand.

The IFRS IC therefore concluded that the entity includes the demand deposit as a component of 'cash and cash equivalents' in its statement of cash flows.

The IFRS IC also noted that:

- IAS 1 requires the entity to disaggregate the cash and cash equivalents line item in the statement of financial position and present the demand deposit separately when this is relevant to an understanding of its financial position. [IAS 1.54, IAS 1.55].
- IAS 7 requires an entity to disclose the components of cash and cash equivalents: applying this requirement, in this fact pattern, the entity discloses the demand deposit as a component of cash and cash equivalents. [IAS 7.45].
- The entity must also consider whether to disclose additional information in the context of the requirements in IFRS 7 *Financial Instruments*: Disclosures about liquidity risk and how the entity manages that risk.
- If the information provided in accordance with IAS 7 and IFRS 7 is insufficient to enable users of financial statements to understand the impact of the restrictions on the entity's financial position, the entity considers whether additional disclosures are required. [IAS 1.31].

Where the restrictions on use do not arise from a separate contractual arrangement with a third party but are part of the terms and conditions directly relating to use of and access to the bank account so that cash cannot be withdrawn on demand the cash held in the bank account will fail to meet the definition of cash. However, it is possible that it may meet the definition of cash equivalents. Section 3.2 below discusses considerations relevant for the classification of a deposit other than cash as cash equivalent.

The IFRS IC agenda decision discussed in this section does not address the classification of cash held by a subsidiary of a group that meets the definition of cash in respect of the subsidiary but for which use is restricted within the wider group, for example, cash and cash equivalents held by a subsidiary operating under exchange controls or other legal restrictions that prevent their general use by the parent or other subsidiaries. Section 11.1.4 below discusses the disclosure requirements that apply in these situations.

3.1.2 Cryptocurrencies vs. Central Bank Digital Currencies (CBDC)

In a June 2019 agenda decision, the IFRS IC defined a cryptocurrency as a crypto-asset with all of the following characteristics:

- a digital or virtual currency recorded on a distributed ledger that uses cryptography for security,
- not issued by a jurisdictional authority or other party, and
- does not give rise to a contract between the holder and another party.

In the agenda decision, the IFRS IC observed that cryptocurrencies did not have at that time the characteristics of cash. In particular, the IFRS IC noted that, although some cryptocurrencies could be used in exchange for particular goods or services, it was not aware of any cryptocurrency that was used as a medium of exchange or as the monetary unit in pricing goods or services to such an extent that it would have been the basis on which all transactions were measured and recognised in financial statements.⁴

Until now, the volume of transactions in which cryptocurrencies are used as a medium of exchange has remained quite low and some crypto-assets are not used as a medium of exchange at all at this stage. There are some jurisdictions where payment in bitcoin, for example, is accepted, but currently, the acceptance of cryptocurrencies by a merchant is not mandated in most jurisdictions.

⁴ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

How we see it

We are not aware of any cryptocurrencies that would currently be considered cash.

In future periods, a holder would need to consider whether those cryptocurrencies represent a medium of exchange and unit of account to such extent that it could be the basis on which the holder recognises and measures all transactions in its financial statements (i.e., it could act as the functional currency of an entity).

Cryptocurrencies also currently do not meet the definition of cash equivalents because they are generally not convertible to known amounts of cash, nor are they subject to an insignificant risk of change in value or have maturities.

Cryptocurrencies are discussed in more detail in Chapter 18 and in our *Applying IFRS: Accounting by holders of crypto assets*.⁵

In contrast, many governments and central banks worldwide are exploring the possibility of using government-backed digital currencies. Central Bank Digital Currencies (CBDC) are issued and regulated by a nation's monetary authority or central bank. They are the digital form of a country's fiat currency. For example, in October 2021, the Central Bank of Nigeria (CBN) issued guidelines for the operation of a permissioned blockchain based CBDC named 'eNaira'. As per the Guidelines, eNaira is the digital form of the Nigerian fiat currency (Naira), issued by the CBN at par with the physical Naira (that is 1:1), as a direct liability of the CBN and as legal tender and part of the currency circulation. CBN exclusively can mint, distribute, redeem and destroy eNaira.

How we see it

Unlike cryptocurrencies discussed above, we believe that a Central Bank Digital Currency would normally be considered as cash because it is the digital form of a country's fiat currency. This is because it is issued by a central bank, as a direct liability of that central bank and as legal tender in the jurisdiction of that Central bank recognised as a medium of exchange in the country of issuance, where prices are expressed in the local currency, of which the CBDC is the digital version.

3.1.3 Client money

Some financial institutions and other entities hold money on behalf of clients. The terms on which such money is held can vary widely. This is discussed in more detail in Chapter 48.

There are numerous types of arrangements that result in an entity holding client money, and conversely result in an entity depositing their money in a client account held by another entity. It is impossible to generalise as to the appropriate treatment in either of the parties' financial statement as this will be dependent on a careful assessment of the terms and conditions of each specific arrangement. However, as explained in Chapter 48, there are a number of factors that must be considered.

From the perspective of the depositary entity (i.e., the entity that holds the money on behalf of its client) it is important to identify precisely how the funds are held. Are they required to be segregated in bank accounts separate from that of the depositary entity itself or are they allowed to be commingled with those of the depositary entity? Other key considerations include:

- Which party is at risk from the failure of assets, such as bank accounts, in which the client money is held?
 - The status of the funds in the event of the insolvency of either the reporting entity or its client
 - Whether the reporting entity can use the cash for its own purposes as opposed to administering the cash on behalf of the client in its capacity as an agent
- And
- Which party has the benefit of income from the assets

If the depositary entity assesses that the funds will be included as an asset on its statement of financial position, it would then need to assess what kind of financial asset this represents; cash or cash equivalents, by applying the definitions in IAS 7. A corresponding liability would also be recognised. Any restrictions on the use of the cash or cash equivalents must be considered and disclosed as explained in section 11.1 below.

⁵ [Applying IFRS, Accounting by holders of crypto-assets: Updated October 2021](#), EY, October 2021, available on [ey.com/IFRS](https://www.ey.com/IFRS).

From the perspective of the entity depositing its money in a client account held by another entity, it would be necessary to consider whether the funds still meet the definition of cash (see section 3.1 above). This would only be the case if the funds are available to withdraw on demand, and without penalty, directly by the entity. [IAS 7.6]. If the funds held are subject to an advance notice period before they can be withdrawn or used, or there are other restrictions on their withdrawal, it is unlikely that they will meet the definition of cash.

Depending on the specific facts and circumstances, the funds may meet the definition of a 'cash equivalent' however, this would only be the case if the definition of cash equivalents is met, including the requirement that the purpose of the funds is to meet short-term cash commitments of the entity as explained in section 3.2 below.

If the definitions of cash and cash equivalents are not met, the funds will be presented as a receivable in the financial statements of the entity depositing its money in a client account.

3.1.4 Impacts of the IFRS 9 and IFRS 7 Amendments to the Classification and Measurement of Financial Instruments on cash balances at the end of a reporting period

In September 2021, the IFRS IC received a request about the recognition of cash received via an electronic transfer system as settlement for a financial asset. The request asked whether the entity can derecognise the trade receivable and recognize cash on the date the cash transfer is initiated (its reporting date), rather than on the date the cash transfer is settled (after its reporting date).

The discussion was subsequently extended to the derecognition of a financial liability settled by a payment made through an electronic transfer system.

Eventually, this led to the issuance of Amendments to IFRS 9 and IFRS 7, *Amendments to the Classification and Measurement of Financial Instruments* ("the Amendments") in May 2024 to facilitate a consistent application of the requirements in IFRS 9. These Amendments are effective for annual periods starting on or after 1 January 2026 with early adoption permitted. [IFRS 9(2026). 7.1.12]. See Chapter 48 for further details on the requirements of these Amendments.

How we see it

Although the Amendments neither change the definition of cash and cash equivalents nor amend IAS 7, they are likely to have a significant impact on how cash payments and receipts in transit are reported at the end of the reporting period. This is because the Amendments indicate that adjustments to an entity's reported cash balance at the reporting date for payments and receipts that are in-transit should not be made (except where the exception for payments made using an electronic payment system has been applied. See section 3.1.4A below).

3.1.4.A Impact of the Amendments on cash balances at the end of the reporting period

During the IFRS IC's original discussions and as articulated in the basis for conclusions to the Amendments, the committee concluded that applying paragraphs 3.2.3(a) and 3.1.1 of IFRS 9, an entity:

- Derecognises a financial asset (e.g., a trade receivable) on the date on which its contractual rights to the cash flows from the asset expire; and
- Recognises the cash (or other financial asset) received as settlement for that financial asset on the same date. [IFRS9(2026).BC.3.38].

Feedback on the Committee's work did not disagree with its technical analysis and conclusions. However, many stakeholders were concerned about the potential operational outcome of applying that accounting within a short time frame.

To address these concerns, the IASB decided to undertake narrow-scope standard-setting to:

- Clarify the requirements of IFRS 9 that financial assets and liabilities are derecognised on the date on which the contractual right to receive, or the contractual obligation to pay, cash or another financial asset expires (i.e., only when the cash or another financial asset is received [IFRS 9(2026).BC3.44] [IFRS 9(2026).BC3.58] [IFRS 9(2026).BC3.60] or when the contractual right is extinguished (the "settlement date"); [IFRS 9 (2026).B3.1.2A] and
- Develop new requirements to permit an entity to derecognise, before the settlement date, a financial liability that will be settled in cash using an electronic payment system when specified conditions are met. However, the IASB decided not to expand the scope of the exception beyond electronic payment systems to other payment methods, such as cheques. [IFRS 9 (2026).B3.3.8] [IFRS 9 (2026).BC.55]. See Chapter 48 for further details on the requirements of these Amendments.

It is important to note that the IASB decided not to extend the exception for the derecognition of financial liabilities to financial assets. *[IFRS 9(2026).BC3.58]*.

How we see it

The right to receive cash (i.e., the financial asset) only expires when cash is received

Similarly, an obligation to deliver cash (i.e., a financial liability) is only extinguished when cash has cleared in the receiving entity's bank account.

Therefore, once the Amendments become effective, entities will be unable to derecognise a financial asset or financial liability, for which a payment has been received or made, until the amount has cleared in the receiving entity's bank account, except in situations where the electronic payment exception permitted by IFRS 9 (2026).B3.3.8 (discussed in Chapter 48) is adopted.

Although this is not explicit in the Amendments, we believe the IASB's clear intention is that; cash is recognised, when, and only when, the corresponding financial asset is derecognised; and cash is derecognised, when and only when, the corresponding financial liability is derecognised.

As noted above, the Amendments introduced an accounting policy choice in the specific scenario of payments made using an electronic payment system that meets specified conditions for financial liabilities. They do not apply to any other means of paying financial liabilities, such as payments by cheque, debit card or credit card.

Under this option, an entity may elect to derecognise a financial liability (or part of a financial liability) settled using an electronic payment system before the settlement date if, and only if, the following conditions are met: *[IFRS 9(2026).B3.3.8] [IFRS 9(2026).B3.3.9]*

- The entity has no practical ability to withdraw, stop or cancel the payment instruction;
- The entity has no practical ability to access the cash to be used for settlement as a result of the payment instruction; and
- The settlement risk associated with the electronic payment system is insignificant.

More detail of the exception and the criteria that must be met to apply the execution are explained in Chapter 48.

3.1.4.B Impact of the Amendments on cash balances when the exception has been applied

When a financial liability is derecognised before the settlement date under the optional exception permitted by IFRS 9.B3.3.8, the cash used to pay that liability is also derecognised at the same time. This is because by deeming the liability to be discharged at the earlier date, the entity also deems its right to the cash used to discharge the liability to be expired at the earlier date which is when it loses the practical ability to access that cash *[IFRS 9(2026).BC3.61]*.

3.1.4.C Impact of the Amendments on cash balances where the exception could have been applied but has not

As discussed above, when the criteria to use the option to derecognise a financial liability before the settlement date in paragraph B3.3.8 of IFRS 9 are met, an entity loses the practical ability to access the cash used to discharge the liability once it has initiated a payment instruction *[IFRS 9(2026).BC3.48] [IFRS 9(2026).BC3.59]*. If an entity chooses not to apply the exemption in such a case the liability will be derecognised at the settlement date. This scenario raises the question of whether an entity should derecognise the cash used to discharge the liability when the payment instruction has been initiated and the entity has lost the practical ability to access the cash, i.e. before the settlement date, in spite of the corresponding financial liability being derecognised at the settlement date?

How we see it

In our view, upon application of the Amendments, an entity that does not apply the option in paragraph B3.3.8 although the conditions for its use are met, continues to present the cash used to discharge the liability as part of its cash balances until the corresponding financial liability is derecognised. As noted in section 3.1.4A above, although not explicit in the Amendments, we believe the IASB's intention is that cash is derecognised, when and only when, the financial liability is derecognised.

This view is supported by the fact that the basis for conclusions of the Amendments discusses the disclosure requirements for an entity that does not apply paragraph B3.3.8, where the IASB notes that paragraph 48 of IAS 7 requires disclosure of significant cash balances held by an entity that are not available for use by the group to help users of financial statements to understand the status of cash balances at that date. [IFRS 9(2026).BC3.63]. This underlines that cash balances should not be adjusted in these circumstances, although disclosure of the restricted cash may be required.

IAS 7 also requires an entity to disclose the components of cash and cash equivalents: applying this requirement, an entity that does not apply the option in paragraph B3.3.8 although the conditions for its use are met may determine that cash in transit used to discharge the liability needs to be disclosed as a separate component of cash and cash equivalents. [IAS 7.45].

The following requirements are relevant when considering the presentation and disclosure requirements for the cash in transit:

- IAS 1 requires the entity to disaggregate the cash and cash equivalents line item in the statement of financial position which may result in the entity presenting the cash in transit separately when this is relevant to an understanding of its financial position. [IAS 1.54, IAS 1.55].
- The entity must also consider whether to disclose additional information in the context of the requirements in IFRS 7 Financial Instruments: Disclosures about liquidity risk and how the entity manages that risk. [IFRS 7.31, IFRS 7.32].
- If the information provided in accordance with IAS 7 and IFRS 7 is insufficient to enable users of financial statements to understand nature of the cash in transit, the entity considers whether additional disclosures are required. [IAS 1.31].

3.2 Cash equivalents

Extract from IAS 7

6 The following terms are used in this Standard with the meanings specified:

...

Cash equivalents are short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value.

...

7 Cash equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes. For an investment to qualify as a cash equivalent it must be readily convertible to a known amount of cash and be subject to an insignificant risk of changes in value. Therefore, an investment normally qualifies as a cash equivalent only when it has a short maturity of, say, three months or less from the date of acquisition. Equity investments are excluded from cash equivalents unless they are, in substance, cash equivalents, for example in the case of preferred shares acquired within a short period of their maturity and with a specified redemption date.

[IAS 7.6, IAS 7.7].

It is important to understand the reporting entity's cash management policies, especially when considering whether balances that are not obviously cash on hand and demand deposits would be classified as cash equivalents, as the standard states that cash equivalents are held to meet short-term cash commitments rather than for investment or other purposes. [IAS 7.7]. Cash management includes the investment of cash in excess of immediate needs into cash equivalents, [IAS 7.9], such as short-term investments.

For investments to qualify as a cash equivalent, they must be:

- Short term
 - Highly liquid
 - Readily convertible into known amounts of cash
- And
- Subject to an insignificant risk of changes in value [IAS 7.6]

However, the purpose for which the investments are held must also be determined. Where investments meet the four criteria above but are not held by the entity to meet short term cash commitments, they cannot be classified as cash equivalents.

As discussed below, careful consideration of facts and circumstances and judgement may be needed to determine whether an investment meets the definition of cash equivalents.

3.2.1 Short-term investments

Cash equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes. For an investment to qualify as a cash equivalent it must be readily convertible to a known amount of cash and be subject to an insignificant risk of changes in value. The standard argues that, normally, only an investment with a short maturity of, say, three months or less from the date of acquisition qualifies as a cash equivalent - see section 3.2.3 below. Equity investments are excluded unless they are cash equivalents in substance. IAS 7 provides an example of such an instrument, being redeemable preference shares acquired within a short period of their maturity and with a specified redemption date. [IAS 7.7]. The IFRS IC considered, in July 2009,⁶ what the standard means when it refers to a 'known amount of cash' and confirmed that the amount of cash that will be received must be known at the time of the initial investment. Accordingly, traded commodities, such as gold bullion, would not be eligible for inclusion in cash equivalents because the proceeds to be realised from such an investment is determined at the date of disposal rather than being known or determinable when the investment is made.

3.2.2 Money market funds

Entities commonly invest in money market-type funds such as an open-ended mutual fund that invests in money market instruments like certificates of deposit, commercial paper, treasury bills, bankers' acceptances and repurchase agreements. Although there are different types of money market funds, they generally aim to provide investors with low-risk, low-return investment while preserving the value of the assets and maintaining a high level of liquidity. The question then arises as to whether investments in such funds can be classified as cash equivalents. As discussed below, entities may consider the underlying investments of the fund when assessing the significance of the risk of changes in value, however when determining whether classification as a cash equivalent is appropriate, the unit of account is the investment in the money market fund itself.

To meet the definition of a cash equivalent, an investment must be short term; highly liquid; readily convertible to a known amount of cash; and subject to insignificant risk of changes in value. IAS 7 considers a maturity date of three months or less from the date of acquisition to be short-term in the context of maturity, however money market funds generally do not have a legal maturity date. Instead, if the investments are puttable and can be sold back to the fund at any time, they meet the short-term criterion.

Typically, investments in money market funds are redeemed directly with the fund, therefore in assessing liquidity of the investment, focus must be on the liquidity of the fund itself. In making this assessment, entities must consider the nature of any redemption restrictions in place as these may prevent the redemption of the investment in the short term. Alternatively, if a money market fund investment is quoted in an active market, it might be regarded as highly liquid on that basis.

The short-term and highly liquid investment must also be readily convertible into known amounts of cash and be subject to an insignificant risk of changes in value. [IAS 7.6]. As discussed in section 3.2.1 above, this means that the amount of cash that will be received must be known at the time of the initial investment. Accordingly, investments in shares or units of money market funds cannot be considered as cash equivalents simply because they are convertible at any time at the then market price in an active market.

⁶ [IFRIC Update](#), July 2009, available on the IFRS Foundation's website.

The IFRS IC also confirmed that an entity would have to satisfy itself that any investment was subject to an insignificant risk of change in value for it to be classified as a cash equivalent.⁷

How we see it

In our view, in order for an entity to satisfy itself that an investment in a money market fund is subject to an insignificant risk of change in value, the entity must conclude that the range of possible returns is very small.

This evaluation is first made at the time of acquiring the investment and reassessment is required if the facts and circumstances change. The evaluation will involve consideration of factors such as:

- the maturity of the underlying investments of the fund
 - the credit rating of the fund; the nature of the investments held by the fund (i.e., not subject to volatility)
 - the extent of diversification in the portfolio (which is expected to be very high)
 - the investment policy of the fund
- And
- any mechanisms by the fund to guarantee returns (for example by reference to short-term money market interest rates)

Investments are often held for purposes other than to act as a ready store of value that can be quickly converted into cash when needed to meet short-term cash commitments. It is therefore important, even where the criteria above are met, to understand the purpose of an investment in a particular money market fund. Where an investment otherwise satisfies the criteria in IAS 7.6 but is not held by the entity to satisfy short-term cash commitments, it must not be classified as a cash equivalent. [IAS 7.7].

Substantial judgement may be required in assessing whether an investment in money market funds can be classified as a cash equivalent. Therefore, appropriate disclosure is essential. As discussed in section 11 below, entities are required to disclose the composition of cash equivalents and, where relevant, this will include significant judgements made in classifying investments in money market funds.

3.2.3 Investments with maturities greater than three months

The longer the term of an investment, the greater the risk that a change in market conditions (such as interest rates) can significantly affect its value. For this reason, IAS 7 excludes most equity investments from cash equivalents and restricts the inclusion of other investments to those with a short maturity (which the standard illustrates as three months or less from the date of their acquisition by the entity). [IAS 7.7].

An investment with a term on acquisition of, say, nine months is not reclassified as a cash equivalent from the date on which there is less than three months remaining to its maturity. This is because the classification as cash equivalent is based on the maturity and the nature of the instrument at acquisition. The fact that the instrument is now approaching its maturity does not change its nature nor the purpose for which it was acquired.

In the final analysis, cash equivalents are held to meet short-term cash commitments and amounts can only be included in cash equivalents if they can be regarded as being nearly as accessible as cash and essentially as free from exposure to changes in value as cash.

For example, an entity might justify including in cash equivalents a fixed deposit with an original term longer than three months if it effectively functions like a demand deposit. Typically, a fixed deposit will carry a penalty charge for withdrawal prior to maturity. A penalty will usually indicate that the investment is held for investment purposes rather than the purpose of meeting short-term cash needs. However, some fixed deposits still offer interest at a prevailing demand deposit rate in the event of early withdrawal, with any penalty limited to the entity being required to forego the incremental higher interest that it would have received if the deposit were held to maturity. In this case, it may be arguable that there is effectively no significant penalty for early withdrawal, as the entity receives at least the same return that it otherwise would have in a demand deposit arrangement.

⁷ [IFRIC Update](#), July 2009, available on the IFRS Foundation's website.

How we see it

In our view, investments in deposit accounts that upon withdrawal are subject to penalties of such significance, that the funds obtained are appreciably different than the funds that would have been obtained had a shorter-term investment been initially purchased, are not consistent with the assertion that the investment was held to meet short-term cash needs.

Significance is viewed from the perspective of the entity, taking into consideration the environment in which it operates. If the investor would be indifferent to the penalty because the funds obtained are relatively consistent with the funds that would have been obtained had a shorter-term investment been initially purchased, the terms of the instrument are consistent with the assertion that the investment was held for meeting short-term cash needs.

This can be seen in the following Illustration:

Illustration 3-1: Investments with a maturity of greater than three months

Entity A places funds with a bank in a fixed deposit with a stated maturity date of six months. The features of the fixed deposit are as follows:

- If held to maturity, the deposit bears interest at a fixed six-month rate (FD rate) determined at the date of deposit. The FD rate is significantly higher than the interest rates offered for a typical demand deposit account (DD rate). The DD rate is significantly higher than zero.
- Interest accrues on a daily basis based on the FD rate.
- The entity can redeem the fixed deposit at any time before the maturity date. When redeemed, the deposit must be redeemed in full. The entity may not increase the deposit amount subsequent to the initial investment. A penalty charge in the form of forfeited interest is imposed upon early redemption (see Scenario 1 and Scenario 2 that illustrate common terms used to calculate the penalty charge).
- The entity asserts that the investment may be used to meet short-term cash commitments.

Scenario 1

If the entity redeems the fixed deposit at any time before the maturity date, the entity will not be entitled to any interest. The entity will only receive the original principal amount.

Scenario 2

If the entity redeems the fixed deposit at any time before the maturity date, the entity is entitled to interest based on the typical DD rate from the initial deposit date to the date of redemption plus the original principal amount. The balance (if any) of the interest at the FD rate in excess of the DD rate is forfeited as an early withdrawal penalty.

In both scenarios 1 and 2 above, the principal amount is always redeemed in full.

Analysis

The conclusion depends on the facts and circumstances. Whether the deposit meets the definition of a cash equivalent is a matter of judgement. The principle is that to be a cash equivalent, the entity must hold the investment for meeting short-term cash needs.

Scenario 1

The fixed deposit has a stated maturity period from the date of deposit but allows the entity to redeem the fixed deposit immediately; accordingly, the instrument could be viewed as short-term and readily convertible. However, in this scenario, the penalty results in the entity earning no interest. If the deposit had been placed in a demand deposit account rather than in the fixed deposit, the interest earned would have been significantly higher than zero, as set out in the fact pattern. This represents an economic penalty which must be evaluated to determine whether it creates a sufficiently large disincentive such that the entity would not withdraw the funds before the maturity date. This assessment may be subject to some degree of judgement based on facts and circumstances. If such a large disincentive exists, this would be inconsistent with the assertion that the investment is held for meeting short-term cash needs and the fixed deposit would not meet the definition of a cash equivalent.

Scenario 2

The fixed deposit is similar to an account with a one-day demand deposit interest rate that earns 'bonus' interest if the deposit is maintained until a specified date (maturity). The potential bonus interest that is forfeited upon early withdrawal is not viewed as a penalty, because the rate of interest received is consistent with management's investment purpose to meet short-term cash commitments rather than an investment to be held until the maturity date. Therefore, the fixed deposit qualifies as a cash equivalent.

Even if the DD rate is not significantly higher than zero, as long as it is not negative, the interest received on early redemption is still consistent with management's investment purpose to meet short-term cash commitments and the fixed deposit qualifies as a cash equivalent.

In scenario 2 in the above example, the investment is classified as a cash equivalent because it meets all criteria and is held for meeting short-term cash needs. A consequence of this classification is that the calculation of the effective interest rate (EIR) in accordance with IFRS 9 must be done on a consistent basis. IFRS 9 requires that, when calculating the EIR, all contractual terms of the financial instrument, for example prepayments, call and similar options, are considered. See Chapter 46. [IFRS 9 Appendix A]. In this example, it is implicit in the classification that the entity may need to withdraw the deposit to meet short-term cash commitments and, as a consequence, will only receive interest at the (lower) demand deposit rate. Therefore, the EIR must reflect this intention.

3.2.4 Bank overdrafts

Although bank borrowings are generally considered to be financing activities, there are circumstances in which bank overdrafts repayable on demand are included as a component of cash and cash equivalents. This is only in cases where bank overdrafts are repayable on demand and the use of short-term overdrafts form an integral part of an entity's cash management practices. Evidence supporting the latter assertion would be that the bank balance often fluctuates from being positive to overdrawn. [IAS 7.8].

The IFRS IC observed that where overdrafts do not often fluctuate from being negative to positive, this is an indicator that the arrangement does not form part of an entity's cash management and, instead, represents a form of financing.⁸

3.2.5 Restrictions on the use of cash equivalents

The nature of any restriction on the use of each item classified as cash equivalents must be carefully assessed to determine whether the restrictions affect the ability to meet the definition of cash equivalents in the standard.

As discussed in section 3.2 above, for investments to qualify as a cash equivalent, they must be short term, highly liquid, readily convertible into known amounts of cash and subject to insignificant risk of changes in value. [IAS 7.6].

However, the purpose for which the investments are held must also be considered and this is a matter of facts and circumstances. Where investments meet the four criteria above but are not held by the entity to meet short term cash commitments, they cannot be classified as cash equivalents. Therefore, any restrictions on the use of an investment, whether arising directly from the contractual terms and conditions of the investment or arising from a separate contractual arrangement with a third party, that prevent the investment being used to meet short term cash commitments, would result in the investment failing to meet the definition of a cash equivalent.

Illustration 3-2: Investment which is not held to meet short term cash commitments

Entity B has in issue loan notes with a remaining 2 years until maturity. One of the provisions of the financing agreement is that Entity B maintains CU30 million minimum cash balance in a separate bank account continuously until the loan notes are fully redeemed. If the balance on the relevant bank account falls below CU30 million, Entity B is obliged to notify a breach of contract, which triggers certain penalties and could, in certain circumstances, constitute an early redemption event. Entity B chooses to deposit the CU30 million in a 60-day fixed maturity deposit account.

Analysis

The fixed deposit does not meet the definition of cash as it is not cash on hand and is not held in a demand deposit. [IAS 7.6]. The stated maturity period from the date of deposit is less than 3 months; accordingly, the instrument could be viewed as short-term and highly liquid. In addition, the nature of the bank deposit is that it is readily convertible into known amounts of cash and subject to insignificant risk of changes in value. However, the fixed deposit will not be used by Entity B to meet short term cash commitments, as the funds are being held to meet the provisions of a financing agreement which extends for a period of 2 years. Therefore, the cash in the account does not meet the definition of cash equivalents.

⁸ [IFRIC Update](#), June 2018, available on the IFRS Foundation's website.

The requirement to consider the purpose for which the investment is held arises as a result of paragraph 7 of IAS 7 which states that cash equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes. [IAS 7.7]. This can be contrasted with the definition of cash (see section 3.1 above) which does not contain any requirement to consider how or when the cash will be used and therefore ignores any restrictions on the use of cash arising from a contract with a third party. See section 3.1.1 above for a discussion on the classification of cash subject to restrictions.

3.2.6 Credit card receivables at the point of sale

In some industries, entities are paid in exchange for their goods or services at the point of sale through credit card payment systems. Since entities have no practical ability to access cash from the expected payments until the settlement date, they cannot recognize such payments as part of their cash balances before that date.

A question arises however as to whether credit card receivables at the point of sale would be eligible for classification as cash equivalents.

IAS 7 defines cash equivalents as short-term, highly liquid investments that are readily convertible to known amounts of cash, and which are subject to an insignificant risk of changes in value.

How we see it

Entities must consider all aspects of the definition of cash equivalents and exercise judgement to consider how a credit card receivable arising at the point of sale should be classified. This analysis should be done with reference to the contractual terms of each credit card payment system and the applicable laws and regulations in the relevant jurisdiction. Factors to consider would include:

- Who bears the risk of payment if the ultimate customer defaults or the transaction is fraudulent;
- The length of time that will elapse between the transaction and the receipt of the cash from the counterparty. For example, if the cash is received shortly (e.g. 5 to 10 days) after the transaction is initiated then there is less risk of a change in value.
- How reputable the counterparty is;
- How the counterparty is regulated; and
- The credit risk of the counterparty.

For example, there may be provisions in the contract between the entity and the credit card system provider such that the entity is not guaranteed to be paid by the credit card payment system provider, including in case of customer credit default or fraudulent use of the card. In this situation, this would be a strong indicator that the credit card receivables would not meet the definition of cash equivalent. These transactions would be accounted for as a sale on credit and the amount outstanding should be classified as a receivable until it has been settled.

Because each arrangement with a credit card system provider may have different contractual characteristics, management may come to different conclusions depending on each arrangement. If material, an entity should disclose and explain the judgement it has made in the process of applying its accounting policy and disclose the amount of the cash equivalents to which this judgement has been applied, in accordance with paragraphs 45 and 46 of IAS 7.

The above guidance does not apply to credit card payments in-transit for the settlement of trade receivables- see section 3.1.4 above for guidance on payments in transit.

3.3 Reassessment of cash and cash equivalents after initial recognition

There is no specific requirement in IAS 7 for the re-assessment of the criteria for classification as cash or cash equivalents after initial recognition. However, it is implicit in the definitions in IAS 7 that the amounts must still meet those definitions at the end of each reporting period to be presented as such. Changes that may affect the criteria for classification could arise from contractual or non-contractual changes. For contractual changes, it will usually be clear when these changes are made and what the nature of the changes are. Such changes could affect the nature of the asset and require the new asset to be tested against the definition of cash and cash equivalents.

Other changes in facts and circumstances could also require careful consideration and the application of judgement. For cash equivalents, reassessment may be particularly relevant when looking at the requirements that cash equivalents are highly liquid and subject to an insignificant risk of changes in value.

For example, since initial recognition of an investment as a cash equivalent, there may have been adverse changes to the credit status of the counterparty to the investment or a significant decline in the economic stability of the jurisdiction in which the funds are invested. At the end of the reporting period, the investment may no longer meet the definition of cash equivalents since it is no longer highly liquid and readily convertible into known amounts of cash and is now subject to more than an insignificant risk of changes in value.

However, as discussed in section 3.2.3 above, an investment with a term on acquisition of, say, nine months is not reclassified as a cash equivalent from the date on which there is less than three months remaining to its maturity. This is because the classification as cash equivalent is based on the maturity and the nature of the instrument at acquisition. The fact that the instrument is now approaching its maturity does not change its nature nor the purpose for which it was acquired.

3.4 Current or non-current classification

In respect of classification as current or non-current, for entities that present current and non-current assets and liabilities in the statement of financial position, IAS 1 requires that cash and cash equivalents are classified as current “unless the asset is restricted from being exchanged or used to settle a liability for at least twelve months after the reporting period.” [IAS 1.66(d)].

As discussed in section 3.1.1 above, in March 2022, the IFRS IC issued an agenda decision concluding that restrictions on the use of a demand deposit arising from a contract with a third party do not result in the deposit no longer being cash, unless those restrictions change the nature of the deposit in a way that it would no longer meet the definition of cash in IAS 7. This raises the question as to how the requirements of IAS 1 paragraph 66(d) apply to cash subject to such restrictions. However, the submission which gave rise to the agenda decision did not ask the IFRS IC to consider how the requirements of IAS 1.66(d) are applied and, the IFRS IC did not conclude on whether the demand deposit in the fact pattern would be classed as current or non-current.

In respect of cash equivalents, the application of IAS 1.66(d) is far more straightforward, given that paragraph 7 of IAS 7 states that “Cash equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes.”

How we see it

In our view, cash equivalents will always be classified as current. This is because cash equivalents must be held for the purpose of meeting short-term cash commitments rather than for investment or other purposes. Any restrictions that prevent the asset from being exchanged or used to settle a liability for at least 12 months after the reporting period would result in the asset failing to meet the definition of cash equivalents.

4 Classification in the statement of cash flows

Extract from IAS 7

- 10** The statement of cash flows shall report cash flows during the period classified by operating, investing and financing activities.

[IAS 7.10].

This classification is intended to allow users to assess the impact of these three types of activity on the financial position of the entity and the amount of its cash and cash equivalents. Whilst not stated explicitly in the standard, the presentation of operating, investing and financing cash flows usually follows this sequence in practice, and a total net cash flow for each standard heading must be shown. Comparative figures are required for all items in the statement of cash flows and the related notes. [IAS 1.38].

The components of cash flows are classified as operating, investing or financing activities in a manner which is most appropriate to the business of the entity. [IAS 7.11]. For example, the purchase of investments is likely to be classified as an operating cash flow for a financial institution, but as an investing cash flow for a manufacturer. Additionally, a single transaction may comprise elements of differently classified cash flows. For example, when repayments on a loan include both interest and capital, the element reflecting the interest expense may be included in either operating activities or financing activities (see section 4.4.1 below) whereas the capital repayment must be classified as a financing cash flow. [IAS 7.12].

A format of the statement of cash flows is illustrated in Practical example 4-1 below. As permitted by the standard, AstraZeneca PLC has included interest paid under operating activities, interest received under investing activities and dividends paid under financing activities.

Practical example 4-1: AstraZeneca PLC (2023)

AstraZeneca Annual Report & Form 20-F Information 2023 [extract]

Financial Statement [extract]

Consolidated Statement of Cash Flows

for the year ended 31 December

	Notes	2023 \$m	2022 \$m	2021 \$m
Cash flows from operating activities				
Profit/(loss) before tax		6,899	2,501	(265)
Finance income and expense	3	1,282	1,251	1,257
Share of after tax losses of associates and joint ventures	11	12	5	64
Depreciation, amortisation and impairment		5,387	5,480	6,530
Increase in trade and other receivables		(1,425)	(1,349)	(961)
(Increase)/decrease in inventories		(669)	3,941	1,577
Increase in trade and other payables and provisions		2,394	1,165	1,405
Gains on disposal of intangible assets	2	(251)	(104)	(513)
Gains on disposal of investments in associates and joint ventures	2	–	–	(776)
Fair value movements on contingent consideration arising from business combinations	20	549	82	14
Non-cash and other movements	17	(386)	(692)	95
Cash generated from operations		13,792	12,280	8,427
Interest paid		(1,081)	(849)	(721)
Tax paid		(2,366)	(1,623)	(1,743)
Net cash inflow from operating activities		10,345	9,808	5,963
Cash flows from investing activities				
Acquisition of subsidiaries, net of cash acquired	27	(189)	(48)	(9,263)
Payments upon vesting of employee share awards attributable to business combinations	27	(84)	(215)	(211)
Payment of contingent consideration from business combinations	20	(826)	(772)	(643)
Purchase of property, plant and equipment		(1,361)	(1,091)	(1,091)
Disposal of property, plant and equipment		132	282	13
Purchase of intangible assets		(2,417)	(1,480)	(1,109)
Disposal of intangible assets		291	447	587
Movement in profit-participation liability	2	190	–	20
Purchase of non-current asset investments		(136)	(45)	(184)
Disposal of non-current asset investments		32	42	9
Movement in short-term investments, fixed deposits and other investing instruments		97	(114)	96
Payments to associates and joint ventures	11	(80)	(26)	(92)
Disposal of investments in associates and joint ventures		–	–	776
Interest received		287	60	34
Net cash outflow from investing activities		(4,064)	(2,960)	(11,058)
Net cash inflow/(outflow) before financing activities		6,281	6,848	(5,095)
Cash flows from financing activities				
Proceeds from issue of share capital		33	29	29
Issue of loans and borrowings		3,816	–	12,929
Repayment of loans and borrowings		(4,942)	(1,271)	(4,759)
Dividends paid		(4,481)	(4,364)	(3,856)
Hedge contracts relating to dividend payments		(19)	(127)	(29)
Repayment of obligations under leases		(268)	(244)	(240)
Movement in short-term borrowings		161	74	(276)
Payments to acquire non-controlling interests		–	–	(149)
Payment of Acerta Pharma share purchase liability		(867)	(920)	–
Net cash (outflow)/inflow from financing activities		(6,567)	(6,823)	3,649
Net (decrease)/increase in Cash and cash equivalents in the period		(286)	25	(1,446)
Cash and cash equivalents at the beginning of the period		5,983	6,038	7,546
Exchange rate effects		(60)	(80)	(62)
Cash and cash equivalents at the end of the period	17	5,637	5,983	6,038

Having reviewed a variety of requests received from constituents for further guidance on the classification of cash flows, the IFRS IC and the IASB have reiterated the general requirement set out in IAS 7.11 that the primary principle for classification of cash flows should be in accordance with the nature of the activity in a manner that is most appropriate to the business of the entity.⁹ However, at its March 2013 meeting, the IFRS IC discussed how the definitions of operating, investing and financing cash flows in IAS 7 could be made clearer and thus could lead to a more consistent application of the primary principle but concluded that clarifying the application of the primary principle was a matter that was too broad for the IFRS IC to address.¹⁰ As a result, pending any change to the standard, there is likely to be some diversity in practice on how some common transactions are presented in the statement of cash flows.

4.1 Cash flows from operating activities

Operating activities are defined as “the principal revenue-producing activities of the entity and other activities that are not investing or financing activities”. [IAS 7.6]. The standard states that the value of information on operating cash flows is twofold. It provides a key indicator of the extent to which the entity has generated sufficient cash flows from its operations to repay debt, pay dividends and make investments to maintain and increase its operating capability, without recourse to external sources of financing. Also, information about the components of historical operating cash flows may assist in the process of forecasting future operating cash flows, when used in conjunction with other financial statement information. [IAS 7.13]. Cash flows from operating activities generally result from transactions and other events that enter into the determination of profit or loss. Examples include: [IAS 7.14]

- Cash receipts from the sale of goods and the rendering of services
- Cash receipts from royalties, fees, commissions and other revenue
- Cash payments to suppliers for goods and services
- Cash payments to and on behalf of employees
- Cash payments or refunds of income taxes unless they can be specifically identified with financing and investing activities
- Cash receipts and payments from contracts held for dealing or trading purposes (see section 4.4.12 below regarding the allocation of cash flows paid or received under derivative contracts)

Operating activities is also a ‘default category’ for any cash flows that do not meet the criteria of investing or financing cash flows. For example, as discussed in section 9.3.1 below, acquisition-related costs in a business combination that must be recognised as an expense, [IFRS 3.53], would also be classified as operating cash flows because there is no related asset that would justify classification as an investing cash flow. [IAS 7.16].

The nature of the business conducted by the entity will be a relevant factor in determining the appropriate classification of cash flows as operating, investing or financing. For example, when an entity holds securities and loans for dealing or trading purposes, they are similar to inventory acquired specifically for resale. Therefore, any related cash flows are classified as operating activities. Similarly, cash advances and loans made by financial institutions are usually classified as operating activities, since they relate to the main revenue-generating activity of that entity (see section 10.1 below). [IAS 7.15].

The proceeds from the sale of property, plant and equipment, which are usually included in cash flows from investing activities, are an example of an item that enters into the determination of profit or loss that is not usually an operating cash flow. [IAS 7.14]. However, the proceeds from sales of assets previously held for rental purposes are classified as cash flows from operating activities if the entity routinely sells such assets in its ordinary course of business. Similarly, cash payments to manufacture or acquire property, plant and equipment held for rental to others, and that are routinely sold in the ordinary course of business after rental, are also classified as cash flows from operating activities (see section 4.4.7 below). [IAS 7.14].

Cash flows from operating activities may be reported on a gross or net basis, also known as the direct and indirect methods. [IAS 7.18]. The use of the direct or indirect method is an accounting policy choice and must be applied consistently from period to period. Any change in method must be reported under IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*. This would require comparatives to be restated and additional disclosures given, including the reasons for the change in policy. [IAS 8.29].

⁹ [IASB Update](#), April 2013, available on the IFRS Foundation’s website.

¹⁰ [IASB Update](#), April 2013, available on the IFRS Foundation’s website.

4.1.1 The direct method

Under the direct method, major classes of gross cash receipts and gross cash payments are disclosed. [IAS 7.18]. IAS 7 encourages entities to use the direct method, because it provides information which may be useful in estimating future cash flows and which is not available under the indirect method. [IAS 7.19].

Under the direct method, information about major classes of gross cash receipts and payments may be obtained either:

(a) From the accounting records of the entity

Or

(b) By adjusting sales, cost of sales (interest and similar income and interest expenses and similar charges for a financial institution) and other items in the statement of comprehensive income for changes during the period in inventories and operating receivables and payables, other items for which the cash effects are investing or financing cash flows and other non-cash items [IAS 7.19]

A statement of cash flows prepared under the direct method must include the same disclosures of gross cash receipts and gross cash payments irrespective of which approach has been used to determine their value. There is no requirement for entities using the approach described in (b) above to present a reconciliation showing the adjustments made between, for example, revenue in the statement of comprehensive income and cash receipts from customers.

Telefonica, S.A. is an example of an entity using the direct method for presenting its cash flows from operating activities, as illustrated in Practical example 4-2 below.

Practical example 4-2: Telefónica, S.A. (2023)

Spain

Consolidated Annual Report 2023 [extract]

Consolidated financial statements 2023 [extract]

Consolidated statements of cash flows for the years ended December 31

Millions of euros	Notes	2023	2022	2021
Cash received from operations	(Note 28)	47,314	46,925	46,415
Cash paid from operations	(Note 28)	(34,646)	(34,778)	(34,379)
Net payments of interest and other financial expenses net of dividends received	(Note 28)	(565)	(292)	(1,309)
Taxes (paid)/proceeds	(Note 28)	(454)	(92)	(459)
Net cash flow provided by operating activities	(Note 28)	11,649	11,763	10,268

...

4.1.2 The indirect method

The indirect method arrives at the same value for net cash flows from operating activities but does so by working back from amounts reported in the statement of comprehensive income. There are two approaches for presenting the net cash flows from operating activities when using the indirect method. The most common approach adjusts reported profit or loss for the effects of:

(a) Changes in inventories and operating receivables and payables during the period

(b) Non-cash items such as depreciation, provisions, deferred taxes, unrealised foreign currency gains and losses, and undistributed profits of associates

And

(c) All other items for which the cash effects are investing or financing cash flows [IAS 7.20]

Woodside Energy Group Ltd has used this adjusted profit approach to present its indirect method statement of cash flows, as illustrated in Practical example 4-3 below.

Practical example 4-3: Woodside Energy Group Ltd (2023)

Alternatively, the indirect method of presentation can show separately revenues and expenses, adjusted for non-cash, investing or financing items, making up operating profit before working capital changes. [IAS 7.20]. An example of this rarely used alternative is given at the end of Example A in the Illustrative Examples accompanying IAS 7. [IAS 7.IE Example A].

4.1.2.A Starting point for the reconciliation

When an entity adjusts reported profit or loss under the indirect method, a question arises as to which measure of profit or loss to use as a starting point for the reconciliation. IAS 7 does not define 'profit or loss'. The term is defined in IAS 1 paragraph 7 as "Profit or loss is the total of income less expenses, excluding the components of other comprehensive income." Paragraph 88 of IAS 1 refers to the profit and loss for the period as containing "all items of income and expense recognised in a period ..." which might suggest that profit or loss after tax (as in Practical example 4-3 above) must be used. However, Example A in the Illustrative Examples accompanying IAS 7 illustrates the indirect method by showing profit before tax as a starting point (as is also shown in Practical example 4-1 above). [IAS 7.IE Example A].

How we see it

In our view, profit before tax and profit after tax can both be used as the starting point for the reconciliation.

We also observe in practice that there may be other profit measures currently used such as operating profit or similar. In our view, it is acceptable for an operating result sub-total to be used as a starting point for the reconciliation provided that it is a clearly identified sub-total on the face of the income statement, is reconciled to profit before or after tax on the face of the income statement and is representative of all the operating activities of the entity. In our view, alternative performance measures such as profit or loss before non-recurring operating items would not be acceptable starting points for the reconciliation.

Entities should take into consideration the views of local regulators who make take a stricter view of this matter.

It is relevant to note that IFRS 18 (which is mandatory for reporting periods beginning on or after 1 January 2027) makes consequential amendments to IAS 7 to require that the starting point for determining cash flows from operating activities is the operating profit or loss subtotal. This operating profit or loss subtotal is defined in IFRS 18 and will be a required subtotal in the statement of financial performance. See Chapter 4.

In the Basis for Conclusions to these amendments, the IASB sets out its rationale for this decision, explaining that an entity using operating profit or loss needs to present fewer adjustments to the starting point, which simplifies the presentation of the operating cash flows category. Fewer adjustments are needed because, compared to profit or loss, operating profit or loss includes fewer items of income and expenses for which the cash effects are classified as investing or financing cash flows. In addition, the difference between cash flows from operating activities and operating profit or loss provides a measure of operating accruals which some users may find useful. [IAS 7(2027).BC47].

4.1.2.B Adjusting for changes in working capital

To obtain the information on working capital movements for the indirect method, the figures in the statement of financial position must be analysed according to the three standard headings of the statement of cash flows. Thus, the reconciliation of profit or loss to cash flow from operating activities will include the increase or decrease in receivables or payables, but only in respect of those elements thereof that relate to operating activities. For example, amounts owed in respect of the acquisition of property, plant and equipment (other than assets held for rental and subsequent sale), intangible assets, or non-operational investments will be excluded from the movement in payables included in this reconciliation.

Furthermore, when a group has acquired a subsidiary during the year, the change in working capital items will have to be split between the increase due to the acquisition (to the extent that the purchase consideration was settled in cash, this will be shown under investing activities) and the element related to post-acquisition operating activities which will be shown in the reconciliation. Further considerations needed when preparing a statement of cash flows for a group are explained in section 9 below.

4.2 Cash flows from investing activities

Investing activities are defined as “the acquisition and disposal of long-term assets and other investments not included in cash equivalents”. [IAS 7.6]. This separate category of cash flows allows users of the financial statements to understand the extent to which expenditures have been made for resources intended to generate future income and cash flows. Cash flows arising from investing activities include:

- (a) Payments to acquire, and receipts from the sale of, property, plant and equipment, intangibles and other long-term assets (including payments and receipts relating to capitalised development costs and self-constructed property, plant and equipment).
 - (b) Payments to acquire, and receipts from the sale of, equity or debt instruments of other entities and interests in jointly controlled entities (other than payments and receipts for those instruments considered to be cash equivalents or those held for dealing or trading purposes).
 - (c) Advances and loans made to, and repaid by, other parties (other than advances and loans made by a financial institution).
- And
- (d) Payments for, and receipts from, futures contracts, forward contracts, option contracts and swap contracts, except when the contracts are held for dealing or trading purposes, or the cash flows are classified as financing activities (see section 4.4.12 below regarding allocation of cash flows on derivative contracts). [IAS 7.16].

As part of its annual improvement project, the IASB added in 2008 that only expenditures that result in a recognised asset in the statement of financial position are eligible for classification as investing activities. [IAS 7.16]. Therefore, cash flows relating to costs recognised as an expense cannot be classified within investing activities. As a result, payments including those for exploration and evaluation activities and for research and development that are recognised as an asset are classified as investing cash flows, while entities that recognise such expenditures as an expense would classify the related payments as operating cash flows.

This requirement was added in response to submissions made to the IFRS IC about the classification of expenditure incurred with the aim of generating future revenues, but that may not always result in the recognition of an asset. Examples included exploration and evaluation expenditure, advertising and promotional activities, staff training, and research and development. [IAS 7.BC3]. The IASB believes this approach aligns the classification of investing cash flows with the presentation in the statement of financial position, reduces divergence in practice and, therefore, results in financial statements that are easier for users to understand. [IAS 7.BC7]. It does not seem unreasonable that recurrent expenditure on items such as research and expensed mining costs are classified as operating cash flows. However, application to other items that do not give rise to an asset in the statement of financial position, such as acquisition-related costs (discussed in section 9.3.1 below) and the settlement of contingent consideration in a business combination (discussed in section 9.3.3 below) may prove to be more complicated.

The IFRS IC and the IASB have discussed the application of this requirement in practice, as some users appear to have given precedence to the classification of cash flows consistently with the classification of the related item in the statement of financial position, [IAS 7.BC7], (sometimes referred to as the 'cohesiveness principle') over the objective in the standard to classify cash flows in accordance with the nature of the activity giving rise to the cash flow. [IAS 7.11]. In its discussion, the IASB agreed that the primary principle for the classification of cash flows should be in accordance with the nature of the activity, and that the requirement for the recognition of an asset should be read as a constraint on the application of the primary principle, rather than as a competing principle.¹¹

Major classes of gross receipts and gross payments arising from investing activities are reported separately, except for those items that IAS 7 permits to be reported on a net basis, as discussed in section 5.2 below. [IAS 7.21].

4.3 Cash flows from financing activities

Financing activities are defined as those "activities that result in changes in the size and composition of the contributed equity and borrowings of the entity". [IAS 7.6]. The standard states that this information is useful in predicting claims on future cash flows by providers of capital to the entity. [IAS 7.17]. However, it would seem more likely that information on financing cash flows would indicate the extent to which the entity has had recourse to external financing to meet its operating and investing needs in the period. The disclosure of the value and maturity of the entity's financial liabilities, as required by IFRS 7, would contribute more to predicting future claims on cash flows. [IFRS 7.39]. Cash flows arising from financing activities include:

- (a) Proceeds from issuing shares or other equity instruments
 - (b) Payments to owners to acquire or redeem the entity's shares
 - (c) Proceeds from issuing, and outflows to repay, debentures, loans, notes, bonds, mortgages and other short or long-term borrowings
- And
- (d) Payments by a lessee for the reduction of the outstanding liability relating to a lease [IAS 7.17]

In consolidated financial statements, financing cash flows will include those arising from changes in ownership interests in a subsidiary that do not result in a loss of control (see section 9.2 below). [IAS 7.42A]. Major classes of gross receipts and gross payments arising from financing activities must be reported separately, except for those items that can be reported on a net basis, as discussed in section 5.2 below. [IAS 7.21].

Disclosure requirements in respect of changes in liabilities arising from financing activities are discussed in section 11.2 below.

¹¹ [IASB Update](#), April 2013, available on the IFRS Foundation's website.

4.4 Allocating items to operating, investing and financing activities

Sometimes it is not clear how to classify cash flows amongst operating, investing and financing activities. IAS 7 provides additional guidance on the classification of certain transactions, including interest, dividends and income taxes, while other questions are not addressed explicitly in the standard. These, as well as some common areas where judgement may be required to classify cash flows, are discussed below.

Where the appropriate classification is not clear from IAS 7 and an entity has therefore applied judgement to determine the appropriate presentation of material items based on the principles of IAS 7, additional disclosure may be needed to explain these judgements. IAS 1 requires disclosure of the judgements that management has made that have the most significant effect on the amounts recognised in the financial statements, [IAS 1.122], as well as information that is relevant to an understanding of any of the entity's financial statements. [IAS 1.112]. (See Chapter 3).

4.4.1 Interest and dividends

An entity is required to disclose separately cash flows from interest and dividends received and paid, and their classification as either operating, investing or financing activities must be applied in a consistent manner from period to period. [IAS 7.31]. For a financial institution, interest paid, and interest and dividends received are usually classified as operating cash flows. However, IAS 7 notes that there is no consensus on the classification of these cash flows for other entities and goes on to state that:

- Interest paid may be classified under either operating or financing activities.
- Interest received and dividends received may be included in either operating or investing cash flows. [IAS 7.33].

The standard allows dividends paid to be classified as a financing cash flow (because they are a cost of obtaining financial resources) or as a component of cash flows from operating activities. [IAS 7.34].

In Practical example 4-1 in section 4 above, AstraZeneca PLC has included interest paid under operating activities, interest received under investing activities and dividends paid under financing activities, as permitted by the standard. A different treatment is adopted by Telefonica, S.A. in Practical example 4-2 in section 4.1.1 above, where interest paid, interest received and dividends received are all included as operating cash flows and dividends paid are included as financing cash flows.

All these treatments comply with the standard; however, the most appropriate treatment will depend on the nature of the entity and its activities. For example, if an entity does not include interest received or dividends received within revenue it may be more appropriate to include the interest or dividend cash inflows as investing cash flows rather than operating cash flows. This is because cash flows from operating activities are primarily derived from the principal revenue-generating activities of the entity, [IAS 7.14], and the amount of cash flows arising from operating activities is intended to be a key indicator of the extent to which the operations of the entity have generated sufficient cash flows to repay loans, pay dividends and make new investments without recourse to external sources of financing. [IAS 7.13]. Similarly, an entity could treat interest and dividends paid as financing cash flows because they are a cost of obtaining financial resources. [IAS 7.34].

In addition, the standard requires the total amount of interest paid during the period to be disclosed in the statement of cash flows, whether it has been recognised as an expense or capitalised as part of the cost of an asset in accordance with IAS 23 *Borrowing Costs*. [IAS 7.32]. A literal reading of this requirement might suggest that interest paid must be presented as a single figure under operating or financing activities. However, it could also be appropriate to classify payments of interests in accordance with the classification of the underlying asset to which those payments were capitalised provided that, when this is done, the total amount of interest paid is also disclosed either on the face of the statement of cash flows or in the notes. For example, payments of interest that is capitalised as part of the cost of property, plant and equipment would be classified as part of an entity's investing activities, and payments of interest that is capitalised as part of the cost of inventories would be classified as part of an entity's operating activities. An attempt to clarify the issue through an annual improvement¹² was never finalised, mainly because the IFRS IC observed that amendments to IAS 7 relating to classification of cash flows should not be made on a piecemeal basis unless the classification was evident from the current guidance in IAS 7 and an amendment to IAS 7 would make that classification clearer.¹³

12 Exposure Draft [ED 2012/1](#), *Annual Improvements to IFRSs 2010-2012 Cycle*, IASB, May 2012, available on the IFRS Foundation's website.

13 [IASB Update](#), April 2013.

Where an entity has issued shares that are classified as financial liabilities in accordance with IAS 32 *Financial Instruments: Presentation* (see Chapter 43), the dividends paid on those shares will be presented in the statement of cash flows as either operating or financing in line with the entity's presentation of other interest paid.

4.4.2 Taxes on income

Cash flows arising from taxes on income shall be separately disclosed within operating cash flows unless they can be specifically identified with investing or financing activities. [IAS 7.35].

Whilst it is possible to match elements of tax expense to transactions for which the cash flows are classified under investing or financing activities; taxes paid are usually classified as cash flows from operating activities because it is often impracticable to match tax cash flows with specific elements of tax expense. Also, those tax cash flows may arise in a different period from the underlying transaction. [IAS 7.36]. However, when it is practicable to make this determination, the tax cash flow is identified as an investing or financing activity in accordance with the individual transaction that gives rise to such cash flows. In cases where tax cash flows are allocated over more than one class of activity, disclosure is required of the total amount for taxes paid. [IAS 7.36].

4.4.3 Sales taxes and other non-income tax cash flows

Although it sets out requirements for the treatment of taxes on income, IAS 7 does not specifically address the treatment of cash flows relating to other taxes, such as value added tax (VAT) or other sales taxes and duty. The IFRS IC has considered whether it should add the question about VAT to its agenda and decided that it was not appropriate to develop an interpretation.

In explaining why, it would not add this question to its agenda, the IFRS IC noted that "IAS 7 does not explicitly address the treatment of VAT" and added that "while different practices may emerge, they are not expected to be widespread".¹⁴

Given the availability of alternative treatments, the IFRS IC noted that it would be appropriate in complying with IAS 1 for entities to disclose whether cash flows are presented inclusive or exclusive of related VAT.¹⁵

How we see it

In our view, entities can choose to disclose sales taxes and other non-income tax receipts and payments separately in the statement of cash flows or as part of the related cash inflows and outflows. Even if presented separately, the tax cash flows are presented as operating, investing or financing in accordance with the classification of the underlying transactions that gives rise to the tax cash flows.

4.4.4 Cash contributions to a long-term employee benefit fund

As discussed in section 4.1 above, the definition of operating activities in IAS 7 includes as one of its examples "cash payments to and on behalf of employees". [IAS 7.14(d)]. Such cash outflows would typically involve wages and salaries paid to employees, taxes paid on behalf of employees and any other employee benefit contributions made on behalf of employees. Where a company makes contributions to a long-term employee benefit fund on behalf of its employees, those cash outflows are part of the compensation for employment services and are classified as operating cash flows.

4.4.5 Cash flows from factoring of trade receivables

Another question not explicitly addressed in the standard is the classification of cash receipts from the factoring of trade receivables.

In the case of debt factoring, an entity aims to receive cash flows from trade receivables more quickly than would arise from normal collection from customers, generally by transferring rights over those receivables to a financial institution. This raises questions as to whether the transfer results in derecognition of the trade receivables, or to the continued recognition of the trade receivables and the recognition of a financial liability for the funding received from the factoring entity. The characteristics determining which of these accounting treatments would be appropriate are discussed in Chapter 48.

¹⁴ [IFRIC Update](#), August 2005, available on the IFRS Foundation's website.

¹⁵ [IFRIC Update](#), August 2005, available on the IFRS Foundation's website.

How we see it

In our view, the classification of the cash receipt from the financial institution depends on the accounting treatment of the trade receivables. Only to the extent that the factoring arrangement results in the derecognition of the original trade receivable would it be appropriate to regard the cash receipt in the same way as any other receipt from the sale of goods and rendering of services and classify it in operating activities.

In cases where the trade receivable is not derecognised and a liability is recorded, the nature of the arrangement is a borrowing secured against trade receivables and accordingly we believe that the cash receipt from factoring must be treated in the same way as any short-term borrowing and included in financing activities. [IAS 7.17(c)]. The later cash inflow from the customer for settlement of the trade receivable would be included in operating cash flows and the reduction in the liability to the financial institution would be a financing outflow. Following the principle in IFRS 9 for the disclosure of income and expense relating to a transferred asset that continues to be recognised, [IFRS 9.3.2.22], these two amounts would not be offset in the statement of cash flows. However, it would be acceptable for the entity to disclose the net borrowing receipts from, and repayments to, the financial institution, if it was determined that these relate to advances made for and the repayment of short-term borrowings such as those which have a maturity period of three months or less. [IAS 7.23A(c)].

In some cases, the factoring arrangement requires customers to remit cash directly to the financial institution, but the arrangement does not result in the derecognition of the original trade receivables. As, discussed above, the initial cash receipt from factoring is included in financing activities. [IAS 7.17]. However, there is currently diversity as to whether, and how, the cash received by the financial institution from customers are presented in the entity's statement of cash flows.

When the transfer does not give rise to derecognition of the trade receivable by the reporting entity, the reporting entity may determine that the factoring entity is acting as its agent and is therefore collecting the cash on its behalf before drawing down amounts to settle the liability it is owed by the reporting entity. In this case, the entity would report an operating cash inflow from the customer and a financing cash outflow to the financial institution when the financial institution collects the cash from the customers. See section 5.3 below for further discussion of the presentation of cash paid or received on an entity's behalf. Alternatively, if the reporting entity determines that the factoring agent is not acting as its agent, the entity will reflect the later settlement of the debt by the customer as a non-cash transaction with no cash flows reported at the time of the ultimate derecognition of the trade receivable and the related factoring liability.

4.4.6 Cash flows from supply-chain financing and reverse factoring arrangements

The IFRS IC discussed the application of IFRS accounting standards to reverse factoring arrangements in their June 2020 and December 2020 meetings. The IFRS IC described reverse factoring arrangements simply as ones in which a financial institution agrees to pay amounts an entity owes to the entity's suppliers and the entity agrees to pay the financial institution at the same date as, or a date later than, suppliers are paid.

An agenda decision¹⁶ was published in December 2020, outlining how IFRS accounting standards are applied to the different aspects of accounting for such arrangements. The agenda decision considers the presentation in the statement of financial position, the derecognition of a financial liability, the presentation in the statement of cash flows and disclosure in the notes to the financial statements. Details of the agenda decision, the impact on the statement of financial position and the impact on the notes to the financial statements can be found in Chapter 50.

In respect of the presentation in the statement of cash flows, an entity that has entered into a reverse factoring arrangement would need to determine whether to classify cash flows under the arrangement as cash flows from operating activities or cash flows from financing activities.

¹⁶ [IFRIC Update](#), December 2020, available on the IFRS Foundation's website.

This in turn poses the following challenges:

- Does the presentation of the liability to the financial institution in the statement of financial position impact the presentation of cash flows? For example, if the liability is presented outside of trade and other payables, must the ultimate payment to the financial institution be presented as a financing outflow? Or can it instead be presented as an operating cash flow based on the nature of the activities that initially led to the recognition of the trade payable that was settled through the supply-chain financing?
- Will the remittance of cash directly to the supplier by the financial institution be reflected at all in the statement of cash flow or is it a non-cash transaction?

With respect to the first question above, the agenda decision notes that “the committee observed that an entity’s assessment of the nature of the liabilities that are part of the arrangement may help in determining whether the related cash flows arise from operating or financing activities. For example, if the entity considers the related liability to be a trade or other payable that is part of the working capital used in the entity’s principal revenue-producing activities, the entity presents cash outflows to settle the liability as arising from operating activities in its statement of cash flows. In contrast, if the entity considers that the related liability is not a trade or other payable because the liability represents borrowings of the entity, the entity presents cash outflows to settle the liability as arising from financing activities in its statement of cash flows”.

How we see it

In our view, the agenda decision does not preclude an entity from presenting the repayment of the liability owed to the factor as an operating cashflow based on the nature of the transaction that led to the initial recognition of the liability to the entity’s supplier, notwithstanding a presentation in the statement of financial position of the liability to the financial institution outside of trade and other payables. This is because there is no automatic link between the statement of financial position and the statement of cash flows.¹⁷ In both cases, such presentations must be applied consistently and disclosed and explained in the notes.

As regards the identification of cash flows and the second question above, the agenda decision notes that “Investing and financing transactions that do not require the use of cash or cash equivalents are excluded from an entity’s statement of cash flows (paragraph 43 of IAS 7). Consequently, if a cash inflow and cash outflow occur for an entity when an invoice is factored as part of a reverse factoring arrangement, the entity presents those cash flows in its statement of cash flows. If no cash inflow or cash outflow occurs for an entity in a financing transaction, the entity discloses the transaction elsewhere in the financial statements in a way that provides all the relevant information about the financing activity (paragraph 43 of IAS 7)”. [IAS 7.43].

How we see it

In our view, the agenda decision does not go beyond confirming the requirements of the standard when it states that if no cash flows are involved, then no cash flows are presented in the cash flow statement. In practice, a careful analysis of the relationship between the entity and the financial institution is needed to determine whether the financial institution is acting as an agent on behalf of the entity and receiving and incurring cash flows on its behalf. This will inform the appropriate presentation in the statement of cash flows. We discuss this issue further, including factors to consider in analysing the relationship between the entity and the financial institution, in section 5.3 below.

In its agenda decision, the IFRS IC rightly observed that assessing how to present liabilities and cash flows related to reverse factoring arrangements may involve judgement and emphasised the requirement in IAS 1 to disclose judgements that management has made in this respect if they are among the judgements made that have the most significant effect on the amounts recognised in the financial statements, [IAS 1.122], as well as any information that is relevant to an understanding of any of the entity’s financial statements. [IAS 1.112].

¹⁷ [IASB Staff Paper](#), Project: Supply Chain Financing Arrangements-Reverse Factoring, Paper topic: Comment letters on tentative agenda decision, IFRS IC Meeting, December 2020, paragraph 50. Available on the IFRS Foundation’s website.

The agenda decision suggests that the issue is only about whether to classify the associated cash flows as operating or financing activities. However, we note that if the cost of the goods or services is capitalised into a longer-term asset such as property, plant and equipment, or possibly an intangible asset, the classification decision would be between investing and financing activities. This may be particularly relevant in asset intensive industries such as telecommunications or the extractive industries.

In the agenda decision the IFRS IC noted that the effects of reverse factoring arrangements may also need to be included in the disclosure of:

- Changes in liabilities arising from financing activities, as required by IAS 7.44A (see section 11.2 below). If an entity classifies the cash flows arising from a reverse factoring arrangement as financing, or will do so in the future, the related liabilities and cash and non-cash changes are included in this disclosure.

And

- Liquidity risk, as required by IFRS 7, [IFRS 7.33, IFRS 7.34, IFRS 7.35, IFRS 7.39, IFRS 7.B11F], because the entity has concentrated a portion of its liabilities with one financial institution rather than a diverse group of suppliers - see Chapter 50. Also, some suppliers may have become accustomed to, or reliant on, earlier payment of their trade receivables under the reverse factoring arrangement. If the financial institution were to withdraw the reverse factoring arrangement, those suppliers could demand shorter credit terms, which would affect the entity's liquidity, particularly if the entity was already in financial distress.

In the process of finalising the agenda decision, the IFRS IC and the Board acknowledged that user information needs may not be met by the current requirements in respect of such arrangements. This resulted in the Board issuing *Supplier Finance Arrangements (Amendments to IAS 7 and IFRS 7)* (the amendments) in May 2023. The disclosure requirements in the amendments are intended to assist users of financial statements in understanding the effects of supplier finance arrangements on an entity's liabilities, cash flows and exposure to liquidity risk. The amendments, which are effective for annual reporting periods beginning on or after 1 January 2024, are discussed in more detail in section 11.4 below.

Early adoption of the amendments is permitted. However, many entities may choose to wait until the mandatory adoption date, not least because they may need to improve their financial reporting systems and/or obtain legal permission from finance providers in order to collect the information that is required to provide the new disclosures. In periods prior to the adoption of the amendments, if the entity has entered into reverse factoring arrangements, management must exercise judgement as to the appropriate level of disclosures.

How we see it

In our view, prior to the adoption of the amendments to IAS 7 and IFRS 7 on disclosures relating to supplier finance arrangements, additional disclosure will still be necessary whenever these arrangements have a material impact on the financial statements to explain the nature of the arrangements and amounts involved, the financial reporting judgements made and impacts thereof and, more specifically, the level of debt and the statement of cash flows.

In Practical example 4-4 below, Wm Morrison Supermarkets Limited discloses how they present liabilities and cash flows associated with their supply chain financing arrangements:

Practical example 4-4:	Wm Morrison Supermarkets Limited (2023)	United Kingdom
Annual Report and Financial Statements for the 52 weeks ended 29 October 2023 [extract]		
Financial statements [extract]		
Notes to the Group financial statements [extract]		
5 Working capital and provisions [extract]		
5.1 Accounting policies [extract]		
<p>Supply chain financing</p> <p>The Group offers suppliers the option to access supply chain financing through certain third party providers. These facilities allow suppliers to receive payments earlier than the contractual payment terms. The Group did not receive any fees or rebates from the providers where the suppliers choose to utilise these facilities. Payment terms continue to be agreed directly between the Group and suppliers, and are independent of supply chain financing being available.</p> <p>The Group makes an assessment of its supply chain finance arrangements to determine if the associated balance is appropriately presented as trade payables or as borrowings. This assessment considers factors such as the commercial purpose of the facility, the nature and specific terms of the arrangements and the credit terms in place with the banks and suppliers. Based on this assessment, the Group has determined that it is appropriate to present amounts outstanding through the supply chain financing arrangement as trade payables. Consistent with this classification, the reported cash flows are reported within cash generated from operations within the consolidated statement of cash flows.</p>		

4.4.7 Property, plant and equipment held for rental

Payments to acquire and receipts from the sale of, property, plant and equipment are usually included in investing cash flows; however, this is not always the case.

A number of entities routinely sell assets that were previously held for rental, for example, car rental companies that acquire vehicles with the intention of holding them as rental cars for a limited period and then selling them. IAS 16 *Property, Plant and Equipment* requires an entity, that, in its ordinary course of business, routinely sells items of property, plant and equipment that it has held for rental to others, to classify the proceeds on the sale of such property, plant and equipment as revenue. [IAS 16.68A]. Accordingly, the proceeds from the sale of such assets are classified as cash flows from operating activities, as are cash payments to manufacture or acquire property, plant and equipment held for rental to others and routinely sold in the ordinary course of business. [IAS 7.14].

In our view, the requirement to classify payments for such property, plant and equipment held for rental under operating cash flows is intended to avoid initial expenditure on purchases of assets being classified as investing activities, while inflows from sales are recorded within operating activities. However, this means that management will need to determine, at the time of acquisition or manufacture, which of the assets that it intends to rent out will be ultimately held for sale in the ordinary course of business.

4.4.8 Cash received as compensation for an insured loss

As noted in section 4.2 above, cash flows arising from investing activities include receipts from the sale of property, plant and equipment and other long-term assets. [IAS 7.16(b)]. This classification would also be appropriate if the receipt of cash came from insurance proceeds received to cover for the loss or damage of such assets. It would not be appropriate to present the cash inflow as an operating cash flow as the insurance proceeds are not derived from the principal revenue-generating activities of the business. [IAS 7.14]. However, the nature of the claim giving rise to the cash inflow must be carefully considered. If the claim relates only partially to the loss of damage of a long-term asset, it may be necessary for the cash inflows to be allocated between cash flows from operating activities (e.g., for the compensation for business interruption) and cash flows from investing activities.

4.4.9 Cash flows for service concession arrangements

Because a cash flow is only classified in investing activities if it results in a recognised asset in the statement of financial position, a question arises regarding the classification of the cash inflows and outflows of the operator of a service concession arrangement that is within the scope of IFRIC 12 *Service Concession Arrangements*.

IFRIC 12 features two possible accounting models - the intangible asset model or the financial asset model. Under both models, the service element relating to the construction of the infrastructure asset is accounted for in accordance with IFRS 15 and the revenue recognised gives rise to an intangible or a financial asset, in the form of a receivable, respectively. It is unclear whether cash flows incurred in the construction or upgrade phase must always be regarded as operating cash flows because they relate to the provision of construction services; or whether they are more accurately classified as investing activities, as they reflect cash outflows that result in the recognition of an asset.

In the case of an arrangement under the intangible asset model, the cash flows incurred during construction or upgrading could be classified in investing activities as they relate to the acquisition of an intangible that will generate future income and cash flows. Once the operating phase is reached, the cash inflows received would be most appropriately classified in operating activities as most operating and maintenance costs are likely to be executory and will be accounted for as incurred.

On the other hand, when the financial asset model applies, cash outflows during the construction phase may be considered to represent the provision of financing to the grantor and as such an investing outflow. In a corollary of the discussion on deferred payments in section 7.1 below, where the time value of money is significant to the transaction, the substance of the transaction may be the provision of a loan. Where this is the case the repayment of such an instrument by the grantor during the operating phase would be considered an investing cash flow (or potentially split between investing and operating cash flows for the capital and interest components respectively, depending on the policy of the entity).

Since there is no specific guidance relating to the classification of cash flows for service concession arrangements, current practice is mixed. IFRIC 12 is discussed in more detail in Chapter 26.

4.4.10 Treasury shares

Treasury shares are an entity's own equity instruments that are acquired and held by the entity, a subsidiary, or other members of the consolidated group. The consideration paid or received for treasury shares is recognised directly in equity and not as a movement in investments. [IAS 32.33]. Similarly, IAS 7 requires that payments and receipts to acquire or dispose of treasury shares are classified within financing activities. [IAS 7.17]. Even where such treasury shares are acquired by the entity as part of an equity-settled share-based payment transaction, the cash outflow is classified under financing activities. Whilst cash payments to and on behalf of employees are classified under operating activities, [IAS 7.14], the acquisition of treasury shares does not settle a transaction between the entity and its employees. An equity-settled share-based payment transaction is completed when the entity transfers its equity instruments to employees in consideration for the services received.

When a cash payment is made by a subsidiary to its parent or a trust that holds treasury shares as part of an equity-settled share-based payment arrangement, the payment is accounted for as a deduction from equity in the separate financial statements of the subsidiary, on the grounds that the payment does not settle the transaction with the employees, but is effectively a distribution to the parent or the trust (see Chapter 30). Having regarded this as a distribution, it follows that the cash flow must be classified as either operating or financing, according to the entity's policy on dividends as discussed in section 4.4.1 above.

4.4.11 Cash flows related to the costs of a share issue

Costs directly related to the issue of shares are required to be deducted from equity. [IAS 32.35]. As the costs reduce the amount of the proceeds received from the share issue, they are classified as a financing cash flow. [IAS 7.17(a)]. However, where a proposed share issue is cancelled, there would be no proceeds from the issue to record and the related expenses would be included in profit and loss rather than equity. As such, the definition of a financing cash flow would not be met, and the transaction costs would be classified in operating cash flows.

4.4.12 Cash flows paid or received under derivative contracts

Payments and receipts relating to derivative contracts can be classified within operating, investing or financing in different circumstances. Where the contract is held for dealing or trading purposes, the cash flows are classified under operating activities. [IAS 7.14(g)]. IAS 7 requires that payments for, and receipts from, futures contracts, forward contracts, option contracts and swap contracts are classified as cash flows from investing activities, except when the contracts are held for dealing or trading purposes, or the cash flows are classified as financing activities. [IAS 7.16(g)].

The standard adds that when a contract is accounted for as a hedge of an identifiable position, the cash flows of the contract are classified under the same heading as the cash flows of the position being hedged. [IAS 7.16]. An example is an interest rate swap. An entity wishing to convert an existing fixed rate borrowing into a floating rate equivalent could enter into an interest rate swap under which it receives interest at fixed rates and pays at floating rates. All the cash flows under the swap are reported under the same cash flow heading as interest paid (i.e., as financing activities or operating activities, in accordance with the entity's determined policy, as discussed in section 4.4.1 above), because they are equivalent to interest or are hedges of interest payments.

More generally, IFRS 9 adds to the requirements of IAS 7 by clarifying that cash flows arising from hedging instruments are classified as operating, investing or financing activities, on the basis of the classification of the cash flows arising from the hedged item and that this should be consistent with the classification of these instruments as hedging instruments under IFRS 9. [IFRS 9.IG G.2].

This seems to leave an open question as to how an entity classifies the cash flows from a derivative contract that is considered by management as part of a hedging relationship, but for which the entity elects not to apply hedge accounting (taking all movements to profit or loss)? Since IAS 7 has not been updated to reflect IFRS 9, this question is not dealt with explicitly in IAS 7.

How we see it

In our view, if a hedging relationship would qualify for hedge accounting had it been so designated, but has not been accounted for applying the hedge accounting requirements of IFRS 9, it would be permitted for the cash flows from the hedging instrument to be presented in the same category as the cash flows of the position being hedged.

This can be explained in the following illustration:

Illustration 4-1: Cash flows from derivatives not designated as hedges

Company A has the euro as its functional currency. On 1 January 20X1, it sells goods to a US customer for which it charges US\$1,000,000. The spot exchange rate on this date is 1:1 and it recognises revenue of €1,000,000. Payment is due to be received on 30 June 20X1. A enters into a forward contract to exchange US\$1,000,000 for €1,095,000 on 30 June 20X1. The hedging relationship would qualify to be accounted for applying the hedge accounting requirements of IFRS 9. However, Company A does not designate it as a hedge because the effects of movements on the contract and those of retranslating the receivable will already offset in profit or loss. On 30 June 20X1 the exchange rate is such that A receives the equivalent of €1,200,000 from its customer and pays €105,000 on the forward contract.

Taken literally, IAS 7 would suggest that, because the forward contract is not held for dealing or trading purposes and is not accounted for as a hedge of an identifiable position, the €105,000 cash outflow on the forward contract cannot be classified under operating activities. As such, the €105,000 would have to appear in investing or possibly financing cash flows. However, had the entity elected to apply hedge accounting, the standard would require the €105,000 to be included in operating cash flows. Therefore, as explained above, in our view entity A could include the payment on the forward contract in cash flows from operating activities.

4.4.13 Debt instrument issued at a discount or redeemed at a premium

Cash outflows that represent the repayment of the principal amount of a loan or other debt instrument are classified as financing activities. [IAS 7.17]. As noted in section 4.4.1 above, interest paid may be classified under either operating or financing activities. Therefore, where an entity adopts a policy of classifying interest under operating activities, it may be necessary to consider carefully the nature of any payment to the lender to ensure the appropriate classification between operating and financing. This will be particularly relevant where the pattern of payments differs from the recognition of the interest expense in profit or loss.

For example, a company that issues a zero-coupon bond at nominal value, with a premium payable on redemption, will not make any interest payments over the life of the bond. However, in accounting for the financial liability at amortised cost under IFRS 9, the entity will recognise interest at the EIR, calculated to reflect the premium payable on redemption, as explained in Chapter 46. This raises the question of how to present the cash paid on redemption. Is it appropriate to present the entire cash outflow within financing activities as the redemption of a debt instrument?

How we see it

In our view, when an entity adopts a policy of classifying interest under operating activities and the cash paid on redemption is presented in the statement of cash flows, a split must be made to show the amount that relates to the interest cost (within operating activities) and the amount that relates to the repayment of the principal (within financing activities). The same principles would be applied where a debt is issued at a discount or in any other situation where the pattern of cash flows relating to interest on a financial liability are not reflected in the pattern of recognition of the interest cost.

4.4.14 Early settlement of a debt instrument

A similar issue to that discussed in sections 4.4.13 above is how to present the cash payments on early settlement of a loan or other borrowing. As already noted in section 4.3 above, cash flows arising from financing activities include outflows to repay borrowings. However, in some situations an element of the cash paid on early settlement could be viewed as compensation to the lender for lost interest.

Lenders will often include a prepayment penalty provision in loan agreements that can be based on a number of factors, including an approximation of the interest that will not be paid as a result of early settlement. This would support a split presentation of the cash outflow between repayment of borrowings and cash outflow for interest. Alternatively, the nature of the entire cash outflow may also be viewed as relating to a financing activity, being the extinguishment of a liability, which is then be presented as one amount in the financing activities section of the statement.

4.4.15 Receipt of a government grant

The accounting requirements for government grants are set out in IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* and are covered in Chapter 25.

Neither IAS 20 nor IAS 7 provide guidance on where in the statement of cash flows to present the cash inflows from the receipt of government grants. The IFRS IC discussed in July 2012 the presentation of cash flows for several fact patterns including government grants.¹⁸ The issue was further discussed in March 2013. The IFRS IC observed that the primary principle behind the classification of cash flows in IAS 7 is that cash flows should be classified on the basis of the nature of the activity in a manner that is most appropriate to the business of the entity in accordance with paragraph 11 of IAS 7 and with the definitions of operating, investing and financing activities in paragraph 6 of IAS 7. In the course of the discussions held, staff initially suggested that grants were providing a source of financing to the entity, and consequently cash received would be part of the entity's financing activities. In a later meeting, however, it reached a different conclusion that cash received from a government grant should be presented as an operating cash flow instead, on the basis that although cash inflows from a grant provide the entity with financing for the designated asset/activity, a grant does not represent a borrowing activity because there is no expectation that the resource will be returned to the provider of finance; or that the provider of finance will be appropriately compensated. Eventually, the IFRS IC concluded that clarifying the application of the primary classification principle in IAS 7 was a matter too broad for it to address and discontinued its work.¹⁹ Consequently, until and unless the IASB addresses this issue as part of its upcoming project on the cash flow statement, there is likely to be diversity in practice for the presentation of all government grants in the statement of cash flows, whether related to assets or to income. Cash flows received from government grants could be considered to be financing by nature because they provide a source of financing to the entity. Alternatively, cash flows received from government grants (or only those from grants related to income) could be presented as operating cash flows by default since they do not seem to meet the definition of financing activities and cash flows received from government grants related to assets could be presented as investing cash flows as they relate to an investing activity.

How we see it

Selecting the most appropriate presentation will be a matter of judgement. Once adopted, the presentation principles must be applied consistently and clear disclosure of the principles and the impact thereof on the cash flow statement must be provided in accordance with IAS 1.

¹⁸ [IFRIC Update](#), July 2012, available on the IFRS Foundation's website.

¹⁹ [IFRIC Update](#), March 2013, available on the IFRS Foundation's website.

As discussed in section 5.2.1 below, IAS 7 requires the cash inflow from the receipt of a government grant to be presented gross in the statement of cash flows as there is no exception provided to the presentation of gross cash receipts and payments in the standard for such transactions. IAS 20 further emphasises this requirement specifically for government grants related to assets regardless of whether or not the government grant is deducted from the related asset for presentation purposes in the statement of financial position. [IAS 20.28].

4.4.16 Classification of cash flows - future impact of IFRS 18 *Presentation and Disclosure in Financial statements*

IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 *Presentation of Financial Statements* for reporting periods beginning on or after 1 January 2027 (with earlier application permitted), was issued by the IASB in April 2024. The standard makes limited consequential amendments to the existing requirements of IAS 7.

The amendments eliminate the current policy choice in IAS 7 for classification of cash flows from interest and dividends in the statement of cash flows. Dividends paid will be included in financing cash flows. Entities that do not have a specified main business activity of investing in assets or providing finance to customers will be required to classify interest paid as financing activities, and interest and dividends received as cash flows from investing activities. For entities that do have a specified main business activity of investing in assets or providing finance to customers, the classification of dividends received, interest paid and interest received will be impacted by the classification of the related income and expenses in the statement of profit or loss.

When applying the indirect approach, IAS 7 is amended to require that the starting point for determining cash flows from operating activities is the operating profit or loss subtotal, which is a required subtotal in the income statement under IFRS 18.

IFRS 18 and the impact on the statement of cash flows is discussed further in Chapter 4.

5 Other cash flow presentation matters

5.1 Material cash flows

IAS 1 requires the nature and amount of material items of income and expense to be disclosed separately. [IAS 1.97]. It also requires additional line items, headings and sub-totals to be presented on the face of the statement of financial position or of the statement(s) presenting profit or loss and other comprehensive income when this is relevant to an understanding of the entity's financial position. [IAS 1.55, IAS 1.85]. IAS 1 does not refer to material cash flows and IAS 7 contains no specific requirements in relation to such disclosures. However, it may be similarly appropriate for material cash flows or cash flows relating to material items in the statements of financial position or of comprehensive income to be presented as separate line items on the face of the statement of cash flows, although they would remain classified according to their nature as either operating, investing or financing cash flows. [IAS 1.97].

How we see it

In our view, where specific events and transactions significantly affect the amount of cash flows reported in the cash flow statement, they must be disclosed and explained in the notes in accordance with IAS 1, regardless of whether they are presented as separate line items on the face of the cash flow statement.

Examples of such events and transactions are the receipt of significant government grants, a change in the pattern of payments to suppliers or from customers or in the contractual terms of payments, the introduction of trade receivables factoring arrangements or supply chain financing or extension of existing arrangements.

5.2 Gross or net presentation of cash flows

Major classes of gross receipts and gross payments arising from investing and financing activities must be reported separately. [IAS 7.21]. IAS 7 permits but does not require, certain cash flows to be presented on a net basis as follows: [IAS 7.22]

Extract from IAS 7

- 22** Cash flows arising from the following operating, investing or financing activities may be reported on a net basis:
- (a) cash receipts and payments on behalf of customers when the cash flows reflect the activities of the customer rather than those of the entity; and
 - (b) cash receipts and payments for items in which the turnover is quick, the amounts are large, and the maturities are short.

Examples given in the standard of cash receipts and payments that reflect the activities of customers rather than those of the entity are the acceptance and repayment of demand deposits by a bank, funds held for customers by an investment company and rents collected on behalf of, and paid over to, the owners of properties. [IAS 7.23].

Examples given in the standard of cash receipts and payments in which turnover is quick, the amounts are large, and the maturities are short include advances made for and the repayment of:

- (a) Principal amounts relating to credit card customers
- (b) The purchase and sale of investments
- (c) Other short-term borrowings, such as those with a maturity on draw down of three months or less [IAS 7.23A]

See section 10.2 below for discussion of the gross or net presentation of cash flows for financial institutions.

5.2.1 Gross or net presentation of cash flows - government grants

IAS 7 requires the cash inflow from the receipt of a government grant to be presented gross in the statement of cash flows as there is no exception provided to the presentation of gross cash receipts and payments in the standard for such transactions. IAS 20 further emphasises this requirement specifically for grants related to assets regardless of whether or not the government grant is deducted from the related asset for presentation purposes in the statement of financial position. [IAS 20.28].

The classification of cash flows from the receipt of a government grant is discussed in section 4.4.15 above.

Government grants are discussed in more detail in Chapter 25.

5.3 Presentation of cash paid or received on an entity's behalf

As discussed in section 7 below, IAS 7 requires that transactions that do not require the use of cash or cash equivalents are excluded from an entity's statement of cash flows. [IAS 7.43]. Examples of such non-cash transactions provided in the standard are the conversion of debt to equity; acquiring assets by assuming directly related liabilities or by entering into a lease; and issuing equity as consideration for the acquisition of another entity. [IAS 7.44].

However, there is no broader guidance in IAS 7, or elsewhere in IFRS accounting standards, to help determine whether cash flows should be included in the statement of cash flows because the entity has directed another party to pay and/or receive cash on its behalf and so, in substance, the cash flows are the entity's cash flows. This is a matter of judgement based on facts and circumstances.

There may be transactions that, in substance, involve cash flows of the entity, without the cash resources of the entity actually changing. For example, where an entity purchases an item of property and finances the purchase by borrowing the funds from a financial institution, it may arrange for the money to be paid directly by the financial institution to the seller rather than receive the cash inflow from the loan into its bank account and make a subsequent cash payment to the seller. The relationship between the entity and the financial institution may be determined to be fiduciary in nature with the financial institution acting as an agent of the entity and receiving and incurring cash flows on its behalf.

In all situations, the nature of the relationship with the third party will need careful examination, including assessment of the terms and conditions of each specific arrangement. Factors to consider as part of the consideration could include:

- Who is directing the payment or receipt? If the reporting entity is directing the movement of the cash, it is more likely that the third party will be acting as its agent and therefore the cash flows will be cash flows of the entity.
- Who controls the timing and amount of the payment or receipt? If the reporting entity has control over the timing and the amount this may suggest the third party is acting as its agent and that the payment or receipt is, in substance, the entity's cash flow.
- Why has the arrangement with the third party been established and who benefits from the arrangement? If the arrangement has been established for the convenience of the reporting entity (for example because they do not have a bank account in a certain jurisdiction) this may provide evidence that the cash flow is, in substance, the entity's cash flow.

How we see it

Where it is determined that cash flows made or received by a third party are, in substance, cash flows of the entity, these cash flows must be reported in the statement of cash flows of the entity.

Appropriate disclosures will be important, in particular, disclosure of the facts considered, and the judgements management has made in applying IAS 7 in accordance with paragraphs 117 and 122 of IAS 1 (see Chapter 3).

This issue is also discussed in the context of specific scenarios in section 4.4.5 above (factoring of trade receivables), section 4.4.6 above (supply-chain financing arrangements and reverse factoring arrangements), section 8.1 below (the in-substance purchase of an asset) and section 9.5.3 below (group treasury arrangements).

6 Foreign currency cash flows

Foreign currency cash flows can arise either when an entity enters into transactions where the cash payments or receipts are denominated in a foreign currency or when the consolidated financial statements of a group include the cash flows of a subsidiary whose functional currency is different from the presentation currency of the group (e.g., a foreign subsidiary).

IAS 21 *The Effects of Changes in Foreign Exchange Rates* excludes from its scope the translation of cash flows of a foreign operation and the presentation of foreign currency cash flows in a statement of cash flows. [IAS 21.7]. Nevertheless, IAS 7 requires foreign currency cash flows to be reported in a manner consistent with IAS 21. [IAS 7.27].

The requirements for entities falling within the scope of IAS 29 *Financial Reporting in Hyperinflationary Economies* are discussed in Chapter 17.

6.1 Foreign currency denominated transactions

When an entity enters into a transaction denominated in a currency other than its functional currency, there are no direct consequences for the statement of cash flows until payments are received or made. Once payment is made or received, the cash outflows or inflows are recorded in the entity's accounting records at the exchange rate prevailing at the date of payment and these amounts are reflected in the statement of cash flows. [IAS 7.25]. If the entity's presentation currency is different from its functional currency, the functional currency cash flows are translated into the presentation currency at the rates at the date of the cash flows. [IAS 7.26].

For practical reasons, an entity can apply a rate that approximates the actual rate on the date of the cash flow (such as a weighted average for a period) but, like the requirements of IAS 21 for income and expenses, translation using the exchange rate as at the end of the reporting period is not permitted. [IAS 7.27].

For operating cash flows presented using the direct method (see section 4.1.1 above), investing and financing cash flows, these requirements are relatively easy to understand, i.e., the amounts reported should be the cash paid or received, translated at the exchange rate prevailing at the date of the payment or receipt or a rate approximating that. For operating cash flows presented using the indirect method, there are additional complications which are considered below.

6.1.1 Operating cash flows presented using the indirect method

For operating cash flows presented using the indirect method, the entity presents the net cash flows from operating activities by working back from amounts reported in the income statement (see section 4.1.2 above). The most common approach adjusts reported profit or loss for the effects of:

- (a) Changes in inventories and operating receivables and payables during the period
- (b) Non-cash items such as depreciation, provisions, deferred taxes, unrealised foreign currency gains and losses, and undistributed profits of associates

And

- (c) All other items for which the cash effects are investing or financing cash flows [IAS 7.20]

The exchange differences reported in profit or loss may include realised and unrealised gains and losses arising from operating activities and investing and financing activities. Entities must therefore determine what adjustments to make to profit or loss to ensure that foreign currency items are only included in the operating cash flow reconciliation to the extent that cash flows have occurred and that they relate to operating activities. This is discussed in the sections below.

6.1.1.A Realised and unrealised gains and losses relating to operating activities

For realised gains or losses that relate to operating items such as sales or purchases of inventory by an entity, no adjustment is needed to get from profit or loss to operating cash flows if the starting point for the reconciliation is profit before tax or profit after tax. This is because it will include both the amount recorded at the date of sale and the amount of the exchange difference on settlement, the combination of which gives the amount of the actual cash flow.

For unrealised gains or losses that relate to operating items, no adjustment will be needed as the unrealised exchange gain or loss is generally already reflected in the movement in the related payable or receivable included in the reconciliation to operating cash flows. Alternatively, some entities may choose to reflect these gains and losses as a reconciling item and then also include an equivalent adjustment in the movement in the related receivable or payable, however this method is rarely seen in practice.

6.1.1.B Realised and unrealised gains and losses relating to non-operating activities

For realised gains or losses arising on a settled transaction relating to investing or financing activities, an adjustment is needed to reconcile reported profit or loss to the net cash flow from operating activities.

For example, the foreign currency purchase of property, plant and equipment would be recorded at the rate prevailing on the date of the purchase and, if not paid for immediately, a creditor would be recorded for the same amount. Any exchange difference arising on final settlement of the creditor would be taken to profit or loss as an exchange gain or loss.

If left unadjusted, operating cash flows determined using the indirect approach would include this amount of exchange gain or loss. In addition, the investing cash flow for the asset purchase would be unadjusted and recorded at the purchase date exchange rate, rather than at the exchange rate prevailing at the date of settlement of the creditor. Therefore, this difference needs to be considered in calculating the cash flow to be shown under the relevant classification, in this case investing cash flows, so that the cash flow for the purchase of the asset reflects the exchange rate at the date of settlement of the related creditor. The difference also needs to be adjusted by subtracting or adding back the exchange gain or loss in the reconciliation of operating cash flows.

For unrealised gains or losses relating to investing or financing activities, an adjustment must be made to reconcile reported profit or loss to the net cash flow from operating activities. This is because the unrealised exchange differences will be reflected in the income statement as an exchange gain or loss. If left unadjusted, the reconciliation of operating cash flows prepared using the indirect approach would total to a figure for operating cash flows which would incorrectly include this amount of non-operating, unrealised exchange gain or loss.

6.2 Cash and cash equivalent balances denominated in foreign currencies

Unrealised gains and losses arising from exchange rate movements on foreign currency cash and cash equivalents are not cash flows. However, it is necessary to include these exchange differences in the statement of cash flows in order to reconcile the movement in cash and cash equivalents at the beginning and end of the reporting period. The effect of exchange rate movements on cash and cash equivalents is presented as a single amount at the foot of the statement of cash flows, separately from operating, investing and financing cash flows and includes the differences, if any, had those cash flows been reported at end of period exchange rates. [IAS 7.28]. An example of this is illustrated in Practical example 4-1 in section 4 above.

This reconciling item reflects:

- The difference between the opening and closing exchange rate used multiplied by the foreign currency cash balances held at the beginning of the year.
- And
- The difference between the exchange rates used to translate foreign currency cash flows (e.g., an average rate) and the closing exchange rate multiplied by the net cash flow activity for the period measured in the foreign currency.

6.3 Consolidated financial statements including foreign subsidiaries

Section 9.1 below discusses the general principles of preparing a consolidated statement of cash flows. When the group contains a foreign subsidiary, the cash flows of that subsidiary must be translated into the presentation currency of the group using the exchange rates prevailing at the dates of the cash flows. [IAS 7.26]. This is similar to the treatment of foreign currency transactions discussed at section 6.1 above. A rate that approximates the actual rate on the date of the cash flow (such as a weighted average for a period) can be used. [IAS 7.27]. However, this does not apply to the cash flows of a foreign subsidiary whose functional currency is the currency of a hyperinflationary economy as all amounts, including cash flows, are translated at the closing rate at the date of the most recent statement of financial position. See Chapter 16 for more discussion on translating amounts in a functional currency that is the currency of a hyperinflationary economy.

6.3.1 The indirect method and foreign subsidiaries

Entities should exercise care when applying the indirect method at the 'more consolidated level' as described in section 9.1 below when there are foreign subsidiaries. If the translated financial statements are used, exchange differences will be included in the movements between the opening and closing group balance sheets. For example, if inventories held by a US subsidiary of a UK parent increase from \$240 to \$270 during the year and the opening exchange rate of £1=\$1.60 becomes £1=\$1.80 by the year-end, inventories will be reported as an unchanged amount of £150 in both balance sheets. This could result in the reconciliation showing no movement between opening and closing inventories which would be incorrect. In these circumstances it would be advisable for an entity to take the functional currency financial statements of the foreign subsidiary as the starting point, or otherwise ensure the exchange differences have been correctly reflected.

6.3.2 Exchange differences on retranslation of foreign subsidiaries reported in other comprehensive income.

All exchange differences arising on translation of foreign operations will have been recognised in other comprehensive income - see Chapter 16. Such exchange differences are not cash flows, and will therefore not be reported as such in the consolidated statement of cash flows. However, any exchange differences relating to the translation of cash and cash equivalents held in foreign currencies by the foreign subsidiaries will be included in the reconciliation of cash and cash equivalents at the beginning and end of the period, as reported at the foot of the statements of cash flows - see section 6.2 above.

7 Non-cash transactions and transactions on deferred terms

Non-cash transactions only ever appear in a statement of cash flows as adjustments to profit or loss for the period when using the indirect method of presenting cash flows from operating activities as discussed in section 4.1.2 above. Investing and financing transactions that do not involve cash or cash equivalents are always excluded from the statement of cash flows. Disclosure is required elsewhere in the financial statements in order to provide all relevant information about these investing and financing activities. [IAS 7.43]. Examples of such non-cash transactions include the conversion of debt to equity; acquiring assets by assuming directly related liabilities or by entering into a lease; and issuing equity as consideration for the acquisition of another entity. [IAS 7.44]. Similarly, asset exchange transactions and the issue of bonus shares out of retained earnings are disclosed as non-cash transactions. Practical example 7-1 below shows the disclosures made by China Mobile Limited.

Practical example 7-1: China Mobile Limited (2020)	Hong Kong
ANNUAL REPORT 2020 [extract]	
Consolidated Statement of Cash Flows [extract]	
...	
Significant non-cash transactions	
The Group recorded payables of RMB63,817 million (as at 31 December 2019: RMB64,480 million) due to equipment suppliers as at 31 December 2020 for additions of construction in progress during the year then ended. In addition, the Group recorded lease liabilities of RMB16,870 million (as at 31 December 2019: RMB13,219 million) as at 31 December 2020 for additions of right-of-use assets during the year then ended.	
...	

7.1 Asset purchased on deferred terms from the supplier

When an asset is purchased on deferred terms granted by the supplier directly, it may not be clear whether the associated cash flows should be classified within investing activities or within financing activities, as the repayment of borrowings.

It could be argued that the payment of a deferred amount would not meet the definition of investing cash flows, because it does not result in recognition of an asset, but rather a reduction of a liability. However, as discussed in section 4 above, the IFRS IC and the IASB have affirmed in 2013 their position that in determining the classification of cash flows, the nature of the activity is still the primary principle to be considered.²⁰

Accordingly, the classification of the payment comes down to a judgement as to whether its nature relates to the acquisition of an asset or the repayment of a liability.

How we see it

The settlement of a short-term payable for the purchase of an asset is an investing cash flow. Where the period between acquisition and payment is significant, judgement must be applied to determine whether the definition of a financing cash flow has now been met.

One method that may be used to determine whether the transaction involves a financing component is to look to the requirements in IFRS 15 in respect of whether a contract contains a significant financing component (see Chapter 28). [IFRS 15.60].

The liability recorded for the deferred consideration would be classified and subsequently measured in accordance with IFRS 9 (see Chapter 44). In this case, the liability might need to be split to separate cash flows for the interest components, depending on the accounting policy of the entity - see section 4.4.1 above.

Where an asset is acquired on deferred terms it would, where significant, require disclosure as a non-cash transaction in accordance with paragraph 43 of IAS 7 (see section 11.3 below).

Where an entity acquires a right-of-use asset under a lease, IAS 7 is clear that the transaction is a non-cash transaction. [IAS 7.44]. The cash flow presentation of leasing transactions is discussed in section 8 below.

²⁰ [IASB Update](#), April 2013, available on the IFRS Foundation's website.

7.2 Asset disposals on deferred terms

As explained in section 7 above, investing and financing transactions that do not involve cash or cash equivalents are always excluded from the statement of cash flows and disclosure is required of these non-cash transactions. [IAS 7.43]. Therefore, if an asset is sold but no payments is received in the period of the sale, there will be no amounts reported in the statement of cash flows. Where the arrangement is determined to be the provision of finance by the vendor, for example the derecognition of property, plant and equipment by the lessor under a finance lease, subsequent cash receipts to reduce the receivable from the purchaser would be investing cash flows, but appropriately described, for example as the receipt of deferred consideration rather than the proceeds on sale of property, plant and equipment. [IAS 7.16].

7.3 Revenue contracts with deferred payment terms

As discussed in Chapter 28, a contract with a customer that has a significant financing component would be separated into a revenue component (for the notional cash sales price) and a loan component (for the effect of the deferred or advance payment terms). [IFRS 15.60]. In the case of deferred payment terms this gives rise to two cash flow components i.e., the revenue component cash flows must be classified as cash flows from operating activities, and the cash flows related to the significant financing component must be classified consistently with the entity's choice to present cash flows from interest received. [IAS 7.31, IAS 7.33]. If the customer pays in advance, however, the sum of the cash amount and the accrued interest represent revenue, and thus there is only one cash flow component (being the advance payment) which must be classified as a cash inflow from operating activities. [IAS 7.14].

7.4 Variable and contingent consideration for asset acquisitions outside of a business combination

Contingent consideration paid on a business combination is discussed in section 9.3.3 below. The purchase price of intangible assets or tangible assets acquired outside of a business combination also sometimes includes variable or contingent consideration for example to resolve an uncertainty or a difference in views about the initial value of the asset transferred.

Accounting for the contingent consideration element of such asset purchases is discussed in Chapter 18 for intangible assets, and Chapter 19 for property, plant and equipment. As explained in those chapters, such transactions can be very complex and payment can be dependent on a number of factors, with no specific guidance provided in IAS 38 *Intangible Assets* or IAS 16. Therefore, an entity must develop and consistently apply an accounting policy for the initial and subsequent measurement of such assets that results in information that is relevant and reliable in its particular circumstances.

Once such an accounting policy is developed, the presentation in the statement of cash flows should be informed by the accounting treatment adopted in the statement of financial position.

As discussed in section 7.1 above, even though the reason for the cash flows in a genuine contingent consideration is to acquire a long-term asset, classifying the resulting cash flows as investing would only be appropriate if the cash flows are in settlement of an expenditure that results in a recognised asset in the statement of financial position. [IAS 7.16]. This is because paragraph 16 of the standard requires the classification of cash flows from investing activities in the statement of cash flows to be aligned with the presentation of recognised assets in the statement of financial position rather than to reflect an entity's judgement as to the most appropriate classification based the entity's business and the definitions of investing activities. [IAS 7.BC5, IAS 7.BC6, IAS 7.BC7].

How we see it

In our view, cash payments up to the amount capitalised in relation to the acquired assets would be classified in investing activities. Since variable and contingent consideration generally arises for reasons other than the provision of finance to the acquirer, any resulting payments would generally not seem to be eligible for classification as financing cash flows. As a result, any variable and contingent consideration in excess of the amount that has been capitalised as part of the cost of the asset (whether on initial recognition or to reflect changes in variable and contingent consideration that have been capitalised in line with the entity's accounting policy for such payments), would need to be presented as operating cash flows by default.

However, if the accounting variability of the contingent consideration is driven from factors such as currency, time value of money or the existence of an embedded derivative that are within the scope of other standards (e.g., IAS 21, IFRS 9), the cash flow presentation must be consistent with such standards.

8 Cash flows from leasing transactions

8.1 Accounting as lessee

As noted in section 7.1 above, where an entity acquires a right-of-use asset under a lease, the acquisition of the asset is clearly a non-cash transaction. The requirements of IFRS 16 for leases and its presentation and disclosure requirements are covered in Chapter 24. In relation to the cash flow presentation, a lessee classifies:

- (a) Cash payments for the principal portion of the lease liability within financing activities.
- (b) Cash payments for the interest portion of the lease liability in a consistent manner to the presentation of other interest paid (i.e., as operating or financing - see section 4.4.1 above).

And

- (c) Short-term lease payments, payments for leases of low-value assets and variable lease payments not included in the measurement of the lease liability within operating activities. [IFRS 16.50].

IFRS 16 also requires disclosure of the total cash outflow for leases. [IFRS 16.53(g)]. This will include lease payments for short-term leases and leases of low-value assets and variable lease payments. See Chapter 24.

A lessee must also include lease liabilities (and the related cash and non-cash movements) in the disclosures required by IAS 7.44A of changes in liabilities arising from financing activities - see section 11.2 below.

However, care may be needed sometimes to distinguish a lease from a purchase of an asset based on the substance of that transaction and not its legal form. IFRS 16 applies to contracts that convey the right to use an underlying asset for a period of time and does not apply to transactions that transfer control of the underlying asset to an entity - such transactions are sales or purchases within the scope of other standards. [IFRS 16.BC139, IFRS 16.BC140]. Consequently, if a contract grants rights that represent the in-substance purchase of an item of property, plant and equipment, such transaction may need to be presented as the purchase of the underlying asset (regardless of whether legal title transfers) either on deferred terms (see section 7.1 above) if entered into directly with the manufacturer or dealer of the asset or together with the provision of financing if entered into with a financial institution which purchases the underlying asset on the entity's behalf from a designated supplier. In the latter case, this raises the question as to whether the payment of the supplier directly by the financial institution will be treated as a non-cash transaction or as a transaction in which the financial institution is acting as a paying agent for the entity. In this case, the entity would report an investing cash outflow to the supplier and a financing cash inflow from the financial institution upon taking control of the underlying asset and subsequent financing cash outflows when the liability is settled in future periods.

In all cases, determining whether another party is acting as agent for the entity is key to whether the cash flows are presented in the statement of cash flows or whether the transaction is disclosed as a non-cash transaction. In all these situations, the nature of the relationship with the third party will need careful examination to ensure that the entity complies with the requirement in IAS 7 that "investing and financing transactions that do not require the use of cash or cash equivalents are excluded from an entity's statement of cash flows". [IAS 7.43]. Factors to consider in making this determination are discussed in section 5.3 above.

8.2 Payments made by the lessee before commencement date

Where a lessee makes a lease payment to the lessor at or before the commencement date, this payment is included in the initial measurement of the right-of-use asset (see Chapter 24). The nature of the activity giving rise to this cash outflow must be considered to determine how it is presented in the statement of cash flows.

For example, if the payment represents all or substantially all of the total lease payments to be made over the lease term, the lessee classifies the cash outflow as an investing activity, being the acquisition of the right of use asset. [IAS 7.16]. In contrast, if the payment is only the first of the periodic lease payments that the lessee will make and is financing in nature, being a payment for the reduction of the lease liability, the cash outflow would then be classified as a financing activity. [IAS 7.17(e)].

8.3 Lease incentives

Lease incentives are defined in IFRS 16 as “payments made by a lessor to a lessee associated with a lease, or the reimbursement or assumption by a lessor of costs of a lessee” and are discussed in Chapter 24.

[IFRS 16 Appendix A].

Neither IFRS 16 nor IAS 7 provide specific guidance on the presentation of the cash inflows from lease incentives. It is however clear that IAS 7 considers a lease transaction to be essentially the provision of finance by the lessor to the lessee. [IAS 7.17(e)]. IFRS 16 defines lease payments as “Payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term ... less any lease incentives”. [IFRS 16 Appendix A]. Therefore, lease incentives are clearly a reduction of the payments made to the lessor as repayment for the financing provided.

How we see it

Considering this definition of lease payments in the context of IAS 7, in our view, the appropriate presentation of cash flows from lease incentives would be to present the corresponding cash flows as part of financing activities in the statement of cash flows, regardless of whether they are received after the commencement date of the lease and are deducted from the lease liability or before the lease commencement date.

Where lease incentives are received in the same period that lease payments are made, these cash inflows and outflows must, where material, be separately presented and not netted. See section 5.2 above.

8.4 Sale and leaseback transactions

A sale and leaseback transaction involves the transfer of an asset by an entity (the seller-lessee) to another entity (the buyer-lessor) and the leaseback of the same asset by the seller-lessee. Sale and leaseback transactions are discussed in Chapter 24.

In terms of presentation in the statement of cash flows, IFRS 16 refers only to leases, requiring the cash payments for the principal portion of the lease liability to be presented in financing activities and cash payments for the interest portion to be presented in a consistent manner to the presentation of other interest paid - see section 8.1 above. [IFRS 16.50]. Nothing is included in IFRS 16 or IAS 7 with respect to cash flow presentation in the case of a sale and leaseback transaction.

Presentation of the cash flows relating to the sale and leaseback transaction for a seller-lessee will depend on how the transaction is accounted for under IFRS 16, specifically whether the transfer of the asset is accounted for as a sale of the asset in accordance with the requirements of IFRS 15. [IFRS 16.99].

If the transaction does not satisfy the requirements of IFRS 15 to be accounted for as a sale (i.e., not a sale and leaseback transaction), the cash received is classified in the cash flow statement as a cash inflow from financing activities because the substance of the transaction is that the lessee has raised finance, with the asset provided as security. The resulting financial liability is accounted for under IFRS 9, [IFRS 16.103], and the seller-lessee splits the cash outflows between repayment of the principal and payment of interest. Repayments of the principal are classified as financing cash flows, whereas interest must be presented in a manner consistent with the presentation of other interest paid in statement of cash flows (see section 4.4.1 above). [IFRS 16.50, IFRS 16.BC211].

If the transaction does satisfy the requirements of IFRS 15 to be accounted for as a sale, the analysis is more complex, as the cash received comprises an amount reflecting the fair value of the underlying asset plus the amount of any additional financing provided by the buyer-lessor to the seller-lessee. [IFRS 16.101]. This will be reflected in the statements of cash flows by splitting the proceeds between investing cash flows and financing cash flows. However, there are different approaches as to how this split could be determined. From an economic standpoint, the seller-lessee has sold only its interest in the value of the underlying asset at the end of the leaseback - it has retained its right to use the asset for the duration of the leaseback. Therefore, the amount that would be shown as an investing cash inflow must reflect this.

How we see it

In our view there are two acceptable approaches for determining the split between investing cash flows and financing cash flows. One approach is to present the investing cash inflow as the amount of the sale proceeds that reflects the proportion of the fair value of the underlying asset that is not retained by the seller-lessee. Any excess would be presented as part of cash flows from financing activities. This presentation in the statement of cash flows would be consistent with the requirement in IFRS 16 to recognise only the amount of any gain or loss on the sale and leaseback relating to the rights that have been transferred to the buyer-lessor and also to measure the right-of-use asset as a proportion of the previous carrying amount of the underlying asset. Alternatively, the seller-lessee may also present any excess of the sale proceeds over the fair value of the asset as financing cash inflows and the remaining proceeds as investing cash inflows.

This can be seen in Illustration 8-1 below (see also Chapter 24), which uses an example in IFRS 16 as a starting point and further expands on the example to demonstrate the presentation of cash flows in the statement of cash flows. [IFRS 16.IE Example 24].

Illustration 8-1: Sale and leaseback transaction: presentation of cash flows

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of CU2,000,000. Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of CU120,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements for determining when a performance obligation is satisfied in IFRS 15. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback. This example ignores any initial direct costs.

The fair value of the building at the date of sale is CU1,800,000. The amount of the excess sale price of CU200,000 (CU2,000,000 - CU1,800,000) is recognised as additional financing provided by the Buyer-lessor to Seller-lessee.

At the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee, which is CU699,556. This is calculated as: CU1,000,000 (the carrying amount of the building) ÷ CU1,800,000 (the fair value of the building) × CU1,259,200 (the discounted lease payments for the 18-year right-of-use asset) and represents 70% of the building's carrying amount.

The above example in IFRS 16 does not discuss the presentation of cash flows in the statement of cash flows.

In our view, in its statement of cash flows, the Seller-lessee presents financing cash inflows of CU1,459,200 (being the sum of the lease liability of CU1,259,200 and the additional financing provided by the Buyer-lessor of CU200,000) and the remaining CU540,800 (i.e., CU2,000,000 - CU1,459,200) as investing cash inflows.

An alternative approach in this example, could be to treat only the excess of any sale proceeds above the fair value of the underlying asset of CU200,000 (i.e., CU2,000,000 - CU1,800,000) as financing cash flows with CU1,800,000 presented within investing activities.

8.5 Accounting as lessor

For lessors, IFRS 16 is silent on the presentation of cash flows arising from their leasing activities. However, since lessor accounting under IFRS 16 is substantially unchanged from the accounting under the predecessor standard, IAS 17 *Leases*, in practice, the presentation of cash flows for lessors should be established and well understood. In summary, the cash inflows from operating leases will form part of the cash flows from operating activities. [IAS 7.14]. The cash inflows from finance leases will follow the treatment set out in section 7.2 above in relation to assets disposed of on deferred terms.

9 Additional IAS 7 considerations for groups

IAS 7 does not distinguish between single entities and groups, and there are no specific requirements as to how an entity prepares a consolidated statement of cash flows. In the absence of specific requirements, cash inflows and outflows would be treated in the same way as income and expenses under IFRS 10 *Consolidated Financial Statements*. Applying these principles, the statement of cash flows presented in consolidated financial statements will reflect only the flows of cash and cash equivalents into and out of the group, i.e., consolidated cash flows are presented as those of a single economic entity. [IFRS 10 Appendix A]. On the same basis, the cash flows of a consolidated subsidiary must be included in the consolidated statement of cash flows for the same period as its results are reported in the consolidated statement of comprehensive income, i.e., from the date the group gains control until the date it loses control. [IFRS 10.B88].

Cash flows that are internal to the group (such as payments and receipts for intra-group sales, management charges, dividends, interest and financing arrangements) must be eliminated. [IFRS 10.B86]. However, transactions with non-controlling interests as well as with associates, joint ventures and unconsolidated subsidiaries would not be eliminated and are discussed in greater detail below.

9.1 Preparing a consolidated statement of cash flows

In principle, the group statement of cash flows will be compiled from those prepared by individual subsidiaries with intra-group cash flows being eliminated as part of the aggregation process. This would generally be the case for entities presenting operating cash flows under the direct method, where information on gross cash receipts and payments has been obtained from each group entity's accounting records.

In practice, however, it may be possible to prepare a statement of cash flows at a more consolidated level, by starting with the disclosures in the consolidated statement of comprehensive income and statement of financial position and then applying the adjustments reflected as part of the financial statement consolidation process, together with information provided on external cash flows by individual subsidiaries. Thus, an entity adopting the direct method could use this information to derive the value of the major classes of gross cash receipts and gross cash payments. [IAS 7.19]. An entity presenting operating cash flows under the indirect method would use this information to calculate the values for movements in inventories, operating receivables and payables and other non-cash items that appear in the reconciliation of consolidated profit or loss to the group's cash flow from operating activities. [IAS 7.20]. As noted in section 6.3 above, groups with foreign subsidiaries will need to take extra care when using this method to ensure exchange differences are treated appropriately.

Cash flows from investing and financing activities could similarly be derived from a reconciliation of the relevant headings in the consolidated statement of comprehensive income to statement of financial position movements. However, for this to be possible, subsidiaries would have to provide supplementary information (as part of internal group reporting) to prevent gross cash flows from being netted off and to ensure that the cash flows are shown under the correct classifications. In particular, detailed information about receivables and payables would be essential to ensure that the movements in operating, investing and financing receivables and payables are identified.

9.2 Transactions with non-controlling interests

Dividends paid to non-controlling interest holders in subsidiaries are included under cash flows from financing activities or operating activities, in accordance with the entity's determined policy for dividends paid (see section 4.4.1 above).

IFRS 10 requires entities to distinguish between transactions that give rise to a change in control and those that do not, because a transaction when there is no change in control is effectively one with the owners in their capacity as owners. [IFRS 10.BCZ168]. Changes in ownership interests in a subsidiary that do not result in a loss of control are therefore accounted for as equity transactions, and the resulting cash flows are classified in the same way as other transactions with owners. [IAS 7.42B]. Accordingly, IAS 7 requires cash flows arising from changes in ownership interests in a subsidiary that occur after control is obtained, but do not give rise to a loss of control to be classified as cash flows from financing activities. [IAS 7.42A].

9.3 Acquisitions and disposals

Extract from IAS 7

- 39 The aggregate cash flows arising from obtaining or losing control of subsidiaries or other businesses shall be presented separately and classified as investing activities.
- 40 An entity shall disclose, in aggregate, in respect of both obtaining and losing control of subsidiaries or other businesses during the period each of the following:
- (a) the total consideration paid or received;
 - (b) the portion of the consideration consisting of cash and cash equivalents;
 - (c) the amount of cash and cash equivalents in the subsidiaries or other businesses over which control is obtained or lost; and
 - (d) the amount of the assets and liabilities other than cash or cash equivalents in the subsidiaries or other businesses over which control is obtained or lost, summarised by each major category.
- 40A ...
- 41 The separate presentation of the cash flow effects of obtaining or losing control of subsidiaries or other businesses as single line items, together with the separate disclosure of the amounts of assets and liabilities acquired or disposed of, helps to distinguish those cash flows from the cash flows arising from the other operating, investing and financing activities. The cash flow effects of losing control are not deducted from those of obtaining control.

[IAS 7.39, IAS 7.40, IAS 7.41].

Cash flows arising from changes in ownership interests in a subsidiary that do not result in a loss of control are classified as financing cash flows (see section 9.2 above). [IAS 7.42A].

The aggregate amount of cash paid or received as consideration is reported in the statement of cash flows net of cash and cash equivalents acquired or disposed of. [IAS 7.42]. The cash flow effects of losing control are not deducted from those of gaining control. [IAS 7.41]. This implies that entities must present one analysis for all acquisitions and another for all disposals, such as that presented by Naspers Limited, shown in Practical example 9-1 below.

Practical example 9-1: Naspers Limited (2023)

9.3.1 Acquisition-related costs

IFRS 3 *Business Combinations* requires acquisition-related costs (other than those costs relating to the issue of equity or debt securities) to be recognised as an expense in the period in which the costs are incurred and the services are received. [IFRS 3.53]. As discussed in section 4.2 above, the definition of investing activities in IAS 7, states that “only expenditures that result in a recognised asset in the statement of financial position” give rise to investing cash flows. [IAS 7.16]. As a result, cash flows relating to acquisition costs recognised as an expense must be classified within operating activities.

9.3.2 Deferred and other non-cash consideration

Not all acquisitions or disposals of businesses are satisfied in full by the exchange of cash. Any non-cash consideration, such as shares issued by either party or amounts to be paid or received by the entity at a later date, is not included in the amount presented under investing activities. [IAS 7.43]. Instead, the non-cash element of the acquisition or disposal is disclosed. As explained in more detail in section 7.1 above, the purchase of assets on deferred terms can be a complicated area because it may not be clear whether to classify the associated cash flows within investing activities or within financing activities, as the repayment of borrowings. Hence, judgement is required when determining the appropriate classification of the deferred payment in the statement of cash flows. These same principles apply on the acquisition of a business involving deferred consideration.

9.3.3 Contingent consideration paid on business combinations

When a business combination agreement allows for adjustments to the cost of the combination that are contingent on one or more future events, IFRS 3 requires the acquirer to recognise the acquisition-date fair value of the contingent consideration, [IFRS 3.39], and classify an obligation to pay the contingent consideration as a liability or as equity in accordance with the provisions of IAS 32. [IFRS 3.40]. Changes resulting from events after the acquisition date, such as meeting a performance target, are not reflected by adjusting the recorded cost of the business combination. Where a liability has been recognised for the contingent consideration payable, any subsequent payment in excess of or below the carrying amount of the liability is recognised in profit or loss. [IFRS 3.58].

The primary principle for the classification of cash flows is the nature of the activity giving rise to the cash flow, according to the definitions of operating, investing and financing activities in the standard. This might imply that all payments relating to a business combination must be classified as investing cash flows. However, as discussed in section 4.2 above, the Board added a requirement in IAS 7 that only expenditures that result in a recognised asset are eligible for classification as investing activities. [IAS 7.16].

How we see it

In our view, cash payments up to the amount recognised for the acquisition-date fair value of the contingent consideration (and thereby included in the carrying value of the acquired assets including goodwill) would be classified in investing activities. Since contingent consideration generally arises for reasons other than the provision of finance to the acquirer, any resulting payments would generally not seem to be eligible for classification as financing cash flows. As a result, any contingent consideration in excess of the amount that was recorded on the acquisition date, would need to be presented as operating cash flows by default.

9.3.4 Contingent consideration conditional on continuing employment

As discussed in Chapter 10, a transaction that remunerates employees or former owners of the acquiree for future services is excluded from the business combination accounting and accounted for separately. [IFRS 3.52]. Therefore, cash flows relating to payment of purchase consideration that is conditional on the continuing employment of the vendors in the business or the existing employees of the business must be classified within operating activities and not within investing activities. This faithfully reflects the fact that these payments are not part of the consideration transferred on a business combination but are remuneration for post-combination services received. [IFRS 3.B55(a)].

9.3.5 Contingent consideration received on disposals

When an entity disposes of a subsidiary, it presents the cash flows separately within investing activities. This will be the case even for the receipt of contingent consideration because the cash inflow is still an investing cash flow being the receipt from the sale of equity or debt instruments of another entity (see section 4.2 above). [IAS 7.16].

9.3.6 Settlement of amounts owed by the acquired entity

A question that sometimes arises is how to treat a payment made by the acquirer, in the consolidated statement of cash flows, to settle amounts owed by a newly acquired subsidiary. If the repayment is made before the acquisition date, the acquiree is not yet part of the group controlled by the acquirer and the debt will not be included in the consolidated balance sheet. Therefore, any payment to settle that debt represents a payment made to acquire the debt instrument of another entity and this would be included under investing activities. [IAS 7.16].

If the repayment is made at or after the acquisition date, it may be more challenging to determine whether the cash outflow should be presented as investing or financing. The repayment may be negotiated with the vendor as a condition of the acquisition agreement or may be triggered by a pre-existing change of control clause in the agreement between the acquired entity and the lender. Alternatively, the payment may be made after the acquisition date and not negotiated and agreed as part of the business combination.

IAS 7 defines investing activities as “the acquisition and disposal of long-term assets and other investments not included in cash equivalents” and financing activities as “activities that result in changes in the size and composition of the contributed equity and borrowings of the entity”. [IAS 7.6]. As discussed in Section 4 above, the primary principle for classification of cash flows should be in accordance with the nature of the activity in a manner that is most appropriate to the business of the entity. [IAS 7.11]. Therefore, depending on the facts and circumstances associated with repayment, the cash outflow may represent either an investing activity or a financing activity in the consolidated cash flow statement of the acquirer.

How we see it

Judgement will be needed, based on consideration of all the specific facts and circumstances associated with the payment, to determine whether the cash outflow is one that is investing in nature or financing in nature.

In our view, in determining the nature of activities associated with the cash outflow, it is important to consider who is requiring or directing the repayment. If the acquirer is directing the movement of the cash because it has made a choice to repay the external borrowings, perhaps because it wants the acquired entity to be debt free or wishes to arrange financing with its own lenders, then it is more likely that the transaction will be financing in nature. However, if the acquirer is forced to repay the borrowings, for example by a pre-existing change of control clause that the external lender has chosen to exercise, then the payment has been triggered by the business combination and is more likely to be investing in nature.

It should be noted that the inclusion of a clause in the acquisition agreement requiring the repayment of the loan by the acquirer is not, in itself, justification for presenting the cash outflow as investing. Although this could be viewed as providing the acquirer with no discretion as to whether it makes the repayment, the acquirer would have been able to influence the content of the acquisition agreement and hence, may have had some choice as to whether this clause was included. In this case, other factors would need to be considered before a conclusion is reached that the cash flow is investing in nature.

Clear disclosure of the presentation treatment adopted in the statement of cash flows will be important, in particular, disclosure of the facts considered, and the judgements management has made in determining the nature of the cash flow, in accordance with paragraphs 117 and 122 of IAS 1 (see Chapter 3).

Other factors that may provide supporting evidence as to the nature of the repayment include:

- ***How close is the timing of the repayment to the date of the acquisition and what is the reason for any difference in timing?***

The longer the period of time elapsed between the acquisition date and the date of repayment, the more likely it is that the payment is financing in nature. However, it will also be necessary to consider the reason for any significant delay. For example, if the timing of the payment is out of the control of the acquirer, such as where this is dictated by the bank through a change of control clause, a difference in timing may not always be indicative of the payment being financing in nature.

- ***Why is the payment being made by the acquirer directly to the lender rather to the vendor or the acquiree who will then repay the borrowings? Is it for the convenience of the vendor or for the convenience of the acquirer?***

If the arrangement has been established purely for the convenience of the acquirer so that they do not need to transfer the cash to the acquiree to repay the borrowings after acquisition, then this suggests that this is part of the financing activities of the group. However, if the vendor has requested that this amount negotiated as part of the acquisition cost be paid directly by the acquirer to the bank, rather than to the vendor who will then repay the borrowings, it is more likely that the cash outflow is investing in nature.

If it is determined that the cash outflow is financing in nature, being the repayment of the borrowings of the acquired entity which is now part of the group, using funds provided by the parent, this is presented as a cash outflow from financing activities in the consolidated statement of cash flows. [IAS 7.17].

If it is determined that the cash outflow is investing in nature because it is part of the payment to acquire control of the acquired entity, then it is presented as an investing cash outflow. Care should be taken when considering whether the payment is part of the consideration for the business combination under IFRS 3 as the payment is not made to the vendor. This is because IFRS 3 paragraph 51 explains that amounts that are not part of what the acquirer and vendor exchanged in the business combination, i.e., amounts that are not part of the exchange for the acquiree, must be accounted for as separate transactions (see Chapter 10).

9.3.7 Settlement of intra-group balances on a demerger

A similarly fine distinction might apply on the demerger of subsidiaries. These sometimes involve the repayment of intra-group indebtedness out of the proceeds from external finance raised by the demerged subsidiary. If the external funding is raised immediately prior to the subsidiary leaving the group, it is strictly a financing inflow in the consolidated statement of cash flows, being cash proceeds from issuing short or long-term borrowings. [IAS 7.17]. If the subsidiary both raises the external funding and repays the intra-group debt after the demerger, the inflow is shown in the consolidated statement of cash flows under investing activities, being a cash receipt from the repayment of advances and loans made to other parties. [IAS 7.16].

9.3.8 Acquisition of a business that is not a subsidiary

A business combination may be enacted through the acquisition of a subsidiary (i.e., a business held in a separate legal entity) or through the acquisition of a group of assets and liabilities that constitute a business (sometimes referred to as 'a purchase of net assets and trade'). Paragraphs 39 and 40 of IAS 7 refer to "obtaining or losing control of subsidiaries or other businesses" and hence are applicable to both types of business combination.

Therefore, the cash flows arising on the acquisition and disposal of a group of assets and liabilities that constitute a business would be classified as investing activities. In addition, the considerations set out in sections 9.3.1 to 9.3.7 above in respect of deferred and contingent consideration, acquisition costs and settlement of amounts must also be applied. The disclosure requirements in IAS 7.40 would also be required.

9.4 Cash flows of associates, joint arrangements and investment entities

9.4.1 Investments in associates and joint ventures

Changes in cash and cash equivalents relating to associates or joint ventures accounted for under the equity or cost method will be reflected in the entity's statement of cash flows only to the extent of the cash flows between the group and the investee. [IAS 7.37]. The same concept would apply to associates or joint ventures carried at fair value as allowed by IAS 28 *Investments in Associates and Joint Ventures* (discussed in Chapter 12). Examples include cash dividends received and loans advanced or repaid. [IAS 7.37]. Cash flows in respect of an entity's investment in an equity accounted associate or joint venture would also be presented. [IAS 7.38].

Cash dividends received from equity accounted associates and joint ventures would be classified as operating or investing activities in accordance with the entity's determined policy for other dividends received (see section 4.4.1 above). Loans advanced or repaid would be classified as investing activities. [IAS 7.16]. Where the net cash inflow from operating activities is determined using the indirect method, the group's share of profits or losses from equity-accounted investments will appear as a non-cash reconciling item in the cash flow statement (see section 4.1.2 above).

The cash flows arising on the acquisition and disposal of an associate or a joint venture would be classified as investing activities. In addition, the considerations set out in section 9.3 above in respect of deferred and contingent consideration on acquisition and disposal of a subsidiary must also be applied when determining the appropriate classifications of cash flows relating to the acquisition and disposal of associates and joint ventures.

9.4.2 Cash flows of joint operations

IAS 7 does not specifically deal with the treatment of the cash flows of joint operations. However, following the principles in IFRS 11 *Joint Arrangements* that all transactions shall be reflected in the accounts of the joint operator's financial results to the extent of its interests in those transactions, [IFRS 11.20], the cash flows of the joint arrangement are already included in the operator's financial statements and no additional adjustments are required to reflect the activities of the joint operation.

The treatment of cash flows for the acquisition and disposal of a joint operation is less clear as there is an argument for presentation either as a single net cash flow in investing activities (as is required for the cost of a business combination, discussed in section 9.3 above); or as separate cash flows, classified according to the nature of the underlying assets and liabilities acquired. IFRS 11 requires an entity to determine whether the activity undertaken by a joint operation constitutes a business as defined in IFRS 3 and to apply business combination or asset acquisition accounting in accordance with that analysis. [IFRS 11.21A].

How we see it

In our view, an entity presents the cash flows for the acquisition and disposal of a joint operation consistently with the treatment of the joint operation as either a business or a group of assets and liabilities as required by IFRS 11.21A. Therefore, acquisitions and disposals of operations meeting the definition of a business would give rise to a single investing cash flow, and acquisitions and disposals of operations not regarded as a business would give rise to cash flows presented according to the nature of the assets and liabilities acquired or disposed.

9.4.3 Cash flows in investment entities

IFRS 10 includes an exception to the consolidation principle for a parent that meets the definition of an investment entity. An investment entity measures its investments in subsidiaries, other than those solely providing services that relate to its investment activities, at fair value through profit or loss in accordance with IFRS 9 instead of consolidating those subsidiaries. The investment entity exception is discussed in Chapter 7. IAS 7 does not specifically address the treatment of cash flows related to subsidiaries held at fair value in an investment entity. However, as discussed in section 4.1 above, the nature of the business conducted by the parent will be a relevant factor in determining the appropriate classification of these cash flows as operating, investing or financing. An investment entity has a business purpose to invest solely for capital appreciation, investment income, or both. [IFRS 10.B85B]. Therefore, investing in subsidiaries is part of the main revenue-generating activity of the parent and so any related cash flows are classified as operating activities.

The disclosures required by an investment entity on the acquisition of subsidiaries are less than those required for other entities. Investment entities need only disclose the total consideration paid or received and the portion of the consideration consisting of cash and cash equivalents. [IAS 7.40, IAS 7.40A].

9.5 Cash flows in separate financial statements

9.5.1 Cash flows of subsidiaries, associates and joint ventures

IAS 7 addresses the treatment of cash flows of associates, joint ventures and subsidiaries accounted for by use of the cost method, restricting its reporting in the statement of cash flows to the cash flows between investor and the investee, for example, to dividends and advances as discussed in section 9.4.1 above. [IAS 7.37]. This treatment would also be applied to associates, joint ventures and subsidiaries either held at fair value through profit or loss or accounted using the equity method in the separate financial statements, as allowed by IAS 27 *Separate Financial Statements* and discussed in Chapter 9.

As noted in section 4.1 above, the nature of the business conducted by the entity will be a relevant factor in determining the appropriate classification of cash flow as operating, investing or financing, having regard to the definitions of operating, investing and financing activities in paragraph 6 of IAS 7. This principle applies to the presentation of cash payments and receipts between a parent and its subsidiaries, associates and joint ventures in the cash flow statement which forms part of the separate financial statements of the parent. For example, where a parent provides a loan to a subsidiary, an associate or a joint venture, it will be necessary to consider whether the cash outflow (and the subsequent cash inflow when the loan is repaid) is presented as part of operating activities or investing activities in the separate financial statements of the parent. [IAS 7.13, IAS 7.16]. Conversely, where a subsidiary, an associate or a joint venture provides a loan to the parent, this is much more clearly part of financing activities of the parent. [IAS 7.17]. See sections 4.1 to 4.3 above for details of the definitions of operating, investing and financing activities in IAS 7.

9.5.2 Group cash pooling and cash sharing arrangements

Many groups use some form of cash pooling or cash sharing arrangement to manage the group's cash position on a consolidated basis, effectively concentrating the group's cash in one place. Such arrangements seek to maximise the return for the group as a whole on its cash, minimise the cost of funding and give visibility to the group of its combined cash and currency position.

The terms and conditions of such arrangements vary, and it is important to understand the specific nature of the pooling or sharing arrangement in place, in order to determine the appropriate accounting treatment.

In sections 9.5.3 and 9.5.4 below we discuss three of the most common types of arrangements.

9.5.3 Group treasury arrangements

Some groups adopt treasury arrangements under which cash resources are held centrally, either by the parent company or by a designated subsidiary company. Any excess cash is transferred to the central bank account which is in the name of the designated 'treasury entity'. In some cases, each individual group company might not even have its own bank account, with all receipts and payments being made directly from the centrally controlled funds.

Each individual group company will need to consider how to present the funds transferred to the treasury entity at the period end; as cash, as cash equivalents or as a short-term intercompany receivable, by examining the specific facts and circumstances of each arrangement with reference to the definitions of cash and of cash equivalents as discussed in sections 3.1 and 3.2 above.

In order to meet the definition of cash, the individual company must be able to withdraw the funds from the treasury entity on demand without prior notice being required and without penalty. To meet the definition of cash equivalents, the funds must be held by the individual company for the purpose of meeting short-term cash commitments and be a short-term highly liquid investment that is readily convertible into known amounts of cash and subject to insignificant risk of changes in value. [IAS 7.6, IAS 7.7].

In relation to the definitions of both cash and cash equivalents, one important factor to consider is the liquidity of the treasury entity holding the cash on behalf of the group companies and of the group as a whole. Clearly, if the treasury entity is limited in its ability to "release" cash to other group companies due to liquidity constraints, it will be difficult to justify that the other group companies have a balance that is available for withdrawal on demand (as in the definition of cash) or "highly liquid" (as required by the definition of cash equivalents). [IAS 7.6].

When looking at the definition of cash equivalents (see section 3.2 above), the funds deposited also need to be subject to an insignificant risk of change in value. [IAS 7.7]. As explained in section 3.2.2 above, this means that the entity must conclude that the range of possible returns is very small. Therefore, the use of the funds by the treasury entity (e.g., the nature and diversification of the investments made by the treasury entity) as well as the credit risk of the treasury entity and the group as a whole, will be important facts to consider.

A further question arises as to whether the subsidiary must prepare a statement of cash flows if there is no cash or cash equivalents balance held at each period end and, in some cases, at any time during the year.

How we see it

In our view, the preparation of the statement of cash flows will be based upon the actual cash flows during the period regardless of cash and cash equivalents balance held directly by the entity. Where no cash flows through an entity, but rather all transactions flow through the group treasury function acting on behalf of the entity, the entity would still record receipts from debtors and payments to suppliers, albeit with an associated deposit to or withdrawal from a balance with another group company. Just as a bank processes payments and receipts as agent for the account holder, so the group treasury function is acting as agent for the entity, and these transactions will be reflected in a statement of cash flows.

For guidance to assist in the determination of whether another entity is acting on behalf of the reporting entity, as the entity's agent, see section 5.3 above.

Where the subsidiary makes net deposits of funds to, or net withdrawals of funds from the designated group entity during the reporting period, a further question arises as to how to present these movements in the subsidiary's statement of cash flows. As explained above, these transactions normally give rise to intercompany balances. Therefore, the deposits or withdrawals must be evaluated against the definitions of the categories of cash flows and presented as either operating activities or alternatively as investing or financing activities, as appropriate. Further consideration may be made as to whether these cash flows meet the criteria for net presentation as discussed in section 5.2 above.

9.5.4 Cash pooling

Groups often use what are commonly known as cash pooling arrangements. Typically, these will involve a number of subsidiaries within a group each having a legally separate bank account with the same bank, but these accounts are managed, with the agreement of the bank, on a consolidated basis. For example, interest will normally be determined on a notional basis using the net balance of all accounts; similarly, any overdraft limit will normally apply to the net balance. Typical characteristics of notional cash pooling and physical cash pooling are discussed below however arrangements vary. Therefore, terms and conditions of each arrangement must be reviewed carefully to ensure that the accounting treatment adopted is appropriate for that specific arrangement.

9.5.4.A Notional cash pooling

Notional cash pooling arrangements allow the group to net off the balances of different accounts across jurisdictions, without physically moving the cash to a header or master account, but with each individual entity continuing to have access to the cash it has deposited in its individual account, sometimes called a 'memo' or 'mirror' account. This is, in essence, an interest rate adjustment, and the ownership of the cash does not change.

In such cases, therefore, each entity will continue to report its cash as 'cash and cash equivalents'.

9.5.4.B Physical cash pooling

Typically, in these arrangements, which are also known as zero balancing, cash concentration or physical cash sweeping, the group physically sweeps excess cash out of the individual bank accounts to a 'header account' on a daily basis. In these arrangements, the ownership of the cash changes: the relationship moves from a deposit with a third-party bank to a loan to the group entity that is the holder of the 'header account'. As in the group treasury arrangements discussed in section 9.5.3 above, the individual companies will need to consider whether to present these balances at the period end as cash, as cash equivalents or as a short-term intercompany receivable.

The presentation of cash balances in cash pooling arrangements in the group accounts, in particular whether the individual balances must be presented net or gross, is discussed in Chapter 50.

10 Additional IAS 7 considerations for financial institutions

IAS 7 applies to banks, insurance entities and other financial institutions. Nevertheless, there are some differences in its application as compared to entities that are not financial institutions. For example, in considering the components of cash and cash equivalents, banks would not usually have borrowings with the characteristics of an overdraft, and cash for their purposes would normally include cash and balances at central banks, together with loans and advances to other banks repayable on demand. NatWest Group plc discloses such items as components of its cash and cash equivalents, as shown in Practical example 10-1 below.

Practical example 10-1: NatWest Group plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial statements [extract]

Notes to the consolidated financial statements [extract]

30 Analysis of cash and cash equivalents

Non-cash and other add back items and movements in operating assets and liabilities are adjusted for in the cash flow statement. Loans to banks and treasury bills with an original maturity of less than three months that are readily convertible to known amounts of cash and subject to insignificant risk of change in value.

	2023	2022	2021
	£m	£m	£m
Cash and balances at central banks	104,262	144,832	177,757
Trading assets	8,851	8,551	7,137
Other financial assets	139	19	16
Loans to banks (1)	5,572	5,047	5,796
Cash and cash equivalents	118,824	158,449	190,706

(1) Includes cash collateral posted with bank counterparties in respect of derivative liabilities of £4,434 million (2022 - £4,895 million; 2021 - £4,293 million).

(1) Includes cash collateral posted with bank counterparties in respect of derivative liabilities of £4,434 million (2022 - £4,895 million; 2021 - £4,293 million).

IAS 7 contains a number of additional provisions affecting the preparation of statements of cash flow by financial institutions. These are covered in broad outline below.

10.1 Operating cash flows

Cash advances and loans made by financial institutions are usually classified as operating activities (and not as investing activities, as they are for other entities) since they relate to a financial institution's main revenue-producing activity. [IAS 7.15, IAS 7.16(e)]. Similarly, receipts from the repayment of loans and advances would be included in operating cash flows. [IAS 7.16(f)].

Interest paid and interest and dividends received are usually classified as operating cash flows for a financial institution. [IAS 7.33].

For an insurance entity, cash receipts and cash payments for premiums and claims, annuities and other policy benefits would be included in its operating cash flows as these relate to the principal activities of the entity.

Under the direct method of reporting operating cash flows, a financial institution that does not obtain information from its accounting records can derive the disclosures for major classes of gross cash receipts and payments by adjusting interest and similar income and interest expense and similar charges and other items recognised in profit or loss for:

- (a) Changes during the period in operating receivables and payables
- (b) Other non-cash items

And

- (c) Other items for which the cash effects are investing or financing cash flows [IAS 7.19]

Subject to the differences noted above, the principles for a financial institution presenting operating cash flows under the indirect method are the same as those discussed in section 4.1.2 above for other entities.

10.2 Reporting cash flows on a net basis

Cash flows from each of the following activities of a financial institution may be reported on a net basis:

- (a) Cash receipts and payments for the acceptance and repayment of deposits with a fixed maturity date
- (b) The placement of deposits with and withdrawal of deposits from other financial institutions

And

- (c) Cash advances and loans made to customers and the repayment of those advances and loans [IAS 7.24]

11 Disclosures

IAS 7 contains a number of specific disclosure requirements to supplement the information that is presented in the statement of cash flows. These are explained below.

In addition, disclosure may be needed to explain the judgements management has made during the preparation of the statement of cash flows, especially where the appropriate classification of an item is not clear from IAS 7. IAS 1 requires disclosure of the judgements that management has made that have the most significant effect on the amounts recognised in the financial statements, [IAS 1.122], as well as any information that is relevant to an understanding of any of the entity's financial statements. [IAS 1.112].

11.1 Disclosure of cash and cash equivalents

IAS 7 paragraphs 45 to 48 include requirements for specific disclosures relating to the composition of cash and cash equivalents. These cover:

- The components of cash and cash equivalents and a reconciliation to the amounts in the statement of financial position (see section 11.1.1 below)
- The policy adopted in determining the composition of cash and cash equivalents (see section 11.1.2 below)
- Details of any change in the policy for determining components of cash and cash equivalents (see section 11.1.3 below)
- The amount of significant cash and cash equivalent balances held by the entity that are not available for use by the group (see section 11.1.4 below).

11.1.1 The components of cash and cash equivalents and reconciliation with items in the statement of financial position

Cash and cash equivalents is one of the required line items that must be presented on the face of the statement of financial position. [IAS 1.54].

However, items forming part of cash and cash equivalents for IAS 7 purposes may not all be shown as a single line item in the statement of financial position. Therefore, disclosure is required to reconcile the line items in the statement of financial position to the amount of cash and cash equivalents in the statement of cash flows: [IAS 32.42, IAS 7.45]

Extract from IAS 7

- 45** An entity shall disclose the components of cash and cash equivalents and shall present a reconciliation of the amounts in its statement of cash flows with the equivalent items reported in the statement of financial position.

For example, as discussed in section 3.2.4 above, there are circumstances in which bank overdrafts repayable on demand are included as a component of cash and cash equivalents. In the statement of financial position, the bank overdrafts will be presented as financial liabilities, separate from cash, unless a legal right of set off exists. Therefore, a reconciliation will be needed.

Keller Group plc provides such a reconciliation below:

Practical example 11-1: Keller Group plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial statements [extract]

Notes to the consolidated financial statements [extract]

21 Cash and cash equivalents

	2023 £m	2022 £m
Bank balances	105.2	97.0
Short-term deposits	46.2	4.1
Cash and cash equivalents in the balance sheet	151.4	101.1
Bank overdrafts	(2.4)	(6.9)
Cash and cash equivalents in the cash flow statement	149.0	94.2

Cash and cash equivalents include £4.4m (2022: £8.5m) of the Group's share of cash and cash equivalents held by joint operations, and £1.1m (2022: £1.4m) of restricted cash which is subject to local country restrictions as it is held as collateral in support of bank guarantees.

11.1.2 The composition of cash and cash equivalents

The standard requires disclosure of the policy an entity adopts in determining the composition of cash and cash equivalents. [IAS 7.46]. Where an entity has applied judgement in interpreting the definitions of cash and cash equivalents (see sections 3.1 and 3.2 above) these judgements must be disclosed.

An example of this disclosure is given in Example C in the Illustrative Examples accompanying IAS 7. [IAS 7.IE Example C].

If an entity changes the purpose for which it holds certain investments, for example a deposit which was previously held for short term cash management is now held to generate an investment return, this would be a change in facts and circumstances, which must be accounted for prospectively.

Similarly, where an entity that previously included its bank overdraft as part of cash and cash equivalents (see section 3.2.4 above) determines that the overdraft no longer forms an integral part of its cash management practices, this must be accounted for prospectively and the overdraft would be reclassified out of cash and cash equivalents and shown as a reconciling item in the cash flow statement. The requirement to present a reconciliation of the amounts in the statement of cash flows is discussed in section 11.1.1 above.

11.1.3 Details of any change in the policy for determining components of cash and cash equivalents

If an entity changes its policy for determining components of cash and cash equivalents the effect of the change is reported in accordance with IAS 8. [IAS 7.47].

11.1.4 The amount of significant cash and cash equivalent balances held by the entity that are not available for use by the group

It is possible for a subsidiary of a group to have amounts held in a bank account that meet the definition of cash in respect of the subsidiary but for which use is restricted within the wider group. In these circumstances, IAS 7 requires disclosure of the amount of significant cash and cash equivalent balances held by an entity that are not available for use by the group, together with a commentary by management to explain the circumstances of the restriction. [IAS 7.48].

Examples include cash and cash equivalents held by a subsidiary operating under exchange controls or other legal restrictions that prevent their general use by the parent or other subsidiaries. [IAS 7.49].

In addition, there may be other circumstances that restrict how cash and cash equivalents can be used by an entity. However, IAS 7 does not contain any specific disclosure requirements in respect of such restrictions. In Exposure Draft ED/2014/6 - *Disclosure Initiative - Proposed amendments to IAS 7*, issued in December 2014, the IASB noted that additional restrictions, such as financial disincentives to utilising certain cash balances, or other considerations may also be relevant to understanding the liquidity of the entity, as they affect the decision to utilise cash and cash equivalents. The example was given of tax liabilities that would arise on the repatriation of foreign cash and cash equivalent balances. The Exposure Draft proposed that where such matters exist, they would need to be disclosed. Although the IASB did not finalise these proposals, disclosure of restrictions must be considered in the context of the liquidity disclosures required by IFRS 7 and more generally, whenever it is material to an understanding of the entity's financial statements. [IAS 1.112].

IFRS 12 *Disclosure of Interests in Other Entities* also contains disclosure requirements in consolidated financial statements of the nature and extent of significant restrictions on the group's ability to access or use assets, and settle liabilities, of its subsidiaries. These disclosures, which are discussed in Chapter 14, are likely to be relevant for restricted cash and cash equivalent balances held by subsidiaries.

11.2 Changes in liabilities arising from financing activities

Extract from IAS 7

44A An entity shall provide disclosures that enable users of financial statements to evaluate changes in liabilities arising from financing activities, including both changes arising from cash flows and non-cash changes.

[IAS 7.44A].

Liabilities arising from financing activities are liabilities for which cash flows were, or future cash flows will be, classified in the statement of cash flows as cash flows from financing activities (see section 4.3 above). In addition, the disclosure requirement also applies to changes in financial assets (such as assets that hedge liabilities arising from financing activities) if cash flows from those financial assets were, or future cash flows will be, included in cash flows from financing activities. [IAS 7.44C].

The following changes are required to be disclosed to explain the movements in these instruments:

- (a) Changes from financing cash flows
- (b) Changes arising from obtaining or losing control of subsidiaries or other businesses
- (c) The effect of changes in foreign exchange rates
- (d) Changes in fair values
- And
- (e) Other changes [IAS 7.44B]

The standard suggests that these disclosures could be presented in the form of a reconciliation of the opening and closing balances in the statement of financial position for liabilities arising from financing activities. Where such a reconciliation is presented, sufficient information must be provided to enable items included in the reconciliation to be linked to the statement of financial position and the statement of cash flows. [IAS 7.44D]. If an entity provides the disclosure required by IAS 7.44A in combination with disclosures of changes in other assets and liabilities, it must disclose the changes in liabilities arising from financing activities separately from changes in those other assets and liabilities. [IAS 7.44E].

The IFRS IC discussed these requirements further in June 2019.²¹ In providing the disclosures required by IAS 7.44A, the IFRS IC noted that the requirements of IAS 1 on aggregation and disaggregation would apply (see Chapter 3). Therefore, an entity must disclose any individually material liability (or asset) and any material reconciling item (i.e., cash or non-cash changes) separately in the reconciliation. An entity must also consider whether additional explanation is needed in order to enable users of financial statements to evaluate changes in liabilities arising from financing activities. The disclosures must be structured and disaggregated appropriately to ensure that they:

- Provide information about the entity's sources of finance
- Enable investors to check their understanding of the entity's cash flows
- Enable investors to link items to the statement of financial position and the statement of cash flows, or related notes

Illustration 11-1 below illustrates how an entity might satisfy the requirement to reconcile liabilities arising from financing activities. The cash flows shown in the example should reconcile to the net of the financing cash inflows and outflows in the statement of cash flows.

Illustration 11-1: Reconciliation of liabilities arising from financing activities

	20X1	Cash flows	Non-cash changes			20X2
			Acquisition	New leases	Exchange differences	
	CU	CU	CU	CU	CU	CU
Bank loans	1,040	250	200	-	25	1,515
Lease liabilities	-	(90)	-	900	10	820
Financing liabilities	1,040	160	200	900	35	2,335

In Practical example 11-2 below, Inspired PLC also presents the disclosure in a tabular format, but with the categories of liabilities across the top of the table.

²¹ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

At 31 December 2023		57,541	2,253	59,794

11.3 Other specific disclosure requirements

IAS 7 contains a number of other specific disclosure requirements which have been discussed in sections 4 to 10 above. These are:

The total amount of interest paid during the period, whether it has been recognised as an expense or capitalised as part of the cost of an asset. [IAS 7.32]. See section 4.4.1 above.

- Disclosures in respect of obtaining and losing control of subsidiaries or other businesses during the period. [IAS 7.40]. See section 9.3 above.
- Disclosure of non-cash transaction. [IAS 7.43]. See section 7 above.

11.4 Supplier finance arrangements

In May 2023, the IASB published *Supplier Finance Arrangements - Amendments to IAS 7 and IFRS 7* to require an entity to provide additional disclosures about its supplier finance arrangements. The amendments are effective for annual reporting periods beginning on or after 1 January 2024.

The disclosure requirements in the amendments are intended to enable users of financial statements to assess the effects of supplier finance arrangements on an entity's liabilities, cash flows and exposure to liquidity risk. [IAS 7.44F]. The disclosures aim to enable users to understand how the entity might be affected if the arrangements were no longer available to it [IAS 7.BC29(b)]. The disclosure requirements in the amendments do not apply to an entity's arrangements that finance receivables or inventory. Also, an entity is not required to identify other actions its suppliers might have taken to finance their receivables (for example, factoring of receivables) [IAS 7.BC32(c)]. The scope of the disclosure requirements is discussed in section 11.4.1 below.

The amendments clarify the characteristics of supplier finance arrangements.

Extract from IAS 7

- 44G** Supplier finance arrangements are characterised by one or more finance providers offering to pay amounts an entity owes its suppliers and the entity agreeing to pay according to the terms and conditions of the arrangements at the same date as, or a date later than, suppliers are paid. These arrangements provide the entity with extended payment terms, or the entity's suppliers with early payment terms, compared to the related invoice payment due date. Supplier finance arrangements are often referred to as supply chain finance, payables finance or reverse factoring arrangements. Arrangements that are solely credit enhancements for the entity (for example, financial guarantees including letters of credit used as guarantees) or instruments used by the entity to settle directly with a supplier the amounts owed (for example, credit cards) are not supplier finance arrangements.

[IAS 7.44G].

The amendments introduce a number of specific disclosure requirements, covering the terms and conditions of the arrangements, information about the carrying amounts associated with the arrangements and details of the non-cash changes in the carrying amounts. [IAS 7.44H].

Extract from IAS 7

- 44H To meet the objectives in paragraph 44F, an entity shall disclose in aggregate for its supplier finance arrangements:**
- (a) the terms and conditions of the arrangements (for example, extended payment terms and security or guarantees provided). However, an entity shall disclose separately the terms and conditions of arrangements that have dissimilar terms and conditions.
 - (b) as at the beginning and end of the reporting period:
 - (i) the carrying amounts, and associated line items presented in the entity's statement of financial position, of the financial liabilities that are part of a supplier finance arrangement.
 - (ii) the carrying amounts, and associated line items, of the financial liabilities disclosed under (i) for which suppliers have already received payment from the finance providers.
 - (iii) the range of payment due dates (for example, 30-40 days after the invoice date) for both the financial liabilities disclosed under (i) and comparable trade payables that are not part of a supplier finance arrangement. Comparable trade payables are, for example, trade payables of the entity within the same line of business or jurisdiction as the financial liabilities disclosed under (i). If ranges of payment due dates are wide, an entity shall disclose explanatory information about those ranges or disclose additional ranges (for example, stratified ranges).
 - (c) the type and effect of non-cash changes in the carrying amounts of the financial liabilities disclosed under (b)(i). Examples of non-cash changes include the effect of business combinations, exchange differences or other transactions that do not require the use of cash or cash equivalents (see paragraph 43)

The amendments require an entity to aggregate information about its supplier finance arrangements. This is because, in most cases, aggregated information about an entity's supplier finance arrangements will satisfy the information needs of users of financial statements. [IAS 7.BC36]. However, an entity must disaggregate information about unusual or unique terms and conditions of individual arrangements when they are dissimilar. [IAS 7.44H]. Explanatory information about payment due dates, when those payment due date ranges are wide, must also be disaggregated. In considering whether, and if so, how to aggregate (or disaggregate) this information, the IASB noted that paragraphs 29 -31 of IAS 1 are relevant when making this assessment. [IAS 7.BC38]. Accordingly, an entity must ensure it provides an appropriate level of disaggregation of information to avoid obscuring material information. The requirements of IAS 1 in respect of materiality and aggregation are discussed in Chapter 3.

Each of the required disclosures is discussed in turn from section 11.4.2 below.

11.4.1 Scope of the disclosure requirements

Paragraph 44G of IAS 7 explains that supplier finance arrangements are characterised by one or more finance providers offering to pay amounts an entity owes its suppliers and the entity agreeing to pay according to the terms and conditions of the arrangements at the same date as, or a date later than, suppliers are paid. [IAS 7.44G]. While this paragraph clarifies the characteristics of supplier finance arrangements, it does not define which arrangements are within the scope of the disclosure requirements. Therefore, determining which arrangements are in the scope may require judgement.

For example, when a purchasing entity is aware that a supplier is factoring its debtors to a third party, and consequently, the entity settles the outstanding balance with the third party directly, would the purchasing entity need to provide the disclosures required by paragraph 44H even if they had not been party to that agreement?

The wording of paragraph 44F of IAS 7 requires an entity to "disclose information about **its** supplier finance arrangements" (emphasis added) which could be read to imply that this only includes arrangements that the entity itself is party to, and not arrangements between other parties.

However, paragraph 44F also explains that the disclosures are to enable users of financial statements to assess the effects of those arrangements on the entity's liabilities and cash flows and on the entity's exposure to liquidity risk which could be interpreted as being wider in scope, possibly covering arrangements that the entity isn't party to but that could impact its liquidity risk. [IAS 7.44F].

In the Basis for Conclusions to the amendments, it is noted that in developing the requirements, the IASB considered various types of supplier finance arrangements and noted that an entity might enter into arrangements with varying structures and for various reasons. [IAS 7.BC31]. IAS 7.44G defines the arrangements within the scope of the disclosures as being those that provide the entity with extended payment terms, or the entity's suppliers with early payment terms, compared to the related invoice payment due date. Paragraph BC32(c) explains that the scope of the requirements is confined to arrangements that finance "amounts an entity owes its suppliers" and that an entity is not required to identify other actions its suppliers might have taken to finance their receivables (for example, factoring of receivables). [IAS 7.BC32].

As a result, judgement may be required in order to determine whether certain arrangements are within the scope of the requirements of IAS 7.44F to 44H.

How we see it

Identifying whether an arrangement is within the scope of the new requirements may involve significant judgement in some circumstances and disclosure of this judgement would be required under IAS 1.122. Care must be taken to assess all relevant facts and circumstances before concluding. It will be relevant to consider the purpose and design of the arrangement with the third-party finance provider, including indicators such as who initiated the scheme, whether it is available to all customers as part of the supplier's standard terms and conditions or only to the entity and what benefits, if any, the entity obtains from it.

This assessment should be performed having regard to the disclosure objective of paragraph 44F which is to "provide information that enables users of financial statements to assess the effects of those arrangements on the entity's liabilities and cash flows and on the entity's exposure to liquidity risk." and how the entity might be affected if the arrangements were no longer available to it.

Illustration 11.2 below explains how the requirements might be applied to certain scenarios.

However, it should be noted that IAS 1.17(c) requires entities to provide additional information to achieve fair presentation and IAS 1.112(c) requires notes to provide additional information if it is relevant to the understanding of the financial statements (see Chapter 3). Therefore, even if a reporting entity concludes that an arrangement does not contain all the characteristics identified in paragraph 44G of IAS 7, it must still carefully consider the extent to which disclosure of the information specified in paragraphs 44H is relevant to an understanding of its financial statements.

Illustration 11-2: Scope of supplier finance arrangements disclosures

An entity purchases goods from a supplier at a cost of CU100. Normal industry terms for the purchase would be 3 months payment terms. As a result of the supplier entering into and maintaining a factoring arrangement with a third party, the entity is required to settle the debt directly with the third party and is required to provide certain information (for example half-year reports and annual financial statements) which would allow the third party to assess the credit risk attached to the entity in order to appropriately tailor the terms of the arrangement.

Question

Is the purchasing entity ('the entity') required to provide the supplier finance arrangement disclosures, as envisaged in IAS 7.44F and 44G, in each of the three scenarios below?

Scenario 1 - Entity is aware that the supplier is factoring its debtors

The entity is aware that the supplier is factoring its debtors to a third party, and consequently, the entity will be required to settle the outstanding balance with the third party directly. The entity is required to settle the invoice of CU100 within the normal industry terms of 3 months.

Scenario 2 - Entity obtains payment terms of 6 months by virtue of the supplier's arrangement

The entity is aware that the supplier is factoring its debtors to a third party, and consequently, the entity will be required to settle the outstanding balance with the third party directly. The entity obtains payment terms of 6 months by virtue of the supplier's arrangement with the third party. The invoiced amount is CU105 to compensate for finance charges.

Scenario 3 - Entity can opt for the extended terms

The purchase agreement between the entity and its supplier includes different payment term options and related costs. At the inception of each purchase, the supplier informs the entity about the possibility of receiving an extension of the due date (from 3 months to 6 months), should the supplier still have the financing facilities available to it through its pre-arranged factoring agreement with the third-party finance provider. If the entity opts for the extended terms, the supplier will issue an invoice for CU105 and 6 month payment terms. If the entity does not opt in, the supplier issues an invoice for CU100 and 3 month payment terms.

Analysis**Scenario 1****How we see it**

In the absence of any other relevant facts or contractual conditions, we believe, it would be appropriate for the entity to conclude that the entity is not required to provide supply chain financing disclosure as it is not a party to the arrangement and indeed does not benefit from the arrangement. This is purely an arrangement of the supplier with a third party to factor the supplier's debtors. As noted in section 11.4.1 above, in the Basis for Conclusions paragraph BC32(c) explains that the scope of the requirements is confined to arrangements that finance "amounts an entity owes its suppliers" and that an entity is not required to identify other actions its suppliers might have taken to finance their receivables (for example, factoring of receivables). The disclosure objective in IAS 7.44F refers to information to enable users of financial statements to assess the effects of those arrangements on the entity's liabilities and cash flows and on the entity's exposure to liquidity risk. This arrangement has had no impact on the entity's liabilities, cash flows or exposure to credit or liquidity risk. This example provides limited facts; entities need to look at all aspects of the arrangement to reach a conclusion.

Scenario 2

In this scenario, care must be taken to assess all relevant facts and circumstances before concluding. It will be relevant to consider the purpose and design of the arrangement with the third-party finance provider, including indicators such as who initiated the scheme and whether it is available to all customers as part of the supplier's standard terms and conditions or only to the entity. This assessment should be performed having regard to the disclosure objective of paragraph 44F which is to "provide information that enables users of financial statements to assess the effects of those arrangements on the entity's liabilities and cash flows and on the entity's exposure to liquidity risk."

How we see it

In the absence of any other relevant facts or contractual conditions, we believe, it would be consistent with the disclosure objective in paragraph 44F to consider that such arrangement is part of the entity's supplier finance arrangements. This is because, the entity is allowed to pay an amount greater than the invoice amount, at a date later than the related invoice date. This example provides limited facts; entities need to look at all aspects of the arrangement to reach a conclusion.

Scenario 3

In this scenario, care must be taken to assess all relevant facts and circumstances before concluding. It will be relevant to also consider the purpose and design of the arrangement with the third-party finance provider, including indicators such as who initiated the scheme and whether it is available to all customers as part of the supplier's standard terms and conditions or only to the entity. This assessment should be performed having regard to the disclosure objective of paragraph 44F which is to "provide information that enables users of financial statements to assess the effects of those arrangements on the entity's liabilities and cash flows and on the entity's exposure to liquidity risk."

How we see it

In our view, in the absence of any other relevant facts or contractual conditions, we believe that it would be consistent with the disclosure objective in paragraph 44F to consider that such arrangement is part of the entity's supplier finance arrangements. This is because, the optional extended payment terms and related costs offered by the supplier are explicitly linked to the financing facilities available to the supplier through its pre-arranged factoring agreement with the third-party finance provider. If the entity chooses to utilise the extended payment terms, the entity becomes party to an arrangement in which the supplier is paid (by the finance provider) at an earlier date, than the date the entity settles its payment obligation towards the finance provider. Paragraph 44F explains that the disclosures are to enable users of financial statements to assess the effects of supplier finance arrangements on the entity's liabilities and cash flows and on the entity's exposure to liquidity risk. If the arrangement between the supplier and finance provider was to cease to exist, the purchasing entity's liquidity would be affected. This example provides limited facts; entities need to look at all aspects of the arrangement to reach a conclusion.

11.4.2 Disclosure of the terms and conditions of the arrangements

This disclosure is to inform users of the financial statements that such arrangements are in place and to explain their nature. As noted above, an entity must disaggregate information about terms and conditions of significant individual arrangements when they are dissimilar. This may include the extended payment terms, security or guarantees provided, and any other terms and conditions relevant to meeting the disclosure objective of enabling users of the financial statements to assess the impact on the entity's liabilities, cash flows and liquidity risk. [IAS 7.44F, IAS 7.44H(a)].

11.4.3 Disclosure of carrying amounts

The amendments require an entity to provide quantitative information about the carrying amount of supplier finance arrangement financial liabilities and the line items in the statement of financial position in which those liabilities are presented. This will include separate disclosure of the amount of the liabilities where the supplier has already taken payment from the third part finance provider. [IAS 7.44H(b)(i), IAS 7.44H(b)(ii)]. This information is required as at the beginning and end of each reporting period. [IAS 7.44H(b)]. See section 11.4.6 below for discussion of transitional reliefs that apply in the first year of application.

Illustration 11-3 below, which is not part of the amendments but is based on the example in the IASB's "Investor Perspectives: Supplier finance - New disclosure requirements to aid investors" document,²² shows one possible way of how a company might satisfy the requirements of IAS 7.44H(b)(i) and (ii):

Illustration 11-3: Carrying amount of liabilities that are part of supplier finance arrangements

Carrying amount of liabilities	20X2	20X1
	CU	CU
Presented within trade and other payables	1,500	1,000
Of which suppliers have received payment	1,000	800
Presented within finance payables	1,000	750
Of which suppliers have received payment	900	650

²² [Investors Perspectives - Supplier finance: new disclosure requirements to aid investors](#), May 2023, available on the IFRS Foundation's website.

11.4.4 Disclosure of the range of payment due dates

An entity is required to disclose the range of payment due dates (for example, 30 to 40 days after the invoice date) for payables within the supplier finance arrangements and for comparable trade payables. The standard includes an example of what is meant by “comparable trade payables”, which would be trade payables with the same line of business or jurisdiction, but which have not been included in any supply finance agreements. When those payment due date ranges are wide, explanatory information about payment due dates, or additional ranges, must be provided. [IAS 7.44H(b)(iii)]. This information is required as at the beginning and end of each reporting period. [IAS 7.44H(b)]. See section 11.4.6 below for discussion of transitional reliefs that apply in the first year of application.

Illustration 11-3 below, which is not part of the amendments but is based on the example in the IASB’s “Investor Perspectives: Supplier finance - New disclosure requirements to aid investors” document,²³ shows one possible way of how a company might satisfy the requirements of IAS 7.44H(b)(iii):

Illustration 11-4: Range of payment due dates

Range (days) of payment due dates	20X2	20X1
Liabilities that are part of the arrangement	85-90 days after invoice date	80-90 days after invoice date
Comparable trade payables that are not part of an arrangement	60-70 days after invoice date	60-65 days after invoice date

11.4.5 Disclosure of the type and effect of non-cash changes

The amendments require disclosure of the type and effect of non-cash changes in the carrying amounts of the financial liabilities that are part of a supplier finance arrangement. These non-cash changes include the effect of business combinations, exchange differences or other transactions that do not require the use of cash or cash equivalents. [IAS 7.44H(c)]. Disclosure of this information enables users of financial statements to assess the carrying amounts of financial liabilities on a more comparable basis from one reporting period to the next and to understand how these non-cash changes affect the entity’s cash flows. [IAS 7.BC37].

See section 4.4.6 above for discussion of the presentation of cash flows arising from supplier finance arrangements, including consideration of when cash payments made on behalf of the reporting entity should be reflected in the entity’s cash flow statement.

11.4.6 Effective date and transitional arrangements

The amendments are effective for annual reporting periods beginning on or after 1 January 2024. [IAS 7.62]. The amendments contain some transitional reliefs from disclosures in the first year of application, meaning that in the annual reporting period in which the amendments are first applied comparative information is not required.

In addition, no disclosures are required in the first year of application of the opening amounts for payables for which the suppliers have already received payment from finance providers or for the range of payment due dates. [IAS 7.63]. However, the requirement to provide quantitative information about the carrying amount of supplier finance arrangement financial liabilities and the line items in the statement of financial position in which those liabilities are presented (see section 11.4.2 above) is not subject to this transitional relief. As a result, this information will need to be disclosed at the beginning of that first period as well as at the end, meaning that an entity will need to ensure that it has collected the necessary information to enable it to provide these disclosures. For example, an entity with a 31 December reporting date will be required to apply the amendments for the first time in the annual reporting period ending 31 December 2024. The disclosure of supplier finance arrangement financial liabilities and the line items in the statement of financial position in which those liabilities are presented will be required as at 1 January 2024 and at 31 December 2024. [IAS 7.44H(b)(i)].

The amendments clarify that entities are not required to provide disclosures according to the new requirements in any interim reporting period during the first annual reporting period in which the amendments apply. [IAS 7.63].

23 [Investors Perspectives - Supplier finance: new disclosure requirements to aid investors](#), May 2023, available on the IFRS Foundation’s website.

11.5 Voluntary disclosures

IAS 7 sets out a number of disclosures which are encouraged but which are not mandatory. [IAS 7.50].

Extract from IAS 7

- 50 Additional information may be relevant to users in understanding the financial position and liquidity of an entity. Disclosure of this information, together with a commentary by management, is encouraged and may include:
- (a) the amount of undrawn borrowing facilities that may be available for future operating activities and to settle capital commitments, indicating any restrictions on the use of these facilities;
 - (b) [deleted]
 - (c) the aggregate amount of cash flows that represent increases in operating capacity separately from those cash flows that are required to maintain operating capacity; and
 - (d) the amount of the cash flows arising from the operating, investing and financing activities of each reportable segment (see IFRS 8 *Operating Segments*).

Although these disclosures are only encouraged in IAS 7, disclosure of the amount of undrawn borrowing facilities that may be available must be considered in the context of the liquidity disclosures required by IFRS 7 and more generally, whenever it is material to an understanding of the entity's financial statements. [IAS 1.112]. (See Chapter 3).

11.5.1 Cash flows to increase and maintain operating capacity

IAS 7 does not contain any guidance as to how to distinguish cash flows for expansion from cash flows for maintenance in relation to the voluntary disclosure referred to under (c) above. The standard merely states that this information is useful in helping the user to determine whether the entity is investing adequately in the maintenance of its operating capacity or whether it may be sacrificing future profitability for the sake of current liquidity and distributions to owners. [IAS 7.51].

Hongkong Land Holdings Limited distinguishes renovations expenditure from developments capital expenditure in its analysis of investing cash flows.

Practical example 11-3: Hongkong Land Holdings Limited (2023)

Bermuda

Annual Report 2023 [extract]

Financial Statements [extract]

Consolidated Cash Flow Statement [extract]

	Note	2023 US\$m	2022 US\$m
...			
Investing activities			
Major renovations expenditure		(85.3)	(94.6)
Repayments from associates and joint ventures	20 (a)	1,183.3	435.3
Investments in associates and joint ventures	20 (a)	(401.4)	(254.3)
Advances to associates and joint ventures	20 (a)	(434.3)	(798.6)
Disposal of subsidiaries		29.3	–
Disposal of joint ventures		8.5	–
Acquisition of subsidiaries		(30.9)	(14.5)
Cash flows from investing activities		269.2	(726.7)
...			

11.5.2 Segment cash flow disclosures

Disclosure of segmental cash flows is encouraged because it reveals the availability and variability of cash flows in each segment and allows users to understand the relationship between the cash flows of the business as a whole and those of its component parts. [IAS 7.52]. However, it should be noted that IFRS 8 *Operating Segments* does not require any segmental cash flow disclosures. See Chapter 32 for guidance on IFRS 8.

IAS 7 is accompanied by an example of the segmental disclosure. [IAS 7.IE Example A part D]. However, this example simply reports the operating, investing and financing cash flows of its two segments with no reconciliation of the total to the statement of cash flows. In practice, it might be difficult to allocate financing cash flows across the entity's reportable segments, given that this may not be how treasury functions tend to operate.

A.P. Møller - Mærsk A/S provided an analysis of operating cash flows and capital expenditure (part of its investing cash flows) by reportable segment. The entity did not disclose financing cash flows by reportable segment (comparative information is provided in the financial statements but is not reproduced here).

Practical example 11-4: A.P. Møller - Mærsk A/S (2017)

12 Requirements of other standards

12.1 Cash flows of discontinued operations

IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* requires an entity to disclose information on the net cash flows of discontinued operations. [IFRS 5.33].

Extract from IFRS 5

33 An entity shall disclose:

(a) ...

(c) the net cash flows attributable to the operating, investing and financing activities of discontinued operations. These disclosures may be presented either in the notes or in the financial statements. These disclosures are not required for disposal groups that are newly acquired subsidiaries that meet the criteria to be classified as held for sale on acquisition (see paragraph 11).

(d) ...

These disclosures can be presented either on the face of the statement of cash flows or in the notes. Disclosure is not required for disposal groups that are newly acquired subsidiaries which are classified as held for sale on acquisition in accordance with IFRS 5. [IFRS 5.33(c)]. The general presentation requirements of IFRS 5 are dealt with in Chapter 5.

IFRS 5 does not amend the requirements of IAS 7.10 to present cash flows classified by activity - see section 4 above. Cash flows from discontinued operations must be analysed amongst each of the three categories. However, the disclosures required by IFRS 5 can be provided in different ways, since IFRS 5 permits presentation on the face of the statement of cash flows or in the notes.

In the Practical example below, Netcare Limited elected to show the cash flows of discontinued operations on the face of the statement of cash flows. In the notes to the financial statements, Netcare Limited further analyses these cash flows by separate major business line.

Practical example 12-1: Netcare Limited (2012)

	2020 £m	2019 £m
Cash flows from operating activities	149.1	69.2
Cash flows from investing activities	(133.0)	(255.6)
Cash flows from financing activities	(23.1)	(73.1)
Net decrease in cash and cash equivalents from discontinued operations, net of inter-company	(7.0)	(259.5)

12.2 Cash flows arising from the exploration of mineral resources

IFRS 6 *Exploration for and Evaluation of Mineral Resources* requires that an entity discloses the amounts of operating and investing cash flows arising from the exploration for and evaluation of mineral resources. [IFRS 6.24(b)]. The requirements of IFRS 6 are discussed in Chapter 39. The requirement for investing cash flows to give rise to the recognition of an asset, discussed in section 4.2 above, is particularly relevant to entities applying IFRS 6.

12.3 Cash flows arising from interests in subsidiaries, joint ventures and associates

IFRS 12 requires an entity to disclose in its consolidated financial statements summarised financial information about the cash flows for each subsidiary that has non-controlling interests that are material to the entity. [IFRS 12.B10(b)]. These amounts are stated before inter-company eliminations. [IFRS 12.B11].

For each material joint venture and associate, an entity is also required to disclose dividends received from the joint venture or associate [IFRS 12.B12(a)] and, for joint ventures, the amount of cash and cash equivalents. [IFRS 12.B13(a)]. In addition, the standard requires disclosure of any significant restrictions on the ability of joint ventures or associates to transfer funds to the entity in the form of cash dividends, or to repay loans or advances made by the entity. [IFRS 12.22(a)]. IFRS 12 is discussed in Chapter 14.

Appendix B - Defined terms

Extract from IAS 7

- 6 The following terms are used in this Standard with the meanings specified:
- Cash* comprises cash on hand and demand deposits.
- Cash equivalents* are short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value.
- Cash flows* are inflows and outflows of cash and cash equivalents.
- Operating activities* are the principal revenue-producing activities of the entity and other activities that are not investing or financing activities.
- Investing activities* are the acquisition and disposal of long-term assets and other investments not included in cash equivalents.
- Financing activities* are activities that result in changes in the size and composition of the contributed equity and borrowings of the entity.

Overview

This chapter addresses the requirements of IAS 34 *Interim Financial Reporting*. Practical examples and Illustrations are used to demonstrate the presentation and disclosure requirements in IAS 34. In addition, the chapter also provides guidance on the overall recognition and measurement principles in interim financial reports.

IAS 34 prescribes the minimum content of an interim financial report and the principles for recognition and measurement in complete or condensed financial statements for an interim period. IAS 34 does not require an entity to prepare an interim financial report, rather, IAS 34 applies if an entity elects or is required to publish an interim financial report in accordance with IFRS accounting standards.

What you need to know

- IAS 34 provides guidance on the form and content of interim financial statements.
- IAS 34 specifies the periods, including comparative information, for which interim financial reports must be presented.
- The overall principle on measurement, in IAS 34, is based on a year-to-date approach. IAS 34 includes guidance on the application of year-to-date approach on specific areas such as pensions.
- IAS 34 requires significant transactions and events and other information to be disclosed in interim financial statements.
- While entities are generally familiar with its requirements, application of IAS 34 continues to be challenging for entities especially considering difficulties related to the distinction between a discrete and an integral approach.

1 Introduction

One of the major issues in interim financial reporting is whether the interim period is a discrete period, or whether an interim period is an instalment of the full year. Under the first approach, an entity uses the same accounting policies and principles for annual financial statements as for interim periods. Under the second approach, the purpose of the interim report is to give investors, analysts and other users a guide to the expected outcome for the full year, which requires modifications to the policies and principles used in annual financial reporting. The former approach is generally referred to as the 'discrete' approach, and the latter as the 'integral' approach.

The integral approach is not defined but implies deferring or accruing items of income or expense in order to present measures of performance for that interim period that are more indicative of the expected outcome for the year as a whole. Critics say that this approach obscures the results of the interim period. Proponents say that such modifications prevent distortion; an interim period is a more artificial interval than a financial year, and that to report transactions outside of the context of the annual operating cycle for which they are incurred could potentially present a misleading picture.

In practice, the distinction between discrete and integral approaches is less clear-cut than the description above suggests. IAS 34 requires an entity to use a 'year-to-date' approach, [IAS 34.28], which is largely based on the requirement to report the entity's financial position as at the interim reporting date, but for which certain estimates and measurements are based on the expected financial position of the entity at year-end. However, the standard does not allow such estimates and measurements to amount to the 'smoothing' of results (shifting revenue and expenses between different reporting periods in order to present the impression that a business has steady earnings). For example, the estimate of tax expense for an interim period is based on actual profits earned as at the interim reporting date and not the expected tax expense for the year divided by the number of interim reporting periods, as discussed in section 9.5 below. The extent of disclosures in interim reports raises similar questions as to the purpose. If interim reporting is simply a more frequently published version of annual reporting, then the form and content of the interim report must be the same. However, if interim reporting is only an instalment of a longer period, then a reporting package that highlights changes in circumstances during an interim period makes more sense than an update of all the disclosures in an entity's annual financial statements. IAS 34 allows an entity to include either a complete set of financial statements or a condensed version in the interim report. [IAS 34.4]. While some companies present a full set of financial statements in their interim reports, predominant practice under IFRS accounting standards is to present the condensed version. The differences between full and condensed interim financial statements are discussed in section 3 below.

There is no requirement for entities that prepare annual financial statements in conformity with IFRS accounting standards to prepare interim financial statements in accordance with IAS 34. The fact that an entity may not have provided interim financial reports at all or may have provided interim financial reports that do not comply with this standard does not prevent the entity making an explicit and unreserved statement of compliance with IFRS accounting standards in respect of its annual financial statements. [IAS 34.2]. Historically, interim reporting was the prerogative of capital markets and regulators and IAS 34 leaves governments, securities regulators, stock exchanges and others to determine which entities are required to report interim information, how often and how soon after the reporting period. [IAS 34.1]. Accordingly, adherence to local regulatory or legal requirements in interim financial reports is required. Nevertheless, governments and regulators often refer to compliance with IAS 34 as part of their own requirements for interim financial reporting.

1.1 Definitions

Extract from IAS 34

Definitions

- 4 The following terms are used in this Standard with the meanings specified:
- Interim period* is a financial reporting period shorter than a full financial year.
- Interim financial report* means a financial report containing either a complete set of financial statements (as described in IAS 1 *Presentation of Financial Statements* (as revised in 2007)) or a set of condensed financial statements (as described in this Standard) for an interim period.

An interim report is distinguishable from an annual report in that the period being reported is shorter than a full financial year. Furthermore, it may also be distinguishable from annual reports in that the financial statements therein are presented on a condensed format, although an entity may choose to apply the same format as applied in a complete set of annual financial statements. [IAS 34.4].

2 Objective and scope of IAS 34

2.1 Objective

Extract from IAS 34

Objective

The objective of this Standard is to prescribe the minimum content of an interim financial report and to prescribe the principles for recognition and measurement in complete or condensed financial statements for an interim period. Timely and reliable interim financial reporting improves the ability of investors, creditors, and others to understand an entity's capacity to generate earnings and cash flows and its financial condition and liquidity.

It is key to note that IAS 34 prescribes minimum requirements in complete or condensed financial statements, but it still requires judgement to be applied in determining the disclosures to be made. See section 4.1 below for discussion on including disclosures that are significant. The objective also places emphasis on reliable information being made available on a timely basis. *[IAS 34 Objective]*.

2.2 Scope

IAS 34 does not prescribe which entities are required to publish interim financial reports, how often, or how soon after the end of an interim period. The standard notes that governments, securities regulators, stock exchanges, and accountancy bodies often require entities whose debt or equity securities are publicly traded to publish interim financial reports. *[IAS 34.1]*. Therefore, in the absence of any specific regulatory requirement (or obligation of the entity, for example, by covenant), entities are not required to publish interim financial information in a form that complies with IAS 34. Instead, IAS 34 only applies if an entity either elects or is required to publish an interim financial report in accordance with IFRS accounting standards. *[IAS 34.1]*. Accordingly, if an entity's interim financial report states that it complies with IFRS accounting standards, then the requirements of IAS 34 must be met in full. *[IAS 34.3]*.

The decision to present interim financial reports in accordance with IFRS accounting standards operates independently of the annual financial statements. Hence, entities may still prepare annual financial statements conforming to IFRS accounting standards even if their interim financial statements do not comply with IAS 34. *[IAS 34.2]*.

Nevertheless, the IASB encourages publicly traded entities to provide interim financial reports that conform to the recognition, measurement and disclosure principles set out in IAS 34. Those entities are specifically encouraged:

- (a) To provide interim financial reports at least as of the end of the first half of their financial year.
And
- (b) To make their interim financial reports available not later than 60 days after the end of the interim period. *[IAS 34.1]*.

However, an entity can only describe an interim financial report as complying with IFRS accounting standards if it meets all of the requirements of IAS 34. *[IAS 34.3]*. Accordingly, an entity that applies all IFRS accounting standards recognition and measurement requirements in its interim financial report but does not include all the required disclosures in IAS 34, cannot describe the interim financial report as complying with IFRS accounting standards.

As shown in the Practical example below, Bluejay Mining plc has disclosed that although the interim financial statements for the period ended 30 June 2023 are prepared in accordance with IFRS accounting standards as adopted by the United Kingdom, it has not selected to apply IAS 34.

Practical example 2-1: Bluejay Mining plc (Half-year 2023)

United Kingdom

Interim Results for the six months ended 30 June 2023 [extract]

NOTES TO THE INTERIM FINANCIAL STATEMENTS [extract]

2. Basis of Preparation

The condensed consolidated interim financial statements have been prepared in accordance with the requirements of the AIM Rules for Companies. As permitted, the Company has chosen not to adopt IAS 34 "Interim Financial Statements" in preparing this interim financial information. The condensed consolidated interim financial statements should be read in conjunction with the annual financial statements for the year ended 31 December 2022. The interim financial statements have been prepared in accordance with UK adopted International Accounting Standards.

...

3 Components, form and content of an interim financial report under IAS 34

As explained above, an entity may choose to include a complete or a condensed set of financial statements in an interim financial report. The standard does not prohibit or discourage an entity from:

- Publishing a complete set of financial statements (as described in IAS 1 *Presentation of Financial Statements*) in its interim financial report, rather than condensed financial statements and selected explanatory notes.

Or

- Including in condensed interim financial statements more than the minimum line items or selected explanatory notes as set out in IAS 34. [IAS 34.7].

The recognition and measurement guidance in the standard, together with the note disclosures required by the standard, apply to both complete and condensed financial statements presented for an interim period. This means that a complete set of financial statements, prepared for an interim period, would include all of the disclosures required by IAS 34 as well as those required by other IFRS accounting standards. [IAS 34.7].

3.1 Complete set of interim financial statements

An entity that publishes a complete set of financial statements in its interim financial report must include the same components that is included in a complete set of financial statements as defined in IAS 1.

[IAS 34.9].

Extract from IAS 34

- 5 IAS 1 defines a complete set of financial statements as including the following components:
- (a) a statement of financial position as at the end of the period;
 - (b) a statement of profit or loss and other comprehensive income for the period;
 - (c) a statement of changes in equity for the period;
 - (d) a statement of cash flows for the period;
 - (e) notes, material accounting policy information and other explanatory information;
 - (ea) comparative information in respect of the preceding period as specified in paragraphs 38 and 38A of IAS 1; and
 - (f) a statement of financial position as at the beginning of the preceding period when an entity applies an accounting policy retrospectively or makes a retrospective restatement of items in its financial statements, or when it reclassifies items in its financial statements in accordance with paragraphs 40A-40D of IAS 1.
- An entity may use titles for the statements other than those used in this Standard. For example, an entity may use the title 'statement of comprehensive income' instead of 'statement of profit or loss and other comprehensive income'.

Entities may use alternative titles for the above statements other than those stated above. For example, an entity may use the title 'statement of comprehensive income' instead of 'statement of profit or loss and other comprehensive income'. [IAS 34.5]. Also, an entity can refer to the 'statement of financial position' as 'balance sheet'.

If an entity publishes a complete set of financial statements in its interim financial report, the form and content of those statements must conform to the requirements of IAS 1. [IAS 34.9]. These requirements are discussed in Chapter 3. In addition, the entity must disclose the information specifically required by IAS 34 for interim financial reports as well as those required by other IFRS accounting standards (particularly those discussed in section 4 below). [IAS 34.7].

In respect of paragraph 5(e) above that refers to disclosure of material accounting policies, see Chapter 3 and section 6 below for guidance on application of the Practice Statement 2 - *Making Materiality Judgements* (PS 2) in interim financial statements.

3.2 Condensed interim financial statements

In the interest of timeliness, cost, and avoiding repetition of previously reported information, an entity might be required to or elect to give less information at interim dates as compared with its annual financial statements. The standard defines the minimum content of an interim report, as including condensed financial statements and selected notes. [IAS 34.6, IAS 34.8, IAS 34.8A]

Extract from IAS 34**Minimum components of an interim financial report**

- 8** An interim financial report shall include, at a minimum, the following components:
- (a) a condensed statement of financial position;
 - (b) a condensed statement or condensed statements of profit or loss and other comprehensive income;
 - (c) a condensed statement of changes in equity;
 - (d) a condensed statement of cash flows; and
 - (e) selected explanatory notes.
- 8A** If an entity presents items of profit or loss in a separate statement as described in paragraph 10A of IAS 1 (as amended in 2011), it presents interim condensed information from that statement.

IAS 34 requires entities to confirm that the same accounting policies and methods of computation are followed in the interim financial statements as compared to their most recent annual financial statements or, if those policies or methods have changed, to describe the nature and effect of the change (see section 4.2 below). [IAS 34.16A(a)]. Accordingly, an entity only departs from the presentation as applied in its most recent annual financial statements if it has determined that the format will change in its next annual financial statements.

The condensed statement of profit or loss and other comprehensive income referred to at (b) above must be presented using the same format as the entity's annual financial statements. Accordingly, if an entity presents a separate statement of profit or loss in its annual financial statements, then it must present a separate statement in the interim financial report as well. Similarly, if a combined statement of profit or loss and other comprehensive income is presented in the annual financial statements, the same format must be adopted in the interim financial report. [IAS 34.8A].

As a minimum, the condensed financial statements must include each of the headings and subtotals that were included in the entity's last annual financial statements. [IAS 34.10]. However, the condensed financial statements do not need to look exactly like the year-end financial statements. Whilst IAS 34 requires 'headings and subtotals' to be the same, there is no similar requirement for the 'line items' under those headings referred to in IAS 1. [IAS 1.54, IAS 1.82].

A literal reading could mean that an entity is only required to present non-current assets, current assets, etc. on an interim statement of financial position. However, one of the purposes of an interim report is to help the users of the financial statements to understand the changes in financial position and performance of the entity since the previous annual reporting period. [IAS 34.15]. To that end, IAS 34 also requires additional line items or notes to be included if their omission makes the condensed financial statements misleading. [IAS 34.10]. In addition, the overriding goal of IAS 34 is to ensure that the interim report includes all information necessary to understand the financial position and the performance during the interim period. [IAS 34.25].

Presenting, in the interim financial statements, most of the line items presented in the annual financial statements has the benefit of providing the most information to help users of the financial statements understand the changes since the previous year-end. Nonetheless, entities may aggregate line items used in the annual financial statements, if doing so does not render the information misleading or prevent users of the financial statements from performing meaningful trend analysis. [IAS 1.30A]. In response to a submission relating to the presentation and content of the condensed statement of cash flows, the IFRS IC expressed a view that a three-line condensed statement of cash flows showing only a total for each of operating, investing and financing cash flows would generally not meet the requirements of IAS 34 as set out above.¹

Consideration must also be given to regulatory requirements, for example, where a regulator requires an entity to present certain line items using some form of materiality criteria (e.g., in terms of amount, percentage relative to headings, or percentage change from prior periods).

¹ [IFRIC Update](#), March 2014, available on the IFRS Foundation's website.

How we see it

Selecting an appropriate presentation approach in condensed interim financial statements depends on several factors such as materiality, regulatory requirements, and the overarching objective of IAS 34. Accordingly, in some cases line items in the annual financial statements may be combined into more aggregated line items in the condensed interim financial statements.

However, in our view, aggregating information in a condensed interim statement of financial position to present only non-current assets, current assets, etc. would be inconsistent with the objectives of IAS 34 and judgement is required to determine which line items provide useful information for decision-makers and accordingly, which are presented.

The following Illustration shows one possible way in which an entity might choose to combine line items presented separately in the annual financial statements when preparing a condensed set of interim financial statements. However, such presentation is at the discretion of management, based on facts and circumstances, including materiality (as noted above), regulatory environment, and the overarching goal of IAS 34 to provide relevant information. [IAS 34.25].

3.3 Requirements that apply to both complete and condensed interim financial information

The general principles for preparing annual financial statements are equally applicable to condensed interim financial statements. These principles include fair presentation, going concern, the accrual basis of accounting, materiality and aggregation, and offsetting. (See Chapter 3).

Furthermore, the following requirements apply irrespective of whether an entity provides complete or condensed financial statements for an interim period:

- If applicable, basic and diluted earnings per share must be presented on the face of the statement that presents items of profit or loss for an interim period. [IAS 34.11]. If the entity presents items of profit or loss in a separate statement, it must present basic and diluted earnings per share in that statement. [IAS 34.11A].
- If the last annual financial statements were consolidated financial statements, the interim financial report must also be prepared on a consolidated basis, if the entity continues to be a parent in the interim period. [IAS 34.14].

If the entity's last annual financial report included the parent's separate financial statements and consolidated financial statements, IAS 34 neither requires nor prohibits the inclusion of the parent's separate financial statements in the interim financial report. [IAS 34.14].

Although not an explicit requirement under IAS 34, it is relevant and good practice to disclose the date on which the interim financial statements are authorised for issue as it helps the users to understand the context of any disclosure of events after the interim reporting date. [IAS 10.17].

3.4 Management commentary

A management commentary is not required by IAS 34 but is frequently included by entities in their interim financial reports along with the interim financial statements. In most cases, the requirement for a narrative review comes from local stock market regulations and the entities must, therefore, follow the relevant guidance issued by those regulators.

IAS 34 allows information required under the standard to be presented outside the interim financial statements, i.e., in other parts of interim financial report (such as a management commentary or risk report). [IAS 34.16A]. The standard itself does not establish specific requirements for the content of a management commentary beyond what must be contained in (or cross-referred from) the interim financial statements (see section 4.2.3 below).

4 Disclosures in condensed financial statements

IAS 34 combines a number of disclosure principles:

- Entities must provide information about events and transactions in the interim period that are significant to an understanding of the changes in financial position and performance since the last annual reporting period. In this context, it is not necessary to provide relatively insignificant updates to information reported in the last annual financial statements (see section 4.1 below). [IAS 34.15, IAS 34.15A].
- In addition, to information that explains significant changes since the last annual reporting period, a number of specific disclosures are required to be given, if this is not disclosed elsewhere in the interim financial report. [IAS 34.16A].
- The materiality assessment for disclosure is based on the interim period by itself, to ensure all information is provided that is relevant to understanding the entity's financial position and its performance during the interim period (see section 6 below). [IAS 34.25].

How we see it

Overall, applying the disclosure principles described above requires the exercise of judgement by an entity regarding what information is significant and relevant. The practice of interim reporting confirms that entities take advantage of that room for judgement, both for disclosures provided in the notes to the interim financial statements and outside the interim financial statements.

4.1 Significant events and transactions

IAS 34 presumes that users of an entity's interim financial report also have access to its most recent annual financial report. [IAS 34.15A]. On that basis, an interim financial report must explain events and transactions that are significant to an understanding of the changes in financial position and performance of the entity since the previous annual reporting period and provide an update to the relevant information included in the financial statements of the previous year. [IAS 34.15, IAS 34.15C]. The inclusion of only selected explanatory notes is consistent with the purpose of an interim financial report which is to update the latest complete set of annual financial statements. Accordingly, condensed financial statements avoid duplicating previously reported information and focus on new activities, events, and circumstances. [IAS 34.6].

Extract from IAS 34

- 15B The following is a list of events and transactions for which disclosures would be required if they are significant: the list is not exhaustive.
- (a) the write-down of inventories to net realisable value and the reversal of such a write-down;
 - (b) recognition of a loss from the impairment of financial assets, property, plant, and equipment, intangible assets, assets arising from contracts with customers, or other assets, and the reversal of such an impairment loss;
 - (c) the reversal of any provisions for the costs of restructuring;
 - (d) acquisitions and disposals of items of property, plant, and equipment;
 - (e) commitments for the purchase of property, plant, and equipment;
 - (f) litigation settlements;
 - (g) corrections of prior period errors;
 - (h) changes in the business or economic circumstances that affect the fair value of the entity's financial assets and financial liabilities, whether those assets or liabilities are recognised at fair value or amortised cost;
 - (i) any loan default or breach of a loan agreement that has not been remedied on or before the end of the reporting period;
 - (j) related party transactions;
 - (k) transfers between levels of the fair value hierarchy used in measuring the fair value of financial instruments;
 - (l) changes in the classification of financial assets as a result of a change in the purpose or use of those assets; and
 - (m) changes in contingent liabilities or contingent assets.

The standard specifies that the above list of events and transactions is not exhaustive and the interim financial report must explain any additional events and transactions that are significant to an understanding of changes in the entity's financial position and performance. [IAS 34.15, IAS 34.15B]. Therefore, when information relating to items not on the above list changes significantly, an entity must still provide disclosure in the interim financial statements in sufficient detail to explain the nature of the change and any changes in estimates. This would apply, for example, if:

- The range of reasonably possible changes in key assumptions has significantly changed since the end of the last annual reporting period. If this is the case an update of relevant sensitivity disclosures may be required.
- The values of non-financial assets and liabilities that are measured at fair value change significantly.

The considerations in the preceding paragraph related to the disclosure of information about significant changes including the examples related to key assumptions and sensitivity is also relevant when an entity prepares its first interim financial statements adopting a new accounting pronouncement as discussed in section 8.1.2 below.

4.1.1 Relevance of other IFRS accounting standards in condensed financial statements

Whilst other IFRS accounting standards specify disclosures required in a complete set of financial statements, if an entity's interim financial report includes only condensed financial statements as described in IAS 34, then the disclosures required by those other IFRS accounting standards are not mandatory. However, if disclosure is considered to be necessary in the context of an interim report, those other IFRS accounting standards provide guidance on the appropriate disclosures for many of these items. [IAS 34.15C]. For example, in meeting the requirements of (g) above to disclose the impact of corrections of prior period errors, the requirements of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* would be relevant to consider (see Chapter 3).

In practice, entities exercise judgement to determine whether including the disclosures required by other IFRS accounting standards are material to an understanding of the entity and will provide a benefit to users of the interim financial statements. [IAS 34.25]. For example, the existence of acquisitions and disposals of items of property plant and equipment does not automatically require the interim report to include a reconciliation of the carrying amount at the beginning and end of the interim period. [IAS 16.73(e)]. In many cases, a narrative disclosure would be sufficient, and in some cases, the change may be immaterial, and therefore, no disclosures are required. However, in an interim period with multiple material changes, for example, when assets are acquired by purchase, obtained in a business combination, transferred to a disposal unit, and disposed of in the normal course of business, such a reconciliation could be judged to be an appropriate way of presenting this information in the interim financial statements.

4.2 Other disclosures required by IAS 34

In addition to disclosing significant events and transactions as discussed in section 4.1 above, IAS 34 requires an entity to include certain specific information, listed below, in the notes to its interim financial statements or elsewhere in the interim financial report. [IAS 34.16A]. The inclusion of the disclosure requirements listed below among the items required by the standard to be given, distinguishes them from the items listed in section 4.1 above, which are disclosed to update information presented in the most recent annual financial report. [IAS 34.15]. Therefore, disclosure of the following information is required for each interim reporting period, subject only to a materiality assessment in relation to that interim report. [IAS 34.25]. In making that judgement, care needs to be taken to ensure any omitted information does not make the interim financial report incomplete and therefore misleading.

- (a) A statement that the same accounting policies and methods of computation are followed in the interim financial statements as in the most recent annual financial statements or, if those policies or methods have changed, a description of the nature and effect of the change.
- (b) Explanatory comments about the seasonality or cyclical nature of interim operations.
- (c) The nature and amount of items affecting assets, liabilities, equity, net income, or cash flows that are unusual because of their nature, size, or incidence.
- (d) The nature and amount of changes in estimates of amounts reported in prior interim periods of the current year or changes in estimates of amounts reported in prior years.
- (e) Issues, repurchases, and repayments of debt and equity securities.
- (f) Dividends paid (aggregate or per share) separately for ordinary shares and other shares.

- (g) Certain segment disclosures required by IFRS 8 *Operating Segments* as discussed in section 4.4 below.
- (h) Events after the interim period that are not reflected in the financial statements for the interim period.
- (i) The effect of changes in the composition of the entity during the interim period, including business combinations, obtaining or losing control of subsidiaries and long-term investments, restructurings, and discontinued operations. For business combinations, the entity must disclose the information required under IFRS 3 *Business Combinations* (see Chapter 10). This is discussed further in sections 4.2.1 and 4.2.2 below.
- (j) For financial instruments, certain fair value disclosures required by IFRS 7 *Financial Instruments: Disclosures* and IFRS 13 *Fair Value Measurement* as discussed in section 4.5 below.
- (k) For entities becoming, or ceasing to be, investment entities, as defined in IFRS 10 *Consolidated Financial Statements*, the disclosures in IFRS 12 *Disclosure of Interests in Other Entities* as required by IFRS 12.9B (see Chapter 14).
- (l) The disaggregation of revenue from contracts with customers required by paragraphs 114 and 115 of IFRS 15 *Revenue from Contracts with Customers*. The requirement to disclose disaggregated revenue in interim financial statements is similar to the requirements applicable to annual financial statements. See Chapter 28 for illustrative examples of disclosures. [IAS 34.16A].

This information is disclosed on a financial year-to-date basis, [IAS 34.16A], except for the information relating to business combinations as discussed in more detail in section 4.2.1 below.

4.2.1 Disclosure relating to business combinations

The requirement in item (i) in section 4.2 above for disclosures of business combinations applies not only for those effected during the current interim period, but also to business combinations after the reporting period but before the interim financial report is authorised for issue. [IFRS 3.59(b), IFRS 3.B66]. See Chapter 10. As noted above, IAS 34 requires disclosure of the effect of changes in the composition of the entity during the interim period, including business combinations, obtaining or losing control of subsidiaries and long-term investments, restructurings, and discontinued operations.

For business combinations, IAS 34 cross refers to the disclosure requirements of IFRS 3, including the requirement to disclose details of business combinations after the reporting period. An entity is not required to provide all the disclosures for business combinations after the reporting period, if the accounting for the business combination is incomplete as at the date on which the financial statements are authorised for issue. In this case, the entity must state which disclosures cannot be made and the reasons why they cannot be made. [IFRS 3.B66].

IFRS 3 requires disclosures in aggregate for business combinations effected during the reporting period that are individually immaterial. [IFRS 3.B65]. However, materiality is assessed for the interim period financial data, [IAS 34.23], which implies that IAS 34 may require detailed disclosures on business combinations that are material to an interim period, even if they could be aggregated for disclosure purposes in the annual financial statements.

4.2.2 Disclosures relating to disposals, discontinued operations and restructurings

If an entity has operations that are discontinued or disposed of during an interim period, these operations must be presented separately in the condensed interim statement of comprehensive income following the principles set out in IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*. In addition, if an entity has non-current assets or a disposal group classified as held for sale or distribution at the end of the interim reporting period, then these must be measured in accordance with the requirements of IFRS 5 and presented separately from other assets and liabilities in the condensed interim statement of financial position.

An entity contemplating a significant restructuring that will have an impact on its composition must follow the guidance in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* for the recognition of any restructuring cost, [IAS 37.71], and IAS 19 *Employee Benefits* for termination benefits. [IAS 19.165(b)]. In subsequent interim periods, any significant changes to provisions will require disclosure. [IAS 34.15B(c), IAS 34.16A(d)].

4.2.3 Location of the specified disclosures in an interim financial report

IAS 34 defines an 'interim financial report' as "a financial report containing either a complete set of financial statements... or a set of condensed financial statements... for an interim period". [IAS 34.4]. Therefore, since an interim financial report contains the interim financial statements, it is clear that these are two different concepts. Accordingly, an entity is not required to disclose the information listed in section 4.2 above in the interim financial statements themselves (but rather, might include the disclosures in the management commentary), as long as a cross-reference is provided from the financial statements to the location of the information included in another part of the interim financial report. [IAS 34.16A].

Additionally, for a cross-reference to be acceptable, the information given 'elsewhere in the interim financial report' needs to both satisfy the disclosure requirements in IFRS accounting standards and be available on the same terms as the interim financial statements, i.e., users must have access to the referenced material (for example, the management commentary or a risk report) on the same basis and at the same time as they have for accessing the interim financial statements from which the reference is made. [IAS 34.16A].

The cross-reference must identify the specific part that includes the required disclosure to allow the reader to easily navigate within the interim financial report.

4.2.3.A Transition disclosures in subsequent interim financial statements in the year of adoption

Section 8.1.2.A below includes guidance regarding the considerations given to which new IFRS accounting standards and interpretations are mandatory in the next (current year) annual financial statements, when preparing interim financial information.

An entity may prepare more than one set of interim financial statements during the year of adoption of new or amended accounting standards and interpretations (e.g., quarterly interim reporting). In that case, the entity must provide information consistent with that which was disclosed in its first interim financial statements for that year but updated for the latest information (see section 8.1.2 below). In some cases, the additional disclosures in a subsequent interim period only relate to information that is relevant to that subsequent interim period as IAS 34.16A allows for cross-referencing to other documents available on the same terms and at the same time.

Entities must consider the views of local regulators when planning not to repeat in the current interim financial statements any disclosures already included in previous interim reports or other documents. That is because there are different views among regulators as to whether the nature and effect of changes including transition disclosures (see section 8.1.2 below) must be repeated in full in each set of interim financial statements issued during the year or whether cross-referencing to earlier interim financial statements or other documents outside the current interim report is acceptable. For example, in April 2018 the European Securities and Markets Authority (ESMA) published its report on the activities of accounting enforcers in 2017. In it, ESMA clarified that they expect issuers applying IFRS 15 for the first time and using a modified retrospective approach to provide the disclosures about transition required by IFRS 15.C8 in all interim periods that include the date of initial application of IFRS 15.²

In any event, if an entity becomes aware of new information about the transitional impact of the new IFRS accounting standards as at the date of initial application in a subsequent interim period, the previously reported disclosures must be updated in that later interim period to reflect the new information.

Local regulators may have additional requirements. For example, foreign private issuers reporting under IFRS accounting standards that are required to file interim statements may be affected by the SEC's reporting requirement to provide both the annual and interim period disclosures prescribed by the new IFRS accounting standard, to the extent not duplicative, in each interim report in the year of adoption.³

2 [Report](#), *Enforcement and Regulatory Activities of Accounting Enforcers in 2017*, ESMA, 03 April 2018, para. 63. Available on ESMA's website.

4.3 Practical examples and Illustrations of disclosures

The Practical examples and Illustrations below illustrate the disclosures required by IAS 34.

4.3.1 Inventory write-down and reversals

In the Practical example below, BP p.l.c. discloses write-downs of its inventories in the current and corresponding periods and a change in the valuation method consequent to a change in strategic direction. [IAS 34.15B(a)].

Practical example 4-1:	BP p.l.c. (Second quarter and half-year 2021)	United Kingdom
Group results: Second quarter and half year 2021 [extract] Notes [extract] Note 10. Inventory valuation <p>A provision of \$17 million was held against hydrocarbon inventories at 30 June 2021 (\$80 million at 31 March 2021 and \$289 million at 30 June 2020) to write them down to their net realizable value. As a result of the changes in strategic direction of the group and the evolution of the trading strategy set out in Note 1, from 1 January, certain inventory, totalling \$11.0 billion as at 30 June 2021 (\$10.2 billion as at 31 March 2021), is now treated as trading inventory and is valued at fair value whereas the equivalent inventory was previously valued at the lower of cost or net realisable value in prior periods.</p>		

In the Practical example below, Tharisa plc discloses the reversal of an inventory write-down in the current period. [IAS 34.15B(a)].

Practical example 4-2:	Tharisa plc (Half-year 2023)	Cyprus
INTERIM MANAGEMENT REPORT [extract] INTERIM CONDENSED CONSOLIDATED FINANCIAL STATEMENTS 31 MARCH 2023 [extract] NOTES TO THE INTERIM CONDENSED CONSOLIDATED FINANCIAL STATEMENTS [extract] 13. INVENTORIES [extract] <p>Certain PGM finished products, which previously were provided for in full, were reprocessed to an acceptable saleable condition. This resulted in a reversal of a write down previously recognised. The reversal amounts to US\$1.1 million at 31 March 2023 (31 March 2022: write down of US\$0.5 million and 30 September 2022: write down of US\$2.0 million). The provision and the net realisable value write down were allocated to the PGM segment.</p> <p>...</p>		

4.3.2 Recognition and reversal of impairment losses

In the Practical example below, AngloGold Ashanti Limited has disclosed impairment losses recognised during the interim period including an indication of the cash-generating unit, reportable segment and class of assets where the impairment losses are recognised. [IAS 34.15B(b)].

Practical example 4-3: AngloGold Ashanti Limited (Half-year 2023)**South Africa****Interim 2023 Results Report for the six months ended 30 June 2023 [extract]****Notes for the six months ended 30 June 2023 [extract]****4 Impairment, derecognition of assets and (loss) profit on disposal [extract]****Impairments**

The group's non-financial assets, other than inventories and deferred tax assets, are assessed for impairment or reversal of impairment indicators at each reporting date or whenever events or changes in circumstances indicate that the carrying value may not be recoverable.

Córrego do Sítio ("CdS")

CdS is owned and operated by AngloGold Ashanti Mineração ("AGA Mineração") in Brazil. The CdS mining complex has been in operation since 1989 and consists of open pit and underground mines. The property is currently in a production stage. Management is currently assessing various options related to the CdS mining complex cash generating unit ("CGU"), ranging from operational improvements through the Full Asset Potential review programme to putting the operations under care and maintenance. In 2022, an impairment loss of \$189m was recognised in respect of the CdS mining complex CGU. During the first half of 2023, the CdS mining complex CGU experienced further operational underperformance and as a result a further impairment loss of \$39m was recognised on the remaining asset balances and new capital expenditures incurred during 2023. The impairment losses in 2022 and the first half of 2023 were recognised and included in the Americas segment.

Cuiabá

Cuiabá is owned and operated by AGA Mineração in Brazil. It has been in operation since 1834 and is an underground mine. The property is currently in the production stage. In 2022, an impairment loss of \$70m was recognised in respect of the Cuiabá mining complex CGU. During the first half of 2023, Cuiabá recognised a further impairment loss of \$53m largely due to the current suspension of operating activities at the Queiroz metallurgical plant while additional buttressing at the Calcinados TSF is designed and completed, and a decision not to restart operations during the dry season (contrary to what was originally planned). The impairment losses in 2022 and the first half of 2023 were recognised and included in the Americas segment.

Impairment Allocation:

Cash Generating Unit	Tangible Assets				
	Mine Development Cost	Mine Infrastructure	Assets under construction	Land	Total Impairment
US Dollar million	Six months ended Jun 2023				
Córrego do Sítio	26	7	5	1	39
Cuiabá	—	25	28	—	53
	26	32	33	1	92

...

In the Practical example below, as part of its note on segments, Equinor ASA discloses the reversal of impairment losses during the reporting period. [IAS 34.15B(b)]. The note also provides an explanation of the reasons for the reversal.

Practical example 4-4: Equinor ASA (Second quarter 2021)**Norway****Second quarter 2021: Financial statements and review [extract]****Notes to the Condensed interim financial statements [extract]****2 Segments [extract]**

In the second quarter of 2021 Equinor recognised net impairment reversals of USD 276 million of which USD 113 million was impairments of acquisition cost and signature bonuses classified as exploration expenses. The line item Exploration expenses in the Consolidated statement of income also includes impairment of capitalised exploration well cost. For information regarding impairment of capitalised exploration cost, see note 6 Property, plant and equipment and intangible assets.

In the E&P International segment the net impairment reversal was USD 93 million. Impairments of USD 95 million related to exploration licenses in South America and were classified as exploration expenses. Net impairment reversal of other assets of USD 188 million were mainly related to an asset in the Europe and Asia area caused by positive change in the short-term price assumptions and a North America offshore asset valued at fair value less cost to sell following the reclassification to held for sale.

In the E&P Norway segment the net impairment reversal was USD 396 million mainly related to an offshore asset caused by a positive change in the short-term price assumptions.

In the MMP segment the impairments were USD 185 million mainly related to a refinery valued at fair value less cost to sell following the reclassification to held for sale.

4.3.3 Acquisitions and disposals of property, plant and equipment

In the Practical example below, Synlait Milk Limited gives a narrative description of its acquisitions, disposals and other movements in property, plant and equipment and intangible assets in the interim period. [IAS 34.15B(d)].

Practical example 4-5:	Synlait Milk Limited (Half-year 2022)	New Zealand
CONDENSED INTERIM FINANCIAL STATEMENTS [extract]		
For the six months ended 31 January 2022 [extract]		
NOTES TO THE CONDENSED INTERIM FINANCIAL STATEMENTS [extract]		
09. PROPERTY, PLANT AND EQUIPMENT		
During the six months ended 31 January 2022, \$27.0m has been added to capital work in progress relating primarily to the Pokeno plant modification project. During this period, \$5.1m of historical work in progress relating primarily to routine capital expenditure has been transferred to fixed assets. \$12.6m of property, plant, and equipment was derecognised in relation to the sale and leaseback of the Group's Auckland land and buildings. Refer to note 2 for further detail.		
10. INTANGIBLE ASSETS		
During the six months ended 31 January 2022, \$16.9m has been added to intangible work in progress relating primarily to the SAP ERP implementation project. During this period, \$0.5m of historical work in progress relating primarily to routine capital expenditure has been transferred to intangible assets. In addition, \$3.2m of New Zealand Units were acquired during the period.		

4.3.4 Capital commitments

In the Practical example below, Sembcorp Industries Ltd discloses its commitments for capital expenditure. [IAS 34.15B(e)]. The note explains that these are additional capital commitments entered into during the interim period.

Practical example 4-6:

Sembcorp Industries Ltd (Half-year 2022)

Singapore

CONDENSED CONSOLIDATED INTERIM FINANCIAL STATEMENTS & DIVIDEND ANNOUNCEMENT [extract]

FOR THE HALF-YEAR ENDED JUNE 30, 2022 [extract]

UNAUDITED RESULTS FOR THE HALF-YEAR ENDED JUNE 30, 2022 [extract]

12. COMMITMENTS

Commitments not provided for in the financial statements are as follows:

		GROUP	
(S\$ million)	Note	As at June 30, 2022	As at December 31, 2021
Commitments in respect of acquisition of investments	(i)	—	1,020
Commitments in respect of contracts placed for property, plant and equipment	(ii)	545	152
Uncalled commitments to subscribe for additional shares in joint ventures and other investments		10	52
Commitments in respect of a civil settlement in China		45	45
		600	1,269

(i) The two acquisitions were completed in 1H2022 (see Note 5e and 7b).

(ii) The increased commitments in 1H2022 mainly related to the building, owning and operating of 200MW of Energy Storage Systems on Jurong Island, Singapore as well as construction of a 150MW battery at Wilton International, Teesside, UK.

4.3.5 Litigation settlements

In the Practical example below, African Rainbow Minerals Limited provides information about significant litigation and the related settlement during the second half-year interim period in 2021. [IAS 34.15B(f)]. The disclosure quantifies the settlement amount and indicates the accounting treatment of the litigation as at the end of the previous reporting period.

Practical example 4-7:	African Rainbow Minerals Limited (Half-year 2021)	South Africa
INTERIM RESULTS for the six months ended 31 December 2021 [extract] Condensed group interim financial statements [extract] Notes to the condensed group interim financial statements [extract] 23 CONTINGENT LIABILITIES [extract]		
<p>ARM COAL</p> <p>The South African Revenue Services (SARS) disallowed Glencore Operations South Africa (Pty) Ltd (GOSA) diesel rebates on the basis that the diesel was not considered to be used in the primary production activities in the mining process. GOSA lost the SARS internal appeal process and took the matter to the High Court. The matter was heard in the High Court, which ruled in favour of GOSA. SARS however appealed the ruling through the Supreme Court of Appeal (SCA). The dispute was heard on 27 May 2021 and judgment was handed down on 10 August 2021 where the SCA ruled in favour of SARS.</p> <p>At 30 June 2021, this matter was disclosed as a contingent liability. During the current reporting period, the calculated shortfall of R8 million has been paid to SARS.</p> <p>...</p>		

4.3.6 Changes in circumstances affecting fair values

In its interim report for 2021, Yorkshire Building Society describes the effect of volatility in financial markets during the period. [IAS 34.15B(h)].

Practical example 4-8:	Yorkshire Building Society (Half-year 2021)	United Kingdom
HALF-YEARLY FINANCIAL REPORT: 30 JUNE 2021 [extract] Interim Management Report [extract] Business highlights [extract] Our financial performance [extract] Income Statement [extract]		
<ul style="list-style-type: none"> ■ A fair value volatility gain of £11.4m was recorded in the six months to 30 June 2021 (2020 H1: £7.9m loss), mainly as a consequence of the external interest rate environment and the effect this has on mortgage pipeline interest rate swaps. 		

4.3.7 Default or breach of loan covenants not remedied before the end of interim period

The Illustration below shows disclosure of a loan default that has not been remedied on or before the end of the reporting period, [IAS 34.15B(i)], and the consequential impact on classification of the loans in the interim financial statements.

Illustration 4-1:	Disclosure of default of loan covenant
<p>As at 30 June 20X2, Entity A did not comply with certain financial covenants set out in its existing agreements for the ordinary bond loans issued by the Entity amounting to CU100 million (hereinafter the Existing OBLs) and had not repaid matured loan instalments of CU100 million from the Existing OBLs. Consequently, as of 30 June 20X2, all Existing OBLs are classified as short-term liabilities.</p>	

4.3.8 Related party transactions

In Practical example 4-9 below, Deutsche Bank Aktiengesellschaft discloses related party transactions. [IAS 34.15B(j)].

Practical example 4-9: Deutsche Bank Aktiengesellschaft (Half-year 2022) Germany

Interim Report as of June 30, 2022 [extract]

Interim consolidated financial statements [extract]

Other financial information [extract]

Related party transactions

Parties are considered to be related if one party has the ability to directly or indirectly control the other party or exercise significant influence over the other party in making financial or operational decisions. The Group's related parties include:

- key management personnel including close family members and entities which are controlled, significantly influenced by, or for which significant voting power is held by key management personnel or their close family members,
- subsidiaries, joint ventures and associates and their respective subsidiaries, and
- post-employment benefit plans for the benefit of Deutsche Bank employees.

Transactions with key management personnel

Key management personnel are those persons having authority and responsibility for planning, directing and controlling the activities of Deutsche Bank Group, directly or indirectly. The Group considers the members of the Management Board as currently mandated and the Supervisory Board of the parent company to constitute key management personnel for purposes of IAS 24. Among the Group's transactions with key management personnel as of June 30, 2022, were loans and commitments of € 5 million and deposits of € 13 million. As of December 31, 2021, there were loans and commitments of € 8 million and deposits of € 13 million among the Group's transactions with key management personnel. In addition, the Group provides banking services, such as payment and account services as well as investment advice, to key management personnel and their close family members.

Transactions with subsidiaries, associates and joint ventures

Transactions between Deutsche Bank AG and its subsidiaries meet the definition of related party transactions. If these transactions are eliminated on consolidation, they are not disclosed as related party transactions. Transactions between the Group and its associated companies and joint ventures and their respective subsidiaries also qualify as related party transactions.

Transactions for subsidiaries, joint ventures and associates are presented combined in below table as these are not material individually.

Loans issued and guarantees granted

in € m.	Jun 30, 2022	Dec 31, 2021
Loans outstanding, beginning of period	153	214
Net movement in loans during the period	(50)	159
Changes in the group of consolidated companies	0	0
Exchange rate changes/other ¹	2	(221)
Loans outstanding, end of period^{1,2}	105	153
Other credit risk related transactions:		
Allowance for loan losses	0	0
Provision for loan losses	0	0
Guarantees and commitments	91	28

¹ Prior years' comparatives aligned to presentation in the current year.

² There were no past due loans as of June 30, 2022 and December 31, 2021. For the above loans, the Group held collateral of € 0 million and € 0 million as of June 30, 2022 and December 31, 2021, respectively.

Deposits received

in € m.	Jun 30, 2022	Dec 31, 2021
Deposits, beginning of period	63	49
Net movement in deposits during the period	(23)	14
Changes in the group of consolidated companies	0	0
Exchange rate changes/other	0	0
Deposits, end of period	41	63

Other transactions

Trading assets and positive market values from derivative financial transactions with associated companies amounted to € 18 million as of June 30, 2022, and € 2 million as of December 31, 2021. Trading liabilities and negative market values from derivative financial transactions with associated companies were € 0 million as of June 30, 2022, and € 0 million as of December 31, 2021.

Other assets related to transactions with associated companies amounted to € 38 million as of June 30, 2022, and € 42 million as of December 31, 2021. Other liabilities related to transactions with associated companies were € 5 million as of June 30, 2022, and € 1 million as of December 31, 2021.

Transactions with pension plans

The Group has business relationships with a number of pension plans pursuant to which it provides financial services, including investment management. Pension funds may hold or trade Deutsche Bank AG shares or securities. As of June 30, 2022, transactions with these plans were not material for the Group.

4.3.9 Transfers between different levels of fair value hierarchy

In the Practical example below HSBC Holdings plc discloses details of the transfers of items between level 1 and level 2 of the fair value hierarchy. [IAS 34.15B(k)].

Practical example 4-10: HSBC Holdings plc (Half-year 2022)

United Kingdom

Interim Report 2022 [extract]

Interim condensed financial statements [extract]

Notes on the interim condensed financial statements (unaudited) [extract]

6 Fair values of financial instruments carried at fair value [extract]

Transfers between Level 1 and Level 2 fair values

	Assets				Liabilities		
	Financial investments	Trading assets	Designated and otherwise mandatorily measured at fair value	Derivatives	Trading liabilities	Designated at fair value	Derivatives
	\$m	\$m	\$m	\$m	\$m	\$m	\$m
At 30 Jun 2022							
Transfers from Level 1 to Level 2	2,407	1,937	538	—	55	—	—
Transfers from Level 2 to Level 1	4,066	3,488	99	—	203	—	—
At 31 Dec 2021							
Transfers from Level 1 to Level 2	8,477	6,553	1,277	103	181	—	212
Transfers from Level 2 to Level 1	6,007	4,132	768	—	638	—	—

Transfers between levels of the fair value hierarchy are deemed to occur at the end of each quarterly reporting period. Transfers into and out of levels of the fair value hierarchy are primarily attributable to observability of valuation inputs and price transparency.

...

4.3.10 Contingent liabilities

In the Practical example below, Jerónimo Martins, S.G.P.S., S.A. discloses changes in its contingent liabilities during the interim period. [IAS 34.15B(m)]. The note focuses on changes from the previous annual financial statements rather than repeating information already appearing in the last annual financial statements.

Practical example 4-11: Jerónimo Martins, S.G.P.S., S.A. (First Half 2023)

Portugal

2023 FIRST HALF CONSOLIDATED REPORT AND ACCOUNTS [extract]

II - Condensed Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

18 Contingencies [extract]

Contingent liabilities

During the first half of 2023, the following changes occurred to the contingencies mentioned in the 2022 Annual Report:

Competition Authorities proceedings:

...

- In Poland, the Company Jeronimo Martins Polska, S.A. (JMP) was notified, in 2019, by the Polish Office of Competition and Consumer Protection (UOKiK) on the opening of one investigation proceeding, regarding missing price labels on shelves and discrepancies between prices on the shelves and the ones indicated at the checkouts.

In August 2020, UOKiK notified the JMP of the decision, concluding with the imposition of a fine of 115 million zloty (c. €25 million). JMP, disagreeing with the understanding and conclusion of this Authority, filed an appeal to the Court of Competition and Consumer Protection (CCCP). On 29 September 2022 the court in the first instance sustained the UOKiK decision and dismissed the appeal. Convinced of the merits of its defence and has factual and legal arguments to be used, JMP filed an appeal to the Second Instance Court. On 27 June 2023 the Court of Appeals dismissed JMP's appeal, making UOKiK decision final. Nevertheless, JMP sustaining its position, will file an extraordinary appeal to the Supreme Court.

During the year 2020, JMP was notified by UOKiK on the opening of one proceeding related to the disclosure of country of origin of fruit and vegetable products at store level. On 22 April 2021 UOKiK notified JMP of the decision on the case, imposing a fine of 60 million zloty (c. €13 million). The mentioned decision is not final, so JMP, disagreeing with the understanding and conclusion of this Authority, filed an appeal before the CCCP. On 17 April 2023 the CCCP sustained UOKiK's decision. JMP filed the appeal to the Court of Appeals.

On 10 August 2022 the President of UOKiK initiated the proceedings regarding the promotional campaign 'Biedronka's Anti-inflation Shield', having on 13 April 2023 issued a decision to impose a fine of 161 million zloty (c. €36 million). JMP filed an appeal to the CCCP.

...

4.3.11 Accounting policies and methods of computation

In the Practical example below, Daimler AG discloses changes to the accounting policies applied in its 2019 interim report. [IAS 34.16A(a)]. Using the guidance in IAS 8, Daimler AG provides information for the adoption of IFRS 16 Leases.

Practical example 4-12: Daimler AG (Second quarter 2019)

Germany

Interim report Q2 2019 [extract]

Notes to the Interim Consolidated Financial Statements [extract]

1. Presentation of the Interim Consolidated Financial Statements [extract]

IFRSs initially applied in the reporting period

In January 2016, the IASB published **IFRS 16 Leases**, replacing IAS 17 Leases and IFRIC 4 Determining Whether an Arrangement Contains a Lease and other interpretations. IFRS 16 abolishes for lessees the previous classification of leasing agreements as either operating or finance leases. Instead, IFRS 16 introduces a single lessee accounting model, requiring lessees to recognize assets for the right to use as well as leasing liabilities for the outstanding lease payments. This means that leases that were previously not reported in the Consolidated Statement of Financial Position will have to be reported in the future – very similar to the current accounting of finance leases.

...

Daimler applies IFRS 16 for the first time at January 1, 2019. In compliance with the transition regulations, Daimler does not adjust the prior-year figures and presents the not significant accumulated transitional effects in retained earnings.

Daimler as lessee uses the following practical expedients of IFRS 16 at the date of initial application:

- With leases previously classified as operating leases according to IAS 17, the lease liability is measured at the present value of the outstanding lease payments, discounted by the incremental borrowing rate at January 1, 2019. The weighted average incremental borrowing rate was 2.27%. The respective right-of-use asset is generally recognized at an amount equal to the lease liability.
- An impairment review is not performed. Instead, a right-of-use asset is adjusted by the amount of any provision for onerous leases recognized in the Statement of Financial Position at December 31, 2018.
- Regardless of their original lease term, leases for which the lease term ends at the latest on December 31, 2019 are recognized as short-term leases.
- At the date of initial application, the measurement of a right-of-use asset excludes the initial direct costs.
- Current knowledge is given due consideration when determining the lease term if the contract contains options to extend or terminate the lease.

In the context of the transition to IFRS 16, right-of-use assets of €3,777 million (including finance leases of €335 million) and lease liabilities of €3,790 million were recognized at January 1, 2019. The following reconciliation (see [7 E.08](#)) to the opening balance for lease liabilities as at January 1, 2019 is based on the other financial obligations from rental agreements and operating leases at December 31, 2018.

E.08**Reconciliation to the lease liabilities in accordance with IFRS 16**

In millions of euros

Other financial obligations resulting from rental agreements and operating leases in accordance with IAS 17 at December 31, 2018	3,800
Exemptions for short-term leases	-226
Exemptions for leases of low-value assets	-36
Payments related to options to extend or terminate a lease	256
Payments related to non-lease components	77
Others	75
Obligations from operating lease arrangements (undiscounted)	3,946
Discounting	-503
Obligations from operating lease arrangements (discounted)	3,443
Carrying amount of liabilities from finance leases in accordance with IAS 17 at December 31, 2018	347
Carrying amount of lease liability in accordance with IFRS 16 at January 1, 2019	3,790

The right-of-use assets and lease liabilities include assets and liabilities, which were recognized until December 31, 2018 as finance leases in accordance with IAS 17.

In the Practical example below, Rio Tinto plc discloses changes to the accounting policies applied in its 2023 interim results. [IAS 34.16A(a)]. Using the guidance in IAS 8, Rio Tinto plc provides information for the adoption of an amendment to IAS 12 *Income Taxes*.

Practical example 4-13: Rio Tinto plc (2023)

Australia

Annual Report 2022 [extract]

Condensed consolidated interim financial statements for the six months ended 30 June 2023 [extract]

Selected explanatory notes to the interim financial statements [extract]

2 Changes in accounting policies [extract]

New standards and amendments applicable for the current period

Deferred Tax related to Assets and Liabilities arising from a Single Transaction (Amendments to IAS 12 'Income Taxes' (IAS 12), mandatory in 2023 and endorsed by the UK)

At 1 January 2023, we adopted narrow-scope amendments to IAS 12 and have restated comparative periods in accordance with the transition arrangements. These amendments introduce an exclusion to the initial recognition exemption application for transactions giving rise to equal and offsetting taxable and deductible temporary differences.

Under the amendments, separate deferred tax assets and liabilities are calculated and recognised, prior to application of any required recovery testing and permitted offsetting, and subsequent movements in those deferred tax assets and liabilities are recognised in the income statement. Our previous accounting policy stated that “where the recognition of an asset and liability from a single transaction gives rise to equal and offsetting temporary differences, we apply the initial recognition exemption allowed by IAS 12, and consequently recognise neither a deferred tax asset nor a deferred tax liability in respect of these temporary differences”.

The most significant impact of implementing these amendments was from temporary differences related to the Group’s provisions for close-down and restoration, and lease obligations and corresponding capitalised closure costs and right-of-use assets. Adjustments to deferred tax assets and liabilities related to these balances have been recognised as at 1 January 2021, being the beginning of the earliest comparative period to be presented in the financial statements for the year ended 31 December 2023, with the cumulative effect recognised as an adjustment to retained earnings or other components of equity at that date. For other transactions, the impact of which was immaterial, the amendments apply only to those taking place on or after 1 January 2021. The impact on equity attributable to owners of Rio Tinto at 1 January 2023 of implementing the amendments to IAS 12 is as follows:

At 1 January	2023 US\$m	2022 US\$m	2021 US\$m
Equity attributable to owners of Rio Tinto (previously reported)	50,175	51,415	47,054
Impact of IAS 12 amendments ^(a)	459	515	516
Restated equity attributable to owners of Rio Tinto	50,634	51,930	47,570

(a) Retained earnings adjustments at 1 January 2023 and 2022 include the impact of income statement adjustments for the years ended 31 December 2022 and 2021, respectively.

The restatement of deferred tax balances for the comparative reporting date is as follows:

	31 December 2022
	US\$m
Deferred tax assets (previously reported)	2,766
Impact of IAS 12 amendments	30
Deferred tax assets (restated)	2,796
Deferred tax liabilities (previously reported)	(3,601)
Impact of IAS 12 amendments	437
Deferred tax liabilities (restated)	(3,164)
Net impact of IAS 12 amendments on deferred tax balances	467
Comprising, prior to offsetting of balances:	
Deferred tax assets arising from:	
- Provisions and other liabilities	1,586
- Capital allowances	(57)
	1,529
Deferred tax liabilities arising from Capital allowances	(1,062)

Restatement of pre-offset balances at 31 December 2022 represents additional gross deferred tax liabilities of US\$922 million and gross deferred tax assets of US\$1,380 million in relation to close-down and restoration obligations and related capitalised closure costs, and additional gross deferred tax liabilities of US\$140 million and gross deferred tax assets of US\$149 million in relation to lease liabilities and related right-of-use assets.

The impact of restatement on net earnings for the six months ended 30 June 2022 is a net credit of US\$35 million related to depreciation of closure and right of use assets and settlement of closure and lease liabilities.

4.3.12 Seasonality or cyclicity of operations

Practical example 4-14 below shows how Ardagh Group S.A. discloses the effects of seasonality in its interim report. [IAS 34.16A(b)]. The note explains the impact of seasonality on revenue, cash flows and working capital.

Practical example 4-14: Ardagh Group S.A. (First Quarter 2024)

Luxembourg

Interim Report for the three months ended March 31, 2024 [extract]

Unaudited Consolidated Interim Financial Statements [extract]

NOTES TO THE UNAUDITED CONSOLIDATED INTERIM FINANCIAL STATEMENTS [extract]

18. Seasonality of operations

The Group's revenue and cash flows are both subject to seasonal fluctuations, with the Group generally building inventories in anticipation of these seasonal demands resulting in working capital requirements typically being the greatest at the end of the first quarter of the year.

The demand for our metal beverage products is strongest during spells of warm weather and therefore demand typically peaks during the summer months, as well as in the period leading up to holidays in December. Demand for beverage products within our Glass Packaging business is similarly strongest during the summer and during periods of warm weather, as well as during the period leading up to holidays in December.

The Group manages the seasonality of working capital principally by supplementing operating cash flows with drawings under our Global Asset Based Loan Facilities.

4.3.13 Amounts that are unusual because of their nature, size or incidence

Sanofi discloses the nature and effects of unusual items in Practical example 4-15 below by identifying 'restructuring costs' and similar items. [IAS 34.16A(c)]. The footnote provides further information on the nature of the costs. The note provides information about unusual items that might be important in the analysis of interim period performance. Paragraph 15 of IAS 34 also requires an explanation of events and transactions that are significant to an understanding of the changes in the financial position and performance of the entity since the end of the last annual financial statements. See Practical example 4-21 in section 4.3.17 below for another example illustrating disclosures about restructuring activities.

Practical example 4-15: Sanofi (Half-year 2023)

France

HALF-YEAR FINANCIAL REPORT 2023 [extract]

1. CONDENSED HALF-YEAR CONSOLIDATED FINANCIAL STATEMENTS [extract]

NOTES TO THE CONDENSED HALF-YEAR CONSOLIDATED FINANCIAL STATEMENTS AS OF JUNE 30, 2023 [extract]

B/ SIGNIFICANT INFORMATION FOR THE FIRST HALF OF 2023 [extract]

B.16. RESTRUCTURING COSTS AND SIMILAR ITEMS

Restructuring costs and similar items comprise the following:

(€ million)	June 30, 2023 (6 months)	June 30, 2022 (6 months)	December 31, 2022 (12 months)
Employee-related expenses	185	524	507
Charges, gains or losses on assets ^(a)	86	(2)	261
Compensation for early termination of contracts (other than contracts of employment)	—	—	1
Costs of transformation programs	265	266	547
Other restructuring costs	11	4	20
Total	547	792	1,336

(a) This line consists of impairment losses and accelerated depreciation charges related to site closures (including leased sites), and gains or losses on divestments of assets arising from reorganization decisions made by Sanofi.

Restructuring costs and similar items were €245 million lower in the first half of 2023 than in the first half of 2022. For the first half of 2023 they include the impact of French pension reforms on future annuities under the rules of each severance plan, while for the first half of 2022 they mainly comprised severance costs recognized further to the announcements made during that period. Also included in restructuring costs are the impacts of ongoing transformational projects, primarily those associated with the creation of the standalone Consumer Healthcare entity and the implementation of Sanofi's new digital strategy.

4.3.14 Issues, repurchases and repayments of debt and equity securities

Practical example 4-16 below illustrates the disclosure of material changes in borrowings. [IAS 34.16A(e)].

Practical example 4-16: Anheuser-Busch InBev NV/SA (Half-year 2022) Belgium

Unaudited Interim Report for the six-month period ended 30 June 2022 [extract]

Notes to the consolidated financial statements [extract]

17. Interest-bearing loans and borrowings [extract]

The current and non-current interest-bearing loans and borrowings amount to 83.3 billion US dollar as at 30 June 2022, compared to 88.8 billion US dollar as at 31 December 2021.

As at 30 June 2022, the company had no outstanding balance on commercial papers (31 December 2021: nil). The commercial papers include programs in US dollar and euro with a total authorized issuance up to 5.0 billion US dollar and 3.0 billion euro, respectively.

In 2022, Anheuser-Busch InBev SA/NV (AB InBev) announced that its wholly-owned subsidiary Anheuser-Busch InBev Finance Inc. ("ABIFI") exercised its option to redeem the outstanding principal amounts for an aggregate principal amount of 3.1 billion US dollar of the following series of notes:

Date of redemption	Issuer (abbreviated)	Title of series of notes redeemed	Currency	Original principal amount outstanding (in million)	Principal amount redeemed (in million)
9 February 2022	ABIFI	3.650% Notes due 2026	USD	1 633	1 633
1 March 2022	ABIFI	4.915% Notes due 2046	USD	1 470	1 470

Net debt is defined as non-current and current interest-bearing loans and borrowings and bank overdrafts minus debt securities and cash and cash equivalents. Net debt is a financial performance indicator that is used by AB InBev's management to highlight changes in the company's overall liquidity position.

AB InBev's net debt decreased to 75.9 billion US dollar as at 30 June 2022, from 76.2 billion US dollar as at 31 December 2021. Aside from operating results that are net of capital expenditures, the net debt is impacted mainly by the payment of interests and taxes (3.8 billion US dollar), dividend payments to shareholders of AB InBev and Ambev (1.3 billion US dollar) and foreign exchange impact on net debt (2.3 billion US dollar decrease of net debt).

...

Practical example 4-17 below illustrates the disclosure of changes in treasury stock resulting from disposal of treasury stock through third-party allotment. [IAS 34.16A(e)].

Practical example 4-17: Nippon Telegraph and Telephone Corporation (Third quarter 2021) Japan

Quarterly Securities Report: From October 1, 2021 to December 31, 2021 [extract]

Notes to Condensed Quarterly Consolidated Financial Statement [extract]

10. Equity and Other Equity Items [extract]

(1) Issued Shares and Treasury Stock [extract]

Reconciliation of the number of issued shares and treasury stock

	(shares)	
	Issued Shares	Treasury Stock
As of April 1, 2020	3,900,788,940	265,592,712
Purchase of treasury stock under resolution of the board of directors	—	93,906,900
Repurchase of treasury stock based on less-than-one-unit share purchase demand	—	62,528
Disposal of treasury stock based on additional less-than-one-unit share purchase demand	—	(10,456)
Disposal of treasury stock through third-party allotment	—	(80,775,400)
As of March 31, 2021	3,900,788,940	278,776,284
Purchase of treasury stock under resolution of the board of directors	—	79,358,500
Repurchase of shares based on less-than-one-unit share purchase demand	—	92,144
Disposal of treasury stock based on additional less-than-one-unit share purchase demand	—	(3,032)
Cancellation of treasury stock	(278,776,284)	(278,776,284)
As of December 31, 2021	3,622,012,656	79,447,612

In addition to the above, 1,089,760 shares held by the BIP trust are recorded as “treasury stock” in Condensed Consolidated Financial Statements.

On November 10, 2021, the Board of Directors resolved that NTT would cancel 278,776,284 of its shares on November 17, 2021, and as a result of NTT cancelling such shares on November 17, 2021, additional paid-in capital decreased by ¥1,292 million and retained earnings decreased by ¥730,623 million.

Acquisition of Toyota Motor Corporation's Shares and Disposal of Treasury Stock by Way of Third-party Allotment

On March 24, 2020, the Board of Directors resolved that NTT would enter into a memorandum of understanding for a business and capital alliance (the “Alliance”) with Toyota Motor Corporation (“Toyota”) and entered into the Alliance on the same day. On April 9, 2020, Toyota and NTT mutually executed a comprehensive underwriting agreement for a third-party allotment of treasury stock of both parties based on the memorandum of understanding. NTT acquired Toyota's shares and conducted a disposition of shares of the NTT's treasury stock through the third-party allotment with Toyota as the subscriber for the shares on the same day.

Overview of a disposition of shares of the NTT's treasury stock through the third-party allotment, with Toyota as the subscriber for the shares

(1) Disposition date	April 9, 2020
(2) Type and number of shares disposed	80,775,400 shares of the NTT's common stock
(3) Disposition price	¥2,476 per share
(4) Amount of funds raised	¥199,999,890,400
(5) Percentage to the total number of issued and outstanding shares held by Toyota	2.07% of the NTT's issued and outstanding common stock

4.3.15 Dividends paid

In the Practical example below, Nestlé S.A. discloses dividends paid during the interim period. [IAS 34.16A(f)].

Practical example 4-18: Nestlé S.A. (Half-Year 2023)	Switzerland
Half-Year Report January-June 2023 [extract] Unaudited Condensed Interim Consolidated Financial Statements [extract] Notes [extract] 8. Equity [extract]	
8.2 Dividend The dividend related to 2022 was paid on April 26, 2023, in accordance with the decision taken at the Annual General Meeting on April 20, 2023. Shareholders approved the proposed dividend of CHF 2.95 per share, resulting in a total dividend of CHF 7829 million.	

4.3.16 Events after the interim reporting date

In the Practical example below, Sappi Limited reports the sale of its interest in a subsidiary and other events which took place after the end of the interim period. [IAS 34.16A(h)].

Practical example 4-19: Sappi Limited (Third Quarter Results 2024)	South Africa
Third Quarter Results for the period ended June 2024 [extract] Condensed consolidated interim financial statements for the quarter and nine months ended June 2024 [extract] Notes to the condensed group results [extract]	
10. Events after balance sheet date On 15 July 2024, we concluded the sale of the shares in Sappi Lanaken NV for €50 million of which €40 million will be paid in cash. The transaction is unconditional and expected to close during October 2024. During July 2024 numerous fires, driven by extreme weather conditions, were experienced in Sappi's plantations in Mpumalanga and KwaZulu-Natal in South Africa. Approximately 7,500 hectares were burnt at an estimated cost of US\$7 million (ZAR130 million). On 17 July 2024, a fire and subsequent explosion occurred on a supplier's truck at the group's Saiccor Mill resulting in estimated damage and lost profitability of US\$5 million (ZAR100 million). The mill was completely shut down for four days.	

4.3.17 Changes in the composition of the entity

The notion of changes in the composition of the entity is broadly defined to include acquisitions, restructurings, obtaining or losing control of subsidiaries and long-term investments and discontinued operations. In the case of business combinations, the entity must disclose the information required by IFRS 3. [IAS 34.16A(i)]. See Chapter 10.

In the Practical example below, Nine Entertainment Co. Holdings Limited discloses changes in the group structure resulting from a business combination during the interim period. The note has also explained significant judgements and estimates involved in the fair value measurements related to the business combination.

**Practical example 4-20: Nine Entertainment Co. Holdings Limited
(Half year 2021)**

Australia

APPENDIX 4D AND HALF YEAR FINANCIAL REPORT [extract]

Notes to the Consolidated Financial Statements for the half year ended 31 December 2021 [extract]

6. Other [extract]
6.1 Business combinations and acquisition of non-controlling interests
Acquisition of Insight Data Solutions Group

On 15 October 2021, Property Data Solutions (2) Pty Ltd, a wholly-owned subsidiary of the Domain Group, acquired 100% of the share capital in Insight Data Solutions Holdings Pty Ltd and its subsidiaries (IDS Group). The acquisition marks another step forward in executing on Domain's marketplace strategy to expand its addressable market beyond Agents and Consumers to Financial Institutions, and Government. The acquisition of the IDS Group establishes Domain as a market leading provider of land and property valuation, insights and analytics services into the Government sector, and significantly expands the size of the Property Data Solutions pillar of Domain's marketplace

A summary of the acquisition is as follows:

Entity or business acquired:	Insight Data Solutions Group
Principal activity:	Land and property valuation and insights and analytics services in the Government sector
Date of acquisition:	15 October 2021
Ownership interest as at 31 December 2021:	100%

The provisionally determined fair values of the identifiable assets and liabilities acquired are detailed below, with their measurement to be finalised within one year from the date of acquisition.

PROVISIONAL FAIR VALUE ON ACQUISITION INSIGHT DATA SOLUTIONS GROUP		\$'000
Current assets		
Cash		622
Trade and other receivables		37
Total current assets		659
Non-current assets		
Intangible assets ¹		3,379
Property, plant and equipment		21
Deferred tax assets		358
Total non-current assets		3,758
Total assets		4,417
Current liabilities		
Payables		5,953
Provisions		496
Total current liabilities		6,449
Total liabilities		6,449
Total identifiable net liabilities at fair value		(2,032)
Goodwill arising on acquisition		83,643
Total identifiable net liabilities and goodwill attributable to the Group		81,611

PROVISIONAL FAIR VALUE ON ACQUISITION
INSIGHT DATA SOLUTIONS GROUP

\$'000

Purchase consideration

Cash paid	54,720
Contingent consideration	26,891

Total purchase consideration	81,611
-------------------------------------	---------------

Net cash outflow on acquisition

Cash paid	(54,720)
Cash acquired	622

Net cash outflow	(54,098)
-------------------------	-----------------

Goodwill of \$83.6 million was recognised at the time of acquisition. The goodwill comprises expected synergies arising from the acquisition. Goodwill is allocated entirely to the Domain segment. None of the goodwill recognised is expected to be deductible for income tax purposes.

Purchase Consideration

The consideration of the acquisition is to be paid in an upfront cash consideration and multiple tranches that are contingent on the future financial and commercial performance of the IDS Group, relating to securing and delivering services under new government contracts, over the performance period ending in June 2027.

The first tranche cash payment of \$54.7 million was settled on 15 October 2021. Other tranches are due to be settled during the performance period between completion and June 2027.

The on target and maximum consideration for the transaction including the undiscounted contingent consideration is \$134.7 and \$153.7 million. The expectation at acquisition is that it will be cash settled, however, the purchase agreement allows for a portion to be settled in equity at the Board of Directors' discretion.

As at the acquisition date, the discounted fair value of the contingent consideration was estimated to be \$26.9 million. The fair value of the contingent consideration determined at the date of acquisition reflects the probabilities of securing certain new government contracts and achieving budgeted financial targets. As at 31 December 2021, no remeasurement charge has been recognised through profit or loss since there were no significant changes in the assumptions used from the date of acquisition.

The contingent consideration is recognised as a financial liability on the balance sheet and is measured at fair value through the profit and loss. The contingent consideration is accounted for in accordance with *AASB 9 Financial Instruments* and disclosed as a financial liability (contingent consideration) as the amount to be paid is variable, based upon the post-acquisition financial and commercial performance of the IDS Group.

AASB 3 Business Combinations allows a measurement period after a business combination to provide the acquirer a reasonable time to obtain the information necessary to identify and measure all of the various components of the business combination as of the acquisition date. The period cannot exceed one year from the acquisition date.

Costs incurred and expensed in relation to the acquisition amounted to \$1.6 million as disclosed in Note 2.4.

Significant judgements, estimates and assumptions

Contingent consideration from business combinations is valued at fair value on the acquisition date as part of the business combination. When the contingent consideration meets the definition of a financial liability, it is remeasured to fair value at each reporting date with revaluations recognised within the Consolidated Statement of Profit or Loss and Other Comprehensive Income.

The determination of the fair value is based on discounted cashflows. The key assumptions include the probability and timing of meeting commercial and financial performance targets and the discount factor. Management has obtained external expert advice for these key assumptions and continues to seek further advice (where applicable) on these throughout the measurement period.

No remeasurement was required at the reporting date. Future developments with the business performance of the IDS Group will require revisions to this estimate. The maximum potential contingent consideration to be paid is \$99.0 million based on the IDS Group securing and delivering specified government contracts over the earn out period ending in June 2027.

The contingent consideration is classified as an 'other payable' and is disclosed as part of 'Trade and other payables' on the Consolidated Balance Sheet.

In the Practical example below, Roche Holding Ltd discloses information on its ongoing significant restructuring activities.

Practical example 4-21: Roche Holding Ltd (Half-year 2021)

Switzerland

HALF-YEAR REPORT 2021 [extract]

Notes to the Roche Group Interim Consolidated Financial Statements [extract]

7. Global restructuring plans

During the six months ended 30 June 2021 the Group expanded the implementation of various global restructuring plans initiated in prior years, including an organisational transformation in the Diagnostics Division and various resourcing optimisation initiatives in the Pharmaceuticals Division.

Global restructuring plans: costs incurred in millions of CHF

	Diagnostics	Site consolidation	Other plans	Total
Six months ended 30 June 2021				
Global restructuring costs				
– Employee-related costs	107	23	276	406
– Site closure costs	31	5	19	55
– Divestment of products and businesses	0	0	0	0
– Other reorganisation expenses	25	1	24	50
Total global restructuring costs	163	29	319	511
Additional costs				
– Impairment of goodwill	0	0	0	0
– Impairment of intangible assets	0	0	0	0
– Legal and environmental cases	0	0	0	0
Total costs	163	29	319	511

...

Diagnostics Division. During the six months ended 30 June 2021 strategy plans in the Diagnostics Division incurred costs of CHF 115 million, which were mainly employee-related.

Other global restructuring plans. During the six months ended 30 June 2021 employee-related costs mainly come from initiatives in the Pharmaceuticals Division and the outsourcing of IT and other functions to shared service centres and external providers.

...

In the Practical example below, Saudi Arabian Oil Company describes the impact of its significant divestment during the interim period.

Practical example 4-22: Saudi Arabian Oil Company (Second quarter and half year 2021)

Saudi Arabia

Second quarter interim report [extract]

Notes to the condensed consolidated interim financial report [extract]

17. Sale of equity interest in subsidiary - Aramco Oil Pipelines Company ("AOPC")

On June 17, 2021, the Company sold a 49% equity interest in AOPC, a newly formed wholly-owned subsidiary of the Company, to EIG Pearl Holdings S.à r.l. ("EIG") for upfront sale proceeds of SAR 46,547 (\$12,412) in cash.

EIG is an entity owned by a consortium of investors led by EIG Global Energy Partners. EIG, as a shareholder of AOPC, is entitled to receive quarterly distributions of its pro rata share of AOPC's available cash when the Company pays discretionary dividends to its ordinary shareholders. EIG's shareholding represents a non-controlling interest and, therefore, the upfront sale proceeds have been recognized in this condensed consolidated interim financial report as a non-controlling interest within equity.

Immediately prior to the closing of the transaction, the Company leased the usage rights to its stabilized crude oil pipelines network to AOPC for a 25-year period. Concurrently, AOPC granted the Company the exclusive right to use, operate and maintain the pipelines network during the 25-year period in exchange for a quarterly, volume-based tariff payable by the Company to AOPC. The tariff is backed by minimum volume commitments. The Company will at all times retain title to, and operational control of, the pipelines.

4.4 Segment information

If an entity is required to disclose segment information in its annual financial statements, certain segment disclosures are required in its interim financial report. IFRS 8 is discussed in more detail in Chapter 32.

An entity applying IFRS 8 in its annual financial statements must include the following information in its interim financial report about its reportable segments:

- (a) Segment revenues from external customers (if included in the measure of segment profit or loss reviewed by or otherwise regularly provided to the chief operating decision maker).
- (b) Intersegment revenues (if included in the measure of segment profit or loss reviewed by or otherwise regularly provided to the chief operating decision maker).
- (c) A measure of segment profit or loss.
- (d) A measure of total assets and liabilities for a particular reportable segment if such amounts are regularly provided to the chief operating decision maker and if there has been a material change from the amount disclosed in the last annual financial statements for that reportable segment.
- (e) A description of differences in the basis of segmentation or in the basis of measurement of segment profit or loss from the last annual financial statements.
- (f) A reconciliation of the total profit or loss for reportable segments to the entity's profit or loss before income taxes and discontinued operations. However, if an entity allocates such items as income taxes to arrive at segment profit or loss, the reconciliation can be to the entity's profit or loss after those items. The entity must separately identify and describe all material reconciling items. [IAS 34.16A(g)].

In Practical example 4-23 below, Polski Koncern Naftowy ORLEN S.A. Capital Group discloses revenues, costs, financial results and increases in non-current assets in its interim financial report for the first quarter 2023. In addition, the comparative information for the three months ended 31 March 2022 is also disclosed but is not reproduced here.

Practical example 4-23: Polski Koncern Naftowy ORLEN S.A. Capital Group Poland
(First quarter 2023)
CONSOLIDATED QUARTERLY REPORT [extract]
INTERIM CONDENSED CONSOLIDATED FINANCIAL STATEMENTS [extract]
EXPLANATORY NOTES TO THE INTERIM CONDENSED CONSOLIDATED FINANCIAL STATEMENTS [extract]
4. Segment's data

As at 31 March 2023 the operations of the ORLEN Group were conducted in:

- the Refining segment, which includes refinery products processing and wholesale, oil production and sale as well as supporting production,
- the Petrochemical segment, which includes the production and wholesale of petrochemicals, production and sale of chemicals and supporting production,
- the Energy segment, which includes production, distribution and sale of electricity and heat and trading in electricity,
- the Retail segment, which includes mainly activity carried out at petrol stations and activity of RUCH Group,
- the Upstream segment, which includes activity related to exploration and extraction of mineral resources conducted through the ORLEN Upstream Group, LOTOS Upstream Group, LOTOS Petrobaltic Group, PGNiG Upstream Norway,
- the Gas segment, which is a new operating segment separated as a result of the merger in 4th quarter of 2022 with the PGNiG Group and includes the sale of imported natural gas, extracted from deposits and purchased on gas exchanges, distribution of natural gas through the distribution network to individual, industrial and wholesale customers as well as operation, repairs and expansion of the distribution network;
- and Corporate Functions, which include activities related to management, administration and remaining activities not allocated to separate operating segments i.e. reconciling items.

The allocation of the ORLEN Group's companies to operating segments and Corporate Functions was presented in note [3.3](#).

Revenues, costs, financial results, increases in non-current assets

Segment assets	319 618	266 730
Corporate Functions	39 102	36 253
Adjustments	(79 716)	(30 656)
	279 004	272 327

Operating segments include all assets except for financial assets, tax assets and cash, which are presented as part of the Corporate Functions. Assets used jointly by the operating segments are allocated based on revenues generated by individual operating segments.

4.5 Fair value disclosures for financial instruments

IAS 34 requires that an entity must include the following in its interim financial report in relation to financial instruments: [IAS 34.16A(j)]

- (a) Disclosures to help users of the financial statements assess the valuation techniques and inputs used to develop the fair value measurements used for financial instruments in the statement of financial position and, for financial instruments measured using unobservable inputs, the effect of those measurements on profit or loss or other comprehensive income in the period, [IFRS 13.91], (see Chapter 15).
- (b) Certain disclosures for fair value measurements that are included in the statement of financial position after initial recognition, including the carrying amount, categorisation within the fair value hierarchy and additional disclosures for those not classified as level 1 (see Chapter 15). [IFRS 13.93].
- (c) Accounting policy disclosures relating to how the entity has determined appropriate classes of financial assets and liabilities for which information about fair value measurement is given; how it determined when transfers between levels of the fair value hierarchy have occurred; and how the entity has measured any groups of financial assets and liabilities managed on the basis of its net exposure (see Chapter 15). [IFRS 13.94, IFRS 13.95, IFRS 13.96].
- (d) Disclosures regarding liabilities measured at fair value and issued with inseparable third-party credit enhancements (see Chapter 15). [IFRS 13.98].
- (e) Disclosures about fair value required by IFRS 7, including for each class of financial asset and financial liability, a comparison between fair value and carrying amount, unless the carrying amount is a reasonable approximation of the fair value. [IFRS 7.25, IFRS 7.26, IFRS 7.29(a)].
- (f) The specific disclosures required by IFRS 7 where an entity did not recognise a day one gain/loss on initial recognition of a financial asset or financial liability because the fair value was different from the transaction price and that fair value was neither evidenced by a quoted price in an active market for an identical asset or liability nor based on a valuation technique that uses only data from observable markets. [IFRS 7.28]. Refer to Chapter 50.

Quantitative disclosures would normally be given in a tabular format unless another format is more appropriate. [IFRS 13.99]. The entity must assess whether the disclosures are sufficient to meet the disclosure objectives of IFRS 13 as set out in IFRS 13.91. This requires judgements to be made about the level of detail; how much emphasis to place on each of the various requirements; and level of aggregation or disaggregation. If necessary, additional information must be given in order to meet those objectives (see Chapter 15). [IFRS 13.92].

The general requirement in IAS 34 is to provide information related to significant events and transactions or updates to information reported in the last annual financial statements. [IAS 34.15]. However, the wording of IAS 34 indicates that the information related to financial instruments as described in IAS 34.16A(j) must be disclosed in the interim financial report even if there are no changes from that disclosed in the last annual financial statements. This is because the standard includes this disclosure requirement among the items required by the standard to be given “in addition to disclosing significant events and transactions...”, [IAS 34.16A], and therefore distinguishes this from the items listed in section 4.1 above, which are disclosed to update information presented in the most recent annual financial report. [IAS 34.15]. Therefore, as discussed in section 4.2 above, disclosure of the above information is required for each interim reporting period, subject only to a materiality assessment in relation to that interim report. [IAS 34.25]. The extent to which these disclosures are provided in the interim financial report is a matter of judgement and in making that judgement, care would need to be taken to ensure any omitted information would not make the interim financial report incomplete and therefore misleading.

An entity may also consider meeting the disclosure requirement through cross-reference to the information disclosed in other parts of the interim report as discussed in section 4.2.3 above.

The Practical example below from the first quarter financial report of Samsung Electronics Co., Ltd. illustrates disclosures related to the fair value hierarchy and valuation techniques used. The entity has applied a tabular format to disclose quantitative information, including valuation techniques and inputs, which is generally encouraged in IFRS 13.

Practical example 4-24: Samsung Electronics Co., Ltd. (Quarter ended March 31, 2022)
South Korea
2022 Interim Business Report: For the quarter ended March 31, 2022 [extract]
III. Financial Affairs [extract]
3. Notes to consolidated financial statements [extract]
25. Financial Risk Management [extract]
(E) Fair value estimation [extract]

- (2) Fair value hierarchy classifications of the financial instruments that are measured or disclosed at fair value as of March 31, 2022 and December 31, 2021 are as follows:

	March 31, 2022			
(In millions of Korean won)	Level 1	Level 2	Level 3	Total balance
1) Assets				
Short-term financial assets at fair value through profit or loss	-	31,642	21,414	53,056
Financial assets at fair value through other comprehensive income	10,783,382	-	2,418,176	13,201,558
Financial assets at fair value through profit or loss	374,950	-	1,121,172	1,496,122
Other	-	606,248	22,305	628,553
2) Liabilities				
Current Debentures	-	6,417	-	6,417
Debentures	-	533,885	-	533,885
Other	-	398,723	5,438	404,161

	December 31, 2021			
(In millions of Korean won)	Level 1	Level 2	Level 3	Total balance
1) Assets				
Short-term financial assets at fair value through profit or loss	-	35,620	5,137	40,757
Financial assets at fair value through other comprehensive income	11,608,708	-	2,357,131	13,965,839
Financial assets at fair value through profit or loss	478,401	-	1,046,943	1,525,344
Other	-	307,213	21,003	328,216
2) Liabilities				
Current Debentures	-	554,106	-	554,106
Debentures	-	546,339	-	546,339
Other	-	331,956	5,438	337,394

The levels of the fair value hierarchy and its application to financial assets and liabilities are described below.

- Level 1: Quoted prices (unadjusted) in active markets for identical assets or liabilities
- Level 2: Inputs other than quoted prices included within Level 1 that are observable for the asset or liability, either directly or indirectly
- Level 3: Inputs for the asset or liability that are not based on observable market data (that is, unobservable inputs)

The fair value of financial instruments traded in active markets is based on quoted market prices at the statements of financial position date. A market is regarded as active if quoted prices are readily and regularly available from an exchange, dealer, broker, industry group, pricing service, or regulatory agency, and those prices represent actual and regularly occurring market transactions on an arm's length basis. The quoted market price used for financial assets held by the Company is the current bid price. These instruments are included in Level 1. The instruments included in Level 1 are listed equity investments, most of which are classified as financial assets at fair value through other comprehensive income.

The fair value of financial instruments that are not traded in an active market (for example, over-the-counter derivatives) is determined by using valuation techniques. These valuation techniques maximize the use of observable market data where it is available and rely as little as possible on entity-specific estimates. If all significant inputs required to fair value an instrument are observable, the instrument is included in Level 2.

If one or more of the significant inputs are not based on observable market data, the instrument is included in Level 3.

The Company performs the fair value measurements required for financial reporting purposes, including Level 3 fair values and discusses valuation processes and results at least once every quarter in line with the Company's quarterly reporting dates. The Company's policy is to recognize transfers between levels at the end of the reporting period, if corresponding events or changes in circumstances have occurred.

Specific valuation techniques used to value financial instruments include:

- Quoted market prices or dealer quotes for similar instruments
- The fair value of forward foreign exchange contracts is determined using forward exchange rates at the statements of financial position date, with the resulting value discounted back to present value

Other techniques, such as discounted cash flow analysis, are used to determine fair value for the remaining financial instruments. For trade and other receivables that are classified as current assets, the book value approximates a reasonable estimate of fair value.

(3) Valuation technique and the inputs

The Company utilizes a present value technique to discount future cash flows using a proper interest rate for corporate bonds, government and public bonds, and bank debentures that are classified as Level 2 in the fair value hierarchy.

The following table presents the valuation technique and the inputs used for major financial instruments classified as Level 3 as of March 31, 2022.

(In millions of Korean won and percentage)

Classification	Fair value	Valuation technique	Level 3 inputs	Input range (Weighted average)
Financial assets at fair value through other comprehensive income				
Samsung Venture Investment	27,331	Discounted cash flow	Permanent growth rate	-1.0%~1.0%(0.0%)
			Weighted average cost of capital	19.3%~21.3%(20.3%)
MiCo Ceramics Co., Ltd.	25,666	Discounted cash flow	Permanent growth rate	-1.0%~1.0%(0.0%)
			Weighted average cost of capital	13.2%~15.2%(14.2%)
TCL China Star Optoelectronics Technology Co., Ltd. (CSOT)	1,349,356	Discounted cash flow	Permanent growth rate	-1.0%~1.0%(0.0%)
			Weighted average cost of capital	11.1%~13.1%(12.1%)
China Star Optoelectronics Semiconductor Display Technology Ltd. (CSOSDT)	402,939	Discounted cash flow	Permanent growth rate	-1.0%~1.0%(0.0%)
			Weighted average cost of capital	11.1%~13.1%(12.1%)
Others				
Put option on equity instruments	22,305	Binomial model	Risk-free discount rate	2.4%~2.5%, 2.5%
			Price volatility	19.2%~29.2%(24.2%) 24.3%~34.3%(29.3%)

4.6 Disclosure of compliance with IFRS accounting standards

If an interim financial report complies with the requirements of IAS 34, this fact must be disclosed. Furthermore, an interim financial report cannot be described as complying with IFRS accounting standards unless it complies with all the requirements of IFRS accounting standards, [IAS 34.19], a requirement similar to that found in IAS 1. [IAS 1.16]. Therefore, an entity would only provide a statement of compliance with IFRS accounting standards (as opposed to IAS 34 alone) in its interim report if it prepared a complete set of interim financial statements.

The Practical example below illustrates basis of preparation of an entity that asserts compliance with IAS 34 in its interim financial report rather than with IFRS accounting standards.

Practical example 4-25: BMW Group (Half-year 2022)**Germany****HALF-YEAR REPORT: 30 June 2022 [extract]****INTERIM GROUP FINANCIAL STATEMENTS [extract]****NOTES TO THE GROUP FINANCIAL STATEMENTS [extract]****ACCOUNTING PRINCIPLES AND POLICIES [extract]****01 Basis of preparation [extract]**

The consolidated financial statements of Bayerische Motoren Werke Aktiengesellschaft (BMW Group Financial Statements or Group Financial Statements) at 31 December 2021 were drawn up in accordance with International Financial Reporting Standards (IFRS), as endorsed by the European Union (EU), and the supplementary requirements of § 315e (1) of the German Commercial Code (HGB). The Interim Group Financial Statements (Interim Report) at 30 June 2022, which have been prepared in accordance with International Accounting Standard (IAS) 34 (Interim Financial Reporting), have been drawn up using, in all material respects, the same accounting methods as those utilised in the 2021 Group Financial Statements. The BMW Group applies the option of publishing condensed group financial statements. All Interpretations issued by the IFRS Interpretations Committee which are mandatory at 30 June 2022 have been applied. The Interim Report also complies with German Accounting Standard No. 16 (GAS 16) – Interim Financial Reporting – issued by the German Accounting Standards Committee e. V. (GASC).

...

When entities either choose or are required by local regulations to meet other requirements in addition to IAS 34, the statement of compliance can be more complicated. In Practical example 4-25 above, BMW Group simply adds a statement confirming its compliance with the specific German Accounting Standard on interim reporting and the supplementary requirements of the German Commercial Code. Additional complexity can arise when the entity seeks to meet the requirements of its (IFRS-based accounting standards) local GAAP as well as IFRS accounting standards as issued by the IASB.

Practical example 4-26 below shows how the dual listed BHP Group Plc disclosed compliance with the requirements of IFRS accounting standards, Australian Accounting Standards and the requirements of the Financial Conduct Authority in the United Kingdom in respect of their interim financial report.

Practical example 4-26: BHP Group Plc (Half year ended 31 December 2021)**Australia****BHP RESULTS FOR THE HALF YEAR ENDED 31 DECEMBER 2021 [extract]****BHP Financial Report: Half year ended 31 December 2021****Notes to the Financial Statements [extract]****1. Basis of preparation**

This general purpose Financial Report for the half year ended 31 December 2021 is unaudited and has been prepared in accordance with IAS 34 'Interim Financial Reporting' as issued by the International Accounting Standards Board (IASB) and AASB 134 'Interim Financial Reporting' as issued by the Australian Accounting Standards Board (AASB) and the Disclosure and Transparency Rules of the Financial Conduct Authority in the United Kingdom and the Australian Corporations Act 2001 as applicable to interim financial reporting.

...

The Practical example above also highlights a potential compliance issue for adopters of IFRS-based accounting standards, such as entities in Australia, the United Kingdom and the European Union. Because of the time taken to secure local endorsement of standards issued by the IASB, an entity may not be able to state at a particular reporting date that the financial statements comply with both IFRS accounting standards as issued by the IASB and IFRS accounting standards as endorsed locally.

For example, when the IASB issues a new accounting standard or an amendment that is effective for the annual period which includes the current interim reporting period, entities may not be able to, or cannot risk to, comply with IAS 34 (as issued by the IASB) in their interim financial statements, either because there is a requirement to apply locally endorsed standards in the interim financial statements or to avoid the risk of applying a new standard or an amendment in their full year financial statements that is not yet locally endorsed. The alternative would be for an entity to publish interim financial information prepared under locally endorsed standards, for example, IFRS accounting standards as endorsed by the European Union. In such cases, the basis of preparation must state that IAS 34 is being applied in this context.

4.7 Disclosure in relation to the going concern assumption

Although IAS 34 does not specifically address the issue of going concern, the general requirements of IAS 1 apply to both a complete set and to condensed interim financial statements. [IAS 1.4]. IAS 1 states that when preparing financial statements, management assesses an entity's ability to continue as a going concern, and that the financial statements are prepared on a going concern basis unless management either intends to liquidate the entity or cease trading or has no realistic alternative but to do so. [IAS 1.25]. The going concern assessment is discussed in more detail in Chapter 3.

Under IAS 1, the assessment is made based on all available information about the future, which at a minimum is twelve months from the end of the reporting period. [IAS 1.26]. Therefore, with respect to interim reporting under IAS 34, the minimum period for management's assessment is also at least twelve months from the interim reporting date; it is not limited, for example, to one year from the date of the most recent annual financial statements. In fact, local stock market requirements and other regulations might set a longer minimum period over which management are required to assess entity's ability to continue as a going concern, for example, to consider a minimum period of twelve months after the date of approval of the interim financial statements.

Illustration 4-2: Going concern assessment under IAS 1

An entity's financial year-end is 31 December (calendar year) and its annual financial statements as of 31 December 20X1 are prepared on a going concern basis. In assessing the going concern assumption as at 31 December 20X1, management considered all future available information through to 31 December 20X2.

In preparing its quarterly interim financial statements (condensed or complete) as at 31 March 20X2, management must evaluate all future available information to at least 31 March 20X3.

If management becomes aware, in making its assessment, of material uncertainties related to events or conditions that may cast significant doubt upon the entity's ability to continue as a going concern, the entity must disclose those uncertainties in its interim financial statements. If the entity does not prepare financial statements on a going concern basis, it must disclose that fact, together with the basis on which it prepared the financial statements and the reason why the entity is not regarded as a going concern. [IAS 1.25]. The requirements in paragraph 25 of IAS 1 also applies to interim financial statements. [IAS 1.4].

In its 2022 interim report, Vesuvius plc considers a period of at least twelve months after the date of approval of the interim financial statements, in accordance with local regulatory requirements.

Practical example 4-27: Vesuvius plc (Half-year 2022)

United Kingdom

Half Year Results for the six months ended 30 June 2022 [extract]

Notes to the Condensed Group Financial Statements [extract]

Basis of preparation [extract]

1.3 Going concern

The Directors have prepared cash flow scenarios for the Group for a period at least 12 months from the date of approval of the 2022 Interim Condensed Financial Statements. These forecasts reflect an assessment of current and future end market conditions, including the impact of covid-related lockdowns in China and war in Ukraine, and their impact on the Group's future trading performance. The analysis undertaken includes a severe but plausible downside scenario which assumes a decline in business activity and profitability in H2 2022 to the level achieved in H2 2020. Relative to H1 2022, this implies a c.30% decline in sales and a c.60% decline in Trading Profit, with no improvement from this level assumed in 2023. Even in this downside scenario, the forecasts show that the Group's maximum net debt / EBITDA (pre-IFRS 16 in-line with the covenant calculation) does not exceed 1.0x, compared to a leverage covenant of 3.25x.

On the basis of the exercise described above and the Group's available committed liquidity which stands at £416m at 30 June 2022, the Directors consider that the Group and the Company have adequate resources to continue in operational existence for a period of at least 12 months from the date of signing of these Interim Condensed Financial Statements. Accordingly, they continue to adopt a going concern basis in preparing the Condensed Financial statements of the Group and the Company.

5 Periods for which interim financial statements are required to be presented

Irrespective of whether an entity presents condensed or complete interim financial statements, the components of its interim reports must include information required by IAS 34.20. [IAS 34.20].

Extract from IAS 34

- 20** Interim reports shall include interim financial statements (condensed or complete) for periods as follows:
- (a) statement of financial position as of the end of the current interim period and a comparative statement of financial position as of the end of the immediately preceding financial year.
 - (b) statements of profit or loss and other comprehensive income for the current interim period and cumulatively for the current financial year to date, with comparative statements of profit or loss and other comprehensive income for the comparable interim periods (current and year-to-date) of the immediately preceding financial year. As permitted by IAS 1 (as amended in 2011), an interim report may present for each period a statement or statements of profit or loss and other comprehensive income.
 - (c) statement of changes in equity cumulatively for the current financial year to date, with a comparative statement for the comparable year-to-date period of the immediately preceding financial year.
 - (d) statement of cash flows cumulatively for the current financial year to date, with a comparative statement for the comparable year-to-date period of the immediately preceding financial year.

An interim report may present for each period either a single statement of 'profit or loss and other comprehensive income', or separate statements of 'profit or loss' and 'comprehensive income'. [IAS 1.10A, IAS 34.20(b)]. The condensed statement of comprehensive income referred to at (b) above must be presented in a manner consistent with the entity's annual financial statements. Accordingly, if the entity presents a separate statement for items of profit or loss in its annual financial statements, it must present a separate condensed statement of profit or loss in the interim financial report. [IAS 34.8A].

If an entity's business is highly seasonal, then the standard encourages reporting additional financial information for the twelve months up to the end of the interim period, and comparative information for the prior twelve-month period, in addition to the financial statements for the periods set out above. [IAS 34.21].

The standard does not require an entity to present a statement of financial position as at the end of the comparable interim period. However, in practice many entities reporting under IFRS accounting standards disclose this information, either on a voluntary basis, or due to local regulations. Similarly, many entities also present the income statement for the immediately preceding full year. Such presentation is allowed under IAS 34. See section 5.1.4 below regarding the requirement to present a third statement of financial position.

The examples below illustrate the periods that an entity is required to disclose under IAS 34. [IAS 34.22, IAS 34.IE A].

Illustration 5-1: Entity publishes interim financial reports half-yearly

If an entity's financial year ends on 31 December (calendar year), it must present the following financial statements (condensed or complete) in its half-yearly interim financial report as of 30 June 20X3:

Half-yearly interim report	End of the current interim period	End of the comparative interim period	Immediately preceding year-end
	30/6/20X3	30/6/20X2	31/12/20X2
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
▪ Current period and year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of changes in equity			
▪ Year-to date (6 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of cash flows			
▪ Year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
● Required			
○ Disclosure encouraged if the entity's business is highly seasonal			

If an entity publishes a separate interim financial report for the final interim period (i.e., second half of its financial year), it presents the following financial statements (condensed or complete) in its second half-yearly interim financial report as of 31 December 20X3:

Second half-yearly interim report	End of the current interim period	End of the comparative interim period
	31/12/20X3	31/12/20X2
Statement of financial position	●	●
Statement(s) of profit or loss and other comprehensive income		
▪ Current period (6 months) ending	●	●
▪ Year-to-date (12 months) ending	●	●
Statement of changes in equity		
▪ Year-to-date (12 months) ending	●	●
Statement of cash flows		
▪ Year-to-date (12 months) ending	●	●
● Required		

Illustration 5-2: Entity publishes interim financial reports quarterly

If an entity's financial year ends on 31 December (calendar year), it must present the following financial statements (condensed or complete) in its quarterly interim financial report for the first quarter of 20X3:

First quarter interim report	End of the current interim period	End of the comparative interim period	Immediately preceding year-end
	31/3/20X3	31/3/20X2	31/12/20X2
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
▪ Current period and year-to-date (3 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of changes in equity			
▪ Year-to-date (3 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of cash flows			
▪ Year-to-date (3 months) ending	●	●	
▪ 12 months ending	○	○	
● Required			
○ Disclosure encouraged if the entity's business is highly seasonal			

Second quarter interim report	End of the current interim period	End of the comparative interim period	Immediately preceding year-end
	30/6/20X3	30/6/20X2	31/12/20X2
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
▪ Current period (3 months) ending	●	●	
▪ Year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of changes in equity			
▪ Year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of cash flows			
▪ Year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
● Required			
○ Disclosure encouraged if the entity's business is highly seasonal			

Third quarter interim report	End of the current interim period	End of the comparative interim period	Immediately preceding year-end
	30/9/20X3	30/9/20X2	31/12/20X2
Statement of financial position	•		•
Statement(s) of profit or loss and other comprehensive income			
▪ Current period (3 months) ending	•	•	
▪ Year-to-date (9 months) ending	•	•	
▪ 12 months ending	○	○	
Statement of changes in equity			
▪ Year-to-date (9 months) ending	•	•	
▪ 12 months ending	○	○	
Statement of cash flows			
▪ Year-to-date (9 months) ending	•	•	
▪ 12 months ending	○	○	
• Required			
○ Disclosure encouraged if the entity's business is highly seasonal			

If an entity publishes a separate interim financial report for the final interim period (i.e., fourth quarter of its financial year), it presents the following financial statements (condensed or complete) in its fourth quarter interim financial report as of 31 December 20X3:

Fourth quarter interim report	End of the current interim period	End of the comparative interim period
	31/12/20X3	31/12/20X2
Statement of financial position	•	•
Statement(s) of profit or loss and other comprehensive income		
▪ Current period (3 months) ending	•	•
▪ Year-to-date (12 months) ending	•	•
Statement of changes in equity		
▪ Year-to-date (12 months) ending	•	•
Statement of cash flows		
▪ Year-to-date (12 months) ending	•	•
• Required		

5.1 Other comparative information

The extent to which comparative information is required in the notes to the interim financial statements will depend on whether the entity has satisfied the requirements of IAS 34 by the preparation of a set of condensed financial statements or by the preparation of a complete set of financial statements.

5.1.1 Complete set of financial statements

Paragraph 4 of IAS 1 clarifies that IAS 1 is not applicable to condensed interim financial statements prepared under IAS 34 except for IAS 1.15 to 35. However, for entities presenting a complete set of financial statements the requirements of IAS 1.38 will apply, although these requirements need to be considered in the context of the requirements in IAS 34.20 (discussed in section 5 above). [IAS 1.38]. Further, IAS 34.9 clarifies that the form and content of complete set of financial statements published as interim financial report must conform with the requirements of IAS 1 for a complete set of financial statements. Accordingly, the requirement to present comparative information in the notes to a set of complete financial statements also applies to a set of complete financial statements prepared to comply with IAS 34.

Extract from IAS 1

38 Except when IFRSs permit or require otherwise, an entity shall present comparative information in respect of the preceding period for all amounts reported in the current period's financial statements. An entity shall include comparative information for narrative and descriptive information if it is relevant to understanding the current period's financial statements.

5.1.2 Disclosure of movement in non-current assets and liabilities

Illustration 5-3: Disclosing movements on non-current assets in a complete set of interim financial statements

An entity preparing complete IFRS accounting financial statements is required to reconcile the carrying amount at the beginning and end of the period showing movements during that period for both intangible assets and property, plant and equipment. [IAS 38.118, IAS 16.73]. Therefore, an entity presenting complete IFRS accounting financial statements for the six months ended 30 June 20X2 would disclose the movements in intangible assets and in property, plant and equipment between 1 January 20X2 and 30 June 20X2.

How we see it

In our view, when interim financial statements are prepared as a complete set of financial statements in accordance with IAS 1, the comparative information on movements in assets and liabilities is for the corresponding interim period. Therefore, in a set of half-year financial statements, the comparative information will be for the first six months of the previous year. Accordingly, IAS 1 requires the entity, in the fact pattern above, to reconcile movements during the comparative interim period, between 1 January 20X1 and 30 June 20X1, even though the entity is not required to present a statement of financial position as at 30 June 20X1 (as shown in Illustration 5-1 in section 5 above).

IAS 1 is written in the context of annual financial statements and the comparative information is generally expected to be for a 12-month period. However, for the purpose of interim financial reports, IAS 1.38 (that includes the requirement for minimum comparative information, see Chapter 3) is read in conjunction with IAS 34.20 (that includes the requirement about the periods for which interim financial statements are presented, see section 5 above). Then it is clear that in the context of interim financial reports 'the previous period' is not the annual period, but the previous interim period, as the purpose of the information is to facilitate an understanding of performance in the current period.

The components of the financial statements that reflect performance for the period (e.g., the statements of comprehensive income, cash flow and changes in equity) are required to include comparative statements for the comparable interim period of the immediately preceding financial year. Therefore, to be consistent, all notes indicating activity for the interim period (i.e., the movement in assets and liabilities for the period) include information for the comparable interim period of the immediately preceding financial year.

Because the comparative statement of financial position required by IAS 34 reflects the end of the preceding financial year, the closing balance in the movement schedule for the comparative period will not reconcile to the comparative statement of financial position. Therefore, in addition to presenting comparative information for the corresponding interim period, it is suggested that entities preparing a complete set of interim financial statements also include information for the previous full year in the case of the statement of financial position, such as the required comparative information for the current interim period and reconciliations to the previous year-end statement of financial position. In Illustration 5-3 above, this requirement could be achieved by reconciling movements in non-current assets during the second six months of the previous year (between 1 July 20X1 and 31 December 20X1) or alternatively could present comparative reconciliations from 1 January 20X1 to 30 June 20X1 and from 1 January 20X1 to 31 December 20X1.

For explanatory notes that analyse and explain the balances in the statement of financial position as at the period end (such as information on the carrying amount of inventories as required by IAS 2 *Inventories*), entities must consider including such notes supporting the statement of financial position as at the end of the preceding financial year.

5.1.3 Condensed financial statements

For entities presenting condensed financial statements under IAS 34, there is no explicit requirement that comparative information be presented in the explanatory notes. Where an explanatory note is required by the standard (such as for inventory write-downs, impairment provisions, segment revenues etc.) or otherwise determined to be needed to provide useful information about changes in the financial position and performance of the entity since the end of the last annual reporting period, [IAS 34.15], entities must consider whether to provide explanatory notes for each period presented. However, in certain cases it would be unnecessary to provide comparative information where this repeats information that was reported in the notes to the most recent annual financial statements. [IAS 34.15A]. For example, it would only be necessary to provide information about business combinations in a comparative period when there is a revision of previously disclosed fair values. Further, entities preparing condensed financial statements under IAS 34 must also consider the discussion in section 5.1.2 above regarding the disclosure of movements in non-current assets and liabilities.

5.1.4 Third statement of financial position

If an entity presents complete financial statements and restates comparative information (e.g., following a change in accounting policy, correction of an error, or reclassification) and this restatement is material, then the entity must present a third statement of financial position at the beginning of the earliest comparative period in its interim financial reporting accordance with IAS 1. [IAS 1.10(f)]. The requirement to present a third statement of financial position is in addition to a comparative statement of financial position as of the end of the immediately preceding financial year. [IAS 34.20(a)]. No such requirement to present a third statement of financial position applies in the case of an entity preparing a condensed set of interim financial statements, [IAS 1.BC33], however, additional disclosures are required in the case of correction of prior period errors, [IAS 34.15B(g)], or when accounting policies are changed, [IAS 34.16A(a)], (see section 4.3.11 above).

5.2 Length of interim reporting period

IAS 34 does not limit interim reporting to quarterly or half-yearly periods; an interim period may be any period shorter than a full financial year. [IAS 34.4]. Nevertheless, interim reporting for a period other than quarterly or half-yearly is not a common practice.

5.3 Change in financial year-end

The requirement in IAS 34 to present a comparative statement of profit or loss and other comprehensive income “for the comparable interim periods (current and year-to-date) of the immediately preceding financial year...”, [IAS 34.20], can give rise to diversity in practice in the case of an entity that changes its annual financial reporting date. For example, an entity changing its reporting date from 31 December to 31 March would change its half-yearly reporting date from 30 June to 30 September and therefore, present its first half-yearly report after its new annual reporting date for the six-month period from 1 April to 30 September. A ‘comparable’ comparative interim period in this scenario could be taken to mean the six months ended 30 September in the prior year, as illustrated in Illustration 5-4 below.

Illustration 5-4: Entity changes financial year-end

An entity changes its financial year-end from 31 December (calendar year) to 31 March, and first reflects the change in its annual financial statements for the period ended 31 March 20X2. It determines that the requirement for comparable comparative information in IAS 34 requires it to present the following financial statements (condensed or complete) in its half-yearly interim financial report for the six months ending 30 September 20X2:

Half-yearly interim report	End of the current interim period	End of the comparative interim period	Immediately preceding year-end
	30/9/20X2	30/9/20X1	31/03/20X2
Statement of financial position	●		●
Statement(s) of profit or loss and other comprehensive income			
▪ Current period and year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of changes in equity			
▪ Year-to date (6 months) ending	●	●	
▪ 12 months ending	○	○	
Statement of cash flows			
▪ Year-to-date (6 months) ending	●	●	
▪ 12 months ending	○	○	
● Required			
○ Disclosure encouraged if the entity's business is highly seasonal			

The entity in the Illustration above did not show information for the half-year ended 30 June 20X1 as the comparative period, notwithstanding the fact that this period would have been the reporting date for the last published half-yearly report.

Other interpretations of IAS 34 in this regard are also possible. As illustrated in the Practical example below, Sirius Minerals Plc changed its annual financial reporting period-end from March to December, which resulted in the company reporting on a shorter (nine-month) annual financial period ended 31 December 2015. For its next set of condensed interim financial statements (for the six months ended 30 June 2016), Sirius Minerals Plc presented comparative information for the first six months of the previous annual financial period, being the six months ended 30 September 2015. The company has also included information for the previous annual reporting period (in this case the shortened nine-month period ended 31 December 2015), in common with many United Kingdom reporters who present comparative information for the previous annual reporting period in addition to the information required by IAS 34.

Practical example 5-1: Sirius Minerals Plc (Half-year 2016)**United Kingdom****CONDENSED INTERIM UNAUDITED CONSOLIDATED FINANCIAL STATEMENTS [extract]****For the six-month period ended 30 June 2016 [extract]****NOTES TO THE FINANCIAL STATEMENTS [extract]****1. ACCOUNTING POLICIES [extract]****BASIS OF PREPARATION**

The condensed interim unaudited consolidated financial statements for the six-month period ended 30 June 2016 have been prepared in accordance with the Disclosure and Transparency Rules of the Financial Conduct Authority and with IAS 34 'Interim Financial Reporting' as adopted by the European Union ("EU"). As a result of changing the accounting reference date, from 31 March to 31 December, these financial statements should be read in conjunction with the condensed financial statements for the six-month period ended 30 September 2015 which have been prepared in accordance with IFRSs as adopted by the EU. Comparability with the current period is maintained due to the low seasonality of the Group's operations.

The accounting policies applied are consistent with those of the Group financial statements for the nine-month period ended 31 December 2015, which have also been voluntarily included in these financial statements for reference.

How we see it

Given the lack of clarity in IAS 34 as to the meaning of ‘comparable’ in the case where the current financial year runs for a period that is different to ‘the immediately preceding financial year’, in our view, there are arguments to support each of the interpretations shown in Illustration 5-4 and Practical example 5-1 above.

In the Practical example above, Sirius Minerals Plc noted that it had considered seasonality of its operations in determining whether the information presented for a prior interim period is comparable. As noted in section 5 above and illustrated in Illustration 5-2 in that section, in cases where the entity’s business is highly seasonal, IAS 34 encourages the reporting of additional financial information for the twelve months up to the end of the interim period, and comparative information for the prior twelve-month period, in addition to the financial statements for the periods set out above. [IAS 34.21].

5.4 Comparatives following a financial period longer than a year

The discussion in section 5.3 above demonstrates that when an entity changes its annual reporting date, the determination of comparative periods in the interim financial statements could be interpreted differently without definitive guidance in IAS 34.

Another situation where confusion may be caused by the requirement to present comparative information for “the comparable interim periods (current and year-to-date) of the immediately preceding financial year...”, [IAS 34.20], arises when the previous annual financial statements related to a period other than twelve months. This situation is not uncommon for a newly incorporated entity, which might have either a shorter or a longer reporting period in its first financial year.

Consider an entity that has a long initial accounting period of eighteen months and that is required to prepare interim financial reports on a quarterly basis. Accordingly, it would have six ‘quarters’ in its first financial reporting period and in line with the requirements of IAS 34, the entity would present statements of profit or loss and other comprehensive income, changes in equity and cash flows for each three-month period and cumulatively for the year-to-date. In the next financial year, however, the previously published year-to-date amounts would no longer be comparable. The following Illustration shows this situation.

Illustration 5-5: Disclosing comparatives in interim financial statements when the preceding financial year covers a longer period

An entity’s financial year-end is 31 December and it issues quarterly interim financial statements. It was incorporated on 1 July 20X0 and prepared its first set of ‘annual’ financial statements for a period of eighteen months to 31 December 20X1. In this period, the entity prepared interim financial statements under IAS 34 for each of the three-month periods ended 30 September 20X0, 31 December 20X0, 31 March 20X1, 30 June 20X1, 30 September 20X1 and 31 December 20X1. Each interim report contained information for the three-month period (statement of profit or loss and other comprehensive income) and the year-to-date (statements of profit or loss and other comprehensive income, cash flows, and changes in equity), which started on 1 July 20X0.

In the next year, a twelve-month annual reporting period, the entity is preparing its interim financial report for the three months ending and year-to-date 30 June 20X2. Accordingly, it presents statements of profit or loss and other comprehensive income for the three-month period from 1 April 20X2 to 30 June 20X2 and presents statements of profit or loss and other comprehensive income, changes in equity and cash flows for the year-to-date (from 1 January 20X2 to 30 June 20X2). Under IAS 34, the entity is also required to present comparative statements of profit or loss and other comprehensive income, cash flows, and changes in equity for the comparable interim periods in the preceding financial year. However, in its interim report for the three months ended 30 June 20X1, i.e., in the prior financial year, the entity had presented information for the three month period from 1 April 20X1 to 30 June 20X1 (statements of profit or loss and other comprehensive income) as well as for the year-to-date period, from 1 July 20X0 to 30 June 20X1 (statements of profit or loss and other comprehensive income, changes in equity and cash flows), which was then a period of twelve months.

The entity determines that the year-to-date comparative statements would cover the same period in the preceding year as the current year, which in this case would be for the three-month period from 1 April 20X1 to 30 June 20X1 and for the six-month period from 1 January 20X1 to 30 June 20X1.

It must be noted in the above Illustration that none of the interim financial statements issued in the entity's first (eighteen month) reporting period would contain comparative information. In particular, no comparatives would be required for the three-month periods ended 30 September 20X1 and 31 December 20X1 because the corresponding periods in the preceding calendar year (i.e., 30 September 20X0 and 31 December 20X0) actually form part of the same (eighteen month) financial period and therefore comparatives from a preceding financial reporting period did not exist.

5.5 When the comparative period is shorter than the current period

The same considerations apply when determining the comparable comparative period in the following circumstances when a newly incorporated entity's first financial year was less than twelve months.

Illustration 5-6: Disclosing comparatives in interim financial statements when the preceding financial year covers a shorter period

An entity was incorporated on 17 December 20X1 and its equity shares were admitted to trading on a recognised stock market in April 20X2. It determined that its annual reporting date will be 30 June each year and issued its first set of annual financial statements for the period ended 30 June 20X2.

In compliance with the rules of the stock market, the entity issues its first half-yearly report for the six months ended 31 December 20X2. This begs the question whether the comparative period for these interim financial statements would be the short period from 17 December 20X1 (i.e., the date of incorporation) to 31 December 20X1 or the first six months following the entity's incorporation, from 17 December 20X1 to 16 June 20X2.

As in Illustration 5-5 in section 5.4 above, the entity could determine that the period-to-date comparative statements would cover the same period in the preceding annual reporting period as the current year, which in this case would be from 17 December 20X1 to 31 December 20X1. The entity must provide sufficient disclosure to explain the particular circumstances and the limited comparability with the current period.

6 Materiality

In making judgements on recognition, measurement, classification, or disclosures in interim financial reports, the overriding goal in IAS 34 is to ensure that an interim financial report includes all information relevant to understanding an entity's financial position and performance during the interim period.

[IAS 34.25]. The standard refers to IAS 1, which defines information as material if omitting, misstating or obscuring it could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements, which provide financial information about a specific reporting entity. [IAS 1.7, IAS 34.24]. However, IAS 34 notes that IAS 1 does not contain quantitative guidance on materiality. [IAS 34.23]. IAS 34 requires materiality to be assessed based on the interim period financial data. [IAS 34.23].

Therefore, decisions on the recognition and disclosure of unusual items, changes in accounting policies or estimates, and errors are based on materiality in relation to the interim period figures to determine whether non-disclosure is misleading. [IAS 34.25].

Neither the previous year's annual financial statements nor any expectations of the financial position at the current year-end are relevant in assessing materiality for interim reporting. However, the standard acknowledges that interim measurements may rely on estimates to a greater extent than measurements of annual financial data. [IAS 34.23].

IFRS Practice Statement 2 is a non-mandatory statement and does not form part of IFRS accounting standards. See Chapter 3 for a discussion on PS 2.

PS 2 includes guidance that specifically relates to materiality judgements for interim reporting. Whilst an entity considers the same materiality factors as in its annual assessment, it would also take into consideration the shorter time period and the different purpose of an interim financial report in the following respects:

- (a) Assessing whether information in the interim financial report is material in relation to the interim period financial data, not annual data. [IAS 34.25].
- (b) Applying the materiality factors on the basis of both the current interim period data and also, whenever there is more than one interim period (e.g., in the case of quarterly reporting), the data for the current financial year to date.
- (c) Considering whether to provide in the interim financial report information that is expected to be material to the annual financial statements. However, information that is expected to be material to the annual financial statements need not be provided in the interim financial report if it is not material to the interim financial report. [PS 2.85].

As regards purpose, the guidance suggests that entities also have regard to the fact that an interim financial report is intended to provide an update on the latest complete set of annual financial statements. Information that is material to the interim period, but was already provided in the latest annual financial statements, does not need to be reproduced in the interim financial report, unless something new occurs or an update is needed. [IAS 34.15, IAS 34.15A, PS 2.87].

When an entity concludes that information about estimation uncertainty is material, it needs to disclose that information. As discussed in section 10 below, measurements included in interim financial reports often rely more on estimates than measurements included in the annual financial statements. [IAS 34.41]. That fact does not, in itself, make the estimated measurements material. Nevertheless, relying on estimates for interim financial data to a greater extent than for annual financial data might result in more disclosures about such uncertainties being material, and thus, being provided in the interim financial report, compared with the annual financial statements. [PS 2.88].

7 Disclosure in annual financial statements

An estimate of an amount reported in an interim period can change significantly during the remainder of the year. An entity that does not present a separate interim financial report for its final interim period must disclose the nature and amount of significant changes in estimates in a note to the annual financial statements for that year. [IAS 34.26]. This disclosure requirement is intended to be narrow in scope, relating only to the change in estimate, and does not create a requirement to include additional interim period financial information in the annual financial statements. [IAS 34.27].

The requirement to disclose significant changes in estimates since the previous interim reporting date is consistent with IAS 8 and IAS 34.16A(d). These standards require disclosure of the nature and the amount of a change in estimate that has a material effect in the current reporting period or is expected to have a material effect in subsequent periods. IAS 34 cites changes in estimates in the final interim period relating to inventory write-downs, restructurings, or impairment losses recognised in an earlier interim period as examples of items that are required to be disclosed. [IAS 34.27].

As noted above, IAS 34.27 clarifies that the requirements in paragraph 26 are narrow in scope and only relate to changes in estimates. This raises the question as to what, if any, disclosures are required in the annual financial statements for that year if an entity identifies an error in amounts reported in the interim financial report before the annual financial statements are issued. IAS 34 does not include specific requirements for disclosure in relation to an error identified in an interim financial report. However, IAS 1.17(c) requires entities to provide additional information to achieve fair presentation and IAS 1.112(c) requires notes to provide additional information if it is relevant to the understanding of the financial statements (see Chapter 3). Therefore, an entity that prepares interim financial reports applying IAS 34 considers the principles in paragraph 26 by analogy and the requirements in IAS 1 to determine whether to disclose the nature and amount of the error in a note to the financial statements for that year.

8 Recognition and measurement

The recognition and measurement requirements in IAS 34 arise mainly from the requirement to report the entity's financial position as at the interim reporting date, but also requires certain estimates and measurements to take into account the expected financial position of the entity at year-end, where those measures are determined on an annual basis (as in the case of income taxes). Some preparers misinterpret this approach as representing some form of hybrid of the discrete and integral methods to interim financial reporting wherein an entity applies the same accounting policies and principles used in the annual financial statements, however, modified to defer or accrue items of income or expenses to indicate the expected outcome for the year as a whole. This can cause confusion in application and can lead to the accusation that IAS 34 seems internally inconsistent.

In requiring the year-to-date to be treated as a discrete period, IAS 34 prohibits the recognition or deferral of revenues and costs for interim reporting purposes unless such recognition or deferral is appropriate at year-end. As with a set of annual financial statements complying with IAS 8, IAS 34 requires changes in estimates and judgements reported in previous interim periods to be revised prospectively, whereas changes in accounting policies and errors are required to be recognised by prior period adjustment. However, IAS 34 sometimes departs from the year-to-date approach to allow looking beyond the interim reporting period, for example in estimating the tax rate to be applied on earnings for the period.

The recognition and measurement requirements of IAS 34 apply regardless of whether an entity presents a complete or condensed set of financial statements for an interim period, [IAS 34.7], and are discussed below.

8.1 Same accounting policies as in annual financial statements

The principles for recognising assets, liabilities, income and expenses for interim periods are the same as in the annual financial statements. [IAS 34.29]. Accordingly, IAS 34 states: [IAS 34.28]

Extract from IAS 34

28 An entity shall apply the same accounting policies in its interim financial statements as are applied in its annual financial statements, except for accounting policy changes made after the date of the most recent annual financial statements that are to be reflected in the next annual financial statements. However, the frequency of an entity's reporting (annual, half-yearly, or quarterly) shall not affect the measurement of its annual results. To achieve that objective, measurements for interim reporting purposes shall be made on a year-to-date basis.

8.1.1 Measurement on a year-to-date basis

Measurement on a year-to-date basis acknowledges that an interim period is a part of a full year and allows adjustments to be made to estimates of amounts reported in prior interim periods of the current year. [IAS 34.29].

This does not override the requirement that the principles for recognition and the definitions of assets, liabilities, income, and expenses for interim periods are the same as in annual financial statements. [IAS 34.29]. Therefore, for assets, the same tests of future economic benefits apply at interim dates as at year-end. Costs that, by their nature, would not qualify as assets at year-end, do not qualify for recognition at interim dates either. Similarly, a liability at the end of an interim reporting period must represent an existing obligation at that date, just as it must at the end of an annual reporting period. [IAS 34.32]. Under IAS 34, as under the IASB's *Conceptual Framework*, an essential characteristic of income and expenses is that the related inflows and outflows of assets and liabilities have already occurred. If those inflows or outflows have occurred, the related income and expense are recognised; otherwise, they are not recognised. [IAS 34.33].

The standard lists several circumstances that illustrate these principles:

- Inventory write-downs, impairments, or provisions for restructurings are recognised and measured on the same basis as at a year-end. Except for reversal of impairment losses recognised on goodwill (see section 9.2 below), later changes in the original estimate are recognised in the subsequent interim period, either by recognising additional accruals or reversals of the previously recognised amount. [IAS 34.30(a)].
- Costs that do not meet the definition of an asset at the end of an interim period are not deferred in the statement of financial position (see section 9.1 below), either to await information on whether such costs meet the definition of an asset, or to smooth earnings over interim periods within a year. [IAS 34.30(b)]. For example, costs incurred in acquiring an intangible asset before the recognition criteria under IAS 38 *Intangible Assets* are met are expensed. Only those costs incurred after the recognition criteria are met can be recognised as an asset; there is no reinstatement as an asset in a later period of costs previously expensed because the recognition criteria were not met at that time. [IAS 38.71].
- Income tax expense is "...recognised in each interim period based on the best estimate of the weighted-average annual income tax rate expected for the full financial year" (see section 9.5 below). "Amounts accrued for income tax expense in one interim period may have to be adjusted in a subsequent interim period of that financial year if the estimate of the annual income tax rate changes." [IAS 34.30(c)].

Another example would be acquisition costs (excluding debt or share issue costs) incurred in relation to a business combination, which are required to be accounted as expenses in the periods in which the costs are incurred and the services are received. [IFRS 3.53]. Such costs would not qualify for deferral at an interim reporting date, even if the business combination to which the costs relate had not been completed until after the interim reporting date.

The year-to-date approach differs from the discrete approach in that the financial position and performance at each reporting date are evaluated not as an isolated period but as part of a cumulative period that builds up to a full year, whose results should not be influenced by interim reporting practices. Amounts reported for previous interim periods are not retrospectively adjusted, and therefore, year-to-date measurements may involve changes in estimates of amounts reported in previous interim periods of the current year. As discussed in sections 4.2 and 7 above, IAS 34 requires disclosure of the nature and amount of material changes in previously reported estimates in the interim financial report and when a separate interim financial report is not presented for the final interim period, in the full year financial statements.

[IAS 34.16A(d), IAS 34.26, IAS 34.34, IAS 34.35, IAS 34.36]. However, the principle that the results of the full year should not be influenced by interim reporting practices, has been challenged, as the IASB and IFRS IC have identified and tried to resolve certain conflicts between IAS 34 and other IFRS accounting standards, as discussed in section 9.2 below.

8.1.2 New accounting pronouncements and other changes in accounting policies

One of the objectives of the year-to-date approach is to ensure that a single accounting policy is applied to a particular class of transactions throughout a year. [IAS 34.44]. To allow accounting policy changes as of an interim date would mean applying different accounting policies to a particular class of transactions within a single year. This would make interim allocation difficult, obscure operating results, and complicate analysis and understandability of the interim period information. [IAS 34.45].

Under IAS 34, an entity uses the same accounting policies in its interim financial statements as in its most recent annual financial statements, adjusted for accounting policy changes that will be in the next annual financial statements, and to determine measurements for interim reporting purposes on a year-to-date basis. [IAS 34.28].

Unless transition rules are specified by a new IFRS accounting standard or interpretation, IAS 34 requires a change in accounting policy to be reflected by:

- (a) Restating the financial statements of prior interim periods of the current year and the comparable interim periods of any prior financial years that will be restated in the annual financial statements under IAS 8.
- (b) When it is impracticable to determine the cumulative effect at the beginning of the year of applying a new accounting policy to all prior periods, adjusting the financial statements of prior interim periods of the current year and comparable interim periods of prior years to apply the new accounting policy prospectively from the earliest date practicable. [IAS 34.43].

Therefore, regardless of when in a financial year an entity decides to adopt a new accounting policy, it has to be applied from no later than the beginning of the current financial year. [IAS 34.44]. For example, if an entity that reports on a quarterly basis decides in its third quarter to change an accounting policy, it must restate the information presented in earlier quarterly financial reports to reflect the new policy as if it had been applied from the start of the annual reporting period.

IAS 34.16A(a) requires entities to confirm that the same accounting policies and methods of computation are followed in the interim financial statements as compared to their most recent annual financial statements or, if those policies or methods have changed, to describe the nature and effect of the change (see sections 3.2 and 4.2 above). Accordingly, in the first set of interim financial statements published applying a new accounting policy or method an entity must disclose the nature and effect of the change in the policies or methods including a description of the new accounting policy or the method adopted.

The only exception to the restatement of all comparative periods is when it is impracticable to determine the cumulative effect of applying a new accounting policy at the beginning of the year of application (see Chapter 3). IAS 1 states that application of a requirement is 'impracticable' when the entity cannot apply it after making every reasonable effort to do so. [IAS 1.7].

8.1.2.A New pronouncements becoming mandatory during the current year

When preparing interim financial information, consideration is given to which new IFRS accounting standards and interpretations are mandatory in the next (current year) annual financial statements. As noted above, IAS 34.28 requires an entity to apply accounting policy changes made after the date of the most recent annual financial statements that are to be reflected in the next annual financial statements. Accordingly, the entity adopts the new or amended accounting standards and interpretations that are expected to be reflected in its next annual financial statements, when preparing the interim financial reports in that year.

For example, IFRS 16 was mandatory for annual periods beginning on or after 1 January 2019. [IFRS 16.C1]. For an entity with a 30 September year-end, the first annual report for which it was required to apply the standard would have been for the year ended 30 September 2020. Therefore, the entity would have applied the standard in its half-yearly report for the six months ending 31 March 2020.

A change in accounting policy would require a restatement of prior comparative financial statements, except for new IFRS accounting standards that have specific application and transition requirements. [IAS 34.43]. For example, IFRS 16.C5(b) allows an entity to apply the requirements in IFRS 16 without restating the prior comparative period (see Chapter 24).

An entity that applies IFRS 17 *Insurance Contracts*, in its interim financial statements prepared applying IAS 34, must make an accounting policy choice as to whether to change the treatment of accounting estimates made in the previous interim or annual financial statements. [IFRS 17.B137]. See Chapter 51. In such instances, the entity must consider disclosing information required by IAS 34.16A(d) in respect of changes in estimates as discussed in section 4.2 above.

8.1.2.B Voluntary changes of accounting policy

Extract from IAS 8

- | | |
|-----|--|
| 14 | An entity shall change an accounting policy only if the change: |
| (a) | is required by an IFRS; or |
| (b) | results in the financial statements providing reliable and more relevant information about the effects of transactions, other events or conditions on the entity's financial position, financial performance or cash flows. |

An entity can also elect at any time during a year to apply a new IFRS accounting standard or interpretation before it becomes mandatory (unless early adoption is prohibited) through a voluntary change in accounting policy. However, IAS 1 and IAS 8 only permit an entity to change an accounting policy if the information results in information that is 'reliable and more relevant' to the users of the financial statements. [IAS 8.14(b)].

After concluding that a voluntary change in accounting policy is permitted and appropriate, its effect is reflected in the first interim report the entity presents after the date on which the entity changed its policy and comparative interim period information is restated. Under IAS 8, a change in accounting policy is reflected by retrospective application, with restatement of prior period financial data as far back as is practicable unless specific transitional reliefs are available on the adoption of the new accounting standard or interpretation. However, if the cumulative amount of the adjustment relating to previous financial years is impracticable to determine, then under IAS 8, the new policy is applied prospectively from the earliest date practicable. [IAS 34.44]. Under IAS 34, an entity is not allowed to reflect the effect of such a voluntary change in accounting policy from a later date than the beginning of the current year, such as at the start of the most recent interim period in which the decision was made to change the policy. [IAS 34.44]. To allow two different accounting policies to be applied to a particular class of transactions within a single year would make interim allocations difficult, obscure operating results, and complicate analysis and understandability of the interim period information. [IAS 34.45].

One exception to this principle of retrospective adjustment of earlier interim periods is when an entity changes from the cost model to the revaluation model under paragraph 31 of IAS 16 *Property, Plant and Equipment* or IAS 38.75 (see Chapter 3). These are not changes in accounting policy that are covered by IAS 8 in the usual manner, but instead are required to be treated as a revaluation in the period i.e., from the date on which the decision is made and the revaluation is determined. [IAS 8.17]. In the case of a policy change from cost to revaluation, the triggering event is the decision to adopt a policy of revaluation. The date of the first valuation must be consistent with that date. The revalued amount of the assets concerned is applicable only from the date of the revaluation and accordingly, the depreciation expense prior to the date of the revaluation must remain on the old, historic cost basis. Therefore, the general requirements of IAS 34 do not override the specific requirements of IAS 8 to treat such changes prospectively.

To avoid using two differing accounting policies for a particular class of assets in a single financial year, consideration must be given to changing from the cost model to the revaluation model at the beginning of the financial year. Otherwise, an entity will depreciate assets based on cost for early interim periods and based on the revalued amounts for later interim periods.

8.1.2.C New pronouncements becoming mandatory in future annual reporting periods

There is no explicit requirement in IAS 34 for a condensed set of financial statements to include disclosures about IFRS accounting standards and interpretations that take effect in future annual reporting periods. However, if an entity has obtained new information about the impact of issued but not yet effective amendments of IFRS accounting standards, it must consider whether to include updated information in the condensed interim financial statements. An entity that prepares a complete set of interim financial statements that has not applied a new IFRS accounting standard which has been issued but is not yet effective must disclose the information required in IAS 8.30 (see Chapter 3).

8.1.3 Voluntary changes in presentation

An entity may wish to change the presentation of the interim financial statements from that used in prior interim reporting periods. In such situations, before changing the presentation used in its interim report from that of previous periods, management must consider:

- (a) The interaction of the requirements of IAS 34 to include in a set of condensed financial statements the same headings and sub-totals as the most recent annual financial statements. [IAS 34.10].
- (b) The requirement in IAS 34 to apply the same accounting policies as the most recent or the next annual financial report. [IAS 34.28].
- (c) The requirements of IAS 1 as they will relate to those next annual financial statements.

IAS 1 states that an entity must retain the presentation and classification of items in the financial statements, unless it is apparent following a significant change in the nature of operations or a review of the financial statements that another presentation is more appropriate, or unless the change is required by IFRS accounting standards. [IAS 1.45].

If a presentation is changed, the entity must also reclassify comparative amounts for both earlier interim periods of the current financial year and comparable periods in prior years. [IAS 34.43(a)]. In such cases, an entity must disclose the nature of the reclassifications, the amount of each item (or class of items) that is reclassified, and the reason for the reclassification. [IAS 1.41, IAS 8.29].

8.2 Seasonal businesses

Some entities do not earn revenues or incur expenses evenly throughout the year, for example, agricultural businesses, holiday companies, domestic fuel suppliers, or retailers who experience peak demand at Christmas. The financial year-end is often chosen to fit their annual operating cycle, which means that an individual interim period would give little indication of annual performance and financial position.

An extreme application of the integral approach would suggest that they must predict their annual results and contrive to report half of that in the half-year interim financial statements. However, this approach does not portray the reality of their business in individual interim periods, and is, therefore, not permitted under the year-to-date approach adopted in IAS 34. [IAS 34.28].

8.2.1 Revenues received seasonally, cyclically, or occasionally

Extract from IAS 34

37 Revenues that are received seasonally, cyclically, or occasionally within a financial year shall not be anticipated or deferred as of an interim date if anticipation or deferral would not be appropriate at the end of the entity's financial year.

Examples of the revenues referred to in the extract above include dividend revenue, royalties, government grants, and seasonal revenues of retailers; such revenues are recognised when they occur. [IAS 34.37, IAS 34.38].

IAS 34 also requires an entity to explain the seasonality or cyclicity of its business and the effect on interim reporting (see section 4.3.12 above). [IAS 34.16A(b)]. If businesses are highly seasonal, IAS 34 encourages reporting of additional information for the twelve months up to the end of the interim period and comparatives for the prior twelve-month period (see section 5 above). [IAS 34.21].

8.2.2 Costs incurred unevenly during the year

IAS 34 prohibits the recognition or deferral of costs for interim reporting purposes if recognition or deferral of that type of cost is inappropriate at year-end, [IAS 34.39], which is based on the principle that assets and liabilities are recognised and measured using the same criteria as at year-end. [IAS 34.29, IAS 34.31]. This principle prevents smoothing of costs in seasonal businesses. Furthermore, the recognition of assets or liabilities at the interim date would not be appropriate if they would not qualify for recognition at the end of an annual reporting period. [IAS 34.32].

For direct costs, this approach has limited consequences, as the timing of recognising these costs and the related revenues is usually similar. However, for indirect costs, the consequences may be greater, depending on which IFRS accounting standard an entity follows.

For example, manufacturing entities that use fixed production overhead absorption rates recognise an asset in respect of attributable overheads based on the normal capacity of the production facilities in accordance with IAS 2. Any variances and unallocated overheads at the interim date are expensed. [IAS 2.13].

Entities applying IFRS 15 can capitalise allocations of costs incurred in fulfilling a contract with a customer that are not within the scope of another IFRS accounting standard only if those costs meet the criteria set out in paragraph 95 of IFRS 15. [IFRS 15.95]. The circumstances in which IFRS 15 allows an asset to be recognised in relation to costs incurred to fulfil a contract are discussed in Chapter 28. If the criteria are not met at the reporting date, the costs are expensed. What is clear is that an entity cannot diverge from these requirements for recognising an expense or an asset just because information is being prepared for an interim period.

9 Examples of the recognition and measurement principles

Part B of the illustrative examples accompanying the standard provides several examples that illustrate the recognition and measurement principles in interim financial statements. [IAS 34.40]. In addition, IFRIC 10 *Interim Financial Reporting and Impairment* addresses the reversal of impairment losses recognised on goodwill in the interim periods. These examples are discussed below.

9.1 Property, plant and equipment and intangible assets

9.1.1 Depreciation and amortisation

Depreciation and amortisation for an interim period is based only on assets owned during that interim period and does not consider asset acquisitions or disposals planned for later in the year. [IAS 34.IE B24].

An entity applying a straight-line method of depreciation (amortisation) does not allocate the depreciation (amortisation) charge between interim periods based on the level of activity. However, under IAS 16 and IAS 38 an entity may use a 'units of production' method of depreciation, which results in a charge based on the expected use or output (see Chapter 19). An entity can only apply this method if it most closely reflects the expected pattern of consumption of the future economic benefits embodied in the asset. The chosen method must be applied consistently from period to period unless there is a change in the expected pattern of consumption of those future economic benefits. [IAS 16.62, IAS 38.98]. Therefore, an entity cannot apply a straight-line method of depreciation in its annual financial statements, while allocating the depreciation charge to interim periods using a 'units of production' based approach.

9.1.2 Impairment of assets

IAS 36 *Impairment of Assets* requires an entity to recognise an impairment loss if the recoverable amount of an asset declines below its carrying amount. [IAS 34.IE B35]. An entity must apply the same impairment testing, recognition, and reversal criteria at an interim date as it would at year-end. [IAS 34.IE B36].

However, IAS 34 states that an entity is not required to perform a detailed impairment calculation at the end of each interim period. Rather, an entity must perform a review for indications of significant impairment since the most recent year-end to determine whether such a calculation is needed. [IAS 34.IE B36]. Nevertheless, the standard does not exempt an entity from performing impairment tests at the end of its interim periods. For example, an entity that recognised an impairment charge in the immediately preceding year, may find that it needs to update its impairment calculations at the end of subsequent interim periods because impairment indicators remain. IFRIC 10 does not allow the reversal of an impairment loss recognised on goodwill in a previous interim period (see section 9.2 below).

9.1.3 Recognition of intangible assets

An entity must apply the same IAS 38 definitions and recognition criteria for intangible assets in an interim period as in an annual period. Therefore, costs incurred before the recognition criteria are met must be recognised as an expense. [IAS 34.IE B8]. Expenditures on intangibles that are initially expensed under IAS 38 cannot be reinstated and recognised as part of the cost of an intangible asset subsequently (e.g., in a later interim period). [IAS 38.71]. Furthermore, 'deferring' costs as assets in an interim period in the hope that the recognition criteria will be met later in the year is not permitted. Only costs incurred after the specific point in time at which the criteria are met must be recognised as part of the cost of an intangible asset. [IAS 34.IE B8].

9.1.4 Capitalisation of borrowing costs

An entity that recognises finance expenses in the cost of a qualifying asset under IAS 23 *Borrowing Costs* must determine the amount to be capitalised from the actual finance cost during the period (when funds are specifically borrowed), [IAS 23.12], or, when the asset is funded out of general borrowings, by applying a capitalisation rate equal to the weighted-average of the finance costs attributable to actual borrowings outstanding during the period, [IAS 23.14], (see Chapter 22). For interim financial reporting, measurement must be on a year-to-date basis, [IAS 34.28], regardless of how often the entity issues interim reports during a year. For example, an entity that issues quarterly interim reports would have to revise its estimated capitalisation rate in successive quarters during the same year for changes in actual year-to-date borrowings and finance costs. As required in IAS 34, the cumulative effect of changes in the estimated capitalisation rate must be recognised in the current quarter (as a change in estimate) and not retrospectively. [IAS 34.36]. In such situations entities must consider the requirement in IAS 34.16A(d) (see sections 7 and 8.1.1 above) to disclose the nature and amount of changes in estimates of amounts reported in prior interim periods of the current financial year.

9.2 Reversal of goodwill impairment losses recognised in a previous interim period (IFRIC 10)

The two requirements in IAS 34, to apply the same accounting policies in interim financial reports as are applied for the annual financial statements, and to use year-to-date measurements for interim reporting purposes, do not sit easily together when considering the reversal of goodwill impairment. IAS 36 prohibits the reversal in a subsequent period of an impairment loss recognised for goodwill. [IAS 36.124].

As discussed in section 9.1.2 above, the requirement to use the same accounting policies means that an entity must apply the same impairment testing, recognition, and reversal criteria at the end of an interim period as it would at year-end. [IAS 34.IE B36].

However, the use of year-to-date measurements implies that the calculation of impairments as at interim reporting dates in the same annual reporting period must be based on conditions as at the end of each interim period and determined independently of assessments at earlier interim dates. Applying this requirement of IAS 34 would lead to reversals of previously reported impairments if conditions change and justify a higher carrying value for the related asset.

IFRIC 10 addresses the interaction between the requirements of IAS 34 and the recognition of impairment losses on goodwill in IAS 36, and the effect of that interaction on subsequent interim and annual financial statements. [IFRIC 10.2].

Whilst it may be unlikely for the conditions causing an impairment of goodwill at an interim date to reverse before year-end, IFRIC 10 states that the specific requirements of IAS 36 take precedence over the more general statement in IAS 34. [IFRIC 10.BC9]. As such, IFRIC 10 prohibits the reversal of an impairment loss recognised in a previous interim period in respect of goodwill. [IFRIC 10.8]. As a result, in an unlikely event where the conditions giving rise to an impairment do reverse in successive interim periods, there can be situations where two entities facing an identical set of circumstances, yet with different frequency of interim reporting, could end up reporting different annual results.

IFRIC 10 cannot be applied by analogy to derive a general principle that the specific requirements of an IFRS accounting standard take precedence over the year-to-date approach in IAS 34. [IFRIC 10.9].

9.3 Employee benefits

9.3.1 Employer payroll taxes and insurance contributions

If employer payroll taxes or contributions to government sponsored insurance funds are assessed on an annual basis, the employer's related expense must be recognised in interim periods using an estimated average annual effective rate, even if it does not reflect the timing of payments. A common example contained in Appendix B to IAS 34 is employer payroll tax or insurance contribution subject to a certain maximum level of earnings per employee. Higher income employees would reach the maximum income before year-end, and the employer would make no further payments for the remainder of the year. [IAS 34.IE B1].

9.3.2 Year-end bonuses

The nature of year-end bonuses vary widely. Some bonus schemes only require continued employment whereas others require certain performance criteria to be attained on a monthly, quarterly, or annual basis. Payment of bonuses may be purely discretionary, contractual or based on years of historical precedent. [IAS 34.IE B5]. A bonus is recognised for interim reporting only if: [IAS 34.IE B6]

- (a) The entity has a present legal or constructive obligation to make such payments as a result of past events.

And

- (b) A reliable estimate of the obligation can be made.

A present obligation exists only when an entity has no realistic alternative but to make the payments. [IAS 19.19]. IAS 19 gives guidance on accounting for profit sharing and bonus plans (see Chapter 31).

In recognising a bonus at an interim reporting date, an entity must consider the facts and circumstances under which the bonus is payable and determine an accounting policy that recognises an expense reflecting the obligation on the basis of the services received to date. Several possible accounting policies are illustrated in Illustration 9-1 below.

Illustration 9-1: Measuring interim bonus expense

An entity pays an annual performance bonus if earnings exceed CU10 million, under which 5% of any earnings in excess over CU10 million will be paid up to a maximum of CU500,000. Earnings for the six months ended 30 June 20X2 are CU7 million, and the entity expects earnings for the full year ended 31 December 20X2 to be CU16 million.

The following table shows various accounting policies and the expense recognised thereunder in the interim financial statements for the six months ended 30 June 20X2.

	Expense (CU)
Method 1	
▪ Constructive obligation exists when earnings target is met	Nil
Method 2	
▪ Assume earnings for remainder of year will be same	200,000
Method 3	
▪ Proportionate recognition based on full-year estimate	131,250
Method 4	
▪ One-half recognition based on full-year estimate	150,000

Method 1 is generally not appropriate, as this method disregards the fact that the entity has a present obligation under the performance bonus arrangement when the employees have provided services during the first six months towards earning the bonus.

Likewise, Method 2 is generally not appropriate, as the expense of CU200,000 [(CU14 million - CU10 million) × 5%] assumes that the employees will continue to provide services in the latter half of the year to achieve the bonus target, but does not attribute any services to that period.

In contrast to Methods 1 and 2, Method 3 illustrates an accounting policy whereby an estimate is made of the full-year expense and attributed to the period based on the proportion of that bonus for which employees have provided services at 30 June 20X2. The amount recognised is calculated as (CU7 million ÷ CU16 million) × [5% × (CU16 million - CU10 million)].

Similar to Method 3, Method 4 also takes the approach of recognising an expense based on the full year estimate, but allocates that full-year estimate equally to each period (which is similar to the approach used for share-based payment transactions). The amount recognised is calculated as [50% × 5% × (CU16 million - CU10 million)].

Depending on facts and circumstances, Methods 3 and 4 may be appropriate methods to use to recognise the bonus expense in the interim period. Alternatively, an entity may determine that another basis, which considers both the constructive obligation that exists as of 30 June 20X2, and the services performed to date, is also appropriate.

9.3.3 Pensions

Pension costs for an interim period are calculated on a year-to-date basis using the actuarially determined pension cost rate at the end of the prior year, adjusted for significant market fluctuations and for significant one-off events, such as plan amendments, curtailments and settlements. [IAS 34.1E B9].

In the absence of such significant market fluctuations and one-off events, the estimate of the actuarial liabilities is rolled forward in the scheme based on assumptions as at the beginning of the year and adjusted for significant changes in the membership of the scheme. If there are significant changes to pension arrangements during the interim period (such as changes resulting from a material business combination or from a major redundancy programme) consideration must be given to obtaining a new actuarial valuation of scheme liabilities. Similarly, if there are significant market fluctuations, such as those arising from changes in corporate bond markets, the validity of the assumptions in the last actuarial estimate, such as the discount rate applied to scheme liabilities, must be reviewed and revised as appropriate.

IAS 19 requires an entity to determine net interest using the net defined benefit liability or asset and the discount rate determined at the start of the annual reporting period unless the defined benefit or liability is remeasured. [IAS 19.123A]. Accordingly, the net interest costs during the interim period are based on the discount rate determined at the end of the preceding financial year. This rate is applied to measure net interest costs during the interim period. Similarly, service costs during the interim period are not updated for changes in discount rate.

In Practical example 9-1 below International Consolidated Airlines Group, S.A. discloses changes in the discount rates used for pension obligations.

As with all approximations, the appropriateness in the circumstances must be considered.

Practical example 9-1: International Consolidated Airlines Group, S.A. (Half-year 2022) Spain

SIX MONTHS RESULTS ANNOUNCEMENT [extract]

Unaudited Condensed Consolidated Interim Financial Statements [extract]

NOTES TO THE ACCOUNTS [extract]

15. EMPLOYEE BENEFIT OBLIGATIONS [extract]

Scheme liability assumptions

At June 30, 2022, the assumptions used to determine the obligations under the APS and NAPS were reviewed and updated to reflect the market condition at that date. Principal assumptions were as follows:

Per cent per annum	June 30, 2022		December 31, 2021	
	APS	NAPS	APS	NAPS
Discount rate	3.70	3.75	1.80	1.90
Rate of increase in pensionable pay	3.45	-	3.55	-
Rate of increase of pensions in payment	3.45	2.80	3.55	2.85
RPI rate of inflation	3.45	3.20	3.55	3.30
CPI rate of inflation	2.85	2.80	2.95	2.85

...

9.3.4 Vacations, holidays, and other short-term paid absences

IAS 19 distinguishes between accumulating and non-accumulating paid absences. [IAS 19.13]. Accumulating paid absences are those that are carried forward and can be used in future periods if the current period's entitlement is not used in full. IAS 19 requires an entity to measure the expected cost of and obligation for accumulating paid absences at the amount the entity expects to pay as a result of the unused entitlement that has accumulated at the end of the reporting period (see Chapter 31). IAS 34 requires the same principle to be applied at the end of interim reporting periods. Conversely, an entity cannot recognise an expense or liability for non-accumulating paid absences at the end of an interim reporting period, just as it would not recognise any at the end of an annual reporting period. [IAS 34.IE B10].

9.4 Inventories and cost of sales

9.4.1 Inventories

The recognition and measurement principles of IAS 2 are applied in the same way for interim financial reporting as for annual reporting purposes. At the end of a financial reporting period an entity would determine inventory quantities, costs, and net realisable values. However, IAS 34 does comment that to save cost and time, entities often use estimates to measure inventories at interim dates to a greater extent than at annual reporting dates. [IAS 34.IE B25].

Net realisable values are determined using selling prices and costs to complete and dispose at the end of the interim period. A write-down must be reversed in a subsequent interim period only if it would be appropriate to do so at year-end (See Chapter 23). [IAS 34.IE B26].

9.4.2 Contractual or anticipated purchase price changes

Both the payer and the recipient of volume rebates, or discounts and other contractual changes in the prices of raw materials, labour, or other purchased goods and services must anticipate these items in interim periods if it is probable that these have been earned or will take effect. However, discretionary rebates and discounts cannot be recognised because the resulting asset or liability would not meet the recognition criteria in the IASB's *Conceptual Framework*. [IAS 34.IE B23]. Where relevant, entities must consider further guidance on the application of variable consideration in respect of contracts with customers (see Chapter 28).

9.4.3 Interim period manufacturing cost variances

Price, efficiency, spending, and volume variances of a manufacturing entity must be recognised in profit or loss at interim reporting dates to the same extent that those variances are recognised at year-end. It is not appropriate to defer variances expected to be absorbed by year-end, which could result in reporting inventory at the interim date at more or less than its actual cost. [IAS 34.IE B28].

9.5 Taxation

Taxation is one of the most difficult areas of interim financial reporting, primarily because IAS 34 does not clearly distinguish between current income tax and deferred tax, referring only to 'income tax expense'. This causes tension between the approach for determining the expense and the asset or liability in the statement of financial position. In addition, the standard's provisions combine terminology, suggesting an integral approach to measurement with guidance requiring a year-to-date basis to be applied in respect of recognition. The integral method appears to be the basis used in determining the effective income tax rate for the whole year, but that rate is applied to year-to-date profit in the interim financial statements. In addition, under a year-to-date basis, the estimated rate is based on tax rates and laws that are enacted or substantively enacted by the end of the interim period. Changes in legislation expected to occur before the end of the current year are not recognised in preparing the interim financial report. The assets and liabilities in the statement of financial position, at least for deferred taxes, are derived solely from a year-to-date approach, but sometimes the requirements of the standard are unclear. For example, as discussed in sections 9.5.2.C and 9.5.4 below, two approaches to determine effective annual average tax rate are noted wherein an entity may include the impact of remeasuring closing deferred tax balances at the end of the financial year in the estimate of effective annual average tax rate or exclude such impact on the estimated rate.

9.5.1 Measuring interim income tax expense

IAS 34 states that income tax expense must be accrued using the "best estimate of the weighted average annual income tax rate expected for the full financial year..." and applying that rate to actual pre-tax income for the interim period. [IAS 34.30(c), IAS 34.IE B12]. Whilst the standard also describes this rate as "the tax rate that would be applicable to expected total annual earnings...", [IAS 34.IE B12], this is not the same as estimating the total tax expense for the year and allocating a proportion of that to the interim period (even though it might sometimes appear that way), as demonstrated in the discussion below. Additional considerations in relation to current tax expense (income) arising from Pillar Two income taxes are discussed in section 9.5.7 below.

Because taxes are assessed on an annual basis, using this approach to determine the annual effective income tax rate and applying it to year-to-date actual earnings is consistent with the basic concept in IAS 34, that the same recognition and measurement principles apply in interim financial reports as in annual financial statements. [IAS 34.IE B13].

In estimating the weighted-average annual income tax rate, an entity must reflect a blend of any progressive tax rate structure expected to be applicable to the full year's earnings, including changes in income tax rates scheduled to take effect later in the year that are enacted or substantively enacted as at the end of the interim period. [IAS 34.IE B13]. This situation is shown in Illustration 9-2 below. [IAS 34.IE B15].

Illustration 9-2: Measuring interim income tax expense - progressive tax rates

An entity reporting quarterly expects to earn CU10,000 pre-tax each quarter and operates in a jurisdiction with a tax rate of 20% on the first CU20,000 of annual earnings and 30% on all additional earnings. Actual earnings match expectations. The following table shows the income tax expense reported each quarter:

(All values in CU)	Pre-tax earnings	Effective tax rate	Tax expense
First quarter	10,000	25%	2,500
Second quarter	10,000	25%	2,500
Third quarter	10,000	25%	2,500
Fourth quarter	10,000	25%	2,500
Annual	40,000		10,000

CU10,000 of tax is expected to be payable for the full year on CU40,000 of pre-tax income (CU20,000 @ 20% + CU20,000 @ 30%), implying an average annual effective income tax rate of 25% (CU10,000 ÷ CU40,000).

In the above Illustration, it might look as if the interim income tax expense is calculated by dividing the total expected tax expense for the year (CU10,000) by the number of interim reporting periods (4). However, this is only the case in this example because profits are earned evenly over each quarter. The expense is actually calculated by determining the effective annual income tax rate and multiplying that rate to year-to-date earnings, as illustrated in Illustration 9-3 below. [IAS 34.IE B16].

Illustration 9-3: Measuring interim income tax expense - quarterly losses

An entity reports quarterly, earns CU15,000 pre-tax profit in the first quarter but expects to incur losses of CU5,000 in each of the three remaining quarters (thus having zero income for the year), and operates in a jurisdiction in which its standard statutory annual income tax rate is 20%. The following table shows the income tax expense reported each quarter:

(All values in CU)	Pre-tax earning	Effective tax rate	Tax expense
First quarter	15,000	20%	3,000
Second quarter	(5,000)	20%	(1,000)
Third quarter	(5,000)	20%	(1,000)
Fourth quarter	(5,000)	20%	(1,000)
Annual	-		-

The above Illustration shows how an expense is recognised in periods reporting a profit and a credit is recognised when a loss is incurred. This result is very different from allocating a proportion of the expected total income tax expense for the year, which in this case is zero.

If an entity operates in a number of tax jurisdictions, or where different income tax rates apply to different categories of income (such as capital gains or income earned in particular industries), the standard requires that to the extent practicable, an entity:

- Estimates the average annual effective income tax rate for each taxing jurisdiction separately and applies it individually to the interim period pre-tax income of each jurisdiction.
- And
- Applies different income tax rates to each individual category of interim period pre-tax income. [IAS 34.IE B14].

This means that the entity must perform the analysis illustrated in Illustration 9-2 above for each tax jurisdiction and arrive at an interim tax charge by applying the tax rate for each jurisdiction to actual earnings from each jurisdiction in the interim period. However, the standard recognises that, whilst desirable, such a degree of precision cannot be achieved in all cases and allows using a weighted-average rate across jurisdictions or across categories of income, if such rate approximates the effect of using rates that are more specific. [IAS 34.IE B14].

Illustration 9-4: Measuring interim tax expense - many jurisdictions

An entity operates in 3 countries, each with its own tax rates and laws. In order to determine the interim tax expense, the entity determines the effective annual income tax rate for each jurisdiction and applies those rates to the actual earnings in each jurisdiction, as follows:

(All values in CU)	Country A	Country B	Country C	Total
Expected annual tax rate	25%	40%	20%	
Expected annual earnings	300,000	250,000	200,000	750,000
Expected annual tax expense	75,000	100,000	40,000	215,000
Actual half-year earnings	140,000	80,000	150,000	370,000
Interim tax expense	35,000	32,000	30,000	97,000

By performing a separate analysis for each jurisdiction, the entity determines an interim tax expense of CU97,000, giving an effective average tax rate of 26.2% (CU97,000 ÷ CU370,000). Had the entity used a weighted-average rate across jurisdictions, using the expected annual earnings, it would have determined an effective tax rate of 28.7% (CU215,000 ÷ CU750,000), resulting in a tax expense for the interim period of CU106,190 (CU370,000 @ 28.7%). Whether the difference of nearly CU9,000 lies within the range for a reasonable approximation is a matter of judgement.

9.5.2 Changes in the effective tax rate during the year

9.5.2.A Enacted changes for the current year that apply after the interim reporting date

As noted above, the estimated income tax rate applied in the interim financial report must reflect changes that are enacted or substantively enacted as at the end of the interim reporting period, but scheduled to take effect later in the year. [IAS 34.1E B13]. IAS 12 acknowledges that in some jurisdictions, announcements by government have substantively the same effect as enactment. [IAS 12.48]. Accordingly, an entity must determine the date on which a change in tax rate or tax law is substantively enacted based on the specific constitutional arrangements of the jurisdiction (see Chapter 29).

Illustration 9-5: Measuring interim income tax expense - progressive tax rates

Taking the fact pattern in Illustration 9-2 above, assume that the 30% tax rate (on earnings above CU20,000) was substantively enacted as at the second quarter reporting date and applicable before year-end. In that case, the estimated income tax rate for interim reporting would be the same as the estimated average annual effective income tax rate computed in that example (i.e., 25%) after considering the higher rate, even though the entity's earnings are not above the required threshold at the half-year.

If legislation is enacted only after the end of the interim reporting period but before the date of authorisation for issue of the interim financial report, its effect is disclosed as an event after the interim period that has not been reflected in the financial statements for the interim period. [IAS 34.16A(h)]. This is consistent with the requirement under IAS 10 *Events after the Reporting Period* where estimates of tax rates and related assets or liabilities are not revised in these circumstances. [IAS 10.22(h)].

9.5.2.B Changes to previously reported estimated income tax rates for the current year

IAS 34 requires an entity to re-estimate at the end of each interim reporting period the estimated average annual income tax rate on a year-to-date basis. [IAS 34.1E B13]. Accordingly, the amounts accrued for income tax expense in one interim period may have to be adjusted in a subsequent interim period if that estimate changes. [IAS 34.30(c)]. Illustration 9-6 below shows adjustment in the third quarter resulting from change in effective tax rate. IAS 34 requires disclosure in interim financial statements of material changes in estimates of amounts reported in an earlier period or, in the annual financial statements, of material changes in estimates of amounts reported in the latest interim financial statements. [IAS 34.16A(d), IAS 34.26].

Illustration 9-6: Changes in the effective tax rate during the year

Taking the fact pattern in Illustration 9-2 above, an entity reporting quarterly expects to earn CU10,000 pre-tax each quarter; from the start of the third quarter the higher rate of tax on earnings over CU20,000 increases from 30% to 40%. Actual earnings continue to match expectations. The following table shows the income tax expense reported in each quarter:

(All values in CU)	Period pre-tax earnings	Pre-tax earnings: year to date	Effective tax rate	Tax expense: year to date	Period tax expense
First quarter [†]	10,000	10,000	25%	2,500	2,500
Second quarter [†]	10,000	20,000	25%	5,000	2,500
Third quarter	10,000	30,000	30%	9,000	4,000
Fourth quarter	10,000	40,000	30%	12,000	3,000
Annual	40,000				12,000

[†] As previously reported from Illustration 9-2 using an effective tax rate of 25%.

The increase in the tax rate means that CU12,000 of tax is expected to be payable for the full year on CU40,000 of pre-tax income (CU20,000 @ 20% + CU20,000 @ 40%), implying an average annual effective income tax rate of 30% (CU12,000 ÷ CU40,000). With cumulative pre-tax earnings of CU30,000 as at the end of the third quarter, the estimated tax liability is CU9,000, requiring a tax expense of CU4,000 (CU9,000 - CU2,500 - CU2,500) to be recognised during that quarter. In the final quarter, earnings of CU10,000 results in a tax charge of CU3,000 using the revised effective rate of 30%.

9.5.2.C Enacted changes applying only to subsequent years

In many jurisdictions, tax legislation is enacted that takes effect not only after the interim reporting date but also after year-end. Such circumstances are not addressed explicitly in the standard. As IAS 34 does not clearly distinguish between current income tax and deferred tax, combined with the different approaches taken in determining the expense recognised in profit or loss compared to the statement of financial position, these issues can lead to confusion in this situation.

On the one hand, the standard states that the estimated income tax rate for the interim period includes enacted or substantively enacted changes scheduled to take effect later in the year. [IAS 34.IE B13]. This implies that the effect of changes that do not take effect in the current year is ignored in determining the appropriate rate for current tax. On the other hand, IAS 34 also requires that the principles for recognising assets, liabilities, income and expenses for interim periods are the same as in the annual financial statements. [IAS 34.29]. In annual financial statements, deferred tax is measured at the tax rates expected to apply to the period when the asset is realised or the liability is settled, based on tax rates (and tax laws) enacted or substantively enacted by the end of the reporting period, as required by IAS 12. [IAS 12.47]. Therefore, an entity must recognise the effect on deferred tax measurement of a change applying to future periods if enacted by the end of the interim reporting period.

These two requirements seem to be mutually incompatible. As discussed in section 5 above, IAS 34 makes sense only in the context of calculating the effective current tax rate on income earned in the period. Once a deferred tax asset or liability is recognised, it must be measured under IAS 12. Therefore, an entity must recognise an enacted change applying to future years in measuring deferred tax assets and liabilities as at the end of the interim reporting period. One way to treat the cumulative effect to date of this remeasurement is to recognise it in full, by a credit to profit or loss or to other comprehensive income, depending on the nature of the temporary difference being remeasured, in the period during which the tax legislation is enacted, in a similar way to the treatment shown in Illustration 9-6 above, and as illustrated in Illustration 9-7 below.

Illustration 9-7: Enacted changes to tax rates applying after the current year

An entity reporting half-yearly operates in a jurisdiction subject to a tax rate of 30%. Legislation is enacted during the first half of the current year, which reduces the tax rate to 28% on income earned from the beginning of the entity's next financial year. Based on a gross temporary difference of CU1,000, the entity reported a deferred tax liability in its most recent annual financial statements of CU300 (CU1,000 @ 30%). Of this temporary difference, CU200 is expected to reverse in the second half of the current year and CU800 in the next financial year. Assuming that no new temporary differences arise in the current period, what is the deferred tax balance at the interim reporting date?

Whilst the entity uses an effective tax rate of 30% to determine the tax expense relating to income earned in the period, it must use a rate of 28% to measure those temporary differences expected to reverse in the next financial year. Accordingly, the deferred tax liability at the half-year reporting date is CU284 (CU200 @ 30% + CU800 @ 28%).

Alternatively, if the effective current tax rate is not distinguished from the measurement of deferred tax, it could be argued that IAS 34 allows the reduction in the deferred tax liability of CU16 (CU300 - CU284) to be included in the estimate of the effective income tax rate for the year. Approach 2 in Illustration 9-10 below applies this argument.

How we see it

In our view, because IAS 34 does not distinguish between current and deferred taxes, either approach illustrated above would be acceptable provided that is applied consistently.

9.5.3 Difference in financial year and tax year

If an entity's financial year and the income tax year differ, the income tax expense for the interim periods of that financial year must be measured using separate weighted-average estimated effective tax rates for each of the income tax years applied to the portion of pre-tax income earned in each of those income tax years. [IAS 34.IE B17]. In other words, an entity must compute a weighted-average estimated effective tax rate for each income tax year, rather than for its financial year.

Illustration 9-8: Difference in financial year and tax year

An entity's financial year ends 30 June and it reports quarterly. Its taxable year end is 31 December. For the financial year that begins 1 July 20X1 and ends 30 June 20X2, the entity earns CU10,000 pre-tax each quarter.

The estimated average annual income tax rate is 30% in the income tax year to 31 December 20X1 and 40% in the year to 31 December 20X2. [IAS 34.IE B18].

Quarter ending (All values in CU)	Pre-tax earnings	Effective tax rate	Tax expense
30 September 20X1	10,000	30%	3,000
31 December 20X1	10,000	30%	3,000
31 March 20X2	10,000	40%	4,000
30 June 20X2	10,000	40%	4,000
Annual	40,000		14,000

9.5.4 Tax loss and tax credit carrybacks and carryforwards

Appendix B to IAS 34 repeats the requirement in IAS 12 that for carryforwards of unused tax losses and tax credits, a deferred tax asset must be recognised to the extent that it is probable that future taxable profit will be available against which the unused tax losses and unused tax credits can be utilised. In assessing whether future taxable profit is available, the criteria in IAS 12 are applied at the interim date. If these criteria are met as at the end of the interim period, the effect of the tax loss carryforwards is included in the estimated average annual effective income tax rate. [IAS 34.IE B21].

Illustration 9-9: Tax loss carryforwards expected to be recovered in the current year

An entity that reports quarterly has unutilised operating losses of CU10,000 for income tax purposes at the start of the current financial year for which a deferred tax asset has not been recognised. The entity earns CU10,000 in the first quarter of the current year and expects to earn CU10,000 in each of the three remaining quarters. Excluding the effect of utilising losses carried forward, the estimated average annual income tax rate is 40%. Including the carryforward, the estimated average annual income tax rate is 30%. Accordingly, tax expense is determined by applying the 30% rate to earnings each quarter as follows: [IAS 34.IE B22]

(All values in CU)	Pre-tax earnings	Effective tax rate	Tax expense
First quarter	10,000	30%	3,000
Second quarter	10,000	30%	3,000
Third quarter	10,000	30%	3,000
Fourth quarter	10,000	30%	3,000
Annual	40,000		12,000

This result is consistent with the general approach for measuring income tax expense in the interim report, in that any entitlement for relief from current tax due to carried forward losses is determined on an annual basis. Accordingly, its effect is included in the estimate of the average annual income tax rate and not, for example, by allocating all of the unutilised losses against the earnings of the first quarter to give an income tax expense of zero in the first quarter and CU4,000 thereafter.

In contrast, the year-to-date approach of IAS 34 means that the benefits of a tax loss carryback are recognised in the interim period in which the related tax loss occurs, [IAS 34.IE B20], and are not included in the assessment of the estimated average annual tax rate, as shown in Illustration 9-3 above. This approach is consistent with IAS 12, which requires the benefit of a tax loss that can be carried back to recover current tax already incurred in a previous period to be recognised as an asset. [IAS 12.13]. Therefore, a corresponding reduction of tax expense or increase of tax income is also recognised. [IAS 34.IE B20].

Where previously unrecognised tax losses are expected to be utilised in full in the current year, it seems intuitive to recognise the recovery of those carried forward losses in the estimate of the average annual tax rate, as shown in Illustration 9-9 above. Where the level of previously unrecognised tax losses exceeds expected taxable profits for the current year, a deferred tax asset must be recognised for the carried forward losses that are now expected to be utilised, albeit in future years. Illustration 9-9 described two approaches where tax loss carryforwards exceed expected profits in the current year.

Illustration 9-10: Tax loss carryforwards in excess of current year expected profits

An entity that reports half-yearly has unutilised operating losses of CU75,000 for income tax purposes at the start of the current financial year for which no deferred tax asset has been recognised. At the end of its first interim period, the entity reports a profit before tax of CU25,000 and expects to earn a profit of CU20,000 before tax in the second half of the year. The entity reassesses the likelihood of generating sufficient profits to utilise its carried forward tax losses and determines that the IAS 12 recognition criteria for a deferred tax asset are satisfied for the full amount of CU75,000. Excluding the effect of utilising losses carried forward, the estimated average annual income tax rate is the same as the enacted or substantially enacted rate of 40%.

As at the end of the current financial year the entity expects to have unutilised losses of CU30,000 (CU75,000 carried forward less current year pre-tax profits of CU45,000). Using the enacted rate of 40%, a deferred tax asset of CU12,000 is recognised at year-end. How is this deferred tax asset recognised in the interim reporting periods?

Approach 1

Under the first approach, the effective tax rate for the effect of the change in the assessment of recoverability of the unused tax losses carried forward to future periods that existed at the beginning of the current financial year is not adjusted. The estimate of the average annual effective tax rate includes only those carried forward losses expected to be utilised in the current financial year and a separate deferred tax asset is recognised for those carried forward losses now expected to be utilised in future annual reporting periods.

In the fact pattern above, using CU45,000 of the carried forward tax losses gives an average effective annual tax rate of nil, as follows:

Estimation of the annual effective tax rate - Approach 1

(All values in CU)

Expected annual tax expense before utilising losses carried forward (45,000 @ 40%)	18,000
Tax benefit of utilising carried forward tax losses (45,000 @ 40%)	(18,000)
Expected annual tax expense before the effect of losses carried forward to future annual periods	-
Expected annual effective tax rate	0%
Effect of tax losses carried forward to future periods (75,000 - 45,000 @ 40%)	(12,000)
Tax income to be recognised in the interim period	(12,000)

The remaining tax losses give rise to a deferred tax asset of 12,000, which is recognised in full at the half-year, to give reported profits after tax as follows:

(All values in CU)	First half-year	Second half-year	Annual
Profit before income tax	25,000	20,000	45,000
Income tax (expense)/credit			
- At expected annual effective rate	-	-	-
- Recognition of deferred tax asset	12,000	-	12,000
Net profit after tax	37,000	20,000	57,000

Approach 2

Under the second approach, the effective tax rate for the effect of the change in the assessment of recoverability of the unused tax losses carried forward to future periods that existed at the beginning of the current financial year is adjusted. The estimate of the average annual effective tax rate reflects the expected recovery of all the previously unutilised tax losses from the beginning of the period in which the assessment of recoverability changed. In the fact pattern above, recognition of the unutilised tax losses gives an average effective annual tax rate of -26.67%, as follows:

Estimation of the annual effective tax rate - Approach 2

(All values in CU)

Expected annual tax expense before utilising losses carried forward (45,000 @ 40%)	18,000
Tax benefit of recognising unutilised tax losses (75,000 @ 40%)	(30,000)
Expected annual tax credit after recognising unutilised tax losses	(12,000)
Expected annual effective tax rate (-12,000 ÷ 45,000)	-26.67%

This approach results in reported profits after tax as follows:

(All values in CU)	First half-year	Second half-year	Annual
Profit before income tax	25,000	20,000	45,000
Income tax (expense)/credit			
- At expected annual effective rate	6,667	5,333	12,000
Net profit after tax	31,667	25,333	57,000

Approach 1 is consistent with the requirements of IAS 12 as it results in recognising the full expected deferred tax asset as soon as it becomes “probable that taxable profit will be available against which the deductible temporary difference can be utilised...”. [IAS 12.24]. Further, applying IAS 34.29 that provides the principles for recognising assets, liabilities, income, and expenses for interim periods are the same as in annual financial statements, this deferred tax asset is fully recognised at the end of the first half-year.

How we see it

Given that IAS 34 does not specifically address the situation illustrated above and is unclear about whether the effective tax rate reflects changes in the assessment of the recoverability of carried forward tax losses, we also believe that Approach 2 is acceptable.

9.5.5 Derecognition of deferred tax assets that are no longer recoverable

As explained in section 9.5.4 above, IAS 34 requires that the benefits of tax loss and tax credit carrybacks and carryforwards are reflected in the estimated annual effective income tax rate in the interim period in which the related tax loss occurs or, if later, in the period when that loss is determined to be recoverable. [IAS 34.IE B20, IAS 34.IE B21]. Illustration 9-10 in section 9.5.4 above shows how an entity might account for the effect of previously unrecognised tax losses being determined to be recoverable during a later interim period. This raises a question how an entity accounts for the derecognition of a deferred tax asset in the interim reporting period when it is determined to no longer be recoverable.

Illustration 9-11: Derecognition of deferred tax assets that are no longer recoverable

An entity that reports half-yearly has previously recognised deferred tax assets of CU30,000 resulting from unutilised tax losses of CU75,000. Excluding the effect of utilisation of losses carried forward, the estimated average annual income tax rate is the same as the enacted or substantially enacted rate of 40%.

Due to adverse changes in its customer markets, the level of earnings has reduced compared to previous estimates and at the end of its first interim period, the entity reports a profit before tax of CU20,000 and expects to earn a profit of CU5,000 before tax in the second half of the year. The entity reassesses the likelihood of generating sufficient taxable profits to utilise its carried forward tax losses and determines that as at the end of the current financial year it expects to have unutilised losses of CU50,000 (CU75,000 carried forward less current year pre-tax profits of CU25,000) but that it will only be able to utilise CU15,000 of those losses. Using the enacted rate of 40%, a deferred tax asset of CU6,000 is recognised at year-end (i.e., a deferred tax asset of CU14,000 is derecognised). How is this derecognition recognised in the interim reporting periods?

Approach 1

Under the first approach, the irrecoverable portion of the deferred tax asset is de-recognised in its entirety in the period when the reassessment is carried out, as follows:

In the fact pattern above, using CU25,000 of the carried forward tax losses in the current year gives an average effective annual tax rate of nil, as follows:

Estimation of the annual effective tax rate - Approach 1	CU
Expected annual tax expense before utilising losses carried forward (CU25,000 @ 40%)	10,000
Tax benefit of utilising carried forward tax losses (CU25,000 @ 40%)	(10,000)
Current tax expense	0

Deferred tax expense - utilisation of recognised tax losses (CU25,000 @ 40%)	(10,000)
Expected annual tax expense before the effect of losses carried forward to future annual periods	(10,000)
Expected annual effective tax rate (CU10,000 ÷ CU25,000)	40%
Effect of derecognising tax losses carried forward [(CU75,000 - CU25,000 - CU15,000) @ 40%]	(14,000)
Tax expense to be recognised in the interim period	(24,000)

Of the remaining tax losses of CU50,000 only CU15,000 are expected to be utilised, requiring the previously recognised deferred tax asset to be reduced by CU14,000 [(CU50,000 - CU15,000) @ 40%], which is recognised in full at the half-year, to give reported profits after tax as follows:

(All values in CU)	First half-year	Second half-year	Annual
Profit before income tax	20,000	5,000	25,000
Income tax expense			
- at expected annual effective rate (40%)	(8,000)	(2,000)	(10,000)
- derecognition of deferred tax asset	(14,000)	0	(14,000)
Net (loss)/profit after tax	(2,000)	3,000	1,000

Approach 2

Under the second approach, the estimate of the average annual effective tax rate reflects the revision to estimates of the expected recovery of the unutilised tax losses from the beginning of the period. In the fact pattern above, derecognition of the related deferred tax asset gives an average effective annual tax rate of 96%, as follows:

Estimation of the annual effective tax rate - Approach 2	CU
Expected annual tax expense before utilising losses carried forward (CU25,000 @ 40%)	10,000
Tax benefit of utilising carried forward losses in the year (CU25,000 @ 40%)	(10,000)
Current tax expense	0
Deferred tax expense (utilisation of recognised tax losses (CU25,000 @ 40%))	(10,000)
Change to estimate of recoverable tax losses (CU50,000 - CU15,000 @ 40%)	(14,000)
Expected annual tax expense after accounting for unutilised tax losses	(24,000)
Expected annual effective tax rate (CU24,000 ÷ CU25,000)	96%

This approach results in reported profits after tax as follows:

(All values in CU)	First half-year	Second half-year	Annual
Profit before income tax	20,000	5,000	25,000
Income tax (expense)/credit			
- at expected annual effective rate (96%)	(19,200)	(4,800)	(24,000)
Net profit after tax	800	200	1,000

How we see it

Approach 1 is consistent with the year-to-date approach and the general requirement of IAS 34 to apply for assets, the same tests of future economic benefits at interim dates as at the end of an entity's financial year. Under this approach, a portion of the deferred tax asset is not recoverable and is therefore derecognised in its entirety. Approach 2 is consistent with the integral approach applied for the measurement of income taxes in IAS 34. As noted in section 9.5.4 above, IAS 34 does not address this specific situation, but requires that when tax losses become recoverable the effect of the tax loss carryforward is reflected in the computation of the estimated average annual effective income tax rate. Under this approach, there remains a deferred tax asset (of CU2,800) in the balance sheet despite it having been determined that this asset is not expected to be recovered. Although Approach 1 is a more faithful representation of the financial position as at the end of the interim period, we believe that both approaches are acceptable.

9.5.6 Tax credits

IAS 34 also discusses in more detail the treatment of tax credits, which may for example be based on amounts of capital expenditures, exports, or research and development expenditures. Such benefits are often granted and calculated on an annual basis under tax laws and regulations and therefore, are generally reflected in the estimated annual effective income tax rate used in the interim report. However, if tax benefits relate to a one-time event, they must be excluded from the estimate of the annual rate and deducted separately from income tax expense in that interim period, in the same way that special tax rates applicable to particular categories of income are not blended into a single effective annual tax rate. Occasionally, some tax credits are more akin to a government grant, which are recognised in the interim period in which they arise. [IAS 34.IE B19]. Similar considerations arise in determining the extent to which the existence of non-taxable income or non-deductible expenditure must be incorporated into the estimate of the weighted-average annual income tax rate expected for the full financial year. This requires the exercise of judgement.

In the Practical example 9-2 below, Anheuser-Busch InBev NV/SA explains the reasons for an increase in the effective tax rate in the interim period and the effect of expenditure that is not deductible for tax purposes.

Practical example 9-2:	Anheuser-Busch InBev NV/SA (Half-year 2023)	Belgium
Unaudited Interim Report for the six-month period ended 30 June 2023 [extract]		
Notes to the consolidated financial statements [extract]		
9. Income taxes [extract]		
...		
<p>The total income tax expense for the six-month period ended 30 June 2023 amounts to 1 192m US dollar compared to 1 244m US dollar for the six-month period ended 30 June 2022. The effective tax rate for the six-month period ended 30 June 2023 was 31.9% compared to an effective tax rate of 26.3% for the six-month period ended 30 June 2022.</p>		
<p>The 2023 effective tax rate was negatively impacted by non-deductible losses from derivatives related to hedging of share-based payment programs and hedging of the shares issued in a transaction related to the combination with Grupo Modelo and SAB, while the 2022 effective tax rate was positively impacted by non-taxable gains from these derivatives.</p>

9.5.7 Pillar Two Income Taxes

Governments around the world are introducing local legislation to implement the Base Erosion and Profit Shifting (BEPS) Pillar Two Model Rules published by the Organisation for Economic Co-operation and Development (OECD). The Pillar Two model rules apply to multinational enterprises (MNEs) with revenue in excess of EUR 750 million per their consolidated financial statements. These rules introduce new taxing mechanisms under which MNEs would pay a minimum level of tax. The mechanism for calculating additional taxes payable under these rules is complex and in recognition of the complexities involved, the IASB issued *International Tax Reform-Pillar Two Model Rules - Amendments to IAS 12 (the Amendments)* in May 2023. Pillar Two income taxes and the related amendments to IAS 12 are discussed in Chapter 29.

The amendments to IAS 12, have introduced a mandatory exception to the accounting and disclosure of information related to deferred taxes arising from the jurisdictional implementation of the Pillar Two model rules. [IAS 12.4A]. However, the amendments have introduced the following disclosure requirements that may be relevant to interim financial statements:

- (a) to disclose that the entity has applied the exception to recognising and disclosing information about deferred tax assets and liabilities related to Pillar Two income taxes. [IAS 12.88A].
- (b) to disclose separately its current tax expense (income) related to Pillar Two income taxes. [IAS 12.88B].
- (c) in periods in which Pillar Two legislation is enacted or substantively enacted but not yet in effect, to disclose known or reasonably estimable information that helps users of financial statements understand the entity's exposure to Pillar Two income taxes arising from that legislation. [IAS 12.88C].
- (d) To meet the disclosure requirement in (c) above, an entity shall disclose 'qualitative and quantitative information about its exposure to Pillar Two income taxes at the end of the reporting period'. [IAS 12.88D]

The amendment provides a relief from including disclosures in paragraphs (b) to (d) above in any interim period ending on or before 31 December 2023. [IAS 12.98M(b)].

IAS 34 was not consequentially amended to reflect the new requirements introduced in IAS 12.

Accordingly, the general principles and requirements in IAS 34, in respect of a condensed interim financial statement (see section 3.2 above), also apply to the requirements in paragraphs 88A-88D of IAS 12 related to Pillar Two income taxes. Where an entity prepares a complete set of financial statements the guidance in section 3.1 above is applicable.

How we see it

In our view, where an entity publishes condensed interim financial statements in its interim financial report, the information regarding mandatory exception as required in (a) above must be included in the condensed interim financial statements published for interim periods within the first annual reporting period the mandatory exception is applied. This is consistent with the requirements in IAS 34.16A(a) to disclose details of any changes in accounting policies and methods of computation compared with the most recent annual financial statements, as discussed in sections 8.1.2 and 8.1.2.A above.

Further, the principles in paragraph 15 and 16A of IAS 34, regarding disclosure of items that are significant to an understanding of the performance of an entity in an interim period, may apply to disclosure of information required in paragraphs (b) to (d) above except in condensed interim financial statements prepared for interim periods ending on or before 31 December 2023, as mentioned above.

Where an entity publishes complete financial statements in its interim financial report, the requirements in IAS 1 would apply as discussed in section 3.1 above.

As described in (b) above, in the periods when the Pillar Two legislation becomes effective, IAS 12.88B requires an entity to disclose separately its current tax expense (income) arising from Pillar Two Model Rules. The current tax expense for Pillar Two income taxes is measured under the existing principles in IAS 34 as discussed in section 9.5.1 above, i.e., by applying a best estimate of the weighted average annual income tax rate expected for the full financial year to the actual pre-tax income of the interim period. However, given paragraph 88B of IAS 12 requires an entity to disclose separately its current tax expense (income) arising from Pillar Two income taxes, such current tax expense (income) needs to be calculated separately from the interim expense (income) for other taxes in scope of IAS 12.

Lastly, entities must consider whether Pillar Two tax legislation is a source of estimation uncertainty that needs to be disclosed in the annual financial statements as required by IAS 1.125. (See Chapter 3). Any update to this information is disclosed in the interim financial statements as required by IAS 34.15 (see Section 4.1 above).

In the Practical example 9-3 below, Shell plc separately discloses the current tax expense related to Pillar Two income taxes as required by (b) above:

Practical example 9-3: Shell plc (Quarter 1 2024)			United Kingdom
1st QUARTER 2024 UNAUDITED RESULTS [extract]			
NOTES TO THE UNAUDITED CONDENSED CONSOLIDATED INTERIM FINANCIAL STATEMENTS [extract]			
8. Other notes to the unaudited Condensed Consolidated Interim Financial Statements [extract]			
...			
Taxation charge/credit			
Quarters			\$ million
Q1 2024	Q4 2023	Q1 2023	
3,604	1,099	5,582	Taxation charge/(credit)
			Of which:
3,525	1,099	5,582	Income tax excluding Pillar Two income tax
79	—	—	Income tax related to Pillar Two income tax
On June 20, 2023, the UK substantively enacted Pillar Two Model Rules, effective as from January 1, 2024.			
...			

9.6 Foreign currency translation

9.6.1 Foreign currency translation gains and losses

An entity measures foreign currency translation gains and losses for interim financial reporting using the same principles that IAS 21 *The Effects of Changes in Foreign Exchange Rates* requires at year-end (see Chapter 16). [IAS 34.IE B29]. An entity must use the actual average and closing foreign exchange rates for the interim period (i.e., it may not anticipate changes in foreign exchange rates for the remainder of the current year in translating at an interim date). [IAS 34.IE B30]. Where IAS 21 requires translation adjustments to be recognised as income or expense in the period in which they arise, the same approach must be used in the interim report. An entity cannot defer some foreign currency translation adjustments at an interim date, even if it expects the adjustment to reverse before year-end. [IAS 34.IE B31].

9.6.2 Interim financial reporting in hyperinflationary economies

Interim financial reports in hyperinflationary economies are prepared using the same principles as at year-end. [IAS 34.IE B32]. IAS 29 *Financial Reporting in Hyperinflationary Economies* requires that the financial statements of an entity that reports in the currency of a hyperinflationary economy be stated in terms of the measuring unit current at the end of the reporting period, and the gain or loss on the net monetary position be included in net income. In addition, comparative financial data reported for prior periods must be restated to the current measuring unit. [IAS 34.IE B33]. As shown in Illustration 5-1 and Illustration 5-2 in section 5 above, IAS 34 requires an interim report to contain many components, which are all restated at every interim reporting date.

The measuring unit used is the same as that as of the end of the interim period, with the resulting gain or loss on the net monetary position included in that period's net income. An entity cannot annualise the recognition of gains or losses, or estimate an annual inflation rate in preparing an interim financial report in a hyperinflationary economy. [IAS 34.IE B34].

IAS 29 applies from the beginning of the reporting period in which an entity identifies the existence of hyperinflation in the country in whose currency it reports. [IAS 29.4]. Accordingly, for interim reporting purposes, IAS 29 must be applied from the beginning of the interim period in which the hyperinflation is identified. In addition, when presenting year-to-date information in accordance with paragraph 20(b) of IAS 34, IAS 29 must be applied from the beginning of the annual financial year. Furthermore, the IFRS IC has clarified that in the reporting period in which an entity identifies the existence of hyperinflation in the economy of its functional currency, adoption of IAS 29 must be fully retrospective, by applying its requirements as if the economy had always been hyperinflationary. [IFRIC 7.3]. The requirement to adopt IAS 29 fully retrospectively applies only to the entity with a functional currency of a hyperinflationary economy and does not apply to its parent entity that has a functional currency of a non-hyperinflationary economy or the group that consolidates the entity (see Chapter 17).

See Chapter 17 for more detailed discussion regarding interim financial reporting in hyperinflationary economies.

9.7 Provisions, contingencies and accruals for other costs.

9.7.1 Provisions

IAS 34 requires an entity to apply the same criteria for recognising and measuring a provision at an interim date as it would at year-end. [IAS 34.IE B4]. Hence, an entity must recognise a provision when it has no realistic alternative but to transfer economic benefits because of an event that has created a legal or constructive obligation. [IAS 34.IE B3]. The standard emphasises that the existence or non-existence of an obligation to transfer benefits is a question of fact and does not depend on the length of the reporting period. [IAS 34.IE B4]. Also, as noted in section 8.1.1 above, measurement on a year-to-date basis requires that a liability at the end of an interim reporting period must represent an existing obligation at that date, just as it must at the end of an annual reporting period. [IAS 34.32]. Entities cannot anticipate obligations that are expected to arise later in the annual reporting period.

The obligation is adjusted upward or downward at each interim reporting date, if the entity's best estimate of the amount of the obligation changes. The standard states that any corresponding loss or gain must normally be recognised in profit or loss. [IAS 34.IE B3]. However, an entity applying IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* might instead need to adjust the carrying amount of the corresponding asset rather than recognise a gain or loss (see Chapter 27). [IFRIC 1.4, IFRIC 1.5, IFRIC 1.6].

9.7.2 Other planned but irregularly occurring costs

Many entities budget for costs that they expect to incur irregularly during the year, such as advertising campaigns, employee training and charitable contributions. Even though these costs are planned and expected to recur annually, they tend to be discretionary in nature. Therefore, it is generally not appropriate to recognise an obligation at the end of an interim financial reporting period for such costs that are not yet incurred, as they do not meet the definition of a liability. [IAS 34.IE B11].

As discussed in section 8.2.2 above, IAS 34 prohibits the recognition or deferral of costs incurred unevenly throughout the year at the interim date if recognition or deferral would be inappropriate at year-end. [IAS 34.39]. Accordingly, such costs must be recognised as they are incurred and an entity cannot recognise provisions or accruals in the interim report to adjust these costs to their budgeted amount.

9.7.3 Major planned periodic maintenance or overhaul

The cost of periodic maintenance, a planned major overhaul, or other seasonal expenditures expected to occur after the interim reporting date cannot be recognised for interim reporting purposes unless an event before the end of the interim period causes the entity to have a legal or constructive obligation. The mere intention or necessity to incur expenditures in the future is not sufficient to recognise an obligation as at the interim reporting date. [IAS 34.IE B2]. Similarly, an entity may not defer and amortise such costs if they are incurred early in the year, but do not satisfy the criteria for recognition as an asset as at the interim reporting date.

9.7.4 Variable lease payments

Variable lease payments can create legal or constructive obligations that are recognised as liabilities even though such amounts are not included in the lease liability in the period. If a lease includes variable payments based on achieving a certain level of annual sales (or annual use of the asset), an obligation can arise in an interim period before the required level of annual sales (or usage) is achieved. If the entity expects to achieve the required level of annual sales (or usage), it must recognise a liability as it has no realistic alternative but to make the future lease payment. [IAS 34.IE B7]. See Chapter 24 for further discussion on variable lease payments.

9.7.5 Levies charged by public authorities

When governments or other public authorities impose levies on entities in relation to their activities, as opposed to income taxes, it is not always clear when the liability to pay a levy arises and a provision must be recognised. IFRIC 21 *Levies* addresses this issue. The scope of the Interpretation is limited to provisions within the scope of IAS 37 and specifically need not be applied to emissions trading schemes. [IFRIC 21.2, IFRIC 21.6].

The Interpretation requires that for an activity within its scope, an entity must recognise a liability for a levy only when the activity that triggers payment, as identified by the relevant legislation, occurs. [IFRIC 21.8].

The Interpretation states that neither a constructive nor a present obligation arises as a result of being economically compelled to continue operating; or from any implication of continuing operations in the future arising from the use of the going concern assumption in the preparation of financial statements (see Chapter 27). [IFRIC 21.9, IFRIC 21.10].

The Interpretation states that the same recognition principles must be applied in the interim financial statements. Therefore, a liability for any levy cannot be anticipated if there is no present obligation to pay the levy at the end of the interim reporting period. Similarly, a liability cannot be deferred if a present obligation to pay the levy exists at the end of the interim period. [IFRIC 21.13].

This is relatively simple when a levy is triggered on a specific day or when a specific event occurs. When a levy is triggered progressively, for example as the entity generates revenues, the levy is accrued over time. At any time in the year, the entity would have a present obligation to pay an amount of levy that would be based on revenues generated to that date and recognises a liability and an expense on that basis. [IFRIC 21.11].

The following Illustrations show the above principles in a number of scenarios and demonstrate how the appropriate accounting treatment has to reflect the specific facts and circumstances that apply in determining an entity's obligation to pay the levy in line with the relevant legislation.

When the legislation provides that a levy is triggered by an entity operating in a market only at the end of the annual reporting period, no liability is recognised until the last day of the annual reporting period. No amount is recognised before that date in anticipation of the entity still operating in the market. This means that in the interim financial reports for that year, no liability for the levy expense is recognised. Only if the entity reports for the last quarter of that year would the expenditure appear in an interim report. [IFRIC 21.IE1 Example 3].

If a levy is triggered in full as soon as the entity commences generating revenues, the liability is recognised in full on the first day that the entity commences generating revenue. In this case, the entity does not defer any expense and amortise this amount over the year or otherwise allocate it to subsequent interim periods. The Illustration below demonstrates this situation. [IFRIC 21.IE1 Example 2].

Illustration 9-12: A levy is triggered in full as soon as the entity generates revenue

An entity has a calendar year end. In accordance with legislation, a levy is triggered in full as soon as the entity generates revenue in 20X3. The amount of the levy is determined by reference to revenue generated by the entity in 20X2. The entity generated revenue in 20X2 and starts to generate revenue in 20X3 on 3 January 20X3.

In this example, the liability is recognised in full on 3 January 20X3 because the obligating event, as identified by the legislation, is the first generation of revenue in 20X3. The generation of revenue in 20X2 is necessary, but not sufficient, to create a present obligation to pay a levy. Before 3 January 20X3, the entity has no obligation. In other words, the activity that triggers the payment of the levy as identified by the legislation is the first generation of revenue at a point in time in 20X3.

The generation of revenues in 20X2 is not the activity that triggers the payment of the levy. The amount of revenue generated in 20X2 only affects the measurement of the liability.

In the interim financial report, because the liability is recognised in full on 3 January 20X3, the expense is recognised in full in the first interim period of 20X3. The expense cannot be deferred until subsequent interim periods and shall not be anticipated in previous interim periods.

Another situation is when a levy is triggered in full as soon as the entity generates revenue from an activity above a certain annual threshold. This is shown in the following Illustration. [IFRIC 21.IE1 Example 4].

Illustration 9-13: A levy is triggered in full as soon as the entity generates revenue from a certain activity above an annual threshold, which is reduced *pro rata* when the entity ceases participation in that activity during the year

A bank has a calendar year-end. In accordance with legislation, a bank levy is triggered only if the bank generated revenue above the annual threshold of CU10 million in 20X3. The amount of the levy payable is calculated based on 0.1% of the annual threshold of CU10 million and is assessed as at 31 December every year. i.e., annual revenue below CU10 million attracts no levy and revenue of at least CU10 million attracts a levy of CU10,000 (0.1% × CU10 million). However, if the bank ceases operations during the year, the annual threshold of CU10 million will then be reduced *pro rata*, based on the number of days the bank was in operation during the year and the levy payable will then be based on 0.1% of the pro-rated annual threshold.

The owners of the bank ceased operation with effect from 1 July 20X3. As at 31 March 20X3 and 30 June 20X3, the revenue generated amounted to CU4 million and CU8 million, respectively.

In this example, the liability is recognised in the interim financial report as follows:

31 March 20X3:	Nil
30 June 20X3:	Nil
30 September 20X3:	CU5,000 (CU10 million × (6/12 months) × 0.1%)
31 December 20X3:	CU5,000 (CU10 million × (6/12 months) × 0.1%)

Based on discussions by the IFRS IC during their March 2015 meeting, the threshold for determining the entity's liability would only be reduced (or pro-rated) if, and only if, the entity stops the relevant activity before the end of the annual assessment period.⁴ This means that the pro-rated annual threshold would only apply from the date the entity stops the relevant activity in the market.

At 31 March 20X3 and 30 June 20X3, the bank has not ceased operations and the annual threshold remains at CU10 million. Since the revenue generated as at 31 March 20X3 and 30 June 20X3 did not meet the annual threshold, no liability is recognised under IFRIC 21 on both dates.

In contrast, the bank ceased operation from 1 July 20X3. Hence, the annual threshold would have been pro-rated and reduced to CU5 million at that date.

For the quarters as at 30 September and 31 December 20X3, a liability of CU5,000 must thus be recognised accordingly.

In many countries, property taxes are levied by municipalities or other local government bodies on the owner of a property. Such taxes are relevant and may be material to entities in certain sectors (e.g., real estate). Even within a single jurisdiction, there could be several different property tax mechanisms. Generally, each property tax arrangement must be assessed on its own merits. To facilitate such assessments, we have explored some example fact patterns of property tax mechanisms in the following Illustrations:

Illustration 9-14: A levy is triggered in full as soon as the entity holds the property at a specified date

In accordance with the legislation, property tax is imposed on the registered owner of the property as at 1 April each year. The amount payable is calculated based on 0.1% of the appraised value estimated by the tax authorities as at 1 April each year. Payments are to be made in arrears in instalments on June, September, December and March month-end dates and any unpaid instalments remain as the liability of the registered owner of the property as at 1 April.

The law also states that if the property is sold during the year, there will be no refund from the government to the seller. The new property owner will only be liable to pay the property tax on 1 April of the coming year, subsequent to the date of purchase.

An entity has a calendar year-end and prepares quarterly interim financial reports. It holds a property as at 1 April 20X3, which has an appraised value of CU50 million. On 30 June 20X3, it sold the property to another entity.

In this example, the liability is recognised in the interim financial report as follows:

31 March 20X3:	Nil, since the obligating event is not until 1 April, assuming that all previous year instalments have been paid on time
1 April 20X3:	CU50,000 (CU50 million × 0.1%), i.e., the liability is recognised in full

For the subsequent interim period's reports as at 30 June, 30 September and 31 December, the liability recognised in the statement of financial position would be CU50,000 less the instalment payments made during the year.

If in a variation to the above fact pattern, the seller is able to obtain a refund of a proportionate share of the paid property tax (i.e., CU37,500) from the buyer of the property and this refund will form part of the sales price of the property based on the sales contract between the buyer and the seller, it would not change the accounting for the levy under IFRIC 21.

⁴ [IFRIC Update](#), March 2014, available on the IFRS Foundation's website.

Yet another situation arises where a levy is triggered progressively.

Illustration 9-15: A levy is triggered progressively as the entity holds the asset through a specified period of time

In accordance with the legislation, property tax is imposed on the registered owner of the property as at 1 April each year. The amount payable is calculated based on 0.1% of the appraised value estimated by the tax authorities as at 1 April each year. Payments are to be made in instalments at every March, June, September and December month-end.

The law does not explicitly state that the property tax relates to a period of time. However, if the property is sold during the year, the amount of property tax will be pro-rated for the period from 1 April to the date of sale, and any excess will be refunded to the entity by the government. The new property owner will only be liable to pay the property tax upon the date of purchase, for the period from the date of purchase.

An entity has a calendar year-end and prepares quarterly interim financial reports. It holds a property as at 1 April 20X3 to 31 March 20X4, which has an appraised value of CU50 million as at 1 April 20X3. Prior to 1 April 20X3 the entity did not hold any property. For simplicity, assume that the appraised value does not change year on year.

In this example, although the law does not explicitly state that the property tax relates to the entity holding the property over a period of time, it is evident that the obligating event occurs rateably over the 12-month period from 1 April to 31 March. This is because the law allows for a pro-rated refund to be given to the entity for the period whereby the entity no longer holds the property. This implies that it is a time-based progressive levy.

As such, the levy is triggered over a 12-month period and the liability is recognised rateably over the 12-month period. In contrast with Illustration 9-13, it is not the ownership of the property at a specified date that is the obligating event. Rather, it is the continued holding of the property throughout the period that gives rise to the obligating event.

As such, the liability is recognised in the interim report as follows:

31 March 20X3:	Nil
30 June 20X3:	CU12,500 (CU50,000 divided by 4), less any instalment payments made
30 September 20X3:	CU25,000 (cumulative portion of the prior quarter and current quarter), less any instalment payments made
31 December 20X3:	CU37,500 (cumulative portion of the prior two quarters and current quarter), less any instalment payments made
31 March 20X4:	CU50,000 (cumulative portion of the prior three quarter and current quarter), less any instalment payments made

The impact on interim reports for the various types of levies is summarised below:

Illustrative examples	Obligating event	Recognition of liability in interim reports
Levy triggered progressively as revenue is generated in specified period	Generation of revenue in the specified period	Recognise progressively based on revenue generated
Levy triggered in full as soon as revenue is generated in one period, based on revenues from a previous period	First generation of revenue in subsequent period	Recognise only if first revenue generated in interim period
Levy triggered in full if entity operates as a bank at the end of the annual reporting period	Operating as a bank at the end of the reporting period	Recognise only if interim period includes the last day of the annual reporting period specified in the legislation. Otherwise, a provision would not be permitted to be recognised in interim reports
Levy triggered if revenues are above a minimum specified threshold (e.g., when a certain level of revenue has been achieved)	Reaching the specified minimum threshold	Recognise only where the minimum threshold has been met or exceeded during the interim period. Otherwise, a provision would not be permitted to be recognised in interim reports

These requirements illustrate what is meant by the concept of the 'year-to-date' basis in IAS 34 which is discussed in section 8 above.

9.8 Earnings per share

Earnings per share (EPS) in an interim period is computed in the same way as for annual periods. However, IAS 33 *Earnings per Share* does not allow diluted EPS of a prior period to be restated for subsequent changes in the assumptions used in those EPS calculations. [IAS 33.65]. This approach might be perceived as inconsistent to the year-to-date approach which must be followed for computing EPS for an interim period. For example, if an entity, reporting quarterly, computes diluted EPS in its first quarter financial statements, it cannot restate the reported diluted EPS subsequently for any changes in the assumptions used. However, following a year-to-date approach, the entity must consider the revised assumptions to compute the diluted EPS for the six months in its second quarter financial statements, which, in this case would not be the sum of its diluted EPS for first quarter and the second quarter.

10 Use of estimates

IAS 34 requires that the measurement procedures followed in an interim financial report must be designed to ensure that the resulting information is reliable and that all material financial information that is relevant to an understanding of the financial position or performance of the entity is appropriately disclosed. Whilst estimation is necessary in both interim and annual financial statements, the standard recognises that preparing interim financial reports generally requires greater use of estimates than at year-end. [IAS 34.41]. Because the standard accepts a higher degree of estimation by the entity, the measurement of assets and liabilities at an interim date may involve less use of outside experts in determining amounts for items such as provisions, contingencies, pensions or non-current assets revalued at fair values. Reliable measurement of such amounts may simply involve updating the previously reported year-end position. The procedures may be less rigorous than those at year-end. The Illustration below is based on Part C of the illustrative examples to IAS 34. [IAS 34.42].

Illustration 10-1: Use of estimates

<i>Inventories</i>	Full stock-taking and valuation procedures may not be required for inventories at interim dates, although it may be done at year-end. It may be sufficient to make estimates at interim dates based on sales margins.
<i>Classifications of current and non-current assets and liabilities</i>	Entities may do a more thorough investigation for classifying assets and liabilities as current or non-current at annual reporting dates than at interim dates.
<i>Provisions</i>	Determining the appropriate provision (such as a provision for warranties, environmental costs, and site restoration costs) may be complex and often costly and time-consuming. Entities sometimes engage outside experts to assist in the annual calculations. Making similar estimates at interim dates often entails updating of the prior annual provision rather than the engaging of outside experts to do a new calculation.
<i>Pensions</i>	IAS 19 requires an entity to determine the present value of defined benefit obligations and the fair value of plan assets at the end of each reporting period and encourages an entity to involve a professionally qualified actuary in measurement of the obligations. As discussed in section 9.3.3 above, market values of plan assets as at the interim reporting date must be available without recourse to an actuary, and reliable measurement of defined benefit obligations for interim reporting purposes can often be extrapolated from the latest actuarial valuation.
<i>Income taxes</i>	Entities may calculate income tax expense and deferred income tax liability at annual dates by applying the tax rate for each individual jurisdiction to measures of income for each jurisdiction. Paragraph 14 of Appendix B (see section 9.5.1 above) acknowledges that while that degree of precision is desirable at interim reporting dates as well, it may not be achievable in all cases, and a weighted-average of rates across jurisdictions or across categories of income is used if it is a reasonable approximation of the effect of using more specific rates.
<i>Contingencies</i>	The measurement of contingencies may involve the opinions of legal experts or other advisers. Formal reports from independent experts are sometimes obtained for contingencies. Such opinions about litigation, claims, assessments, and other contingencies and uncertainties may or may not also be needed at interim dates.
<i>Revaluations and fair value accounting</i>	IAS 16 allows an entity to choose as its accounting policy the revaluation model whereby items of property, plant and equipment are revalued to fair value. IFRS 16 allows a lessee to measure right-of-use assets applying the revaluation model in IAS 16 if those right-of-use assets relate to a class of property, plant and equipment to which the lessee applies the revaluation model in IAS 16. Similarly, IAS 40 <i>Investment Property</i> requires an entity to measure the fair value of investment property. An entity must revalue at the end of the interim reporting period, but may choose not to rely on professionally qualified valuers to the extent that is required at year-end.

<i>Intercompany reconciliations</i>	Some intercompany balances that are reconciled on a detailed level in preparing consolidated financial statements at year-end might be reconciled at a less detailed level in preparing consolidated financial statements at an interim date.
<i>Specialised industries</i>	Because of complexity, costliness, and time, interim period measurements in specialised industries might be less precise than at year-end.

Although an entity is not required to use professionally qualified valuers at interim reporting dates, and may only update the previous year-end position, the entity is required to recognise impairments in the relevant interim period (see section 9.1.2 above).

11 Effective dates and transitional rules

11.1 First-time presentation of interim reports complying with IAS 34

IAS 34 does not contain any general transitional rules. Therefore, a reporting entity already applying IFRS accounting standards must apply the requirements of IAS 34 in full and without any transitional relief when it first chooses (or is required) to publish an interim financial report prepared under IFRS accounting standards.

For example, an entity that has already published annual financial statements prepared under IFRS accounting standards and either chooses (or is required) to prepare interim financial reports in compliance with IAS 34 must present all the information required by the standard for the current interim period, cumulatively for the current year-to-date, and for comparable periods (current and year-to-date) of the preceding year. [IAS 34.20]. The absence of any transitional provisions requires such entities to restate previously reported interim financial information to comply with IAS 34 and to present information relating to comparative interim periods, such as in respect of segment disclosures or in relation to asset write-downs and reversals thereof, which might not previously have been reported.

11.1.1 Condensed financial statements in the year of incorporation or when an entity converts from its local GAAP to IFRS accounting standards

The standard defines 'interim period' as a financial reporting period shorter than a full financial year, [IAS 34.4], and requires the format of condensed financial statements for an interim period to include each of the headings and subtotals that were included in the entity's most recent annual financial statements. [IAS 34.10].

Entities that have converted from local GAAP to IFRS accounting standards and have not yet presented annual financial statements under IFRS accounting standards are subject to additional requirements under IFRS 1 *First-time Adoption of International Financial Reporting Standards* when presenting interim reports in accordance with IAS 34. Such requirements are discussed in detail in Chapter 6. IAS 34 provides no guidance for an entity that either is required or chooses to issue interim financial statements before it has prepared a set of annual financial statements compliant with IFRS accounting standards. This situation as stated above might arise in the entity's first year of its existence or in the year in which the entity converts from its local GAAP to IFRS accounting standards. Whilst the standard does not prohibit the entity from preparing a condensed set of interim financial statements, it does not specify how an entity would interpret the minimum disclosure requirements of IAS 34 when there are no annual financial statements to refer to.

The entity must consider making additional disclosures to recognise that a user of this first set of interim financial statements does not have the access otherwise assumed by the standard to the most recent annual financial report of the entity. Accordingly, the explanation of significant events and transactions and changes in financial position in the period must be more detailed than the update normally expected in IAS 34. [IAS 34.15, IAS 34.15A]. In the absence of any specific regulatory requirements to which the entity is subject, the following are examples of additional considerations that would apply:

- Since it is not possible to make a statement that the same accounting policies and methods of computation have been applied, [IAS 34.16A(a)], the entity must disclose all those accounting policies and methods of computation in the same level of detail as it would in a set of annual financial statements. When the entity issues interim reports on a quarterly basis, the first quarter interim report must provide the above-mentioned details; subsequent quarterly reports could refer to the details included in the first quarter report.
- Similarly, the disclosure of the nature and amount of changes in estimates of amounts reported in prior periods will have to go into more detail than just the changes normally required to be disclosed. [IAS 34.16A(d)].
- Mere disclosure of transfers between levels of the fair value hierarchy used in measuring the fair value of financial instruments, [IAS 34.15B(k)], would not be meaningful unless put in the context of how those fair values are determined (e.g., methods used, any assumptions applied) and providing a detailed classification of all such financial instrument measurements using fair value hierarchy, based on the significance of the inputs used.
- Rather than disclosing changes in the basis of segmentation or in the basis of measurement of segment profit and loss, [IAS 34.16A(gXv)], a full description will be necessary, as will the disclosure of segment assets and liabilities, [IAS 34.16A(gXiv)], where such information is required to be disclosed in the annual financial statements. [IAS 34.16A(g)].

- More extensive disclosure than simply the changes since the last report date will be required for contingent liabilities and contingent assets. *[IAS 34.15B(m)]*.
- In the absence of a complete set of annual financial statements complying with IFRS accounting standards, the entity must include each of the headings and subtotals in the condensed financial statements that it would expect to include in its first financial statements prepared under IFRS accounting standards. *[IAS 34.10]*.

12. Future developments

12.1 IFRS 18 Presentation and Disclosure in Financial Statements

IFRS 18, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted), was issued by the IASB in April 2024.

See Chapter 4 for the consequential amendments to IAS 34 and Chapter 4 for further details on the transitional impact on interim financial reporting.

12.2 IFRS 19 Subsidiaries without Public Accountability: Disclosures

IFRS 19 was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries, that elect to apply IFRS 19, are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards.

IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement).

See Chapter 4 for further details on the requirements of IFRS 19.

Appendix B - Defined terms

Extract from IAS 34

Definitions

- 4 The following terms are used in this Standard with the meanings specified:
- Interim period* is a financial reporting period shorter than a full financial year.
- Interim financial report* means a financial report containing either a complete set of financial statements (as described in IAS 1 *Presentation of Financial Statements* (as revised in 2007)) or a set of condensed financial statements (as described in this Standard) for an interim period.

Overview

IAS 41 *Agriculture* prescribes the accounting treatment for most agricultural activity, from the initial recognition of a biological asset to the harvest of agricultural produce.

IAS 41 applies to some, but not all biological assets. In particular, IAS 41 excludes bearer plants, as defined, from its scope. Instead, they are within the scope of IAS 16 *Property, Plant and Equipment* and are subject to all of the requirements therein. However, agricultural produce growing on bearer plants (e.g., fruit growing on a tree) are within the scope of IAS 41 and are treated as biological assets.

Government grants related to agricultural activity are also within the scope of IAS 41. IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* applies to all other government grants and to disclosures about other government assistance.

This chapter discusses the requirements of IAS 41, along with the requirements that apply to bearer plants within the scope of IAS 16. It also discusses the accounting for trees held to generate carbon offsets for use or sale. The requirements of IAS 16 are discussed in Chapter 19. The requirements of IAS 20 are discussed in Chapter 25.

What you need to know

- IAS 41 prescribes the accounting treatment for biological assets, agricultural produce at the point of harvest and government grants related to agricultural activity.
- Bearer plants are within the scope of IAS 16, but IAS 41 applies to the produce growing on a bearer plant.
- Biological assets and agricultural produce at the point of harvest within the scope of IAS 41 are measured at fair value less costs to sell, with limited exceptions. IAS 41 includes a rebuttable presumption that fair value can be reliably measured for biological assets.

1 Introduction

IAS 41 applies to most biological assets, agricultural produce at the point of harvest, and government grants related to agricultural activity. Produce growing on a bearer plant is within the scope of IAS 41, but the bearer plants they grow on are within the scope of IAS 16.

Practical difficulties may arise when determining which assets are within the scope of the standard, particularly for arrangements that involve leases or concessions. Entities may also find it particularly challenging to apply two different measurement models under two different standards to bearer plants, as defined, and the produce growing thereon. However, it is IAS 41's application of the fair value model that can be the most challenging and contentious.

The nature of agricultural activity can create uncertainty or may conflict with traditional accounting models, particularly because the critical events associated with biological transformation (growth, degeneration, production, and procreation) that alter the substance of biological assets are difficult to deal with in an accounting model based on historical cost and realisation.

As a result, for assets that are in-scope, IAS 41 requires the application of the fair value model to animals and plant life alike, with limited relief. Under this approach, a market price for an animal or part-grown crop is presumed to exist (or is presumed to be reliably measurable if there is no such market price) and the animal or part-grown crop must be valued at this price in the entity's financial statements. The fair value model is applied to all biological assets that are in scope, regardless of whether they are consumed as part of the agricultural activity (consumable biological assets) or not (bearer biological assets).

2 Objective, definitions and scope

2.1 Objective

The stated objective of IAS 41 is: [IAS 41 Objective]

Extract from IAS 41

Objective

The objective of this Standard is to prescribe the accounting treatment and disclosures related to agricultural activity.

2.2 Definitions

2.2.1 Agriculture-related definitions

IAS 41 defines 'agricultural activity' as "the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets". [IAS 41.5].

The standard states that 'agricultural activity' covers a wide range of activities, e.g., "raising livestock, forestry, annual or perennial cropping, cultivating orchards and plantations, floriculture, and aquaculture (including fish farming)". [IAS 41.6]. Nevertheless, these agricultural activities have certain common features:

- "(a) *Capability to change*. Living animals and plants are capable of biological transformation;
- "(b) *Management of change*. Management facilitates biological transformation by enhancing, or at least stabilising, conditions necessary for the process to take place (for example, nutrient levels, moisture, temperature, fertility, and light). Such management distinguishes agricultural activity from other activities. For example, harvesting from unmanaged sources (such as ocean fishing and deforestation) is not agricultural activity; and
- "(c) *Measurement of change*. The change in quality (for example, genetic merit, density, ripeness, fat cover, protein content, and fibre strength) or quantity (for example, progeny, weight, cubic metres, fibre length or diameter, and number of buds) brought about by biological transformation or harvest is measured and monitored as a routine management function." [IAS 41.6].

Biological transformation under IAS 41 "comprises the processes of growth, degeneration, production, and procreation that cause qualitative or quantitative changes in a biological asset". [IAS 41.5]. The standard explains that biological transformation results in the following types of outcomes:

- "(a) asset changes through (i) growth (an increase in quantity or improvement in quality of an animal or plant), (ii) degeneration (a decrease in the quantity or deterioration in quality of an animal or plant), or (iii) procreation (creation of additional living animals or plants); or
- (b) production of agricultural produce such as latex, tea leaf, wool, and milk." [IAS 41.7].

IAS 41 defines the following additional terms that are used throughout the standard: [IAS 41.5]

- A *biological asset* is a living animal or plant.
- A *group of biological assets* is an aggregation of similar living animals or plants.
- *Agricultural produce* is the harvested product of the entity's biological assets.
- *Harvest* is the detachment of produce from a biological asset or the cessation of a biological asset's life processes.
- *Costs to sell* are the incremental costs directly attributable to the disposal of an asset, excluding finance costs and income taxes.

The standard provides examples to illustrate the above definitions. In addition to providing these examples, the standard notes that some of the plants mentioned in the table below may meet the definition of bearer plants and, therefore, be within the scope of IAS 16. However, the produce growing on such plants is within the scope of IAS 41 (see sections 2.2.1.A and 2.3.3 below) and is considered a biological asset. *[IAS 41.5C]*. Figure 2-1 below is based on those examples, but has been modified to provide examples of possible bearer plants and produce growing on those plants: *[IAS 41.4]*

Figure 2-1: Examples of biological assets (including possible bearer plants), agricultural produce and products that are the result of processing after harvest

Biological assets that may meet the definition of a bearer plant	Biological assets (including produce growing on a bearer plant)	Agricultural produce	Products that are the result of processing after harvest
	Sheep	Wool	Yarn, carpet
	Trees in a timber plantation	Felled trees	Logs, lumber
	Dairy cattle	Milk	Cheese
	Pigs	Carcass	Sausages, cured hams
Cotton plants	Growing cotton	Harvested cotton	Thread, clothing
Sugar-cane roots	Growing sugarcane	Harvested cane	Sugar
Tobacco plants	Leaves on the tobacco plants	Picked leaves	Cured tobacco
Tea bushes	Leaves on the tea bushes	Picked leaves	Tea
Grape vines	Grapes on the vines	Picked grapes	Wine
Fruit trees	Fruit on the trees	Picked fruit	Processed fruit
Oil palms	Growing fruit	Picked fruit	Palm oil
Rubber trees	Latex	Harvested latex	Rubber products

2.2.1.A Definition of bearer plants

A bearer plant is defined as “a living plant that:

- (a) is used in the production or supply of agricultural produce;
- (b) is expected to bear produce for more than one period; and
- (c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales”.

[IAS 41.5].

All of the above criteria need to be met for a plant to be considered a bearer plant.

The definition captures plants that would intuitively be considered to be bearers, for instance, grape vines. Some plants may appear to be consumable, such as the root systems of perennial plants (e.g., sugar cane, bamboo or asparagus), but due to the perennial nature of their root systems, it is likely they will also meet the definition of a bearer plant.

Annual crops and other plants that are held solely to be harvested as agricultural produce (e.g., many traditional arable crops such as maize, wheat and soya, as well as trees grown for lumber), are explicitly excluded from the definition of a bearer plant. In addition, plants that have a dual use (i.e., plants cultivated to bear agricultural produce, but for which there is more than a remote likelihood that the plant itself will be harvested and sold as agricultural produce, beyond incidental scrap sales) are not bearer plants. *[IAS 41.5A]*. This may be the case when, for example, an entity holds rubber trees to sell both the latex as agricultural produce and the trees as lumber.

Bearer animals, like bearer plants, may be held solely for the produce that they bear. However, when IAS 41 was amended to exclude bearer plants from its scope, bearer animals were explicitly excluded from the amendments and continue to be accounted for under IAS 41 on the basis that the measurement model would become more complex if applied to such assets.

How we see it

Determining whether an asset meets the definition of a bearer plant may not be entirely intuitive. Careful assessment is, therefore, important. We believe that judgement is needed, in particular in determining:

- Whether the plant will be used in the production or supply of agricultural produce
- Whether the plant is expected to bear produce for more than one period
- What constitutes incidental scrap sales

We discuss these areas of judgement in more detail below.

- *Used in the production or supply of agricultural produce*

Judgement might be needed to determine whether a plant is used in the production or supply of agricultural produce, rather than consumed in the process. For example, some plants that are generally thought of as consumable are harvested twice, but with the first harvest having the principal purpose of improving the yield of the second harvest. It is not clear whether the fact that there are two harvests is sufficient to make these plants bearer assets.

For certain plants, new produce may be capable of being grown from various parts of the plant (e.g., pineapples). For others, the plant itself may be cut back and re-grown. For example, after a harvest of bananas, the banana plant may be cut down to its base and re-grown the next year to produce more bananas. In such situations, judgement may be needed to determine which part of the plant might be the bearer plant (e.g., the banana palm or the base).

- *Expected to bear produce for more than one period*

The definition of a bearer plant requires that a plant be expected to bear produce for more than one period. It would seem appropriate to think of an annual period in this context. However, the standard does not use this term, so an entity needs to consider if an interim period, a season or a production cycle (i.e., through to harvest) might also be appropriate.

- *Incidental scrap sales*

Whether the likelihood of the plant being sold as agricultural produce is remote is also a matter of judgement. However, it is intended to be a high hurdle. The standard does allow for the fact that there may be some 'incidental scrap sales', but this term is not defined.

The standard notes that bearer plants might be cut down and sold as scrap, (e.g., for firewood) at the end of their productive life and states that "such incidental scrap sales would not prevent the plant from satisfying the definition of a bearer plant". [IAS 41.5B]. However, in the example given in the standard (i.e., firewood), it is reasonably evident that such sales would be 'incidental'. Since no further guidance is given in the standard, entities need to apply judgement in determining what constitutes 'scrap sales' (e.g., would it include ad-hoc sales before the productive life ends, such as selling trees removed while thinning?). Furthermore, the standard does not clarify at what level sales cease to be incidental and whether this is a qualitative or quantitative assessment. Therefore, judgement could be needed.

Frequently asked questions

Question 2-1: What IFRS accounting standard applies if a plant initially meets the definition of a bearer plant, but this subsequently changes?

In addition to the considerations above, an entity might also need to reassess whether a plant meets the definition of a bearer plant after initial recognition. If a plant initially meets the definition of a bearer plant, but this subsequently changes, would IAS 41 then apply instead of IAS 16? Neither IAS 16 nor IAS 41 address this question or specify how to transfer such assets between IAS 16 and IAS 41 (or *vice versa*).

How we see it

In the absence of guidance, management will need to apply judgement in developing an accounting policy (in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*) in these situations. For example, entities might look to the requirements in IAS 40 *Investment Property* on transfers of property to, or from investment property for guidance on determining the threshold for when to account for a transfer of bearer plants to biological assets. IAS 40.57 requires a transfer when there is 'a change in use' and states that "A change in use occurs when ... there is evidence of the change in use. In isolation, a change in management's intentions for the use of a property does not provide evidence of a change in use".

It is, however, important to note that the Basis for Conclusions on IAS 16 states, "The Board noted that it would be rare for transfers to take place between IAS 16 and IAS 41 for bearer plants, particularly in the light of the Board's decision to change criterion (c) of the definition of a bearer plant to 'has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales'". [IAS 16.BC83].

2.2.2 General definitions

IAS 41 defines the general terms it uses throughout the standard as follows: [IAS 41.8]

- *Carrying amount* is the amount at which an asset is recognised in the statement of financial position.
- *Government grants* are as defined in IAS 20 (see Chapter 25).

IFRS 13 *Fair Value Measurement* defines fair value as "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date". [IAS 41.8, IFRS 13.9]. Measuring fair value in accordance with IFRS 13 is discussed further in section 4 below and in Chapter 15.

2.3 Scope

IAS 41 applies to most biological assets, agricultural produce at the point of harvest, and government grants involving biological assets measured at fair value less costs to sell. However, to be within the scope of IAS 41, these items must relate to agricultural activity. [IAS 41.1]. As discussed in section 2.2.1 above, agricultural activity refers to "the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets". [IAS 41.5]. It is important to note that this definition does not focus on the primary purpose of holding such assets or the number of sales that may result. In fact, the definition refers to 'sale or conversion'; therefore, an entity need not intend to sell the biological assets or agricultural produce in order for the entity to be undertaking agricultural activity. Furthermore, the standard contemplates an entity applying IAS 41 to assets that it will use itself; the Basis for Conclusions refers, as an example, to an entity accounting for trees as biological assets within IAS 41 when it intends to use the harvested logs in the construction of a building for its own use. [IAS 41.B8].

IAS 41 explicitly excludes the following assets from its scope: [IAS 41.2]

- Bearer plants (see section 2.2.1.A above), which are within the scope of IAS 16 (see Chapter 19), however, produce growing on a bearer plant is still within the scope of IAS 41
 - Government grants that relate to bearer plants, to which IAS 20 applies (see Chapter 25)
 - Land related to agricultural activity, which are accounted for under either IAS 16 (see Chapter 19) or IAS 40 (see Chapter 20) [IAS 41.B55, IAS 41.B56, IAS 41.B57]
 - Intangible assets related to agricultural activity, for instance the costs of developing new disease resistant crops, which are accounted for under IAS 38 *Intangible Assets* (see Chapter 18) [IAS 41.B58, IAS 41.B59, IAS 41.B60]
- And
- Right-of-use assets arising from a lease of land related to agricultural activity, which is accounted for under IFRS 16 *Leases* (see Chapter 24)

2.3.1 Biological assets outside the scope of IAS 41

Biological assets are outside the scope of IAS 41 when they are not used in agricultural activity. For example, animals in a zoo (or game park) that does not have an active breeding programme and rarely sells any animals or animal products would be outside the scope of the standard. Another example is activities in the pharmaceutical industry that involve the culture of bacteria. Such activity would not fall within the scope of IAS 41. While the bacteria could be considered a biological asset, the development of a culture by a pharmaceutical company would not constitute agricultural activity. Refer to section 2.3.7 below for further discussion on trees held to generate carbon offsets.

Biological assets outside the scope of IAS 41 will normally fall within the scope of either IAS 16 (see Chapter 19) or IAS 2 *Inventories* (see Chapter 23).

2.3.2 Agricultural produce before and after harvest

IAS 41 applies to agricultural produce (i.e., harvested produce) at the point of harvest only; not subsequent to harvest. Under IAS 41, unharvested agricultural produce is considered to be part of the biological asset from which it will be harvested. Therefore, before harvest, agricultural produce is not accounted for separately from the biological asset from which it comes. For example, milk is accounted for as part of the dairy cow right up to the moment at which the cow is milked.

Subsequent to harvest, agricultural produce is accounted for under IAS 2 or another standard, if applicable. [IAS 41.3]. Under IAS 2, agricultural produce is initially recognised as inventory at its fair value less costs to sell (measured in accordance with IAS 41), which becomes its cost for IAS 2 purposes (see Chapter 23).

[IAS 41.B41, IAS 41.B42, IAS 41.B43, IAS 41.B44, IAS 41.B45].

2.3.3 Bearer plants and produce growing on a bearer plant

IAS 41 explicitly excludes bearer plants (see section 2.2.1.A above) from its scope; instead, IAS 16 applies to these assets (see Chapter 19). However, the produce growing on a bearer plant remains within the scope of IAS 41. [IAS 41.2(b)].

Entities will need to carefully assess which of its plants meet the definition of a bearer plant. This is because the scope exclusion, while focused on the definition of a bearer plant, also affects the accounting treatment for the produce growing on a bearer plant and any related government grants (see section 3.3 below).

Bearer plants and their agricultural produce are considered to be two separate assets for accounting purposes (i.e., two units of account), with different measurement models being applied under different standards (see section 3.2.3 below for further discussion).

In developing the requirements for bearer plants, the Board noted that bearer plants are held by an entity solely to grow produce over their productive life, similar to plant and equipment and, therefore, do not directly affect the entity's future cash flows. As a result, it decided that bearer plants need to be treated as property, plant and equipment in accordance with IAS 16. However, the IASB believes that "the same argument is not true for the produce growing on the bearer plants that is undergoing biological transformation until it is harvested (for example, grapes growing on a grape vine). The Board observed that the produce is a consumable biological asset growing on the bearer plant and the growth of the produce directly increases the expected revenue from the sale of the produce. Consequently, fair value measurement of the growing produce provides useful information to users of financial statements about future cash flows that an entity is expected to realise". [IAS 41.BC4B]. The Board also indicated that such produce ultimately has a market value on its own, whereas the bearer plants on which it grows generally do not. As such, the Board decided that produce growing on a bearer plant would remain within the scope of IAS 41, which is expected to ensure consistency between produce growing in the ground and produce growing on a bearer plant. [IAS 41.BC4A, IAS 41.BC4B, IAS 41.BC4C, IAS 41.BC4D].

2.3.4 Products that are the result of processing after harvest

IAS 41 does not deal with the processing of agricultural produce after harvest. The standard makes it clear that, even if the processing is considered "a logical and natural extension of agricultural activity, and the events taking place ... bear some similarity to biological transformation, such processing is not included within the definition of agricultural activity". [IAS 41.3]. For example, the process of brewing beer - in which yeast (a fungus) converts sugars into alcohol - would not meet the definition of agricultural activity in the standard. Similarly, cheese production would fall outside the definition of agricultural activity.

2.3.5 Leases of biological assets (excluding bearer plants)

Leases involving biological assets are common in some jurisdictions, for example, the leasing of a sheep farm, where the lessee rents the farm, including the land, sheep and other assets, tends the sheep and sells the wool (agricultural produce). Other examples include leased dairy cows, or leased vineyards, as is illustrated below.

Illustration 2-1: Renting out land with producing vines under an operating lease

Entity A owns a vineyard that includes the following main assets: vineyard land, vineyard infrastructure (e.g., trellises), winery buildings, winery plant and machinery (crushing equipment, distilling equipment), vines and grapes.

The vineyard (the vineyard land and vines) is rented out (as an operating lease) such that the lessee can grow and harvest grapes, and in some instances process the grapes using the winery plant and equipment. Entity A (the lessor) is not entitled to the grapes harvested from the vines. There is no adjustment or contingent rental at the end of the lease for payments or rebates in the movement of the market value of the vines during the lease term.

Under the contract, the lessee must manage the vines including pruning, irrigation, fertilisation, soil management and other necessary activities to preserve and maintain the vineyard and the vines in a proper and efficient state of cultivation in accordance with best viticultural practice. These obligations protect the lessor's interest in the vines by maintaining the long-term health and productivity of the vineyard, and are similar in nature to the obligations of a lessee of a building to ensure that the building is in a suitable condition to be re-let at the end of the lease.

Entity A does not actively participate in the managing of the vines themselves, or the soil that the vines grow in, and it does not have any employees or contractors who are viticulturists. Also, Entity A does not participate in the operating plans or budgets of the lessees.

The risks associated with claims and damages to the vineyard including diseases reside with the lessee for the term of the lease. The lessee takes the risk of loss of grapes from the vines, and takes the risk of deterioration (or improvement) in yields and quality because of disease and weather. Entity A is only at risk for deterioration of the vines from disease at the end of the lease, when renewals are renegotiated.

The grapes produced on Entity A's vineyard are predominantly premium quality grapes. However, these grapes do not have any unique qualities and can be replaced by the grapes grown in the same area under similar conditions.

Any upgrades to the vineyard, such as additional vines plantations or change in grape varieties, made by the lessee must be agreed with Entity A in advance. The upgrades are carried out by the lessee on behalf of Entity A, with Entity A reimbursing upgrade costs to the lessee. The upgrades attract additional lease payments.

Entity A considers the definition of agricultural activity in IAS 41. Entity A notes there is the capability for biological transformation, they are able to measure those changes and there is also harvest of produce resulting from that biological transformation. There is also management of the biological transformation, even though Entity A does not manage the change itself (the lessee manages that change instead).

How we see it

IAS 41 does not specify who must do the managing. Therefore, we believe the definition of agricultural activity can be met even when an entity is not directly managing the biological transformation itself.

Therefore, Entity A concludes that renting out of land containing vines producing grapes under an operating lease by a lessor is within that definition. As a result, the vines are a bearer plant (see section 2.3.3 above) related to agricultural activity and the grapes growing on the vines are biological assets related to agricultural produce.

2.3.5.A Leases of biological assets (excluding bearer plants) - lessee accounting

IFRS 16 excludes from its scope the lessee accounting for leases of biological assets that are within the scope of IAS 41. [IFRS 16.3(b)]. The scope exemption in IFRS 16 does not specify whether the asset would be recognised in accordance with IAS 41; only that it is an asset that would be within the scope of IAS 41. Nor does it explain how an entity would account for its lease liability since it is outside the scope of IFRS 16.

Entities affected by this scope exemption will need to use judgement to develop an appropriate accounting policy, considering the requirements of IAS 8¹ (see Chapter 3). [IAS 8.10, IAS 8.11, IAS 8.12, IAS 8.13].

It is important to note that leases of bearer plants that are within the scope of IAS 16 are not excluded from the scope of IFRS 16. "Consequently, leases of bearer plants such as orchards and vineyards held by a lessee are within the scope of IFRS 16". [IFRS 16.BC68(b)].

2.3.5.B Leases of biological assets (excluding bearer plants) - lessor accounting

Chapter 24 contains a discussion of lessor accounting. For lessors, leases of biological assets, including those within the scope of IAS 41, are within the scope of IFRS 16. A lessor would account for its leases as either operating or finance leases in accordance with IFRS 16. [IFRS 16.67-97].

For finance leases of biological assets, the lessor would:

- Account for the net investment in the lease (i.e., the lease receivable, not the biological asset) in accordance with IFRS 16.

For operating leases of biological assets, the lessor would:

- Account for the lease payments as income in accordance with IFRS 16.
- Present the leased biological asset in accordance with its nature, consistent with other assets in the scope of IAS 41.
- Account for other rights and obligations under the lease (e.g., lease income) in accordance with IFRS 16.
- Make disclosures both in accordance with IFRS 16, and for the asset subject to the operating lease, in accordance with IAS 41. [IFRS 16.81-88].

Beyond discussing certain costs, depreciation and impairment, IFRS 16.81-88 do not specifically discuss how to recognise and measure the asset subject to an operating lease if it is within the scope of IAS 41. [IFRS 16.81-88].

How we see it

IFRS 16.BC58-BC66 outlines the IASB's rationale in retaining the requirements of the predecessor standard to IFRS 16, IAS 17 *Leases*, for lessors, virtually unchanged. Furthermore, IAS 41.B82(n), which outlined the interaction between IAS 41 and IAS 17, was not amended on the issuance of IFRS 16. Therefore, it is likely that lessors will continue to measure a biological asset in accordance with IAS 41.

Such lease arrangements may include the land to which the asset is attached. Any leased land would need to be separately accounted for under the relevant standard, for example IAS 16 or IAS 40, as it is explicitly excluded from the scope of IAS 41 (see section 2.3 above). [IAS 41.2(e)].

It is worth noting that, unless specifically excluded from its scope, IAS 41 applies to all biological assets when they relate to agricultural activity. [IAS 41.1]. In the example discussed above in section 2.3.5, where the sheep are leased under an operating lease, the wool is the agricultural produce. The sheep are being managed to produce that wool, albeit by the lessee and not the lessor. Since IAS 41 does not specify who must do the managing, the definition of agricultural activity is met. Therefore, the leased sheep would be a lease of biological assets within the scope of IAS 41. Similarly, in Illustration 2-1 in section 2.3.5 above, Entity A concludes the definition of agricultural activity is met even though it is the lessee that does the management, rather than Entity A.

2.3.6 Concessions

A concession typically involves a government, or other controlling authority, granting land to an entity, but requiring that the land be used for a specific purpose, for example, growing certain crops for a minimum period of time.

The treatment of each concession will depend on the specific facts and circumstances. However, if the concession requires an entity to undertake agricultural activity, as defined in IAS 41 (see section 2.2.1 above), the biological assets (excluding bearer plants, but including the produce growing on bearer plants) and agriculture produce will be within the scope of IAS 41. The grant received can also be within the scope of the standard. However, the land granted would be within the scope of IAS 16 or IAS 40 (see Chapters 19 and 20, respectively), and any bearer plants would be within the scope of IAS 16. The discussion in section 3.3 below addresses the treatment of government grants related to biological assets (other than bearer plants).

¹ The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8.

2.3.7 Trees held to generate carbon offsets for use or sale

Climate change and carbon emissions are a global concern. In an effort to offset some of their emissions, entities might buy or plant trees that will absorb carbon dioxide (i.e., act as carbon sinks) and thereby generate carbon offsets. Similarly, forestry companies might change their business models to defer, or cease, planned harvests to generate carbon offsets. In light of the current demand, some entities also sell carbon credits generated by the trees over time.

Entities that directly owns such trees (rather than indirectly through investments in entities that owns the trees) will need to determine whether the trees are:

- Biological assets related to agricultural activity to which IAS 41 applies
 - Bearer plants related to agricultural activity to which IAS 16 applies
- Or
- Assets not related to agricultural activity, in which case, it is likely an entity would apply the requirements in IAS 16

Determining the nature of the asset is fundamental to this assessment. As discussed in sections 2.2.1 and 2.3 above to be within the scope of IAS 41 or to be a bearer plant within the scope of IAS 16, the trees must relate to agricultural activity. [IAS 41.1(a), IAS 41.5]. The accounting requirements that apply, depending on the nature of the asset are discussed in section 3.2.4 below.

Although IFRS accounting standards need to be applied to the individual trees (i.e., the unit of account), in practice, entities might be able to assess each stand (A group of trees occupying a specific area that are sufficiently uniform (e.g., species, age)) of trees or groups of stands if the intended use of those trees is consistent. It may not be possible to account for an entire forest in the same way if an entity intends to use different parts of the forest in different ways.

(a) Determine whether the definition of agricultural activity is met

Trees are living plants and, therefore, meet the definition of a biological asset. [IAS 41.5]. However, to be within the scope of IAS 41 or to be a bearer plant within the scope of IAS 16, they must relate to agricultural activity. [IAS 41.1(a)].

Considering the definition of agricultural activity in section 2.2.1 above, by their very nature, trees will be subject to biological transformation (growth, degeneration, production and procreation processes), which will result in qualitative and quantitative changes over time. Such change for trees can be measured. [IAS 41.5, IAS 41.6, IAS 41.7]. However, for there to be agricultural activity, as defined in IAS 41, the entity also needs both of the following:

- Management of change
What constitutes management is discussed in section 2.2.1 above. For trees, management normally includes silviculture activities, such as planting, pruning, thinning, and fertilising. Harvesting unmanaged sources (deforestation) will not meet the definition of agricultural activity. [IAS 41.6].
- Harvest of agricultural produce
Also discussed in section 2.2.1 above, IAS 41 limits the definition of agricultural produce to that which can be harvested. This includes harvesting produce growing on, or in, the trees (e.g., fruit, latex) and felling the trees. The harvested produce need not solely be for sale; an entity might also harvest for its own use (e.g., lumber used by an entity in constructing a building for its own use). [IAS 41.B8].

How we see it

While carbon dioxide is absorbed and oxygen is produced by the trees, the oxygen cannot be captured at the point of production and detached in the manner contemplated by the definition of agricultural produce in IAS 41. Similarly, in our view, carbon offsets are not agricultural produce of trees.

IAS 41 does not provide guidance on the extent of harvest needed to qualify as an agricultural activity. If the entity actively manages the trees, thinning the trees will involve harvesting some trees to give space for others to grow. Trees can also be felled to create, or maintain, an access road. Even if the entity does not plan to harvest, a wind or a water event might naturally fell the trees. It is not clear the extent to which such felling might constitute harvesting of agricultural produce (and, therefore, agricultural activity) if the entity were to sell (e.g., at stump) or use the logs.

How we see it

The definition of a bearer plant permits incidental scrap sales (e.g., trees sold for firewood) not to taint the definition of bearer plants (see section 2.3.3 above). It is not clear whether an entity could analogise to this guidance. That is, would it be possible not to meet the definition of agricultural activity if the only harvesting were for incidental scrap sales? While very limited scrap sales might not prevent an entity from applying the bearer plant guidance by analogy, more extensive sales would generally lead to a conclusion that the entity is engaged in agricultural activity.

(b) Determine whether the bearer plant definition is met

If an entity determines there is agricultural activity, it will need to determine whether the trees are bearer plants. Trees related to agricultural activity will be within the scope of IAS 41, unless they meet the definition of a bearer plant. IAS 16 applies to the bearer plants, however, any produce growing in, or on, the trees would be treated as biological assets under IAS 41 until harvest (i.e., as two units of account).

Bearer plants are a subset of biological assets. They are living plants that: are used in the production or supply of agricultural produce; are expected to bear produce for more than one period; and have a remote likelihood of being sold as agricultural produce themselves, except for incidental scrap sales. Examples might include rubber trees, oil palms and fruit trees. However, IAS 41 makes it clear that “plants cultivated to be harvested as agricultural produce (for example, trees grown for use as lumber)”, and “trees that are cultivated both for their fruit and their lumber” (i.e., those with dual purpose) are not bearer plants.

[IAS 41.5, IAS 41.5A, IAS 41.5B].

Since bearer plants must relate to agricultural activity, trees held solely to produce carbon offsets will not be bearer plants. However, it is likely that some bearer plants might also produce carbon offsets.

Where it is determined that the trees are not held in relation to agricultural activity, it is likely that an entity would apply the requirements in IAS 16 (refer to section 3.2.4 below, and Chapter 19).

(c) Determine the nature of the asset

The considerations discussed above will, in turn, determine the nature of the asset. The consequent accounting requirements are discussed in section 3.2.4 below.

Figure 2-2: Trees held to generate carbon offsets: determining the nature of the asset

Nature of the asset	Agricultural activity	Bearer plant definition	Example
Biological asset related to agricultural activity	Yes	Not met	Trees in a plantation forest with deferred harvest to allow generation of carbon offsets
Bearer plant related to agricultural activity	Yes	Met	Rubber trees held to generate carbon offsets as well as harvest produce within those trees
Asset not related to agricultural activity	No	Not met	Trees held to generate carbon offsets that are unmanaged and/or not harvested

How we see it

If the trees are held solely to generate carbon offsets, whether sold or used, determining the nature of the asset may require judgement.

After initial recognition, it is not clear whether reassessment might be required if circumstances change. For example, assume an entity had no intention of felling the trees, but that subsequently changed for some of the trees due to windthrow. If these circumstances were to arise, an entity would need to apply the hierarchy in IAS 8 to develop an appropriate policy.

3 Recognition and measurement principles

3.1 Recognition

The standard includes the following recognition requirements for biological assets (including produce growing on a bearer plant) and agricultural produce: *[IAS 41.10]*

Extract from IAS 41

- 10** An entity shall recognise a biological asset or agricultural produce when, and only when:
- (a) the entity controls the asset as a result of past events;
 - (b) it is probable that future economic benefits associated with the asset will flow to the entity; and
 - (c) the fair value or cost of the asset can be measured reliably.

Considerations for the recognition of produce growing on a bearer plant are discussed in section 3.2.3.B below.

In agricultural activity, an entity may evidence control by, for example, “legal ownership of cattle and the branding or otherwise marking of the cattle on acquisition, birth, or weaning”. *[IAS 41.11]*.

3.2 Measurement

3.2.1 Biological assets within the scope of IAS 41

3.2.1.A Initial and subsequent measurement

A biological asset that is within the scope of IAS 41 (i.e., excluding bearer plants, but including produce growing on a bearer plant) is measured on initial recognition and at the end of each reporting period at its fair value less costs to sell, unless an entity can demonstrate at initial recognition that its fair value cannot be measured reliably. *[IAS 41.12]*. In the latter case, the entity measures the biological asset at historic cost less any accumulated depreciation and any accumulated impairment losses (see section 3.2.6 below), unless/until the fair value becomes reliably measurable. *[IAS 41.30]*.

3.2.1.B Subsequent expenditure

IAS 41 does not prescribe how an entity accounts for subsequent expenditure in relation to biological assets, because the (then) IASC believed this to be unnecessary with a fair-value-based measurement approach. *[IAS 41.B62]*.

Such expenditure may be expensed as incurred or capitalised as additions to the related biological asset. However, under the fair value model, the biological asset will be re-measured at the end of each reporting period. As such, any amounts capitalised will only result in a reallocation between expenses and the fair value gain or loss for the biological asset. Therefore, an entity’s policy in relation to subsequent expenditure will have no effect on its equity or net profit or loss, although it will affect all of the following:

- The reconciliation of changes in the carrying amount of biological assets
- The classification of the expenditure in the income statement as either an expense or as part of the net gain or loss on biological assets
- The presentation of subsequent expenditure on biological assets in the statement of cash flows as either operating or investing activities, as appropriate

How we see it

In our view, an entity needs to select an accounting policy for subsequent expenditure that is broadly consistent with the principles in other standards, such as IAS 16 and IAS 38.

In the case of livestock, for example, an entity could expense maintenance costs, such as routine vaccinations, while treating costs that increase the originally expected yield of the asset as capital expenditure. In this case, an entity must consider whether it is appropriate to add costs that improve initially anticipated yields (such as additional vaccinations or feed supplements) to the carrying value of the asset. However, such additions would be adjusted at each period end when the biological asset concerned is revalued to its new fair value. Judgement might be required to determine whether costs that take place after maturity (e.g., vaccinations or feed supplements) would be maintenance costs or improvements. Furthermore, care will be needed when costs are related to both bearer plants and produce growing on a bearer plant or when it is not clear to which of those assets it relates. This is discussed further in section 3.2.3 below.

In September 2019, the IFRS IC discussed a submission about the accounting for costs related to the biological transformation of biological assets (subsequent expenditure) applying IAS 41. The submitter asked whether an entity: (a) recognises subsequent expenditure as an expense when incurred; or (b) capitalises the subsequent expenditure (i.e., adds it to the carrying amount of the asset).

The IFRS IC decided not to take the issue onto its standard setting agenda noting that IAS 41 does not specify requirements on the accounting for subsequent expenditure and an entity can either capitalise subsequent expenditure or recognise it as an expense when incurred. The IFRS IC observed that capitalising subsequent expenditure or recognising it as an expense has no effect on the fair value measurement of biological assets nor does it have any effect on profit or loss; however, it affects the presentation of amounts in the statement of profit or loss.

The IFRS IC drew attention to the requirements of:

- Paragraph 13 of IAS 8, whereby an entity would apply its accounting policy for subsequent expenditure consistently to each group of biological assets
- And
- Paragraphs 117-124 of IAS 1 *Presentation of Financial Statements* whereby an entity would also disclose the selected accounting policy if that disclosure would assist users of financial statements in understanding how those transactions are reflected in reported financial performance [IAS 1.117-124, IAS 8.13]

The IFRS IC also noted that when “assessing how to present such subsequent expenditure in the statement of profit or loss, an entity would apply the requirements in paragraphs 81-105 of IAS 1”. In particular, an “entity would:

- Applying paragraph 85, ‘present additional line items (including by disaggregating the line items listed in paragraph 82), headings and subtotals in the statement(s) presenting profit or loss and other comprehensive income when such presentation is relevant to an understanding of the entity’s financial performance’; and
- Applying paragraph 99, present in the statement(s) presenting profit or loss and other comprehensive income or in the notes ‘an analysis of expenses recognised in profit or loss using a classification based on either their nature or their function within the entity, whichever provides information that is reliable and more relevant’’. [IAS 1.85, IAS 1.99].²

The presentation of items in the statement of profit or loss is further discussed in Chapter 3.

3.2.2 Agricultural produce

Agricultural produce harvested from an entity’s biological assets is initially “measured at its fair value less costs to sell at the point of harvest”. [IAS 41.13]. The standard presumes that an entity can always reliably measure this amount and hence does not permit valuation at historical cost. [IAS 41.32, IAS 41.B43].

The value resulting from initial measurement is subsequently used as cost in applying IAS 2 (if the agricultural produce is to be sold, see Chapter 23), IAS 16 (if harvested logs are used for the construction of a building, see Chapter 19) or other applicable IFRS accounting standards. [IAS 41.13, IAS 41.B8].

An important reason for requiring agricultural produce at the point of harvest to be measured at fair value was to ensure that the basis of measurement would be consistent with that of biological assets and to avoid inconsistent and distorted reporting of current period performance upon harvest of agricultural produce. [IAS 41.B42].

² [IFRIC Update](#), September 2019, available on the IFRS Foundation’s website.

3.2.3 Requirements for produce growing on a bearer plant

3.2.3.A Requirements for bearer plants in the scope of IAS 16

Bearer plants are subject to all of the recognition and measurement requirements in IAS 16 (see Chapter 19), including the following (see Figure 3-1 below):

- Before maturity, bearer plants must be measured at their accumulated cost, similar to the accounting treatment for a self-constructed item of plant and equipment before it is available for use. [IAS 16.22A].
And
- After the bearer plant is mature, entities have a policy choice to measure the bearer plants using either the cost model or the revaluation model. [IAS 16.29]. It is important to note that:
 - If the revaluation model is selected, revaluations need to take place with sufficient regularity to ensure the carrying amount does not differ materially from the asset's fair value had it been measured at the end of the reporting period. [IAS 16.22A].
 - Entities following either model need to determine the useful life of the bearer plant in order to depreciate it. The useful life needs to be re-evaluated each year. [IAS 16.51].
And
 - Unlike biological assets within the scope of IAS 41, items of property, plant and equipment within the scope of IAS 16 are not scoped out of IAS 36 *Impairment of Assets*. Entities, therefore, need to assess whether there are indicators that a bearer plant is impaired at the end of each reporting period. If such indicators exist, the bearer plant will be subject to an impairment test in accordance with IAS 36. [IAS 16.63, IAS 36.8, IAS 36.9]. An impairment loss is recognised if the carrying value is higher than the bearer asset's recoverable amount (being the higher of the asset's fair value less costs of disposal and its value in use). [IAS 36.60]. The requirements of IAS 36 are discussed in Chapter 21.

The requirements for bearer plants do not completely eliminate volatility in profit or loss, as entities still need to recognise any changes in the fair value of agricultural produce growing on the bearer plant, as discussed in section 3.2.3.B below.

Figure 3-1: Measurement requirements for bearer plants (assuming fair value can be reliably measured)

Timing	Measurement requirement
At initial recognition	<ul style="list-style-type: none"> ▪ Measured separately from any related agricultural produce (i.e., two units of account). ▪ Measured at cost, accumulated until maturity.
Subsequent measurement requirements	<ul style="list-style-type: none"> ▪ Measured separately from any related agricultural produce (i.e., two units of account). ▪ Measured at: <ul style="list-style-type: none"> ▪ Cost, less any subsequent accumulated depreciation and impairment, with changes recognised in profit or loss. Or ▪ Fair value at each revaluation date, less any subsequent accumulated depreciation and impairment. Revaluation adjustments (and impairment, to the extent it reverses previous revaluation increases) recognised in other comprehensive income; all other changes recognised in profit or loss.

IAS 16 is written with property, plant and equipment in mind. As such, entities may need to use judgement to apply its requirements to bearer plants and we note the following areas for consideration.

(a) Unit of account for bearer plants

IAS 16 does not specify the unit of account for bearer plants. Therefore, entities need to use the general requirements of IAS 16 (see Chapter 19) and need to consider that IAS 41 applies to each item of produce growing on a bearer plant.

The Basis for Conclusions to IAS 16 notes that "IAS 16 does not prescribe the unit of measure, or the extent to which items can be aggregated and treated as a single item of property, plant and equipment. Consequently, applying the recognition criteria in IAS 16 to bearer plants will require judgement. This gives an entity flexibility, depending on its circumstances, to decide how to aggregate individual plants for the purpose of determining a measurable unit of bearer plants". [IAS 16.BC81].

(b) Determining when a bearer plant is mature

IAS 16 requires an entity to determine when a bearer plant reaches maturity - that is, when it is in the "location and condition necessary for it to be capable of operating in the manner intended by management". [IAS 16.16(b)]. This determination is important because it is when an entity must cease capitalising costs as part of the initial cost of the asset. The requirements for bearer plants seem to assume that the point in time when a plant is capable of producing (which is referred to as 'maturity') marks a distinct end to all bearer plants' biological transformation. However, the life cycles of plants can vary widely, and it may be difficult, in practice, to identify when maturity has been reached.

Determining at what stage during biological transformation a bearer plant would be considered mature could, therefore, be challenging. Alternatives could include:

- When the bearer plant is capable of producing its first crop
 - When the produce is expected to be of sufficient quality to be sold (e.g., macadamia trees start producing fruit after 3-4 years, but only reach commercial levels when the trees are 7 years old)
- Or
- When the growth phase of biological transformation is complete for the bearer plant (and thereafter the plant is expected to degenerate or its productive capacity is expected to decline)

The Board decided not to provide specific application guidance for bearer plants. As such, entities need to apply judgement to determine when a bearer plant is mature for accounting purposes. In reaching its decision not to provide additional guidance, the IASB noted that options, such as those listed above, would have needed further defining and could have led to interpretive issues. Furthermore, the Board noted that "a similar scenario arises for a factory or retail outlet that is not yet capable of operating at full capacity and did not think that this was a major issue in practice". [IAS 16.BC82]. Entities, therefore, need to carefully consider the requirements of IAS 16, including those related to sales prior to an item of property, plant and equipment being available for use (see Chapter 19).

(c) Determining initial cost for bearer plants (prior to maturity)

IAS 16 requires that: [IAS 16.22A]

Extract from IAS 16

22A Bearer plants are accounted for in the same way as self-constructed items of property, plant and equipment before they are in the location and condition necessary to be capable of operating in the manner intended by management. Consequently, references to 'construction' in this Standard should be read as covering activities that are necessary to cultivate the bearer plants before they are in the location and condition necessary to be capable of operating in the manner intended by management.

While IAS 16 provides guidance (see Chapter 19) that entities need to consider for bearer plants, there are differences between traditional plant and equipment and biological assets. As such, entities need to apply judgement in determining which costs can be capitalised. For example, as a plant is growing, an entity will incur costs related to water, fertiliser, greenhouses, etc. The entity needs to assess whether these costs are directly attributable to the bearer plant reaching maturity.

Another example is the cost of abnormal amounts of wasted material, labour and other resources. IAS 16 does not permit these costs to be included in the cost of a self-constructed asset. [IAS 16.22]. Entities need to determine what constitutes a normal level of wastage for bearer plants. For example, many bearer plants die before maturity (e.g., due to disease or adverse weather) and are subject to planned thinning. Whether either or both of these is normal wastage requires judgement.

(d) Costs incurred after maturity

A number of costs, such as fertilising, pruning and thinning are incurred after maturity and can improve the quality of the produce or extend the productive life of a bearer plant. Entities need to use judgement to determine whether these costs are maintenance costs or are considered to be improvements.

In addition, after maturity many costs are incurred to benefit both the bearer plant and the produce growing on the bearer plant. Entities need to carefully consider the basis on which to allocate costs between a bearer plant and the produce growing on a bearer plant when the costs are incurred in relation to both assets (e.g., fertilising costs).

(e) Depreciation and impairment considerations

Entities need to carefully consider an appropriate depreciation rate for their bearer plants. Similar considerations are discussed in section 3.2.6.B below in relation to biological assets for which the cost model is used under IAS 41. The model in IAS 16 generally assumes that improvements in productivity and quality of produce do not occur after maturity without additional expenditure to improve the asset. However, many plants mature with age and cultivation. As discussed in section 2.2.1 above, biological transformation continues after a bearer plant begins to produce and includes degeneration. [IAS 41.5, IAS 41.7]. A decline in productivity might, therefore, occur only at the end of a plant's productive life, which differs from wear and tear on an item of machinery.

Applying the requirements of IAS 36 to a bearer plant may also be challenging. For example, an individual bearer plant may not generate its own cash inflows and may, therefore, need to be tested for impairment as part of a cash generating unit. In addition, the produce growing on a bearer plant is treated as a separate asset from the bearer plant and, because it is measured at fair value less costs to sell on an ongoing basis under IAS 41, it is excluded from the scope of IAS 36. When testing the bearer plant for impairment, entities need to determine whether or not they can include the produce currently growing on the bearer plant in their impairment assessment.

(f) Revaluation model in IAS 16

IAS 16 permits an entity, after initial recognition to apply the revaluation model. However, this is not the same as applying the fair value model in IAS 41. The former is one that recognises valuation adjustments in other comprehensive income as a form of capital maintenance; the latter is a model that recognises valuation adjustments in the income statement as part of periodic performance. In addition, unlike the model in IAS 41, if the revaluation model is applied under IAS 16 entities are required to:

- Depreciate bearer plants between revaluations, with the depreciation expense recognised in profit or loss
- Identify appropriate indicators of impairment for bearer plants in accordance with IAS 36, and assess annually whether indicators exist. If impairment indicators do exist, then those bearer plants are tested for impairment (as discussed above)

And

- Maintain cost records for each bearer plant so as to separately track those impairments that are recognised in profit or loss and those impairments that are recognised in other comprehensive income

Furthermore, an entity is unable to recognise increases in fair value that arise from a bearer plant's biological transformation in profit or loss, during the periods in which it is held and used. Since bearer plants are considered property, plant and equipment, the sale of a bearer plant results in a gain or loss on disposal, while revenue is recognised only in relation to sales of agricultural produce.

Despite these challenges, entities could elect to measure their bearer plants using the revaluation model to ensure consistency with the produce growing on them or because the fair value information is useful. That is, a change in the productive capacity of a bearer plant, or a change in the prices for the future output of a bearer plant, can provide useful information.

3.2.3.B Requirements for agricultural produce growing on bearer plants

As noted in section 3.2.3.A above, IAS 16 and IAS 41 require an entity to recognise a bearer plant separately from produce growing on it from the time it exists until the point of harvest.

Produce growing on a bearer plant remains within the scope of IAS 41 and is measured at fair value less costs to sell, with changes recognised in profit or loss as the produce grows. In the IASB's view, this requirement ensures that produce growing in the ground as an annual crop (e.g., wheat) and produce growing on a bearer biological asset (e.g., grapes) are accounted for consistently. [IAS 41.BC4D]. As a result, changes in the fair value of such agricultural produce continue to be recognised in profit or loss at the end of each reporting period.

Figure 3-2: Measurement requirements for produce growing on bearer plants

Timing	Measurement requirement
At the end of each reporting period prior to harvest (i.e., biological asset)	Measured separately from the bearer plant at fair value less costs to sell.
At the point of harvest (i.e., agricultural product)	Measured separately from the bearer plant at fair value less costs to sell.
After harvest	Measured separately from the bearer plant. Fair value less costs to sell at the point of harvest becomes initial cost for the purpose of applying IAS 2 or another applicable IFRS accounting standard (see section 2.3.2 above).

(a) Determining when agricultural produce exists

As discussed in section 3.1 above, IAS 41.10 provides criteria for recognising biological assets and agricultural produce. [IAS 41.10]. However, since produce growing on a plant is not acquired, but grown, it may be difficult to determine when that produce exists and can be recognised for accounting purposes. Would an entity, for example, wait for physical evidence, e.g., blossom on a tree? If so, how would this be done when the produce is within the bearer plant and not visible, such as with maple or rubber trees? Entities also need to check their procedures for ensuring that sufficient information is gathered, i.e., identifying each item of produce growing on a bearer plant when it is at the right stage of development to be recognised. The key question when assessing the recognition criteria (see section 3.1 above) may be whether it is probable that future economic benefits will flow to the entity. At such an early stage of development, this may be difficult to determine for each item of produce growing on the bearer plant. However, historical information about similar bearer plants and their produce may be of help.

Determining when produce on a bearer plant exists is important as it affects when an entity would recognise and initially measure fair value less costs to sell. This, in turn, determines when an entity assesses whether it is able to measure produce at fair value reliably (or otherwise apply the measurement exception discussed in section 3.2.6 below).

(b) Applying the requirements for biological assets to produce growing on a bearer plant

IAS 41 does not explicitly address the accounting for produce growing on a bearer plant. Instead, the standard says that “produce growing on bearer plants is a biological asset”. [IAS 41.5C]. Therefore, an entity is required to apply the accounting required for other biological assets to such produce. This has a number of consequences, including the following:

- The unit of account is each item of produce, not the produce growing on each plant as a group. However, while the unit of account is the individual item, an entity is permitted to group these together for measurement purposes (see section 4.2.2 below).
- Each item of produce growing on a bearer plant must be measured at fair value less costs to sell from the time it is recognised until the point of harvest, unless the measurement exception for biological assets for which the fair value cannot be reliably measured at initial recognition is applicable. (See section 3.2.6 below, including discussion by the IFRS IC in 2017 in relation to applying these requirements to produce growing on a bearer plant).

The fair value less costs to sell may initially be negligible. That is, a market participant acquiring the bearer plant would only pay a negligible amount for the produce in the early stages of development because they would want to be compensated for the costs, they would need to incur to continue growing the produce through to harvest and for the related risks, such as crop failure or price falls during the maturation period. Furthermore, cost to sell needs to be deducted from the fair value of the asset. As discussed in section 3.2.3.A above, entities also need to carefully consider which costs relate to a bearer plant and which relate to the produce growing on the bearer plant.

The different stages of maturity of the produce and the allocation of the costs related to both the bearer plants and to the produce may make valuing the produce on its own challenging. Measuring fair value for produce growing on a bearer plant also presents the same challenges as measuring part-grown biological assets and those that are physically attached to land (as discussed in sections 4.7 and 4.6.2.A below, respectively).

- The disclosure requirements that apply to biological assets also apply to produce growing on a bearer plant (see section 5 below). Some of the required disclosures may be challenging for entities. For example, IAS 41.46 requires an entity to disclose non-financial measures or estimates of physical quantities for each group of biological assets. [IAS 41.46]. While entities might gather such information for management reporting purposes, they need to ensure that information is available for produce growing on bearer plants separately from the bearer plants on which they are growing.

3.2.4 Requirements for trees held to generate carbon offsets for use or sale

As discussed in section 2.3.7 above, to determine the accounting requirements that apply to trees held to generate carbon offsets, entities need to determine the nature of the asset, i.e., whether the trees are:

- Biological assets related to agricultural activity to which IAS 41 applies
 - Bearer plants related to agricultural activity to which IAS 16 applies
- Or
- Assets not related to agricultural activity, in which case, it is likely that an entity would apply the requirements in IAS 16 (refer to Chapter 19).

Figure 3-3: Trees held to generate carbon offsets: applicable standard(s) and measurement requirements

Nature of the asset	Applicable standard(s)	Measurement requirements
Biological asset related to agricultural activity	IAS 41	Fair value less costs to sell at initial recognition (see section 3.2.1 above) and subsequently (see section 3.2.1.B above for considerations relating to subsequent expenditure). If the presumption that fair value can be reliably measured is rebutted on initial recognition (see section 3.2.6 below), an entity is permitted to measure a biological asset at its cost less any accumulated depreciation until fair value becomes reliably measurable. [IAS 41.30].
Bearer plant related to agricultural activity	Produce growing on, or in, the bearer plant: IAS 41 (treated as biological assets under that standard)	Fair value less costs to sell at initial recognition (see section 3.2.2 above) and subsequently (see section 3.2.3.B above). If the presumption that fair value can be reliably measured is rebutted on initial recognition (see section 3.2.6 below), an entity is permitted to measure a biological asset at its cost less any accumulated depreciation until fair value becomes reliably measurable. [IAS 41.30].
	Trees: IAS 16	Initial recognition at cost determined using the requirements for bearer plants; choice between cost or revaluation model subsequently (see section 3.2.3.A above).
Assets not related to agricultural activity	Likely to be IAS 16	Initial recognition at cost determined using the general requirements for property, plant and equipment; choice between cost or revaluation model subsequently.

As Figure 3-3 above illustrates, the accounting requirements can vary depending on the nature of the asset.

If IAS 41 applies, the trees (or produce growing on a bearer plant) are measured at fair value less costs to sell both at initial recognition and subsequently (unless the measurement exception applies because fair value cannot be reliably measured), with recognition of those changes through profit or loss.

If IAS 16 applies (see Chapter 19), the initial measurement requirements will differ depending on whether the asset is a bearer plant or not:

- Bearer plants: they are measured at their accumulated cost, similar to the accounting treatment for a self-constructed item of plant and equipment before it is 'available for use', which is typically when they are mature (see section 3.2.3.A above).
- Other assets: they are measured at their accumulated cost until they are available for use, which will generally be as soon as they are planted. An entity would not need to apply the requirements for bearer plants.

Subsequently, under IAS 16, entities have a policy choice to measure trees (whether bearer plants or not) using either the cost model or the revaluation model.

- If the revaluation model is selected, revaluations need to take place with sufficient regularity to ensure the carrying amount does not differ materially from the asset's fair value had it been measured at the end of the reporting period. In addition, unlike IAS 41, revaluation changes are recognised through other comprehensive income.
- Entities following either model need to determine the useful life of the trees in order to depreciate them. The useful life needs to be re-evaluated each year.
- Unlike biological assets in the scope of IAS 41, property, plant and equipment is not scoped out of IAS 36 (refer to Chapter 21). Entities, therefore, need to assess whether there are indicators that the trees are impaired at the end of each reporting period. If such indicators exist, an impairment loss will be recognised if the carrying value is higher than the asset's recoverable amount (being the higher of the asset's fair value less costs of disposal and its value in use).

How we see it

While measurement of fair value can be complex and subject to measurement uncertainty, determining the cost of growing trees can also be challenging. For example, pruning and thinning maintains the trees in the forest, but can also improve yield. It might also be difficult to determine an appropriate useful life for a growing asset. Therefore, regardless of the measurement requirements, entities might need to apply judgement in accounting for such trees. Similar considerations apply to bearer plants (discussed further in section 3.2.3.A above) and to biological assets if the cost model in IAS 41 applies (discussed further in section 3.2.6.B below).

3.2.5 Gains and losses

IAS 41 requires gains and losses arising on the initial recognition of a biological asset (including produce growing on a bearer plant) at fair value less costs to sell to be included in profit or loss for the period in which they arise. [IAS 41.26]. The standard warns that: [IAS 41.27]

Extract from IAS 41

- 27 A loss may arise on initial recognition of a biological asset, because costs to sell are deducted in determining fair value less costs to sell of a biological asset. A gain may arise on initial recognition of a biological asset, such as when a calf is born.

Subsequent to initial recognition, reported gains or losses essentially represent the difference between two fair values. As such, the standard effectively decouples profit recognition from a sales transaction. One consequence of this approach is to anticipate some of the profit that will be realised, often by a matter of years for long-term crops, such as trees.

The implications for initial recognition of agricultural produce are similar - an entity need to recognise a gain or loss on agricultural produce upon harvesting if the fair value of the harvested produce is different from the pre-harvest valuation. [IAS 41.29]. The standard requires that "A gain or loss arising on initial recognition of agricultural produce at fair value less costs to sell ... be included in profit or loss for the period in which it arises". [IAS 41.28].

3.2.6 Inability to measure fair value reliably

3.2.6.A Rebutting the presumption

Under IAS 41, there is a presumption that the fair value of all biological assets (including produce growing on a bearer plant) can be measured reliably. This presumption can only be rebutted on initial recognition for a biological asset (not agricultural produce).

How we see it

In our view, such a rebuttal will be rare as, to be able to do so, an entity must demonstrate both of the following:

(a) Quoted market prices for the biological asset (including produce growing on a bearer plant) are not available.

And

(b) Alternative fair value measurements for the biological asset are determined to be clearly unreliable.

The following considerations are relevant when determining whether the presumption can be rebutted.

Since IAS 41 requires that the fair value of a biological asset (including produce growing on a bearer plant) be measured in accordance with IFRS 13 (see Chapter 15), an entity needs to consider the requirements of that standard in order to determine whether fair value can be reliably measured.

In relation to (a) above, it is important to note that IAS 41 does not restrict the criteria to quoted prices in an active market. Therefore, in order to rebut the presumption, an entity needs to determine that quoted prices in both active and inactive markets are unavailable for the asset.

If an entity is able to determine that quoted prices for the asset are unavailable, it still needs to determine that all other methods for measuring fair value are clearly unreliable before it can rebut the presumption. This is not the same identifying that a fair value measurement is complex and/or subjective. That is, measuring fair value often involves estimation and significant judgement, but this does not mean that it is automatically unreliable. Furthermore, the requirement is for the measurements to be 'clearly unreliable', which is arguably a higher hurdle than 'unreliable'.

Determining that alternative fair value measurements are clearly unreliable is likely to include, but not be limited to, considering the reliability of the following factors:

- Estimates of quantities on hand and the stage of development - while estimates are often required of quantities on hand (including current stage of biological transformation and anticipated yields for future agricultural produce), the mere fact that estimates are used is not sufficient to demonstrate that fair value is unreliable. Rather, an entity needs to demonstrate that their estimates of the quantity and current state of their biological assets are often incorrect. This may be challenging for entities to demonstrate if the underlying information is regularly used by management to make decisions about future operations of the business.
- Prices for the asset in a future state (e.g., for the mature biological asset or the agricultural produce that will ultimately be harvested).
- Prices for similar assets that can be used as an input into the fair value measurement - this could include plants and animals that are similar to the asset held by the entity or the ultimate agricultural produce that will result from managing the biological transformation of the asset held by the entity.
- Cash flow projections for the asset.
- The replacement cost of the asset.

Entities might also need to consider whether other entities (within a country or globally) are able to demonstrate that fair value can be reliably measured for the same or similar assets.

In 2017, the IFRS IC received a request to consider whether fruit growing on oil palms is considered an example of a biological asset for which an entity might rebut the fair value presumption applying IAS 41.30. The IFRS IC rejected this request observing that its role is not to conclude upon very specific application questions, particularly when they relate to the application of the judgements required in applying IFRS accounting standards. In rejecting the request, "the Committee concluded that the reference to 'clearly unreliable' in paragraph 30 of IAS 41 indicates that, to rebut the presumption, an entity must demonstrate that any fair value measurement is clearly unreliable. Paragraph BC4C of IAS 41 suggests that, when developing the amendments to IAS 41 on bearer plants, the Board's expectation was that fair value measurements of produce growing on bearer plants might be clearly unreliable when an entity encounters significant practical difficulties. However, the Committee observed that the converse is not necessarily true - i.e., if an entity encounters significant practical difficulties, this does not necessarily mean that any fair value measurement of produce is clearly unreliable".³ [IAS 41.30, IAS 41.BC4C]. In addition to these observations, the IFRS IC noted that possible differences in supportable assumptions, (which might give rise to significantly different measurements) do not constitute evidence of 'significant practical difficulties' as discussed in IAS 41.BC4C. This is because these would not, on their own, result in fair value measurements that are clearly unreliable.

³ [IFRIC Update](#), June 2017, available on the IFRS Foundation's website.

The IFRS IC's observations indicate that a rebuttal of the presumption that the fair value can be measured reliably will be rare. If they cannot rebut the presumption, entities will need to measure fair value and that fair value may be subject to significant estimation uncertainty. As a result, the Committee also emphasised that entities need to comply with the disclosure requirements in IAS 1.125 (regarding significant assumptions and estimates) and those in IFRS 13.91 so as to assist users of financial statements understand the valuation techniques, inputs used and the effect of measurements that use Level 3 inputs.⁴ [IAS 1.125, IFRS 13.91].

An entity that previously measured a biological asset at its fair value less costs to sell cannot revert to a cost-based measurement in a later period, even if a fair value can no longer be measured reliably. [IAS 41.31]. The standard assumes that reliable estimates of fair value would rarely, if ever, cease to be available. [IAS 41.B36]. This assumption holds during times of heightened market volatility or uncertainty. A more detailed discussion of some of the practical problems associated with determining fair value in the absence of a market price can be found in section 4.7 below.

If an entity rebuts the presumption at initial recognition and then it becomes possible at a later date to measure the fair value of a biological asset reliably, the entity is required to apply the fair value model to that asset from that date onwards. [IAS 41.30]. In developing the standard, the (then) IASC noted in this respect that "in agricultural activity, it is likely that fair value becomes measurable more reliably as biological transformation occurs and that fair value measurement is preferable to cost in those cases". Therefore, the IASC "decided to require fair value measurement once fair value becomes reliably measurable". [IAS 41.B35].

IAS 41 presumes that the fair value of a non-current biological asset that "meets the criteria to be classified as held for sale (or is included in a disposal group that is classified as held for sale) in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*" can always be measured reliably. [IAS 41.30].

Frequently asked questions

Question 3-1: Can acquisition-related transaction costs be taken into account when subsequently measuring fair value?

In situations where the cost model is initially applied and then fair value becomes reliably measurable, a question that sometimes arises is whether acquisition-related transaction costs (i.e., those that have been incurred by the entity on purchasing the asset) that have been capitalised can be taken into account when subsequently measuring the fair value component of 'fair value less costs to sell'. Fair value is a market-based measure and is defined in IFRS 13 as an exit price. The objective is to measure the price that would be obtained in a transaction between market participants to sell an asset; not the costs each party would incur in order to transact - those costs reflect the characteristics of the transaction and not of the asset being hypothetically sold.

How we see it

In light of the above, we believe it would be inappropriate to include acquisition-related transaction costs when measuring fair value, particularly since a seller would not incur such costs.

In addition, as discussed in section 4.6.4.A below, IFRS 13 specifically states that transaction costs that would be incurred in a transaction to sell an asset are not part of fair value (that is, they are not added to, or deducted from, the exit price used to measure fair value). [IFRS 13.25]. However, IAS 41 requires 'costs to sell' to be deducted from fair value, measured in accordance with IFRS 13, before recognition in the financial statements leading to a lower valuation than a pure IFRS 13 valuation.

3.2.6.B The cost model

If, on initial recognition, an entity rebuts the presumption and demonstrates that fair value cannot be measured reliably, it applies the cost model to the biological asset (including produce growing on a bearer plant), i.e., the asset is measured at cost less any accumulated depreciation and any accumulated impairment losses. [IAS 41.30].

When determining cost, accumulated depreciation and accumulated impairment losses an entity needs to consider the requirements of IAS 2, IAS 16 and IAS 36. [IAS 41.33]. Refer to Chapter 23, Chapter 19 and Chapter 21, respectively, for discussion on each of these standards. IAS 41 provides no further guidance on the application of the cost model or the extent to which entities need to consider the requirements of these standards.

⁴ [IFRIC Update](#), June 2017, available on the IFRS Foundation's website.

How we see it

Both IAS 2 and IAS 16 establish frameworks within which to determine cost. The nature of the biological asset could be helpful when determining which approach to use. The nature of the biological asset could also be helpful in determining when to commence depreciation and the useful life of the asset.

Consumable biological assets that are to be harvested as agricultural produce or sold as biological assets, for example livestock to be slaughtered or held for sale, fish in farms or crops to be harvested, could be more consistent with inventories accounted for in accordance with IAS 2. Bearer biological assets, such as dairy cows could be more consistent with plant and equipment accounted for in accordance with IAS 16. When the IASB issued the bearer plants amendments, it noted that, although bearer plants are dissimilar in form to plant and machinery, similarities in how they are used supported accounting for them in the same way. [IAS 16.BC67].

IAS 16.55 requires depreciation to commence when an asset is available for use. [IAS 16.55]. Determining when a biological asset is available for use may be more obvious in relation to bearer biological assets. For example, a cow may be considered available for use as soon as it is sufficiently mature to produce milk. However, for consumable biological assets defining when an asset is available for use is less clear because the period between these assets reaching maturity and being sold or harvested is typically short.

The last component of the cost model is the assessment of impairment in accordance with IAS 36. That standard requires an entity to determine the recoverable amount of an asset or cash-generating unit (CGU) and compare it to its carrying amount in order to determine whether the asset or CGU is impaired. Recoverable amount is defined by IAS 36 as the higher of either the value in use or fair value less costs of disposal of the asset or CGU (IAS 36 is discussed in Chapter 21).

How we see it

Entities that have demonstrated that fair value cannot be reliably determined for a biological asset need to ensure they apply a consistent approach when determining the recoverable amount of that asset. As such, using a value in use approach to determine recoverable amount will be required, possibly at the CGU level. Even in this situation, entities may need to carefully consider whether information used to measure value in use could be used to measure the fair value of the biological asset.

An entity that uses the reliability exception (and, therefore, applies the cost model) is required to disclose certain additional information in its financial statements. This is discussed further in section 5.3 below. [IAS 41.B37].

3.3 Government grants

Government grants involving biological assets that are within the scope of IAS 41 (i.e., excluding bearer plants, which are specifically scoped out of IAS 41) are only accounted for under IAS 20 if the biological asset is “measured at its cost less any accumulated depreciation and any accumulated impairment losses” as discussed in section 3.2.6 above (see Chapter 25 for a discussion of government grants within the scope of IAS 20). [IAS 41.37, IAS 41.38]. IAS 41 applies to government grants relating to all other biological assets (including produce growing on a bearer plant) accounted for at fair value less costs to sell.

What is not clear is whether government grants that relate to both a bearer plant and the produce growing on that bearer plant would be within the scope of either IAS 20 or IAS 41. It is also not clear how an entity would deal with a government grant if the related biological asset is initially measured in accordance with the cost model in IAS 41 (and so applies IAS 20 to the related government grant), but later is measured at fair value less costs to sell because fair value becomes reliably measurable. Entities will need to use judgement in relation to such grants.

Under IAS 20, government grants are either:

- Recognised as deferred income and then recognised in profit or loss on a systematic basis over the useful life of the asset
- Or
- Deducted in calculating the carrying amount of the asset and then recognised in profit or loss over the life of a depreciable asset as a reduced depreciation expense

Under IAS 41, an unconditional government grant related to a biological asset that is “measured at its fair value less costs to sell shall be recognised in profit or loss when, and only when, the government grant becomes receivable”. [IAS 41.34]. An entity is, therefore, not permitted under IAS 41 to deduct a government grant from the carrying amount of the related asset. This would be inconsistent with a “fair value model in which an asset is measured and presented at its fair value” because the entity would recognise even conditional government grants in income immediately. [IAS 41.B66].

Any conditional government grant related to a biological asset measured at its fair value less costs to sell - including government grants that require an entity not to engage in a specified agricultural activity - are only recognised when the conditions attaching to the grant are met. [IAS 41.35]. IAS 41 permits an entity to recognise a government grant as income only to the extent that it: (i) has met the terms and conditions of the grant; and (ii) has no obligation to return the grant. The following Illustration, which is derived from an example in IAS 41, shows how an entity applies these requirements. [IAS 41.36].

Illustration 3-1: Conditional government grants

A government grant requires an entity to farm in a particular location for five years and requires the entity to return the entire government grant if it farms for less than five years. The government grant is not recognised as income until the five years have passed.

Another government grant allows for part of the government grant to be retained based on the passage of time. The entity recognises this government grant as income on a time proportion basis.

4 Measuring fair value less costs to sell

4.1 The interaction between IAS 41 and IFRS 13

IFRS 13 specifies how to measure fair value. However, it does not specify what must be measured at fair value or when a fair value measurement must be performed. Therefore, an entity applies IAS 41 to determine what to measure at fair value less costs to sell and when to measure fair value (i.e., the measurement date). The entity then applies IFRS 13 to measure 'fair value', taking into consideration the specific requirements in IAS 41 (see section 4.5 below). 'Costs to sell', measured in accordance with IAS 41, are then deducted.

As discussed in section 5 below, disclosures in relation to the fair value measurement will need to be provided in accordance with IFRS 13 and also IAS 41, to the extent that it requires additional agriculture-specific disclosures.

The following sections consider further the interaction between IFRS 13 and IAS 41 and highlight some of the key requirements of IFRS 13 relating to biological assets and agricultural produce. See Chapter 15 for a discussion of the requirements in IFRS 13.

4.2 Establishing what to measure

4.2.1 Unit of account

The unit of account identifies what is being measured for financial reporting purposes, i.e., the level of aggregation (or disaggregation) for presentation and disclosure purposes. For example, whether the information presented and disclosed in the financial statements is for an individual asset or for a group of assets.

The unit of account in IAS 41 is the individual biological asset or agricultural produce. For example, the standard applies to the individual trees in a forest, not the forest as a whole. As discussed in section 4.2.2 below, the standard does permit grouping of assets to facilitate measuring fair value, but this does not change the unit of account.

Another important factor is that the asset is being measured in its current form, and not as it will be once mature. Therefore, understanding the different stages of maturity for the asset and determining what stage the asset is in at the measurement date is crucial. Consider for example a farmer raising chickens, the farmer needs to consider the various stages from egg, to hatchling, day-old chick, partly-grown and finally mature chicken. The different stages the chickens are in at the measurement date could result in different methods and inputs being used to measure fair value, and different assumptions, for example different principal markets at each stage (see section 4.6.3 below). Also refer to section 4.7 below for a further discussion on measuring fair value for part-grown or immature biological assets.

4.2.2 Grouping of assets

IAS 41 states that: *[IAS 41.15]*

Extract from IAS 41

15 The fair value measurement of a biological asset or agricultural produce may be facilitated by grouping biological assets or agricultural produce according to significant attributes; for example, by age or quality. An entity selects the attributes corresponding to the attributes used in the market as a basis for pricing.

For example, when undertaking a valuation of livestock, an entity may group each of the animals in the herd based on factors such as species, age, weight and the expected yield.

4.3 When to measure fair value

In order to apply the requirements of IFRS 13, an entity needs to determine when to measure fair value, i.e., the measurement date. IFRS 13 relies on the standard that requires, or permits, the fair value measurement to specify this date, i.e., IAS 41 for biological assets (including produce growing on a bearer plant) and agricultural produce.

As discussed in section 3.2.1.A above, biological assets within the scope of IAS 41 are required to be measured at fair value less costs to sell at initial recognition and subsequently, on a recurring basis, at least at the end of each reporting period.

The fair value less costs to sell of agricultural produce is measured on the date that it is harvested (see section 3.2.2 above).

4.4 Determining costs to sell

Costs to sell are defined in IAS 41 as “the incremental costs directly attributable to the disposal of an asset, excluding finance costs and income taxes”. [IAS 41.5].

Therefore, of all the costs that are necessary for a sale to occur, costs to sell only include those costs that would otherwise not arise. However, costs already included within the fair value measurement, such as transportation costs, are excluded from costs to sell. Examples of costs to sell could include brokers’ and dealers’ commissions, levies by regulatory agencies and commodity exchanges, transfer taxes and duties. [IAS 41.BC3, IAS 41.B22].

4.5 Measuring fair value: IAS 41-specific requirements

4.5.1 Use of external independent valuers

IAS 41 does not require an entity to use an external independent valuer to determine the value of biological assets. In fact, the Board rejected a proposal to require external independent valuations because they are “not commonly used for certain agricultural activity and it would be burdensome to require an external independent valuation. The Board believes that it is for entities to decide how to determine fair value reliably, including the extent to which independent valuers need to be involved”. [IAS 41.B33]. Furthermore, the Board also noted that requiring the disclosure of the extent to which the carrying amount of biological assets reflects a valuation by an external independent valuer would not be appropriate for the same reasons. [IAS 41.B81].

4.5.2 Obligation to re-establish a biological asset after harvest

It is common in certain industries, particularly where a biological asset is physically attached to land, for an entity to have an obligation to re-establish a biological asset after harvest. The standard gives the example of an entity that has an obligation to replant the trees in forest after harvest.

IAS 41 does not permit an entity to include the costs of re-establishing a biological asset after harvest when using estimated future cash flows to measure fair value. [IAS 41.22]. This is consistent with the unit of account being the individual biological asset (see section 4.2.1 above). For example, an entity that owns a forest might consider its intention, or obligation, to replace its trees in the future if it were measuring the fair value of the forest as a whole. However, the entity is required by IAS 41 to measure the individual trees that are actually planted in the forest on the measurement date. It would be inconsistent to consider replanting, since removal of an existing tree (in order to plant a new tree) would be the end of that asset’s useful life.

The IFRS IC considered such obligations in May 2004 and confirmed its previous decisions that, if an entity has an obligation to re-establish a biological asset after harvest, that obligation is attached to the land and does not affect the fair value of the biological assets currently growing on the land.

The problem of how to account for an obligation to replant was considered by the Board in 2007. Circumstances can arise where an entity is legally obliged (whether by law or contract) to replant a biological asset after harvest. The interaction of the fair value measurement basis of IAS 41, the prohibition on including the replanting costs in determining that fair value in IAS 41.22 and the potential recognition of a provision for the cost of replanting in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 27) when the biological asset is harvested, could lead to a net expense being recognised at the point of harvest.

Even in situations where there is a legal obligation to replant, an entity cannot consider replanting when measuring the fair value of a biological asset.

4.5.3 Forward sales contracts

When an entity enters into a contract to sell its biological assets (including produce growing on a bearer plant) or agricultural produce at a future date, the standard does not permit it to measure those assets at the contracted price, stating that “the fair value ... is not adjusted because of the existence of a contract”. [IAS 41.16].

When IAS 41 was developed, the Board considered whether the standard should require sales contracts to be measured at fair value but concluded that no solution would be practicable without a complete review of the accounting for commodity contracts that are not accounted for as financial instruments. [IAS 41.B50-B54]. It follows from this that, if an entity engaged in agricultural activity enters into forward sales contracts for its produce, it will need to consider whether such contracts are within the scope of IFRS 9 *Financial Instruments*. IFRS 9.2.4 states “This standard shall be applied to those contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments, with the exception of contracts that were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity’s expected purchase, sale or usage requirements”. [IFRS 9.2.4]. Accordingly, an agricultural commodity sales contract will be accounted for under IFRS 9 by an entity that intends to net settle that contract, even if it is also a producer of the underlying agricultural produce. Conversely, a farmer who intends to settle a forward sales contract for barley by physical delivery would not typically account for the contract under IFRS 9, but would treat it as an executory contract. However, IFRS 9 is applied to such contracts if an entity designates them as measured at fair value through profit or loss in accordance with IFRS 9.2.5. [IFRS 9.2.5]. This issue is discussed further in Chapter 41.

4.5.4 Onerous contracts

Although a forward sales contract that is scoped out of IFRS 9 is treated as an executory contract, IAS 41 notes that, if the contracted price is lower than the fair value of the assets, the contract for the sale of a biological asset (including produce growing on a bearer plant) or agricultural produce may be an onerous contract, as defined in IAS 37. If it meets the definition of an onerous contract, it is accounted for under IAS 37 [IAS 41.16] - the accounting for onerous contracts is dealt with in Chapter 27.

However, IAS 41 provides no further guidance on the subject of when such a contract becomes onerous. The standard is also silent on what this might mean, given the fact that IAS 37 defines an onerous contract as “a contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it”. [IAS 41.B50, IAS 41.B51, IAS 41.B52, IAS 41.B53, IAS 41.B54]. In other words, a contract that is not loss-making, but that has a contract price lower than the fair value of the produce concerned, is not automatically defined as onerous by IAS 37, yet seems to be regarded as onerous under IAS 41.

How we see it

In our view, a contract to sell a biological asset at an amount that is below its fair value less costs to sell (and, therefore, its carrying amount) would be regarded as onerous under IAS 37.

4.5.5 Financing cash flows and taxation

IAS 41 does not permit an entity to include any cash flows for financing an asset when using estimated future cash flows to measure fair value. [IAS 41.22].

Previously, the standard also required an entity to exclude tax cash flows when measuring fair value in accordance with IAS 41. [IAS 41(2021).22]. However, in May 2020 the Board issued an amendment to IAS 41 as part of its *Annual Improvements to IFRS Standards 2018-2020* which removed that requirement. The amendment became effective for annual periods beginning on or after 1 January 2022 and applied prospectively.⁵ This amendment aligned the requirements in IAS 41 on fair value measurement with those in IFRS 13, which allows the use of post-tax cash flows and post-tax discount rates when measuring fair value.

The previous exclusion of taxation had been practically challenging if an entity used an income approach to measure fair value. Valuers typically prepared post-tax calculations, discounting post-tax cash flows using a post-tax discount rate. If this approach was used to derive a pre-tax equivalent fair value, entities needed to ensure the assumptions related to tax were not entity-specific. As discussed in section 4.6 below, IFRS 13 requires that assumptions used to measure fair value reflect what market participants would consider.

⁵ Annual Improvements to IFRS Standards 2018-2020, May 2020, pp.15-17.

4.6 Measuring fair value: overview of IFRS 13's requirements

4.6.1 The fair value measurement framework

The objective of a fair value measurement is “to estimate the price at which an orderly transaction to sell the asset or to transfer the liability would take place between market participants at the measurement date under current market conditions”. [IFRS 13.B2]. In order to measure the fair value of a biological asset or agricultural produce, an entity needs to determine all of the following: [IFRS 13.B2]

- The particular asset that is the subject of the measurement (consistent with its unit of account - see section 4.2 above)
- The valuation premise that is appropriate for the measurement (consistent with its highest and best use - see section 4.6.2 below)
- The principal market (or in the absence of a principal market, the most advantageous market) for the asset or liability (see section 4.6.3 below)
- The valuation technique(s) appropriate for the measurement, considering the availability of data with which to develop inputs that represent the assumptions that market participants would use when pricing the asset and the level of the fair value hierarchy within which the inputs are categorised (see sections 4.6.3 and 4.6.4 below)

When valuations are subject to significant measurement uncertainty due to market volatility and there is a wider range of possible estimates of fair value measurement, an entity is required to apply judgement to determine the point within that range that is most representative of fair value measurement in the circumstances.

Climate change can have a tangible effect on an entity's assets and liabilities now or in the future. Entities might be subject to real or perceived risks or opportunities as a result of climate change, both physical risks (such as rising water levels, changing weather patterns, increased pollution levels) and transition risks (such as known or anticipated changes to laws and regulations or commitments to agreed targets or spending to mitigate the effects of pollution). Entities need to ensure that their fair value measurements appropriately consider relevant climate-related risk factors and opportunities.

Since fair value focuses on what market participants in the principal (or most advantageous) market would consider when pricing the asset or liability, care is needed in determining whether, and to what extent, climate change might affect the assumptions used to measure fair value. This might include, for example, how market participants believe climate-related risks would affect the price of the asset or liability; the effect of restrictions imposed on assets in response to climate change (if it is a characteristic of the asset); and the highest and best use of a non-financial asset, which must be physically possible, legally permissible and financially feasible, and is presumed to be the entity's current use. Sustainability reporting disclosures might provide more information about an asset or liability and, therefore, affect what market participants would be willing to pay. However, determining the impact of that information on market participant assumptions, inputs and sensitivities, is likely to require significant judgement.⁶

4.6.2 Highest and best use and valuation premise

IFRS 13 requires that the fair value of non-financial assets, such as biological assets and agricultural produce, take into account “a market participant's ability to generate economic benefits by using the asset in its *highest and best use* or by selling it to another market participant that would use the asset in its highest and best use” (emphasis added). [IFRS 13.27].

The objective in determining highest and best use is to identify the use by market participants that would maximise the value of the asset, either on its own or with other assets and/or liabilities. Therefore, in order to determine the highest and best use of a non-financial asset, an entity needs to make the assessment from the perspective of market participants (see section 4.6.3 below).

Importantly, IFRS 13 starts with the presumption that the highest and best use is an asset's current use. Alternative uses are not considered unless market or other factors suggest that market participants would use that asset differently to maximise the value of that asset. [IFRS 13.29]. If such factors exist, an entity would only consider those alternative uses that are physically possible, legally permissible and financially feasible. [IFRS 13.28]. Appropriately determining an asset's highest and best use is a critical step and can have significant implications on the measurement of fair value. Therefore, this assessment is based on the weight of evidence available. Careful consideration is needed to ensure consistent assumptions regarding the principal market (or in the absence of a principal market, the most advantageous market) and the participants in that market, since highest and best use is determined from the market participants' perspective.

⁶ For more information on the topic of accounting for climate change refer to our publication titled *Applying IFRS: Connected Financial Reporting: Accounting for Climate Change* available on [ey.com](https://www.ey.com).

Determining highest and best use is discussed further in Chapter 15. As discussed in Chapter 15 and in section 5.2 below, additional disclosures are required if an entity determines that the highest and best use of a non-financial asset is different from its current use.

Dependent on its highest and best use, the fair value of the non-financial asset will either be measured based on the value it would derive on a stand-alone basis or in combination with other assets or other assets and liabilities (known as the valuation premise). [IFRS 13.31]. For example, as discussed in section 4.6.2.A below, the highest and best use of a biological asset might be in combination with the land to which it is physically attached. For produce growing on a bearer plant, it may also be in combination with the bearer plant upon (or within) which it grows.

Even in situations where the valuation premise of a biological asset (including produce growing on a bearer plant) is 'in combination with other assets and/or liabilities', the objective of a fair value measurement is still to measure the price to sell the biological asset, not the combined group. IFRS 13 assumes that the market participants that would purchase the biological asset would use it in combination with those other assets and/or liabilities. That is, if the market participants already had those other assets and/or liabilities, what price would the market participants pay to acquire the biological asset? In reality, sales are unlikely to be structured in this way. Entities might need to sell the 'other assets and/or liabilities' in order to sell the biological asset (particularly if they are physically attached, as is discussed in section 4.6.2.A below). However, regardless of how an entity might structure an actual sale, IFRS 13 contemplates a hypothetical sale and specifically states that, when the highest and best use is the use of the asset in combination with other assets and/or liabilities, a fair value measurement assumes that the market participant acquiring the asset already holds the complementary assets and/or the associated liabilities. [IFRS 13.32].

In practice, an entity may need to measure the price to sell the biological asset by measuring the price for the combined assets and/or liabilities and then allocating that fair value to the various components. IFRS 13 does not specify which allocation approaches can or cannot be used. Therefore, an entity must use its judgement to select the most appropriate technique. Even if this approach is used, the objective is to measure the fair value of the biological asset assuming it is sold consistent with its unit of account, which for a biological asset is the individual asset. [IFRS 13.32]. This is discussed further in section 4.6.2.A below.

4.6.2.A Biological assets attached to land

IAS 41 observes that biological assets are often physically attached to land, for example, crops growing in a field. In many cases, there will be no separate market for biological assets in their current condition and location. The objective of a fair value measurement is to determine the price for the asset in its current form. However, as discussed in section 4.7 below (see also Chapter 15), if no market exists for an biological asset in its current form, but there is a market for the converted or transformed asset, an entity would adjust the price that would be received for the converted or transformed asset for the costs a market participant would incur to recondition the asset (after acquiring the asset in its current condition) and the compensation they would expect for the effort in order to measure fair value.

IFRS 13 does not require a market to be observable or active in order to measure fair value. However, it is clear that, if there is a principal market for the asset, the fair value measurement represents the price in that market at the measurement date (regardless of whether that price is directly observable or estimated using another valuation technique). This price must be used even if a price in a different market is potentially more advantageous. [IFRS 13.18]. While the price need not be observable to measure fair value, the standard does require an entity to prioritise observable inputs in the principal (or in the absence of a principal market, the most advantageous) market over unobservable inputs. [IFRS 13.67].

If an income approach (such as a discounted cash flow approach) is used to measure the biological asset (excluding the land) and the land, to which the asset is physically attached, is owned by the entity, care is needed to ensure that fair value measurement is not overstated. This is because land owned by the entity would not derive any expected cash outflows. It is, therefore, common for entities to include a notional rental charge for the land, reflecting what would be paid to rent the land, using market participant assumptions.

IAS 41 suggests that where there is no separate market for biological assets in their current form and they are physically attached to land, an active market might exist for the combined assets, i.e., for the biological assets, land and land improvements. If this is the case, an entity could use the information regarding the combined assets to determine the fair value of the biological assets. [IAS 41.25]. Similar considerations will also be relevant for produce growing on a bearer plant, which is unlikely to have a separate market in its current form and is physically attached to the bearer plant and, in turn, to the land.

IFRS 13 defines an active market as: [IFRS 13 Appendix A]

Extract from IFRS 13

Appendix A Defined terms

active market	A market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis.
----------------------	---

Whether such a market exists for the combined assets is a matter of judgement, taking into consideration all the relevant facts and circumstances. However, an entity needs to have sufficient evidence to support such an assumption.

Importantly, the unit of account established by IAS 41 is an individual asset (see section 4.2.1 above). Therefore, if fair value is measured for the combined assets, the total fair value would need to be allocated to each component in order to derive the fair value for the biological asset or produce growing on a bearer plant (as is illustrated by Figure 4-1 below). As discussed in section 4.6.2 above, IFRS 13 does not provide guidance on how to perform such an allocation. IAS 41 suggests the use of the residual method as one possible way to allocate the fair value between the biological assets and the land. However, this might be difficult to apply in practice, as illustrated in Illustration 4-1 below. Therefore, entities will need to apply judgement when determining the appropriate allocation.

Illustration 4-1: Assets attached to land

Entity A acquired a 10-hectare vineyard on 1 January 20X1 for CU1,200. The purchase price of the vineyard was attributed as follows:

1 January 20X1	CU
Purchase price	1,200
Land	(780)
Vineyard improvements	(130)
Grape vines	(255)
Grapes growing on the vines	35

At the end of its financial year Entity A needs to determine the fair value of the grapes growing on the vines in accordance with IAS 41 and invites two equally skilled professional valuers to determine their value.

	Valuer 1	Valuer 2
31 December 20X1	CU	CU
Fair value of an average 10-hectare vineyard	1,105	1,100
Adjustment for soil and climatic conditions	135	150
Estimated fair value of Entity A's vineyard	1,240	1,250
Fair value of the land	(830)	(825)
Fair value of vineyard improvements	(135)	(125)
Fair value of grape vines	(245)	(250)
Grapes growing on the vines	30	50

Valuer 1 and Valuer 2 make a virtually identical assessment of the market values of the vineyard, the land, vineyard improvements and the grape vines. Nevertheless, because the value of grapes growing on the vines is calculated by subtracting all the other known elements from the total value of the vineyard, a noticeable difference arises in the valuation of the grapes growing on the vines. In a similar vein, entities that use only one valuer need to be aware that even small changes in assumptions from period-to-period could have a significant impact on the valuation of biological assets or plants growing on a bearer plant and, therefore, reported profits or losses. For this reason, IFRS 13 requires extensive disclosures about assumptions used in determining fair value.

In April 2012, the IFRS IC received a request to clarify the use of the residual approach, as discussed in IAS 41.25 (in light of the requirement in IFRS 13 to measure the fair value of non-financial assets based on their highest and best use). Specifically, the IFRS IC was asked to consider the situation where a biological asset was physically attached to land and no separate market for the biological asset existed in its current condition and location. The submitter of the request assumed entities would apply IAS 41.25, measure the biological asset and land on a combined basis and use the residual approach to derive a fair value for the biological asset. The submitter was concerned about situations where the highest and best use of the biological asset is in combination with the land, but the value of the land could be higher if measured assuming some alternative use (such as property development). In these circumstances, the allocated fair value of the biological asset might be nil or negligible. The fact pattern was further complicated because it was assumed the land to which the biological asset was attached was measured using the cost model in accordance with IAS 16.⁷

The IFRS IC elected not to take the issue onto its agenda, but noted that, in the development of IFRS 13, the IASB had considered the situation where the highest and best use of an asset in a group of assets is different from its current use. However, “IFRS 13 does not explicitly address the accounting implications if those circumstances arise and the fair value measurement of the asset based on its highest and best use assumes that other assets in the group need to be converted or destroyed”. The IFRS IC also observed that this issue may affect non-financial assets within the scope of other standards, not just those within the scope of IAS 41.⁸ The IFRS IC asked the IASB to provide clarification of the accounting requirements for the issues it had considered. However, as outreach indicated the issue was not widespread, in May 2013, the IASB decided it could, instead, be considered for review in the Post-Implementation Review (PIR) of IFRS 13.⁹ Most respondents to the IASB’s requests for information as part of its PIR of IFRS 13 that had experience with biological assets said that fair value measurement of biological assets was challenging (highlighting specific aspects that are challenging) and asked for additional guidance (particularly in relation to measuring the fair value of growing produce) and/or changes to IAS 41. However, there were different views about how the Board could help.¹⁰

In considering all of the feedback to its request for information, the Board completed its review of findings and concluded in March 2018 that IFRS 13 is working as it intended. It also decided to:

- “a. feed the PIR findings regarding the usefulness of disclosures into the Board’s work on Better Communication in Financial Reporting, in particular, into the Targeted Standards-level Review of Disclosures and the Primary Financial Statements projects;
- b. continue liaising with the valuation profession, monitor new developments in practice and promote knowledge development and sharing; and
- c. conduct no other follow-up activities as a result of findings from the PIR.”¹¹

In relation to education about measuring the fair value of biological assets, “the Board concluded that, although there might be inconsistent application in fair value measurement of biological assets, detailed application questions are best addressed by the valuation profession, and not by accounting standard-setters”.¹² Determining the highest and best use of an asset requires judgement (see section 4.6.2 above), but an entity starts with the presumption that the highest and best use is an asset’s current use. As discussed above, IAS 41.25 is only relevant where there is no separate market for a biological asset or produce growing on a bearer plant in its current form and it (or the bearer plant on which it grows) is physically attached to land. In addition, that paragraph suggests an active market may exist for the combined assets (e.g., land and biological asset) and, therefore, that an observable price in that market for the assets (on a combined basis) could be used to derive fair value for the biological asset. [IAS 41.25]. Selecting appropriate valuation techniques with which to measure fair value in accordance with IFRS 13 requires judgement. Some might use the residual approach to do this, as indicated in the submission. However, IAS 41.25 does not require the use of the residual approach; it is only mentioned as an example.

12 [IFRS Project Reporting and Feedback Statement](#): *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, page 16. Available on the IFRS Foundation’s website.

The IASB reaffirmed this when they considered this matter in May 2013. They also noted that IFRS 13 encourages the use of multiple valuation techniques, where appropriate.¹³

How we see it

The outcome from a fact pattern such as the one the IFRS IC discussed may be somewhat counterintuitive. However, the fact that the fair value of the land, in that situation, would not be recognised in the financial statements is, in our view, irrelevant to the measurement of fair value. The objective of a fair value measurement does not change regardless of whether it is recognised or unrecognised.

Figure 4-1: Applying IAS 41.25 to measure the fair value of a biological asset

4.6.3 Selecting appropriate assumptions

Selecting the appropriate assumption with which to measure the fair value of biological assets and agricultural produce can often be difficult. According to IFRS 13 (see Chapter 15), an entity selects assumptions that:

- Market participants would use, i.e., they are not entity-specific
 - Are consistent with the unit of account and characteristics of the asset, including an asset's condition and location and any restrictions on the use or sale of the asset
 - Are consistent with an orderly transaction to sell the asset in the principal market, or in the absence of a principal market, the most advantageous market
- And
- Maximise the use of observable inputs and minimise the use of unobservable inputs (based on the fair value hierarchy)

IFRS 13 clarifies that the transaction to sell the asset would be between market participants, not between the entity and a market participant. In addition, assumptions need to reflect those that market participants generally would assume, not those of a particular market participant. In order to select the appropriate assumptions, an entity would identify characteristics of market participants. At a minimum, IFRS 13 assumes that market participants will be independent of each other, knowledgeable about the asset, able and willing to enter into a transaction for the asset. [IFRS 13 Appendix A]. An entity need not identify specific market participants, but needs to identify the distinguishing characteristics of market participants.

[IFRS 13.23].

Identifying the appropriate market participants (or their characteristics) depends on the principal market for the asset or, in the absence of a principal market, the most advantageous market (see Chapter 15 for further discussion). [IFRS 13.23]. There is a general presumption in IFRS 13 that the principal market is the one in which the entity would normally enter into a transaction to sell the asset, unless there is evidence to the contrary. [IFRS 13.17].

¹³ [IASB Update](#), May 2013, available on the IFRS Foundation's website.

In times of market volatility, additional judgement may be needed to select appropriate assumption for fair value measurement. IFRS 13 has specific guidance on evaluating whether there has been a significant decrease in the volume or level of activity for an asset (see Chapter 15) and identifying transactions that are not orderly (Chapter 15). It also provides guidance on estimating fair value when there has been a significant decrease in volume and level of activity (Chapter 15).

4.6.3.A Condition and location

Fair value measured in accordance with IFRS 13 takes into consideration an asset's condition and location, provided they are a characteristic of the asset being measured that a market participant would consider when pricing the asset. [IFRS 13.11].

This will have a direct impact on what is being measured. For example, entities measuring partly grown crops may also need to consider the fair value of the land in which they are planted (see section 4.6.2.A above). It may also require an entity to consider alternative markets. For example, an entity that rears chickens have to consider whether there is a market for immature chicks and/or day-old chicks and not just consider the market for mature chickens as the only market available. Another example is the market for vines versus the market for grapes, or seeds versus seedlings.

It is possible for a market to exist in one geographical area, but not in another area. For example, transportation costs may limit the geographical size of the market for agricultural produce significantly, possibly to the point where a local cooperative or factory is the only buyer.

If no market exists for an asset in its current form, but there is a market for the converted or transformed asset, an entity adjusts the fair value for the costs a market participant would incur to re-condition the asset (after acquiring the asset in its current condition) and the compensation they would expect for the effort.

If the location of a biological asset or agricultural produce would require it to be transported to the market in order to sell it, transportation costs would be deducted from the market price in order to measure fair value. Given the logistical problems and generally high costs of transporting living animals and plants, there could be many different fair values for identical biological assets depending on their location.

4.6.4 Valuation techniques in IFRS 13

IFRS 13 does not limit the types of valuation techniques an entity might use to measure fair value. However, it does require the valuation techniques to be consistent with one of three approaches: the market approach; the income approach; or the cost approach. [IFRS 13.62]. According to IFRS 13, multiple techniques need to be used, when applicable. Therefore, judgement is needed to select the techniques that are appropriate in the circumstances. [IFRS 13.63]. Selecting appropriate valuation techniques is discussed further in Chapter 15.

IFRS 13 does not prioritise the use of one valuation technique over another, or require the use of only one technique. Instead, IFRS 13 establishes a hierarchy for the inputs used in those valuation techniques, requiring an entity to maximise observable inputs and minimise the use of unobservable inputs (this is discussed further in Chapter 15). [IFRS 13.74]. The best indication of fair value is a quoted price in an active market for the identical asset. However, even when fair value needs to be estimated, an entity must maximise the use of observable inputs and minimise the use of unobservable inputs.

A significant decrease in volume or activity in a market can also influence which valuation techniques are used, how those techniques are applied and whether inputs are observable at the measurement date. This is discussed further in Chapter 15.

4.6.4.A Cost as an approximation of fair value

IFRS 13 defines fair value as a current exit price, not an entry price. Therefore, while exit and entry prices may be identical in many situations, the transaction price (an entry price) is not presumed to represent the fair value of an asset or liability measured in accordance with IFRS 13 on its initial recognition. [IFRS 13.57, IFRS 13.58, IFRS 13.59].

IAS 41 indicates that cost can sometimes approximate fair value. The standard gives two situations where this might occur: [IAS 41.24]

- When little biological transformation has taken place since cost was initially incurred - seedlings planted immediately prior to the end of a reporting period and newly acquired livestock are given as examples
- Or
- When the impact of the biological transformation on price is not expected to be material - for example, during the initial phase of growth for a pine plantation with a 30-year production cycle

Even in such situations, the objective is still to measure fair value in accordance with IFRS 13. Therefore, as with an entry price on initial recognition, an entity cannot presume that cost approximates fair value. Instead, it must ensure cost is materially consistent with a current exit price for the asset.

How we see it

Entities need to carefully consider which costs could be included in the entry price. IFRS 13 specifically states that transaction costs are not part of fair value (that is, they are not added to or deducted from the exit price), therefore, we would not expect an entity to deduct such costs from the entry price - particularly as 'costs to sell' are deducted from fair value before being recognised in the financial statements. Nor would we expect entities applying a fair value model to include acquisition-related transaction costs within an entry price used to approximate fair value.

4.7 The problem of measuring fair value for part-grown or immature biological assets

Entities may be required to measure their biological assets part way through the transformation process, particularly when the time to harvest is greater than 12 months. In these circumstances, there may not be an active market for the asset in its current condition and location. In the absence of an active market, preparers often use a discounted cash flow model to estimate fair value.

In these situations, a common question is whether an entity can take into consideration the future biological transformation when estimating the fair value of a biological asset.

As discussed in section 4.6.3.A above, IFRS 13 makes it clear that the fair value of an asset considers characteristics of an asset, such as its current condition and location. An entity must consider this objective in determining an appropriate discount rate and estimating its future cash flows, which must be based on assumptions market participants would use. Therefore, if a market participant would consider the potential for future growth or maturation, the related cash flows and risks from that additional biological transformation are included in determining the appropriate fair value. Assume, for example, that a particular breed of chicken is considered mature between 16 and 24 weeks of age and an entity needs to measure the fair value of a 10-week-old chick at the measurement date. An immature chick at 10 weeks of age is closer in age to a mature chicken than to a day-old chick. There may not be an observable price for 10-week-old chicks and, therefore, an entity might use the price of a mature chicken as an input, adjusting for the risks and cash flows that market participants would incur (as well as a reasonable profit margin) since the chick is only 10 weeks old at the measurement date (see section 4.7.1 below for further discussion).

It is important to consider the requirements of IFRS 13 (Chapter 15) for determining the principal, or most advantageous, market for the specific unit of account. Therefore, in applying IAS 41, an entity needs to identify the principal market for each individual asset. An entity first determines the markets that it can access, which could include local and/or foreign markets. Then it determines which of those markets has the greatest volume and liquidity in relation to the particular asset; this is the principal market (also refer to Chapter 15). It would be reasonable for an entity to conclude there are different principal markets for different types of assets, for example, for different species of fish. It is also possible to have different principal markets at different maturation stages (e.g., for eggs, day old chicks and mature chickens).

IFRS 13 requires that, if there is a principal market for the asset or liability, the fair value measurement shall represent the price in that market at the measurement date (regardless of whether that price is directly observable or estimated using another valuation technique). The price in the principal market must be used even if the price in a different market is potentially more advantageous. [IFRS 13.18]. Since an entity can consider the expected cash flows the asset can generate in its principal market, the entity is not permitted to use available prices in other active markets for part-grown biological assets. Even in situations where there is no principal market, once the most advantageous market has been selected, an entity would not look to other markets for available prices or use prices in the most advantageous market if market participants would not consider them.

4.7.1 The use of prices for similar assets, for which observable prices do exist, as an input into the fair value measurement

The original version of IAS 41 had caused confusion in this area, as it had required that the estimation of future cash flows “exclude any increases in value from additional biological transformation and future activities of the entity”. [IAS 41(2008).21]. This seemed to suggest that the value of immature biological assets is based on values in their current condition, rather than recognising that part of the value must logically lie in their potential, given appropriate husbandry, to grow to full size. The IASB amended IAS 41 to clarify that entities need to consider the risks associated with cash flows from additional biological transformation in determining the cash flows, the discount rate or some combination of the two provided a market participant would take the additional biological transformation into consideration.

While IAS 41.21 was subsequently deleted by the introduction of IFRS 13, this clarification is consistent with the requirements in that standard and is helpful in understanding its requirements in situations where prices are available in an active market for part-grown biological assets, but that market is not the principal market (or in the absence of a principal market, the most advantageous market).

This issue is illustrated by an extract from (the former) CESR’s database of enforcement decisions published in April 2007 (Decision ref. EECS/O407-11) in relation to the fair value measurement requirements in IAS 41 (prior to the issuance of IFRS 13). Norwegian fish farmers had developed a practice of recording live immature fish at cost on the basis that they were unable to value them reliably in accordance with IAS 41.30. The Norwegian regulator took the view that slaughtered fish sold whole and gutted need to be considered the same as live salmon under paragraph 18(b) of the 2012 version of IAS 41 (IAS 41(2012)) and that it was possible to value the live immature fish based on the market price for slaughtered fish of the same size. Smaller fish are sold on the market because they are harvested with mature fish, however their value per kilo is significantly below that of mature fish and the Norwegian fish farming entities did not, therefore, believe that it was appropriate to use their market price as a basis for fair value. The regulator’s decision was appealed to the Norwegian Ministry of Finance and the database reports the conclusion as follows:

“The Ministry of Finance upheld the decision of the enforcer, with some adjustments and additions. Most significantly, the final ruling upholds the enforcer’s decision that slaughtered salmon which is sold whole and gutted is in an accounting sense to be considered as a similar asset of live salmon, according to IAS 41.18(b) and that this also applies to so-called immature farmed salmon. Hence, the observable prices of slaughtered salmon shall be used as a basis for determining the fair value of live immature salmon. The key amendment to the decision made by the Ministry of Finance is that it added certain comments relating to how the term ‘adjustments to reflect differences’ in IAS 41.18(b) was to be applied. The adjustments should reflect the differences between the price of an immature salmon and the hypothetical market price in an active market for live immature salmon.”

As a result of this decision, the Norwegian entities were required to record immature salmon at fair value, rather than at cost, by making appropriate adjustments to available market prices for similar sized slaughtered fish.

While IFRS 13 has now replaced the requirements in paragraph 18(b) of IAS 41 (2012) to which this decision related, the same approach could be used when measuring fair value in accordance with that standard. IFRS 13 prioritises the use of observable inputs for identical or similar items when measuring fair value. Therefore, in situations where an active market does not exist for the asset in its current form, entities might use prices for similar assets, for which observable prices do exist, as an input into the fair value measurement. [IFRS 13.82(a), IFRS 13.82(b)].

As discussed in the Norwegian salmon example above and in Chapter 15, an entity would need to identify any differences between the asset being measured at fair value and similar assets (e.g., a converted or transformed assets), for which observable market prices are available. The entity would then adjust the similar asset’s market price for the costs a market participant would incur (after acquiring the asset in its current condition) and the compensation they would expect for the effort. Such adjustments could affect the categorisation of the fair value measurement (as a whole) within the fair value hierarchy. Categorisation within the hierarchy is done for disclosure purposes and affects how much information must be disclosed about the fair value measurement (see section 5.2 below). IFRS 13 requires that, “If an observable input requires an adjustment using an unobservable input and that adjustment results in a significantly higher or lower fair value measurement, the resulting measurement would be categorised within Level 3 of the fair value hierarchy”. [IFRS 13.75]. Categorisation within IFRS 13’s fair value hierarchy is discussed further in Chapter 15.

5 Disclosure

5.1 General

In addition to the discussion in this chapter, our publication, *Good Group (International) Limited - Agriculture*, which is a supplement to *Good Group (International) Limited - Illustrative consolidated financial statements*,¹⁴ includes illustrative disclosures for biological assets, including bearer plants, and agricultural produce, as required by IFRS 13, IAS 16 and IAS 41.

5.1.1 Statement of financial position

IAS 1 requires biological assets (including produce growing on a bearer plant) to be presented separately on the face of an entity's statement of financial position (see Chapter 3). [IAS 1.54]. As discussed in section 2.3.2 above, agricultural produce after the point of harvest is accounted for under IAS 2 or another applicable IFRS accounting standard (e.g., IAS 16). IAS 2 does not require agricultural produce to be disclosed separately on the face of the statement of financial position (see Chapter 23). The following extract from the Illustrative Examples to IAS 41 illustrates the requirement to disclose biological assets in the statement of financial position. [IAS 41.IE Example 1].

Extract from IAS 41 Illustrative Examples

- A1 Example 1 illustrates how the disclosure requirements of this Standard might be put into practice for a dairy farming entity. This Standard encourages the separation of the change in fair value less costs to sell of an entity's biological assets into physical change and price change. That separation is reflected in Example 1. Example 2 illustrates how to separate physical change and price change.
- A2 The financial statements in Example 1 do not conform to all of the disclosure and presentation requirements of other Standards. Other approaches to presentation and disclosure may also be appropriate.

Example 1 XYZ Dairy Ltd

Total current liabilities	165,822	150,020
Total equity and liabilities	2,068,650	2,015,020

(a) An entity is encouraged, but not required, to provide a quantified description of each group of biological assets, distinguishing between consumable and bearer biological assets or between mature and immature biological assets, as appropriate. An entity discloses the basis for making any such distinctions.

5.1.1.A Current versus non-current classification

IAS 1¹⁵ requires an asset to be classified as current when: [IAS 1.66]

- (a) The entity expects to sell, consume or realise the asset in its normal operating cycle.
 - (b) The asset is primarily for trading purposes.
 - (c) The entity expects to realise the asset within 12 months after the reporting period.
- Or
- (d) The asset is cash or a cash equivalent (as defined in IAS 7 *Statement of Cash Flows*, see Chapter 36), unless it is restricted from being exchanged or used to settle a liability for at least twelve months after the reporting period.

If these criteria are not met, the asset is classified as non-current.

The classification of agricultural produce is usually consistent with an entity's assessment for its inventories, i.e., typically classified as a current asset because it will be sold, consumed or realised as part of the normal operating cycle.

The classification of biological assets (including produce growing on a bearer plant) typically varies based on the nature of the biological asset and the time it takes to mature.

For consumable biological assets that only have one harvest, classification will depend on when the asset will be harvested and sold. For example, livestock held for slaughter would likely be realised within 12 months after the end of the reporting period or as part of the normal operating cycle, and therefore would be classified as a current asset. Pine trees in a forest usually take more than 20 years to mature. Therefore, pine forests are usually classified as non-current.

Bearer biological assets, such as dairy cows or animals used for breeding, are often classified as non-current. Such assets usually provide multiple harvests, which may extend beyond one accounting period. Therefore, in order to classify the asset appropriately, an entity would need to consider the period over which it will derive future economic benefits from the asset, which is likely to be when the biological asset will be sold, replaced or removed. This is essentially consistent with determining the useful life of an item of property, plant and equipment in accordance with IAS 16.

In situations where biological assets are classified as non-current, there is some debate about whether a portion should be classified as current. Some believe that, particularly for bearer biological assets, the asset should be classified as non-current, consistent with the classification of property, plant and equipment under IAS 16. In this situation, an entity would probably only classify the asset as current when it is held for sale in accordance with IFRS 5 (see Chapter 5). Others argue that, since the unit of account in IAS 41 is the individual asset (see section 4.2.1 above), a portion of a group of biological assets could be classified as current. The current portion would be comprised of biological assets that will be removed permanently (e.g., sold, uprooted or otherwise removed) within 12 months after the end of the reporting period. Determining such a split may be more obvious for consumable biological assets with only one harvest, for example, the trees in a forest an entity expects to harvest within 12 months of the end of the reporting period. For other biological assets, care is needed to ensure that it is the final removal of the biological asset itself that is considered and not its agricultural produce. An example of the final removal of such biological assets includes dairy cows in a herd that an entity sells for slaughter.

15 Refer to section 5.1.5 for more on IFRS 18, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027.

How we see it

Regardless of which of the above approaches is used, an entity needs to be consistent from period to period across all similar types of biological assets. An entity also needs to assess whether its policy for classifying, or not classifying, a portion of its biological assets as current needs to be disclosed (see Chapter 3 for further discussion).

Produce growing on a bearer plant (e.g., grapes on a vine) are accounted for in accordance with IAS 41, separately from the bearer plant (which is within the scope of IAS 16, see section 3.2.3 above). As a result, entities need to consider the appropriate classification of any produce growing on a bearer plant. It is likely that produce growing on a bearer plant will be a current asset, unless it takes more than an operating cycle (e.g., a year) to mature.

5.1.1.B Bearer plants

The disclosure requirements of IAS 16 are applicable to bearer plants (see Chapter 19). Bearer plants are an example of a separate class of property, plant and equipment listed in IAS 16.37, therefore, the disclosure requirements of IAS 16.73 are provided for bearer plants separately to those of other classes. [IAS 16.37, IAS 16.73].

The Practical example below, from the consolidated financial statements of T&G Global Limited, is an example of disclosures provided of bearer plants (trees and vines) under IAS 16 and of the produce growing on the bearer plants (unharvested fruit) under IAS 41.

Practical example 5-1: T&G Global Limited (2023)

New Zealand

Annual Report 2023 [extract]

Financials [extract]

Notes to the financial statements [extract]

Operating assets [extract]

8. Biological assets

Biological assets consists of unharvested fruit growing on bearer plants, and are stated at fair value based on their present location and condition less estimated point-of-sale costs. Any gain or loss from changes in the fair value of biological assets is recognised in the income statement.

Point-of-sale costs include all other costs that would be necessary to sell the assets.

The fair value of the Group's apples, berries, citrus fruit and tomatoes are determined by management using a discounted cash flow approach.

Costs are based on current average costs and referenced back to industry standard costs. The costs are variable depending on the location, planting and the variety of the biological asset. A suitable discount rate has been determined in order to calculate the present value of those cash flows. The fair value of biological assets at or before the point of harvest is based on the value of the estimated market price of the estimated volumes produced, net of harvesting and growing costs. Changes in the estimates and assumptions supporting the valuations could have a material impact on the carrying value of biological assets and reported profit.

The following significant assumptions and considerations have been taken into account in determining the fair value of the Group's biological assets:

- Forecasts for the following year based on management's view of projected cash flows, including sales and margins, adjusted for inflation, location and variety of crops.
- The Group has unhedged projected cash flows from sales in foreign currencies. These have been translated to the Group's functional currency at average exchange rates sourced from financial institutions based on forecasted sales profiles.
- Discount rates to adjust for risks inherent to the crop, including natural events, disease or any other adverse factors that may impact the quality, yield or price.
- Any significant changes to management of the crop in the current and following year.

Valuation process

Within the Group's finance team are individuals who work closely with the Group's key biological asset categories during the year. These finance team members are also responsible for performing valuations of the Group's biological assets for financial reporting purposes.

Discussions of valuation processes and results are held between the Chief Financial Officer and the finance team at least once every six-months in line with the Group's reporting requirements.

The main level 3 inputs used by the Group are derived and evaluated as follows:

- Production yields, including tray carton equivalents per hectare and tonnes per hectare, are determined based on historical production trends for each orchard and forecasted expected yields based on the underlying age and health of the orchards.
- Annual gate prices represent management's assessment of expected future returns for the biological assets based on historical trends, current market pricing, and known market factors at balance date.
- Discount rates are determined by reference to historical trends and loss events, and an assessment of the time value of money and any risks specific for the current crop being valued.
- The fair value of biological assets and the level 3 inputs to the fair value model are analysed at the end of each reporting period.

As part of the analysis the level 3 inputs are reviewed and assessed for reasonableness with reference to current market conditions. The calculated fair value of biological assets is also reviewed to determine if it is a fair reflection of management's expected returns for each crop type.

The cash outflows used in the fair value calculation include notional cash flows for land and bearer plants owned by the Group. They are based on market rent payable for orchards of similar size.

	Apples \$'000	Tomatoes \$'000	Citrus \$'000	Blueberries \$'000	Total \$'000
2022					
Balance at 1 January	18,914	3,634	2,516	65	25,129
Capitalised costs	38,549	-	6,211	1,439	46,199
Change in fair value less costs to sell	768	6,484	1,961	(475)	8,738
Decrease due to harvest	(36,776)	(6,614)	(8,747)	(327)	(52,464)
Balance at 31 December	21,455	3,504	1,941	702	27,602
2023					
Balance at 1 January	21,455	3,504	1,941	702	27,602
Capitalised costs	20,248	-	5,378	1,800	27,426
Change in fair value less costs to sell	(1,238)	4,522	2,004	1,013	6,301
Decrease due to harvest	(20,476)	(4,223)	(6,987)	(1,394)	(33,080)
Balance at 31 December	19,989	3,803	2,336	2,121	28,249

Fair value measurement

Techniques applied by the Group which are used to value biological assets are considered to be level 3 in the fair value hierarchy. Inputs are not based on observable market data (that is, unobservable inputs). There have been no transfers between levels during the year.

The unobservable inputs used by the Group to fair value its biological assets are detailed below:

Produce	Unobservable inputs	Range of unobservable inputs	
		2023	2022
Apples	Tray carton equivalent (TCE) per hectare per annum	81 to 3,380	162 to 4,416
	Weighted average TCE per hectare per annum	1,264	1,915
	Export prices per export TCE	\$26 to \$64	\$31 to \$58
	Weighted average export prices per export TCE per annum	\$33.74	\$44.85
	Risk-adjusted discount rate	31%	25%
Tomatoes	Tonnes per hectare per annum	129 to 480	148 to 512
	Weighted average tonnes per hectare per annum	329	349
	Annual price per kilogram (kg) per season	\$1.57 to \$25.77	\$1.65 to \$25.73
	Weighted average price per kg per season	\$6.01	\$4.34
	Risk-adjusted discount rate	27%	25%
Citrus	Tonnes per hectare per annum	31	37
	Weighted average tonnes per hectare per annum	31	37
	Annual gate price per tonne per season	\$553 to \$3,314	\$739 to \$4,260
	Weighted average gate price per tonne per season	\$1,958	\$3,269
	Risk-adjusted discount rate	25%	14%
Blueberries	Tonnes per hectare per annum	2.9 to 6.5	3.4
	Weighted average tonnes per hectare per annum	4.9	3.4
	Annual gate price per kg per season	\$8.00 to \$30.80	\$8.26 to \$19.29
	Weighted average gate price per kg per season	\$21.76	\$19.15
	Risk-adjusted discount rate	22%	18%

As the yield per hectare and gate price or export price per TCE increases, the fair value of biological assets increases. As the discount rate used increases, the fair value of biological assets decreases.

For the Group's apples crop, an increase or decrease of 10% in the discount rate would result in a fair value change of \$1.0 million and \$1.1 million respectively (2022: 5% change in discount rate would result in fair value change of \$0.5 million).

For the Group's tomatoes, citrus, and blueberry crops, an increase or decrease of 10% in the discount rate would not have a material impact on the fair value of the crop.

For the Group's apples crop, an increase or decrease of 10% in volumes would result in a fair value change of \$3.3 million. For the Group's tomatoes crop, an increase or decrease of 10% in volume would result in a fair value change of \$2.2 million and \$2.1 million respectively (2022: 5% increase or decrease in volumes would result in a fair value change of \$1.9 million and \$0.5 million respectively).

For the citrus and blueberry crops, an increase or decrease of 10% in volumes would not have a material impact on the fair value of the crop.

Risk

Being involved in agricultural activity, the Group is exposed to financial risks arising from adverse climatic or natural events that could impact on the Group's biological assets through damage to crop caused by severe weather events. In the current year, the Group has assessed that the expectation of severe weather events is higher than previously assumed. As such, the Group has increased its discount rates this year when calculating the fair value of its biological assets. The TCE per hectare per annum assumption used in the biological assets calculation for Apples has been reduced to reflect the impact on Cyclone Gabrielle. In its sensitivity analyses of the impact of changes in volumes and discount rates to the fair value of crop, the Group has also increased the sensitivity of these calculations from 5% to 10%.

The Group continues to work with research partners to develop and commercialise new categories of fruit that can thrive in a warming climate, for example Tutti™ the world's first specifically bred hot climate tolerant apple variety.

Financial risk arises through adverse changes in market prices or volumes harvested, and adverse movements in foreign exchange rates.

Price risk is minimised by close monitoring of commodity prices and factors that influence those commodity prices. The Group also takes reasonable measures to ensure that harvests are not affected by climatic and natural events, disease, or any other factors that may negatively impact on the quality and yield of crop. Foreign currency risk is mitigated by using derivative instruments such as foreign currency hedging contracts to hedge foreign currency exposure.

Activity on productive owned and leased land

The productive owned and leased land growing different types of biological assets and by agricultural product types are detailed in the table below:

	Hectares		Production units		Unit measure
	2023	2022	2023	2022	
Apples	444	578	573,336	1,156,124	TCE
Tomatoes	24	24	8,463,825	8,478,183	kg
Citrus	90	90	2,778,756	3,465,186	kg
Blueberries	19	11	94,888	37,138	kg

10. Property, plant and equipment [extract]

Commercial land and improvements, orchard land and improvements, and buildings are stated at their fair value less accumulated depreciation and impairment losses. All other items of property, plant and equipment are stated at their cost less accumulated depreciation and impairment losses.

Revaluations

The Group's policy is to revalue commercial land and improvements, orchard land and improvements, and buildings every three years with valuations being performed by independent registered valuers based on the price that would be received to sell the asset in an orderly transaction between market participants under current market conditions. Valuation assessments are performed earlier than every three years if market evidence suggests that property values have moved materially since the time of the last valuation assessment.

All property valuers used are members of the New Zealand Institute of Valuers, with the exception of the valuers appointed in Belgium and the United Kingdom who have the appropriate expertise as required in those jurisdictions.

The revaluations are conducted on a systematic basis across the Group so that the asset revaluations are performed with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at balance date. Where valuations are not obtained for land and improvements, and buildings, the carrying values of these assets are reassessed for any material change.

Any revaluation increase arising on the revaluation of such land and buildings is credited to the property's revaluation reserve, except to the extent that it reverses a revaluation decrease for the same asset previously recognised as an expense, in which case the increase is credited to profit or loss to the extent of the decrease previously expensed. A decrease in carrying amount arising on the revaluation of such land and buildings is charged as an expense to the extent that it exceeds the balance, if any, held in the property's revaluation reserve relating to a previous revaluation of that asset.

Depreciation

Depreciation of property, plant and equipment, other than commercial and orchard land which is not depreciated, is calculated on a straight-line basis so as to expense the cost of the assets, or the revalued amounts, to their expected residual values over their useful lives as follows:

Asset	Time
• Commercial land improvements	15 to 50 years
• Orchard land improvements	15 to 50 years
• Buildings	15 to 50 years
• Bearer plants	7 to 40 years
• Glasshouses	33 years
• Motor vehicles	5 to 7 years
• Plant and equipment and hire containers	3 to 15 years

Impairment

Items of property, plant and equipment are assessed for indicators of impairment at each reporting date. An impairment loss is recognised immediately in profit or loss, unless the relevant asset is carried at a revalued amount, in which case the impairment loss is treated as a revaluation decrease and to the extent that the impairment loss is greater than the related revaluation surplus, the excess impairment loss is recognised in profit or loss.

	Commercial land and improvements \$'000	Orchard land and improvements \$'000	Buildings \$'000	Bearer plants \$'000	Glass- houses \$'000	Motor vehicles \$'000	Plant and equipment and hire containers \$'000	Work in progress \$'000	Total \$'000

Climate considerations

The Group has identified climate-related risks that could impact on the Group's property, plant, and equipment through damage to commercial and orchard land and buildings due to severe weather events, or decline in the value of the Group's bearer plants as existing crop could be grown in areas with declining land suitability for horticultural activity.

During the year the Group wrote off assets damaged as a result of Cyclone Gabrielle and also incurred higher insurance costs to ensure it has optimal insurance programmes in place. The Group continually assesses its risk in this area and looks for opportunities to diversify growing regions or invest in new crop varieties that will thrive in hot climates. Continued investment in protection structures, such as hail netting, also mitigates the risk of damage through severe weather events.

The Group has also identified a risk around the increasing cost of doing business due to the convergence of climate-related cost increases in glasshouse growing. One of the Group's strategies to mitigate this risk in the current year is the investment in new thermal screens at the Group's glasshouse growing operations.

5.1.2 Income statement

IAS 1 is silent on the presentation of gains and losses on biological assets (including produce growing on a bearer plant) and agricultural produce in the income statement.

IAS 41 requires that: [IAS 41.40]

Extract from IAS 41

40 An entity shall disclose the aggregate gain or loss arising during the current period on initial recognition of biological assets and agricultural produce and from the change in fair value less costs to sell of biological assets.

The standard only requires disclosure of the aggregate gain or loss; it does not require or encourage disaggregating the gain or loss. [IAS 41.B78, IAS 41.B79]. Example 1 of the Illustrative Examples to IAS 41 illustrates gains on biological assets and agricultural produce presented near the top of the income statement, although it is not entirely clear from the example whether losses on biological assets should be presented in the same position or elsewhere in the income statement. [IAS 41.IE Example 1].

The Practical example below is from the consolidated financial statements of Mondi plc. The Mondi plc group recognised changes in fair value less costs to sell in profit or loss, but did not separately disclose that amount on the face of the financial statements. Instead, as is illustrated below, the change in the fair value less costs to sell of biological assets was separately disclosed in the notes to the financial statements.

Practical example 5-2: Mondi plc (2023)

United Kingdom

Integrated report and financial statements 2023 [extract]**Financial statements [extract]****Notes to the consolidated financial statements [extract]****1 Basis of preparation [extract]****Critical accounting judgements and significant accounting estimates**

The preparation of the Group's consolidated financial statements includes the use of estimates and assumptions. Although the estimates used are based on management's best information about current circumstances and future events and actions, actual results may differ from those estimates. The critical accounting judgements and significant accounting estimates with a significant risk of a material change to the carrying value of assets and liabilities within the next year in terms of IAS 1, 'Presentation of Financial Statements', are:

Significant accounting estimates

- Fair value of forestry assets – refer to note 14
- Actuarial valuations of retirement benefit obligations – refer to note 24

Other areas of judgement and accounting estimates

The consolidated financial statements include other areas of judgement and accounting estimates. While these areas do not meet the definition under IAS 1 of significant accounting estimates or critical accounting judgements, the recognition and measurement of certain material assets and liabilities are based on assumptions and/or are subject to longer-term uncertainties. The other areas of judgement and accounting estimates include:

- Hyperinflation accounting – refer to notes 1 and 35
- Climate change – refer to note 1
- Taxation – refer to notes 7 and 35
- Residual values and useful economic lives of property, plant and equipment – refer to notes 10 and 35
- Fair value of assets acquired and liabilities assumed in business combinations – refer to notes 25 and 35

Climate change

Management has considered the impact of climate change in preparing these consolidated financial statements, in particular in the context of the disclosures included in the Strategic report, including the Group's science-based Net-Zero GHG emission reduction targets as detailed in the Mondi Action Plan 2030 (MAP2030) Taking Action on Climate section on pages 51-64. These considerations, which are integral to the Group's strategy, did not have a material impact on the accounting estimates and judgements, including the following areas:

- Estimates of future cash flows used in the impairment assessment of goodwill – refer to note 12
- Assumptions used in the fair value measurement of forestry assets – refer to note 14
- Residual values and useful economic lives of property, plant and equipment – refer to note 35
- Fair value of assets acquired and liabilities assumed in business combinations – refer to note 25

While these considerations did not have a material impact on the areas set out above, this may change in future periods as management evolves its understanding of climate change-related impacts on the Group.

35 Accounting policies [extract]**Non-current non-financial assets excluding goodwill, deferred tax and net retirement benefits assets [extract]****Agriculture – owned forestry assets (note 14)**

Owned forestry assets are biological assets measured at fair value less costs to sell, calculated by applying the expected selling price, less costs to harvest and deliver, to the estimated volume of timber on hand at each reporting date. The fair value less costs to sell is determined using a market-based approach. The estimated volume of timber on hand is determined based on the maturity profile of the area under afforestation, the species, the geographic location, climate and other environmental considerations and excludes future growth. The product of these is then adjusted for risks associated with forestry assets.

Changes in fair value are recognised in the consolidated income statement within other net operating expenses. At point of harvest, the carrying value of forestry assets is transferred to inventory and recorded as a felling cost reduction to the fair value of forestry assets.

Directly attributable costs incurred during the year of biological growth and investments in standing timber are capitalised and presented within cash flows from investing activities.

14 Forestry assets [extract]

€ million	2023	2022
At 1 January	485	348
Investment in forestry assets	48	49
Fair value gains	128	169
Felling costs	(87)	(78)
Currency movements	(55)	(3)
At 31 December	519	485
Mature	359	309
Immature	160	176

The Group has 254,858 hectares (2022: 252,857 hectares) of owned and leased land available for forestry activities, all of which is in South Africa. 80,614 hectares (2022: 80,227 hectares) are set aside for conservation activities and infrastructure needs. 1,044 hectares (2022: 1,045 hectares) relate to non-core activities. The balance of 173,200 hectares (2022: 171,585 hectares) are under afforestation, which forms the basis of the valuation set out above.

Mature forestry assets are those plantations that are harvestable, while immature forestry assets have not yet reached that stage of growth. Timber is harvested according to a rotation plan, once trees reach maturity. The maturity period ranges from 6.5 to 14.5 years (2022: 6.5 to 14.5 years) depending on species, climate and location.

The fair value of forestry assets is a level 3 measure in terms of the fair value measurement hierarchy, consistent with prior years.

The following assumptions have a significant impact on the valuation of the Group's forestry assets:

- The net selling price is defined as the selling price less the costs of transport, harvesting, extraction and loading, and all selling prices and costs are denominated in South African rand. The net selling price is based on third-party transactions and is influenced by the species, maturity profile and location of timber. In 2023, the net selling price used ranged from the South African rand equivalent of €15 per tonne to €53 per tonne (2022: €14 per tonne to €47 per tonne), with a weighted average of €34 per tonne (2022: €33 per tonne).
- The conversion factor, which is used to convert hectares of land under afforestation to tonnes of standing timber, is dependent on the species, the maturity profile of the timber, the geographic location and a variety of other environmental factors, such as the anticipated impact of climate change on water scarcity and fire risks. In 2023, the conversion factors ranged from 7.6 to 25.0 (2022: 7.9 to 23.9).
- The risk premium on immature timber of 12.4% (2022: 12.5%) is based on an assessment of the risks associated with forestry assets in South Africa and is applied for the years the immature timber has left to reach maturity. A risk premium on mature timber of 4.0% (2022: 4.0%) was applied. The risk premium applied to immature and mature timber includes factors for the anticipated impact of climate change on water scarcity and fire risks. An increase in the severity and frequency of extreme weather events, such as higher temperatures, changes in rainfall patterns and drought conditions, may result in higher timber losses in future years caused by stronger winds, erosion, fires, pests and diseases.

The valuation of the Group's forestry assets is determined in South African rand and converted to euro at the closing exchange rate on 31 December of each year.

Management has performed sensitivity analyses of reasonably possible changes in the significant assumptions and the EUR/ZAR exchange rate. The sensitivity table is based on historical experience; however, the estimates may vary by greater amounts. Therefore, the Board considers the forestry assets valuation to be a significant accounting estimate. The reported value of owned forestry assets would change as follows should there be a change in these underlying assumptions on the basis that all other factors remain unchanged:

€ million	2023	2022
Effect of €5/tonne increase in net selling price	79	75
Effect of 1% increase in conversion factor (hectares to tonnes)	6	5
Effect of 1% increase in risk premium	(8)	(7)
Effect of 10% increase in EUR/ZAR exchange rate	(47)	(44)

IAS 41 is not clear about how gains should be presented in the income statement. IAS 1 prohibits offsetting of income and expenses in the income statement, unless required or permitted by another standard. [IAS 1.32]. Therefore, if the sale of biological assets or agricultural produce meets the definition of revenue under IFRS 15 *Revenue from Contracts with Customers*, i.e., "income arising from the ordinary activities of the entity", [IFRS 15 Appendix A], it is presented on a gross basis in the income statement. Furthermore, if the sale of biological assets results from a contract with a customer and is within the scope of IFRS 15, it would be accounted for in accordance with IFRS 15 and presented as revenue from contracts with customers (see Chapter 28). However, for an entity's sales of non-current biological assets "that do not generate revenue but are incidental to the main revenue-generating activities of the entity. An entity presents the results of such transactions, when this presentation reflects the substance of the transaction or other event, by netting any income with related expenses arising on the same transaction". [IAS 1.34]. However, under IAS 41 the gross margin on agricultural produce sold shortly after harvest may be negligible, as the produce may have been previously carried at a valuation near to its sales price.

5.1.3 Groups of biological assets

The standard requires an entity to provide a narrative or quantitative description of each group of biological assets. [IAS 41.41, IAS 41.42]. An entity is encouraged to provide “a quantified description of each group of biological assets, distinguishing between consumable and bearer biological assets or between mature and immature biological assets, as appropriate”. [IAS 41.43]. The standard suggests that an entity may separately disclose the carrying amounts of: [IAS 41.43, IAS 41.44]

- Consumable biological assets (i.e., assets that are to be harvested as agricultural produce, sold as biological assets or produce growing on a bearer plant)

And

- Bearer biological assets (i.e., assets that are not consumable, but rather are self-regenerating)

The standard continues by suggesting that an entity “may further divide those carrying amounts between mature and immature assets. These distinctions provide information that may be helpful in assessing the timing of future cash flows”. [IAS 41.43]. Mature biological assets are defined by the standard as those assets “that have attained harvestable specifications (for consumable biological assets) or are able to sustain regular harvests (for bearer biological assets)”. [IAS 41.45]. If an entity makes such distinctions, it discloses the basis for making those distinctions. [IAS 41.43].

5.1.4 Other disclosures

If not disclosed elsewhere in information published with the financial statements, an entity is required to describe:

“(a) the nature of its activities involving each group of biological assets; and

“(b) non-financial measures or estimates of the physical quantities of:

“(i) each group of the entity’s biological assets at the end of the period; and

“(ii) output of agricultural produce during the period”. [IAS 41.46].

In addition, an entity shall disclose the following information:

- (a) The existence and carrying amounts of biological assets whose title is restricted, and the carrying amounts of biological assets pledged as security for liabilities [IAS 41.49]
- (b) The amount of commitments for the development or acquisition of biological assets [IAS 41.49]
- (c) Financial risk management strategies related to agricultural activity [IAS 41.49]
- (d) A reconciliation of changes in the carrying amount of biological assets between the beginning and the end of the current period, which includes: [IAS 41.50]
 - (i) The gain or loss arising from changes in fair value less costs to sell
 - (ii) Increases due to purchases
 - (iii) Decreases attributable to sales and biological assets classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with IFRS 5
 - (iv) Decreases due to harvest
 - (v) Increases resulting from business combinations
 - (vi) Net exchange differences arising on the translation of financial statements into a different presentation currency, and on the translation of a foreign operation into the presentation currency of the reporting entity

And

 - (vii) Other changes

Fair value measurement disclosures are discussed in section 5.2 below and in Chapter 15.

The standard also encourages, but does not require, an entity “to disclose, by group or otherwise, the amount of change in fair value less costs to sell included in profit or loss due to physical changes and due to price changes”, because this information is “useful in appraising current period performance and future prospects, particularly when there is a production cycle of more than one year”. [IAS 41.51, IAS 41.B74, IAS 41.B75, IAS 41.B76, IAS 41.B77]. IAS 41 notes that physical change itself can be broken down further into growth, degeneration, production and procreation, but the standard does not specifically encourage disclosure of this information. [IAS 41.52]. The following example from the standard, explains how an entity would go about separating the effect of physical changes from those of price changes. [IAS 41.IE Example 2].

Extract from IAS 41 Illustrative Examples**Example 2 Physical change and price change**

The following example illustrates how to separate physical change and price change. Separating the change in fair value less costs to sell between the portion attributable to physical changes and the portion attributable to price changes is encouraged but not required by this Standard.

A herd of 10 2 year old animals was held at 1 January 20X1. One animal aged 2.5 years was purchased on 1 July 20X1 for 108, and one animal was born on 1 July 20X1. No animals were sold or disposed of during the period. Per-unit fair values less costs to sell were as follows:

2 year old animal at 1 January 20X1	100	
Newborn animal at 1 July 20X1	70	
2.5 year old animal at 1 July 20X1	108	
Newborn animal at 31 December 20X1	72	
0.5 year old animal at 31 December 20X1	80	
2 year old animal at 31 December 20X1	105	
2.5 year old animal at 31 December 20X1	111	
3 year old animal at 31 December 20X1	120	
Fair value less costs to sell of herd at 1 January 20X1 (10 × 100)		1,000
Purchase on 1 July 20X1 (1 × 108)		108
Increase in fair value less costs to sell due to price change:		
10 × (105 - 100)	50	
1 × (111 - 108)	3	
1 × (72 - 70)	2	55
Increase in fair value less costs to sell due to physical change:		
10 × (120 - 105)	150	
1 × (120 - 111)	9	
1 × (80 - 72)	8	
1 × 70	70	237
Fair value less costs to sell of herd at 31 December 20X1		
11 × 120	1,320	
1 × 80	80	1,400

In January 2012, the IFRS IC considered a request for clarification in relation to IAS 41.51. The submitter was concerned that this paragraph may be contributing to an unacceptable application of the market approach to valuing biological assets. To remedy this, the submitter suggested that the disclosure be amended as part of annual improvements so that it would only be encouraged when the entity's biological assets are at the same level of biological transformation as those quoted in an active market. However, the IFRS IC did not believe an amendment was needed, noting that IAS 41.51 addresses disclosures, not measurement. The IFRS IC also pointed out that the requirements for measuring fair value are set out in IFRS 13, which is not affected by IAS 41.51.¹⁶

In addition to the above required and encouraged disclosures, the standard notes that agricultural activity is "often exposed to climatic, disease and other natural risks. If an event occurs that gives rise to a material item of income or expense, the nature and amount of that item are disclosed in accordance with IAS 1" (see Chapter 3). For example, an entity may need to disclose events such as "an outbreak of a virulent disease, a flood, a severe drought or frost, and a plague of insects". [IAS 41.53].

¹⁶ [IFRIC Update](#), January 2012, available on the IFRS Foundation's website.

Many of the uncertainties and judgements inherent in the valuations and also climate-related risk and events, that have to be made under IAS 41 are discussed in the financial statements of T&G Global Limited (as shown in section 5.1.1.B above), Mondi plc (as shown in section 5.1.2 above), Mowi ASA and Sappi Limited, as shown in the following Practical examples.

Practical example 5-3: Mowi ASA (2023)

Norway

Integrated Annual Report 2023 [extract]

3 Group results [extract]

Financial statement and notes [extract]

NOTE -3A - ESTIMATES AND JUDGEMENTS [extract]

BIOLOGICAL ASSETS

Biological assets comprise eggs, juveniles, smolt and fish in the sea. These assets are measured at fair value less cost to sell, unless the fair value cannot be measured reliably. The estimation of the fair value relies on a series of uncertain assumptions, e.g., biomass volume, biomass quality, size distribution, market prices, expected future costs, remaining time to harvest and total time to harvest.

Mowi measures all deviations in biomass volume compared to estimates when a site is harvested out. Except for situations where there has been an incident causing mass mortality, particularly early in the cycle, combined with an inability to count and weigh fish after the event in fear of further stressing the fish, volume deviations are normally minor. Similarly, excluding the effects of soft flesh and melanin, the quality of the fish can normally be estimated with a relatively high degree of accuracy. Categorisation of quality is normally set per country based on averages, but can be set individually per site when needed. The size distribution shows some degree of variation but normally not to an extent that significantly changes the estimated value of the biomass (the value of two fish at five kg is very similar to the value of two fish weighing four and six kg, respectively).

The accumulated cost of the fish per kg will only deviate from the estimate if the volume is different from the estimate. For the estimation of future costs, there is uncertainty with regard to feed prices, other input costs and biological development. Mowi measures cost deviations vs. budget as part of the follow up of business units. Excluding special situations (incidents etc.), the deviations in costs vs budgets are normally limited for a group of sites, although individual sites might show deviations. The estimation of costs influences the biomass value through the recognised fair value adjustment in the statements of comprehensive income and financial position (calculated as fair value less accumulated biological costs).

The key element in the estimation of fair value is the assumed market price. The assumed market price is the price that we expect to receive on the future date when the live fish is harvested. We derive these prices from a variety of sources, normally a combination of the prices achieved in the previous month and the contracts most recently entered into. For salmon of Norwegian, Scottish, Icelandic and Faroese origin, quoted forward prices (Nasdaq) are normally used in the estimation, see Note 2. The use of third-party forward prices improves the reliability and comparability of the price estimation.

For further information about biological asset values please see Note 6, Biological assets.

NOTE 3B - ENVIRONMENTAL RISK

Climate change represents both risks and opportunities for Mowi. We recognise the growing significance of climate change on our business and the increasing role of producing food from the ocean as a solution to climate change. Mowi has developed a sustainability strategy, the Leading the Blue Revolution Plan. It sets ambitious goals to ensure our salmon is raised in the ocean in harmony with nature and local coastal communities, using an eco-efficient value chain while offering solutions to global challenges such as climate change and plastic pollution.

Climate change has been identified as an operational, strategic, reporting and compliance risk to Mowi which can potentially impact our business in the short, medium, and long term. Mowi follows the COSO (Committee of Sponsoring Organisations) enterprise risk framework to assess and identify risks, including climate change risks. The risk of climate change on Mowi's financial position can be classified into two types of risks; physical risk and transition risk. Physical risks are related to the increase and severity of extreme weather and long-term environmental changes. The physical related climate risks and opportunities relate to extreme weather events, sea levels and temperatures, the frequency of algae blooms, and the availability of the raw materials for our fish feed (medium to long term impact). Transition risks refer to the changes in technological advancements within clean energy, shifts in consumer behaviour and political interventions, such as restrictions and costs related to emissions etc. The transition risks and opportunities include legislation or regulations imposing overall caps or taxes on greenhouse gas emissions, or mandating the increased use of electricity from renewable energy sources (short-term impact). An increased recognition of seafood as a low carbon footprint protein is a transitional opportunity for Mowi.

These risks can affect Mowi in multiple ways, such as winters storms or el ninos giving tougher conditions, an increase of algae blooms and jelly fish due to increased water temperature can reduce quality and cause mortality on fish reducing revenue, or result in increased operating expenses with increased level of maintenance on nets and pens with tougher climate and expenses based on access to raw material in our fish feed, additional expenses for taxes with new regulation, or expenses to adapt our way of business to changed expectations from stakeholders. The changes, however, can also provide opportunities with faster growing fish in higher sea temperatures and increased revenues. The risk can also impact the carrying amount and useful life of both tangible and intangible assets as weather tear or regulation might require earlier replacements.

These risks and opportunities are part of our risk assessment as part of the annual budget and long term plan process and considered in our impairment testing at year end. The long-term effects of climate change are uncertain, but we believe that Mowi will play an increasing role in producing healthy nutritious food through an eco-efficient value chain. No impairment related to environmental risk is recognised as of year end and there has been no change in useful life for our assets.

Practical example 5-4: Sappi Limited (2023)

South Africa

2023 Group Annual Financial Statements [extract]**Notes to the Group Annual Financial Statements [extract]****2. Accounting policies [extract]****2.3 Critical accounting policies and key sources of estimation uncertainty [extract]****2.3.4 Plantations**

Plantations are stated at fair value less costs to sell with all changes in fair value being recognised in profit or loss. The fair value of forestry assets is a Level 3 measure in terms of the fair value measurement hierarchy. The group uses a combination of both the income approach and the market approach in determining fair value as it believes that these methods yield the most appropriate valuations. The income approach which uses discounted cash flows is applied to immature timber due to the extended time period required for the timber to reach maturity whereas the market approach which is based on the selling price of similar assets is applied to mature timber due to its shorter time period to maturity.

The key inputs are the selling prices, costs to sell, discount rates, volume and growth estimations. The impact of these inputs are disclosed in note 12.

- **Selling prices and costs to sell**

The net selling price is defined as the selling price less the costs to sell which include the costs of transport, harvesting, loading and overheads. The selling prices are based on external third-party transactions during the year and are benchmarked against international pricing of recent market transactions and which are influenced by species, maturity profile and location of timber. Forecast consumer price indexes are also considered for both timber prices and costs to sell.

A current net selling price is used for mature timber that is expected to be felled within 12 months from the end of the reporting period as such timber is expected to be used in the short term whereas a market trend related fair value price is used for immature timber and mature timber that is expected to be felled 12 months after the reporting date.

- **Discount rate**

The discount rate used is the real pre-tax discount rate. This is applied to pre-tax cash flows.

- **Volume and growth estimations**

The group focuses on good husbandry techniques which include ensuring that the rotation of plantations is met with adequate planting activities for future harvesting. The age threshold used for quantifying immature timber is dependent on the rotation period of the specific timber genus which varies between five and 18 years. In the Southern African region, softwood less than eight years and hardwood less than five years are classified as immature timber.

Trees are generally felled at the optimum age when ready for intended use. At the time the tree is felled, it is taken out of plantations and accounted for under inventory and reported as a depletion cost (fellings).

Depletion costs includes harvesting (fellings) and damages. The fair value of timber felled is determined using the current net selling price while damages are calculated using the market trend related fair value price. Damages are written-off against standing timber to record loss or damage caused by fire, storms, disease and stunted growth. Harvesting (fellings) depletion costs are accounted for as actual tons multiplied by the current net selling price. Damages depletion costs are accounted for as actual damaged tons multiplied by the market trend related fair value price. Damaged tons are calculated using the projected growth to rotation age and are extrapolated to current age on a straight-line basis.

The group has projected growth estimation over a period of five to 18 years per rotation. In deriving this estimate, the group established a long-term sample plot network which is representative of the species and sites on which trees are grown and the measured data from these permanent sample plots were used as input into the group's growth estimation. Periodic adjustments are made to existing models for new genetic material.

Volume and growth assumptions are used in determining standing tons at valuation date.

The associated costs for managing plantations are recognised as silviculture costs in cost of sales (see note 4). Silviculture costs are presented as operating activities in the statement of cash flows.

12. Plantations

US\$ million	2023	2022
Fair value of plantations at beginning of year	382	477
Additions	–	7
Gains arising from growth	74	74
Fire, flood, storms and related events	(1)	(1)
In-field inventory	(1)	–
Gain arising from fair value price changes	123	(38)
Harvesting – agriculture produce (fellings)	(69)	(55)
Translation differences	(20)	(82)
Fair value of plantations at end of year	488	382

The group has 399,996 hectares (2022: 399,996 hectares) of owned and leased land available for forestry activities. 138,785 hectares (2022: 138,391 hectares) are set aside for conservation activities. The balance of 261,211 hectares (2022: 261,605 hectares) are under afforestation which forms the basis of the valuation set out above.

The fair value of forestry assets is a Level 3 measure in terms of the fair value measurement hierarchy, consistent with the prior year.

The following assumptions have a significant impact on the valuation of the forestry assets:

- A market trend related fair value price that closely approximates the spot fair value price. At year-end the gross weighted average timber price was US\$49 per tonne (2022: US\$45 per tonne) and the costs to sell was US\$32 per tonne (2022: US\$32 per tonne).
- A real pre-tax discount rate of 14.61% was used for immature timber (2022: 14.49%)
- Approximately 29 million standing tons of timber (2022: 29 million standing tons) were valued
- The average annual growth is measured at approximately 17 tons (2022: 17 tons) of timber per hectare.

Sappi amended its plantation valuation technique in the fourth quarter from using a 12-quarter historical average fair value price for immature and mature timber to be felled more than 12 months after each reporting period to a market trend related fair value price that closely approximates the spot fair value price. The 12-quarter average rate did previously approximate the spot rate but due to changing macro-economic conditions this was no longer the case. The effect of this change in estimate resulted in a favourable US\$78 million adjustment which is included in the overall US\$123 million price fair value adjustment for the year. We believe that this change in valuation technique will closely approximate the spot fair value price at future measurement dates.

The valuation of the group's forestry assets is determined in South African Rand and converted to US\$, the group's presentation currency, at the closing exchange rate.

A sensitivity analysis of a change in each of these assumptions is tabled below:

US\$ million	2023	2022
Effect of 1% impact in gross selling price	4	2
Effect of 1% impact in costs to sell	(3)	(2)
Effect of 1% impact in net selling price	2	1
Effect of 1% impact in discount rate	(3)	(2)
Effect of 1% impact in volume	5	4
Effect of 1% impact in rate of growth	1	1

5.1.5 Developments in presentation and disclosure

IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted. IFRS 19 contains no reduced disclosure impact for IAS 41 disclosures. See Chapter 4 for further details on the requirements of IFRS 19.

5.2 Fair value measurement disclosures

IFRS 13 specifies the disclosures that are required for fair value measurements of biological assets and agricultural produce.

IFRS 13 requires a substantial amount of information to be disclosed about fair value measurements, for example:

- The methods and assumptions used in measuring fair value
 - The categorisation of a fair value measurement (as a whole) within the fair value hierarchy, i.e., Level 1, 2 or 3, and, for recurring fair value measurements, any transfers between levels in the hierarchy
 - A detailed reconciliation of movements for fair value measurements classified within Level 3 of the hierarchy, along with narrative sensitivity analysis
- And
- The highest and best use of a non-financial asset if it differs from its current use, including why the non-financial asset is being used in a manner that differs from its highest and best use [IFRS 13.93]

Chapter 15 discusses IFRS 13's disclosure requirements in more detail.

In times of heightened market volatility and uncertainty, entities should pay particular attention to the IFRS 13 disclosure requirements on the sensitivity of Level 3 measurements to changes in significant unobservable inputs. These are discussed in Chapter 15.

In instances where climate-related risk factors have a material impact on fair value measurements, additional disclosures could be required, particularly for those categorised within Level 3 of the fair value hierarchy. This includes any changes in the valuation processes, and sensitivity to changes in unobservable inputs and the interrelationship of those inputs. Entities might need to consider whether additional information is needed to meet the disclosure objective in IFRS 13. Should they wish to convey more information (e.g., the entity's incorporation of climate-related factors for its own purposes, rather than financial reporting), entities need to consider whether disclosure within the financial statements is appropriate or it is better presented in the management's discussion and analysis (MD&A).

Entities need to ensure that any climate change variables incorporated in a fair value measurement are those that market participants would consider when pricing the asset or liability to ensure it is an IFRS 13 fair value measurement. More information about climate-related risks will be made available in future, including information disclosed outside the financial statements, for example, following the publication of IFRS S2 *Climate-related Disclosures* by the International Sustainability Standards Board (ISSB). Reliably pricing climate-related risk and incorporating climate change variables into valuations is expected to gradually improve.

Significant judgement may be needed when considering climate-related factors in fair value measurements, which might lead to greater estimation uncertainty. As a result, entities will need to provide sufficient transparency in their disclosures about the impact of climate-related risks on fair value measurements.

The following Practical example illustrates fair value disclosures for biological assets, as do the Practical examples in sections 5.1.1.B, 5.1.2 and 5.1.4 above.

Practical example 5-5: Mowi ASA (2023)

Norway

Integrated Annual Report 2023 [extract]**3 Group results [extract]****Financial statement and notes [extract]****NOTE 6 - BIOLOGICAL ASSETS [extract]****VALUATION OF BIOLOGICAL ASSETS**

Biological assets are, in accordance with IAS 41, measured at fair value less cost to sell. All fish at sea are subject to a fair value calculation, while broodstock and smolt are measured at cost less impairment losses.

Biomass measured at fair value, is categorised at Level 3 in the fair value hierarchy, as the input is mostly unobservable. In line with IFRS 13, the highest and best use of the biological assets is applied for the valuation. In accordance with the principle for highest and best use, we consider that the fish have optimal harvest weight at 4 kg gutted. This corresponds to a live weight of approximately 4.8 kg (there may be regional variances). Fish of this weight or above are classified as ready for harvest (mature fish), while fish that have still not achieved this weight are classified as not ready for harvest (immature fish). The valuations are carried out at business unit level based on a common model and basis for assumptions established at group level. All assumptions are subject to monthly quality assurance and analysis at the group level.

The valuations are based on an income approach and takes into consideration unobservable input based on biomass in the sea, the estimated growth rate and cost to completion at site level. Mortality, quality of the fish going forward and market price are considered at business unit level. A special assessment is performed for sites with high/low performance due to disease or other deviating factors. The market prices are derived from observable market prices where available.

ASSUMPTIONS USED FOR DETERMINING FAIR VALUE OF LIVE FISH

The estimated fair value of the biomass will always be based on uncertain assumptions, even though the group has built substantial expertise in assessing these factors. Estimates are applied to the following factors; biomass volume, the quality of the biomass, size distribution, cost, mortality and market prices.

Biomass volume: The biomass volume is in itself an estimate based on the number of smolt released into the sea, the estimated growth from the time of stocking, estimated mortality based on observed mortality in the period, etc. There is normally little uncertainty with regard to biomass volume.

The level of uncertainty will, however, be higher if an incident has resulted in mass mortality, especially early in the cycle, or if the fish's health status restricts handling. If the total biomass at sea was 1% lower than our estimates, this would result in a change in value of EUR -6.5 million.

The quality of the biomass: The quality of the biomass can be difficult to assess prior to harvesting, if the reason for downgrading

is related to muscle quality (e.g. the effect of Kudoa in Canada). In Norway downgraded fish is normally priced according to standard rates of deduction compared to a Superior quality fish. In our fair value model for salmon of Norwegian origin, we have used EUR 0.21 and EUR 0.61 as deductions from Superior grade for Ordinary and Production grade quality respectively. In other countries the price deductions related to quality are not as standardised. The quality of harvested fish has been good in 2023. For the Group as a whole, 88% of the fish were graded as Superior quality. A one percentage point change from Superior quality to Production grade quality would result in a change in value of EUR -3.8 million.

The size distribution: Fish in sea grow at different rates, and even in a situation with good estimates for the average weight of the fish there can be a considerable spread in the quality and weight of the fish. The size distribution affects the price achieved for the fish, as each size category of fish is priced separately in the market. When estimating the biomass value, a normal size distribution is applied.

Cost: For the estimation of future costs, there is uncertainty with regard to feed prices, other input costs and biological development. Mowi measures cost deviations vs. budget as part of the follow up of business units. Excluding special situations (incidents etc.), the deviations in costs vs budgets are normally limited for a group of sites, although individual sites might show deviations. The estimation of costs influences the biomass value through the recognised fair value adjustment in the statements of comprehensive income and financial position (calculated as fair value less accumulated biological costs).

Mortality: Normalised mortality will affect the fair value estimates both as a reduction of estimated harvesting volumes and because cost to completion includes cost incurred on fish that eventually will perish.

Market price: The market price assumption is very important for the valuation and even minor changes in the market price will result in significant changes in the valuation. The methodology used for establishing the market price is explained in Note 2. A EUR 0.1 decrease in the market price would result in a decrease in value of EUR 17.1 million.

The market price risk is reduced through fixed price/volume customer contracts and financial contracts, as well as our downstream integration as explained in Note 13.

Climate Risk : Climate risk is included in the assessment for calculating the Fair value of live fish. Due to the short time period relevant for the Fair value uplift (maximum of 2 years) climate risk has not had a material effect on the valuation of biomass in sea.

WRITE-DOWN OF BIOMASS AND INCIDENT-BASED MORTALITY

Incident-based mortality is accounted for when a site either experiences elevated mortality over time or substantial mortality due to an incident at the farm (outbreak of disease, lack of oxygen etc). The cost of incident based mortality is included in “cost of materials” in the statement of comprehensive income. The

fair value element is adjusted through fair value adjustment on incident based mortality, and included in net fair value adjustment in the statement of comprehensive income.

RECONCILIATION OF CHANGES IN THE CARRYING AMOUNT OF BIOLOGICAL ASSETS (EUR MILLION)	2023	2022
Carrying amount as of 01.01	1 912.5	1 529.5

5.3 Additional disclosures if fair value cannot be measured reliably

If an entity rebuts the presumption that fair value can be reliably measured on initial recognition of a biological asset (including produce growing on a bearer plant) and measures the asset at its cost less any accumulated depreciation and any accumulated impairment losses it is required to disclose the following information:

- (a) If the entity holds such assets at the end of the period: *[IAS 41.54]*
 - (i) A description of the biological assets
 - (ii) An explanation of why fair value cannot be measured reliably
 - (iii) If possible, the range of estimates within which fair value is highly likely to lie
 - (iv) The depreciation method used
 - (v) The useful lives or the depreciation rates used

And

 - (vi) The gross carrying amount and the accumulated depreciation (aggregated with accumulated impairment losses) at the beginning and end of the period
- (b) If the entity held such assets at any point during the current period: *[IAS 41.55]*
 - (i) Any gain or loss recognised on disposal of such biological assets
 - (ii) The reconciliation required by IAS 41.50 (see section 5.1.4 above) shall disclose amounts related to such biological assets separately
 - (iii) That reconciliation shall include the following amounts included in profit or loss related to those biological assets:
 - Impairment losses
 - Reversals of impairment losses

And

 - Depreciation
- (c) If the entity held such assets and their fair value became reliably measurable during the current period: *[IAS 41.56]*
 - (i) A description of the biological assets
 - (ii) An explanation of why fair value has become reliably measurable

And

 - (iii) The effect of the change

5.4 Government grants

An entity that has received government grants related to agricultural activity covered by IAS 41 is required to disclose the following information: *[IAS 41.57]*

Extract from IAS 41

Government grants

- 57 An entity shall disclose the following related to agricultural activity covered by this Standard:
- (a) the nature and extent of government grants recognised in the financial statements;
 - (b) unfulfilled conditions and other contingencies attaching to government grants; and
 - (c) significant decreases expected in the level of government grants.

Appendix A - Index of Illustrations

Illustration 2-1:	Renting out land with producing vines under an operating lease	3210
Illustration 3-1:	Conditional government grants	3225
Illustration 4-1:	Assets attached to land	3231

Appendix B - Index of Frequently asked questions

Question 2-1:	What IFRS accounting standard applies if a plant initially meets the definition of a bearer plant, but this subsequently changes?	3208
Question 3-1:	Can acquisition-related transaction costs be taken into account when subsequently measuring fair value?	3223

Appendix C - Defined terms

Extract from IAS 41

- 5 The following terms are used in this Standard with the meanings specified:
- Agricultural activity* is the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets.
- Agricultural produce* is the harvested produce of the entity's biological assets.
- A bearer plant* is a living plant that:
- (a) is used in the production or supply of agricultural produce;
 - (b) is expected to bear produce for more than one period; and
 - (c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales.
- A biological asset* is a living animal or plant.
- Biological transformation* comprises the processes of growth, degeneration, production, and procreation that cause qualitative or quantitative changes in a biological asset.
- Costs to sell* are the incremental costs directly attributable to the disposal of an asset, excluding finance costs and income taxes.
- A group of biological assets* is an aggregation of similar living animals or plants.
- Harvest* is the detachment of produce from a biological asset or the cessation of a biological asset's life processes.

Appendix B - Defined terms common in the Extractive Industries	3459

Overview

The purpose of this chapter is to focus on issues that are specific to entities operating in the extractives industries, specifically mining entities and oil and gas entities. Entities in the extractives industries face a range of complex accounting issues as a result of the uncertainties involved in mineral exploration and extraction, the wide range of risk sharing arrangements, and government involvement in the form of mandatory participations and special tax regimes. At the same time, however, some of the business arrangements that are aimed at mitigating certain risks give rise to financial reporting complications.

Historically the IASB ('Board') and its predecessor, the IASC, have not addressed the specific accounting issues that arise in the extractive industries and have in many instances excluded minerals and mineral products/reserves from the scope of their accounting standards. Other than IFRS 6 *Exploration for and Evaluation of Mineral Resources*, there are no standards specific to the extractive industries. It is the combination of industry specific factors noted above, a lack of specific guidance in IFRS accounting standards and a long history of industry practice and guidance from previous GAAPs that have given rise to a range of accounting practices in the extractive industries.

Currently there is no IFRS accounting standard that addresses all of the specific issues of the extractive industries although attempts to devise such a standard commenced quite some time ago. Furthermore, draft proposals to date have not addressed many of the specific issues that affect the extractive industries.

This chapter looks to explore some of the common accounting challenges faced by extractive industries entities in applying the direct and analogous requirements and guidance provided by IFRS accounting standards. Other than IFRS 6, the underlying requirements of other relevant standards are covered in other chapters and cross referenced rather than being repeated in this chapter.

What you need to know

- This chapter focuses on financial reporting issues affecting mining entities and oil and gas entities.
- To date, there is no IFRS accounting standard that addresses all the specific financial reporting issues of the extractive industries.
- This chapter explores some of the common accounting challenges faced by extractives entities in applying the direct and analogous requirements of the accounting standards.
- Recent developments: On 23 May 2023, the IASB issued *International Tax Reform-Pillar Two Model Rules - Amendments to IAS 12 (the Amendments)*. The amendments have introduced:
 - A mandatory temporary exception to the accounting for deferred taxes arising from the jurisdictional implementation of the Pillar Two model rules. See Chapter 29
 - Disclosure requirements for affected entities to help users of the financial statements better understand an entity's exposure to Pillar Two income taxes arising from that legislation, particularly before its effective date. See Chapter 29
- In March 2024, the IASB issued an Exposure Draft *Business Combinations-Disclosures, Goodwill and Impairment* (proposed amendments to IFRS 3 and IAS 36) (the ED).¹ The proposed amendments to IFRS 3 add new disclosure requirements that would result in an entity disclosing:
 - For a strategic business combination, information about the performance of business combinations, specifically, information about the entity's acquisition-date key objectives and targets and the extent to which those key objectives and targets are met in subsequent periods; And
 - Quantitative information about synergies expected to arise as a result of a business combination. See Chapter 10

¹ Exposure Draft, [ED/2024/1 Business Combinations-Disclosures, Goodwill and Impairment](#), IASB, March 2024. Available on the IFRS Foundation's website.

1 Introduction and background

1.1 Defining extractive industries

'Extractive industries' were defined in the IASC's Issues Paper *Extractive Industries* (IASC Issues Paper) published in November 2000 as "...those industries involved in finding and removing wasting natural resources located in or near the earth's crust".² However, this chapter adopts a slightly narrower focus and concentrates on the accounting issues that affect mining entities and oil and gas entities. The IASC Issues Paper was prepared by the IASC as part of its original project on 'extractive industries' which was led by an IASC Steering Committee on Extractive Industries. This paper considered a broad range of issues including reserves and resources estimation, historical and valuation-based concepts of measurement of resources related assets, treatment of removal and restoration costs, impairment, revenue, inventories and arrangements to share risks and costs. While it was non-authoritative, this paper is referred to throughout this chapter where relevant as it provided a broad range of information on the common practices observed in the extractive industries and the common terms used.

IFRS accounting standards currently use the term 'minerals' and 'mineral assets' when referring to the extractive industries as a whole. This is used as a collective term to include both mining and oil and gas reserves and resources. In contrast, a distinction between the two industries was introduced in the *Extractive Activities* DP (discussed below in section 1.3), where the term 'minerals' has been used to refer to the mining sector and the term 'oil and gas' has been used to refer to the oil and gas sector.

For the purposes of this chapter, consistency with the current wording in IFRS accounting standards will be maintained and therefore, unless stated otherwise, 'minerals' and 'mineral assets' will encompass both mining and oil and gas.

Historically, the IASB and its predecessor, the IASC, have avoided dealing with specific accounting issues in the extractive industries by excluding minerals and mineral products/reserves from the scope of their accounting standards. Currently, minerals and mineral products/reserves are excluded, at least in part, from the scope of the following standards:

- IAS 2 *Inventories* [IAS 2.3(a), IAS 2.4]
- IAS 16 *Property, Plant and Equipment* [IAS 16.3(d)]
- IFRS 16 *Leases* [IFRS 16.3(a)]
- IAS 38 *Intangible Assets* [IAS 38.2(d)]
- IAS 40 *Investment Property* [IAS 40.4(b)]

While these standards exclude 'minerals' from their scope, the exact wording of the scope exclusions differ between standards - see section 3.1.1 below for more information. In addition, although minerals and mineral products/reserves themselves are excluded from the scope of many standards, assets used for the exploration, development and extraction of minerals are covered by existing IFRS accounting standards.

Many of the financial reporting issues that affect entities that operate in the extractive industries are a result of the environment in which they operate. Specific accounting issues arise because of the uncertainties involved in mineral exploration and extraction, the wide range of risk sharing arrangements, and government involvement in the form of mandatory participations and special tax regimes. At the same time, however, some of the business arrangements that are aimed at mitigating certain risks give rise to financial reporting complications. The financial reports of these entities need to reflect the risks and rewards to which they are exposed. In many cases, there are legitimate differences of opinion about how an entity is required to account for these matters.

The IASC Issues Paper identified the following characteristics of activities in the extractive industries, which are closely related to the financial reporting issues that are discussed in this chapter:

- *High risks* - In the extractive industries there is a high risk that the amounts spent in finding new mineral resources will not result in additional commercially recoverable reserves. In financial reporting terms, this means that it can remain uncertain for a long period whether or not certain expenditures give rise to an asset. Further risks exist in relation to production (i.e., quantities actually produced may differ considerably from those previously estimated) and price (i.e., commodity prices are often volatile).

2 IASC Issues Paper, Issues Paper Extractive Industries, IASC, November 2000, 1.5.

- *Little relationship between risks and rewards* - In the extractive industries, a small expenditure may result in finding mineral deposits with a value of many times the amount of the expenditure. Conversely, large expenditures can frequently result in little or no future production. This has given rise to different approaches in financial reporting that can be broadly categorised as follows: (1) expense all expenditures as the future benefits are too uncertain; (2) capitalise some or all expenditures as the cumulative expenditures may be matched to the cumulative benefits, or (3) recognise the mineral assets found at fair value.
- *Long lag between expenditure and production* - Exploration and/or development may take years to complete. During this period, it is often far from certain that economic benefits will be derived from the costs incurred.
- *High costs of individual projects* - The costs of individual projects can be very high (e.g., offshore oil and gas projects and deep mining projects). Exploration expenditures that are carried forward pending the outcome of mineral acquisition and development projects may be highly significant in relation to the equity and the total assets of an entity.
- *Unique cost-sharing arrangements* - High costs and high risks, as discussed above, often lead entities in the extractive industries to enter into risk-sharing arrangements and other funding arrangements (e.g., joint arrangements, farm-out arrangements, carried interest arrangements, oilfield services arrangements, contract mining and streaming arrangements). These types of arrangements, which are much more common in the extractive industries than elsewhere, often give rise to their own financial reporting issues.
- *Intense government oversight and regulation* - The regulation of the extractive industries ranges from “outright governmental ownership of some (especially petroleum) or all minerals to unusual tax benefits or penalties, price controls, restrictions on imports and exports, restrictions on production and distribution, environmental and health and safety regulations, and others”. Governments may also seek to charge an economic rent for resources extracted. These types of government involvement give rise to financial reporting issues, particularly when the precise nature of the government involvement is not obvious.
- *Scarce non-replaceable assets* - Mineral reserves are unique and scarce resources that an entity may not be able to replace in any location or in any form.
- *Economic, technological and political factors* - While these factors are not unique to the extractive industries, the IASC Issues Paper argues that they tend to have a greater impact on the extractive industries because:
 - “(a) fluctuating market prices for minerals (together with floating exchange rates) have a direct impact on the economic viability of reserves and mineral properties. A relatively small percentage change in long-term prices can change decisions on whether or when to explore for, develop, or produce minerals;
 - (b) there is a sharp impact from cost changes and technological developments. Changes in costs and, probably more significantly, changes in technology can significantly change the economic viability of particular mineral projects; and
 - (c) in almost every country, mineral rights are owned by the state. In those countries where some mineral rights are privately owned, public reliance on adequate sources of minerals for economic and defence purposes often leads to governmental regulations and control. At other times, governmental policies may be changed to levy special taxes or impose governmental controls on the extractive industries.”

While it may be the case that the above factors affect the extractive industries more than others, to the extent that they also arise in the pharmaceutical, bio-technology, agricultural and software industries, some of these risks give rise to further financial reporting issues. However, those industries are not affected by the combination of these circumstances to the same extent as is the case with the extractive industries. It is a combination of these factors, a lack of specific guidance in IFRS accounting standards and a long history of industry practice and guidance from previous GAAPs that have given rise to a range of accounting practices in the extractive industries.

There is no IFRS accounting standard that addresses all of the specific issues of the extractive industries although there has been past attempts to devise such a standard. It has been observed that , previous draft proposals to date would not have addressed many of these specific issues that affect the extractive industries.

1.1.1 Definition of key terms

The most important terms and abbreviations used which are specific to the extractive industries or IFRS 6 are defined in this chapter when discussed or in the defined terms at Appendix B below. However, alternative or more detailed definitions of financial reporting terms, and of mining and oil and gas technical terms and abbreviations, can be found in publications such as, but not limited to:

- Issues Paper Extractive Industries, IASC, November 2000
- Petroleum Resources Management System, Society of Petroleum Engineers, 2007 (revised June 2018 (v. 1.03))
- The Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code), Australasian Joint Ore Reserves Committee (the JORC Committee)
- The former UK Oil Industry Accounting Committee Statement of Recommended Practice (OIAC SORP) (see section 1.4 below)

1.2 The development of IFRS 6 *Exploration for and Evaluation of Mineral Resources*

In December 2004, the IASB issued IFRS 6 which addresses the accounting for one particular aspect of the extractive industries, being exploration and evaluation (E&E) activities. IFRS 6 was originally issued as a form of interim guidance to clarify the application of IFRS accounting standards and the IASB's *Conceptual Framework* to E&E activities. This was because mineral rights and mineral resources are outside the scope of IAS 16 and IAS 38, and while E&E expenditures are significant to entities engaged in extractive activities, there were different views on how these expenditures are required to be accounted for under IFRS accounting standards. Other standard-setting bodies had diverse accounting practices for E&E assets which often differed from practices in other sectors with analogous expenditures. [IFRS 6(2010).IN1].

One of the IASB's goals in developing IFRS 6, at the time, was to avoid unnecessary disruption for both users and preparers. The Board therefore proposed to limit the need for entities to change their existing accounting policies for E&E assets. As a result, IFRS 6 defines what E&E expenditures are, makes limited improvements to existing accounting practices for E&E expenditures, such as specifying when entities need to assess E&E assets for impairment in accordance with IAS 36 *Impairment of Assets*, and requires certain disclosures.

Given that IFRS 6 was originally intended to be an interim measure, between 2018 and 2023 the IASB embarked on a research project to determine whether to amend or replace IFRS 6, this included research on improving:

- The recognition and measurement requirements to reduce the diversity of accounting policies used in practice for exploration and evaluation expenditure;
- The disclosure requirements to increase the transparency, comparability and relevance of information provided in financial statements about that expenditure and the related activities; and
- Other IFRS accounting standards to address matters relating to extractive activities identified by stakeholders that are not in the scope of IFRS 6.

The outcome of the IASB's activities resulted in them deciding not to develop new or amended recognition, measurement or disclosure requirements for exploration and evaluation expenditure or other aspects of accounting for extractive activities. This was because the IASB did not find compelling evidence that standard-setting would be necessary.

The IASB also acknowledged that diverse accounting policies for exploration and evaluation expenditure would continue to be used in practice. Diversity mainly arises from entities making decisions about:

- whether to capitalise exploration and evaluation expenditure as assets;
- which types of expenditure are capitalised;
- when to start and stop capitalising that expenditure; and what unit of account is applied to that expenditure (such as whether to aggregate expenditure by oil well, licence area or country).

Similarly, the IASB did not find evidence of a significant financial reporting problem that could be addressed by standard-setting, despite evidence of diversity, some of which could be explained by an entity's particular circumstances. It was noted that the extractives industry has well-established accounting practices that predate IFRS 6. Feedback from investors and other users of financial statements suggested those diverse accounting policies were not a significant concern. Overall, the research findings suggested that any improvements to financial reporting that might result from amending or replacing the requirements in IFRS 6 or other IFRS accounting standards are likely to be outweighed by the costs of developing and implementing any such changes.

Following from the above decisions, the IASB did decide to remove the word 'Temporary' from the headings of the section in IFRS 6 that exempts an entity from applying some of the requirements in IAS 8, Accounting Policies, Changes in Accounting Estimates and Errors, to its accounting policies for exploration and evaluation expenditure.

IFRS 6 specifically exempts an entity from applying the application of paragraphs 11-12 in IAS 8, to its accounting policies for exploration and evaluation expenditure. Paragraphs 11-12 of IAS 8 specify a hierarchy of criteria that an entity uses to develop an accounting policy if no IFRS accounting standard applies to a particular item.

It should be noted that an entity is still required to apply paragraph 10 of IAS 8 when developing its accounting policies, requiring accounting policies to be developed that result in information that is relevant and reliable.

IFRS 6 defines E&E expenditures and E&E assets as follows: [IFRS 6 Appendix A]

Extract from IFRS 6

Appendix A

Defined terms

exploration and evaluation assets	Exploration and evaluation expenditures recognised as assets in accordance with the entity's accounting policy.
exploration and evaluation expenditures	Expenditures incurred by an entity in connection with the exploration for and evaluation of mineral resources before the technical feasibility and commercial viability of extracting a mineral resource are demonstrable.

The detailed requirements of IFRS 6 are discussed in section 3 below.

1.3 The IASB Extractive Activities Project and April 2010 Discussion Paper

In April 2010, subsequent to the issuance of IFRS 6 and as part of the long running project to finalise the issue of developing separate accounting principles for extractive industries, the IASB published the staff Discussion Paper *Extractive Activities* (the DP or the *Extractive Activities DP*). The DP was developed by a research team comprising members of the Australian, Canadian, Norwegian and South African accounting standard-setters.³

The DP addressed some of the financial reporting issues associated with exploring for and finding minerals, oil and natural gas deposits, developing those deposits and extracting the minerals, oil and natural gas. These were collectively referred to as 'extractive activities' or, alternatively, as 'upstream activities'.⁴ The aim of the project was to create a single accounting and disclosure model that would only apply to upstream extractive activities in both the minerals and oil and gas industries. This would have represented a change from IFRS 6, which included exploration and evaluation activities relating to minerals, oil, natural gas and similar non-regenerative resources within its scope. The project team decided against a broader scope in the DP as this would result in the need to develop additional definitions, accounting models and disclosures.⁵

The DP concluded that there were similarities in the main business activities, and the geological and other risks and uncertainties of both the minerals and oil and gas industries.⁶ There were also similarities in the definitions of reserves and resources used by the Committee for Mineral Reserves International Reporting Standards (CRIRSCO) and the Society of Petroleum Engineers Oil and Gas Reserves Committee (SPE OGRS).⁷ The DP therefore proposed that there should be a single accounting and disclosure model that applies to all extractive activities (as defined, see section 1.1 above).

3 Discussion Paper [DP/2010/1](#), *Extractive Activities*, IASB, April 2010, p.7. Available on the IFRS Foundation's website.

4 Discussion Paper [DP/2010/1](#), *Extractive Activities*, IASB, April 2010, para. 1.1. Available on the IFRS Foundation's website.

5 Discussion Paper [DP/2010/1](#), *Extractive Activities*, IASB, April 2010, paras. 1.4-1.5. Available on the IFRS Foundation's website.

6 Discussion Paper [DP/2010/1](#), *Extractive Activities*, IASB, April 2010, para. 1.9. Available on the IFRS Foundation's website.

7 Discussion Paper [DP/2010/1](#), *Extractive Activities*, IASB, April 2010, para. 1.10. Available on the IFRS Foundation's website.

While it has been generally acknowledged that the issues addressed in the DP are important, a significant number of respondents to the DP commented that the scope of the DP did not address many of the more complex accounting issues where practice is diverse and greater consistency is required.

These issues included:

- The lack of guidance on complex areas such as farm-out and farm-in transactions (see section 6.2 below)
- Accounting for production sharing and royalty agreements (see sections 5.3 and 5.7 below)

The main proposals in the DP as well as subsequent feedback and findings from the IASB's Extractive Activities project have been summarised in section 1.3 as well as in the sections below.

1.3.1 Definitions of reserves and resources

The DP explored a number of alternatives for defining reserves and resources. The definition used is "...reserves and resources are either the most significant assets or amongst the most significant assets for most entities engaged in extractive activities. Assessing the financial position and performance of an entity engaged in extractive activities in order to make economic decisions therefore requires an understanding of the entity's minerals or oil and gas reserves and resources, which are the source of future cash flows".⁸

Feedback from investors as part of the IASB's Extractive Project also suggested that information about reserves and resources is important for forecasting and valuation modelling and analyses used for the purposes of acquisition accounting and in assessing an assets recoverable amount. Reserve and resource information can also be an important input in determining financial statement items such as depreciation, impairment losses and decommissioning provisions.

Whilst, many stakeholders suggested that the IASB consider whether to develop requirements for entities to disclose reserve and resource information in financial statements. Equally, many stakeholders also noted that requiring the disclosure of reserve and resource information is beyond the remit of the IASB and of financial statements. In most jurisdictions with large extractive industries, regulators already require the disclosure of reserve and resource information. To this end, most investors suggested they obtain sufficient reserve and resource information for the majority of entities they follow.

The IASB was also concerned that any new disclosure requirements for reserve and resource information could diverge from local regulations, creating confusion for users of financial statements. Stakeholders also highlighted significant costs of auditing reserve and resource information in financial statements. For these reasons, the IASB did not find sufficient evidence to develop new requirements for the disclosure of reserve and resource information in financial statements.

This chapter considers the definitions of reserves and resources that could be considered for use in financial reporting. See section 2 below for further discussion.

1.3.2 Asset recognition

The DP proposed that legal rights (i.e., exploration rights and extraction rights) should form the basis of a mineral asset or oil and gas asset. An asset should be recognised when the legal rights are acquired. Associated with these legal rights is information about the (possible) existence of minerals or oil and gas, the extent and characteristics of the deposit, and the economics of their extraction. The project team believed that rights and information associated with minerals or oil and gas properties satisfy the asset recognition criteria. While such information does not represent a separate asset, the project team proposed that information obtained from subsequent exploration and evaluation activities and development works would be treated as enhancements of the asset represented by the legal rights.

When considering the appropriate unit of account (see section 4 below), the DP proposed that the geographical boundary of the unit of account would be defined initially on the basis of the exploration rights held. As exploration, evaluation and development activities took place, the unit of account would contract progressively until it became no greater than a single area, or group of contiguous areas, for which the legal rights were held, and which are managed separately and would be expected to generate largely independent cash flows.

⁸ Discussion Paper [DP/2010/1](#), *Extractive Activities*, IASB, April 2010, para. 2.1. Available on the IFRS Foundation's website.

1.3.3 Asset measurement

The DP considered both current value (e.g., fair value) and historical cost as potential measurement bases for minerals and oil and gas assets. Based on their findings and taking the views of users and preparers into account, the project team concluded that minerals and oil and gas assets should be measured at historical cost and that detailed disclosures should be provided to enhance the relevance of the financial statements. The project team acknowledged that its choice of historical cost as the measurement basis was based to a large extent on doing the ‘least harm’.

In relation to impairment, it was considered that the IAS 36 impairment testing model was not feasible for exploration properties given the early stage of such properties. Therefore, the DP concluded that exploration properties should only be tested for impairment whenever, in management’s judgement, there is evidence that suggests that there is a high likelihood that the carrying amount of an exploration asset will not be recovered in full. This would require management to apply a separate set of indicators to such properties in order to assess whether their continued recognition as assets would be justified. In addition, further disclosures would be required in respect of the impairment of exploration properties due to the fact that management may take different views on the exploration properties. These would include separate presentation of exploration properties, the factors that led to an impairment being recognised, and management’s view as to why the remaining value of the asset or the other exploration assets is not impaired. This impairment assessment would need to be conducted separately for each exploration property.

1.3.4 Disclosure

The DP proposed extensive disclosures aimed at ensuring users of financial reports could “...evaluate:

- the value attributable to an entity’s minerals or oil and gas assets;
- the contribution of those assets to current period financial performance; and
- the nature and extent of risks and uncertainties associated with those assets”.

The DP proposed detailed disclosures about the quantities of reserves and resources, and production revenues and costs. If the assets are measured at historical cost, then detailed information should be disclosed about their current value and how it was determined. If, instead, the assets are measured at fair value then detailed information should be disclosed about that fair value and how it was determined.

It is noted that a number of the proposed disclosures differed from US GAAP. These included disclosures of:

- Key reserve estimate assumptions and sensitivity analysis (not required by US GAAP)
- Proved and probable reserves (US GAAP only requires proved reserves, with an option to disclose probable reserves)

Likewise, the IASB, in their Extractive Project, also explored three areas to determine whether more useful information could be disclosed about:

- accounting policies applied to exploration and evaluation expenditure to improve transparency;
- cumulative exploration and evaluation expenditure to improve comparability of entities applying different accounting policies; and
- risks and uncertainties associated with exploration and evaluation expenditure and activities to improve assessments of future cash flows.

However, the IASB’s research found that the benefits of such additional information would likely be marginal, because information about an entity’s accounting policy applied to exploration and evaluation expenditure is often not material for large entities primarily engaged in production activities to users of financial statements.

The IASB also noted that IFRS 6 requires an entity to disclose its accounting policies for exploration and evaluation expenditure, including the recognition of exploration and evaluation assets. The IASB expects that other requirements—for example, amendments to IAS 1 Presentation of Financial Statements and IFRS Practice Statement 2 Making Materiality Judgements in 2021, and requirements developed in its Primary Financial Statements project (IFRS 18⁹)-should lead to entities providing more transparent information about how they account for exploration and evaluation expenditure when that information is material. Therefore, the IASB decided, based on its research, that there was not a compelling case for standard-setting for the other disclosure suggestions.

⁹ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18

1.3.5 Publish What You Pay proposals

At the time of the DP development, a coalition of non-governmental organisations had promoted, and continues to promote, a campaign called Publish What You Pay (PWYP), proposing that entities undertaking extractive activities should be required to disclose, in their financial reports, the payments they make to each host government. Furthermore, PWYP recommended that its disclosure proposals should be incorporated into an eventual IFRS accounting standard for extractive activities. Given this, a section in the DP was dedicated to the PWYP proposals. The DP acknowledged that the disclosure of payments made to governments provides information that would be of use to capital providers in making their investment and lending decisions but noted that providing this information might be difficult and costly for some entities.

These proposals were partially in response to a perception that in certain countries some mining entities and oil and gas entities are not paying their “...fair share” in exchange for extracting scarce natural resources. In addition, there had been increasing political pressure to expand the disclosure of payments to governments by entities within extractive industries as a means of reducing corruption by shining a light on these payments. As well as the proposals made in the DP, there were also increasing calls for transparency in the reporting of taxes and other payments to governments. This led to a variety of transparency or publish what you pay types of initiatives being introduced in different jurisdictions around the world (e.g., US, Europe, UK, Canada, Australia, to name just a few), however these are outside the scope of IFRS accounting standard and are governed by specific legislation.

1.4 Status of the Statement of Recommended Practice, UK Oil Industry Accounting Committee, June 2001 (OIAC SORP)

The Oil Industry Accounting Committee (OIAC), based in the United Kingdom, had previously developed a Statement of Recommended Practice (SORP) titled *Accounting for Oil and Gas Exploration, Development, Production and Decommissioning Activities*, which was updated and adopted by the UK Accounting Standards Board (ASB) in 2001.

The main function of the OIAC SORP had been to set out best practice in relation to activities in the oil and gas industry that were not covered directly by the main body of UK accounting standards. However, as much of the OIAC SORP has now been superseded by subsequent changes to accounting standards, the OIAC concluded that the SORP was no longer applicable in directing best practice guidance. From 1 January 2015, non-listed UK GAAP reporting entities moved to new accounting standards - FRS 100 *Application of Financial Reporting Requirements*, FRS 101 *Reduced Disclosure Framework* and FRS 102 *The Financial Reporting Standard applicable in the UK and Republic of Ireland* and were required by FRS 101 and FRS 102 to apply IFRS 6. As such, there will be no intention to further update the SORP for future industry developments or changes in accounting standards. The ASB indicated it would continue to provide the OIAC SORP as a reference document, but it would primarily be for educational purposes, it would not carry the authoritative accounting weight it did previously and would not be reviewed or endorsed by the UK Financial Reporting Council (UK FRC). In the future, the OIAC may, when considered necessary, issue guidance notes addressing industry specific accounting matters under IFRS accounting standards and UK GAAP but these will not be endorsed by the UK FRC.

Given the long history of entities in certain jurisdictions looking to the OIAC SORP for guidance for oil and gas accounting and reporting, and the lack of definitive guidance elsewhere, the SORP is likely to continue to be a valuable source of industry guidance e.g., reserves reporting (see section 2.4.1 below). However, we highlight the importance of having to overlay IFRS pronouncements and guidance as and when they are available.

Throughout this chapter the OIAC SORP will be referred to as the ‘former OIAC SORP’ because it has been decommissioned.

1.5 Guidance under national accounting standards

Entities complying with IFRS accounting standards do not have a free hand in selecting accounting policies - indeed the very purpose of a body of accounting literature is to restrict such choices. IAS 8 makes it clear that when a standard or an interpretation specifically applies to a transaction, other event or condition, the accounting policy or policies applied to that item should be determined by applying the standard or interpretation and considering any relevant implementation guidance issued by the IASB. [IAS 8.7].

However, in the extractive industries there are many circumstances where a particular event, transaction or other condition is not specifically addressed by IFRS. When this is the case, IAS 8 sets out a hierarchy of guidance to be considered in the selection of an accounting policy (see Chapter 3).

The primary requirement of the standard is that management should use its judgement in developing and applying an accounting policy that results in information that is both relevant and reliable. [IAS 8.10].

In making the judgement, management should refer to, and consider the applicability of, the following sources in descending order:

- (a) The requirements in standards and interpretations dealing with similar and related issues.

And

- (b) The definitions, recognition criteria and measurement concepts for assets, liabilities, income and expenses in the *Conceptual Framework*. [IAS 8.11].

Management may also take into account the most recent pronouncements of other standard-setting bodies that use a similar conceptual framework to develop accounting standards, other accounting literature and accepted industry practices, to the extent that these do not conflict with the sources in (a) and (b) above. [IAS 8.12].

The stock exchanges in Australia, Canada, South Africa, the United Kingdom and the United States have historically been home to the majority of the listed mining entities and oil and gas entities. Consequently, it is organisations from those countries that have been the most active in developing both reserves and resources measurement standards and accounting standards specifically for entities engaged in extractive activities. In developing an accounting policy for an issue that is not specifically dealt with in IFRS accounting standards, an entity operating in an extractive industry may find it useful to consider accounting standards developed in these countries. It should be noted, however, that the requirements in such guidance were developed under national accounting standards and may contradict specific requirements and guidance in IFRS accounting standards that deals with similar and related issues.

1.6 Upstream versus downstream activities

Upstream activities in the extractive industries are defined as “...exploring for, finding, acquiring, and developing mineral resources up to the point that the reserves are first capable of being sold or used, even if the enterprise intends to process them further”.¹⁰ *Downstream activities* are “...the refining, processing, marketing, and distributing of petroleum, natural gas, or mined mineral (other than refining or processing that is necessary to make the minerals that have been mined or extracted capable of being sold)”.¹¹

Thus, activities that are required to make the product saleable or usable are generally considered to be upstream activities. For example, the removal of water to produce dry gas would be an upstream activity, because otherwise the gas cannot be sold at all. However, refining crude oil is considered to be a downstream activity, because crude oil can be sold.

This chapter focuses on upstream activities in the extractive industries as they are primarily affected by the issues discussed above. However, downstream activities are discussed to the extent that they give rise to issues that are unique to the extractive industries (e.g., provisional pricing clauses) or are subject to the same issues as upstream activities (e.g., production sharing contracts).

1.6.1 Phases in upstream activities

Although there is not a universally accepted classification of upstream activities in the extractive industries, the IASC Issues Paper identified the following eight phases which other authors also commonly identify:¹²

- (a) *Prospecting* - Prospecting involves activities undertaken to search for an area of interest, a geologic anomaly or structure that may warrant detailed exploration.¹³ Prospecting is undertaken typically before mineral rights in the area have been acquired, and if the prospecting results are negative, the area of prospecting generally will be abandoned and no mineral rights acquired.¹⁴ However, sometimes it will be necessary to acquire a prospecting permit as the prospecting activities require access to the land to carry out geological and geophysical tests.¹⁵

¹⁰ IASC Issues Paper, 1.16.

¹¹ IASC Issues Paper, 1.18.

¹² IASC Issues Paper, 2.3.

¹³ IASC Issues Paper, 2.5.

¹⁴ IASC Issues Paper, 2.6.

¹⁵ IASC Issues Paper, 2.10.

- (b) *Acquisition of mineral rights* - The acquisition phase involves the activities related to obtaining legal rights to explore for, develop, and/or produce wasting resources on a mineral property.¹⁶ Legal rights may be acquired in a number of ways as discussed in section 5 below.
- (c) *Exploration* - Exploration is the detailed examination of a geographical area of interest that has shown sufficient mineral-producing potential to merit further exploration, often using techniques that are similar to those used in the prospecting phase.¹⁷ In the mining sector, exploration usually involves taking cores for analysis, sinking exploratory shafts, geological mapping, geochemical analysis, cutting drifts and crosscuts, opening shallow pits, and removing overburden in some areas.¹⁸ In the oil and gas sector, exploration involves techniques such as shooting seismic, core drilling, and ultimately the drilling of an exploratory well to determine whether oil and gas reserves do exist.¹⁹
- (d) *Appraisal or evaluation* - This involves determining the technical feasibility and commercial viability of mineral deposits that have been found through exploration.²⁰ This phase typically includes:²¹
 - (i) Detailed engineering studies and drilling of additional wells by oil and gas entities to determine how the reservoir can best be developed to obtain maximum recovery.
 - (ii) Determination by mining entities of the volume and grade of deposits through drilling of core samples, trenching, and sampling activities in an area known to contain mineral resources.
 - (iii) Examination and testing by mining entities of extraction methods and metallurgical or treatment processes.
 - (iv) Surveying transportation and infrastructure requirements.
 - (v) Conducting market and finance studies.

And

 - (vi) Making detailed economic evaluations to determine whether development of the reserves is commercially justified.
- (e) *Development* - Development is the establishment of access to the mineral reserve and other preparations for commercial production. In the mining sector, development includes sinking shafts and underground drifts, making permanent excavations, developing passageways and rooms or galleries, building roads and tunnels, and advance removal of overburden and waste rock.²² In the oil and gas sector, the development phase involves gaining access to, and preparing, well locations for drilling, constructing platforms or preparing drill sites, drilling wells, and installing equipment and facilities.²³
- (f) *Construction* - Construction involves installing facilities, such as buildings, machinery and equipment to extract, treat, and transport minerals.²⁴
- (g) *Production* - The production phase involves the extraction of the natural resources from the earth and the related processes necessary to make the produced resource marketable or transportable.²⁵
- (h) *Closure and decommissioning* - Closure means ceasing production, removing equipment and facilities, restoring the production site to appropriate conditions after operations have ceased and abandoning the site.²⁶

The above phases are not necessarily discrete sequential steps. Instead, the phases often overlap or take place simultaneously. Nevertheless, they provide a useful framework for developing accounting policies in the extractive industries. Accounting for expenditures depends very much on the phase during which they are incurred; for example, as discussed further below, costs incurred in the prospecting phase cannot be recognised as assets, whereas most costs incurred in the construction phase should be capitalised.

2 Mineral reserves and resources

As noted in section 1.1 above, IFRS accounting standards currently use the term ‘minerals’ and ‘mineral assets’ when referring to the extractive industries as a whole. This is used as a collective term to include reserves and resources associated with both mining and oil and gas activities. For the purposes of this chapter, consistency with the current wording in IFRS accounting standards will be maintained and therefore, unless stated otherwise, ‘minerals’ and ‘mineral assets’ will encompass both mining and oil and gas.

This section provides some information on the underlying principles used by entities in the mining and oil and gas sectors to estimate the quantity of recoverable mineral reserves and resources for their respective sectors, that the entity owns or has a right to extract. At the commercial level, these estimates are considered of paramount importance by stakeholders in making investment decisions and are also fundamental in accounting for mining activities and oil and gas activities.

The importance of estimating reserves and resources is matched by the difficulty in doing so, both technically and methodologically. For example, there is no firm consensus amongst regulators and the industries on which commodity prices should be used in reserves and resources estimation (i.e., historical, spot or forward-looking). We therefore aim to provide an introduction to this subject, and to explain the main methods used to arrive at reserves and resources estimates, including the valuation methods used once quantities have been estimated. In our view, without a sound grasp of the issues surrounding the estimation of reserves and resources, including the main methods used to arrive at reserves and resources estimates, and the valuation methods used once quantities have been estimated, it is difficult to make an informed judgement as to how to account for mineral extraction activities.

Mineral reserves and resources are often the most valuable assets of entities in the mining sector and oil and gas sector and mineral reserves, and resources estimates are a very important part of the way these entities report to their stakeholders. However, in an entity’s financial statements, assets relating to the extraction of mineral reserves and resources are generally measured under IFRS accounting standards at their historical cost which generally, other than by coincidence, will not be their market value. Currently, IFRS accounting standards do not require disclosure of reserves and resources, though certain national standards (e.g., US GAAP) and stock exchange regulators (e.g., US Securities and Exchange Commission (SEC), Australian Securities Exchange (ASX), Toronto Stock Exchange (TSX), Johannesburg Stock Exchange (JSE), Securities Commission Malaysia (SC) to name just a few) do require disclosure of certain categories of quantities. There are, therefore, variances in the categories of reserves and resources that are disclosed as either mandated or voluntary disclosures, as well as differences between those relating to mining and oil and gas operations.

Notwithstanding there are no specific disclosure requirements in IFRS accounting standards, reserves and resources estimates are required in order to apply historical cost accounting under IFRS in:

- Assessing whether and for how long to capitalise E&E costs, based on an expectation of future commercial production from resource estimates (see section 3.2 below)
- Calculating the annual depreciation, depletion and amortisation charge under the units of production method (see section 16.1.3 below)
- Calculating deferred stripping cost adjustments (applicable to mining entities only - see section 15.5 below)
- Determining impairment charges and reversals under IAS 36 (see section 11 below)
- Determining whether a gain or loss should be recognised on transactions such as asset swaps, carried interest arrangements and farm-in or farm-out arrangements (see section 6 below)
- Determining the fair value of acquired mineral reserves and resources when applying the acquisition method of accounting under IFRS 3 *Business Combinations* (see section 8 below)
- Estimating the timing of decommissioning or restoration activities (see section 10 below)

Reserves and resources reporting in the mining sector and oil and gas sector have been under development since the beginning of the twentieth century. However, reserves and resources estimation techniques in these sectors have developed largely independently as a result of the different nature of the reserves and resources involved. Therefore, the definitions and terminology used in the oil and gas sector and mining sector are discussed separately in sections 2.2 and 2.3 below respectively. Disclosure is discussed in section 2.4 below.

The international efforts to harmonise reserve and resource estimation and reporting are also discussed below.

2.1 International harmonisation of reserve reporting

The project team concluded in the *Extractive Activities* DP (see section 1.3 above) that the nature and extent of the similarities between the CRIRSCO Template (mining) and the PRMS reserve and resource definitions (oil and gas) indicate that these definitions are capable of providing a platform for setting comparable accounting and disclosure requirements for both mining and oil and gas activities. While the Extractive Activities Project proceeded quite differently from the direction contemplated in the DP, at that time the project team did recommend that the CRIRSCO Template and the PRMS definitions of reserves and resources would have been a suitable platform. Nonetheless, there is, however, some tension between the definition of an asset in the IASB's *Conceptual Framework* and the assumptions underlying the reserves and resources definitions.²⁷ The points of tension highlighted in the DP include:

- The CRIRSCO Template and the PRMS both make use of entity-specific assumptions that are applied to derive a reserve or resource estimate, whereas IFRS accounting standards typically requires that estimates should make use of economic assumptions that reflect market-based evidence, where available.
- The CRIRSCO Template and the PRMS require certain "... conditions that must exist before a resource can be converted into a reserve". In contrast, management's intentions are not a feature of the Conceptual Framework's definition of an asset.
