It is also important to note that when applying the portfolio approach, entities may offset credit and market risks at different levels of aggregation. This approach is consistent with risk management practices employed by many entities. Such an approach may be required because it is unlikely that all of the financial assets and liabilities giving rise to the net exposure for a particular market risk will be with the same counterparty. The example below illustrates this concept.

²⁵ [IASB Staff Paper 6](#): Project: *Measuring Quoted Investments in Subsidiaries, Joint Ventures and Associates at Fair Value: Proposed amendments to IFRS 10, IFRS 12, IAS 27, IAS 28 and IAS 36 and Illustrative Examples for IFRS 13*, IASB meeting, April 2015, Illustrative Example for IFRS 13 - Portfolios. Available on the IFRS Foundation's website.

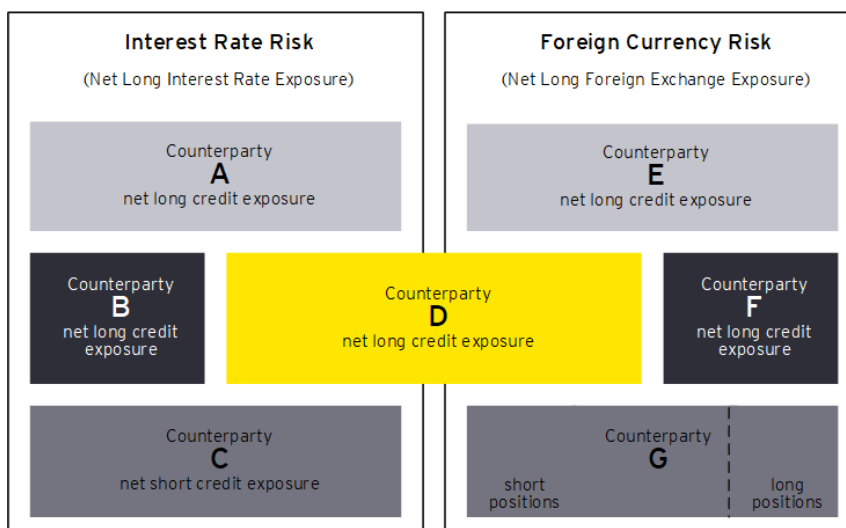

²⁶ [IASB Update](#), April 2015, available on the IFRS Foundation's website.

Illustration 11-1: Calculating net exposure

Entity XYZ holds a portfolio of long and short derivative positions (USD interest rate swaps and USD/JPY foreign currency forwards) with various counterparties as follows:

- Counterparties A, B and C: only interest rate swaps.
- Counterparty D: interest rate swaps and foreign currency forwards.
- Counterparties E, F and G: only foreign currency forwards.

Entity XYZ has executed master netting agreements in respect of credit risk with each of its counterparties except counterparty G. In addition, the agreement in place with counterparty D can be applied across products.

Using the measurement exception, Entity XYZ may consider its credit risk exposure to each individual counterparty except counterparty G on a net basis (i.e., net long credit exposure to Counterparty A, net short credit exposure to Counterparty C, etc).

At the same time, the entity may consider its net long exposure to USD interest rate risk from its portfolio of derivatives with counterparties A, B, C and D. The entity may also consider its net long exposure to foreign currency risk (Japanese yen risk) from its portfolio of derivatives with counterparties D, E, F and G.

11.2.1 Exposure to market risks

When measuring fair value using the measurement exception for offsetting positions, the entity is required to ensure the following in relation to market risks:

- Market risk (or risks), to which the entity is exposed within that portfolio, is substantially the same. For example, combining the interest rate risk associated with a financial asset with the commodity price risk associated with a financial liability would not be appropriate because it would not mitigate the entity's exposure to interest rate risk or commodity price risk.

The standard requires any basis risk resulting from the market risk parameters not being identical to be taken into account in the fair value measurement of the financial assets and financial liabilities within the group. [IFRS 13.54].

- The duration of the entity's exposure to a particular market risk (or risks) must be substantially the same. [IFRS 13.55].

The standard gives the example of an entity that uses a 12-month futures contract against the cash flows associated with 12 months' worth of interest rate risk exposure on a five-year financial instrument. The futures and five-year financial instruments are within a group that is made up of only those financial assets and financial liabilities. The entity measures the fair value of the exposure to 12-month interest rate risk on a net basis and the remaining interest rate risk exposure (i.e., years 2-5) on a gross basis.

Management selects the price within the bid-ask spread that is most representative of fair value in the circumstances to the entity's net exposure to the particular market risk(s) (pricing within the bid-ask spread is discussed further in section 14.3 below). [IFRS 13.53].

11.2.2 Exposure to the credit risk of a particular counterparty

In some cases, an entity might enter into an arrangement to mitigate the credit risk exposure in the event of default, for example, a master netting agreement with the counterparty or the exchange of collateral on the basis of each party's net exposure to the credit risk of the other party.

An entity is not required to prove that such agreements will be legally enforceable in all jurisdictions to use the measurement exception. Instead, an entity should consider market participant expectations about the likelihood that such an arrangement would be legally enforceable in the event of default when valuing the net credit exposure. *[IFRS 13.56]*.

When market participants would take into account any of these existing arrangements, the fair value measurement (using the measurement exception for offsetting positions) must include the effect of the entity's net exposure to the credit risk of that counterparty and/or the counterparty's net exposure to the credit risk of the entity.

12 Fair value at initial recognition

12.1 Exit price versus entry price

IFRS 13 defines fair value as the price that would be received to sell the asset or paid to transfer the liability; this is an exit price notion. When an entity acquires an asset, or assumes a liability, the price paid (or the transaction price) is an entry price. Conceptually, entry prices and exit prices are different. Entities do not necessarily sell assets at the prices paid to acquire them. Similarly, entities do not necessarily transfer liabilities at the prices received to assume them. This distinction is significant and can have important implications on the initial recognition of assets and liabilities at fair value. However, IFRS 13 acknowledges that, in many cases, an entry price may equal an exit price (e.g., when the transaction takes place in the entity's principal market); since one party is selling an asset, that transaction is also an exit transaction. [IFRS 13.57, IFRS 13.58].

12.1.1 Assessing whether the transaction price equals fair value at initial recognition

Prior to the issuance of IFRS 13, it was common for entities to use the transaction price as fair value of an asset or liability on its initial recognition. While IFRS 13 acknowledges that in many situations, an entry price may equal an exit price, it does not presume that these prices are equal. Therefore, an entity must determine whether the transaction price represents the fair value of an asset or liability at initial recognition. [IFRS 13.59].

IFRS 13.B4 provides certain factors that an entity should consider in making this determination. For example, a transaction price may not represent fair value if the unit of account represented by the transaction price is different from the unit of account for the asset or liability measured at fair value. [IFRS 13.B4(c)]. This may be the case with a complex financial instrument where the transaction price includes a fee for structuring the transaction or when an entity acquires a block and the transaction price includes a block discount.

Another factor to consider is whether the market in which an entity acquired the asset (or assumed the liability) is different from the principal (or most advantageous) market in which the entity will sell the asset (or transfer the liability). [IFRS 13.B4(d)]. For example, a securities dealer may acquire an asset in the retail market but sell it in the inter-dealer market. However, the fair value measurement should consider the fact that, while the inter-dealer price (i.e., the exit price in a hypothetical transaction) may differ from the retail price (i.e., transaction price), another dealer would also expect to earn a profit on the transaction. Accordingly, a pricing model's value should incorporate assumptions regarding the appropriate profit margin that market participants (i.e., other dealers) would demand when estimating the instrument's fair value at inception.

Other examples identified by IFRS 13.B4 when assessing whether the transaction price equals fair value include the following: [IFRS 13.B4(a)-(b)]

- The transaction is between related parties - although IFRS 13 does allow the price in a related party transaction to be used as an input into a fair value measurement if the entity has evidence that the transaction was entered into at market terms
- The transaction takes place under duress or the seller is forced to accept the price in the transaction - for example, if the seller is experiencing financial difficulty

In addition, the measurement of fair value in accordance with IFRS 13 should take into consideration market participant assumptions about risk. Adjustments for uncertainty associated with a valuation technique or certain inputs used to measure fair value are required if market participants would incorporate such risk adjustments when pricing the asset or liability. A measurement (e.g., a 'mark-to-model' measurement) that ignores these market participant adjustments for risk is not representative of fair value.

While helpful in identifying the factors, entities should consider in assessing whether a transaction price would equal fair value, the examples provided in the standard are not intended to be exhaustive.

12.2 Day one gains and losses

IFRS 13's measurement framework applies to initial fair value measurements, if permitted or required by another IFRS. At initial recognition, if the measurement of fair value in accordance with IFRS 13 and the transaction price differ, the entity recognises the resulting gain or loss in profit or loss unless the related IFRS (i.e., the IFRS that permits or requires the initial measurement at fair value) specifies otherwise. [IFRS 13.60]. As noted in Example 7 in the standard (extracted in section 12.2.1 below), IFRS 9 has specific requirements with regard to the recognition of inception (or 'day one') gains and losses for financial instruments within the scope of the standard when fair value is determined using unobservable inputs (see Chapter 45). [IFRS 9.B5.1.2A]. In developing IFRS 13, the IASB did not change the recognition threshold in those standards in relation to day one gains or losses. However, IFRS 9 was amended to clarify that an entity: (i) measures the fair value of financial instruments at initial recognition in accordance with IFRS 13, then; (ii) considers the requirements of IFRS 9 in determining whether (and when) the resulting difference (if any) between fair value at initial recognition and the transaction price is recognised. [IFRS 13.BC138].

FASB differences

US GAAP contains no specific threshold regarding the observability of fair value inputs. As such, US GAAP does not specifically prohibit the recognition of day-one gains or losses even when the fair value measurement is based on significant unobservable inputs.

12.2.1 Day one losses for over-the-counter derivative transactions

The definition of fair value as an exit price affects the accounting by retail customers as much as financial institutions (i.e., dealers). For example, retail customers whose entry and exit market for a financial asset (or financial liability) measured at fair value is with a wholesaler (e.g., a dealer) could experience a day one loss, because the price at which a wholesaler would sell a financial asset to a retail customer would generally exceed the price a wholesaler would pay to acquire that financial asset from a retail customer (this difference in price is commonly referred to as the bid-ask spread in many financial markets).

The following example from IFRS 13 discusses how an interest rate swap at initial recognition may be measured differently by a retail counterparty (i.e., an end-user) and a dealer. [IFRS 13.IE Example 7, IFRS 13.IE24, IFRS 13.IE25, IFRS 13.IE26].

Extract from IFRS 13

Example 7-Interest rate swap at initial recognition

Entity A (a retail counterparty) enters into an interest rate swap in a retail market with Entity B (a dealer) for no initial consideration (ie the transaction price is zero). Entity A can access only the retail market. Entity B can access both the retail market (ie with retail counterparties) and the dealer market (ie with dealer counterparties).

From the perspective of Entity A, the retail market in which it initially entered into the swap is the principal market for the swap. If Entity A were to transfer its rights and obligations under the swap, it would do so with a dealer counterparty in that retail market. In that case the transaction price (zero) would represent the fair value of the swap to Entity A at initial recognition, ie the price that Entity A would receive to sell or pay to transfer the swap in a transaction with a dealer counterparty in the retail market (ie an exit price). That price would not be adjusted for any incremental (transaction) costs that would be charged by that dealer counterparty.

From the perspective of Entity B, the dealer market (not the retail market) is the principal market for the swap. If Entity B were to transfer its rights and obligations under the swap, it would do so with a dealer in that market. Because the market in which Entity B initially entered into the swap is different from the principal market for the swap, the transaction price (zero) would not necessarily represent the fair value of the swap to Entity B at initial recognition. If the fair value differs from the transaction price (zero), Entity B applies IAS 39 *Financial Instruments: Recognition and Measurement* or IFRS 9 *Financial Instruments* to determine whether it recognises that difference as a gain or loss at initial recognition.

This example seems to indicate that a retail counterparty may not have any gain or loss at initial recognition because the retail counterparty would likely be presumed to transact both at inception and on disposal (i.e., a hypothetical exit) in the same principal market (i.e., the retail market with securities dealers). However, this example does not address the bid-ask spread.

The bid-ask spread is the difference between the price a prospective dealer is willing to pay for an instrument (the 'bid' price) and the price at which the dealer would sell that same instrument (the 'ask' price), allowing the dealer to earn a profit for its role as a 'market maker' in the over-the-counter marketplace. The bid-ask spread may differ by dealer, as well as by the market and type of instrument that is being transacted.

IFRS 13 requires that instruments that trade in markets with bid-ask spreads (e.g., a dealer market) be measured at the price within the bid-ask spread that is most representative of fair value in the circumstances (pricing within the bid-ask spread is discussed further in section 14.3 below). Therefore, an inception loss could be experienced by the retail counterparty due to a difference in the price within the bid-ask spread that the retail counterparty could hypothetically exit the instrument and the price within the bid-ask spread that the retail counterparty actually transacted.

The IASB has acknowledged that the fair value of a financial instrument may differ from its transaction price because of the bid-ask spread, even when the entry and exit markets for the instrument are identical. [IFRS 13.BC165]. In addition to the bid-ask spread, retail counterparties may recognise additional losses or expenses at the inception of derivative contracts. For example, if the transaction price for a complex derivative includes a structuring fee, the retail counterparty would likely recognise a loss when measuring the fair value of the derivative. Because the transaction price includes the price for the derivative instrument, as well as the fee paid by the retail counterparty to the dealer for structuring the transaction, the unit of account represented by the transaction price differs from the unit of account for the instrument being measured, as discussed in IFRS 13. [IFRS 13.B4(c)].

12.2.2 Day one gains and losses when entry and exit markets for the transaction are deemed to be the same

IFRS 13 contains no explicit prohibitions on the recognition of day one gains or losses, even in situations where the entry and exit markets are the same. For example, it may be acceptable in certain situations for a dealer to recognise a day one gain or loss on a transaction where the entry and exit markets are deemed to be the same (e.g., inter-dealer market). A difference in the price within the bid-ask spread at which a dealer could exit a transaction versus where it entered the transaction could be one reason to record an inception gain or loss. IFRS 13 clarifies that the exit price within the bid-ask spread that is most representative of fair value in the circumstances should be used to measure fair value, regardless of where in the fair value hierarchy the input falls (pricing within the bid-ask spread is discussed further in section 14.3 below).

Notwithstanding the guidance in IFRS 13, IFRS 9 provides specific requirements in relation to the recognition of any day one gains or losses. For example, where fair value is not measured using a quoted price in an active market (without adjustment), recognition of day one gains or losses is generally prohibited (see Chapter 45).

12.3 Related party transactions

As discussed in section 6 above, the definition of market participants makes it clear that buyers and sellers for the item being measured are not related parties (as defined in IAS 24, see Chapter 35). That is, the hypothetical transaction used to determine fair value in IFRS 13 is assumed to take place between market participants that are independent from one another. However, IFRS 13 indicates that the price in a related party transaction may be used as an input into a fair value measurement if there is evidence, the transaction was entered into at market terms. The Boards believe such an approach is consistent with the requirements of IAS 24. As with disclosures made in accordance with IAS 24, evidence to support that a related party transaction was executed at market terms may be difficult to substantiate absent corroborating market data from transactions between independent parties.

13 Valuation techniques

There are two key distinctions between the way previous IFRSs considered valuation techniques and the approach in IFRS 13. On adoption of the standard, these distinctions, in and of themselves, may not have changed practice. However, they may have required management to reconsider their methods of measuring fair value.

Firstly, IFRS 13's requirements in relation to valuation techniques apply to all methods of measuring fair value. Traditionally, references to valuation techniques in IFRS have indicated a lack of market-based information with which to value an asset or liability. Valuation techniques as discussed in IFRS 13 are broader and, importantly, include market-based approaches.

Secondly, IFRS 13 does not prioritise the use of one valuation technique over another, unlike previous fair value requirements, or require the use of only one technique (with the exception of the requirement to measure identical financial instruments that trade in active markets at price multiplied by quantity (P×Q)). Instead, the standard establishes a hierarchy for the inputs used in those valuation techniques, requiring an entity to maximise observable inputs and minimise the use of unobservable inputs (the fair value hierarchy is discussed further in section 15 below). [IFRS 13.74]. In some instances, the approach in IFRS 13 may be consistent with previous requirements in IFRS. For example, the best indication of fair value continues to be a quoted price in an active market. However, since IFRS 13 indicates that multiple techniques should be used when appropriate and sufficient data is available, judgement will be needed to select the techniques that are appropriate in the circumstances. [IFRS 13.61].

13.1 Selecting appropriate valuation techniques

IFRS 13 recognises the following three valuation approaches to measure fair value:

- *Market approach*: based on market transactions involving identical or similar assets or liabilities
- *Income approach*: based on future amounts (e.g., cash flows or income and expenses) that are converted (discounted) to a single present amount
- *Cost approach*: based on the amount required to replace the service capacity of an asset (frequently referred to as current replacement cost)

IFRS 13 requires that an entity use valuation techniques that are consistent with one or more of the above valuation approaches (these valuation approaches are discussed in more detail in sections 13.2 to 13.4 below). [IFRS 13.62]. These approaches are consistent with generally accepted valuation methodologies used outside financial reporting. Not all of the approaches will be applicable to all types of assets or liabilities. However, when measuring the fair value of an asset or liability, IFRS 13 requires an entity to use valuation techniques that are appropriate in the circumstances and for which sufficient data is available. As a result, the use of multiple valuation techniques may be required. [IFRS 13.61, IFRS 13.62].

The determination of the appropriate technique(s) to be applied requires significant judgement, sufficient knowledge of the asset or liability and an adequate level of expertise regarding the valuation techniques. Within the application of a given approach, there may be a number of possible valuation techniques. For instance, there are a number of different techniques used to value intangible assets under the income approach (such as the multi-period excess earnings method and the relief-from-royalty method - see Chapter 10) depending on the nature of the asset.

As noted above, the fair value hierarchy does not prioritise the valuation techniques to be used; instead, it prioritises the inputs used in the application of these techniques. As such, the selection of the valuation technique(s) to apply should consider the exit market (i.e., the principal (or most advantageous) market) for the asset or liability and use valuation inputs that are consistent with the nature of the item being measured. Regardless of the technique(s) used, the objective of a fair value measurement remains the same - i.e., an exit price under current market conditions from the perspective of market participants. [IFRS 13.2].

Selection, application, and evaluation of the valuation techniques can be complex. As such, reporting entities may need assistance from valuation professionals.

13.1.1 Single versus multiple valuation techniques

The standard does not contain a hierarchy of valuation techniques because particular valuation techniques might be more appropriate in some circumstances than in others.

Selecting a single valuation technique may be appropriate in some circumstances, for example, when measuring a financial asset or liability using a quoted price in an active market. However, in other situations, more than one valuation technique may be deemed appropriate and multiple approaches should be applied. For example, it may be appropriate to use multiple valuation techniques when measuring fair value less costs of disposal for a CGU to test for impairment. *[IFRS 13.63]*.

The nature of the characteristics of the asset or liability being measured and the availability of observable market prices may contribute to the number of valuation techniques used in a fair value analysis. For example, the fair value of a business is often estimated by giving consideration to multiple valuation approaches; such as an income approach that derives value from the present value of the expected future cash flows specific to the business and a market approach that derives value from market data (such as EBITDA or revenue multiples) based on observed transactions for comparable assets. On the other hand, financial assets that frequently trade in active markets are often valued using only a market approach given the availability and relevance of observable data.

Even when the use of a single approach is deemed appropriate, entities should be aware of changing circumstances that could indicate using multiple approaches may be more appropriate. For example, this might be the case if there is a significant decrease in the volume and level of activity for an asset or liability in relation to normal market activity. Observable transactions that once formed the basis for the fair value estimate may cease to exist altogether or may not be determinative of fair value and, therefore, require an adjustment to the fair value measurement (this is discussed further in section 7.3 above). As such, the use of multiple valuation techniques may be more appropriate.

13.1.2 Using multiple valuation techniques to measure fair value

When the use of multiple valuation techniques is considered appropriate, their application is likely to result in a range of possible values. IFRS 13 requires that management evaluate the reasonableness of the range and select the point within the range that is most representative of fair value in the circumstances.

[IFRS 13.63].

As with the selection of the valuation techniques, the evaluation of the results of multiple techniques requires significant judgement. The merits of each valuation technique applied, and the underlying assumptions embedded in each of the techniques, will need to be considered. Evaluation of the range does not necessarily require the approaches to be calibrated to one another (i.e., the results from different approaches do not have to be equal). The objective is to find the point in the range that most reflects the price to sell an asset or transfer a liability between market participants.

If the results from different valuation techniques are similar, the issue of weighting multiple value indications becomes less important since the assigned weights will not significantly alter the fair value estimate. However, when indications of value are disparate, entities should seek to understand why significant differences exist and what assumptions might contribute to the variance. IFRS 13 indicates that when evaluating results from multiple valuation approaches, a wide range of fair value measurements may be an indication that further analysis is needed. *[IFRS 13.B40]*. For example, divergent results between a market approach and income approach may indicate a misapplication of one or both of the techniques and would likely necessitate additional analysis.

The standard gives two examples that illustrate situations where the use of multiple valuation techniques is appropriate and, when used, how different indications of value are assessed.

Firstly, an entity might determine that a technique uses assumptions that are not consistent with market participant assumptions (and, therefore, is not representative of fair value). This is illustrated in Example 5 in the standard (included in the extract below), where the entity eliminates use of the cost approach because it determines a market participant would not be able to construct the asset itself.

[IFRS 13.IE Example 5, IFRS 13.IE15, IFRS 13.IE16, IFRS 13.IE17].

Extract from IFRS 13

Example 5-Software asset

An entity acquires a group of assets. The asset group includes an income-producing software asset internally developed for licensing to customers and its complementary assets (including a related database with which the software asset is used) and the associated liabilities. To allocate the cost of the group to the individual assets acquired, the entity measures the fair value of the software asset. The entity determines that the software asset would provide maximum value to market participants through its use in combination with other assets or with other assets and liabilities (ie its complementary assets and the associated liabilities). There is no evidence to suggest that the current use of the software asset is not its highest and best use. Therefore, the highest and best use of the software asset is its current use. (In this case the licensing of the software asset, in and of itself, does not indicate that the fair value of the asset would be maximised through its use by market participants on a stand-alone basis.)

The entity determines that, in addition to the income approach, sufficient data might be available to apply the cost approach but not the market approach. Information about market transactions for comparable software assets is not available. The income and cost approaches are applied as follows:

- (a) The income approach is applied using a present value technique. The cash flows used in that technique reflect the income stream expected to result from the software asset (licence fees from customers) over its economic life. The fair value indicated by that approach is CU15 million.
- (b) The cost approach is applied by estimating the amount that currently would be required to construct a substitute software asset of comparable utility (ie taking into account functional and economic obsolescence). The fair value indicated by that approach is CU10 million.

Through its application of the cost approach, the entity determines that market participants would not be able to construct a substitute software asset of comparable utility. Some characteristics of the software asset are unique, having been developed using proprietary information, and cannot be readily replicated. The entity determines that the fair value of the software asset is CU15 million, as indicated by the income approach.

Secondly, as is illustrated in Example 4 in the standard (included in the extract below), [IFRS 13.IE Example 4, IFRS 13.IE11, IFRS 13.IE12, IFRS 13.IE13, IFRS 13.IE14], an entity considers the possible range of fair value measures and considers what is most representative of fair value by taking into consideration that:

- One valuation technique may be more representative of fair value than others
 - Inputs used in one valuation technique may be more readily observable in the marketplace or require fewer adjustments (inputs are discussed further in section 14 below)
 - The resulting range in estimates using one valuation technique may be narrower than the resulting range from other valuation techniques
- And
- Divergent results from the application of the market and income approaches would indicate that additional analysis is required, as one technique may have been misapplied, or the quality of inputs used in one technique may be less reliable

Extract from IFRS 13**Example 4-Machine held and used**

An entity acquires a machine in a business combination. The machine will be held and used in its operations. The machine was originally purchased by the acquired entity from an outside vendor and, before the business combination, was customised by the acquired entity for use in its operations. However, the customisation of the machine was not extensive. The acquiring entity determines that the asset would provide maximum value to market participants through its use in combination with other assets or with other assets and liabilities (as installed or otherwise configured for use). There is no evidence to suggest that the current use of the machine is not its highest and best use. Therefore, the highest and best use of the machine is its current use in combination with other assets or with other assets and liabilities.

The entity determines that sufficient data are available to apply the cost approach and, because the customisation of the machine was not extensive, the market approach. The income approach is not used because the machine does not have a separately identifiable income stream from which to develop reliable estimates of future cash flows. Furthermore, information about short-term and intermediate-term lease rates for similar used machinery that otherwise could be used to project an income stream (ie lease payments over remaining service lives) is not available. The market and cost approaches are applied as follows:

- (a) The market approach is applied using quoted prices for similar machines adjusted for differences between the machine (as customised) and the similar machines. The measurement reflects the price that would be received for the machine in its current condition (used) and location (installed and configured for use). The fair value indicated by that approach ranges from CU40,000 to CU48,000.
- (b) The cost approach is applied by estimating the amount that would be required currently to construct a substitute (customised) machine of comparable utility. The estimate takes into account the condition of the machine and the environment in which it operates, including physical wear and tear (ie physical deterioration), improvements in technology (ie functional obsolescence), conditions external to the condition of the machine such as a decline in the market demand for similar machines (ie economic obsolescence) and installation costs. The fair value indicated by that approach ranges from CU40,000 to CU52,000.

The entity determines that the higher end of the range indicated by the market approach is most representative of fair value and, therefore, ascribes more weight to the results of the market approach. That determination is made on the basis of the relative subjectivity of the inputs, taking into account the degree of comparability between the machine and the similar machines. In particular:

- (a) the inputs used in the market approach (quoted prices for similar machines) require fewer and less subjective adjustments than the inputs used in the cost approach.
- (b) the range indicated by the market approach overlaps with, but is narrower than, the range indicated by the cost approach.
- (c) there are no known unexplained differences (between the machine and the similar machines) within that range.

Accordingly, the entity determines that the fair value of the machine is CU48,000.

If customisation of the machine was extensive or if there were not sufficient data available to apply the market approach (eg because market data reflect transactions for machines used on a stand-alone basis, such as a scrap value for specialised assets, rather than machines used in combination with other assets or with other assets and liabilities), the entity would apply the cost approach. When an asset is used in combination with other assets or with other assets and liabilities, the cost approach assumes the sale of the machine to a market participant buyer with the complementary assets and the associated liabilities. The price received for the sale of the machine (ie an exit price) would not be more than either of the following:

- (a) the cost that a market participant buyer would incur to acquire or construct a substitute machine of comparable utility; or
- (b) the economic benefit that a market participant buyer would derive from the use of the machine.

Both Example 4 and Example 5, extracted above, highlight situations where it was appropriate to use more than one valuation approach to estimate fair value. Although the indication of value from the cost approach was ultimately not given much weight in either example, performing this valuation technique was an important part of the estimation process. Even when a particular valuation technique is given little weight, its application can highlight specific characteristics of the item being measured and may help in assessing the value indications from other techniques.

How we see it

Determining the point in a range of values that is ‘most representative of fair value’ can be subjective and requires the use of judgement by management. In addition, although Example 4 in the standard (extracted above) refers to ‘weighting’ the results of the valuation techniques used, in our view, this is not meant to imply that an entity must explicitly apply a percentage weighting to the results of each technique to determine fair value. However, this may be appropriate in certain circumstances.

The standard does not prescribe a specific weighting methodology (e.g., explicit assignment of percentages versus qualitative assessment of value indications). As such, evaluating the techniques applied in an analysis will require judgement based on the merits of each methodology and their respective assumptions. Identifying a single point within a range is not the same as finding the point within the range that is most representative of fair value. As such, simply assigning arbitrary weights to different indications of value is not appropriate. The weighting of multiple value indications is a process that requires significant judgement and a working knowledge of the different valuation techniques and inputs. Such knowledge is necessary to properly assess the relevance of these methodologies and inputs to the asset or liability being measured. For example, in certain instances it may be more appropriate to rely primarily on the fair value indicated by the technique that maximises the use of observable inputs and minimises the use of unobservable inputs. In all cases, entities should document how they considered the various indications of value, including how they evaluated qualitative and quantitative factors, in determining fair value.

13.1.3 Valuation adjustments

In certain instances, adjustments to the output from a valuation technique may be required to appropriately determine a fair value measurement in accordance with IFRS 13. An entity makes valuation adjustments if market participants would make those adjustments when pricing an asset or liability (under the market conditions at the measurement date). This includes any adjustments for measurement uncertainty (e.g., a risk premium).

Valuation adjustments may include the following: [IFRS 13.BC145]

- (a) An adjustment to a valuation technique to take into account a characteristic of an asset or a liability that is not captured by the valuation technique. The need for such an adjustment is typically identified during calibration of the value calculated using the valuation technique with observable market information (see section 13.1.3.A below).
- (b) Applying the point within the bid-ask spread that is most representative of fair value in the circumstances (see section 14.3 below).
- (c) An adjustment to take into account credit risk (e.g., an entity’s non-performance risk or the credit risk of the counterparty to a transaction) (see section 10.3 above).
- (d) An adjustment to take into account measurement uncertainty (e.g., when there has been a significant decrease in the volume or level of activity when compared with normal market activity for the asset or liability, or similar assets or liabilities, and the entity has determined that the transaction price or quoted price does not represent fair value).

Practical example 13-1 below, demonstrates the use of valuation adjustments.

Practical example 13-1: UBS Group AG (2023)

Switzerland

Annual Report 2023 [extract]

Consolidated financial statements [extract]

UBS Group AG consolidated financial statements [extract]

Notes to the UBS Group AG consolidated financial statements [extract]

Additional information [extract]

Note 21 Fair value measurement [extract]

d) Valuation adjustments and other items [extract]

Other valuation adjustments

Instruments that are measured as part of a portfolio of combined long and short positions are valued at mid-market levels to ensure consistent valuation of the long- and short-component risks. A liquidity valuation adjustment is then made to the overall net long or short exposure to move the fair value to bid or offer as appropriate, reflecting current levels of market liquidity. The bid-offer spreads used in the calculation of this valuation adjustment are obtained from market transactions and other relevant sources and are updated periodically.

Uncertainties associated with the use of model-based valuations are incorporated into the measurement of fair value through the use of model reserves. These reserves reflect the amounts that the Group estimates should be deducted from valuations produced directly by models to incorporate uncertainties in the relevant modeling assumptions, in the model and market inputs used, or in the calibration of the model output to adjust for known model deficiencies. In arriving at these estimates, the Group considers a range of market practices, including how it believes market participants would assess these uncertainties. Model reserves are reassessed periodically in light of data from market transactions, consensus pricing services and other relevant sources.

Other valuation adjustment reserves on the balance sheet

	As of		
USD m	31.12.23	31.12.22	31.12.21
Credit valuation adjustments ¹	(145)	(33)	(44)
Funding and debit valuation adjustments	(116)	(46)	(47)
Other valuation adjustments	(2,654)	(839)	(913)
of which: liquidity	(2,051)	(311)	(341)
of which: model uncertainty	(603)	(529)	(571)

¹ Amount does not include reserves against defaulted counterparties.

Credit valuation adjustments and Funding and debit valuation adjustments include USD 108m and USD 34m respectively, attributable to the Credit Suisse Group. Liquidity and model uncertainty adjustments in Credit Suisse amount to USD 1,741m and USD 181m, respectively.

13.1.3.A Adjustments to valuation techniques that use unobservable inputs

Regardless of the valuation technique(s) used, the objective of a fair value measurement remains the same - i.e., an exit price under current market conditions from the perspective of market participants. [IFRS 13.2]. As such, if the transaction price is determined to represent fair value at initial recognition (see section 12 above) and a valuation technique that uses unobservable inputs will be used to measure the fair value of an item in subsequent periods, the valuation technique must be calibrated to ensure the valuation technique reflects current market conditions. [IFRS 13.64]. In other words, at initial recognition the output from the valuation technique should be adjusted to equal the transaction price.

Calibration ensures that a valuation technique incorporates current market conditions. The calibration also helps an entity to determine whether an adjustment to the valuation technique is necessary by identifying potential deficiencies in the valuation model. For example, there might be a characteristic of the asset or liability that is not captured by the valuation technique.

If an entity measures fair value after initial recognition using a valuation technique (or techniques) that uses unobservable inputs, an entity must ensure the valuation technique(s) reflects observable market data (e.g., the price for a similar asset or liability) at the measurement date. [IFRS 13.64]. That is, it should be calibrated to observable market data, when available.

13.1.4 Making changes to valuation techniques

The standard requires that valuation techniques used to measure fair value be applied on a consistent basis among similar assets or liabilities and across reporting periods. [IFRS 13.65]. This is not meant to preclude subsequent changes, such as a change in its weighting when multiple valuation techniques are used or a change in an adjustment applied to a valuation technique.

An entity can make a change to a valuation technique or its application (or a change in the relative importance of one technique over another), provided that change results in a measurement that is equally representative (or more representative) of fair value in the circumstances.

IFRS 13 provides the following examples of circumstances that may trigger a change in valuation technique or relative weights assigned to valuation techniques: [IFRS 13.65]

- (a) New markets develop
- (b) New information becomes available
- (c) Information previously used is no longer available
- (d) Valuation techniques improve
- (e) Market conditions change

In addition, a change in the exit market, characteristics of market participants that would transact for the asset or liability, or the highest and best use of an asset by market participants could also warrant a change in valuation techniques in certain circumstances.

Changes to fair value resulting from a change in the valuation technique or its application are accounted for as a change in accounting estimate in accordance with IAS 8. However, IFRS 13 states that the disclosures in IAS 8 for a change in accounting estimate are not required for such changes. [IFRS 13.66]. Instead, information would be disclosed in accordance with IFRS 13 (see section 19.3.5 below for further discussion). If a valuation technique is applied in error, the correction of the technique would be accounted as a correction of an error in accordance with IAS 8.

13.2 Market approach

IFRS 13 describes the market approach as a widely used valuation technique: [IFRS 13.B5]

Extract from IFRS 13

B5	The market approach uses prices and other relevant information generated by market transactions involving identical or comparable (ie similar) assets, liabilities or a group of assets and liabilities, such as a business.
----	--

The market approach uses prices that market participants would pay or receive for the transaction, for example, a quoted market price. The market price may be adjusted to reflect the characteristics of the item being measured, such as its current condition and location, and could result in a range of possible fair values.

Valuation techniques consistent with the market approach use prices and other market data derived from observed transactions for the same or similar assets, for example, revenue, or EBITDA multiples. Multiples might be in ranges with a different multiple for each comparable asset or liability. The selection of the appropriate multiple within the range requires judgement, considering qualitative and quantitative factors specific to the measurement. [IFRS 13.B6].

Another example of a market approach is matrix pricing. Matrix pricing is a mathematical technique used principally to value certain types of financial instruments, such as debt securities, where specific instruments (e.g., CUSIPs) may not trade frequently. The method derives an estimated price of an instrument using transaction prices and other relevant market information for benchmark instruments with similar features (e.g., coupon, maturity or credit rating). [IFRS 13.B7].

13.3 Cost approach

The cost approach (or current replacement cost) is typically used to measure the fair value of tangible assets, such as plant or equipment. IFRS 13 states: [IFRS 13.B8]

Extract from IFRS 13

B8 The cost approach reflects the amount that would be required currently to replace the service capacity of an asset (often referred to as current replacement cost).

From the perspective of a market participant seller, the price that would be received for the asset is based on the cost to a market participant buyer to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence.

Obsolescence is broader than depreciation, whether for financial reporting or tax purposes. According to the standard, obsolescence encompasses: [IFRS 13.B9]

- Physical deterioration
- Functional (technological) obsolescence
- Economic (external) obsolescence

Physical deterioration and functional obsolescence are factors specific to the asset. Physical deterioration refers to wear, tear or abuse. For example, machines in a factory might deteriorate physically due to high production volumes or a lack of maintenance. Something is functionally obsolete when it does not function in the manner originally intended (excluding any physical deterioration). For example, layout of the machines in the factory may make their use, in combination, more labour intensive, increasing the cost of those machines to the entity. Functional obsolescence also includes the impact of technological change, for example, if newer, more efficient and less labour-intensive models were available, demand for the existing machines might decline, along with the price for the existing machines in the market.

Economic obsolescence arises from factors external to the asset. An asset may be less desirable or its economic life may reduce due to factors such as regulatory changes, excess supply or a decrease in demand due to climate change. Consider the machines in the factory; assume that, after the entity had purchased its machines, the supplier had flooded the market with identical machines. If demand was not as high as the supplier had anticipated, it could result in an oversupply and the supplier would be likely to reduce the price in order to clear the excess stock.

13.3.1 Use of depreciated replacement cost to measure fair value

The depreciated replacement cost method measures the cost to replace the asset at the measurement date in light of its current use, location and condition, using depreciation as a proxy for obsolescence. Use of this method to measure fair value would necessarily assume that:

- Exit and entry markets are the same (in order for the entry and exit prices to be equal)
- Highest and best use of the asset is its current use
- Depreciation charge appropriately reflects physical deterioration, functional (technological) obsolescence and economic (external) obsolescence
- Inputs used are consistent with market participant assumptions about the asset

Consider an entity that provides port freight and logistics services. Its plant or equipment comprises highly specialised assets from which the entity earns berthing and tonnage fees. The entity accounts for these assets in accordance with IAS 16 using the revaluation model. At the end of the reporting period, the assets are tested for impairment under IAS 36. As part of determining the assets' recoverable amount, the entity may need to determine their fair value less costs of disposal. However, there are no readily available observable transactions and/or inputs available to use in measuring fair value because of the highly specialised nature of the assets and because there is no history of such assets ever being sold, other than as part of a business combination.

As discussed in section 13.3 above, IFRS 13 permits the use of a cost approach for measuring fair value. However, care is needed in using depreciated replacement cost to ensure the resulting measurement is consistent with the requirements of IFRS 13 for measuring fair value.

How we see it

Before using depreciated replacement cost as a method to measure fair value, an entity needs to ensure that both:

- Highest and best use of the asset is its current use (see section 9 above)
- Exit market for the asset (i.e., the principal market or in its absence, the most advantageous market, see section 5 above) is the same as the entry market (i.e., the market in which the asset was/will be purchased)

In addition, an entity needs to ensure that both:

- The inputs used to determine replacement cost are consistent with what market participant buyers would pay to acquire or construct a substitute asset of comparable utility
- The replacement cost has been adjusted for obsolescence that market participant buyers would consider - i.e., that the depreciation adjustment reflects all forms of obsolescence (i.e., physical deterioration, technological (functional) and economic obsolescence), which is broader than depreciation calculated in accordance with IAS 16

Even after considering these factors, the resulting depreciated replacement cost must be assessed to ensure market participants would actually transact for the asset, in its current condition and location, at this price. Example 4 in the standard (extracted and discussed in section 13.1.2 above) reflects this stating that “the price received for the sale of the machine (i.e., an exit price) would not be more than either of the following:

- (a) the cost that a market participant buyer would incur to acquire or construct a substitute machine of comparable utility; or
- (b) the economic benefit that a market participant buyer would derive from the use of the machine.”

[IFRS 13.IE14].

In light of the above, the port freight and logistics services entity in our example above might conclude that depreciated replacement cost be used to measure fair value, but only in situations where it represents a current exit price for its assets rather than their cost.

13.4 Income approach

IFRS 13 states the following about the income approach: [IFRS 13.B10, IFRS 13.B11]

Extract from IFRS 13

- | | |
|-----|--|
| B10 | The income approach converts future amounts (eg cash flows or income and expenses) to a single current (ie discounted) amount. When the income approach is used, the fair value measurement reflects current market expectations about those future amounts. |
| B11 | Those valuation techniques include, for example, the following: <ol style="list-style-type: none"> (a) present value techniques (see paragraphs B12-B30); (b) option pricing models, such as the Black-Scholes-Merton formula or a binomial model (ie a lattice model), that incorporate present value techniques and reflect both the time value and the intrinsic value of an option; and (c) the multi-period excess earnings method, which is used to measure the fair value of some intangible assets. |

IFRS 13.B11 provides a number of examples that are consistent with the income approach; however, the standard does not limit the valuation techniques that are consistent with the income approach to these examples. An entity may consider other valuation techniques. The standard provides some application guidance, but only in relation to present value techniques (see section 20 below for further discussion regarding this application guidance).

14 Inputs to valuation techniques

14.1 General principles

When selecting the inputs to use in a valuation technique, IFRS 13 requires that they: [IFRS 13.69]

- Be consistent with the characteristics of the asset or liability that market participants would take into account (see section 4.2 above)
- Exclude premiums or discounts that reflect size as a characteristic of the entity's holding, rather than a characteristic of the item being measured (for example, blockage factors)
- Exclude other premiums or discounts if they are inconsistent with the unit of account (see section 4.1 above for discussions regarding unit of account)

Premiums, discounts and blockage factors are discussed further in section 14.2 below.

In all cases, if there is a quoted price in an active market (i.e., a Level 1 input) for the identical asset or a liability, an entity shall use that price without adjustment when measuring fair value. Adjustments to this price are only permitted in certain circumstances, which are discussed in section 16.1 below.

Regardless of the valuation techniques used to estimate fair value, IFRS 13 requires that these techniques maximise the use of relevant observable inputs and minimise the use of unobservable inputs. [IFRS 13.67].

This requirement is consistent with the idea that fair value is a market-based measurement and, therefore, is determined using market-based observable data, to the extent available and relevant.

The standard provides some examples of markets in which inputs might be observable: [IFRS 13.68, IFRS 13.B34]

- (a) *Exchange markets*, where closing prices are both readily available and generally representative of fair value (e.g., the Hong Kong Stock Exchange)
- (b) *Dealer markets*, where dealers stand ready to trade for their own account (e.g., over-the-counter markets, for which prices are publicly reported) - typically, bid and ask prices (see section 14.3 below) are more readily available than closing prices
- (c) *Brokered markets*, where brokers attempt to match buyers with sellers but do not stand ready to trade for their own account (e.g., electronic communication networks in which buy and sell orders are matched, commercial and residential real estate markets) - typically, the broker knows the prices bid and asked by the respective parties, but each party is unaware of another party's price requirements, though prices for completed transactions may be available
- (d) *Principal-to-principal markets*, where transactions, both new and re-sales, are negotiated independently with no intermediary - little, if any, information about these transactions in these markets may be publicly available

The standard clarifies that the relevance of market data must be considered when assessing the priority of inputs in the fair value hierarchy. When evaluating the relevance of market data, the number and range of data points should be considered, as well as whether this data is directionally consistent with pricing trends and indications from other more general market information.

Relevant market data reflects the assumptions that market participants would use in pricing the asset or liability being measured. Recent transaction prices for the reference asset or liability (or similar assets and liabilities) are typically considered to represent relevant market data, unless the transaction is determined not to be orderly (see section 7 above for a discussion of factors to consider when determining if a transaction is orderly). However, even in situations where a transaction is considered to be orderly, observable transaction prices from inactive markets may require adjustment to address factors, such as timing differences between the transaction date and the measurement date or differences between the asset being measured and a similar asset that was the subject of the transaction. In those instances where the adjustments to observable data are significant and are determined using unobservable data, the resulting measurement would be considered a Level 3 measurement.

Whether observable or unobservable, all inputs used in determining fair value should be consistent with a market-based measurement. As such, the use of unobservable inputs is not intended to allow for the inclusion of entity-specific assumptions in a fair value measurement. While IFRS 13 acknowledges that unobservable inputs may sometimes be developed using an entity's own data, the guidance is clear that these inputs should reflect market participant assumptions. When valuing an intangible asset using unobservable inputs, for example, an entity should take into account the intended use of the asset by market participants, even though this may differ from the entity's intended use. The entity may use its own data, without adjustment, if it determines that market participant assumptions are consistent with its own assumptions (see section 18.1 below for additional discussion on how an entity's own assumptions may be applied in a fair value measurement).

The term 'input' is used in IFRS 13 to refer broadly to the assumptions that market participants would use when pricing an asset or liability, rather than to the data entered into a pricing model. This important distinction implies that an adjustment to a pricing model's value (e.g., an adjustment for the risk that a pricing model might not replicate a market price due to the complexity of the instrument being measured) represents an input, which should be evaluated when determining the measurement's category in the fair value hierarchy. For example, when measuring a financial instrument, an adjustment for model risk would be considered an input (most likely a Level 3 input) that, if deemed significant (see section 15.2.1 below for further discussion on assessing the significance of inputs) may render the entire fair value estimate a Level 3 measurement.

It is also important to note that an input is distinct from a characteristic. IFRS 13 requires an entity to consider the characteristics of the asset or liability (if market participants would take those characteristics into account when pricing the asset or liability at the measurement date). As discussed in section 4.2 above, examples of such characteristics could include: *[IFRS 13.11]*

- Condition and location of an asset
- Restrictions, if any, on the sale or use of an asset or transfer of a liability

To draw out the distinction between an input and a characteristic, consider the example of a restricted security that has the following characteristics, which would be considered by a market participant:

- The issuer is a listed entity
- The security is restricted

An entity is required to select inputs in pricing the asset or liability that are consistent with its characteristics. In some cases, those characteristics result in the application of an adjustment, such as a premium or discount. In our example, the inputs could be:

- Quoted price for an unrestricted security
- Discount adjustment (to reflect the restriction)

The quoted price for the unrestricted security may be an observable and a Level 1 input. However, given the restriction and the standard's requirement that inputs be consistent with the characteristics of the asset or liability being measured, the second input in measuring fair value is an adjustment to the quoted price to reflect the restriction. If this input is unobservable, it would be a Level 3 input and, if it is considered to be significant to the entire measurement, the fair value measurement of the asset would also be categorised within Level 3 of the fair value hierarchy.

14.2 Premiums and discounts

IFRS 13 indicates that when measuring fair value, entities should select inputs that: (i) are consistent with the characteristics of the asset or liability being measured; and (ii) would be considered by market participants when pricing the asset or liability. In certain instances, these characteristics could result in a premium or discount being incorporated into the fair value measurement.

Determining whether a premium or discount applies to a particular fair value measurement requires judgement and depends on specific facts and circumstances.

IFRS 13 distinguishes between premiums or discounts that reflect size as a characteristic of the entity's holding (specifically, a blockage factor) and control premiums, discounts for non-controlling interests and discounts for lack of marketability that are related to characteristics of the asset or liability being measured.

Control premiums, discounts for non-controlling interests and discounts for lack of marketability reflect characteristics of the asset or liability being measured at fair value. Provided these adjustments are consistent with the unit of account (see section 4.1 above) of the asset or liability being measured they can be taken into consideration when measuring fair value. *[IFRS 13.69]*.

Apart from block discounts (discussed in section 14.2.1 below), IFRS 13 does not provide explicit guidance on the types of premiums or discounts that may be considered, or when they should be applied to a fair value measurement. Instead, the guidance indicates that premiums and discounts (e.g., control premiums or discounts for lack of marketability) should be incorporated into non-Level 1 fair value measurements if all of the following conditions are met:

- Application of the premium or discount reflects the characteristics of the asset or liability being measured
- Market participants, acting in their 'economic best interest' (see section 6.2 above), would consider these premiums or discounts when pricing the asset or liability
- Inclusion of the premium or discount is not inconsistent with the unit of account in the IFRS that requires (or permits) the fair value measurement (see section 4.1 above)

IFRS 13 emphasises that prices of instruments that trade in active markets (i.e., Level 1 measurements) should generally not be adjusted and should be measured based on the quoted price of the individual instrument multiplied by the quantity held ($P \times Q$).

Figure 14-1: Differentiating between blockage factors and other premiums and discounts

Examples of premiums and discounts	Blockage factor (or block discount)	Control premium	Discount for lack of marketability
Can fair value be adjusted for the premium or discount?	No.	Yes, in certain circumstances.	Yes, in certain circumstances.
In what situations would these arise?	When an entity sells a large holding of instruments such that the market's normal daily trading volume is not sufficient to absorb the entire quantity (i.e., flooding the market). IFRS 13 does not permit an entity to take block discounts into consideration in the measurement of fair value.	When an entity transacts for a controlling interest in another entity (and the unit of account is deemed to be the controlling interest and not the individual shares).	When an asset or liability is not readily marketable, for example, where there is no established market of readily available buyers and sellers or as a result of restrictions.
Example	An entity holds a 20% investment in a listed company. The normal daily trading for those shares on the exchange is 1-2%. If the entity were to sell its entire holding, the price per share would be expected to decrease by 30%.	An entity transacts for a controlling interest in a private business and determines that the fair value of the business is greater than the aggregate value of the individual shares due to its ability to control the acquired entity.	The shares of a private company for which no liquid market exists.
What does the premium or discount represent?	The difference between the price to sell the individual asset or liability, and an entity's entire holding. IFRS 13 does not permit an entity to include such a difference in the measurement of fair value.	The difference between the price to sell the individual shares in the controlled entity, and the entire controlling interest.	The difference between the price to sell an asset or liability that does not trade in a liquid market, and an identical asset or liability for which a liquid market exists.

14.2.1 Blockage factors (or block discounts)

IFRS 13 explicitly prohibits the consideration of blockage factors (or block discounts) in a fair value measurement. [IFRS 13.69, IFRS 13.80]. While the term blockage factor may be subject to different interpretations, during their deliberations the Boards indicated that they view a blockage factor as an adjustment to the quoted price of an asset or liability because the market's normal trading volume is not sufficient to absorb the quantity held by a reporting entity.

Regardless of the hierarchy level in which a measurement is categorised, blockage factors are excluded from a fair value measurement because such an adjustment is specific to the size of an entity's holding and its decision to transact in a block. That is, the Boards believe such an adjustment is entity-specific in nature. [IFRS 13.BC157]. However, the standard clarifies that there is a difference between size being a characteristic of the asset or liability being measured (based on its unit of account) and size being a characteristic of the reporting entity's holding. While any adjustment for the latter is not permitted, the former should be considered if it is consistent with how market participants would price the asset or liability. [IFRS 13.69].

The following example illustrates how IFRS 13 distinguishes between size as a characteristic of the item being measured and size as a characteristic of an entity's holding.

Illustration 14-1: Blockage factors

Bank X has one outstanding OTC derivative contract with Dealer A.

The notional amount of this contract is CU1 billion, which is significantly larger than the market norm for these types of contracts.

Bank Y has 100 identical OTC derivative contracts outstanding with various dealers (whose risks are not offsetting because all the contracts are assets and therefore are not measured using the measurement exception).

Each of the 100 contracts has a notional amount of CU10 million, which is consistent with the market norm for these types of contracts.

Although Bank X and Bank Y have virtually identical market exposures (ignoring credit risk for simplicity), IFRS 13 would allow Bank X to consider a discount for lack of marketability but would preclude Bank Y from applying a similar discount.

For Bank X, the large notional amount (CU1 billion) is a characteristic of the instrument being measured and would likely be considered by market participants when transacting for the derivative based on its unit of account (the derivative contract). As such, the fair value of the individual derivative should incorporate an adjustment for size if market participants would consider one in pricing the instrument.

In contrast, the unit of account for Bank Y's 100 derivative contracts is the individual OTC contracts, not the aggregate gross exposure stemming from the 100 contracts (i.e., the block). In pricing the individual contracts, market participants would likely not consider a discount associated with the size of the contracts, since the notional amount for each contract is consistent with the market norm. In accordance with IFRS 13, Bank Y would be prohibited from applying a discount based on the size of its entire holding (i.e., the 100 contracts) as this would represent a block discount that cannot be considered in a fair value measurement.

As discussed in section 4.1 above, the unit of account is determined by the relevant IFRS that permits or requires an asset or liability to be measured at fair value, unless IFRS 13 states otherwise. In some cases, the unit of account may be clear, for example, the unit of account for financial instruments in the scope of IFRS 9 is typically the individual instrument. However, it may be less clear in other standards, for example, the unit of account for a CGU when testing non-financial assets for impairment in accordance with IAS 36. In December 2018, the IASB concluded its PIR of IFRS 13, in which it had considered issues relating to prioritising Level 1 inputs or the unit of account. This is discussed further in section 4.1.1 above.

14.3 Pricing within the bid-ask spread

The 'bid price' represents the price at which a dealer or market maker is willing to buy an asset (or dispose of a liability). The 'ask price' (or offer price) represents the price at which a dealer or market maker is willing to sell an asset (or assume a liability). The spread between these two prices represents the profit a dealer requires for making a market in a particular security (i.e., providing two-way liquidity).

The use of bid prices to measure assets and ask prices to measure liabilities is permitted, but not required. Instead, for assets and liabilities that are bought and sold in markets where prices are quoted using a bid-ask spread (e.g., over-the-counter markets), the entity must use the price within the bid-ask spread that is most representative of fair value in the circumstances to measure fair value. In making this assessment, entities should evaluate their recent transaction history to support where in the bid-ask spread they are able to exit their positions. For some entities this could result in valuing assets at the bid price and liabilities at the ask price, but in other instances judgement is required to determine the point in the bid-ask spread that is most indicative of fair value (see Practical example 10-1 above for an illustrative disclosure). The use of the price within the bid-ask spread that is most representative of fair value applies regardless of whether the input (i.e., the bid or ask price) is observable or not (i.e., regardless of its categorisation in the fair value hierarchy - see section 15 below for further discussion). [IFRS 13.70].

Entities need to be consistent in their application of this concept. It would not be appropriate for an entity to measure similar assets at different prices within the bid-ask spread, without evidence indicating that the exit prices for those assets would be at different points within the bid-ask spread.

14.3.1 Mid-market pricing

As a practical expedient, IFRS 13 allows the use of mid-market pricing, or other pricing conventions that are used by market participants, when measuring fair value within the bid-ask spread. [IFRS 13.71]. Use of a mid-market pricing convention results in a valuation of an asset or liability at the mid-point of the bid-ask spread. Practical example 10-1 in section 10.3.2.B above illustrates use of mid-market pricing.

The Standard does not limit or restrict the use of mid-market pricing to specific types of instruments or entities. However, as discussed in section 13 above, valuation techniques used to measure fair value should be consistently applied. [IFRS 13.65].

Frequently asked questions

Question 14-1: What does the bid-ask spread include?

The commentary in the Basis for Conclusions acknowledges that the previous guidance in IAS 39 only includes transaction costs in the bid-ask spread. The Boards chose not to specify what is included in the bid-ask spread, except for transaction costs. However, they did make it clear that, in their view, the bid-ask spread does not include adjustments for counterparty credit risk. [IFRS 13.BC164].

The IASB has not provided any clarity regarding the interaction between the guidance in IFRS 13 on transaction costs (i.e., transaction costs are not considered an attribute of the asset or liability and, accordingly, are excluded from fair value measurements) and the guidance on the use of prices within the bid-ask spread. If transaction costs are included in the bid-ask spread, measuring an asset at the bid price would include certain future transaction costs in the fair value measurement for the asset.

Given the lack of any specific guidance on this issue, there may be some diversity in practice between entities with respect to how transaction costs are considered. However, we would expect an entity to apply a consistent approach to all of its own fair value measurements.

14.4 Risk premiums

IFRS 13 defines a risk premium as “compensation sought by risk-averse market participants for bearing the uncertainty inherent in the cash flows of an asset or a liability”. [IFRS 13 Appendix A]. Regardless of the valuation technique(s) used, a fair value measurement is intended to represent an exit price and, as such, should include a risk premium that reflects the compensation market participants would demand for bearing the uncertainty inherent in the cash flows of an asset or liability. [IFRS 13.B16, IFRS 13.B39]. While this risk premium should reflect compensation required in an orderly transaction (not a forced or distressed sale), it should also capture market participant assumptions regarding risk under current market conditions. Example 14 in the standard (extracted and discussed in section 7.3.2 above) illustrates that this risk adjustment may include assumptions about liquidity and uncertainty based on relevant market data.

IFRS 13 states the following: [IFRS 13.B16]

Extract from IFRS 13

B16 Market participants generally seek compensation (ie a risk premium) for bearing the uncertainty inherent in the cash flows of an asset or a liability. A fair value measurement should include a risk premium reflecting the amount that market participants would demand as compensation for the uncertainty inherent in the cash flows. Otherwise, the measurement would not faithfully represent fair value. In some cases determining the appropriate risk premium might be difficult. However, the degree of difficulty alone is not a sufficient reason to exclude a risk premium.

The objective of a risk premium is often misunderstood. Many incorrectly assume that a risk premium is unnecessary when fair value is determined using probability-weighted cash flows. That is, they believe it is appropriate to discount probability-weighted cash flows using a risk-free rate under the assumption that all uncertainty is captured by probability-weighting the cash flows. While expected cash flows (i.e., the probability-weighted average of possible future cash flows) incorporate the uncertainty in the instrument's cash flows, they do not incorporate the compensation that market participants demand for bearing that uncertainty. [IFRS 13.B25-B29]. In order to capture this required compensation in the measurement, a market risk premium must be added (either as an adjustment to the discount rate or to the expected cash flows). IFRS 13's application guidance addresses this point when discussing systematic and unsystematic risk and certainty-equivalent cash flows (see section 20 below for additional discussion on how risk premiums are applied in a present value technique).

It is important to note that increased risk associated with an asset generally decreases the fair value of that asset, whereas increased risk associated with a liability generally increases the fair value of that liability (with the exception of non-performance risk). Uncertainty associated with an asset reduces the amount a market participant would pay for the asset. In contrast, all else being equal, compensation for an uncertainty related to a liability results in an increase to the amount that the market participant would expect to receive for assuming the obligation. If that compensation is accounted for in the discount rate, rather than in the cash flows, it would result in an increase in the discount rate used to measure the fair value of an asset. However, it would result in a reduction of the discount rate used in the fair value measurement of the liability (i.e., the discount rate must be lower so that the resulting fair value of the liability is higher). [IFRS 13.BC91]. This concept only applies when measuring the fair value of a liability that does not have a corresponding asset using an income approach. As discussed in section 10.2.1 above, when a quoted price for the transfer of an identical or similar liability or entity's own equity instrument is held by another party as an asset, the fair value of this liability or own equity instrument should be determined from the perspective of the market participant that holds the identical item as an asset.

14.5 Broker quotes and pricing services

When quoted prices from brokers or pricing services are used to measure fair value, it is the entity's responsibility to understand the source and nature of this information to accurately assess its relevance. When there has been a significant decrease in the volume or level of activity for the asset or liability, management should evaluate whether the prices received from brokers or pricing services are based on current information from orderly transactions or valuation techniques that appropriately reflect market participant assumptions regarding risk. IFRS 13 states that entities should place less reliance on third-party quotes that are not based on transactions, compared to other value indications that are based on market transactions. [IFRS 13.B46].

When information from brokers and pricing services is based on transaction data, entities should assess whether, and to what extent, the observed prices are a result of orderly transactions when determining the weight to place on these data points, compared to other value indications (see section 7.2 above for additional information on the factors an entity may consider when assessing whether transactions are orderly). Facts and circumstances will determine the weight that an entity should place on a transaction price, including:

- Comparability of the transaction to the asset or liability being measured at fair value
- Proximity of the transaction to the measurement date
- Size of the transaction
- Nature of the quote (e.g., binding versus indicative quote) and the number of quotes received

See section 15.2.3 below for additional discussion on fair value hierarchy considerations when using quoted prices from brokers and pricing services.

Frequently asked questions

Question 14-2: How should values provided by central clearing organisations for margin purposes be evaluated when determining the fair value of centrally cleared derivatives for financial reporting?

For OTC derivatives that are centrally cleared, counterparties are typically required on an ongoing basis to post collateral based on the change in value of the derivative (sometimes referred to as 'variation margin').²⁷ As a result, entities with centrally cleared OTC derivatives will periodically receive a 'value mark' from a clearing organisation that states the amount of variation margin to be posted or received.

How we see it

This 'value mark' cannot be presumed to represent fair value (an exit price) in accordance with IFRS 13. Different clearing organisations may have different approaches for calculating variation margin requirements and while practice may continue to evolve, it is our understanding that the 'value marks' provided generally do not represent an actual transaction price (i.e., a price at which the reporting entity could execute a trade to buy or sell the contract). Instead, this value might be based on a clearing organisation's analysis of information provided by clearing members and certain of its own assumptions.

While this value may potentially be an appropriate estimate of fair value in certain instances, the reporting entity should understand how this value is determined and evaluate whether it includes only those factors that would be considered by market participants in an orderly transaction to sell or transfer the derivative. For example, to provide themselves with additional protection, some clearing organisations may include an incremental amount in their variation margin requirement in excess of the 'true' change in the value of the derivative.

As with pricing information provided by brokers or third-party pricing services, reporting entities are responsible for understanding the source and nature of information provided by central clearing organisations. An entity should assess whether the value indication represents fair value in accordance with IFRS 13 or whether an adjustment may be needed. See section 15.2.4 below for a discussion of the categorisation of centrally cleared OTC derivatives in the fair value hierarchy.

²⁷ Note that for certain centrally cleared derivatives, commonly referred to as settled-to-market (STM) contracts, the variation margin payments are legally characterised as settlements of the derivatives' exposure, as opposed to collateral. The fair value (exit price) of these contracts will generally approximate zero as the change in the instrument's fair value is essentially settled daily.

15 The fair value hierarchy

The fair value hierarchy is intended to increase consistency and comparability in fair value measurements and the related disclosures. [IFRS 13.72]. Application of the hierarchy requires an entity to prioritise observable inputs over those that are unobservable when measuring fair value. In addition, for disclosures, it provides a framework for users to consider the relative subjectivity of the fair value measurements made by the reporting entity.

15.1 The fair value hierarchy

The fair value hierarchy classifies the inputs used to measure fair value into three levels, which are described in Figure 15-1 below.

Figure 15-1: Fair value hierarchy

	Level 1	Level 2	Level 3
Definition [IFRS 13 Appendix A]	Quoted prices (unadjusted) in active markets for identical assets or liabilities that the entity can access at the measurement date.	Inputs other than quoted prices included within level 1 that are observable for the asset or liability, either directly or indirectly.	Unobservable inputs for the asset or liability.
Example	The price for a financial asset or financial liability for the identical asset that is traded on an active market (e.g., Tokyo Stock Exchange).	Interest rates and yield curves observable at commonly quoted intervals, implied volatilities, and credit spreads.	Projected cash flows used in a discounted cash flow calculation.

Valuation techniques used to measure fair value must maximise the use of relevant observable inputs and minimise the use of unobservable inputs. The best indication of fair value is a quoted price in an active market (i.e., “a market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis”. [IFRS 13 Appendix A]).

The fair value hierarchy focuses on prioritising the inputs used in valuation techniques, not the techniques themselves. [IFRS 13.74]. While the availability of inputs might affect the valuation technique(s) selected to measure fair value, as discussed in section 13 above, IFRS 13 does not prioritise the use of one technique over another (with the exception of the requirement to measure identical financial instruments that trade in active markets at P×Q). The determination of the valuation technique(s) to be used requires significant judgement and will be dependent on the specific characteristics of the asset or liability being measured and the principal (or most advantageous) market in which market participants would transact for the asset or liability.

Although the valuation techniques themselves are not subject to the fair value hierarchy, a risk adjustment that market participants would demand to compensate for a risk inherent in a particular valuation technique (e.g., a model adjustment) is considered an input that must be assessed within the fair value hierarchy. As discussed in section 15.2 below, if this type of risk adjustment is included, it should be considered when categorising the fair value measurement within the fair value hierarchy.

15.2 Categorisation within the fair value hierarchy

IFRS 13 distinguishes between where in the fair value hierarchy an individual input to a valuation technique may fall and where the entire measurement is categorised for disclosure purposes.

Inputs used in a valuation technique may fall into different levels of the fair value hierarchy. However, for disclosure purposes, the fair value measurement must be categorised in its entirety (i.e., the fair value measure for the asset or liability or the group of assets and/or liability, depending on the unit of account) within the hierarchy. Categorising the entire measurement (and the required disclosure of this information, see section 19.3.3 below) provides users of financial statements with an indication of the overall observability or subjectivity of a fair value measurement.

Categorisation of a fair value measurement (as a whole) within the hierarchy, therefore, is dependent on what constitutes an ‘observable’ input and a ‘significant’ input. Observability affects all levels of the hierarchy and is important for classifying each input (discussed in sections 16 to 18 below). The significance of an unobservable input affects categorisation of the measurement (as a whole) within Level 2 and Level 3 of the hierarchy (see section 15.2.1 below).

It is important to note that the categorisation of fair value measurement within the fair value hierarchy does not provide information about asset quality. Rather, it provides information about the observability of the significant inputs used in a fair value measurement.

The appropriate categorisation may be obvious when only a single input is used, for example, when measuring fair value using a quoted price in an active market, without adjustment. However, an asset or liability that is not traded in an active market with a quoted price will often require more than one input to determine its fair value. For example, an over-the-counter option on a traded equity security measured at fair value using an option pricing model requires the following market-based inputs: (i) expected volatility; (ii) expected dividend yield; and (iii) the risk-free rate of interest.

IFRS 13 clarifies that the hierarchy categorisation of a fair value measurement, in its entirety, is determined based on the lowest level input that is significant to the entire measurement. The standard also makes it clear that adjustments to arrive at measurements based on fair value (e.g., 'costs to sell' when measuring fair value less costs to sell) are not be taken into account in this determination. [IFRS 13.73]. In the over-the-counter equity option example, assume that the risk-free interest rate and the dividend yield were determined to be Level 2 inputs, but the expected volatility was determined to be a Level 3 input. If expected volatility was determined to be significant to the overall value of the option, the entire measurement would be categorised within Level 3 of the fair value hierarchy.

If an observable input requires an adjustment using an unobservable input and that adjustment actually results in a significantly higher or lower fair value measurement, the standard is clear that the resulting fair value measurement would be categorised within Level 3 of the fair value hierarchy. [IFRS 13.75]. Consider our example of a restricted security discussed in section 14.1 above. While the quoted price for the unrestricted security may be observable, if Level 3 inputs are needed to determine the effect of the restriction on the instrument's fair value, and this effect is significant to the measurement, the asset would be categorised within Level 3 of the fair value hierarchy. In addition, as discussed in section 7 above, in certain situations adjustments to a transaction price in an inactive market may be required. If these adjustments are based on unobservable inputs and significant to the measurement, the item would be categorised within Level 3 of the fair value hierarchy.

It is important to understand that the determination of the hierarchy level in which the fair value measure falls (and, therefore, the category in which it will be disclosed - see section 19.3.3 below) is based on the fair value measurement for the specific item being measured, which will be dependent on the unit of account for the asset or liability. This may create practical challenges in relation to fair value measurements for non-financial assets and financial assets and liabilities with offsetting risk measured using the measurement exception discussed in section 11 above. For example, in situations where the unit of account for a non-financial asset is the individual item, but the valuation premise is in combination with other assets (or other assets and liabilities), the value of the asset group would need to be attributed to the individual assets or liabilities or to the various instruments within each level of the fair value hierarchy. For example, consider Illustration 9-2 in section 9.2.2 above. The unit of account for the grapes growing on the vines was that specified by IAS 41 and the vines and the land was that specified by IAS 16. However, their highest and best use was in combination, together and with other assets. The value of that group would need to be attributed to each of the assets, including the grapes growing on the vines, the vines and land, as the fair value of these individual assets should be categorised within the fair value hierarchy.

In its final report on the PIR on IFRS 13, the IASB noted that "some respondents reported a perception that the fair value hierarchy implies that information about items on Level 1 or Level 2 is always more relevant to users than information about items on Level 3. They indicated that this perception puts pressure on classification. They also said that this perception can be mistaken, as evidenced by academic research." Furthermore, respondents noted that categorisation within the hierarchy may be affected by some negative perceptions associated with categorisation within Level 3 of the fair value hierarchy (e.g., including the volume of disclosure required).²⁸ There are measurement uncertainties for both Level 2 and Level 3 fair value measurements, as both may include unobservable inputs. Therefore, significant judgement is often needed to determine whether a particular asset or liability should be categorised within Level 2 or Level 3 of the fair value hierarchy. It may be particularly challenging for entities to determine the level of evidence required to support a Level 2 classification, especially when the measurement is determined using information received from third parties (see section 15.2.3 below).

28 [IFRS Project Report and Feedback Statement](#), *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, p.16, 18. Available on the IFRS Foundation's website.

15.2.1 Assessing the significance of inputs

Assessing the significance of a particular input to the entire measurement requires judgement and consideration of factors specific to the asset or liability (or group of assets and/or liabilities) being measured. [IFRS 13.73].

IFRS 13 does not provide specific guidance on how entities should evaluate the significance of individual inputs. This determination will require judgement and consideration of factors specific to the asset or liability (or group of assets and liabilities) being measured. In the absence of any 'bright lines' for determining significance, there may be a lack of comparability between different entities with fair value measurements that use the same inputs.

How we see it

The standard is clear that it considers significance in relation to 'the entire measurement'. In our view, this requires the assessment to consider the fair value measure itself, rather than any resulting change in fair value, regardless of whether that change is recognised (i.e., in profit or loss or other comprehensive income) or unrecognised.

Assume, for example, an investment property is measured at fair value at the end of each reporting period. In the current reporting period, the fair value of the investment property reduces by CU200,000 to CU500,000. The significance of any inputs to the fair value measurement would be assessed by reference to the CU500,000, even though CU200,000 is the amount that will be recognised in profit or loss. However, a reporting entity may deem it appropriate to also consider significance in relation to the change in fair value from prior periods, in addition to considering the significance of an input in relation to the entire fair value measurement. Such an approach may be helpful in relation to cash-based instruments (e.g., loans or structured notes with embedded derivatives) whose carrying amounts, based on fair value, are heavily affected by their principal or face amount.

As noted in section 15.2 above, if an observable input requires an adjustment using an unobservable input and that adjustment actually results in a significantly higher or lower fair value measurement, the standard is clear that the resulting fair value measurement would be categorised within Level 3 of the hierarchy. [IFRS 13.75]. What is not clear, however, is the appropriate categorisation when an observable input requires an adjustment using an unobservable input and: (a) that adjustment does not actually result in a significantly higher or lower fair value in the current period; but (b) the potential adjustment from using a different unobservable input would result in a significantly higher or lower fair value measurement. As noted in section 15.2 above, the categorisation of a fair value measurement indicates the overall observability or subjectivity of a measurement, in its entirety. To this end, in some cases, the use of sensitivity analysis or stress testing (i.e., using a range of reasonably possible alternative input values as of the measurement date) might be appropriate to assess the effects of unobservable inputs on a fair value measure. In situations where more than one unobservable input is used in a fair value measure, the assessment of significance should be considered based on the aggregate effect of all the unobservable inputs.

During the PIR on IFRS 13, many respondents indicated they found the assessment of whether an unobservable input is significant to the measurement as a whole challenging and asked for additional guidance. Some indicated that this assessment may be affected by negative perceptions associated with categorisation within Level 3 of the fair value hierarchy (e.g., including the volume of disclosure required). The IASB decided not to provide additional guidance, noting in particular that the requirements are principles-based and, as such, judgement will always be needed in their application.²⁹

Entities should have a documented policy with respect to their approach to determining the significance of unobservable inputs on its fair value measurements and apply that policy consistently. This is important in light of the disclosure requirements in IFRS 13, particularly for fair value measurements categorised within Level 3 of the fair value hierarchy (see section 19.3 below).

15.2.2 Transfers between levels within the fair value hierarchy

For assets or liabilities that are measured at fair value (or measurements based on fair value) at the end of each reporting period, their categorisation within the fair value hierarchy may change over time. This might be the case if the market for a particular asset or liability that was previously considered active (Level 1) becomes inactive (Level 2 or Level 3) or if significant inputs used in a valuation technique that were previously unobservable (Level 3) become observable (Level 2) given transactions that were observed around the measurement date. Such changes in categorisation within the hierarchy are referred to in IFRS 13 as transfers between levels within the fair value hierarchy.

²⁹ [IFRS Project Report and Feedback Statement](#), *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, p.16. Available on the IFRS Foundation's website.

An entity is required to select, and consistently apply, a policy for determining when transfers between levels of the fair value hierarchy are deemed to have occurred, that is, the timing of recognising transfers. This policy must be the same for transfers into and out of the levels. Examples of policies for determining the timing of transfers include: *[IFRS 13.95]*

- Date of the event or change in circumstances that caused the transfer
 - Beginning of the reporting period
- Or
- End of the reporting period

An illustration is given below in Practical example 15-1.

Practical example 15-1: Beazley plc (2023)		United Kingdom
Annual report and accounts 2023 [extract]		
Financial statements [extract]		
Notes to the financial statements [extract]		
18 Financial assets and liabilities [extract]		
18e Transfers		
The Group determines whether transfers have occurred between levels in the fair value hierarchy by assessing categorisation at the end of the reporting period. The following transfers between levels 1 & 2 for the period ended 31 December 2023 reflect the level of trading activities including frequency and volume derived from market data obtained from an independent external valuation tool. There were no transfers into or out of level 3 in the year to 31 December 2023 (2022: no transfers).		
	Level 1	Level 2
	\$m	\$m
31 December 2023 vs 31 December 2022 transfer from level 2 to level 1		
– Corporate Bonds – Investment grade	446.0	(446.0)
...		

The standard requires an entity to disclose this policy (see section 19.2 below). In addition, the selected timing (i.e., when transfers are deemed to have occurred) has a direct impact on the information an entity needs to collate in order to meet the disclosure requirements in IFRS 13 - specifically those required by IFRS 13.93(c) and IFRS 13.93(e)(iv) - for both transfers between Levels 1 and 2 and transfers into and out of Level 3 (these disclosure requirements are discussed in section 19.3.2 below). *[IFRS 13.93(c), IFRS 13.93(e)(iv)]*.

15.2.3 Information provided by third-party pricing services or brokers

IFRS 13 does not preclude the use of quoted prices provided by third parties, such as pricing services or brokers, provided those quoted prices are developed in accordance with the standard. Quoted prices provided by third parties represent an important source of information in estimating fair value for many entities. While not precluded, the standard makes it clear that the use of broker quotes, third-party pricing services, or a third-party valuation specialist does not alleviate management's responsibility for the fair value measurements (and the related disclosures) that will be included in its financial statements. *[IFRS 13.B45]*.

It is important for entities to understand the source of information received from brokers and pricing services, particularly when there has been a significant decrease in the volume or level of activity for the asset or liability, as management needs to assess the relevance of these quotes. This is discussed further in section 7.3 above.

As discussed in section 14.5 above, an entity should evaluate whether quotes from brokers and pricing services are based on current information that reflects orderly transactions or were determined using valuation techniques that appropriately reflect market participant assumptions regarding risk. Entities should place less weight on third-party quotes that are not based on transactions compared to fair value indications that are based on market transactions.

How we see it

Determining the level in which assets and liabilities are categorised within the fair value hierarchy for disclosure purposes often requires judgement. Information provided by third-party pricing services or brokers could represent Level 1, Level 2, or Level 3 inputs depending on the source of the information and the type of instrument being measured. For example, pricing services may provide quoted market prices (e.g., closing price) for financial instruments traded in active markets. These prices are Level 1 measurements.

Alternatively, a pricing service may provide an entity with consensus pricing information (e.g., information obtained by polling dealers for indications of mid-market prices for a particular asset class). The non-binding nature of consensus pricing would generally result in its categorisation as Level 3 information, assuming no additional corroborating evidence.

Pricing services may also use valuation models to estimate values for certain instruments. For example, pricing services may use matrix pricing to determine the value of many fixed-income securities. The hierarchy level in which these instruments would be categorised depends on the observability of the valuation model's inputs. Therefore, entities that use pricing services should understand the data sources and valuation methods used to derive those third-party quotes. This information will determine where the entity's instruments would be categorised within the fair value hierarchy.

Similarly, the level within the hierarchy in which a broker quote is categorised depends on the nature of the quote. [IFRS 13.B47]. In certain brokered markets, firm quotes are disclosed and an entity has the ability to 'hit' or execute a transaction at the quoted price. Depending on the level of activity in these markets, those quotes may be categorised as Level 1 or Level 2. However, when an entity has to solicit a quote from a broker, the quotes are often non-binding and may include a disclaimer that releases the broker from being held to that price in an actual transaction. On their own, non-binding quotes would generally represent a Level 3 input. In addition, when the quote includes explanatory language or a disclaimer, the entity should assess whether the quote represents fair value (exit price) or whether an adjustment is needed.

If an entity uses multiple quotes within a narrow range when measuring fair value, it will likely provide stronger evidence of fair value than a single quote or quotes that are widely dispersed. However, the number of quotes should not, in and of itself, affect the categorisation within the fair value hierarchy. An entity would still need to consider the nature of those quotes. For example, multiple Level 3 inputs, within a reasonable range, would not result in a Level 2 measurement without additional observable corroborating evidence.

In August 2014, the IFRS IC received a request to clarify the circumstances in which a fair value measurement, in its entirety, that uses prices that are provided by third parties (e.g., consensus prices) could be categorised within Level 1 of the fair value hierarchy, particularly in relation to debt securities that are actively traded. The submitter highlighted that categorisation within the fair value hierarchy for debt securities is not straightforward and that there were divergent views on the appropriate level within the hierarchy such fair value measurements should be categorised.

After considering the analyses and outreach performed by its staff, the IFRS IC decided not to add this issue to its agenda, noting the following:³⁰

- The guidance in IFRS 13 relating to the categorisation within the fair value hierarchy was sufficient to draw an appropriate conclusion on this issue.
- The fair value hierarchy prioritises the inputs to valuation techniques, not the valuation techniques used to measure fair value. When the fair value of assets or liabilities is measured based on prices provided by third parties, the categorisation of those measurements within the fair value hierarchy depends on the evaluation of the inputs used by the third party to derive those prices; not on the pricing methodology the third party has used.

Only unadjusted quoted prices in active markets for identical assets or liabilities that the entity can access at the measurement date qualify as Level 1 measurement. Therefore, a fair value measurement that is based on prices provided by third parties can only be categorised within Level 1 of the fair value hierarchy if that measurement relies solely on unadjusted quoted prices in an active market for an identical instrument that the entity can access at the measurement date (i.e., P×Q, without adjustment).

30 [IFRIC Update](#), January 2015, available on the IFRS Foundation's website.

15.2.4 Categorisation of over-the-counter derivative instruments

Depending on the observability of the inputs used, fair value measurements of over-the-counter derivatives that are not centrally cleared would likely be within either Level 2 or Level 3 of the fair value hierarchy.

Although over-the-counter derivative instruments may initially be executed in active markets, quoted prices for the identical asset or liability will often not be available when measuring fair value subsequently. For example, consider a 10-year plain vanilla interest-rate swap entered into on 1 January 2021 that is not centrally cleared. While there may be quoted prices for 10-year swaps, when measuring the fair value of the swap on 31 March 2021, the subject instrument would represent a 9.75-year swap for which quoted prices are generally not available. As a result, most over-the-counter derivative contracts that are not centrally cleared are valued based on inputs used in pricing models.

In addition, centrally cleared derivatives would not be categorised within Level 1 unless their fair value was determined based on an unadjusted quoted price in active markets for an identical instrument. See section 14.5 above for additional discussion on the consideration of values provided by central clearing organisations when determining the fair value.

16 Level 1 inputs

“Level 1 inputs are quoted prices (unadjusted) in active markets for identical assets or liabilities that the entity can access at the measurement date”. [IFRS 13.76]. According to IFRS 13, this price represents the most reliable evidence of fair value. If a quoted price in an active market is available, an entity must use this price to measure fair value without adjustment; although adjustments are permitted in limited circumstances (see section 16.3 below). [IFRS 13.77].

16.1 Use of Level 1 inputs

As a general principle, IFRS 13 mandates the use of quoted prices in active markets for identical assets and liabilities whenever available. With limited exceptions, quoted prices in active markets should not be adjusted when determining the fair value of identical assets and liabilities, as the IASB believes these prices provide the most reliable evidence of fair value.

Adjustments can only be made to a quoted price in an active market (a Level 1 input) in the following circumstances: [IFRS 13.79]

- (a) *When an entity holds a large number of similar (but not identical) assets or liabilities (e.g., debt securities) that are measured at fair value and a quoted price in an active market is available but is not readily accessible for each of those assets or liabilities individually*

Since the assets or liabilities are not identical and given the large number of similar assets or liabilities held by the entity, it would be difficult to obtain pricing information for each individual asset or liability at the measurement date. In this situation, IFRS 13 provides a practical expedient allowing an entity to measure fair value using an alternative pricing method that does not rely exclusively on quoted prices (e.g., matrix pricing - see section 13.2 above).

- (b) *When a quoted price in an active market does not represent fair value at the measurement date*

This may be the case if significant events (e.g., transactions in a principal-to-principal market, trades in a brokered market or announcements), take place after the close of a market, but before the measurement date. An entity must establish and consistently apply a policy for identifying those events that might affect fair value measurements.

- (c) *When measuring the fair value of a liability or an entity's own equity instrument using the quoted price for the identical item traded as an asset in an active market and that price needs to be adjusted for factors specific to the item or the asset*

These exceptions are discussed further in sections 16.1.1, 16.2 and 16.3 below. Level 1 inputs are most commonly associated with financial instruments, for example, shares that are actively traded on a stock exchange. It may be that an asset or liability is traded in multiple active markets, for example, shares that are listed on more than one stock exchange. In light of this, the standard emphasises the need within Level 1 to determine both, the principal (or most advantageous) market (see section 5 above) and whether the entity can enter into a transaction for the asset or liability at the price in that market at the measurement date (see section 7 above). [IFRS 13.78].

As discussed in section 15.2 above, if no adjustment is made to a Level 1 input, the result is the entire fair value measurement being categorised within Level 1 of the fair value hierarchy. However, any adjustment made to a Level 1 input or use of the practical expedient in (a) above would result in categorisation within a lower level of the fair value hierarchy. If the adjustment uses significant unobservable inputs, it would need to be categorised within Level 3. [IFRS 13.75].

16.1.1 Level 1 liabilities and instruments classified in an entity's own equity

Quoted prices in active markets for identical liabilities and instruments classified as an entity's own equity are Level 1 measurements. These instruments would likewise be categorised within Level 1 when a quoted price exists for the identical instrument traded as an asset in an active market, provided no adjustment to the quoted price is required.

The fair value of corporate debt issued by a reporting entity, for example, would be a Level 1 measurement if the asset corresponding to the issuer's liability (i.e., the corporate bond) trades in an active market and no adjustment is made to the quoted price. While the liability itself is not transferred in an active market, the IASB concluded that Level 1 categorisation is appropriate when the identical instrument trades as an asset in an active market.

If an adjustment to the corresponding asset's price is required to address differences between the asset and the liability or equity instrument (as discussed in section 10 above), [IFRS 13.79(c)], the adjusted price would not be a Level 1 measurement. For example, an adjustment to the quoted price of an asset that includes the effect of a third-party credit enhancement would be warranted when measuring the fair value of the liability. In this case, the corresponding asset and the liability would have different units of account (as discussed in section 10.3.1 above).

16.2 Alternative pricing methods

When an entity holds a large number of similar assets and liabilities for which quoted prices exist, but are not easily accessible, IFRS 13 allows for the use of alternative pricing methods (e.g., matrix pricing) as a practical expedient. [IFRS 13.79(a)]. The IASB provided this practical expedient to ease the administrative burden associated with obtaining quoted prices for each individual instrument. However, if the practical expedient is used, the resulting fair value measurement would not be considered a Level 1 measurement.

16.3 Quoted prices in active markets that are not representative of fair value

IFRS 13 recognises that in certain situations a quoted price in an active market might not represent the fair value of an asset or liability, such as when significant events occur before or on the measurement date, but after the close of trading. In these situations, entities would adjust the quoted price to incorporate this new information into the fair value measurement. [IFRS 13.79(b)]. The relevance of observable data (e.g., the most recent transaction prices, including transactions occurring after the measurement date that provide valuable insight into the assumptions used in estimating fair value as of the measurement date) must be considered when assessing how much weight to ascribe to this information when estimating fair value. However, if the quoted price is adjusted, the resulting fair value measurement would no longer be considered a Level 1 measurement.

An entity's valuation policies and procedures should address how these 'after-hour' events will be identified and assessed. Controls should be put in place to ensure that any adjustments made to quoted prices are appropriate under IFRS 13 and are applied in a consistent manner.

16.4 Unit of account

Although the unit of account is generally determined in accordance with other IFRSs, IFRS 13 addresses the unit of account for Level 1 assets and liabilities. IFRS 13 states that "if an entity holds a position in a single asset or liability (including a position comprising a large number of identical assets or liabilities, such as a holding of financial instruments) and the asset or liability is traded in an active market, the fair value of the asset or liability shall be measured within Level 1 as the product of the quoted price for the individual asset or liability and the quantity held by the entity". [IFRS 13.80]. By dictating that fair value be determined based on $P \times Q$, IFRS 13 effectively prescribes the unit of account as the individual asset or liability in these situations.

This requirement is generally accepted when the asset or liability being measured is a financial instrument in the scope of IFRS 9. However, when an entity holds an investment in a listed subsidiary, joint venture or associate, some believe the fair value should include an adjustment (e.g., a control premium) to reflect the value of the investor's control, joint control or significant influence over their investment as a whole. In September 2014, the IASB issued an exposure draft that proposed clarifying that the requirement in IFRS 13 to use $P \times Q$, without adjustment, to measure fair value would apply even in situations where the unit of account is the entire investment. After considering the responses from constituents, the IASB had directed its staff to perform additional research before they deliberated further. That research was fed into the PIR of IFRS 13. In December 2018, the IASB concluded its PIR and decided to do no further work on this topic. This is discussed further in section 4.1.1 above.

16.5 Examples of Level 1 inputs

Below are examples of fair value measurements of financial instruments that use Level 1 inputs, along with the considerations for determining whether an input qualifies as Level 1.

Asset or Liability	Example of a Level 1 Input
A unit in an investment fund quoted in an active market, whose investments are classified at Levels 2 and 3 in the fair value hierarchy.	The fund's units - The valuation of the fund's assets and liabilities is not relevant to the assessment as the fund's units are quoted in an active market.
An instrument traded in an active market for which one or more market participants provide a binding price quotation on the balance sheet date.	The binding quote - a binding quote is a bid price and is evidence of the amount for which an asset could be exchanged, between knowledgeable, willing parties, in an arm's length transaction (see section 14.5 above).
An instrument whose fair value is provided by a pricing service, vendor or broker or custodian.	For these services it is important to understand the methodology employed by the pricing service or vendor that provides the data. The conclusion depends on the methodology and liquidity of the market in which the financial asset or liability is traded. If the price provider uses only transaction prices of transactions occurring in an active market on the valuation date of the same instrument, the transaction price would be a Level 1 input (see section 14.5 above).

17 Level 2 inputs

17.1 Use of Level 2 inputs

Level 2 inputs include quoted prices (in non-active markets or in active markets for similar assets or liabilities), observable inputs other than quoted prices and inputs that are not directly observable, but are corroborated by observable market data. [IFRS 13.82].

The inclusion of market-corroborated inputs is significant because it expands the scope of Level 2 inputs beyond those directly observable for the asset or liability. Inputs determined through mathematical or statistical techniques, such as correlation or regression, may be categorised as Level 2 if the inputs into, and/or the results from, these techniques can be corroborated with observable market data.

IFRS 13 requires that a Level 2 input be observable (either directly or indirectly through corroboration with market data) for substantially the full contractual term of the asset or liability being measured. [IFRS 13.81]. Therefore, a long-term input extrapolated from short-term observable market data (e.g., a 30-year yield extrapolated from the observable 5-, 10- and 15-year points on the yield curve) would generally not be considered a Level 2 input.

17.2 Examples of Level 2 inputs

IFRS 13's application guidance provides a number of examples of Level 2 inputs for specific assets or liabilities. These examples are included in Figure 17-1 below, which is adapted from IFRS 13. [IFRS 13.B35].

Figure 17-1: Examples of Level 2 inputs

Asset or Liability	Example of a Level 2 Input
Receive-fixed, pay-variable interest rate swap based on the Interbank Offered Rate (IBOR) swap rate	The IBOR swap rate if that rate is observable at commonly quoted intervals for substantially the full term of the swap.
Receive-fixed, pay-variable interest rate swap based on a yield curve denominated in a foreign currency	The swap rate based on a yield curve denominated in a foreign currency that is observable at commonly quoted intervals for substantially the full term of the swap. This would be a Level 2 input if the term of the swap is 10 years and that rate is observable at commonly quoted intervals for 9 years, provided that any reasonable extrapolation of the yield curve for year 10 would not be significant to the fair value measurement of the swap in its entirety.
Receive-fixed, pay-variable interest rate swap based on a specific bank's prime rate	The bank's prime rate derived through extrapolation if the extrapolated values are corroborated by observable market data, for example, by correlation with an interest rate that is observable over substantially the full term of the swap.
Three-year option on exchange-traded shares	<p>The implied volatility for the shares derived through extrapolation to year 3 if both of the following conditions exist:</p> <ul style="list-style-type: none"> (i) Prices for one-year and two-year options on the shares are observable. (ii) The extrapolated implied volatility of a three-year option is corroborated by observable market data for substantially the full term of the option. <p>In this situation, the implied volatility could be derived by extrapolating from the implied volatility of the one-year and two-year options on the shares and corroborated by the implied volatility for three-year options on comparable entities' shares, provided that correlation with the one-year and two-year implied volatilities is established.</p>
Licensing arrangement	For a licensing arrangement that is acquired in a business combination and was recently negotiated with an unrelated party by the acquired entity (the party to the licensing arrangement), a Level 2 input would be the royalty rate in the contract with the unrelated party at inception of the arrangement.
Cash-generating unit	A valuation multiple (e.g., a multiple of earnings or revenue or a similar performance measure) derived from observable market data, e.g., multiples derived from prices in observed transactions involving comparable (i.e., similar) businesses, taking into account operational, market, financial and non-financial factors.
Finished goods inventory at a retail outlet	<p>For finished goods inventory that is acquired in a business combination, a Level 2 input would be either a price to customers in a retail market or a price to retailers in a wholesale market, adjusted for differences between the condition and location of the inventory item and the comparable (i.e., similar) inventory items so that the fair value measurement reflects the price that would be received in a transaction to sell the inventory to another retailer that would complete the requisite selling efforts.</p> <p>Conceptually, the fair value measurement will be the same, whether adjustments are made to a retail price (downward) or to a wholesale price (upward). Generally, the price that requires the least amount of subjective adjustments should be used for the fair value measurement.</p>
Building held and used	The price per square metre for the building (a valuation multiple) derived from observable market data, e.g., multiples derived from prices in observed transactions involving comparable (i.e., similar) buildings in similar locations.

The following table contains other examples of Level 2 inputs.

Figure 17-2: Examples of Level 2 inputs

Asset or Liability	Example of a Level 2 Input
An instrument for which there is currently no active market. An observable, recent transaction took place in this particular instrument.	The price in the recently observed transaction could be considered Level 2.
An instrument for which there is currently no active market. An observable, recent transaction took place for a similar instrument.	The price of the similar instrument.
An instrument whose fair value is provided by a pricing service, vendor or broker or custodian.	If the price provider uses a valuation technique and the inputs are observable, the inputs could be considered Level 2. For these services, it is important to understand the methodology employed by the pricing service or vendor that provides the data.

17.3 Market corroborated inputs

Level 2 inputs, as discussed in section 17.1 above, include market-corroborated inputs. That is, inputs that are not directly observable for the asset or liability, but, instead, are corroborated by observable market data through correlation or other statistical techniques.

IFRS 13 does not provide any detailed guidance regarding the application of statistical techniques, such as regression or correlation, when attempting to corroborate inputs to observable market data (Level 2) inputs. However, the lack of any specific guidance or 'bright lines' for evaluating the validity of a statistical inference by the IASB should not be construed to imply that the mere use of a statistical analysis (such as linear regression) would be deemed valid and appropriate to support Level 2 categorisation (or a fair value measurement for that matter). Any statistical analysis that is relied on for financial reporting purposes should be evaluated for its predictive validity. That is, the statistical technique should support the hypothesis that the observable input has predictive value with respect to the unobservable input.

In Figure 17-1 in section 17.2 above, for the three-year option on exchange-traded shares, the implied volatility derived through extrapolation has been categorised as a Level 2 input because the input was corroborated (through correlation) to an implied volatility based on an observable option price of a comparable entity. In this example, the determination of an appropriate proxy (i.e., a comparable entity) is a critical component in supporting that the implied volatility of the actual option being measured is a market-corroborated input.

In practice, identifying an appropriate benchmark or proxy requires judgement that should appropriately incorporate both qualitative and quantitative factors. For example, when valuing equity-based instruments (e.g., equity options), an entity should consider the industry, nature of the business, size, leverage and other factors that would qualitatively support the expectation that the benchmarks are sufficiently comparable to the subject entity. For example, equity valuation of an investment in an oil company that has invested heavily in developing a renewable energy product offering is likely to be impacted differently by climate-related risk factors than a similar oil company that does not have a transition plan to develop its product offering.

Qualitative considerations may differ depending on the type of input being analysed or the type of instrument being measured (e.g., a foreign exchange option versus an equity option).

In addition to the qualitative considerations discussed above, quantitative measures are used to validate a statistical analysis. For example, if a regression analysis is used as a means of corroborating non-observable market data, the results of the analysis can be assessed based on statistical measures.

17.4 Making adjustments to a Level 2 input

The standard acknowledges that, unlike a Level 1 input, adjustments to Level 2 inputs may be more common, but will vary depending on the factors specific to the asset or liability. [IFRS 13.83].

There are a number of reasons why an entity may need to make adjustments to Level 2 inputs. Adjustments to observable data from inactive markets (see section 7 above), for example, might be required for timing differences between the transaction date and the measurement date, or differences between the asset being measured and a similar asset that was the subject of the transaction. In addition, factors such as the condition or location of an asset should also be considered when determining if adjustments to Level 2 inputs are warranted.

If the Level 2 input relates to an asset or liability that is similar, but not identical to the asset or liability being measured, the entity would need to consider what adjustments may be required to capture differences between the item being measured and the reference asset or liability. For example, if they have different characteristics, such as credit quality of the issuer in the case of a bond, adjustments may be needed for differences between the two. [IFRS 13.83].

If an adjustment to a Level 2 input is significant to the entire fair value measurement, it may affect the fair value measurement's categorisation within the fair value hierarchy for disclosure purposes. If the adjustment uses significant unobservable inputs, it would need to be categorised within Level 3 of the hierarchy. [IFRS 13.84].

17.5 Recently observed prices in an inactive market

Valuation technique(s) used to measure fair value must maximise the use of *relevant* observable inputs and minimise the use of unobservable inputs. While recently observed transactions for the same (or similar) items often provide useful information for measuring fair value, transactions or quoted prices in inactive markets are not necessarily indicative of fair value. A significant decrease in the volume or level of activity for the asset or liability may increase the chances of this. However, transaction data should not be ignored, unless the transaction is determined to be disorderly (see section 7 above).

The relevance of observable data, including last transaction prices, must be considered when assessing the weight this information should be given when estimating fair value and whether adjustments are needed (as discussed in section 17.4 above). Adjustments to observed transaction prices may be warranted in some situations, particularly when the observed transaction is for a similar, but not identical, instrument. Therefore, it is important to understand the characteristics of the item being measured compared with an item being used as a benchmark.

When few, if any, transactions can be observed for an asset or liability, an index may provide relevant pricing information if the underlying risks of the index are similar to the item being measured. While the index price may provide general information about market participant assumptions regarding certain risk features of the asset or liability, adjustments are often required to account for specific characteristics of the instrument being measured or the market in which the instrument would trade (e.g., liquidity considerations). While this information may not be determinative for the particular instrument being measured, it can serve to either support or contest an entity's determination regarding the relevance of observable data in markets that are not active.

IFRS 13 does not prescribe a methodology for applying adjustments to observable transactions or quoted prices when estimating fair value. Judgement is needed when evaluating the relevance of observable market data and determining what (if any) adjustments should be made to this information. However, the application of this judgement must be within the confines of the stated objective of a fair value measurement within the IFRS 13 framework. Since fair value is intended to represent the exit price in a transaction between market participants in the current market, an entity's intent to hold the asset due to current market conditions, or any entity-specific needs, is not relevant to a fair value measurement and is not a valid reason to adjust observable market data.

18 Level 3 inputs

All unobservable inputs for an asset or liability are Level 3 inputs. The standard requires an entity to minimise the use of Level 3 inputs when measuring fair value. As such, they should only be used to the extent that relevant observable inputs are not available, for example, in situations where there is limited market activity for an asset or liability. *[IFRS 13.86, IFRS 13.87].*

18.1 Use of Level 3 inputs

A number of IFRS accounting standards permit or require the use of fair value measurements regardless of the level of market activity for the asset or liability as at the measurement date (e.g., the initial measurement of intangible assets acquired in a business combination). As such, IFRS 13 allows for the use of unobservable inputs to measure fair value in situations where observable inputs are not available. In these cases, the IASB recognises that the best information available with which to develop unobservable inputs may be an entity's own data. However, IFRS 13 is clear that while an entity may begin with its own data, this data should be adjusted if: *[IFRS 13.89]*

- Reasonably available information indicates that other market participants would use different data
- Or
- There is something particular to the entity that is not available to other market participants (e.g., an entity-specific synergy)

For example, when measuring the fair value of an investment property, we would expect that a reporting entity with a unique tax position would consider the typical market participant tax rate in its analysis. While this example is simplistic and is meant only to illustrate a concept, in practice significant judgement will be required when evaluating what information about unobservable inputs or market data may be reasonably available.

It is important to note that an entity is not required to undertake exhaustive efforts to obtain information about market participant assumptions when pricing an asset or liability. Nor is an entity required to establish the absence of contrary data. As a result, in those situations where information about market participant assumptions does not exist or is not reasonably available, a fair value measurement may be based primarily on the reporting entity's own data. *[IFRS 13.89].*

Even in situations where an entity's own data is used, the objective of the fair value measurement remains the same - i.e., an exit price from the perspective of a market participant that holds the asset or owes the liability. *[IFRS 13.2].* As such, unobservable inputs should reflect the assumptions that market participants would use, which includes the risk inherent in a particular valuation technique (such as a pricing model) and the risk inherent in the inputs. This may be more challenging if risks are not yet priced in a market. For example, providing climate information is expected to improve investor sentiment towards an entity but the impact of that sentiment on the entity might be difficult to quantify. As discussed in section 6.2 above, if a market participant would consider those risks in pricing an asset or liability, an entity must include that risk adjustment; otherwise the result would not be a fair value measurement. When categorising the entire fair value measurement within the fair value hierarchy, an entity would need to consider the significance of the model adjustment as well as the observability of the data supporting the adjustment. *[IFRS 13.87, IFRS 13.88].*

18.2 Examples of Level 3 inputs

IFRS 13's application guidance provides a number of examples of Level 3 inputs for specific assets or liabilities, as outlined in Figure 18-1 below. *[IFRS 13.B36].*

Figure 18-1: Examples of Level 3 inputs

Asset or Liability	Example of a Level 3 Input
Long-dated currency swap	An interest rate in a specified currency that is not observable and cannot be corroborated by observable market data at commonly quoted intervals or otherwise for substantially the full term of the currency swap. The interest rates in a currency swap are the swap rates calculated from the respective countries' yield curves.
Three-year option on exchange-traded shares	Historical volatility, i.e., the volatility for the shares derived from the shares' historical prices. Historical volatility typically does not represent current market participants' expectations about future volatility, even if it is the only information available to price an option.
Interest rate swap	An adjustment to a mid-market consensus (non-binding) price for the swap developed using data that are not directly observable and cannot otherwise be corroborated by observable market data.
Decommissioning liability assumed in a business combination	A current estimate using the entity's own data about the future cash outflows to be paid to fulfil the obligation (including market participants' expectations about the costs of fulfilling the obligation and the compensation that a market participant would require for taking on the obligation to dismantle the asset) if there is no reasonably available information that indicates that market participants would use different assumptions. That Level 3 input would be used in a present value technique together with other inputs, e.g., a current risk-free interest rate or a credit-adjusted risk-free rate if the effect of the entity's credit standing on the fair value of the liability is reflected in the discount rate rather than in the estimate of future cash outflows.
Cash-generating unit	A financial forecast (e.g., of cash flows or profit or loss) developed using the entity's own data if there is no reasonably available information that indicates that market participants would use different assumptions.

The following table contains other examples of Level 3 inputs.

Figure 18-2: Examples of Level 3 inputs

Asset or Liability	Example of a Level 3 Input
An instrument for which there is currently no active market. The entity uses a valuation model that is accepted in the market/industry.	A credit spread that is based on historical default statistics and a credit rating assigned by an agency would be a Level 3 input.
An instrument for which there is currently no active market. A consensus pricing mechanism is used to determine its fair value.	The prices are usually Level 3. The consensus pricing mechanism gets its inputs from market participants who may determine the fair value using models with unobservable inputs. The quotes that the participants provide to the consensus pricing mechanism are not binding bids and are not necessarily supported by prices from observable current market transactions.
An instrument for which there is currently no active market. The entity obtains non-binding quotes from different sources.	The non-binding quotes would not be regarded as "observable" transactions. These would be Level 3 unless evidence can be provided that the quotes are supported by observable transactions or inputs.
An equity instrument for which there is currently no active market.	The entity uses a valuation technique that is accepted in the market/industry based on a price/earnings ratio for similar entities. Although the calculation of a price/earnings ratio is usually based on market transactions, the application of the ratio is not evidence of market transactions in the same instrument.
A loan or debt instrument for which no active market exists. The entity uses a discounted cash flow model to calculate the fair value.	Risk-free interest rate plus an unobservable credit spread that is significant to the measurement. The credit spread is unobservable because the entity does not have quoted debt.

19 Disclosures

The disclosure requirements in IFRS 13 apply to fair value measurements recognised in the statement of financial position, after initial recognition, and disclosures of fair value (i.e., those items that are not measured at fair value in the statement of financial position, but whose fair value is required to be disclosed). However, as discussed in section 2.2.4 above, IFRS 13 provides a scope exception in relation to disclosures for:

- Plan assets measured at fair value in accordance with IAS 19
- Retirement benefit plan investments measured at fair value in accordance with IAS 26
- Assets for which recoverable amount is fair value less costs of disposal in accordance with IAS 36

In addition to these scope exceptions, the IASB decided not to require the IFRS 13 disclosures for items that are recognised at fair value only at initial recognition. Disclosure requirements in relation to fair value measurements at initial recognition are covered by the standard that is applicable to that asset or liability. For example, IFRS 3 requires disclosure of the fair value measurement of assets acquired and liabilities assumed in a business combination. [IFRS 13.BC184].

However, it should be noted that, unlike IAS 19, IAS 26 and IAS 36, there is no scope exemption for IFRS 3 or other standards that require fair value measurements (or measures based on fair value) at initial recognition. Therefore, if those standards require fair value measurements (or measures based on fair value) after initial recognition, IFRS 13's disclosure requirements would apply.

This section assumes an entity applies IAS 1 *Presentation of Financial Statements*, not IFRS 18 *Presentation and Disclosure in Financial Statements*. For considerations under IFRS 18, refer to Chapter 4.

19.1 Disclosure objectives

IFRS 13 requires a number of disclosures designed to provide users of financial statements with additional transparency regarding:

- Extent to which fair value is used to measure assets and liabilities
- Valuation techniques, inputs and assumptions used in measuring fair value
- Effect of Level 3 fair value measurements on profit or loss (or other comprehensive income)

The standard establishes a set of broad disclosure objectives and provides the minimum disclosures an entity must make (see section 19.2 to 19.5 below for discussion regarding the minimum disclosure requirements in IFRS 13).

The objectives of IFRS 13's disclosure requirements are to: [IFRS 13.91]

- (a) Enable users of financial statements to understand the valuation techniques and inputs used to develop fair value measurements
- (b) Help users to understand the effect of fair value measurements on profit or loss and other comprehensive income for the period when fair value is based on unobservable inputs (Level 3 inputs)

After providing the minimum disclosures required by IFRS 13 and other standards, such as IAS 1 or IAS 34 *Interim Financial Reporting*, an entity must assess whether its disclosures are sufficient to meet the disclosure objectives in IFRS 13. If not, additional information must be disclosed in order to meet those objectives. [IFRS 13.92]. This assessment requires judgement and will depend on the specific facts and circumstances of the entity and the needs of the users of its financial statements.

An entity must consider all the following: [IFRS 13.92]

- Level of detail needed to satisfy the disclosure requirements
- How much emphasis to place on each of the various requirements
- Level of aggregation or disaggregation (see section 19.1.2 below)
- Whether users of financial statements need additional information to evaluate the quantitative information disclosed

An entity might, for example, disclose the nature of the item being measured at fair value, including the characteristics of the item being measured that are taken into account in the determination of relevant inputs. For example, if climate risk factors have a material impact on the fair value measurements, an entity might disclose whether and how climate-related factors have been incorporated within the methodologies and inputs. In addition, when describing the valuation techniques and inputs used for fair value measurements categorised within Levels 2 and 3, the entity might disclose how third-party information (such as broker quotes, pricing services, net asset values and relevant market data) was taken into account when measuring fair value. For example, for residential mortgage-backed securities, an entity might disclose the following: [IFRS 13.IE64(a)]

- Types of underlying loans (e.g., prime loans or sub-prime loans)
- Collateral
- Guarantees or other credit enhancements
- Seniority level of the tranches of securities
- Year of issue
- Weighted-average coupon rate of the underlying loans and the securities
- Weighted-average maturity of the underlying loans and the securities
- Geographical concentration of the underlying loans
- Information about the credit ratings of the securities

IFRS 13 includes the above example to illustrate the type of additional information an entity might disclose based on the considerations outlined in IFRS 13.92. These additional disclosures are intended to help financial statement users better understand and evaluate the quantitative information provided by the entity (e.g., the quantitative information the entity disclosed regarding the valuation of its residential mortgage-backed securities holdings).

19.1.1 Format of disclosures

IFRS 13's requirements, with regard to the format of disclosures, are limited to the presentation of quantitative information. An entity is required to use a tabular format to present the quantitative disclosures required by IFRS 13, unless another format is more appropriate. [IFRS 13.99].

19.1.2 Level of disaggregation

IFRS 13 requires disclosures to be presented by class of asset or liability (the definition of a class of asset or liability is discussed in section 19.1.2.A below). Unlike certain other IFRSs, IFRS 13 does not specify the level of aggregation or disaggregation an entity must use when complying with its disclosure requirements. Instead, as discussed below, it simply provides the basis for making this determination. As such, the appropriate class of assets and liabilities may depend on the entity's specific facts and circumstances and the needs of users of its financial statements.

According to the standard, a class of assets and liabilities will often require greater disaggregation than the line items presented in the statement of financial position. Therefore, an entity must present information in sufficient detail to permit reconciliation back to the statement of financial position. [IFRS 13.94]. Such a reconciliation could be presented through the use of subtotals that correspond to line items disclosed in the statement of financial position; however, other approaches may be acceptable.

During the PIR of IFRS 13, respondents indicated that the level of aggregation or disaggregation was a challenge. In particular, respondents said that the information was less useful if aggregated too much and suggested more guidance and examples would be helpful to promote more appropriate levels of aggregation. This was considered as part of the Board's Primary Financial Statements project (see section 19 above).

19.1.2.A Determining appropriate classes of assets and liabilities for disclosure

Determining appropriate classes of assets and liabilities requires judgement. An entity bases this determination on the nature, characteristics and risks of the asset or liability and the level of the fair value hierarchy within which the fair value measurement is categorised (see section 15.2 above for further discussion). [IFRS 13.94]. In addition, the standard specifies that the number of classes may need to be greater for fair value measurements categorised within Level 3 of the fair value hierarchy because they have a greater degree of uncertainty and subjectivity.

Other IFRS accounting standards may specify classes for asset or liability. For example, IAS 16 and IAS 38 require disclosures by class of property, plant and equipment or intangible respectively. If another IFRS specifies the class for an asset or a liability and that class meets the requirements for determining a class in accordance with IFRS 13, an entity may use that class in providing IFRS 13's required disclosures. [IFRS 13.94].

The determination of a class includes considering the fair value measurement's categorisation within the fair value hierarchy as noted above with respect to Level 3 measurements. IFRS 13 requires disclosure of this categorisation for each class of asset or liability (see sections 19.3 to 19.4 below). While an entity takes the fair value categorisation into consideration when determining a class, this does not mean assets or liabilities within a single class cannot be categorised within different levels of the hierarchy. For example, assume an entity has grouped all its buildings within one class in accordance with IAS 16 and measures all those buildings using the revaluation approach in that standard. Further assume that the fair value measurements of some buildings are categorised within Level 2 while others are categorised within Level 3, based on the availability of observable inputs used in the fair value measurement. In and of itself, the assets' categorisation within two levels of the hierarchy does not necessarily mean the entity would need to further disaggregate the IAS 16 class of buildings into two classes for disclosure in accordance with IFRS 13. However, it may be appropriate to do that if the differing categorisation indicated the buildings categorised within Level 2 were different in their nature, characteristics or risks compared to those categorised within Level 3.

The Practical example below illustrates classes of financial instruments for assets categorised within level 3 of the fair value hierarchy for the purpose of these disclosures.

19.1.3 Differentiating between 'recurring' and 'non-recurring'

IFRS 13 has different disclosure requirements for those fair value measurements that are recognised (rather than just disclosed), depending on whether those measurements are recurring or non-recurring in nature (see section 19.3 below). Therefore, it is important to understand the distinction.

- *Recurring* fair value measurements are those that another IFRS requires or permits to be recognised in the statement of financial position at the end of each reporting period. [IFRS 13.93(a)]. For example, the fair value of a financial asset classified as fair value through profit or loss in accordance with IFRS 9 would need to be measured at the end each reporting period. Other examples include a liability to distribute non-cash assets to shareholders, measured at fair value in accordance with IFRIC 17 *Distributions of Non-cash Assets to Owners*.

How we see it

In our view, revaluations of property, plant and equipment in accordance with IAS 16 represent a recurring fair value measurement. The revaluation model in IAS 16 requires that revaluations be made "with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the end of the reporting period". Furthermore, "the frequency of revaluations depends upon the changes in fair values of the items of property, plant and equipment being revalued. When the fair value of a revalued asset differs materially from its carrying amount, a further revaluation is required". Therefore, while an entity might not revalue an asset each year, the objective is to ensure the carrying amount approximates fair value, subject to materiality.

- *Non-recurring* fair value measurements are those that another IFRS requires or permits to be recognised in the statement of financial position in particular circumstances. For example, IFRS 5 requires an entity to measure an asset held for sale at the lower of its carrying amount and fair value less costs to sell. Since the asset's fair value less costs to sell is only recognised in the statement of financial position when it is lower than its carrying amount, that fair value measurement is non-recurring. [IFRS 13.93(a)]. However, it should be noted that in a disposal group, not all assets and liabilities are subject to the measurement requirements of IFRS 5. If financial assets categorised as fair value through other comprehensive income in accordance of IFRS 9 were included in a disposal group, an entity would continue to measure these assets in accordance with IFRS 9 at fair value. These fair value measurements would continue to be recurring.

19.2 Accounting policy disclosures

In general, the requirements to disclose an entity's accounting policies will be addressed by the standard that requires or permits an item to be measured at fair value. The disclosure requirements of IAS 8 would address any changes to an entity's accounting policies (see Chapter 3). In addition to these, IFRS 13 requires the disclosure of the following two policies:

- Firstly, if an entity makes an accounting policy decision to use the exception in relation to the measurement of fair value for financial assets and financial liabilities with offsetting positions, it must disclose that fact (see section 11 above for further discussion regarding the measurement exception and criteria for selecting this accounting policy choice). [IFRS 13.96].
- Secondly, an entity must disclose its policy for determining when transfers between levels of the fair value hierarchy are deemed to have occurred (see section 15.2.2 above for further discussion regarding this policy choice). [IFRS 13.95].

As discussed in section 13.1.4 above, changes to fair value resulting from a change in the valuation technique or its application are accounted for as a change in accounting estimate in accordance with IAS 8 (unless the valuation technique is applied in error, which would be accounted for as a correction of an error in accordance with IAS 8). However, information would be disclosed in accordance with IFRS 13, not IAS 8; specifically, that there has been a change in valuation technique and the reasons for the change (see section 19.3.5 below for further discussion). [IFRS 13.93(d)]. This is illustrated in the extract from the financial statements of ING Groep N.V. in the Practical example below.

Practical example 19-2: ING Groep N.V. (2014)	Netherlands
Annual Report 2014 [extract] Notes to the consolidated annual accounts [extract] 1 Accounting policies [extract] Critical accounting policies [extract] Fair values of real estate Real estate investments are reported at fair value. The fair value of real estate investments is based on regular appraisals by independent qualified valuers. The fair values are established using valuation methods such as: comparable market transactions, capitalisation of income methods or discounted cash flow calculations. The underlying assumption used in the valuation is that the properties are let or sold to third parties based on the actual letting status. The discounted cash flow analyses and capitalisation of income method are based on calculations of the future rental income in accordance with the terms in existing leases and estimations of the rental values for new leases when leases expire and incentives like rental free periods. The cash flows are discounted using market based interest rates that reflect appropriately the risk characteristics of real estate. Market conditions in recent years have led to a reduced level of real estate transactions. Transaction values were significantly impacted by low volumes of actual transactions. As a result comparable market transactions have been used less in valuing ING's real estate investments by independent qualified valuers. More emphasis has been placed on discounted cash flow analysis and capitalisation of income method. Reference is made to Note 43 'Fair value of assets and liabilities' for more disclosure on fair values of real estate investments. The valuation of real estate involves various assumptions and techniques. The use of different assumptions and techniques could produce significantly different valuations. Consequently, the fair values presented may not be indicative of the net realisable value. In addition, the calculation of the estimated fair value is based on market conditions at a specific point in time and may not be indicative of future fair values. To illustrate the uncertainty of our real estate investments valuation, a sensitivity analysis on the changes in fair value of real estate is provided in the 'Risk management' section.	

19.3 Disclosures for recognised fair value measurements

IFRS 13.93 establishes the minimum disclosure requirements for fair value measurements (and those based on fair value) that are recognised in the statement of financial position after initial recognition. The requirements vary depending on whether the fair value measurements are recurring or non-recurring and their categorisation within the fair value hierarchy (i.e., Level 1, 2, or 3 - see section 15 above for further discussion regarding the fair value hierarchy).

Irrespective of the frequency with which the fair value is measured, the disclosures under IFRS 13 are intended to provide financial statement users with additional insight into the relative subjectivity of various fair value measurements and enhance their ability to broadly assess an entity's quality of earnings.

In order to meet the disclosure objectives, the following information, at a minimum, must be disclosed for all fair value measurements. Disclosures are required for each class of asset and liability, whether recurring or non-recurring, that are recognised in the statement of financial position after initial recognition: [IFRS 13.93]

- (a) The fair value measurement at the end of the reporting period (see Example 15 in the standard, discussed in section 19.3.3 below)
- (b) For non-financial assets, if the highest and best use differs from its current use, an entity must disclose that fact and why the non-financial asset is being used in a manner that differs from its highest and best use
- (c) The fair value measurement's categorisation within the fair value hierarchy (Level 1, 2 or 3 - see Example 15 in the standard, discussed in section 19.3.3 below)
- (d) If categorised within Level 2 or Level 3 of the fair value hierarchy:
 - (i) A description of the valuation technique(s) used in the fair value measurement
 - (ii) The inputs used in the fair value measurement
 - (iii) If there has been a change in valuation technique (e.g., changing from a market approach to an income approach or the use of an additional valuation technique), disclose the change and the reason(s) for making it
- (e) Quantitative information about the significant unobservable inputs used in the fair value measurement for those categorised within Level 3 of the fair value hierarchy (see Example 17 in the standard and section 19.3.5.A below)
- (f) If categorised within Level 3 of the fair value hierarchy, a description of the valuation processes used by the entity (including, how an entity decides its valuation policies and procedures and analyses changes in fair value measurements from period to period) - this requirement focuses on valuation processes rather than the specific valuation techniques, which are covered by the requirements in (d) above

In addition to these requirements, an entity must provide the disclosures discussed in sections 19.3.1 and 19.3.2 below depending on whether the measurement is recurring or non-recurring.

19.3.1 Disclosures for recognised recurring fair value measurements

The disclosure requirements in IFRS 13.93 (see section 19.3 above and sections 19.3.1.A and 19.3.1.B below) apply to all fair value measurements that are recognised in the financial statements on a recurring basis. Given the increased subjectivity, IFRS 13 requires additional disclosures for fair value measurements categorised within Level 3 of the fair value hierarchy than for those categorised within Levels 1 or 2 (see section 19.3.1.B below).

The IASB had proposed additional disclosures for Level 2 fair value measurements that are closer in terms of measurement uncertainty to Level 3 of the fair value hierarchy as part of Exposure Draft ED/2021/3 (see Section 19.6 below) as users of financial statements noted that limited information is often provided about material fair value measurements. However, respondents to the Exposure Draft asked for more guidance on identifying the Level 2 fair value measurements that are closer to Level 3 of the fair value hierarchy, whilst others were concerned that additional costs would be incurred to collate the information for measurements outside of Level 3 of the fair value hierarchy.³¹

19.3.1.A Recurring fair value measurements categorised as Level 1 or Level 2

For recurring fair value measurements that are categorised within either Level 1 or Level 2 of the fair value hierarchy, an entity must disclose both of the following:

- Information required to comply with the disclosure requirements discussed in section 19.3 above
- For any transfers between Level 1 and Level 2 of the fair value hierarchy:
 - (i) The amounts of any transfers between Level 1 and Level 2 of the fair value hierarchy
 - (ii) The reasons for those transfers
 - (iii) The entity's policy for determining when transfers between levels are deemed to have occurred (see sections 15.2.2 and 19.2 above for further discussion)

The standard requires transfers into each level to be disclosed and discussed separately from transfers out of each level. [IFRS 13.93].

31 [Project Summary and Feedback Statement](#), *Disclosure Initiative-Targeted Standards-level Review of Disclosures*, IASB, March 2023, p. 28. Available on the IFRS Foundation's website.

19.3.1.B Recurring fair value measurements categorised as Level 3

In addition to the disclosure requirements listed in section 19.3 above, recurring fair value measurements that are categorised within Level 3 of the fair value hierarchy are subject to additional disclosure requirements: [IFRS 13.93]

- (a) A reconciliation from the opening balances to the closing balances, disclosing separately changes during the period (also referred to as the Level 3 roll-forward)
- (b) A narrative description of the sensitivity of Level 3 fair value measurements to changes in unobservable inputs
- (c) For financial assets and financial liabilities only, quantitative sensitivity analysis for Level 3 fair value measurements

These additional disclosure requirements for Level 3 fair value measurements are discussed further in sections 19.3.5 to 19.3.8 below.

19.3.2 Disclosures for recognised non-recurring fair value measurements

Certain disclosure requirements in IFRS 13 do not apply to fair value measurements that are non-recurring in nature (e.g., a non-current asset (or disposal group) held for sale measured at fair value less costs to sell in accordance with IFRS 5 where the fair value less costs to sell is lower than its carrying amount).

Specifically, the following disclosures are *not* required for non-recurring recognised fair value measurements: [IFRS 13.93]

- Information about any transfers between Level 1 and Level 2 of the fair value hierarchy
- A reconciliation of the opening balances to the closing balances for Level 3 measurements (also referred to as the Level 3 roll-forward)
- A narrative description of the sensitivity of Level 3 fair value measurements to changes in unobservable inputs
- For financial assets and financial liabilities, quantitative sensitivity analysis for Level 3 fair value measurements

Information regarding transfers between hierarchy levels and the Level 3 reconciliation do not lend themselves to non-recurring measurements and, therefore, are not required. While discussing the sensitivity of Level 3 measurements to changes in unobservable inputs might provide financial statement users with some information about how the selection of these inputs affects non-recurring valuations, the Boards ultimately decided that this information is most relevant for recurring measurements.

However, entities are required to disclose the reason for any non-recurring fair value measurements made subsequent to the initial recognition of an asset or liability. [IFRS 13.93]. For example, the entity may intend to sell or otherwise dispose of it, thereby resulting in the need for its measurement at fair value less costs to sell based on the requirements of IFRS 5, if lower than the asset's carrying amount.

While obvious for recurring measurements, determining the periods in which the fair value disclosures should be made for non-recurring measurements is less clear. For example, assume a listed entity classifies a building as held for sale in accordance with IFRS 5 at the end of its second quarter and appropriately decreases the carrying value of the asset to its then fair value less costs to sell. In its interim financial statements, the entity would make all of the disclosures required by IFRS 13 for non-recurring fair value measurements. During the second half of the financial year, the sale falls through and the asset is no longer held for sale. In accordance with IFRS 5, the asset is measured at its carrying amount before the asset (or disposal group) was classified as held for sale, adjusted for any depreciation, as this is lower than its recoverable amount. The entity continues to account for the asset in accordance with IAS 16. While the carrying value of the asset at the end of the financial year is no longer at fair value less costs to sell, the asset was adjusted to fair value less costs to sell during the year. Therefore, in its annual financial statements, the entity would again disclose the information required by IFRS 13 for non-recurring fair value measurements.

How we see it

While not explicit in IFRS 13, we believe the above approach is consistent with the interim and annual disclosure requirements for assets subsequently measured under the revaluation model in IAS 34 and IFRS 5. In these situations, we recommend that the disclosures clearly indicate that the fair value information presented is not current, but rather as at the date fair value was measured. Entities should also indicate whether the carrying amount of the asset no longer equals its fair value.

19.3.3 Fair value hierarchy categorisation

IFRS 13 requires entities to disclose the fair value hierarchy level in which each fair value measurement is categorised. As noted in section 15.2 above, the categorisation of a fair value measurement of an asset or liability in the fair value hierarchy is based on the lowest level input that is significant to the fair value measurement in its entirety. Although the hierarchy disclosure is presented by class of asset or liability, it is important to understand that the determination of the hierarchy level in which a fair value measurement falls (and therefore the category in which it will be disclosed) is based on the fair value measurement for the specific item being measured and is, therefore, driven by the unit of account for the asset or liability.

For example, in situations where the unit of account for a financial instrument is the individual item, but the measurement exception for financial instruments is used (as discussed in section 11 above), entities may need to allocate portfolio-level adjustments to the various instruments that make up the net exposure for purposes of hierarchy categorisation.

This may seem inconsistent to certain constituents given the discussion in section 11 above about the consideration of size as a characteristic of the net risk exposure when the measurement exception for financial instruments is used. However, the IASB and FASB staffs have indicated that the determination of the net risk exposure as the unit of measurement applies only for measurement considerations and was not intended to change current practice with respect to disclosures. As such, the entire net exposure would not be categorised within a single level of the fair value hierarchy (e.g., Level 2), unless all of the individual items that make up the net exposure fell within that level.

To illustrate, consider an individual derivative that is valued using the measurement exception as part of a group of derivative instruments with offsetting credit risk (due to the existence of a legally enforceable netting agreement). Assuming the portfolio included instruments that on their own must be categorised within different levels of the fair value hierarchy (i.e., Level 2 and Level 3), for disclosure purposes, the portfolio-level adjustment for credit risk (considering the effect of master netting agreements) may need to be attributed to the individual derivative transactions within the portfolio or to the group of transactions that fall within each of the levels of the hierarchy. This example assumes that the portfolio-level adjustment for credit risk is based on observable market data. If the portfolio-level adjustment was determined using unobservable inputs, the significance of the adjustment to the measurement of the individual derivative instruments would need to be considered in order to determine if categorisation in Level 2 or Level 3 was appropriate.

IFRS 13 provides an example illustrating how an entity might disclose, in tabular format, the fair value hierarchy category for each class of assets and liabilities measured at fair value at the end of each reporting period. [IFRS 13.IE Example 15, IFRS 13.IE60]. In that example, the gain or loss recognised during the period for assets and liabilities measured at fair value on a non-recurring basis would be separately disclosed in the notes to the financial statements.

19.3.4 Transfers between hierarchy levels for recurring fair value measurements

IFRS 13 requires entities to disclose information regarding all transfers between fair value hierarchy levels (i.e., situations where an asset or liability was categorised within a different level in the fair value hierarchy in the previous reporting period). [IFRS 13.93(c), IFRS 13.93(e)(iv)]. However, this disclosure requirement only applies to assets and liabilities held at the end of the reporting period which are measured at fair value on a recurring basis. Information regarding transfers into or out of Level 3 is captured in the Level 3 reconciliation (discussed in section 19.3.6 below) as these amounts are needed to roll forward Level 3 balances from the beginning to the end of the period being disclosed. The amounts of any transfers between Level 1 and Level 2 of the fair value hierarchy are also required to be disclosed. Regardless of the hierarchy levels involved, transfers into each level of the hierarchy are disclosed separately from transfers out of each level. That is, all transfers are required to be presented on a gross basis by hierarchy level, whether included in the Level 3 reconciliation or disclosed separately.

For all transfer amounts disclosed, an entity is required to discuss the reasons why the categorisation within the fair value hierarchy has changed (i.e., transferred between hierarchy levels). [IFRS 13.93(c), IFRS 13.93(e)(iv)]. Reasons might include the market for a particular asset or liability previously considered active (Level 1) becoming inactive (Level 2 or Level 3), or significant inputs used in a valuation technique that were previously unobservable (Level 3) becoming observable (Level 2) given transactions that were observed around the measurement date.

As discussed in sections 15.2.2 and 19.2 above, IFRS 13 also requires that entities disclose and consistently follow their policy for determining when transfers between fair value hierarchy levels are deemed to have occurred. That is, an entity's policy about the timing of recognising transfers into the hierarchy levels should be the same as the policy for recognising transfers out, and this policy should be used consistently from period to period. IFRS 13.95 includes the following examples of potential policies: the actual date of the event or change in circumstances that caused the transfer, the beginning of the reporting period or the end of the reporting period. In practice, some variation of these approaches may also be used by entities. For example, some entities may use an intra-period approach using a transfer amount based on the fair value as at the month-end in which the transfer occurred, as opposed to the actual date within the month. [IFRS 13.95]. The following illustrative example demonstrates the differences between the three methods noted above.

Illustration 19-1: Comparison of policies for recognising transfers

Assume an entity acquires an asset at 31 December 20X0 for CU1,000 that was categorised within Level 2 of the fair value hierarchy at year end 20X0 and throughout Q1 20X1. At the end of Q1 20X1, the fair value of the asset based on market observable information was CU950, and, as such, the asset was excluded from the Level 3 reconciliation. During Q2 20X1, observable market information was no longer available, so the entity categorised the asset in Level 3 at the end of Q2 20X1. During Q2 20X1, the fair value of the asset decreased from CU950 to CU750, with CU200 of the change in fair value arising subsequent to the time when market observable information was no longer available.

Under the three approaches described above, the Level 3 reconciliation for Q2 20X1 would be as follows:

	Transferred to Level 3 at:		
	Beginning of the period	Actual date	End of the period
Beginning fair value	-	-	-
Purchases, issuances and settlements	-	-	-
Transfers in	CU950	CU800	CU750
Total losses	(CU200)	(CU50)	-
Ending fair value	CU750	CU750	CU750

How we see it

As previously noted, the disclosures under IFRS 13 are intended to provide information that enables users to identify the effects of fair value measurements that are more subjective in nature on reported earnings, and, thereby, enhance financial statement users' ability to make their own assessment regarding earnings quality. We believe that this objective is best met by considering the level of observability associated with the fair value measurement made at the end of the reporting period (i.e., the observability of the inputs used to determine fair value on the last day in the period). As such, while no specific approach is required under IFRS, we note the following about the approaches mentioned in the standard.

We believe a beginning-of-period approach for recognising transfers provides greater transparency on the effect that unobservable inputs have on fair value measurements and reported earnings. Under this view, all changes in fair value that arise during the reporting period of the transfer are disclosed as a component of the Level 3 reconciliation. However, any unrealised gains or losses for items that move from Level 3 to Level 2 during the reporting period would not be reflected.

While the 'actual date' approach more precisely captures the date on which a change in the observability of inputs occurred, its application can be more operationally complex. In addition, in our view, it does not necessarily provide more decision-useful information than the beginning-of-period approach. This is because, for a given period, the intra-period approach results in an allocation of the fair value changes between hierarchy levels that is inconsistent with the actual categorisation of the item as at the end of the reporting period. As such, the intra-period approach implies that a portion of the earnings recognised during the period is of a higher (or lower) quality solely because there was observable information regarding the value of the instrument at some point during the period.

To further illustrate this point, assume an entity acquires an investment in a private company in Q1 for CU1,000. In the middle of Q2, the company completes an initial public offering that values the investment at CU1,500. At the end of Q2, the fair value of the investment is CU2,200 based on a quoted market price. Under the intra-period approach for the six-month period ended Q2, CU500 would be included as an unrealised gain in the Level 3 reconciliation, despite the fact that the entire CU1,200 unrealised gain recognised during the six-month period is supported by observable market information (i.e., a quoted price less cash paid).

Of the three alternatives, we believe the end-of-period approach is the least effective in achieving IFRS 13's disclosure objectives. Under this approach, the Level 3 reconciliation would not reflect any unrealised gains or losses for items that move from Level 2 to Level 3 during the reporting period.

19.3.5 Disclosure of valuation techniques and inputs

Entities are required to describe the valuation techniques and inputs used to measure the fair value of items categorised within Level 2 or Level 3 of the fair value hierarchy. In addition, entities are required to disclose instances where there has been a change in the valuation technique(s) used during the period, and the reason for making the change. As discussed in section 19.3.5.A below, the standard also requires quantitative information about the significant unobservable inputs to be disclosed for Level 3 fair value measurements. [IFRS 13.93(d)].

Importantly, the disclosures related to valuation techniques and inputs (including the requirement to disclose quantitative information about unobservable inputs) apply to both recurring and non-recurring fair value measurements. [IFRS 13.93(d)].

19.3.5.A Significant unobservable inputs for Level 3 fair value measurements

For Level 3 measurements, IFRS 13 specifically requires that entities provide quantitative information about the significant unobservable inputs used in the fair value measurement. [IFRS 13.93(d)]. For example, an entity with asset-backed securities categorised within Level 3 would be required to quantitatively disclose the inputs used in its valuation models related to prepayment speed, probability of default, loss given default and discount rate (assuming these inputs were all unobservable and deemed to be significant to the valuation).

Consistent with all of the disclosures in IFRS 13, entities are required to present this information separately for each class of assets or liabilities based on the nature, characteristics and risks of their Level 3 measurements. [IFRS 13.93]. As such, we expect that entities will likely disclose both the range and weighted average of the unobservable inputs used across a particular class of Level 3 assets or liabilities. In addition, entities should assess whether the level of disaggregation at which this information is provided results in meaningful information to users, consistent with the objectives of IFRS 13.

In some situations, significant unobservable inputs may not be developed by the reporting entity itself, such as when an entity uses third-party pricing information without adjustment. In these instances, IFRS 13 states that an entity is not required to create quantitative information to comply with its disclosure requirements. However, when making these disclosures, entities cannot ignore information about significant unobservable inputs that is 'reasonably available'.

Determining whether information is 'reasonably available' will require judgement, and there may be some diversity in practice stemming from differences in entities' access to information and information vendors may be willing or able to provide. If the valuation has been developed, either by the entity or an external valuation expert at the direction of the entity, quantitative information about the significant unobservable inputs would be expected to be reasonably available and therefore should be disclosed. As a result, entities need to ensure any valuers they use provide them with sufficient information to make the required disclosures.

In contrast, when an entity receives price quotes or other valuation information from a third-party pricing service or broker, the specific unobservable inputs underlying this information may not always be reasonably available to the entity. While determining whether information is reasonably available in these instances will require judgement, we would expect entities to make good-faith efforts to obtain the information needed to meet the disclosure requirements in IFRS 13. In addition, some diversity in practice may stem from differences in entities' access to information and the nature of information that various vendors may be willing or able to provide. However, in all cases, any adjustments made by an entity to the pricing data received from a third party should be disclosed if these adjustments are not based on observable market data and are deemed to be significant to the overall measurement.

IFRS 13 provides an example illustrating the type of information an entity might provide to comply with the requirement to disclose quantitative information about Level 3 fair value measurements. [IFRS 13.IE Example 17, IFRS 13.IE63]. Practical example 19-4 from Standard Chartered PLC and Practical example 19-5 from Centrica plc in section 19.3.8.A below also illustrate this disclosure in relation to derivatives categorised within Level 3.

19.3.6 Level 3 reconciliation

IFRS 13 requires a reconciliation (also referred to as the Level 3 roll-forward) of the beginning and ending balances for any recurring fair value measurements that utilise significant unobservable inputs (i.e., Level 3 inputs). Therefore, any asset or liability (measured at fair value on a recurring basis) that was determined to be a Level 3 measurement at either the beginning or the end of a reporting period would need to be considered in the Level 3 reconciliation.

To reconcile Level 3 balances for the period presented, entities must present the following information for each class of assets and liabilities:

- Balance of Level 3 assets or liabilities (as at the beginning of the period)
- Total gains or losses
- Purchases, sales, issues and settlements (presented separately)
- Transfers in and/or out of Level 3 (presented separately)
- Balance of Level 3 assets or liabilities (as at the end of the period)

In addition, entities are required to separately present gains or losses included in earnings from those gains or losses recognised in other comprehensive income, and to describe in which line items these gains or losses are reported in profit or loss, or in other comprehensive income. To enhance the ability of financial statement users to assess an entity's quality of earnings, IFRS 13 also requires entities to separately disclose the amount of total gains and losses reported in profit or loss (for the period) that are attributable to changes in unrealised gains and losses for assets and liabilities categorised within Level 3 and are still held at the end of the reporting period. Effectively, this requires an entity to distinguish its unrealised gains and losses from its realised gains and losses for Level 3 measurements.

IFRS 13 provides an example illustrating how an entity could comply with the Level 3 reconciliation requirements. [IFRS 13.IE Example 16, IFRS 13.IE61]. IFRS 13 also provides an example to illustrate how an entity could comply with the requirements to separately disclose the amount of total gains and losses reported in profit or loss that are attributable to changes in unrealised gains and losses for assets and liabilities categorised within Level 3 and are still held at the end of the reporting period. [IFRS 13.IE Example 16, IFRS 13.IE62]. Practical example 19-4 from Standard Chartered PLC and Practical example 19-5 from Centrica plc in section 19.3.8.A below also illustrate these disclosure requirements in relation to derivatives categorised within Level 3.

19.3.7 Disclosure of valuation processes for Level 3 measurements

Entities are required to describe the valuation processes used for fair value measurements categorised within Level 3 of the fair value hierarchy, whether on a recurring or non-recurring basis. This is illustrated in the extract from the financial statements of UBS Group AG below. The Boards decided to require these disclosures for Level 3 measurements because they believe this information, in conjunction with the other Level 3 disclosures, will help users assess the relative subjectivity of these measurements.

Practical example 19-3: UBS Group AG (2023)

Switzerland

Annual Report 2023 [extract]**Financial statements [extract]****Consolidated financial statements [extract]****UBS Group AG consolidated financial statements [extract]****Notes to the UBS Group AG consolidated financial statements [extract]****Additional information [extract]****Note 21 Fair value measurement [extract]****b) Valuation governance**

UBS's fair value measurement and model governance framework includes numerous controls and other procedural safeguards that are intended to maximize the quality of fair value measurements reported in the financial statements. New products and valuation techniques must be reviewed and approved by key stakeholders from the risk and finance control functions. Responsibility for the ongoing measurement of financial and non-financial instruments at fair value is with the business divisions.

Fair value estimates are validated by the risk and finance control functions, which are independent of the business divisions. Independent price verification is performed by Finance through benchmarking the business divisions' fair value estimates with observable market prices and other independent sources. A governance framework and associated controls are in place in order to monitor the quality of third-party pricing sources where used. For instruments where valuation models are used to determine fair value, independent valuation and model control groups within Finance and Risk Control evaluate UBS's models on a regular basis, including valuation and model input parameters, as well as pricing. As a result of the valuation controls employed, valuation adjustments may be made to the business divisions' estimates of fair value to align with independent market data and the relevant accounting standard.

› Refer to Note 21d for more information

IFRS 13 provides an example of how an entity could comply with the requirements to disclose the valuation processes for its Level 3 fair value measurements, suggesting this disclosure might include the following: [IFRS 13.IE65]

- (i) For the group within the entity that decides the entity's valuation policies and procedures:
 - Its description
 - To whom that group reports
 - The internal reporting procedures in place (e.g., whether and, if so, how pricing, risk management or audit committees discuss and assess the fair value measurements)
- (ii) The frequency and methods for calibration, back testing and other testing procedures of pricing models
- (iii) The process for analysing changes in fair value measurements from period to period
- (iv) How the entity determined that third-party information, such as broker quotes or pricing services, used in the fair value measurement was developed in accordance with the IFRS
- (v) The methods used to develop and substantiate the unobservable inputs used in a fair value measurement

19.3.8 Sensitivity of Level 3 measurements to changes in significant unobservable inputs

IFRS 13 requires entities to provide a narrative description of the sensitivity of recurring Level 3 fair value measurements to changes in the unobservable inputs used, if changing those inputs would significantly affect the fair value measurement. As part of Exposure Draft ED/2021/3 (see Section 19.6 below), the IASB had proposed replacing this disclosure with information about reasonably possible alternative fair value measurements, such as the range of alternative fair value measurements using inputs that were reasonably possible at the reporting date. Some respondents commented that sensitivity analysis is critical information and ought to be required, whilst others commented that the new disclosures would be difficult and costly to prepare - the Board decided not to proceed with the proposals.³²

Except in relation to financial instruments (see section 19.3.8.A below) there is no requirement to quantify the extent of the change to the unobservable input, or the quantitative effect of this change on the measurement (i.e., only discuss directional change).

³² [Project Summary and Feedback Statement](#), Disclosure Initiative-Targeted Standards-level Review of Disclosures, IASB, March 2023, p. 28. Available on the IFRS Foundation's website.

At a minimum, the unobservable inputs quantitatively disclosed based on the requirements described in section 19.3.5 above must be addressed in the narrative description. In addition, entities are required to describe any interrelationships between the unobservable inputs and discuss how they might magnify or mitigate the effect of changes on the fair value measurement.

This disclosure, combined with the quantitative disclosure of significant unobservable inputs, is designed to enable financial statement users to understand the directional effect of certain inputs on an item's fair value and to evaluate whether the entity's views about individual unobservable inputs differ from their own. The Boards believe these disclosures can provide meaningful information to users who are not familiar with the pricing models and valuation techniques used to measure a particular class of assets or liabilities (e.g., complex structured instruments).

The following example from IFRS 13 illustrates how an entity could comply with the disclosure requirements related to the sensitivity of Level 3 measurements to changes in significant unobservable inputs. [IFRS 13.IE Example 19, IFRS 13.IE66].

Extract from IFRS 13

Example 19-Information about sensitivity to changes in significant unobservable inputs

For recurring fair value measurements categorised within Level 3 of the fair value hierarchy, the IFRS requires an entity to provide a narrative description of the sensitivity of the fair value measurement to changes in significant unobservable inputs and a description of any interrelationships between those unobservable inputs. An entity might disclose the following about its residential mortgage-backed securities to comply with paragraph 93(h)(i) of the IFRS:

The significant unobservable inputs used in the fair value measurement of the entity's residential mortgage-backed securities are prepayment rates, probability of default and loss severity in the event of default. Significant increases (decreases) in any of those inputs in isolation would result in a significantly lower (higher) fair value measurement. Generally, a change in the assumption used for the probability of default is accompanied by a directionally similar change in the assumption used for the loss severity and a directionally opposite change in the assumption used for prepayment rates.

We note that the above example is fairly general in nature, because no numbers relating to how the unobservable inputs might be changed, or how such a change would affect fair value, are required to be disclosed. However, in making this disclosure we would encourage entities to avoid over-generalisations that may not hold true in all cases.

19.3.8.A Quantitative sensitivity of Level 3 measurements of financial instruments to changes in significant unobservable inputs

In addition to the qualitative sensitivity analysis, IFRS 13 requires quantitative sensitivity analysis for Level 3 fair value measurements of financial assets and financial liabilities (as noted in section 19.3.1.B above, this is only for recurring fair value measurements), which is generally consistent with the existing disclosure requirement in IFRS 7 (see Chapter 50). If changing one or more of the unobservable inputs to reflect reasonably possible alternative assumptions would change fair value significantly, an entity must disclose the fact and the effect of those changes.

The entity must also disclose how the effect of a change to reflect a reasonably possible alternative assumption was calculated. For the purpose of this disclosure requirement, significance is judged with respect to profit or loss, and total assets or total liabilities, or, when changes in fair value are recognised in other comprehensive income, total equity. [IFRS 13.93(h)(ii)]

The following extracts from Standard Chartered PLC and Centrica plc illustrate the disclosures required for Level 3 measurements.

Notes to the financial statements [extract]

13. Financial instruments [extract]

Sensitivities in respect of the fair values of Level 3 assets and liabilities

Sensitivity analysis is performed on products with significant unobservable inputs. The Group applies a 10 per cent increase or decrease on the values of these unobservable inputs, to generate a range of reasonably possible alternative valuations. The percentage shift is determined by statistical analysis performed on a set of reference prices based on the composition of the Group's Level 3 inventory as the measurement date. Favourable and unfavourable changes (which show the balance adjusted for input change) are determined on the basis of changes in the value of the instrument as a result of varying the levels of the unobservable parameters. The Level 3 sensitivity analysis assumes a one-way market move and does not consider offsets for hedges.

	Held at fair value through profit or loss			Fair value through other comprehensive income		
	Net exposure \$million	Favourable changes \$million	Unfavourable changes \$million	Net exposure \$million	Favourable changes \$million	Unfavourable changes \$million
Financial instruments held at fair value						
Loans and advances	1,366	1,398	1,328	–	–	–
Reverse repurchase agreements and other similar secured lending	1,566	1,579	1,550	–	–	–
Asset-backed securities	–	–	–	–	–	–
Debt securities, alternative tier one and other eligible bills	349	366	332	40	41	38
Equity shares	186	205	168	493	541	442
Other assets	26	29	24	–	–	–
Derivative financial instruments	(4)	10	(16)	–	–	–
Customer accounts	(454)	(447)	(461)	–	–	–
Deposits by banks	(283)	(278)	(287)	–	–	–
Debt securities in issue	(821)	(764)	(879)	–	–	–
Other liabilities	(1)	(1)	(1)	–	–	–
At 31 December 2021	1,930	2,097	1,758	533	582	480

Financial instruments held at fair value						
Loans and advances	918	947	867	–	–	–
Reverse repurchase agreements and other similar secured lending	1,064	1,089	1,040	–	–	–
Asset-backed securities	87	94	80	–	–	–
Debt securities, alternative tier one and other eligible bills	171	183	159	40	40	39
Equity shares	279	307	251	381	418	345

ANNUAL REPORT AND ACCOUNTS 2023 [extract]

Financial statements [extract]

Notes to the Financial Statements [extract]

Supplementary Information [extract]

S6. FAIR VALUE OF FINANCIAL INSTRUMENTS [extract]**(a) Fair value hierarchy [extract]**

...

The reconciliation of the Level 3 fair value measurements during the year is as follows:

	2023		2022	
	Financial assets £m	Financial liabilities £m	Financial assets £m	Financial liabilities £m
Level 3 financial instruments				
1 January	610	(946)	501	(290)
Total realised and unrealised (losses)/gains:				
Recognised in Group Income Statement	(297)	252	10	(784)
Recognised in Other Comprehensive Income	(1)	—	—	—
Net movement in contingent consideration liability	—	(27)	—	(96)
Purchases, sales, issuances and settlements (net)	2	194	(4)	—
Transfers between Level 3 and Level 2 ⁽ⁱ⁾	(96)	131	101	224
Foreign exchange movements	(1)	1	2	—
31 December	217	(395)	610	(946)
Total (losses)/gains for the year for Level 3 financial instruments held at the end of the reporting period	(297)	252	10	(784)

(i) Transfers between levels are deemed to occur at the beginning of the reporting year.

(b) Valuation techniques used to derive Level 2 and Level 3 fair values and Group valuation process [extract]

Level 2 interest rate derivatives and foreign exchange derivatives comprise interest rate swaps and forward foreign exchange contracts. Interest rate swaps are fair valued using forward interest rates extracted from observable yield curves. Forward foreign exchange contracts are fair valued using forward exchange rates that are quoted in an active market, with the resulting market value discounted back to present value using observable yield curves.

Level 2 energy derivatives are fair valued by comparing and discounting the difference between the expected contractual cash flows for the relevant commodities and the quoted prices for those commodities in an active market. The average discount rate applied to value this type of contract during the year was 5% per annum (2022: average discount rate of 5% per annum).

For Level 3 energy derivatives, the main input used by the Group pertains to deriving expected future commodity prices in markets that are not active as far into the future as some of our contractual terms. This applies to certain contracts within Europe and North America. Fair values are then calculated by comparing and discounting the difference between the expected contractual cash flows and these derived future prices using an average discount rate of 5% (Europe) and 5% (North America) per annum (2022: average discount rate of 5% (Europe) and 5% (North America) per annum).

Active period of markets	Gas	Power	Coal	Emissions	Oil
UK (years)	4	4	3	3	3

Because the Level 3 energy derivative valuations involve the prediction of future commodity market prices, sometimes a long way into the future, reasonably possible alternative assumptions for gas, power, coal, emissions or oil prices may result in a higher or lower fair value for Level 3 financial instruments. The impact of reasonably possible changes in commodity prices on profit and loss are included in note S3. Other than commodity prices there are no other unobservable inputs which would have a material impact.

...

S3. FINANCIAL RISK MANAGEMENT [extract]**(d) Sensitivity analysis [extract]****(iv) Commodity price risk – proprietary trades**

As at 31 December 2023 the VaR associated with proprietary trading was £4 million (2022: £5 million). This represents the statistical downside risk associated with the proprietary trade and associated hedging positions. The changes in the year only relate to changes in commodity prices. Intra-day trading positions are monitored using a live time risk management system.

The impacts of reasonably possible changes using probability-based high and low price curves applied to level 3 proprietary trades are as follows:

	2023 Impact on profit ⁽ⁱ⁾ £m	2022 Impact on profit ⁽ⁱ⁾ £m
Incremental profit/(loss)		
Level 3 proprietary trades – increase/(decrease) ⁽ⁱⁱ⁾	24/(24)	891/(877)

(i) The reasonably possible change in variable and the impact on profit are calculated using both the active and inactive market curves for energy prices, see note 7(c) for detail on market curves.

(ii) The level 3 proprietary financial instruments' sensitivity has been valued in Secure Environment and excludes associated hedges which would mitigate this impact.

19.3.9 Highest and best use

As discussed in section 9 above, if the highest and best use of a non-financial asset differs from its current use, entities are required to disclose this fact and why the non-financial asset is being used in a manner that differs from its highest and best use. [IFRS 13.93(i)]. The Boards believe this information is useful to financial statement users who project expected cash flows based on how an asset is actually being used.

19.4 Disclosures for unrecognised fair value measurements

For each class of assets and liabilities not measured at fair value in the statement of financial position, but for which the fair value is disclosed (e.g., financial assets carried at amortised cost whose fair values are required to be disclosed in accordance with IFRS 7), entities are required to disclose the following: [IFRS 13.97]

- (a) The level of the fair value hierarchy within which the fair value measurements are categorised in their entirety (Level 1, 2 or 3)
- (b) If categorised within Level 2 or Level 3 of the fair value hierarchy:
 - (i) Description of the valuation technique(s) used in the fair value measurement
 - (ii) Description of the inputs used in the fair value measurement
 - (iii) If there has been a change in valuation technique (e.g., changing from a market approach to an income approach or the use of an additional valuation technique):
 - The change
 - The reason(s) for making it
- (c) For non-financial assets, if the highest and best use differs from its current use, an entity must disclose that fact and why the non-financial asset is being used in a manner that differs from its highest and best use

None of the other IFRS 13 disclosures are required for assets and liabilities whose fair value is only disclosed. For example, even though certain fair value disclosures are categorised within Level 3, entities are not required to provide quantitative information about the unobservable inputs used in their valuation because these items are not measured at fair value in the statement of financial position.

19.5 Disclosures regarding liabilities issued with an inseparable third-party credit enhancement

IFRS 13 includes an additional disclosure requirement for liabilities measured at fair value that have been issued with an inseparable third-party credit enhancement (see section 10.3.1 above for further discussion regarding these instruments). The standard requires that an issuer disclose the existence of the third-party credit enhancement and whether it is reflected in the fair value measurement of the liability. [IFRS 13.98].

19.6 Proposed amendments resulting from the *Disclosure Initiative-Targeted Standards-level Review of Disclosures* project

On 25 March 2021, the Board issued an Exposure Draft ED/2021/3, *Disclosure Requirements in IFRS Standards - A Pilot Approach (Proposed amendments to IFRS 13 and IAS 19)* (the ED), in which the Board proposed guidance for its own use when developing and drafting disclosure requirements in IFRS accounting standards. In its pilot application of the guidance, amendments to IFRS 13 and IAS 19 were proposed. The Board was aiming to address the concern about the current disclosures in financial statements, which are sometimes referred to as 'disclosure overload', 'disclosure ineffectiveness' or, as described in the ED, the 'disclosure problem'. If the pilot was successful, the intention was to develop similar proposals for other IFRS accounting standards.

The proposed amendments to IFRS 13 suggested an overall disclosure objective that, "An entity shall disclose information that enables users of financial statements to evaluate the entity's exposure to uncertainties associated with fair value measurements of classes of assets and liabilities measured at fair value in the statement of financial position after initial recognition".³³ This information was intended to enable users to understand the significance of the classes of assets and liabilities on the entity's financial position and financial performance, how fair value measurements have been determined and how changes could affect the entity's financial position.

33 Exposure Draft ED/2021/3: *Disclosure Requirements in IFRS Standards - A Pilot Approach: Proposed amendments to IFRS 13 and IAS 19*, IASB, March 2021, Proposed overall disclosure objective, paragraph 100. Available on the IFRS Foundation's website.

The overall disclosure objectives were supplemented by proposed specific disclosure objectives and items of information intended to ensure compliance with the overall disclosure objective, including requiring information:³⁴

- About the amount, nature and other characteristics of assets and liabilities measured at fair value after initial recognition and how those characteristics relate to the categorisation of assets and liabilities in the fair value hierarchy
- That enables users to understand the significant techniques and inputs used in determining the fair value measurements for each class of assets and liabilities measured at fair value after initial recognition
- For recurring fair value measurements, that would allow users to understand alternative fair value measurements, using inputs that were reasonably possible at the end of the reporting period
- About the reason for changes in fair value measurements

For assets and liabilities not measured at fair value, but for which the fair values are disclosed in the notes, the Board proposed disclosure of “the amount, nature and other characteristics of each class of assets and liabilities...and how the characteristics relate to the categorisation of those classes of assets and liabilities in the fair value hierarchy”.³⁵

The comment period for the ED ended on 12 January 2022.³⁶ During the comment period, 50 companies participated in fieldwork by applying the proposed disclosure requirements for either, or both, of IFRS 13 and IAS 19. In February 2022, the IASB discussed feedback from the preparer fieldwork participants and users of financial statements:

- Some participants from all industries supported the proposed amendments to IFRS 13 and found the disclosure objectives useful in explaining user needs and making their disclosures more useful. Others said the proposals enabled them to restructure, streamline or simplify their notes to better respond to user needs
- Some users supported the approach of having disclosure objectives, rather than prescriptive disclosure requirements, although many other users raised concerns about losing information that they get today, and about the effects on comparability. Some suggested the use of a combination of both disclosure objectives and minimum prescriptive disclosure requirements. A few users preferred to have prescriptive disclosure requirements for highly technical and quantitative information

In May 2022, the IASB discussed feedback provided in comment letters. For assets and liabilities measured at fair value in the statement of financial position, many respondents agreed with the proposed overall disclosure objective. However, some respondents believed it to be too generic and similar to the current disclosure objective in IFRS 13.

The specific disclosure objectives and items of information for these assets and liabilities received a mixed response. A few respondents said the proposals would result in more relevant information for users about movements and uncertainties in fair value measurements, whilst many thought the scope of the disclosures should be restricted to avoid irrelevant disclosures being made. Some respondents expressed concern about the clarity of the specific disclosure objective for assets and liabilities within each level of the fair value hierarchy.

Some respondents disagreed with the proposal to disclose reasonably possible alternative fair value measurements on the grounds of cost, usefulness and the consequent undermining of the credibility of an entity's fair value measurement.

For assets and liabilities for which fair value is only disclosed in the notes, many respondents agreed with the proposed specific disclosure objective and items of information, whilst others questioned how useful the disclosures would be.

34 Exposure Draft [ED/2021/3: Disclosure Requirements in IFRS Standards - A Pilot Approach: Proposed amendments to IFRS 13 and IAS 19](#), IASB, March 2021, Proposed specific disclosure objectives, paragraphs 103, 107, 111, 114. Available on the IFRS Foundation's website.

35 Exposure Draft [ED/2021/3: Disclosure Requirements in IFRS Standards - A Pilot Approach: Proposed amendments to IFRS 13 and IAS 19](#), IASB, March 2021, Proposed paragraph 118. Available on the IFRS Foundation's website.

36 [IASB Update](#), July 2021, available on the IFRS Foundation's website.

In October 2022, the IASB decided not to proceed with any further work on the disclosure requirements in IFRS 13 because:

- The standard had been selected primarily to test the proposed guidance for developing and drafting disclosure requirements
- The PIR of IFRS 13 found that disclosures relating to fair value measurements are useful to users
- If information about measurement uncertainty relating to an entity's Level 2 fair value measurements was material to users of its financial statements, then applying the requirements in IAS 1.31 would result in the entity disclosing that information
- The IASB's Third Agenda Consultation hadn't identified amendments to the disclosures a priority³⁷

³⁷ [Project Summary and Feedback Statement](#), *Disclosure Initiative-Targeted Standards-level Review of Disclosures*, IASB, March 2023. Available on the IFRS Foundation's website.

20 Application guidance - present value techniques

This section focuses on the application guidance in IFRS 13 regarding the use of present value techniques to estimate fair value.

20.1 General principles for use of present value techniques

A present value technique is an application of the income approach, which is one of the three valuation approaches prescribed by IFRS 13. Valuation techniques under the income approach, such as present value techniques or option pricing models, convert expected future amounts to a single present amount. That is, a present value technique uses the projected future cash flows of an asset or liability and discounts those cash flows at a rate of return commensurate with the risk(s) associated with those cash flows. Present value techniques, such as discounted cash flow analyses, are frequently used to estimate the fair value of business entities, non-financial assets and non-financial liabilities, but are also useful for valuing financial instruments that do not trade in active markets.

The standard does not prescribe the use of a single specific present value technique, nor does it limit the use of present value techniques to those discussed. The selection of a present value technique will depend on facts and circumstances specific to the asset or liability being measured at fair value and the availability of sufficient data. [IFRS 13.B12].

The application guidance in IFRS 13 regarding the use of present value techniques specifically focuses on three techniques: a discount rate adjustment technique and two methods of the expected cash flow (expected present value) technique. These approaches are summarised in the following table.

Figure 20-1: Comparison of present value techniques described in IFRS 13

	Discount rate adjustment technique (see section 20.3 below)	Expected present value technique	
		Method 1 (see section 20.4 below)	Method 2 (see section 20.4 below)
Nature of cash flows	Conditional cash flows - may be contractual or promised or the most likely cash flows	Expected cash flows	Expected cash flows
Cash flows based on probability weighting?	No	Yes	Yes
Cash flows adjusted for certainty?	No	Yes - cash risk premium is deducted. Cash flows represent a certainty-equivalent cash flow	No
Cash flows adjusted for other market risk?	No	Yes	Yes - to the extent not already captured in the discount rate
Discount rate adjusted for the uncertainty inherent in the cash flows?	Yes - uses an observed or estimated market rate of return, which includes adjustment for the possible variation in cash flows	No - already captured in the cash flows	No - already captured in the cash flows
Discount rate adjusted for the premium a market participant would require to accept the uncertainty?	Yes	No - represents time value of money only (i.e., the risk-free rate is used)	Yes - represents the expected rate of return (i.e., the risk-free rate is adjusted to include the risk premium)

Additional considerations when applying present value techniques to measuring the fair value of a liability and an entity's own equity instrument not held by other parties as assets are discussed in section 10 above. The Board conducted a research project on discount rates used in IFRS accounting standards and published their findings in February 2019. In that summary they noted that the output from the research would be used as an input for the Targeted Standard-level Review of Disclosures project for present values measures which includes IFRS 13 (see section 19.6 above).³⁸

20.2 The components of a present value measurement

Present value measurements use future cash flows or values to estimate amounts in the present, using a discount rate. Present value techniques can vary in complexity depending on the facts and circumstances of the item being measured. Nevertheless, for the purpose of measuring fair value in accordance with IFRS 13, the standard requires a present value technique to capture all the following elements from the perspective of market participants at the measurement date: [IFRS 13.B13]

- An estimate of future cash flows for the asset or liability being measured
- Expectations about the uncertainty inherent in the future cash flows (i.e., the possible variations in the amount and timing of the cash flows)
- The time value of money - represented by a risk-free interest rate. That is, the rate on risk-free monetary assets that have maturity dates (or durations) that coincide with the period covered by the cash flows and pose neither uncertainty in timing nor risk of default to the holder
- A risk premium (i.e., the price for bearing the uncertainty inherent in the cash flows)
- Other factors that market participants would take into account in the circumstances
- For a liability, the non-performance risk relating to that liability, including the entity's (i.e., the obligor's) own credit risk

For example, when estimating future cash flows from an investment property, the estimate would incorporate the effects of climate change, which may affect assumptions such as the cost of energy, the rental income that is achievable from the property, the vacancy rates and expenditure on maintenance.

Since present value techniques may differ in how they capture these elements, IFRS 13 sets out the following general principles that govern the application of any present value technique used to measure fair value: [IFRS 13.B14]

(a) Both cash flows and discount rates should:

- Reflect assumptions that market participants would use when pricing the asset or liability
- Take into account only the factors attributable to the asset or liability being measured
- Have internally consistent assumptions

For example, if the cash flows include the effect of inflation (i.e., nominal cash flows), they would be discounted at a rate that includes the effect of inflation, for example, a rate built off the nominal risk-free interest rate. If cash flows exclude the effect of inflation (i.e., real cash flows), they should be discounted at a rate that excludes the effect of inflation. Similarly, post-tax and pre-tax cash flows should be discounted at a rate consistent with those cash flows.

(b) Discount rates should also:

- Be consistent with the underlying economic factors of the currency in which the cash flows are denominated
 - Reflect assumptions that are consistent with those assumptions inherent in the cash flows
- This principle is intended to avoid double-counting or omitting the effects of risk factors.

For example, a discount rate that reflects non-performance (credit) risk is appropriate if using contractual cash flows of a loan (i.e., a discount rate adjustment technique - see section 20.3 below). The same rate would not be appropriate when using probability-weighted cash flows (i.e., an expected present value technique - see section 20.4 below) because the expected cash flows already reflect assumptions about the uncertainty in future defaults. Similarly, a discount rate would be adjusted for climate-related risk if the risk is not captured within the cash flows (assuming market participants would make such an adjustment).

³⁸ [IFRS Standards Project summary: Discount Rates in IFRS Standards](#), IASB, February 2019. Available on the IFRS Foundation's website.

20.2.1 Time value of money

The objective of a present value technique is to convert future cash flows into a present amount (i.e., a value as at the measurement date). Therefore, time value of money is a fundamental element of any present value technique. [IFRS 13.B13(c)]. A basic principle in finance theory, time value of money holds that 'a dollar today is worth more than a dollar tomorrow', because the dollar today can be invested and earn interest immediately. Therefore, the discount rate in a present value technique must capture, at a minimum, the time value of money. For example, a discount rate equal to the risk-free rate of interest encompasses only the time value element of a present value technique. If the risk-free rate is used as a discount rate, the expected cash flows must be adjusted into certainty-equivalent cash flows to capture any uncertainty associated with the item being measured and the compensation market participants would require for this uncertainty.

20.2.2 Risk and uncertainty in a present value technique

At its core, the concept of value measures expected rewards against the risks of realising those rewards. Present value techniques implicitly contain uncertainty as they generally deal with estimates rather than known amounts. In many cases, both the amount and timing of the cash flows are uncertain. The standard notes that even contractually fixed amounts are uncertain if there is risk of default. [IFRS 13.B15].

Market participants generally require compensation for taking on the uncertainty inherent in the cash flows of an asset or a liability. This compensation is known as a risk premium. IFRS 13 states that in order to faithfully represent fair value, a present value technique should include a risk premium. The standard acknowledges that determining the appropriate risk premium might be difficult. However, the degree of difficulty alone is not a sufficient reason to exclude a risk premium if market participants would demand one. [IFRS 13.B16].

Depending on the present value technique used, risk may be incorporated in the cash flows or in the discount rate. However, identical risks should not be captured in both the cash flows and the discount rate in the same valuation analysis. For example, if the probability of default and loss given default for a liability are already incorporated in the discount rate (i.e., a risk-adjusted discount rate), the projected cash flows should not be further adjusted for the expected losses.

The present value techniques discussed in the application guidance to IFRS 13 differ in how they adjust for risk and in the type of cash flows they use, as follows: [IFRS 13.B17]

- The discount rate adjustment technique uses a risk-adjusted discount rate and contractual, promised or most likely cash flows (see section 20.3 below).
- Method 1 of the expected present value technique uses certainty-equivalent cash flows and a risk-free rate (see section 20.4 below).
- Method 2 of the expected present value technique uses expected cash flows that are not risk-adjusted and a discount rate adjusted to include the risk premium that market participants require. That rate is different from the rate used in the discount rate adjustment technique (see section 20.4 below).

If the risks are accounted for fully and appropriately, the three present value techniques noted above should all produce an identical fair value measurement, regardless of whether risk is captured in the cash flows or the discount rate (see Illustration 20-1 in section 20.4.1 below for a numerical example illustrating this point).

20.3 Discount rate adjustment technique

The discount rate adjustment technique attempts to capture all of the risk associated with the item being measured in the discount rate and is most commonly used to value assets and liabilities with contractual payments, such as debt instruments. This technique uses a single set of cash flows from the range of possible estimated amounts and discounts those cash flows using a rate that reflects all of the risk related to the cash flows.

According to the standard, the cash flows may be contractual or promised or the most likely cash flows. In all cases, those cash flows are conditional upon the occurrence of specified events. For example, contractual or promised cash flows for a bond are conditional on the event of no default by the debtor. [IFRS 13.B18].

The discount rate is derived from observable rates of return for comparable assets and liabilities that are traded in the market and incorporates all of the following:

- The risk-free interest rate
- Market participants' expectations about possible variations in the amount or timing of the cash flows
- The price for bearing the uncertainty inherent in these cash flows (or risk premium)
- Other risk factors specific to the asset or liability

As such, under this technique the cash flows are discounted at an observed or estimated market rate appropriate for such conditional cash flows (that is, a market rate of return).

The discount rate adjustment technique requires an analysis of market data for comparable assets or liabilities. Comparability is established by considering: [IFRS 13.B19]

- The nature of the cash flows - for example, whether the cash flows are contractual or non-contractual and whether the cash flows are likely to respond similarly to changes in economic conditions
- Other factors, such as credit standing, collateral, duration, restrictive covenants and liquidity

Alternatively, if a single comparable asset or liability does not fairly reflect the risk inherent in the cash flows of the asset or liability being measured, it may be possible to derive a discount rate using a 'build-up' approach. That is, the entity should use data for several comparable assets or liabilities in conjunction with the risk-free yield curve. The extract in section 20.3.1 below illustrates this further.

If the discount rate adjustment technique is applied to fixed receipts or payments, the adjustment for any risk inherent in the cash flows is included in the discount rate. In some applications of the discount rate adjustment technique to cash flows that are not fixed receipts or payments, an entity may need to make an adjustment to the cash flows to achieve comparability with the observed asset or liability from which the discount rate is derived. [IFRS 13.B22].

Although IFRS 13 does not prescribe when a particular present value technique should be used, the extent of market data available for a particular type of asset or liability will influence when use of the discount rate adjustment technique is appropriate. IFRS 13 states that the "discount rate adjustment technique requires an analysis of market data for comparable assets or liabilities". [IFRS 13.B19]. Therefore, certain assets and liabilities may not lend themselves to the use of the discount rate adjustment technique, even though it may be possible to derive discount rates using market data from several comparable items when no single observable rate of return reflects the risk inherent in the item being measured.

The most challenging aspect of applying this technique is the identification of market observable rates of return that appropriately capture the risk inherent in the asset or liability being measured. Understanding the various risk factors associated with certain types of assets and liabilities is not always easy and quantifying the effect of these factors is even more difficult. However, it may be helpful to deconstruct a discount rate into its component parts to understand what risks are being considered; beginning with the risk-free rate, which represents the time value of money. In addition to the risk-free rate, entities should consider credit or non-performance risk if the subject asset or liability requires performance in the future (including, but not limited to, a cash payment). For example, in the case of a financial asset, the discount rate would include compensation required by market participants to assume the risk that the counterparty will be unable to fulfil its obligation. Not all discount rates require an explicit adjustment for credit (or non-performance) risk. Equity interests, for example, may assume perpetual residual cash flows from the operations of a business, rather than a contractual future payment. In this case, an additional component of risk is captured through an equity risk premium, instead of a credit risk adjustment. The long-term incremental rate of return of equity interests over long-term risk-free interest rates may generally represent an identifiable component of risk.

When applying the discount rate adjustment technique, the credit spread (above the risk-free rate) will implicitly include assumptions about probabilities of default and losses given default without requiring an adjustment to the projected cash flows used in the analysis. However, a credit adjusted risk-free rate may not sufficiently capture all the risk related to the subject asset or liability. Depending on facts and circumstances of the item being measured, the observable rate of return should also capture other potential variability with respect to the timing and amount of the cash flows (e.g., potential variability due to prepayment risk for financial instruments such as mortgage backed securities) and the price for bearing such uncertainty (risk premium).

In addition, when assessing discount rates, it is important to keep in mind the exit price objective of a fair value measurement in IFRS 13. Because the discount rate represents the rate of return required by market participants in the current market, it should also incorporate factors such as illiquidity and the current risk appetite of market participants.

20.3.1 Illustrative example of the discount rate adjustment technique

The following example from IFRS 13 illustrates how a build-up approach is applied when using the discount rate adjustment technique. [IFRS 13.B20, IFRS 13.B21].

Extract from IFRS 13

- B20** To illustrate a build-up approach, assume that Asset A is a contractual right to receive CU800¹ in one year (ie there is no timing uncertainty). There is an established market for comparable assets, and information about those assets, including price information, is available. Of those comparable assets:
- (a) Asset B is a contractual right to receive CU1,200 in one year and has a market price of CU1,083. Thus, the implied annual rate of return (ie a one-year market rate of return) is 10.8 per cent $[(CU1,200 / CU1,083) - 1]$.
 - (b) Asset C is a contractual right to receive CU700 in two years and has a market price of CU566. Thus, the implied annual rate of return (ie a two-year market rate of return) is 11.2 per cent $[(CU700 / CU566)^{0.5} - 1]$.
 - (c) All three assets are comparable with respect to risk (ie dispersion of possible pay-offs and credit).
- B21** On the basis of the timing of the contractual payments to be received for Asset A relative to the timing for Asset B and Asset C (ie one year for Asset B versus two years for Asset C), Asset B is deemed more comparable to Asset A. Using the contractual payment to be received for Asset A (CU800) and the one-year market rate derived from Asset B (10.8 per cent), the fair value of Asset A is CU722 $(CU800 / 1.108)$. Alternatively, in the absence of available market information for Asset B, the one-year market rate could be derived from Asset C using the build-up approach. In that case the two-year market rate indicated by Asset C (11.2 per cent) would be adjusted to a one-year market rate using the term structure of the risk-free yield curve. Additional information and analysis might be required to determine whether the risk premiums for one-year and two-year assets are the same. If it is determined that the risk premiums for one-year and two-year assets are not the same, the two-year market rate of return would be further adjusted for that effect.

¹ In this IFRS monetary amounts are denominated in 'currency units (CU)'.

As evidenced in the extract above, using a build-up approach requires that market data for comparable assets be available. In addition, when applying the build-up approach, significant judgement may be required in determining comparability between the item being measured and the available benchmarks, as well as quantifying the appropriate adjustments necessary to account for any differences that may exist between the item being measured and the applicable benchmark (e.g., differences in credit risks, nature and timing of the cash flows).

20.4 Expected present value technique

The expected present value technique is typically used in the valuation of business entities, assets and liabilities with contingent or conditional payouts and items for which discount rates cannot be readily implied from observable transactions.

This technique uses, as a starting point, a set of cash flows that represent the probability-weighted average of all possible future cash flows (i.e., the expected cash flows). Unlike the cash flows used in the discount rate adjustment technique (i.e., contractual, promised or most likely amounts), expectations about possible variations in the amount and/or timing of the cash flows are explicitly incorporated in the projection of the expected cash flows themselves, rather than solely in the discount rate. [IFRS 13.B23].

The application guidance in IFRS 13 identifies two types of risk, based on portfolio theory: [IFRS 13.B24]

- (a) *Unsystematic (diversifiable) risk* - the risk specific to a particular asset or liability
- (b) *Systematic (non-diversifiable) risk* - the common risk shared by an asset or a liability with the other items in a diversified portfolio (i.e., market risk)

According to portfolio theory, in a market in equilibrium, market participants will be compensated only for bearing the systematic risk inherent in the cash flows. If the market is inefficient or is out of equilibrium, other forms of return or compensation might be available.

While, in theory, all possible future cash flows are meant to be considered, in practice, a discrete number of scenarios are often used to capture the probability distribution of potential cash flows. The number of possible outcomes to be considered will generally depend on the characteristics of the specific asset or liability being measured. For example, the outcome of a contingency may be binary, therefore, only two possible outcomes need be considered. In contrast, certain complex financial instruments are valued using option pricing models, such as Monte Carlo simulations, that generate thousands of possible outcomes. Estimating the probability distribution of potential outcomes requires judgement and will depend on the nature of the item being measured.

Assuming the entity's use of the asset is consistent with that of market participants, an entity might look to its own historical performance, current and expected market environments (including expectations of volatility) and budgetary considerations to develop expectations about future cash flows and appropriate weightings. However, as discussed in section 18.1 above, the use of an entity's own data can only be a starting point when measuring fair value. Adjustments may be needed to ensure that the measurement is consistent with market participant assumptions. For example, synergies that can be realised by the entity should not be considered unless they would similarly be realised by market participants.

The concept of a risk premium is just as important under an expected present value technique as it is under the discount rate adjustment technique. The use of probability-weighted cash flows under an expected present value technique does not remove the need to consider a market risk premium when estimating fair value. While 'expected cash flows' capture the uncertainty in the amount and timing of the future cash flows, the probability weighting does not include the compensation market participants would demand for bearing this uncertainty. For example, assume Asset A is a contractual right to receive CU10,000. Asset B has a payout that is conditional upon the toss of a coin: if 'heads', Asset B pays CU20,000; and if 'tails' it pays nothing. Assuming no risk of default, both assets have an expected value of CU10,000 (i.e., $CU10,000 \times 100\%$ for Asset A, and $CU20,000 \times 50\% + CU0 \times 50\%$ for Asset B). However, risk-averse market participants would find Asset A more valuable than Asset B, as the cash-certain payout of CU10,000 for Asset A is less risky than the expected cash flow of CU10,000 for Asset B.

Although the variability in the cash flows of Asset B has been appropriately captured by probability-weighting all the possible cash flows (i.e., there is no subjectivity involved in the determination of the probability weighting in the simplified example since the payout is based on a coin toss), Asset B's expected value does not capture the compensation market participants would require for bearing the uncertainty in the cash flows. As such, all else being equal, the price for Asset B would be lower than the price for Asset A. That is, the required rate of return for Asset B would be higher than that for Asset A, in order to compensate the holder for the incremental risk in Asset B's cash flows (relative to Asset A).

20.4.1 Expected present value technique - method 1 and method 2

The standard describes two methods of the expected present value technique:

- **Method 1** - the expected cash flows are adjusted for the systematic (market) risk by subtracting a cash risk premium. This results in risk-adjusted expected cash flows that represent a certainty-equivalent cash flow. The cash flows are then discounted at a risk-free interest rate. [IFRS 13.B25].

Because all of the risk factors have been incorporated into the cash flows under Method 1, the discount rate used would only capture the time value of money. That is, use of a risk-free discount rate is appropriate when using this technique, provided that credit risk considerations are not applicable or have already been considered in the cash flows.

A certainty-equivalent cash flow is an expected cash flow adjusted for risk so that a market participant is indifferent to trading a certain cash flow for an expected cash flow. For example, if a market participant was willing to trade an expected cash flow of CU1,200 for a cash flow that the market participant is certain to receive of CU1,000, the CU1,000 is the certainty-equivalent of the CU1,200 (i.e., the CU200 would represent the cash risk premium). [IFRS 13.B25].

- **Method 2** - adjusts for systematic (market) risk by applying a risk premium to the risk-free interest rate (i.e., the risk premium is captured in the discount rate). As such, the discount rate represents an expected rate of return (i.e., the expected rate associated with probability-weighted cash flows). In Method 2, the expected cash flows are discounted using this rate. [IFRS 13.B26].

The use of a risk-free discount rate is not appropriate under Method 2, because the expected cash flows, while probability weighted, do not represent a certainty-equivalent cash flow. The standard suggests that models used for pricing risky assets, such as the capital asset pricing model, could be used to estimate the expected rate of return. As discussed in section 20.3 above, the discount rate used in the discount rate adjustment technique also uses a rate of return, but it is related to conditional cash flows. A discount rate determined in accordance with the discount rate adjustment technique is likely to be higher than the discount rate used in Method 2, which is an *expected* rate of return relating to expected or probability-weighted cash flows. [IFRS 13.B26].

The key difference between Method 1 and Method 2 is where the market risk premium is captured. Capturing the risk premium in the cash flows versus the discount rate has no effect on relative fair values under each method. That is, Method 1 and Method 2 should result in the same fair value measurement, all else being equal.

The extract below illustrates the application of Method 1 and Method 2 when measuring fair value.

[IFRS 13.B27, IFRS 13.B28, IFRS 13.B29].

Extract from IFRS 13

B27 To illustrate Methods 1 and 2, assume that an asset has expected cash flows of CU780 in one year determined on the basis of the possible cash flows and probabilities shown below. The applicable risk-free interest rate for cash flows with a one-year horizon is 5 per cent, and the systematic risk premium for an asset with the same risk profile is 3 per cent.

Possible cash flows	Probability	Probability-weighted cash flows
CU500	15%	CU75
CU800	60%	CU480
CU900	25%	CU225
Expected cash flows		CU780

B28 In this simple illustration, the expected cash flows (CU780) represent the probability-weighted average of the three possible outcomes. In more realistic situations, there could be many possible outcomes. However, to apply the expected present value technique, it is not always necessary to take into account distributions of all possible cash flows using complex models and techniques. Rather, it might be possible to develop a limited number of discrete scenarios and probabilities that capture the array of possible cash flows. For example, an entity might use realised cash flows for some relevant past period, adjusted for changes in circumstances occurring subsequently (eg changes in external factors, including economic or market conditions, industry trends and competition as well as changes in internal factors affecting the entity more specifically), taking into account the assumptions of market participants.

B29 In theory, the present value (ie the fair value) of the asset's cash flows is the same whether determined using Method 1 or Method 2, as follows:

- (a) Using Method 1, the expected cash flows are adjusted for systematic (ie market) risk. In the absence of market data directly indicating the amount of the risk adjustment, such adjustment could be derived from an asset pricing model using the concept of certainty equivalents. For example, the risk adjustment (ie the cash risk premium of CU22) could be determined using the systematic risk premium of 3 per cent ($CU780 - [CU780 \times (1.05 / 1.08)]$), which results in risk-adjusted expected cash flows of CU758 ($CU780 - CU22$). The CU758 is the certainty equivalent of CU780 and is discounted at the risk-free interest rate (5 per cent). The present value (ie the fair value) of the asset is CU722 ($CU758 / 1.05$).
- (b) Using Method 2, the expected cash flows are not adjusted for systematic (ie market) risk. Rather, the adjustment for that risk is included in the discount rate. Thus, the expected cash flows are discounted at an expected rate of return of 8 per cent (ie the 5 per cent risk-free interest rate plus the 3 per cent systematic risk premium). The present value (ie the fair value) of the asset is CU722 ($CU780 / 1.08$).

The selection of Method 1 or Method 2 will depend on facts and circumstances specific to the asset or liability being measured, the extent to which sufficient data are available and the judgements applied. [IFRS 13.B30]. However, in practice, Method 1 is rarely used because in most cases, to mathematically estimate the cash certainty adjustment, one must already know the market risk premium that would be applied to the discount rate under Method 2.

In Illustration 20-1 below, we have expanded the example from IFRS 13 to include the discount rate adjustment technique (described in section 20.3 above). Illustration 20-1 shows how all three techniques converge to the same fair value measurement, while highlighting the difference in the discount rates applied under each approach.

Illustration 20-1: Comparison of present value techniques

An entity is estimating the fair value of an asset that will expire in one year and has determined that the probability distribution of the future cash flows is as follows:

Possible cash flows	Probability	Probability-weighted cash flows
CU		CU
500	15%	75
800	60%	480
900	25%	225
Expected cash flows		780

Assume that the risk-free interest rate is 5% and the risk premium is 3%. The table below shows that all three present value techniques yield identical results:

Method	Contractual cash flows	Most likely cash flows	Expected cash flows	Certainty-equivalent adjustment	Certainty-equivalent cash flows	Discount rate	Present value
Discount rate adjustment technique	N/A	CU800	N/A	N/A	N/A	10.8%	CU722
EPV Method 1^(a)	N/A	N/A	CU780	CU(22)	CU758	5.0%	CU722
EPV Method 2^(b)	N/A	N/A	CU780	N/A	N/A	8.0%	CU722

(a) Adjust expected cash flows for risk premium

(b) Adjust discount rate for risk premium

Method	Fair value	Calculation
Discount rate adjustment technique	CU722	= Most likely cash flow / (1 + risk-free rate + adjustment for cash flow uncertainty + risk premium)
EPV Method 1	CU722	= (Expected cash flow - certainty-equivalent adjustment ^(a)) / (1 + risk-free rate)
EPV Method 2	CU722	= Expected cash flow / (1 + risk-free rate + risk premium)

(a) Certainty-equivalent adjustment = $\frac{\text{Expected cash flow} - [\text{Expected cash flow} \times (1 + \text{risk-free rate})]}{(1 + \text{risk-free rate} + \text{risk premium})}$

The three techniques differ in the manner in which the risks in the cash flows are captured, but not the level of the risk inherent in those cash flows. In the discount rate adjustment technique, the most likely cash flow (CU800) is discounted at a rate that reflects all the risk inherent in the investment (i.e., time value of money, possible variations in the amount of cash flows, risk premium).

Method 1 of the expected present value technique incorporates asset-specific and systematic uncertainty directly into the cash flows (certainty-equivalent cash flow of CU758) and therefore uses the risk-free rate for discounting, as all the risks associated with the investment are incorporated in the cash flows. The adjustment to the cash flows for systematic risk is based on the 3% risk premium.

Instead of using the risk premium to estimate a certainty-equivalent cash flow, Method 2 of the expected present value technique incorporates the risk premium in the discount rate. The difference between the discount rate in Method 1 and Method 2 is the market risk premium.

Appendix B - Index of Frequently asked questions

Question 4-1:	Does IFRS 13 allow fair value to be measured by reference to an asset's (or liability's) components?	1054
Question 4-2:	In determining the fair value of a restricted security, is it appropriate to apply a constant discount percentage over the entire life of the restriction?	1061
Question 4-3:	Considerations when a restriction is present on a call option for its entire contractual life	1061
Question 5-1:	Can an entity have more than one principal market for the same asset or liability?	1064
Question 5-2:	In situations where an entity has access to multiple markets, is the determination of the principal market based on entity-specific volume and activity or market-based volume and activity?	1064
Question 7-1:	Are all transactions entered into to meet regulatory requirements or transactions initiated during bankruptcy assumed to be not orderly?	1076
Question 7-2:	Is it possible for orderly transactions to take place in a 'distressed' market?	1076
Question 8-1:	Are transaction costs in IFRS 13 the same as 'costs to sell' in other IFRS accounting standards?	1081
Question 8-2:	Transaction costs in IFRS 13 versus acquisition-related transaction costs in other IFRS accounting standards	1082
Question 10-1:	Do the requirements of IFRS 13 regarding third-party credit enhancements in a fair value measurement apply to liabilities other than debt?	1103
Question 10-2:	Does IFRS 13 require an entity to consider the effects of both counterparty credit risk and its own credit risk when valuing its derivative transactions?	1103
Question 11-1:	Is there a minimum level of offset required to use the portfolio approach?	1114
Question 11-2:	Can Level 1 instruments be included in a portfolio of financial instruments with offsetting risks when calculating the net exposure to a particular market risk?	1114
Question 14-1:	What does the bid-ask spread include?	1136
Question 14-2:	How should values provided by central clearing organisations for margin purposes be evaluated when determining the fair value of centrally cleared derivatives for financial reporting?	1138

Appendix C - Defined terms

Extract from IFRS 13

Appendix A Defined terms

This appendix is an integral part of the IFRS.

active market	A market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis.
cost approach	A valuation technique that reflects the amount that would be required currently to replace the service capacity of an asset (often referred to as current replacement cost).
entry price	The price paid to acquire an asset or received to assume a liability in an exchange transaction.
exit price	The price that would be received to sell an asset or paid to transfer a liability.
expected cash flow	The probability-weighted average (ie mean of the distribution) of possible future cash flows.
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.
highest and best use	The use of a non-financial asset by market participants that would maximise the value of the asset or the group of assets and liabilities (eg a business) within which the asset would be used.
income approach	Valuation techniques that convert future amounts (eg cash flows or income and expenses) to a single current (ie discounted) amount. The fair value measurement is determined on the basis of the value indicated by current market expectations about those future amounts.
inputs	The assumptions that market participants would use when pricing the asset or liability, including assumptions about risk, such as the following: (a) the risk inherent in a particular valuation technique used to measure fair value (such as a pricing model); and (b) the risk inherent in the inputs to the valuation technique. Inputs may be observable or unobservable.
Level 1 inputs	Quoted prices (unadjusted) in active markets for identical assets or liabilities that the entity can access at the measurement date.
Level 2 inputs	Inputs other than quoted prices included within Level 1 that are observable for the asset or liability, either directly or indirectly.
Level 3 inputs	Unobservable inputs for the asset or liability.
market approach	A valuation technique that uses prices and other relevant information generated by market transactions involving identical or comparable (ie similar) assets, liabilities or a group of assets and liabilities, such as a business.
market-corroborated inputs	Inputs that are derived principally from or corroborated by observable market data by correlation or other means.

market participant	<p>Buyers and sellers in the principal (or most advantageous) market for the asset or liability that have all of the following characteristics:</p> <ul style="list-style-type: none"> (a) They are independent of each other, ie they are not related parties as defined in IAS 24, although the price in a related party transaction may be used as an input to a fair value measurement if the entity has evidence that the transaction was entered into at market terms. (b) They are knowledgeable, having a reasonable understanding about the asset or liability and the transaction using all available information, including information that might be obtained through due diligence efforts that are usual and customary. (c) They are able to enter into a transaction for the asset or liability. (d) They are willing to enter into a transaction for the asset or liability, ie they are motivated but not forced or otherwise compelled to do so.
most advantageous market	The market that maximises the amount that would be received to sell the asset or minimises the amount that would be paid to transfer the liability, after taking into account transaction costs and transport costs.
non-performance risk	The risk that an entity will not fulfil an obligation. Non-performance risk includes, but may not be limited to, the entity's own credit risk.
observable inputs	Inputs that are developed using market data, such as publicly available information about actual events or transactions, and that reflect the assumptions that market participants would use when pricing the asset or liability.
orderly transaction	A transaction that assumes exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities; it is not a forced transaction (eg a forced liquidation or distress sale).
principal market	The market with the greatest volume and level of activity for the asset or liability.
risk premium	Compensation sought by risk-averse market participants for bearing the uncertainty inherent in the cash flows of an asset or a liability. Also referred to as a 'risk adjustment'.
transaction costs	<p>The costs to sell an asset or transfer a liability in the principal (or most advantageous) market for the asset or liability that are directly attributable to the disposal of the asset or the transfer of the liability and meet both of the following criteria:</p> <ul style="list-style-type: none"> (a) They result directly from and are essential to that transaction. (b) They would not have been incurred by the entity had the decision to sell the asset or transfer the liability not been made (similar to costs to sell, as defined in IFRS 5).
transport costs	The costs that would be incurred to transport an asset from its current location to its principal (or most advantageous) market.
unit of account	The level at which an asset or a liability is aggregated or disaggregated in an IFRS for recognition purposes.
unobservable inputs	Inputs for which market data are not available and that are developed using the best information available about the assumptions that market participants would use when pricing the asset or liability.

Appendix D - Convergence with US GAAP

D.1 The development of IFRS 13

IFRS 13 was the result of a convergence project between the IASB and the US Financial Accounting Standards Board (FASB). However, the Boards began developing their fair value measurement standards separately. The FASB issued Statement of Financial Accounting Standards No. 157, *Fair Value Measurements* (SFAS 157, now ASC 820) in 2006. The IASB's initial discussion paper issued in 2006 and subsequent exposure draft issued in 2009, were developed using the requirements of SFAS 157. However, the proposed requirements were not wholly consistent with that guidance and responses from constituents emphasised the need for a common set of requirements regarding the determination of fair value measurements under both IFRS and US GAAP. As a result, the Boards began joint discussions in 2010. From the IASB's perspective, the project had "the following objectives:

- (a) to establish a single set of requirements for all fair value measurements required or permitted by IFRSs to reduce complexity and improve consistency in their application, thereby enhancing the comparability of information reported in financial statements;
- (b) to clarify the definition of fair value and related guidance to communicate the measurement objective more clearly;
- (c) to enhance disclosures about fair value measurements that will help users of financial statements assess the valuation techniques and inputs used to develop fair value measurements; and
- (d) to increase the convergence of IFRSs and US generally accepted accounting principles (GAAP)".

[IFRS 13.BC6].

The Boards' joint discussions resulted in the issuance of IFRS 13 and Accounting Standards Update (ASU) 2011-04 and created a generally uniform framework for applying fair value measurement in both IFRS and US GAAP (refer to section D.2 below for further discussion of the differences).

IFRS 13 was also part of the IASB's response to G20 requests in relation to the financial crisis. Therefore, the disclosures required by the standard are intended to help users assess the valuation techniques and inputs used to measure fair value. The IASB had originally proposed to require entities to disclose a quantitative sensitivity analysis for non-financial assets and liabilities measured at fair value. While the proposed disclosures were favoured by users and were consistent with the recommendations from the IASB's Expert Advisory Panel, the proposals were heavily criticised by preparers. Their concerns included the additional cost involved. Therefore, the Boards decided not to include this requirement and sensitivity disclosures are only required for financial assets and liabilities (this continues the current disclosure requirements in IFRS 7). [IFRS 13.BC202-208].

As part of the PIR of IFRS 13, the board received feedback that maintaining convergence with US GAAP was important in that it leads to increased comparability for financial statements globally. This increased comparability is facilitating efficient capital markets, increased user confidence and reduced compliance costs. It was also indicated that the convergence has led to more material to be available for stakeholders around fair value measurements.³⁹

D.2 US GAAP differences

As noted above, the Boards' joint fair value measurement project resulted in both the issuance of IFRS 13 and amendments to particular aspects of ASC 820. These standards now have a consistent definition of fair value and represent converged guidance in relation to how to measure fair value. However, some differences still remain. The main differences are discussed in sections D.2.1 to D.2.5 below.

It is also worth noting that there continue to be differences between IFRS and US GAAP as to what is measured at fair value, but those differences were outside the scope of the joint project, which focused on how to measure fair value.

³⁹ [IFRS Project Report and Feedback Statement](#), *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, p.17. Available on the Accounting Foundation's website.

In 2014, the Financial Accounting Foundation issued its post-implementation review of SFAS 157, concluding that the standard met its intended objectives.⁴⁰ While agreeing that a comprehensive review of the fair value guidance was not needed, the FASB noted that it plans to potentially address more challenging aspects of the standard in the years ahead.⁴¹ The FASB issued an amendment *Fair Value Measurement (Topic 820) Disclosure Framework* (ASU 2018-13) in August 2018 that eliminates, adds and modifies certain disclosure requirements for fair value measurements as part of its disclosure framework project.

The amendments were effective for all entities for fiscal years beginning after 15 December 2019 and for interim periods within those fiscal years. An entity was permitted to early adopt either the entire standard or only the provisions that eliminate or modify requirements. The IASB has not made similar amendments to IFRS 13, as the discussions confirmed through the PIR, the Board is aware of all the issues the FASB identified. As discussed in section 19 above, the IASB has fed the PIR findings regarding the usefulness of disclosures into the work on Better Communications in Financial Reporting.

D.2.1 Practical expedient for alternative investments

ASC 820 provides a practical expedient to measure the fair value of certain investments in investment companies (e.g., investments in hedge funds or private equity funds that do not have readily determinable fair values) using NAV, without adjustment.⁴² Furthermore, in May 2015, the FASB issued ASU 2015-07 - *Fair Value Measurement (Topic 820): Disclosures for Investments in Certain Entities That Calculate Net Asset Value per Share (or Its Equivalent)*, which eliminates the requirement to categorise in the fair value hierarchy investments measured using the NAV practical expedient.⁴³ While this exemption provides some relief for entities, they now have additional disclosure requirements specific to investments that are measured using the NAV practical expedient. These requirements are intended to help financial statement users reconcile amounts reported to the face of the financial statements and better understand the nature and risk of these investments, including whether the investments, if sold, are likely to be sold at amounts different from their NAV.

IFRS 13 does not have a similar practical expedient. Nor does it provide a similar disclosure exemption or requirements specific to such investments. Therefore, IFRS preparers cannot presume that NAV, or an equivalent measure, will be the same as fair value as measured in accordance with IFRS 13 (this is discussed further in section 2.5.1.A above). In addition, entities will need to categorise such investments within the fair value hierarchy and comply with the general disclosure requirements in IFRS 13.

At the time IFRS 13 was issued, the IASB believed it would be difficult to identify when such a practical expedient would be applied, given the different practices entities across the world use to calculate NAV. This difference was expected to be addressed as part of the IASB's project on Investment Entities. However, when the IASB issued *Investment Entities (Amendments to IFRS 10, IFRS 12 and IAS 27)* in October 2012, a footnote was added to the Basis for Conclusions to IFRS 13 which confirmed it had reconsidered providing a net asset value practical expedient, but decided against providing one because of the different calculation methods around the world and because it was outside the scope of the Investment Entities project to provide fair value measurement guidance for investments in investment entities. [IFRS 13.BC238(a)].

43 FASB Accounting Standards Codification Topic 820, *Fair Value Measurements and Disclosures*, FASB, section 10-35-54B, which was added by ASU 2015-07, *Fair Value Measurement (Topic 820): Disclosures for Investments in Certain Entities That Calculate Net Asset Value per Share (or Its Equivalent)*.

D.2.2 Fair value of liabilities with a demand feature

The guidance in IFRS on measuring the fair value of a financial liability with a demand feature differs slightly from US GAAP. IFRS 13 states that the fair value of a liability with a demand feature cannot be less than the present value of the amount payable on demand, which was consistent with the existing requirements in IFRS. US GAAP has specific industry guidance for banks and depository institutions.⁴⁴ The industry specific guidance states that the fair value of deposit liabilities with no defined maturities is the amount payable on demand at the reporting date. Since deposit liabilities, withdrawable on demand, of banks and depository institutions are excluded from the scope of the fair value option guidance in ASC 825, the industry guidance in US GAAP around how to fair value these liabilities is applicable to disclosure only. [IFRS 13.BC238(b)].

D.2.3 Recognition of day-one gains and losses

While fair value is defined in IFRS 13 as an exit price (which can differ from an entry price), the standard defers to other IFRS accounting standards on whether to recognise any difference between fair value and transaction price at initial recognition, that is, day-one gains or losses. IFRS 9 restricts the recognition of day-one gains and losses when fair value is determined using unobservable inputs.

US GAAP contains no specific threshold regarding the observability of fair value inputs. As such, US GAAP does not specifically prohibit the recognition of day-one gains or losses even when the fair value measurement is based on significant unobservable inputs (i.e., a Level 3 measurement - see section 15.2 above for further discussion regarding categorisation within the fair value hierarchy).

D.2.4 Fair value of equity securities subject to contractual sale restrictions

If an equity security is subject to a contractual sale restriction, an IFRS preparer must assess whether it is a characteristic of the asset or the holder, as is discussed in section 4.2.2 above. The requirements in IFRS and US GAAP are generally converged in this area. However, in June 2022, the FASB issued an amendment to ASC 820⁴⁵ to specify that, under US GAAP, a contractual sale restriction (e.g., restrictions on the sale of securities issued in capital-raising and other transactions, such as business combinations) does not affect the fair value of an equity security. After adopting the amendment, these securities will be measured in the same way as identical equity securities that are not subject to such a restriction (e.g., based on the quoted price). This is because the amendment specifies that such a contractual sale restriction is a characteristic of the entity holding the security, rather than a characteristic of the asset.

The amendment is intended to eliminate diversity in practice under US GAAP in the measurement of the fair value of equity securities subject to contractual sale restrictions. To value these securities, some US GAAP stakeholders previously applied a discount to the fair value of an identical equity security that is not subject to a contractual sale restriction, while others believed the application of such a discount was inconsistent with the fair value measurement principles in ASC 820.

No similar amendment has been proposed under IFRS. Therefore, entities could account for similar restrictions differently under US GAAP and IFRS if an IFRS preparer concludes the contractual sale restriction is a characteristic of the asset.

D.2.5 Disclosures

IFRS 13 and ASC 820 have some differences in the disclosure requirements for fair value measurements. For example, IFRS 13 does not provide exceptions to its disclosure requirements for non-public entities, whereas ASC 820 does. However, *IFRS for Small and Medium-Sized Entities* addresses the accounting for entities that do not have public accountability, and the disclosures about their fair value measurements. [IFRS 13.BC238(c)].

44 FASB Accounting Standards Codification Topic 825, *Financial Instruments* and Topic 942, *Financial Services - Depository and Lending*, FASB.

45 FASB [Accounting Standards Update 2022-03](#), *Fair Value Measurement (Topic 820): Fair Value Measurement of Equity Securities Subject to Contractual Sale Restrictions*, FASB. The amendment will be applied prospectively for fiscal years beginning after 15 December 2023 for public business entities (as defined), with early adoption permitted. All other entities have a one-year deferral, with early adoption permitted. The transition requirements differ depending on whether an entity is an investment company.

Overview

An entity can engage in foreign currency activities in the following two ways:

- It may enter directly into transactions which are denominated in foreign currencies, the results of which need to be translated into the currency in which the company measures its results and financial position.
- It may conduct foreign operations through a foreign entity, such as a subsidiary, associate, joint arrangement or branch which keeps its accounting records in terms of its own currency. In this case the entity will need to translate the financial statements of the foreign entity for the purposes of inclusion in its consolidated financial statements.

In addition, an entity may choose to present its financial statements in a different currency.

IAS 21 *Foreign Currencies* sets out the requirements for all of these situations and this chapter addresses all aspects of that standard.

IAS 21 does not address the accounting for hedges of foreign currency risk, that being addressed in IFRS 9 *Financial Instruments* (see Chapter 49).

Nor does IAS 21 address the reporting of foreign currency cash flows in the statement of cash flows - that is addressed in IAS 7 *Statement of Cash Flows* although the approach set out in IAS 7 (see Chapter 36) is broadly consistent with IAS 21.

What you need to know

- Each entity, whether a standalone entity, a parent with foreign operations or a foreign operation such as a subsidiary determines its functional currency.
- An entity's functional currency is the currency of the primary economic environment in which the entity operates.
- An entity draws up its financial statements initially by translating foreign currency items into its functional currency.
- Most of the exchange differences arising from this process are recognised in profit or loss.
- When preparing financial statements the results and financial position of the entity (or, in the case of consolidated financial statements, each entity within the group) are translated into a presentation currency, which may be different to the entity's (or parent's) functional currency.
- Exchange differences arising from this process are recognised in other comprehensive income.
- Exchange differences recognised in other comprehensive income are reclassified to profit or loss on disposal of a foreign operation.

1 Introduction

1.1 Background

An entity can engage in foreign currency activities in two ways. It may enter directly into transactions which are denominated in foreign currencies, the results of which need to be translated into the currency in which the company measures its results and financial position. Alternatively, it may conduct foreign operations through a foreign entity, such as a subsidiary, associate, joint arrangement or branch which keeps its accounting records in terms of its own currency. In this case it will need to translate the financial statements of the foreign entity for the purposes of inclusion in the consolidated financial statements.

Before an international standard was developed, there were four distinct methods which could be used in the translation process:

- (a) *Current rate method* - all assets and liabilities are translated at the current rate of exchange, i.e., the exchange rate at the end of the reporting period
- (b) *Temporal method* - assets and liabilities carried at current prices (e.g., cash, receivables, payables, and investments at market value) are translated at the current rate of exchange. Assets and liabilities carried at past prices (e.g., property, investments at cost, prepayments) are translated at the rate of exchange in effect at the dates to which the prices pertain
- (c) *Current/non-current method* - all current assets and current liabilities are translated at the current rate of exchange. Non-current assets and liabilities are translated at historical rates, i.e., the exchange rate in effect at the time the asset was acquired or the liability incurred
- (d) *Monetary/non-monetary method* - monetary assets and liabilities, i.e., items which represent the right to receive or the obligation to pay a fixed amount of money, are translated at the current rate of exchange. Non-monetary assets and liabilities are translated at the historical rate

There was no consensus internationally on the best theoretical approach to adopt. In essence, the arguments surround the choice of exchange rates to be used in the translation process and the subsequent treatment of the exchange differences which arise.

1.2 Relevant pronouncements

The principal international standard dealing with this topic is IAS 21 *The Effects of Changes in Foreign Exchange Rates*, the original version of which dates back to 1983. In December 2003, the IASB issued a revised version of IAS 21 as part of a wide ranging project to improve its standards and this forms the core of the current standard. IAS 21 has been subject to a number of subsequent amendments since then, the most extensive of which was published in August 2023 and addresses the determination of an exchange rate when exchangeability between two currencies is lacking (see section 7 below).

One interpretation of the earlier version of IAS 21 issued by the SIC remains applicable. SIC-7 *Introduction of the Euro* deals with the application of IAS 21 to the changeover from the national currencies of participating Member States of the European Union to the euro and is covered in section 9 below. IFRIC 16 *Hedges of a Net Investment in a Foreign Operation* is not actually an interpretation of IAS 21, but provides guidance on applying certain aspects of the standard and is discussed in sections 6.1.4 and 6.6.3 below.

IFRIC 22 *Foreign Currency Transactions and Advance Consideration* provides guidance on determining the date of a transaction for the purposes of applying IAS 21 when consideration is paid or received in advance. This interpretation is primarily discussed in section 5.1.2 below.

2 IAS 21: Objective, scope and definitions

2.1 Objective of the standard

An entity may carry on foreign activities in two ways. It may have transactions in foreign currencies or it may have foreign operations. In addition, an entity may present its financial statements in a foreign currency. IAS 21 does not set out what the objective of foreign currency translation is, but just states that the objective of the standard is "to prescribe how to include foreign currency transactions and foreign operations in the financial statements of an entity and how to translate financial statements into a presentation currency". [IAS 21.1].

It also indicates that the principal issues to be addressed are "which exchange rate(s) to use and how to report the effects of changes in exchange rates in the financial statements". [IAS 21.2].

2.2 Scope

IAS 21 is applied: [IAS 21.3]

- (a) In accounting for transactions and balances in foreign currencies, except for those derivative transactions and balances that are within the scope of IFRS 9
- (b) In translating the results and financial position of foreign operations that are included in the financial statements of the entity by consolidation or the equity method
- (c) In translating an entity's results and financial position into a presentation currency

IFRS 9 applies to many foreign currency derivatives and, accordingly, these are excluded from the scope of IAS 21. However, those foreign currency derivatives that are not within the scope of IFRS 9 (e.g., some foreign currency derivatives that are embedded in other contracts) are within the scope of IAS 21. In addition, IAS 21 applies when an entity translates amounts relating to derivatives from its functional currency to its presentation currency. [IAS 21.4].

IAS 21 also does not apply to hedge accounting for foreign currency items, including the hedging of a net investment in a foreign operation. [IAS 21.5]. This is dealt with in IFRS 9 (or IAS 39 *Financial Instruments: Recognition and Measurement*¹) which has detailed rules on hedge accounting that are different from the requirements of IAS 21 (see Chapter 49). [IAS 21.27].

The requirements of IAS 21 are applicable to financial statements that are described as complying with International Financial Reporting Standards. They do not apply to translations of financial information into a foreign currency that do not meet these requirements, although the standard does specify information to be disclosed in respect of such 'convenience translations' (see section 11.3 below). [IAS 21.6].

IAS 21 does not apply to the presentation in a statement of cash flows of the cash flows arising from transactions in a foreign currency, or to the translation of cash flows of a foreign operation. [IAS 21.7]. These are dealt with in IAS 7 *Statement of Cash Flows* (see Chapter 36).

1 After applying IFRS 9 an entity can actually continue applying some or all of the hedge accounting requirements of IAS 39. These options are considered further in Chapter 40 and in Chapter 49 but are not dealt with any further in this chapter.

2.3 Definitions of terms

The definitions of terms which are contained in IAS 21 are as follows: [IAS 21.8]

Extract from IAS 21

- 8 The following terms are used in this Standard with the meanings specified:
- Closing rate* is the spot exchange rate at the end of the reporting period.
- A currency is *exchangeable* into another currency when an entity is able to obtain the other currency within a time frame that allows for a normal administrative delay and through a market or exchange mechanism in which an exchange transaction would create enforceable rights and obligations.
- Exchange difference* is the difference resulting from translating a given number of units of one currency into another currency at different exchange rates.
- Exchange rate* is the ratio of exchange for two currencies.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See *IFRS 13 Fair Value Measurement*.)
- Foreign currency* is a currency other than the functional currency of the entity.
- Foreign operation* is an entity that is a subsidiary, associate, joint arrangement or branch of a reporting entity, the activities of which are based or conducted in a country or currency other than those of the reporting entity.
- Functional currency* is the currency of the primary economic environment in which the entity operates.
- A *group* is a parent and all its subsidiaries.
- Monetary items* are units of currency held and assets and liabilities to be received or paid in a fixed or determinable number of units of currency.
- Net investment in a foreign operation* is the amount of the reporting entity's interest in the net assets of that operation.
- Presentation currency* is the currency in which the financial statements are presented.
- Spot exchange rate* is the exchange rate for immediate delivery.

The terms 'exchangeable', 'functional currency', 'monetary items' and 'net investment in a foreign operation' are elaborated on further within the standard. These are discussed in sections 7, 4, 5.4 and 6.3.1 below, respectively.

3 Summary of the approach required by IAS 21

Many reporting entities comprise a number of individual entities (e.g., a group is made up of a parent and one or more subsidiaries). Various types of entities, whether members of a group or otherwise, may have investments in associates or joint arrangements. They may also have branches or divisions (see section 4.4 below). It is necessary for the results and financial position of each individual entity included in the reporting entity to be translated into the currency in which the reporting entity presents its financial statements (if this presentation currency is different from the individual entity's functional currency).

[IAS 21.18].

In preparing financial statements, the following approach is followed:

- Each entity - whether a stand-alone entity, an entity with foreign operations (such as a parent) or a foreign operation (such as a subsidiary or branch) - determines its functional currency. *[IAS 21.17].* This is discussed in section 4 below.

In the case of group financial statements, it is emphasised that there is not a 'group' functional currency; each entity included within the group financial statements, be it the parent, or a subsidiary, associate, joint arrangement (whether a joint venture or joint operation) or branch, has its own functional currency.

- Where an entity enters into a transaction denominated in a currency other than its functional currency, it translates those foreign currency items into its functional currency and reports the effects of such translation in accordance with the provisions of IAS 21 discussed in section 5 below. *[IAS 21.17].*
- The results and financial position of any individual entity within the reporting entity whose functional currency differs from the presentation currency are translated in accordance with the provisions of IAS 21 discussed in section 6 below. *[IAS 21.18].*

IAS 21 permits the presentation currency of a reporting entity to be any currency (or currencies), although relevant laws or regulations might restrict that choice. Therefore, this translation process will also apply to the parent's figures if its functional currency is different from the presentation currency.

The standard also permits a stand-alone entity preparing financial statements or an entity preparing separate financial statements in accordance with IAS 27 Separate Financial Statements to present its financial statements in any currency (or currencies). If the entity's presentation currency differs from its functional currency, its results and financial position are also translated into the presentation currency in accordance with this process. *[IAS 21.19].*

4 Determination of an entity's functional currency

4.1 General

Functional currency is defined as the currency of "the primary economic environment in which the entity operates" (see section 2.3 above). This will normally be the one in which it primarily generates and expends cash. [IAS 21.9].

IAS 21 sets out a number of factors or indicators that any entity considers in determining its functional currency. When the factors or indicators are mixed and the functional currency is not obvious, management uses its judgement to determine the functional currency that most faithfully represents the economic effects of the underlying transactions, events and conditions. As part of this approach, management gives priority to the primary indicators before considering the other indicators, which are designed to provide additional supporting evidence to determine an entity's functional currency. [IAS 21.12].

The primary factors that IAS 21 requires an entity to consider in determining its functional currency are as follows: [IAS 21.9]

Extract from IAS 21

- 9 The primary economic environment in which an entity operates is normally the one in which it primarily generates and expends cash. An entity considers the following factors in determining its functional currency:
- (a) the currency:
 - (i) that mainly influences sales prices for goods and services (this will often be the currency in which sales prices for its goods and services are denominated and settled); and
 - (ii) of the country whose competitive forces and regulations mainly determine the sales prices of its goods and services.
 - (b) the currency that mainly influences labour, material and other costs of providing goods or services (this will often be the currency in which such costs are denominated and settled).

Where the functional currency of the entity is not obvious from the above, the following factors may also provide evidence of an entity's functional currency: [IAS 21.10]

- (a) The currency in which funds from financing activities (i.e., issuing debt and equity instruments) are generated
- (b) The currency in which receipts from operating activities are usually retained

An operation that is 'integral' to its parent, i.e., it carries on business as if it were an extension of the parent's operations, will always have the same functional currency as the parent. (In this context, the term parent is drawn broadly and is the entity that has the foreign operation as its subsidiary, branch, associate or joint arrangement). [IAS 21.BC6]. Therefore, the following additional factors are also considered in determining the functional currency of a foreign operation, particularly whether its functional currency is the same as that of the reporting entity: [IAS 21.11]

- (a) Whether the activities of the foreign operation are carried out as an extension of the reporting entity, rather than being carried out with a significant degree of autonomy. An example of the former is when the foreign operation only sells goods imported from the reporting entity and remits the proceeds to it. An example of the latter is when the operation accumulates cash and other monetary items, incurs expenses, generates income and arranges borrowings, all substantially in its local currency.
- (b) Whether transactions with the reporting entity are a high or a low proportion of the foreign operation's activities.
- (c) Whether cash flows from the activities of the foreign operation directly affect the cash flows of the reporting entity and are readily available for remittance to it.
- (d) Whether cash flows from the activities of the foreign operation are sufficient to service existing and normally expected debt obligations without funds being made available by the reporting entity.

Although the standard says that these factors 'are' considered in determining the functional currency of a foreign operation, this contradicts the requirement in the standard that management gives priority to the primary indicators before considering the other indicators. If it is obvious from the primary indicators what the entity's functional currency is, then there is no need to consider any of the other factors.

Illustration 4-1: Factors to be considered when determining the functional currency

A French entity (Parent A) has a US subsidiary (Subsidiary B) that produces and sells knitwear in the United States.

It is clear from the primary factors in IAS 21 that Subsidiary B's functional currency is the US dollar, because the US dollar mainly influences sales prices for goods, labour, material and other costs of providing goods, and the competitive forces and regulations that mainly determine the sales prices of the goods are located in the United States.

However, suppose Subsidiary B is financed by an inter-company loan denominated in euros granted from Parent A and the cash flows generated by Subsidiary B are transferred to Parent A on a regular basis. Would these additional factors be taken into account in determining the functional currency of Subsidiary B?

How we see it

In our view, these additional factors are not taken into account in determining the functional currency of Subsidiary B. They are only considered when it is not obvious from the primary factors what Subsidiary B's functional currency is.

However, in practice, there are occasions when the functional currency is not completely clear from the primary factors and it will often be necessary to consider the other indicators. For example, if Subsidiary B was not producing the knitwear itself, but purchasing it from sources outside of the US (such that its operating costs were not predominantly in US dollars) this would mean that it was no longer obvious based on the primary factors that its functional currency was the US dollar and the additional factors would be taken into account in determining Subsidiary B's functional currency.

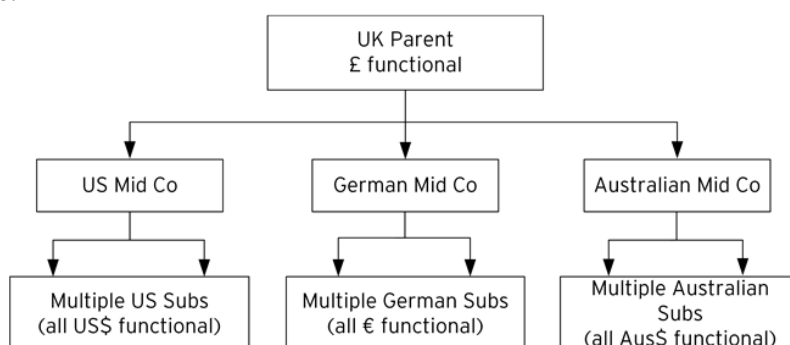

Since an entity's functional currency reflects the underlying transactions, events and conditions that are relevant to it, once it is determined, IAS 21 requires that the functional currency is not changed unless there is a change in those underlying transactions, events and conditions. [IAS 21.13]. The implication of this is that management of an entity cannot decree what the functional currency is - it is a matter of fact, albeit subjectively determined fact based on management's judgement of all the circumstances.

4.2 Intermediate holding companies or finance subsidiaries

For many entities the determination of functional currency may be relatively straightforward. However, for some entities, particularly entities within a group, this is not always the case. One particular difficulty is the determination of the functional currency of an intermediate holding company or finance subsidiary within an international group.

Illustration 4-2: Functional currency of intermediate holding companies or finance subsidiaries

An international group is headquartered in the UK. The UK parent entity has a functional currency of pound sterling, which is also the group's presentation currency. The group has three international sub-operations, structured as follows:

What is the functional currency of the three Mid Cos?

There are a variety of factors to be considered for intermediate holding companies or finance subsidiaries when deciding on the appropriate functional currency. Therefore, there will not be a single analysis applicable to all such entities.

IAS 21 defines a 'foreign operation' as "an entity that is a subsidiary...the activities of which are based or conducted in a country or currency other than those of the reporting entity" (see section 2.3 above). This definition would seem to suggest that a foreign operation must have its own 'activities'.

Also, IAS 21.9 states that the functional currency is “the currency of the primary economic environment in which the entity operates”. However, under IAS 21.9 this is determined by reference to the currency that mainly influences sales prices and the operation’s costs, and is therefore not directly relevant to intermediate holding companies or finance subsidiaries (see section 4.1 above). Paragraphs 10 and 11 set out a number of factors to consider in determining the functional currency of a foreign operation. The theme running through these factors is the extent to which the activities and cash flows of the foreign operation are independent of those of the reporting entity.

How we see it

In the case of an intermediate holding company or finance subsidiary, the acid-test question to consider is whether it is an extension of the parent and performing the functions of the parent - i.e., whether its role is simply to hold the investment in, or provide finance to, the foreign operation on behalf of the parent company or whether its functions are essentially an extension of a local operation (e.g., performing selling, payroll or similar activities for that operation) or indeed it is undertaking activities on its own account.

This means that subsidiaries that do nothing but hold investments or borrow money on behalf of the parent will normally have the functional currency of the parent. The borrowings of such companies are frequently guaranteed by the parent, which is itself likely to be a relevant factor. In other words, on whose credit is the lender relying? If the lender is looking to the ultimate parent, then the functional currency is likely to be that of the ultimate parent. However, if the lender is looking to the sub-group, then the functional currency of the companies in the sub-group will be relevant.

How we see it

Any analysis that such a company has a functional currency other than that of the parent will require careful consideration of the features of the entity which give rise to that conclusion. Complex situations are likely to require the application of careful management judgement as indicated by the standard.

As for other entities within a group, the particular circumstances of each entity are reviewed against the indicators and factors set out in the standard. This review requires management to use its judgement in determining the functional currency that most faithfully represents the economic effects of the underlying transactions, events and conditions applicable to that entity.

4.3 Investment holding companies

A similar, but subtly different, issue arises in situations where a group comprises an investment holding company incorporated in one jurisdiction and a number of operating subsidiaries which operate in a different jurisdiction and have the local currency as their functional currency. The question is how to determine the functional currency of the investment holding company which is often little more than a ‘shell’ with few transactions of its own.

This issue is common for parent companies established in Hong Kong (where the Hong Kong dollar is the local currency) that have subsidiaries operating in Mainland China (where Renminbi is the local currency), although very similar situations arise in other jurisdictions. Often the investment holding company will be listed in Hong Kong, incur some expenses, e.g., directors’ remuneration, limited staff costs and office rental payments, in Hong Kong dollars and raise capital (shares and borrowings) in Hong Kong dollars. Furthermore, dividends from subsidiaries will either be received in Hong Kong dollars or be converted into Hong Kong dollars on receipt.

In 2010, the IFRS IC was asked to consider this issue and the staff identified two broad approaches being used in practice, namely:

- The parent uses the currency of its local environment, i.e., the one in which its operating expenses are denominated, it receives dividends from its subsidiaries and it raises funding
- The parent uses the currency of the local environment of its subsidiaries as its functional currency as this is the environment which drives the dividend income it receives, which is its primary source of revenue, i.e., the parent is seen as an extension of its subsidiaries

The IFRS IC chose not to take the issue onto its agenda because any guidance it could provide would be in the nature of application guidance and simply emphasised that judgement needed to be applied.² In practice the judgement will often be based on whether the holding company's operations are considered sufficiently substantive to enable it to have a different functional currency from its subsidiaries.

4.4 Branches and divisions

IAS 21 uses the term 'branch' to describe an operation within a legal entity that may have a different functional currency from the entity itself. However, it contains no definition of that term, nor any further guidance on what arrangements are regarded as a branch.

Many countries' governments have established legal and regulatory regimes that apply when a foreign entity establishes a place of business (often called a branch) in that country.

How we see it

Where an entity has operations that are subject to such a regime, it will normally be appropriate to regard them as a branch and evaluate whether those operations have their own functional currency. In this context, the indicators in IAS 21.11 used to assess whether an entity has a functional currency that is different from its parent (see section 4.1 above) will be particularly relevant.

An entity may also have an operation, e.g., a division, that operates in a different currency environment to the rest of the entity but which is not subject to an overseas branch regime.

How we see it

If that operation represents a business unit with a significant degree of autonomy it may be appropriate to view it as a branch and evaluate whether it has a functional currency that is different to the rest of the legal entity. However, in our experience, this situation will not be a common occurrence.

4.5 Documentation of judgements made

Since the determination of an entity's functional currency is critical to the translation process under IAS 21, we believe that it is appropriate for an entity to clearly document its decision about its functional currency, setting out the factors taken into account in making that determination, particularly where it is not obvious from the primary factors set out in IAS 21.9. We recommend that the ultimate parent entity of a group does this for each entity within the group and agree that determination with the local management of those entities, particularly where those entities are presenting financial statements in accordance with IFRS accounting standards. Although the determination of functional currency is a judgemental issue, it would be expected that within the group the same determination would be made as to the functional currency of a particular entity. If local management has come up with a different analysis of the facts from that of the parent, both parties discuss this to ensure that they have considered all the relevant facts and circumstances before a final determination is made.

By documenting the decision about the functional currency of each entity, and the factors taken into account in making that determination, the reporting entity will be better placed in the future to determine whether a change in the underlying transactions, events and conditions relating to that entity warrant a change in its functional currency.

Available on the IFRS Foundation's website.

5 Reporting foreign currency transactions in the functional currency of an entity

Where an entity enters into a transaction denominated in a currency other than its functional currency then it will have to translate those foreign currency items into its functional currency and report the effects of such translation. The general requirements of IAS 21 are as follows.

5.1 Initial recognition

Extract from IAS 21

- 20 A foreign currency transaction is a transaction that is denominated or requires settlement in a foreign currency, including transactions arising when an entity:
- (a) buys or sells goods or services whose price is denominated in a foreign currency;
 - (b) borrows or lends funds when the amounts payable or receivable are denominated in a foreign currency; or
 - (c) otherwise acquires or disposes of assets, or incurs or settles liabilities, denominated in a foreign currency.
- 21 A foreign currency transaction shall be recorded, on initial recognition in the functional currency, by applying to the foreign currency amount the spot exchange rate between the functional currency and the foreign currency at the date of the transaction.

The date of a transaction is the date on which it first qualifies for recognition in accordance with IFRS accounting standards. For convenience, an average rate for a week or month may be used for all foreign currency transactions occurring during that period, if the exchange rate does not fluctuate significantly. [IAS 21.20, IAS 21.21, IAS 21.22].

In most cases determining an exchange rate will be a relatively straightforward exercise, but this will not always be the case, particularly where there are restrictions on entities wishing to exchange one currency for another. This issue is covered in section 7 below, including information on amendments to IAS 21 published in August 2023.

5.1.1 Identifying the date of transaction

The date of a transaction is the date on which it first qualifies for recognition in accordance with IFRS accounting standards. Although this sounds relatively straightforward, the following Illustration shows the difficulty that can sometimes arise in determining the transaction date:

Illustration 5-1: Establishing the transaction date (1)

A Belgian entity buys an item of inventory from a Canadian supplier. The dates relating to the transaction, and the relevant exchange rates, are as follows:

Date	Event	€1=C\$
14 April 20X2	Goods are ordered	1.50
5 May 20X2	Goods are shipped from Canada and invoice dated that day	1.53
7 May 20X2	Invoice is received	1.51
10 May 20X2	Goods are received	1.54
14 May 20X2	Invoice is recorded	1.56
7 June 20X2	Invoice is paid	1.60

IAS 2 *Inventories* does not make any reference to the date of initial recognition of inventory. However, IFRS 9 deals with the initial recognition of financial liabilities. It requires the financial liability to be recognised when, and only when, the entity becomes a party to the contractual provisions of the instrument. [IFRS 9.3.1.1]. In discussing firm commitments to purchase goods, it indicates that an entity placing the order does not recognise the liability at the time of the commitment, but delays recognition until the ordered goods have been shipped or delivered, [IFRS 9.B3.1.2(b)], normally on the date that the risks and rewards of ownership are considered to have passed.

Accordingly, using the date the goods are ordered as the date of the transaction is unlikely to be correct.

If the goods are shipped free on board (f.o.b.) then the risks and rewards of ownership are normally considered to pass on shipment (5 May) and this date would be used. If, however, the goods are not shipped f.o.b. then the risks and rewards of ownership will often be considered to pass on delivery (10 May) and therefore the date the goods are received would be treated as the date of the transaction. In practice, the transaction date will depend on the precise terms of the agreement (which are often based on standardised agreements such as the Incoterms rules).

The dates on which the invoice is received and is recorded are irrelevant to when the risks and rewards of ownership pass and therefore are not in principle considered to be the date of the transaction. In practice, it may be acceptable as a matter of administrative convenience that the exchange rate at the date the invoice is recorded is used, particularly if there is no undue delay in processing the invoice. If this is done then care is taken to ensure that the exchange rate used is not significantly different from that ruling on the 'true' date of the transaction.

It is clear from IAS 21 that the date the invoice is paid is not the date of the transaction because if it were then no exchange differences would arise on unsettled transactions.

In the Illustration above, one of the difficulties in identifying the date of transaction is the fact that IAS 2 contains little guidance on determining when purchased inventory is recognised as an asset. Some standards, particularly those published more recently such as IFRS 15 *Revenue from Contracts with Customers* contain more detailed guidance in this respect. Nevertheless, determining the date of transaction may still require the application of judgement and the date that a transaction is recorded in an entity's books and records will not necessarily be the same as the date at which it qualifies for recognition under IFRS accounting standards. Other situations where this issue is likely to arise is where an entity is recording a transaction that relates to a period, rather than one being recognised at a single point in time, as illustrated below:

Illustration 5-2: Establishing the transaction date (2)

On 30 September 20X2 Company A, whose functional currency is the euro, acquires a US dollar bond for US\$8,000 which is measured at amortised cost. The bond carries fixed interest of 5% per annum paid quarterly, i.e., US\$100 per quarter. The exchange rate on acquisition is US\$1 to €1.50.

On 31 December 20X2, the US dollar has appreciated and the exchange rate is US\$1 to €2.00. Interest received on the bond on 31 December 20X2 is US\$100 (= €200).

Although the interest might only be recorded on 31 December 20X2, the rate on that date is not the spot rate ruling at the date of the transaction. Since the interest has accrued over the 3 month period, it is translated at the spot rates applicable to the accrual of interest during the 3 month period. Accordingly, a weighted average rate for the 3 month period is used. Assuming that the appropriate average rate is US\$1 to €1.75 the interest income is €175 (= US\$100 × 1.75).

Accordingly, there is also an exchange gain on the interest receivable of €25 (= US\$100 × [2.00 - 1.75]) to be reflected in profit or loss. The journal entry for recording the receipt of the interest on 31 December 20X2 is therefore as follows:

Dr	Cash	€200	
	Cr	Interest income (profit or loss)	€175
	Cr	Exchange gain (profit or loss)	€25

5.1.2 Deposits and other consideration received or paid in advance

An entity might receive (or pay) a deposit in a foreign currency in advance of delivering (or receiving) goods or services in circumstances where the resulting liability (or asset) is considered a non-monetary item (see section 5.4.1 below). IFRIC 22 explains that, in general, the appropriate application of IAS 21 in these circumstances is to use the exchange rate at the date the advance payment is recognised, normally the payment date, rather than a subsequent date (or dates) when the goods or services are actually delivered. [IFRIC 22.8]. If there are multiple payments or receipts in advance, an entity determines a date of transaction for each payment or receipt of advance consideration. [IFRIC 22.9].

IFRIC 22 applies to a foreign currency transaction (or part of it) when an entity recognises a non-monetary asset or non-monetary liability arising from the payment or receipt of advance consideration before the related asset, expense or income (or part of it) is recognised. [IFRIC 22.4]. It does not apply when an entity measures the asset, income or expense arising from the advance payment at fair value or at the fair value of the consideration paid or received at a date other than the date of initial recognition of the non-monetary asset or non-monetary liability, for example the measurement of goodwill when applying IFRS 3 *Business Combinations*. [IFRIC 22.5].

The interpretation need not be applied to income taxes or insurance contracts (including reinsurance contracts) issued or reinsurance contracts held. [IFRIC 22.6]. Application of IFRS 17 *Insurance Contracts*, which was required for periods commencing on or after 1 January 2023, specifies how the foreign currency effects of a group of insurance contracts are accounted for. These requirements, as well as guidance on accounting for groups of insurance contracts that generate cash flows in more than one currency, are addressed in section 5.3.1 and section 5.4.8 below as well as in Chapter 51.

5.1.3 Using average rates

Rather than using the actual rate ruling at the date of the transaction IAS 21 notes that “an average rate for a week or month may be used for all foreign currency transactions occurring during that period” if the exchange rate does not fluctuate significantly (see section 5.1 above). [IAS 21.22]. For entities which engage in a large number of foreign currency transactions it will be more convenient for them to use an average rate rather than using the exact rate for each transaction. If an average rate is to be used, what guidance can be given in choosing and using such a rate?

(a) Length of period

As an average rate is only used as an approximation of actual rates then care has to be taken that significant fluctuations in the day-to-day exchange rates do not arise in the period selected. For this reason the period chosen is not to be too long.

How we see it

We believe that it would be inappropriate to use a period of more than one month and where there is volatility of exchange rates it will be better to set rates more frequently, say on a weekly basis, especially where the value of transactions is significant.

(b) Estimate of average rate relevant to date of transaction

The estimation of the appropriate average rate will depend on whether the rate is to be applied to transactions which have already occurred or to transactions which will occur after setting the rate. Obviously, if the transactions have already occurred then the average rate used relates to the period during which those transactions occurred, e.g., purchase transactions for the previous week are translated using the average rate for that week, not an average rate for the week the invoices are being recorded.

If the rate is being set for the following period the rate selected is a reasonable estimate of the expected exchange rate during that period. This could be done by using the closing rate at the end of the previous period or by using the actual average rate for the previous period.

How we see it

We would suggest that the former be used. Whatever means is used to estimate the average rate, the actual rates during the period need to be monitored and if there is a significant move in the exchange rate away from the average rate then the rate being applied is revised.

(c) Application of average rate to type of item

How we see it

We believe that average rates are to be used only as a matter of convenience where there are a large number of transactions.

Even where an average rate is used, therefore, we recommend that the actual rate is used for large one-off transactions such as the purchase of a fixed asset or an overseas investment or taking out a foreign loan. Where the number of foreign currency transactions is small it will probably not be worthwhile setting and monitoring average rates and therefore actual rates are to be used.

5.1.4 Dual rates

One of the practical difficulties in translating foreign currency amounts that was noted above is where there is more than one exchange rate for that particular currency depending on the nature of the transaction. In some cases the difference between the exchange rates can be small and therefore it probably does not matter which rate is actually used. However, in other situations the difference can be quite significant.

In these circumstances, what rate is to be used? IAS 21 states that: *[IAS 21.26]*

Extract from IAS 21

- 26 When several exchange rates are available, the rate used is that at which the future cash flows represented by the transaction or balance could have been settled if those cash flows had occurred at the measurement date. ...

Companies therefore look at the nature of the transaction and apply the appropriate exchange rate.

5.2 Reporting at the ends of subsequent reporting periods

Extract from IAS 21

- 23 At the end of each reporting period:
- (a) foreign currency monetary items shall be translated using the closing rate;
 - (b) non-monetary items that are measured in terms of historical cost in a foreign currency shall be translated using the exchange rate at the date of the transaction; and
 - (c) non-monetary items that are measured at fair value in a foreign currency shall be translated using the exchange rates at the date when the fair value was measured.

The carrying amount of an item is determined in conjunction with the relevant requirements of other IFRS accounting standards. For example, property, plant and equipment may be measured in terms of fair value or historical cost in accordance with IAS 16 *Property, Plant and Equipment*. Irrespective of whether the carrying amount is determined on the basis of historical cost or fair value, if the amount is determined in a foreign currency, IAS 21 requires that amount to be translated into the entity's functional currency.

[IAS 21.23, IAS 21.24].

The carrying amount of some items is determined by comparing two or more amounts. For example, IAS 2 requires the carrying amount of inventories to be determined as the lower of cost and net realisable value. Similarly, in accordance with IAS 36 *Impairment of Assets* the carrying amount of an asset for which there is an indication of impairment is the lower of its carrying amount before considering possible impairment losses and its recoverable amount. When such an asset is non-monetary and is measured in a foreign currency, the carrying amount is determined by comparing:

- The cost or carrying amount, as appropriate, translated at the exchange rate at the date when that amount was determined (i.e., the rate at the date of the transaction for an item measured in terms of historical cost) with
- The net realisable value or recoverable amount, as appropriate, translated at the exchange rate at the date when that value was determined (e.g., the closing rate at the end of the reporting period)

The effect of this comparison may be that an impairment loss is recognised in the functional currency but would not be recognised in the foreign currency, or *vice versa*. *[IAS 21.25].*

5.3 Treatment of exchange differences

5.3.1 Monetary items

The general rule in IAS 21 is that exchange differences on the settlement or retranslation of monetary items are recognised in profit or loss in the period in which they arise. *[IAS 21.28].*

When monetary items arise from a foreign currency transaction and there is a change in the exchange rate between the transaction date and the date of settlement, an exchange difference results. When the transaction is settled within the same accounting period as that in which it occurred, all the exchange difference is recognised in that period. However, when the transaction is settled in a subsequent accounting period, the exchange difference recognised in each period up to the date of settlement is determined by the change in exchange rates during each period. *[IAS 21.29].*

These requirements can be shown in the following illustrations:

Illustration 5-3: Reporting an unsettled foreign currency transaction in the functional currency

A French entity purchases plant and equipment on credit from a Canadian supplier for C\$328,000 in January 20X2 when the exchange rate is €1=C\$1.64. The entity records the asset at a cost of €200,000. At the French entity's year end at 31 March 20X2 the account has not yet been settled. The closing rate is €1=C\$1.61. The amount payable would be retranslated at €203,727 in the statement of financial position and an exchange loss of €3,727 would be reported as part of the profit or loss for the period. The cost of the asset would remain as €200,000.

Illustration 5-4: Reporting a settled foreign currency transaction in the functional currency

A UK entity sells goods to a German entity for €87,000 on 28 February 20X2 when the exchange rate is £1=€1.45. It receives payment on 31 March 20X2 when the exchange rate is £1=€1.50. On 28 February the UK entity will record a sale and corresponding receivable of £60,000. When payment is received on 31 March the actual amount received is only £58,000. The loss on exchange of £2,000 would be reported as part of the profit or loss for the period.

There are situations where the general rule above will not be applied. The first exception relates to exchange differences arising on a monetary item that, in substance, forms part of an entity's net investment in a foreign operation (see section 6.3.1 below). In this situation the exchange differences are recognised initially in other comprehensive income until the disposal of the investment (see section 6.6 below). However, this treatment only applies in the financial statements that include the foreign operation and the reporting entity (e.g., consolidated financial statements when the foreign operation is a consolidated subsidiary or equity method investment). It does not apply to the reporting entity's separate financial statements or the financial statements of the foreign operation. Rather, the exchange differences will be recognised in profit or loss in the period in which they arise in the financial statements of the entity that has the foreign currency exposure. [IAS 21.32]. This is discussed further in section 6.3.1 below.

The next exception relates to hedge accounting for foreign currency items, to which IFRS 9 applies. The application of hedge accounting requires an entity to account for some exchange differences differently from the treatment required by IAS 21. For example, IFRS 9 requires that exchange differences on monetary items that qualify as hedging instruments in a cash flow hedge or a hedge of a net investment in a foreign operation are recognised initially in other comprehensive income to the extent the hedge is effective. Hedge accounting is discussed in more detail in Chapter 49.

Another situation where exchange differences on monetary items are not recognised in profit or loss in the period they arise would be where an entity capitalises borrowing costs under IAS 23 *Borrowing Costs* since that standard requires exchange differences arising from foreign currency borrowings to be capitalised to the extent that they are regarded as an adjustment to interest costs (see Chapter 22). [IAS 23.6].

One example of a monetary item given by IAS 21 is 'provisions that are to be settled in cash'. In most cases it will be appropriate for the exchange differences arising on provisions to be recognised in profit or loss in the period they arise. However, it may be that an entity has recognised a decommissioning provision under IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*. One practical difficulty with such a provision is that due to the long timescale of when the actual cash outflows will arise, an entity might not be able to say with any certainty the currency in which the transaction will actually be settled. Nevertheless, if it is determined that the provision is expected to be settled in a foreign currency it will be a monetary item. The main issue then is what happens to any exchange differences. IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* applies to any decommissioning or similar liability that has been both included as part of the cost of an asset and measured as a liability in accordance with IAS 37 (see Chapter 27). IFRIC 1 requires, *inter alia*, that any adjustment to such a provision resulting from changes in the estimated outflow of resources embodying economic benefits (e.g., cash flows) required to settle the obligation is not recognised in profit or loss as it occurs, but is added to or deducted from the cost of the asset to which it relates. The requirement of IAS 21 to recognise the exchange differences arising on the provision in profit or loss in the period in which they arise conflicts with this requirement in IFRIC 1.

How we see it

We believe that either approach set out above, i.e., the one set out in IFRIC 1 or the one set out in IAS 21, could be applied as an accounting policy choice. However, in our experience, such exchange differences are most commonly dealt with in accordance with IFRIC 1, particularly by entities with material long-term provisions.

As set out in section 5.4.8 below, IFRS 17 requires an insurance contract to be treated as a monetary item. However, IFRS 17 specifies that exchange differences are recognised in other comprehensive income if they relate to changes in the carrying amounts of groups of insurance contracts that are themselves recognised in other comprehensive income (see Chapter 51). [IFRS 17.92].

5.3.2 Non-monetary items

When non-monetary items are measured at fair value in a foreign currency they are translated using the exchange rate as at the date when the fair value was determined. Therefore, any re-measurement gain or loss will include an element relating to the change in exchange rates. In this situation, the exchange differences are recognised as part of the gain or loss arising on the fair value re-measurement.

When a gain or loss on a non-monetary item is recognised in other comprehensive income, any exchange component of that gain or loss is recognised in other comprehensive income. [IAS 21.30]. For example, IAS 16 requires some gains and losses arising on a revaluation of property, plant and equipment to be recognised in other comprehensive income (see Chapter 19). When such an asset is measured in a foreign currency, the revalued amount is translated using the rate at the date the value is determined, resulting in an exchange difference that is also recognised in other comprehensive income. [IAS 21.31].

Conversely, when a gain or loss on a non-monetary item is recognised in profit or loss, e.g., financial instruments that are measured at fair value through profit or loss in accordance with IFRS 9 (see Chapter 46) or an investment property accounted for using the fair value model (see Chapter 20), any exchange component of that gain or loss is recognised in profit or loss. [IAS 21.30].

An example of an accounting policy dealing with the reporting of foreign currency transactions in the functional currency of an entity is illustrated below.

Practical example 5-1: ING Groep N.V. (2022)

The Netherlands

Annual Report 2022 [extract]

Notes to the Consolidated financial statements [extract]

1 Basis of preparation and significant accounting policies [extract]

1.10 Foreign currency translation

Functional and presentation currency

Items included in the financial statements of each of ING Group's entities are measured using the currency of the primary economic environment in which the entity operates (the functional currency). The Consolidated financial statements are presented in euros, which is ING Group's presentation currency.

Transactions and balances

Foreign currency transactions are translated into the functional currency using the exchange rate prevailing at the date of the transactions. Exchange rate differences resulting from the settlement of such transactions and from the translation at year-end exchange rates of monetary assets and liabilities denominated in foreign currencies are recognised in the statement of profit or loss, except when deferred in equity as part of qualifying cash flow hedges or qualifying net investment hedges.

Non-monetary items that are measured in terms of historical cost in a foreign currency are translated using the exchange rate at the date of the transaction.

5.4 Determining whether an item is monetary or non-monetary

Extract from IAS 21

- 16 The essential feature of a monetary item is a right to receive (or an obligation to deliver) a fixed or determinable number of units of currency. Examples include: pensions and other employee benefits to be paid in cash; provisions that are to be settled in cash; lease liabilities; and cash dividends that are recognised as a liability. Similarly, a contract to receive (or deliver) a variable number of the entity's own equity instruments or a variable amount of assets in which the fair value to be received (or delivered) equals a fixed or determinable number of units of currency is a monetary item. Conversely, the essential feature of a non-monetary item is the absence of a right to receive (or an obligation to deliver) a fixed or determinable number of units of currency. Examples include: amounts prepaid for goods and services; goodwill; intangible assets; inventories; property, plant and equipment; right-of-use assets; and provisions that are to be settled by the delivery of a non-monetary asset.

IAS 21 generally requires that monetary items denominated in foreign currencies be retranslated using closing rates at the end of the reporting period and non-monetary items are not retranslated (see section 5.2 above). Monetary items are defined as "units of currency held and assets and liabilities to be received or paid in a fixed or determinable number of units of currency". [IAS 21.8]. The standard elaborates further on this by stating that "the essential feature of a monetary item is a right to receive (or an obligation to deliver) a fixed or determinable number of units of currency". Examples given by IAS 21 are pensions and other employee benefits to be paid in cash; provisions that are to be settled in cash; cash dividends that are recognised as a liability; and lease liabilities. [IAS 21.16]. More obvious examples are cash and bank balances; trade receivables and payables; and loan receivables and payables.

IFRS 9 also indicates that where a foreign currency bond is held as a debt instrument measured at fair value through other comprehensive income, it is first accounted for at amortised cost in the underlying currency, thus effectively treating that amount as if it was a monetary item. This guidance is discussed further in Chapter 46.

IAS 21 also states that "a contract to receive (or deliver) a variable number of the entity's own equity instruments or a variable amount of assets in which the fair value to be received (or delivered) equals a fixed or determinable number of units of currency is a monetary item". [IAS 21.16]. No examples of such contracts are given in IAS 21. However, it would seem to embrace those contracts settled in the entity's own equity shares that under IAS 32 *Financial Instruments: Presentation* would be presented as financial assets or liabilities (see Chapter 43).

Conversely, the essential feature of a non-monetary item is the absence of a right to receive (or an obligation to deliver) a fixed or determinable number of units of currency. Examples given by the standard are amounts prepaid for goods and services; goodwill; intangible assets; inventories; property, plant and equipment; provisions that are to be settled by the delivery of a non-monetary asset; and right-of-use assets. [IAS 21.16]. IFRS 9 states that investments in equity instruments are non-monetary items.

[IFRS 9.B5.7.3]. It follows that equity investments in subsidiaries, associates or joint ventures are non-monetary items.

Even with this guidance there will clearly be a number of situations where the distinction is not altogether clear.

5.4.1 Deposits or progress payments

Entities may be required to pay deposits or progress payments when acquiring certain assets, such as property, plant and equipment or inventories, from foreign suppliers. The question then arises as to whether such payments are retranslated as monetary items or not.

Illustration 5-5: Deposits or progress payments

A Dutch entity contracts to purchase an item of plant and machinery for US\$10,000 on the following terms:

Payable on signing contract (1 August 20X2)	- 10%
Payable on delivery (19 December 20X2)	- 40%
Payable on installation (7 January 20X3)	- 50%

At 31 December 20X2 the entity has paid the first two amounts on the due dates when the respective exchange rates were €1=US\$1.25 and €1=US\$1.20. The closing rate at the end of its reporting period, 31 December 20X2, is €1=US\$1.15.

	(i)	(ii)
	€	€
First payment - US\$1,000	800	870
Second payment - US\$4,000	3,333	3,478
	<u>4,133</u>	<u>4,348</u>

- If the payments made are regarded as prepayments or as progress payments then the amounts are treated as non-monetary items and included in the statement of financial position at €4,133. This would appear to be consistent with US GAAP which in defining 'transaction date' states: "A long-term commitment may have more than one transaction date (for example, the due date of each progress payment under a construction contract is an anticipated transaction date)."
- If the payments made are regarded as deposits, and are refundable, then the amounts could possibly be treated as monetary items and included in the statement of financial position at €4,348 and an exchange gain of €215 recognised in profit or loss. A variant of this would be to only treat the first payment as a deposit until the second payment is made, since once delivery is made it is less likely that the asset will be returned and a refund sought from the supplier.

How we see it

In practice, it will often be necessary to consider the terms of the contract to ascertain the nature of the payments made in order to determine the appropriate accounting treatment and this may well require the application of judgement, something acknowledged in IFRIC 22 (see section 5.1.2 above).

5.4.2 Deposits and advance payments for actively traded commodities

In most cases the analysis in section 5.4.1 above will be equally relevant for deposits or payments made in advance for commodities that are actively traded and have an observable market price. However, the fact that a market price for a commodity is available means it is easier for entities to enter into contracts to purchase or sell such items that give rise to monetary items as shown in the following Illustration.

Illustration 5-6: Deposit paid for future delivery of gold

Company X is a German entity which has the euro as its functional currency. It manufactures and sells jewellery using various metals including gold. On 1 October 20X2, when the quoted price of gold is US\$100,000/kg, Company X enters into two contracts, each involving the purchase of 2kg of gold to be delivered on 31 January 20X3. The gold will be used to make jewellery so the contracts will be treated as normal purchases rather than derivatives within the scope of IFRS 9 (see Chapter 41). Each contract requires Company X to pay a deposit of US\$40,000 to the supplier immediately and this amount will be deducted from the total price which is due to be paid on 28 February 20X3.

Fixed price contract

The first contract specifies that the total amount to be paid for the gold is US\$200,000 with the remaining US\$160,000 becoming payable in February.

The nature of this contract is no different to that of the one illustrated in Illustration 5-5 in section 5.4.1 above. The deposit represents a prepayment of 20% of the cost of gold and will consequently be accounted for as a non-monetary asset. Therefore, Company X will not retranslate the balance between payment in October 20X2 and delivery in January 20X3. At the point of delivery Company X will recognise a payable of US\$160,000, which will be a monetary liability.

Variable price contract

The second contract, which secures supply rather than price, specifies that the total price to be paid for the gold is determined by the US dollar denominated spot price on 31 January 20X3. If the spot price on delivery is below US\$20,000/kg, the total amount due for the gold will be less than the US\$40,000 deposit and the supplier will either repay Company X any excess or apply the excess against a future order.

Although this second contract may seem very similar to the first, the analysis is somewhat different. The cost of the gold can only be determined on 31 January 20X3 and, regardless of the market price of gold, the remaining amount Company X has to settle is the 'market value of the gold on 31 January 20X3' minus US\$40,000. Therefore, as the deposit does not expose Company X to the price of gold and it merely reduces the future payable by US\$40,000, it is considered to be a monetary item.

If the market price of gold is below US\$20,000/kg at the point of delivery, Company X will receive gold and cash or credit that together are worth US\$40,000.

In other words, Company X will always receive US\$40,000 of value for its US\$40,000 deposit at the date of delivery. Therefore, the deposit paid in respect of the second contract represents a US dollar denominated monetary asset.

5.4.3 Investments in preference shares

Entities may invest in preference shares of other entities. Whether such shares are monetary items or not will depend on the rights attaching to the shares. IFRS 9 states that investments in equity instruments are non-monetary items (see section 5.4 above). [IFRS 9.B5.7.3]. Thus, if the terms of the preference shares are such that they are classified by the issuer as equity, rather than as a financial liability, then they are non-monetary items. However, if the terms of the preference shares are such that they are classified by the issuer as a financial liability (e.g., a preference share that provides for mandatory redemption by the issuer for a fixed or determinable amount at a fixed or determinable future date) and by the holder as a financial asset measured at amortised cost or at fair value through other comprehensive income (see Chapter 46), they are treated as monetary items.

5.4.4 Foreign currency share capital

An entity may issue share capital denominated in a currency that is not its functional currency or, due to changes in circumstances that result in a re-determination of its functional currency, may find that its share capital is no longer denominated in its functional currency. Neither IAS 21, IAS 32 nor IFRS 9 address the treatment of translation of share capital denominated in a currency other than the functional currency. In theory two treatments are possible: the foreign currency share capital (and any related share premium or additional paid-in capital) could be maintained at a fixed amount by being translated at a historical rate of exchange, or at each reporting date it could be retranslated at the closing rate as if it were a monetary amount. In the latter case a second question would arise: whether to recognise the difference arising on translation in profit or loss or in other comprehensive income or to deal with it within equity.

Where the shares denominated in a foreign currency are ordinary shares, or are otherwise irredeemable and classified as equity instruments, in our experience the most commonly applied view is that the shares are translated at historical rates and not remeasured. This view reflects the fact that the effect of rate changes is not expected to have an impact on the entity's cash flows associated with those shares. Such capital items are included within the examples of non-monetary items listed in US GAAP (FASB ASC 830 *Foreign Currency Matters*) as accounts to be remeasured using historical exchange rates when the temporal method is being applied. IAS 21 requires non-monetary items that are measured at historical cost in a foreign currency to be translated using the historical rate (see section 5.2 above).

How we see it

Where such share capital is retranslated at the closing rate, we do not believe that it is appropriate for the exchange differences to be recognised in profit or loss, since they do not affect the cash flows of the entity. Further, because the retranslation of such items has no effect on assets or liabilities it is not an item of income or expense to be recognised in other comprehensive income. Instead, the exchange differences are taken to equity.

Consequently, whether such share capital is maintained at a historical rate, or is dealt with in this way, the treatment has no impact on the overall equity of the entity.

Where the shares are not classified as equity instruments, but as financial liabilities, under IAS 32, e.g., preference shares that provide for mandatory redemption by the issuer for a fixed or determinable amount at a fixed or determinable future date, then, as with investments in such shares (see section 5.4.3 above), they are treated as monetary items and translated at the closing rate. Any exchange differences will be recognised in profit or loss, unless the shares form part of a hedging relationship and IFRS 9 would require the exchange differences to be accounted for differently (see Chapter 49).

5.4.5 Deferred tax

One of the examples of a monetary item included within the exposure draft that preceded IAS 21 was deferred tax.³ However, this was dropped from the list of examples in the final standard. No explanation is given in IAS 21 as to why this is the case. Until 2007, IAS 12 *Income Taxes* suggested that any deferred foreign tax assets or liabilities are monetary items since it stated that "where exchange differences on deferred foreign tax liabilities or assets are recognised in the income statement, such differences may be classified as deferred tax expense (income) if that presentation is considered to be the most useful to financial statement users".⁴ The reference to 'income statement' has now been changed to 'statement of comprehensive income', although the suggestion remains the same. The Basis for Conclusions to IFRIC 7 *Applying the Restatement Approach under IAS 29 Financial Reporting in Hyperinflationary Economies* also acknowledges that deferred tax items may meet the definition of monetary items. [IFRIC 7.BC22].

5.4.6 Post-employment benefit plans - foreign currency assets

For most entities, benefits payable under a defined benefit post-employment plan will be payable in the functional currency of the entity. However, such a plan may have monetary assets that are denominated in a foreign currency and/or non-monetary assets, the fair value of which are determined in a foreign currency. Where benefits are payable in a currency that is different to the entity's functional currency, the considerations in section 5.4.7 below will be relevant.

³ Exposure Draft of Revised IAS 21, IASB, May 2002, para. 14.

⁴ IAS 12 (2007), *Income Taxes*, 2007 Bound Volume, IASB, para. 78.

Consider, for example, a UK company with the pound sterling as its functional currency which has a funded pension scheme in which benefit payments are based on the employees' sterling denominated salaries and are paid in sterling. The majority of plan assets comprise a mix of sterling denominated bonds, UK equities and UK properties. However, those assets also include a number of US dollar denominated bonds and equities issued by US companies that are listed on a US stock exchange. IAS 19 *Employee Benefits* requires all these assets to be measured at their fair value at the end of the reporting period, but how does the entity deal with any exchange differences or changes in fair value attributable to changes in exchange rates arising on the US assets?

IAS 21 gives as an example of a monetary item "pensions and other employee benefits to be paid in cash". Further, the accounting for defined benefit schemes under IAS 19 requires an entity to reflect net interest on the net defined benefit asset or liability in profit or loss and any difference between this amount and the actual return on plan assets in other comprehensive income (see Chapter 31). [IAS 19.120, IAS 19.127(b)].

How we see it

It would consequently seem appropriate to view the net pension asset or liability as a single unit of account measured in sterling. Therefore, the gains and losses on all the US plan assets attributable to changes in foreign exchange rates would be dealt with as remeasurements in accordance with IAS 19 and recognised in other comprehensive income.

5.4.7 Post-employment benefit plans - foreign currency plans

For some entities the pension benefits payable under a post-employment benefit plan will not be payable in the functional currency of the entity. For example, a UK entity in the oil and gas industry may determine that its functional currency is the US dollar, but its employee costs including the pension benefits are payable in sterling. How does such an entity account for its post-employment benefit plan?

One of the examples of a monetary item given by IAS 21 is "pensions and other employee benefits to be paid in cash". However, the standard does not expand on this, and does not appear to make any distinction between pensions provided by defined contribution plans or defined benefit plans. Nor does it distinguish between funded or unfunded defined benefit plans.

Clearly for pensions that are payable under a defined contribution plan (or one that is accounted for as such) this is straightforward. Any liability for outstanding contributions at the end of the reporting period is a monetary item that is translated at the closing rate, with any resulting exchange differences recognised in profit or loss. For an unfunded defined benefit plan in which the benefit payments are denominated in a foreign currency, applying IAS 21 would also seem to be straightforward. The defined benefit obligation is regarded as a monetary liability and exchange differences on the entire balance are recognised in profit or loss.

A funded defined benefit plan is a more a complex arrangement to assess under IAS 21, particularly if the plan assets include items that considered in their own right would be non-monetary and/or foreign currency monetary items. However, in the light of the guidance in IAS 21 noted above, one approach is to consider such arrangements as a single monetary item denominated in the currency in which the benefit payments are made. Therefore, the requirements of IAS 19 will be applied in the currency in which the benefit payments are denominated and foreign currency gains or losses on the net asset or liability would be recognised in profit or loss.

Another approach would be to argue that a funded scheme is more akin to a non-monetary item and the exchange differences relating to the defined benefit obligation are similar to actuarial gains and losses. The calculation of the obligation under IAS 19 would be based on actuarial assumptions that reflect the currency of the obligation to the employee (for example, the discount rate used "shall be consistent with the currency and estimated term" of the obligation [IAS 19.83]). Any variations from those assumptions on both the obligation and the assets would be dealt with in the same way under IAS 19. Actuarial assumptions are "an entity's best estimates of the variables that will determine the ultimate cost of providing post-employment benefits" and include financial assumptions. [IAS 19.76]. Although IAS 19 does not refer to exchange rates, it is clearly a variable that will determine the ultimate cost to the entity of providing the post-employment benefits. On that basis, the exchange differences relating to the defined benefit obligation would be accounted for in a similar manner to actuarial gains and losses.

How we see it

Our preferred approach in these circumstances is to view the funded defined benefit plan as a single monetary item denominated in the currency in which the benefit payments are made. Although not our preferred accounting treatment we consider the second approach, which views the exchange rate as an actuarial assumption, to be acceptable.

Some might argue that the plan is to be regarded as a 'foreign operation' under IAS 21 (see section 2.3 above). However, in this situation it is very difficult to say that its 'functional currency' can be regarded as being different from that of the reporting entity given the relationship between the plan and the reporting entity (see section 4 above). Thus, it would appear that the entity cannot treat the plan as a foreign operation with a different functional currency from its own.

5.4.8 Insurance contracts

IFRS 17 specifies that a group of insurance contracts that generates cash flows in a foreign currency is treated as a monetary item. This applies to both the fulfilment cash flows and the contractual service margin. [IFRS 17.30].

What is less clear is how to apply IAS 21 and IFRS 17 to groups of insurance contracts that generate cash flows in more than one currency. In September 2022, the IFRS IC published an agenda decision setting out its conclusion that an entity uses its judgement and IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* to develop an accounting policy to determine on initial recognition the single currency or multiple currencies in which the group (including the contractual service margin) is denominated. Further information about this issue is included in Chapter 51.⁵

5.5 Change in functional currency

IAS 21 requires management to use its judgement to determine the entity's functional currency such that it most faithfully represents the economic effects of the underlying transactions, events and conditions that are relevant to the entity (see section 4 above). Accordingly, once the functional currency is determined, it may be changed only if there is a change to those underlying transactions, events and conditions. For example, a change in the currency that mainly influences the sales prices of goods and services may lead to a change in an entity's functional currency. [IAS 21.36].

IAS 21 indicates: [IAS 21.35]

Extract from IAS 21

35 When there is a change in an entity's functional currency, the entity shall apply the translation procedures applicable to the new functional currency prospectively from the date of the change.

In other words, an entity translates all items into the new functional currency using the exchange rate at the date of the change. The resulting translated amounts for non-monetary items are treated as their historical cost. Exchange differences arising from the translation of a foreign operation recognised in other comprehensive income are not reclassified from equity to profit or loss until the disposal of the operation (see section 6.6 below). [IAS 21.37].

⁵ [IFRIC Update](#), September 2022, available on the IFRS Foundation's website.

Illustration 5-7: Change in functional currency

The management of Entity A has considered the functional currency of the entity to be the euro. However, as a result of a change in circumstances affecting the operations of the entity, management determines that on 1 January 2022 the functional currency of the entity is now the US dollar. The exchange rate at that date is €1=US\$1.20. Entity A's statement of financial position at 1 January 2022 in its old functional currency is as follows:

	€
Property, plant and equipment	200,000
Current assets	
Inventories	10,000
Receivables	20,000
Cash	5,000
	<u>35,000</u>
Current liabilities	
Payables	15,000
Taxation	3,000
	<u>18,000</u>
Net current assets	<u>17,000</u>
	217,000
Long-term loans	120,000
	<u>97,000</u>

Included within the statement of financial position at 1 January 2022 are the following items:

- Equipment with a cost of €33,000 and a net book value of €16,500. This equipment was originally purchased for £20,000 in 2016 and has been translated at the rate ruling at the date of purchase of £1=€1.65.
- Inventories with a cost of €6,000. These were purchased for US\$6,000 and have been translated at the rate ruling at the date of purchase of €1=US\$1.00.
- Payables of €5,000 representing the US\$6,000 due in respect of the above inventories, translated at the rate ruling at 1 January 2022.
- Long-term loans of €15,000 representing the outstanding balance of £10,000 on a loan originally taken out to finance the acquisition of the above equipment, translated at £1=€1.50, the rate ruling at 1 January 2022.

Entity A applies the translational procedures applicable to its new functional currency prospectively from the date of change. Accordingly, all items in its statement of financial position at 1 January 2022 are translated at the rate of €1=US\$1.20 giving rise to the following amounts:

	\$
Property, plant and equipment	240,000
Current assets	
Inventories	12,000
Receivables	24,000
Cash	6,000
	<u>42,000</u>
Current liabilities	
Payables	18,000
Taxation	3,600
	<u>21,600</u>
Net current assets	<u>20,400</u>
	260,400
Long-term loans	144,000
	<u>116,400</u>

As far as the equipment that was originally purchased for £20,000 is concerned, the cost and net book value in terms of Entity A's new functional currency are US\$39,600 and US\$19,800 respectively, being €33,000 and €16,500 translated at €1=US\$1.20. Entity A does not go back and translate the £20,000 cost at whatever the £ sterling/US dollar exchange rate was at the date of purchase and calculate a revised net book value on that basis.

Similarly, the inventories purchased in US dollars are included at \$7,200, being €6,000 translated at €1=US\$1.20. This is despite the fact that Entity A knows that the original cost was \$6,000.

As far as the payables in respect of the inventories are concerned, these are included at \$6,000, being €5,000 translated at €1=US\$1.20. This represents the original amount payable in US dollars. However, this is logical since the original payable had been translated into euros at the rate ruling at 1 January 2022 and has just been translated back into US dollars at the same rate. The impact of the change in functional currency is that whereas Entity A had recognised an exchange gain of €1,000 while the functional currency was the euro, no further exchange difference will be recognised in respect of this amount payable. Exchange differences will now arise from 1 January 2022 on those payables denominated in euros, whereas no such differences would have arisen on such items prior to that date.

Similarly, the £10,000 amount outstanding on the loan will be included at \$18,000, being €15,000 translated at €1=US\$1.20. This is equivalent to the translation of the £10,000 at a rate of £1=US\$1.80, being the direct exchange rate between the two currencies at 1 January 2022. In this case, whereas previously exchange gains and losses would have been recognised on this loan balance based on movements of the £/€ exchange rate, as from 1 January 2022 the exchange gains and losses will be recognised based on the £/\$ exchange rate.

Often an entity's circumstances change gradually over time and it might not be possible to determine a precise date on which the functional currency changes. In these circumstances an entity will need to apply judgement to determine an appropriate date from which to apply the change, which might coincide with the beginning or end of an interim or annual accounting period.

Where an entity's functional currency changes, its management will often choose to align the entity's presentation currency with the new functional currency. The approach to be adopted when changing presentation currency is covered in section 8 below.

5.6 Books and records not kept in functional currency

Occasionally, an entity may keep its underlying books and records in a currency that is not its functional currency under IAS 21. For example, it could record its transactions in terms of the local currency of the country in which it is located, possibly as a result of local requirements. In these circumstances, at the time the entity prepares its financial statements all amounts are converted into the functional currency in accordance with the requirements of the standard discussed in sections 5.1 to 5.3 above.⁶ This process is intended to produce the same amounts in the functional currency as would have occurred had the items been recorded initially in the functional currency. For example, monetary items are translated into the functional currency using the closing rate, and non-monetary items that are measured on a historical cost basis are translated using the exchange rate at the date of the transaction that resulted in their recognition which will result in local currency denominated transactions giving rise to exchange differences. [IAS 21.34].

⁶ In this context, IAS 21 does not actually refer to those requirements relating to the treatment of exchange differences arising from the translation process. However, we believe that any resulting exchange differences are recognised as discussed in section 5.3 above.

6 Use of a presentation currency other than the functional currency

An entity may, subject to the requirements of relevant laws and regulations, present its financial statements in any currency (or currencies) (see section 3 above). [IAS 21.38].

Extract from IAS 21

38 An entity may present its financial statements in any currency (or currencies). If the presentation currency differs from the entity's functional currency, it translates its results and financial position into the presentation currency. For example, when a group contains individual entities with different functional currencies, the results and financial position of each entity are expressed in a common currency so that consolidated financial statements may be presented.

There is no concept of a 'group' functional currency. Each entity within the group has its own functional currency, and the results and financial position of each entity have to be translated into the presentation currency that is used for the consolidated financial statements. [IAS 21.18].

The requirements of IAS 21 in respect of this translation process are discussed below. The procedures to be adopted apply not only to the inclusion of foreign subsidiaries in consolidated financial statements but also to the incorporation of the results of associates and joint arrangements. [IAS 21.44]. They also apply when the results of a foreign branch are to be incorporated into the financial statements of an individual entity or a stand-alone entity preparing financial statements or when an entity preparing separate financial statements in accordance with IAS 27 presents its financial statements in a currency other than its functional currency.

In addition to these procedures, IAS 21 has additional provisions that apply when the results and financial position of a foreign operation are translated into a presentation currency so that the foreign operation can be included in the financial statements of the reporting entity by consolidation or the equity method. [IAS 21.44]. These additional provisions are covered in sections 6.3 to 6.5 below.

6.1 Translation to the presentation currency

Under IAS 21, the method of translation depends on whether the entity's functional currency is that of a hyperinflationary economy or not, and if it is, whether it is being translated into a presentation currency which is that of a hyperinflationary economy or not. A hyperinflationary economy is defined in IAS 29 *Financial Reporting in Hyperinflationary Economies* (see Chapter 17). The requirements of IAS 21 discussed below can be summarised as follows:

	Presentation currency	
	Non-hyperinflationary	Hyperinflationary
Non-hyperinflationary functional currency		
<i>Assets/liabilities</i>		
▪ Current period	Closing rate (current B/S date)	Closing rate (current B/S date)
▪ Comparative period	Closing rate (comparative B/S date)	Closing rate (comparative B/S date)
<i>Equity items</i>		
▪ Current period	Not specified	Not specified
▪ Comparative period	Not specified	Not specified
<i>Income/expenses (including those recognised in other comprehensive income)</i>		
▪ Current period	Actual rates (or appropriate average for current period)	Actual rates (or appropriate average for current period)
▪ Comparative period	Actual rates (or appropriate average for comparative period)	Actual rates (or appropriate average for comparative period)
<i>Exchange differences</i>	Separate component of equity	Separate component of equity

Hyperinflationary functional currency*Assets/liabilities*

▪ Current period	Closing rate (current B/S date)	Closing rate (current B/S date)
▪ Comparative period	Closing rate (comparative B/S date)	Closing rate (current B/S date)

Equity items

▪ Current period	Closing rate (current B/S date)	Closing rate (current B/S date)
▪ Comparative period	Closing rate (comparative B/S date)	Closing rate (current B/S date)

Income/expenses (including those recognised in other comprehensive income)

▪ Current period	Closing rate (current B/S date)	Closing rate (current B/S date)
▪ Comparative period	Closing rate (comparative B/S date)	Closing rate (current B/S date)

<i>Exchange differences</i>	Not specified	Not applicable
-----------------------------	---------------	----------------

In June 2022 the IFRS IC discussed how the requirements summarised above apply to a parent with a hyperinflationary functional and presentation currency that consolidates a subsidiary with a non-hyperinflationary functional currency. The specific matter considered was whether, in addition to applying the requirements in IAS 21, the parent would then apply IAS 29 and restate the non-hyperinflationary subsidiary's results and financial position in terms of the measuring unit current at the end of the reporting period. Initially the IFRS IC concluded that the parent could select an accounting policy to restate or a policy not to restate.⁷

However, after further research, the IFRS IC recommended that the IASB develop a narrow-scope amendment addressing the matter above as well as the related matter of an entity whose functional currency is the currency of a non-hyperinflationary economy but that presents its financial statements in the currency of a hyperinflationary economy.⁸ Consequently, in July 2024, the IASB published an exposure draft of proposals to amend IAS 21 which is discussed in more detail in Chapter 17 and in section 12.1 below.

In most cases determining an exchange rate will be a relatively straightforward exercise, but this will not always be the case, particularly where there are restrictions on entities wishing to exchange one currency for another. This issue is covered in section 7 below, including information on amendments to IAS 21 published in August 2023.

6.1.1 Functional currency is not that of a hyperinflationary economy

The results and financial position of an entity whose functional currency is not the currency of a hyperinflationary economy are translated into a different presentation currency using the following procedures: [IAS 21.39]

- Assets and liabilities for each statement of financial position presented (i.e., including comparatives) are translated at the closing rate at the reporting date
- Income and expenses for each statement of comprehensive income or separate income statement presented (i.e., including comparatives) are translated at exchange rates at the dates of the transactions
- All resulting exchange differences are recognised in other comprehensive income

For practical reasons, the reporting entity may use a rate that approximates the actual exchange rate, e.g., an average rate for the period, to translate income and expense items. However, if exchange rates fluctuate significantly, the use of the average rate for a period is inappropriate. [IAS 21.40].

⁷ [IFRIC Update](#), June 2022, available on the IFRS Foundation's website.

⁸ [IFRIC Update](#), June 2023, available on the IFRS Foundation's website.

As discussed in section 5.1.2 above, IFRIC 22 explains how to determine the “date of transaction” for the purposes of an entity recording a foreign currency transaction in its functional currency, particularly when payments are made or received in advance of the associated transaction occurring.

How we see it

In our view, the guidance noted above does not apply to the translation of an entity’s results into a presentation currency; instead the date of transaction for this purpose is the date on which income or expense is recorded in profit or loss or other comprehensive income of the foreign operation.

A foreign operation may have reclassification adjustments to profit or loss of gains or losses previously recognised in other comprehensive income, for example as a result of the application of cash flow hedge accounting. However, IAS 21 does not explicitly address how these adjustments are translated into the presentation currency. In our experience the most commonly applied approach is to regard them as income or expenses of the foreign operation to be translated at the exchange rate at the date of reclassification in accordance with IAS 21.39(b). For cash flow hedges, this better reflects the hedge accounting reported in the foreign operation’s own financial statements. Nevertheless, some would argue that reclassification adjustments do not represent income or expenses. Consequently, IAS 21.39(b) would not apply and the reclassification is translated using the historical exchange rates at the dates the original gains or losses arose.

How we see it

In our view, each of the approaches described above represents an acceptable accounting policy choice.

The translational process above makes only limited reference to the translation of equity items, although the selection of accounting policy for translating reclassification adjustments is likely to influence whether an entity translates the associated equity balance in order to prevent a residual amount being left within the reserve. The treatment of such items is discussed in section 6.2 below.

IAS 21 indicates that the exchange differences referred to in item (c) above result from: [IAS 21.41]

- Translating income and expenses at the exchange rates at the dates of the transactions and assets and liabilities at the closing rate. Such exchange differences arise both on income and expense items recognised in profit or loss and on those recognised in other comprehensive income
- Translating the opening net assets at a closing rate that differs from the previous closing rate

This is not in fact completely accurate since if the entity has had any transactions with equity holders that have resulted in a change in the net assets during the period there are likely to be further exchange differences that need to be recognised to the extent that the closing rate differs from the rate used to translate the transaction. This will particularly be the case where a parent has subscribed for further equity shares in a subsidiary.

The reason why these exchange differences are not recognised in profit or loss is because the changes in exchange rates have little or no direct effect on the present and future cash flows from operations.

[IAS 21.41].

The application of these procedures is shown in the following Illustration.

Illustration 6-1: Translation of a non-hyperinflationary functional currency to a non-hyperinflationary presentation currency

An Australian entity owns 100% of the share capital of a foreign entity which was set up a number of years ago when the exchange rate was A\$1=FC2. It is consolidating the financial statements of the subsidiary in its consolidated financial statements for the year ended 31 December 20X2. The exchange rate at the year-end is A\$1=FC4 (20X1: A\$1=FC3). For the purposes of illustration, it is assumed that exchange rates have not fluctuated significantly and the appropriate weighted average rate for the year was A\$1=FC3.5, and that the currency of the foreign entity is not that of a hyperinflationary economy. The income statement of the subsidiary for that year and its statement of financial position at the beginning and end of the year in its functional currency and translated into Australian dollars are as follows:

Income statement

	FC	A\$
Sales	35,000	10,000
Cost of sales	(33,190)	(9,483)
Depreciation	(500)	(143)
Interest	(350)	(100)
Profit before taxation	960	274
Taxation	(460)	(131)
Profit after taxation	500	143

Statements of financial position	20X1	20X2	20X1	20X2
	FC	FC	A\$	A\$
Property, plant and equipment	6,000	5,500	2,000	1,375
Current assets				
Inventories	2,700	3,000	900	750
Receivables	4,800	4,000	1,600	1,000
Cash	200	600	67	150
	7,700	7,600	2,567	1,900
Current liabilities				
Payables	4,530	3,840	1,510	960
Taxation	870	460	290	115
	5,400	4,300	1,800	1,075
Net current assets	2,300	3,300	767	825
	8,300	8,800	2,767	2,200
Long-term loans	3,600	3,600	1,200	900
	4,700	5,200	1,567	1,300
Share capital	1,000	1,000	500	500
Retained profits*	3,700	4,200	1,500	1,643
Exchange reserve*			(433)	(843)
	4,700	5,200	1,567	1,300

* The opening balances for 20X1 in A\$ have been assumed and represent cumulative amounts since the foreign entity was set up.

The movement of A\$(410) in the exchange reserve included as a separate component of equity is made up as follows:

(i) The exchange loss of A\$392 on the opening net investment in the subsidiary, calculated as follows:

Opening net assets at opening rate	- FC4,700 at FC3 = A\$1 =	A\$1,567
Opening net assets at closing rate	- FC4,700 at FC4 = A\$1 =	A\$1,175
Exchange loss on net assets		A\$392

(ii) The exchange loss of A\$18, being the difference between the income account translated at an average rate, i.e., A\$143, and at the closing rate, i.e., A\$125.

When the exchange differences relate to a foreign operation that is consolidated but not wholly-owned, accumulated exchange differences arising from translation and attributable to non-controlling interests are allocated to, and recognised as part of, non-controlling interests in the consolidated statement of financial position. [IAS 21.41].

An example of an accounting policy dealing with the translation of entities whose functional currency is not that of a hyperinflationary economy is illustrated in the following Practical example.

Practical example 6-1: Lloyds Banking Group plc (2022)	United Kingdom
Annual Report and Accounts 2022 [extract] Financial statements [extract] Notes to the consolidated financial statements [extract] Note 2: Accounting policies [extract] (N) Foreign currency translation Items included in the financial statements of each of the Group's entities are measured using the currency of the primary economic environment in which the entity operates (the functional currency). Foreign currency transactions are translated into the appropriate functional currency using the exchange rates prevailing at the dates of the transactions. Foreign exchange gains and losses resulting from the settlement of such transactions and from the translation at year end exchange rates of monetary assets and liabilities denominated in foreign currencies are recognised in the income statement, except when recognised in other comprehensive income as qualifying cash flow or net investment hedges. Non-monetary assets that are measured at fair value are translated using the exchange rate at the date that the fair value was determined. Translation differences on equities and similar non-monetary items held at fair value through profit and loss are recognised in profit or loss as part of the fair value gain or loss. Translation differences on non-monetary financial assets measured at fair value through other comprehensive income, such as equity shares, are included in the fair value reserve in equity unless the asset is a hedged item in a fair value hedge. The results and financial position of all Group entities that have a functional currency different from the presentation currency are translated into the presentation currency as follows: the assets and liabilities of foreign operations, including goodwill and fair value adjustments arising on the acquisition of a foreign entity, are translated into sterling at foreign exchange rates ruling at the balance sheet date; and the income and expenses of foreign operations are translated into sterling at average exchange rates unless these do not approximate to the foreign exchange rates ruling at the dates of the transactions, in which case income and expenses are translated at the dates of the transactions. Foreign exchange differences arising on the translation of a foreign operation are recognised in other comprehensive income and accumulated in a separate component of equity together with exchange differences arising from the translation of borrowings and other currency instruments designated as hedges of such investments (see (F)(3) above). On disposal or liquidation of a foreign operation, the cumulative amount of exchange differences relating to that foreign operation is reclassified from equity and included in determining the profit or loss arising on disposal or liquidation.	

The IASB had considered an alternative translation method, which would have been to translate all amounts (including comparatives) at the most recent closing rate. This was considered to have several advantages: it is simple to apply; it does not generate any new gains and losses; and it does not change ratios such as return on assets. Supporters of this method believed that the process of merely expressing amounts in a different currency preserves the same relationships among amounts as measured in the functional currency. [IAS 21.BC17]. These views were probably based more on the IASB's proposals for allowing an entity to present its financial statements in a currency other than its functional currency, rather than the translation of foreign operations for inclusion in consolidated financial statements. Such an approach does have theoretical appeal. However, the major drawback is that it would require the comparatives to be restated from those previously reported.

The IASB rejected this alternative and decided to require the method that the previous version of IAS 21 required for translating the financial statements of a foreign operation. [IAS 21.BC20]. It is asserted that this method results in the same amounts in the presentation currency regardless of whether the financial statements of a foreign operation are first translated into the functional currency of another group entity and then into the presentation currency or translated directly into the presentation currency. [IAS 21.BC18]. We agree that it will result in the same amounts for the statement of financial position, regardless of whether the translation process is a single or two-stage process. However, it does not necessarily hold true for income and expense items particularly if an indirectly held foreign operation is disposed of - this is discussed further in sections 6.1.4 and 6.6.3 below. Differences will also arise between the two methods if an average rate is used, although these are likely to be insignificant.

The IASB states that the method chosen avoids the need to decide the currency in which to express the financial statements of a multinational group before they are translated into the presentation currency. In addition, it produces the same amounts in the presentation currency for a stand-alone entity as for an identical subsidiary of a parent whose functional currency is the presentation currency. [IAS 21.BC19]. For example, if a Swiss entity with the Swiss franc as its functional currency wishes to present its financial statements in euros, the translated amounts in euros would be the same as those for an identical entity with the Swiss franc as its functional currency that are included within the consolidated financial statements of its parent that presents its financial statements in euros.

6.1.2 Functional currency is that of a hyperinflationary economy

The results and financial position of an entity whose functional currency is the currency of a hyperinflationary economy are translated into a different presentation currency using the following procedures: [IAS 21.42]

- (a) All amounts (i.e., assets, liabilities, equity items, income and expenses, including comparatives) are translated at the closing rate at the date of the most recent statement of financial position, except that:
- (b) When amounts are translated into the currency of a non-hyperinflationary economy, comparative amounts are those that were presented as current year amounts in the relevant prior year financial statements (i.e., not adjusted for subsequent changes in the price level or subsequent changes in exchange rates).

Similarly, in the period during which the functional currency of a foreign operation such as a subsidiary becomes hyperinflationary and applies IAS 29 for the first time, the parent's consolidated financial statements for the comparative period are not restated for the effects of hyperinflation. Nor are any exchange differences associated with such a foreign operation that were accumulated in a separate component of equity reclassified within equity. Instead they will be reclassified to profit or loss on disposal or partial disposal of the foreign operation as set out in section 6.6 below.⁹

When an entity's functional currency is the currency of a hyperinflationary economy, the entity restates its financial statements in accordance with IAS 29 before applying the translation method set out above, except for comparative amounts that are translated into a currency of a non-hyperinflationary economy (see (b) above). [IAS 21.43].

When the economy ceases to be hyperinflationary and the entity no longer restates its financial statements in accordance with IAS 29, it uses as the historical costs for translation into the presentation currency the amounts restated to the price level at the date the entity ceased restating its financial statements.

[IAS 21.43].

Illustration 6-2: Translation of a hyperinflationary functional currency to a non-hyperinflationary presentation currency

Using the same basic facts as Illustration 6-1 in section 6.1.1 above, but assuming that the functional currency of the subsidiary is that of a hyperinflationary economy, the income statement of the subsidiary for that year and its statement of financial position at the beginning and end of the year in its functional currency and translated into Australian dollars are as shown below. The IAS 29 hyperinflation adjustments have not been illustrated below. For a discussion of these adjustments, see Chapter 17, which explains how they may be presented in a situation such as this.

Income statement	FC	A\$
Sales	35,000	8,750
Cost of sales	(33,190)	(8,298)
Depreciation	(500)	(125)
Interest	(350)	(87)
Profit before taxation	960	240
Taxation	(460)	(115)
Profit after taxation	500	125

Statements of financial position	20X1	20X2	20X1	20X2
	FC	FC	A\$	A\$
Property, plant and equipment	6,000	5,500	2,000	1,375
Current assets				
Inventories	2,700	3,000	900	750
Receivables	4,800	4,000	1,600	1,000
Cash	200	600	67	150
	7,700	7,600	2,567	1,900

⁹ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

Current liabilities				
Payables	4,530	3,840	1,510	960
Taxation	870	460	290	115
	<u>5,400</u>	<u>4,300</u>	<u>1,800</u>	<u>1,075</u>
Net current assets	<u>2,300</u>	<u>3,300</u>	<u>767</u>	<u>825</u>
	8,300	8,800	2,767	2,200
Long-term loans	<u>3,600</u>	<u>3,600</u>	<u>1,200</u>	<u>900</u>
	<u>4,700</u>	<u>5,200</u>	<u>1,567</u>	<u>1,300</u>
Share capital	1,000	1,000	333	250
Consolidation adjustment*			167	250
Retained profits**	3,700	4,200	1,500	1,625
Exchange reserve**			(433)	(825)
	<u>4,700</u>	<u>5,200</u>	<u>1,567</u>	<u>1,300</u>

* The consolidation adjustment plus the restated A\$ amount of share capital eliminates against the parent's investment in subsidiary recorded at the historical exchange rate of A\$1=FC2, i.e., A\$500. If the example incorporated the IAS 29 hyperinflation adjustments, this difference would include both translation and hyperinflation effects.

** The opening balances for 20X1 in A\$ have been assumed and represent cumulative amounts since the foreign entity was set up.

The movement in retained profits is represented by the A\$125 profit for the year and the movement in the exchange reserve is an exchange loss of A\$392 which represents the reduction in opening net assets due to the movements in exchange, calculated as follows:

Opening balance at opening rate	- FC4,700 at FC3 = A\$1 =	A\$1,567
Opening balance at closing rate	- FC4,700 at FC4 = A\$1 =	<u>A\$1,175</u>
Exchange loss		A\$(392)

Historically it was considered unclear what happens to such an exchange difference (and also the movement in share capital caused by the change in exchange rates) since IAS 21.42 makes no reference to any possible exchange differences arising from this process. Typically, they were recognised, in aggregate with the related adjustment arising from applying IAS 29 (which in the Illustration above are ignored), in other comprehensive income or directly in equity.¹⁰

However, in March 2020 the IFRS IC clarified that the exchange differences above are recognised in other comprehensive income. The agenda decision also addressed how the adjustments from applying IAS 29 are presented and a more extensive discussion of this issue is included in Chapter 17, although in summary they would be recognised in other comprehensive income if considered exchange differences and directly in equity otherwise.¹¹

10 [IASB Staff Paper 4A](#): Project: *Translating a Hyperinflationary Foreign Operation (IAS 21 and IAS 29)*, Paper topic: *Initial consideration--Presenting Exchange Differences when a Foreign Operation is Hyperinflationary*, IFRS IC Meeting, September 2019. Available on the IFRS Foundation's website.

11 [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

An example of an accounting policy dealing with the translation of entities whose functional currency is that of a hyperinflationary economy is illustrated in the following Practical example.

Practical example 6-2: Unilever PLC

United Kingdom

Unilever Annual Report and Accounts 2024 [extract]

Financial statements [extract]

Notes to the Consolidated Financial Statements Unilever Group [extract]

1. Accounting information and policies [extract]

FOREIGN CURRENCIES

The consolidated financial statements are presented in euros.

Items included in the financial statements of individual group companies are recorded in their respective functional currency which is the currency of the primary economic environment in which each entity operates.

Foreign currency transactions in individual group companies are translated into functional currency using exchange rates at the date of the transaction. Foreign exchange gains and losses from settlement of these transactions, and from translation of monetary assets and liabilities at year-end exchange rates, are recognised in the income statement except when deferred in equity as qualifying hedges.

In preparing the consolidated financial statements, the balances in individual group companies are translated from their functional currency into euros. Apart from the financial statements of group companies in hyperinflationary economies (see below), the income statement, the cash flow statement and all other movements in assets and liabilities are translated at average rates of exchange as a proxy for the transaction rate, or at the transaction rate itself if more appropriate. Assets and liabilities are translated at year-end exchange rates.

The financial statements of group companies whose functional currency is the currency of a hyperinflationary economy are adjusted for inflation and then translated into euros using the balance sheet exchange rate. Amounts shown for prior years for comparative purposes are not modified. To determine the existence of hyperinflation, the Group assesses the qualitative and quantitative characteristics of the economic environment of the country, such as the cumulative inflation rate over the previous three years.

...

The effect of exchange rate changes during the year on net assets of foreign operations is recorded in equity. For this purpose, net assets include loans between group companies and any related foreign exchange contracts where settlement is neither planned nor likely to occur in the foreseeable future.

The Group applies hedge accounting to certain exchange differences arising between the functional currencies of a foreign operation and the functional currency of the parent entity, regardless of whether the net investment is held directly or through an intermediate parent. Differences arising on retranslation of a financial liability designated as a foreign currency net investment hedge are recorded in equity to the extent that the hedge is effective. These differences are reported within profit or loss to the extent that the hedge is ineffective.

Cumulative exchange differences arising since the date of transition to IFRS of 1 January 2004 are reported as a separate component of other reserves. In the event of disposal or part disposal of an interest in a group company either through sale or as a result of a repayment of capital, the cumulative exchange difference is recognised in the income statement as part of the profit or loss on disposal of group companies.

6.1.3 Calculation of average rate

When translating the results of an entity whose functional currency is not that of a hyperinflationary economy, for practical reasons, the reporting entity may use a rate that approximates the actual exchange rate, e.g., an average rate for the period, to translate income and expense items. [IAS 21.40].

The standard does not give any guidance on the factors that are to be taken into account in determining what may be an appropriate average rate for the period - it merely says that "if exchange rates fluctuate significantly, the use of the average rate for the period is inappropriate". [IAS 21.40]. What methods are, therefore, available to entities to use in calculating an appropriate average rate? Possible methods might be:

- (a) Mid-year rate
- (b) Average of opening and closing rates
- (c) Average of month end/quarter end rates
- (d) Average of monthly average rates
- (e) Monthly/quarterly results at month end/quarter end rates
- (f) Monthly/quarterly results at monthly/quarterly averages

Illustration 6-3: Calculation of average rate

A Spanish entity has a foreign subsidiary and is preparing its consolidated financial statements for the year ended 30 April 20X2. It intends to use an average rate for translating the results of the subsidiary. The relevant exchange rates for €1=FC are as follows:

Month	Month end	Average for month	Average for quarter	Average for year
April 20X1	1.67			
May 20X1	1.63	1.67		
June 20X1	1.67	1.64		
July 20X1	1.64	1.65	1.65	
August 20X1	1.67	1.64		
September 20X1	1.70	1.63		
October 20X1	1.67	1.68	1.65	
November 20X1	1.65	1.70		
December 20X1	1.66	1.66		
January 20X2	1.64	1.67	1.68	
February 20X2	1.60	1.65		
March 20X2	1.61	1.63		
April 20X2	1.61	1.62	1.63	1.65

Average of month end rates - 1.65

Average of quarter end rates - 1.64

The results of the subsidiary for each of the 12 months to 30 April 20X2 and the translation thereof under each of the above methods (using monthly figures where appropriate) are shown below:

Method (a)	FC31,050 @ 1.67 = €18,593
Method (b)	FC31,050 @ 1.64 = €18,933
Method (c) - monthly	FC31,050 @ 1.65 = €18,818
Method (c) - quarterly	FC31,050 @ 1.64 = €18,933
Method (d)	FC31,050 @ 1.65 = €18,818

		(e)	(e)	(f)	(f)
		quarterly	monthly	quarterly	monthly
Month	FC	€	€	€	€
May 20X1	1,000		613		599
June 20X1	1,100		659		671
July 20X1	1,200	2,012	732	2,000	727
August 20X1	1,300		778		793
September 20X1	1,300		765		798
October 20X1	1,350	2,365	808	2,394	804
November 20X1	1,400		848		824
December 20X1	1,400		843		843
January 20X2	2,000	2,927	1,220	2,857	1,198
February 20X2	5,000		3,125		3,030
March 20X2	10,000		6,211		6,135
April 20X2	4,000	11,801	2,484	11,656	2,469
Total	31,050	19,105	19,086	18,907	18,891

It can be seen that by far the simplest methods to use are the methods (a) to (d).

How we see it

In our view methods (a) and (b) are not normally used as it is unlikely in times of volatile exchange rates that they will give appropriate weighting to the exchange rates which have been in existence throughout the period in question. They are only likely to give an acceptable answer if the exchange rate has been static or steadily increasing or decreasing throughout the period.

Method (c) based on quarter end rates has similar drawbacks and therefore is not normally used.

Method (c) based on month end rates and method (d) are better than the previous methods as they do take into account more exchange rates which have applied throughout the year, with method (d) being more precise, as this will have taken account of daily exchange rates. Method (d) will normally give reasonable and acceptable results when there are no seasonal variations in items of income and expenditure.

Average monthly rates for most major currencies are likely to be given in publications issued by the government, banks and other sources and therefore it is unnecessary for entities to calculate their own. The work involved in calculating an average for the year, therefore, is not very onerous.

Where there are seasonal variations in items of income and expenditure, using a single average rate for the entire reporting period is unlikely to result in a reasonable approximation of applying actual rates. In these situations appropriate exchange rates are applied to the appropriate items. This can be done by using either of methods (e) or (f) preferably using figures and rates for each month. Where such a method is being used care is to be taken to ensure that the periodic accounts are accurate and that cut-off procedures have been adequate, otherwise significant items may be translated at the wrong average rate.

Where there are significant one-off items of income and expenses then it is likely that actual rates at the date of the transaction will need to be used to translate such items.

6.1.4 Accounting for foreign operations where sub-groups exist

A reporting entity comprising a group with intermediate holding companies may adopt either the direct or the step-by-step method of consolidation. The direct method involves the financial statements of foreign operations being translated directly into the presentation currency of the ultimate parent. The step-by-step method involves the financial statements of the foreign operation first being translated into the functional currency of any intermediate parent(s) and then into the presentation currency of the ultimate parent.

[IFRIC 16.17].

It is asserted that both methods will result in the same amounts being reported in the presentation currency. [IAS 21.BC18]. However, as set out in section 6.6.3 below, particularly in Illustration 6-11, and as acknowledged by the IFRS IC,¹² this assertion is demonstrably untrue in certain situations.

Whilst the various requirements of the standard appear to indicate that the direct method is to be used and the IFRS IC has indicated it is the conceptually correct method,¹³ IAS 21 does not require an entity to use the direct method or to make adjustments to produce the same result. Rather, an entity has an accounting policy choice as to which of the two methods it uses and the method selected is to be used consistently for all net investments. [IFRIC 16.17].

6.2 Translation of equity items

The method of translation of the results and financial position of an entity whose functional currency is not the currency of a hyperinflationary economy is discussed in section 6.1.1 above. The translation process makes only limited reference to the translation of equity items. The exposure draft that preceded the standard had proposed that "... equity items other than those resulting from income and expense recognised in the period ... shall be translated at the closing rate". However, the IASB decided not to specify in the standard the translation rate for equity items,¹⁴ but no explanation has been given in the Basis for Conclusions about this matter.

So how are entities to deal with the translation of equity items?

6.2.1 Share capital

Where an entity presents its financial statements in a currency other than its functional currency, the same issues arise as they do when an entity issues foreign currency share capital (see section 5.4.4 above).

In these circumstances it would also seem more appropriate that the entity's share capital (whether they are ordinary shares, or are otherwise irredeemable and classified as equity instruments) are translated at historical rates of exchange. Such capital items are included within the examples of non-monetary items listed in US GAAP as accounts to be remeasured using historical exchange rates when the temporal method is being applied (see section 5.4.4 above). IAS 21 requires non-monetary items that are measured at historical cost in a foreign currency to be translated using the historical rate (see section 5.2 above). Translation at an historical rate would imply using the rate ruling at the date of the issue of the shares. However, where a subsidiary is presenting its financial statements in the currency of its parent, it may be that the more appropriate historical rate for share capital that was in issue at the date it became a subsidiary would be that ruling at the date it became a subsidiary of the parent, rather than at earlier dates of issue.

How we see it

Where such share capital is retranslated at the closing rate, we do not believe that it is appropriate for the exchange differences to be recognised in other comprehensive income nor for them to be taken to the separate component of equity required by IAS 21 (since to do so could result in them being reclassified from equity to profit or loss upon disposal of part of the entity's operations in the future), but are either taken to retained earnings or some other reserve.

Consequently, whether such share capital is maintained at a historical rate, or is dealt with in this way, the treatment has no impact on the overall equity of the entity.

6.2.2 Other equity balances resulting from transactions with equity holders

In addition to share capital, an entity may have other equity balances resulting from the issue of shares, such as a share premium account (additional paid-in capital). Like share capital, the translation of such balances could be done at either historical rates or at the closing rate.

¹² [IFRIC Update](#), March 2008, p.2. Available on the IFRS Foundation's website.

¹³ [IFRIC Update](#), March 2008, p.2. Available on the IFRS Foundation's website.

¹⁴ [IASB Update](#), February 2003, p.5. Available on the IFRS Foundation's website.

How we see it

We believe that whichever method is adopted it is to be consistent with the treatment used for share capital. Again, where exchange differences arise through using the closing rate, we believe that it is not appropriate for them to be recognised in other comprehensive income or taken to the separate component of equity required by IAS 21.

A similar approach is adopted where an entity has acquired its own equity shares and has deducted those 'treasury shares' from equity as required by IAS 32 (see Chapter 43).

6.2.3 Other equity balances resulting from income and expenses being recognised in other comprehensive income

Under IAS 21, income and expenses recognised in other comprehensive income are translated at the exchange rates ruling at the dates of the transaction. [IAS 21.39(b), IAS 21.41]. Examples of such items include certain gains and losses on:

- Revalued property, plant and equipment under IAS 16 (see Chapter 19) and revalued intangible assets under IAS 38 *Intangible Assets* (see Chapter 18)
- Debt instruments measured at fair value through other comprehensive income, investments in equity instruments designated at fair value through other comprehensive income and financial liabilities designated at fair value through profit or loss under IFRS 9 (see Chapter 46)
- Gains and losses on cash flow hedges under IFRS 9 (see Chapter 49)
- Any amounts of current and deferred tax recognised in other comprehensive income under IAS 12 (see Chapter 29)

This would suggest that where these gains and losses are accumulated within a separate reserve or component of equity, then any period-end balance will represent the cumulative translated amounts of such gains and losses. However, as IAS 21 is silent on the matter it would seem to be acceptable to translate these equity balances at the closing rate.

The treatment of equity balances that are subsequently reclassified to profit or loss, for example cash flow hedge reserves of a foreign operation, typically depends on the exchange rate used to translate the reclassification adjustments (a topic which is discussed in section 6.1.1 above). Where reclassification adjustments are translated using the exchange rate at the date of reclassification, translating the equity balance at closing rate means no residual balance is left in the reserve once the hedge accounting is completely accounted for. Conversely, where reclassification adjustments are translated using exchange rates at the dates the original gains or losses arose, an entity would avoid a residual balance remaining in the reserve by not retranslating the equity balance. However, whether such balances are maintained at the original translated rates, or are translated at closing rates, the treatment has no impact on the overall equity of the entity.

6.3 Exchange differences on intragroup balances

The incorporation of the results and financial position of a foreign operation with those of the reporting entity follows normal consolidation procedures, such as the elimination of intragroup balances and intragroup transactions of a subsidiary. [IAS 21.45]. On this basis, there is a tendency sometimes to assume that exchange differences on intragroup balances do not impact on the reported profit or loss for the group in the consolidated financial statements. However, an intragroup monetary asset (or liability), whether short-term or long-term, cannot be eliminated against the corresponding intragroup liability (or asset) without the entity with the currency exposure recognising an exchange difference on the intragroup balance.

This exchange difference will be reflected in that entity's profit or loss for the period (see section 5.3.1 above) and, except as indicated below, IAS 21 requires this exchange difference to continue to be included in profit or loss in the consolidated financial statements. This is because the monetary item represents a commitment to convert one currency into another and exposes the reporting entity to a gain or loss through currency fluctuations.

6.3.1 Monetary items included as part of the net investment in a foreign operation

An exception to the general rule in section 6.3 above applies where an exchange difference arises on a balance that, in substance, forms part of an entity's net investment in a foreign operation, for example an intragroup balance with a subsidiary. Instead, the exchange difference is not recognised in profit or loss in the consolidated financial statements, but is recognised in other comprehensive income and accumulated in a separate component of equity until the disposal of the foreign operation (see section 6.6 below).

[IAS 21.32, IAS 21.45].

The 'net investment in a foreign operation' is defined as being "the amount of the reporting entity's interest in the net assets of that operation". [IAS 21.8]. This will include a monetary item that is receivable from or payable to a foreign operation for which settlement is neither planned nor likely to occur in the foreseeable future (often referred to as a 'permanent as equity' loan) because it is, in substance, a part of the entity's net investment in that foreign operation. Such monetary items may include long-term receivables or loans. They do not include trade receivables or trade payables. [IAS 21.15].

6.3.1.A Trade receivables or payables included as part of the net investment in a foreign operation

How we see it

In spite of what IAS 21 says about trade receivables and payables, in our view they can be included as part of the net investment in the foreign operation, but only if cash settlement is not made or planned to be made in the foreseeable future. However, if a subsidiary makes payment for purchases from its parent, but is continually indebted to the parent as a result of new purchases, then in these circumstances, since individual transactions are settled, no part of the inter-company balance is regarded as part of the net investment in the subsidiary.

Accordingly, exchange differences on such balances are recognised in profit or loss.

These requirements and our view are shown in the following Illustration.

Illustration 6-4: Receivables/payables included as part of net investment in a foreign operation

A UK entity, A, has a Belgian subsidiary, B. A has a receivable due from B amounting to £1,000,000. In each of the following scenarios, could the receivable be included as part of A's net investment in B?

Scenario 1

The receivable arises from the sale of goods, together with interest payments and dividend payments which have not been paid in cash but have been accumulated in the inter-company account. A and B agree that A can claim at any time the repayment of this receivable. It is likely that there will be a settlement of the receivable in the foreseeable future.

Although the standard states that trade receivables and payables are not included, we do not believe that it necessarily precludes deferred trading balances from being included. In our view, such balances can be included as part of the net investment in the foreign operation, but only if cash settlement is not made or planned to be made in the foreseeable future.

In this scenario, the settlement of A's receivable due from B is not planned; however, it is likely that a settlement will occur in the foreseeable future. Accordingly, the receivable does not qualify to be treated as part of A's net investment in B. The term 'foreseeable future' is not defined and no specific time period is implied. It could be argued that the receivable is only to be considered as part of the net investment if it will be repaid only when the reporting entity disinvests from the foreign operation. However, it is recognised that in most circumstances this would be unrealistic and therefore a shorter time span is considered in determining the foreseeable future.

Scenario 2

The receivable represents a loan made by A to B and it is agreed that the receivable will be repaid in 20 years. In this scenario, A's receivable due from B has a specified term for repayment. This suggests that settlement is planned. Accordingly, the receivable does not qualify to be treated as part of A's investment in B.

Scenario 3

A and B have previously agreed that the receivable under scenario 2 will be repaid in 20 years but A now decides that it will replace the loan on maturity either with a further inter-company loan or with an injection of equity. This approach is consistent with A's intention to maintain the strategic long-term investment in B.

In this scenario, the words from IAS 21.15 "... settlement is neither planned nor likely to occur in the foreseeable future ..." are potentially problematic, since a loan with a fixed maturity must, *prima facie*, have a planned settlement. However, from the date A decides that it will re-finance the inter-company debt upon maturity with a further long-term instrument, or replace it with equity, the substance of the inter-company loan is that it is part of the entity's net investment in the foreign operation, and there is no actual 'intent' to settle the investment without replacement. On this basis, loans with a stated maturity may qualify to be treated in accordance with IAS 21.32, with foreign currency gains and losses recognised in other comprehensive income and accumulated in a separate component of equity in the consolidated financial statements. However, in our view, management's intention to refinance the loan must be documented appropriately, for example in the form of a minute of a meeting of the management board or board of directors. In addition, any established historical pattern of the entity demanding repayment of such inter-company debt without replacement would be inconsistent with treatment in accordance with IAS 21.32.

Consequently, when the purpose of the loan is to fund a long-term strategic investment then it is the entity's overall intention with regard to the investment and ultimate funding thereof, rather than the specific terms of the inter-company loan funding the investment, that is considered.

Scenario 4

The receivable arises from the sale of goods, together with interest payments and dividend payments which have not been paid in cash but have been accumulated in the inter-company account. However, in this scenario, A and B agree that A can claim the repayment of this receivable only in the event that the subsidiary is disposed of. A has no plans to dispose of entity B.

In this scenario, the settlement of A's receivable due from B is not planned nor is it likely to occur in the foreseeable future. Although the term 'foreseeable future' is not defined, it will not go beyond a point of time after the disposal of a foreign operation. Accordingly, the receivable does qualify for being treated as part of a net investment in a foreign operation.

The question of whether or not a monetary item is as permanent as equity can, in certain circumstances, require the application of significant judgement.

6.3.1.B Manner of settlement of monetary items included as part of the net investment in a foreign operation

The meaning of the term 'settlement' is set out in certain IFRS accounting standards for specific purposes. For instance, IAS 1 *Presentation of Financial Statements* and IFRS 18 *Presentation and Disclosure in Financial Statements*, the latter of which supersedes IAS 1 for periods beginning on or after 1 January 2027, refer to the meaning of settlement for the purpose of classifying a liability as current or non-current (see Chapter 3) and this would include extinguishment of a liability by the entity issuing its own equity instruments. [IAS 1.76A, IFRS 18.B107]. In addition, until 2018, the IASB's conceptual framework suggested that settlement may occur when one liability is replaced with another. However, IFRS accounting standards contain no general definition.

How we see it

We believe it can be appropriate to use a different meaning of settlement when applying IAS 21 if it is clear the substance of a monetary item is that it forms part of an entity's net investment in a foreign operation. This will be the case if an entity expects a monetary item to be settled in a manner that does not actually change the substance of its net investment in a foreign operation.

For example, consider a parent that makes a three-year loan to a subsidiary that is a foreign operation. If it is both planned and likely that (a) the original loan will be settled at maturity but immediately replaced with another three-year loan from the parent for the same amount and (b) any such replacement loan will be similarly rolled over for the foreseeable future, the original and replacement loans would, in substance, represent part of the parent's net investment in the subsidiary. Likewise, if the loan is expected (or even contractually required) to be settled by the subsidiary issuing equity shares to the parent, the loan would still represent part of the parent's net investment in the subsidiary.

6.3.1.C Currency of monetary items included as part of the net investment in a foreign operation

When a monetary item is considered to form part of a reporting entity's net investment in a foreign operation and is denominated in the functional currency of the reporting entity, an exchange difference will be recognised in profit or loss for the period when it arises in the foreign operation's individual financial statements. If the item is denominated in the functional currency of the foreign operation, an exchange difference will be recognised in profit or loss for the period when it arises in the reporting entity's separate financial statements. Such exchange differences are only recognised in other comprehensive income and accumulated in a separate component of equity in the financial statements that include the foreign operation and the reporting entity (i.e., financial statements in which the foreign operation is consolidated or accounted for using the equity method). [IAS 21.32, IAS 21.33].

Illustration 6-5: Monetary item in functional currency of either the reporting entity or the foreign operation

A UK entity has a Belgian subsidiary. On the last day of its financial year, 31 March 20X1, the UK entity lends the subsidiary £1,000,000. Settlement of the loan is neither planned nor likely to occur in the foreseeable future, so the UK entity regards the loan as part of its net investment in the Belgian subsidiary. The exchange rate at 31 March 20X1 was £1=€1.40. Since the loan was made on the last day of the year there are no exchange differences to recognise for that year. At 31 March 20X2, the loan has not been repaid and is still regarded as part of the net investment in the Belgian subsidiary. The relevant exchange rate at that date was £1=€1.50. The average exchange rate for the year ended 31 March 20X2 was £1=€1.45.

In the UK entity's separate financial statements no exchange difference is recognised since the loan is denominated in its functional currency of pound sterling. In the Belgian subsidiary's financial statements, the liability to the parent is translated into the subsidiary's functional currency of euros at the closing rate at €1,500,000, giving rise to an exchange loss of €100,000, i.e., €1,500,000 less €1,400,000 (£1,000,000 @ £1=€1.40). This exchange loss is reflected in the Belgian subsidiary's profit or loss for that year. In the UK entity's consolidated financial statements, this exchange loss included in the subsidiary's profit or loss for the year will be translated at the average rate for the year, giving rise to a loss of £68,966 (€100,000 @ £1=€1.45). This will be recognised in other comprehensive income and accumulated in the separate component of equity together with an exchange gain of £2,299, being the difference between the amount included in the Belgian subsidiary's income statement translated at average rate, i.e., £68,966, and at the closing rate, i.e., £66,667 (€100,000 @ £1=€1.50). The overall exchange loss recognised in other comprehensive income is £66,667. This represents the exchange loss on the increased net investment of €1,400,000 in the subsidiary made at 31 March 20X1, i.e., £1,000,000 (€1,400,000 @ £1=€1.40) less £933,333 (€1,400,000 @ £1=€1.50).

If, on the other hand, the loan made to the Belgian subsidiary had been denominated in the equivalent amount of euros at 31 March 20X1, i.e., €1,400,000, the treatment would have been as follows:

In the UK entity's separate financial statements, the amount receivable from the Belgian subsidiary would be translated at the closing rate at £933,333 (€1,400,000 @ £1=€1.50), giving rise to an exchange loss of £66,667, i.e., £1,000,000 (€1,400,000 @ £1=€1.40) less £933,333, which is included in its profit or loss for the year. In the Belgian subsidiary's financial statements, no exchange difference is recognised since the loan is denominated in its functional currency of euros. In the UK entity's consolidated financial statements, the exchange loss included in its profit or loss for the year in its separate financial statements will be recognised in other comprehensive income and accumulated in the separate component of equity. As before, this represents the exchange loss on the increased net investment of €1,400,000 in the subsidiary made at 31 March 20X1, i.e., £1,000,000 (€1,400,000 @ £1=€1.40) less £933,333 (€1,400,000 @ £1=€1.40).

In most situations, intragroup balances for which settlement is neither planned nor likely to occur in the foreseeable future will be denominated in the functional currency of either the reporting entity or the foreign operation. However, this will not always be the case. If a monetary item is denominated in a currency other than the functional currency of either the reporting entity or the foreign operation, the exchange difference arising in the reporting entity's separate financial statements and in the foreign operation's individual financial statements are also recognised in other comprehensive income and accumulated in the separate component of equity in the financial statements that include the foreign operation and the reporting entity (i.e., financial statements in which the foreign operation is consolidated or accounted for using the equity method). [IAS 21.33].

6.3.1.D Treatment in the individual financial statements of monetary items included as part of the net investment in a foreign operation

The exception for exchange differences on monetary items forming part of the net investment in a foreign operation applies only in the financial statements that include the foreign operation (for example consolidated financial statements when the foreign operation is a subsidiary). In the individual financial statements of the entity (or entities) with the currency exposure the exchange differences have to be reflected in that entity's profit or loss for the period.

6.3.1.E Monetary items transacted by other members of the group

As shown in Illustrations 6-4 and 6-5 in sections 6.3.1.A and 6.3.1.C above respectively, the requirements of IAS 21 whereby exchange differences on a monetary item that forms part of the net investment in a foreign operation are recognised in other comprehensive income clearly apply where the monetary item is transacted between the parent preparing the consolidated financial statements and the subsidiary that is the foreign operation. However, loans from any entity (and in any currency) qualify for net investment treatment, so long as the conditions of IAS 21.15 are met. [IAS 21.15A].

6.3.1.F Monetary items becoming part of the net investment in a foreign operation

An entity's plans and expectations in respect of an intragroup monetary item may change over time and the status of such items are assessed each period. For example, a parent may decide that its subsidiary requires refinancing and instead of investing more equity capital in the subsidiary decides that an existing inter-company account, which has previously been regarded as a normal monetary item, will become a long-term deferred trading balance and no repayment of such amount will be requested within the foreseeable future.

How we see it

In our view, such a 'capital injection' is regarded as having occurred at the time it is decided to redesignate the inter-company account. Consequently, the exchange differences arising on the account up to that date are recognised in profit or loss and the exchange differences arising thereafter are recognised in other comprehensive income on consolidation.

This is discussed further in the following Illustration.

Illustration 6-6: Monetary item becoming part of the net investment in a foreign operation

A UK entity has a wholly owned Canadian subsidiary whose net assets at 31 December 20X1 were C\$2,000,000. These net assets were arrived at after taking account of a liability to the UK parent of £250,000. Using the closing exchange rate of £1=C\$2.35 this liability was included in the Canadian company's statement of financial position at that date at C\$587,500. On 30 June 20X2, when the exchange rate was £1=C\$2.45, the parent decided that in order to refinance the Canadian subsidiary it would regard the liability of £250,000 as a long-term liability which would not be called for repayment in the foreseeable future. Consequently, the parent thereafter regarded the loan as being part of its net investment in the subsidiary. In the year ended 31 December 20X2 the Canadian company made no profit or loss other than any exchange difference to be recognised on its liability to its parent. The relevant exchange rate at that date was £1=C\$2.56. The average exchange rate for the year ended 31 December 20X2 was £1=C\$2.50.

The financial statements of the subsidiary in C\$ and translated using the closing rate are as follows:

Statement of financial position	31 December 20X2		31 December 20X1	
	C\$	£	C\$	£
Assets	2,587,500	1,010,742	2,587,500	1,101,064
Amount due to parent	640,000	250,000	587,500	250,000
Net assets	1,947,500	760,742	2,000,000	851,064
Income statement				
Exchange difference	(52,500)			

If the amount due to the parent is not part of the parent's net investment in the foreign operation, this exchange loss would be translated at the average rate and included in the consolidated profit and loss account as £21,000. As the net investment was C\$2,000,000 then there would have been an exchange loss recognised in other comprehensive income of £69,814, i.e., £851,064 less £781,250 (C\$2,000,000 @ £1=C\$2.56), together with an exchange gain of £492, being the difference between profit or loss translated at average rate, i.e., £21,000, and at the closing rate, i.e., £20,508.

However, the parent now regards the amount due as being part of the net investment in the subsidiary. The question then arises as to when this is to be regarded as having happened and how the exchange difference on it is calculated. No guidance is given in IAS 21.

In our view, the 'capital injection' is regarded as having occurred at the time it is decided to redesignate the inter-company account. The exchange differences arising on the account up to that date are recognised in profit or loss. Only the exchange difference arising thereafter would be recognised in other comprehensive income on consolidation. The inter-company account that was converted into a long-term loan becomes part of the entity's (UK parent's) net investment in the foreign operation (Canadian subsidiary) at the moment in time when the entity decides that settlement is neither planned nor likely to occur in the foreseeable future, i.e., 30 June 20X2. Accordingly, exchange differences arising on the long-term loan are recognised in other comprehensive income and accumulated in a separate component of equity from that date. The same accounting treatment would have been applied if a capital injection had taken place at the date of redesignation.

At 30 June 20X2 the subsidiary would have translated the inter-company account as C\$612,500 (£250,000 @ £1=C\$2.45) and therefore the exchange loss up to that date was C\$25,000. Translated at the average rate this amount would be included in consolidated profit or loss as £10,000, with only an exchange gain of £234 recognised in other comprehensive income, being the difference between profit or loss translated at average rate, i.e., £10,000, and at the closing rate, i.e., £9,766. Accordingly, £11,000 (£21,000 less £10,000) offset by a reduction in the exchange gain on the translation of profit or loss of £258 (£492 less £234) would be recognised in other comprehensive income. This amount represents the exchange loss on the 'capital injection' of C\$612,500. Translated at the closing rate this amounts to £239,258 which is £10,742 less than the original £250,000.

Some might argue that an approach of regarding the 'capital injection' as having occurred at the beginning of the accounting period would have the merit of treating all of the exchange differences for this year in the same way. However, for the reasons provided above we do not regard such an approach as being acceptable.

Suppose, instead of the inter-company account being £250,000, it was denominated in dollars at C\$587,500. In this case the parent would be exposed to the exchange risk; what would be the position?

The subsidiary's net assets at both 31 December 20X1 and 20X2 would be:

Assets	C\$2,587,500
Amount due to parent	C\$587,500
Net assets	C\$2,000,000

As the inter-company account is expressed in Canadian dollars, there will be no exchange difference thereon in the subsidiary's profit or loss.

There will, however, be an exchange loss in the parent as follows:

C\$587,500	@ 2.35 =	£250,000
	@ 2.56 =	£229,492
		<u>£20,508</u>

Again, in the consolidated financial statements as the inter-company account is now regarded as part of the equity investment some of this amount is recognised in other comprehensive income. For the reasons stated above, in our view it is only the exchange differences that have arisen after the date of redesignation, i.e., 30 June 20X2, that are recognised in other comprehensive income.

On this basis, the exchange loss would be split as follows:

C\$587,500	@ 2.35 =	£250,000	
	@ 2.45 =	£239,796	
		<u>£10,204</u>	
	@ 2.45 =	£239,796	
	@ 2.56 =	£229,492	
		<u>£10,304</u>	

The exchange loss up to 30 June 20X2 of £10,204 would be recognised in consolidated profit or loss and the exchange loss thereafter of £10,304 would be recognised in other comprehensive income. This is different from when the account was expressed in sterling because the 'capital injection' in this case is C\$587,500 whereas before it was effectively C\$612,500.

6.3.1.G Monetary items ceasing to be part of the net investment in a foreign operation

The previous section dealt with the situation where a pre-existing monetary item was subsequently considered to form part of the net investment in a foreign operation. However, what happens where a monetary item ceases to be considered part of the net investment in a foreign operation, either because the circumstances have changed such that it is now planned or is likely to be settled in the foreseeable future or indeed that the monetary item is in fact settled?

Where the circumstances have changed such that the monetary item is now planned or is likely to be settled in the foreseeable future, then similar issues to those discussed in section 6.3.1.F above apply; i.e., are the exchange differences on the intragroup balance to be recognised in profit or loss only from the date of change or from the beginning of the financial year?

How we see it

For the same reasons set out in section 6.3.1.F above, including in Illustration 6-6 above, in our view, the monetary item ceases to form part of the net investment in the foreign operation at the moment in time when the entity decides that settlement is planned or is likely to occur in the foreseeable future. Accordingly, exchange differences arising on the monetary item up to that date are recognised in other comprehensive income and accumulated in a separate component of equity. The exchange differences that arise after that date are recognised in profit or loss.

Consideration also needs to be given as to the treatment of the cumulative exchange differences on the monetary item that have been recognised in other comprehensive income, including those that had been recognised in other comprehensive income in prior years. The treatment of these exchange differences is to recognise them in other comprehensive income and accumulate them in a separate component of equity until the disposal of the foreign operation. [IAS 21.45]. The principle question is whether the change in circumstances or actual settlement in cash of the intragroup balance represents a disposal or partial disposal of the foreign operation and this is considered in more detail in section 6.6 below.

6.3.2 Dividends

If a subsidiary pays a dividend to the parent during the year the parent records the dividend at the rate ruling when the dividend was declared. An exchange difference will arise in the parent's own financial statements if the exchange rate moves between the declaration date and the date the dividend is actually received. This exchange difference is required to be recognised in profit or loss and will remain there on consolidation.

The same will apply if the subsidiary declares a dividend to its parent on the last day of its financial year and this is recorded at the year-end in both entities' financial statements. There is no problem in that year as both the intragroup balances and the dividends will eliminate on consolidation with no exchange differences arising. However, as the dividend will not be received until the following year an exchange difference will arise in the parent's financial statements in that year if exchange rates have moved in the meantime. Again, this exchange difference remains in consolidated profit or loss as it is no different from any other exchange difference arising on intragroup balances resulting from other types of intragroup transactions. It is not recognised in other comprehensive income.

It may seem odd that the consolidated results can be affected by exchange differences on inter-company dividends. However, once the dividend has been declared, the parent now effectively has a functional currency exposure to assets that were previously regarded as part of the net investment. In order to minimise the effect of exchange rate movements entities would, therefore, need to arrange for inter-company dividends to be paid on the same day the dividend is declared, or as soon after the dividend is declared as possible.

6.3.3 Unrealised profits on intragroup transactions

The other problem area is the elimination of unrealised profits resulting from intragroup transactions when one of the parties to the transaction is a foreign subsidiary.

Illustration 6-7: Unrealised profits on an intragroup transaction

An Italian parent has a wholly owned Swiss subsidiary. On 30 November 20X2 the subsidiary sold goods to the parent for CHF1,000. The cost of the goods to the subsidiary was CHF700. The goods were recorded by the parent at €685 based on the exchange rate ruling on 30 November 20X2 of €1=CHF1.46. All of the goods are unsold by the year-end, 31 December 20X2. The exchange rate at that date was €1=CHF1.52. How is the intragroup profit to be eliminated?

IAS 21 contains no specific guidance on this matter. However, US GAAP requires the rate ruling at the date of the transaction to be used.

The profit shown by the subsidiary is CHF300 which translated at the rate ruling on the transaction of €1=CHF1.46 equals €205. Consequently, the goods will be included in the statement of financial position at:

Per parent company statement of financial position	€685
Less unrealised profit eliminated	€205
	<u>€480</u>

It can be seen that the resulting figure for inventory is equivalent to the original euro cost translated at the rate ruling on the date of the transaction. Whereas if the subsidiary still held the inventory it would be included at €461 (CHF700 @ €1=CHF1.52).

If in the above example the goods had been sold by the Italian parent to the Swiss subsidiary then the approach in US GAAP would say the amount to be eliminated is the amount of profit shown in the Italian entity's financial statements. Again, this will not necessarily result in the goods being carried in the consolidated financial statements at their original cost to the group.

6.4 Non-coterminous period ends

IAS 21 recognises that in preparing consolidated financial statements it may be that a foreign operation is consolidated on the basis of financial statements made up to a different date from that of the reporting entity (see Chapter 8). In such a case, the standard initially states that the assets and liabilities of the foreign operation are to be translated at the exchange rate at the end of the reporting period of the foreign operation rather than at the date of the consolidated financial statements. However, it then goes on to say that adjustments are made for significant changes in exchange rates up to the end of the reporting period of the reporting entity in accordance with IFRS 10 *Consolidated Financial Statements*. The same approach is used in applying the equity method to associates and joint ventures in accordance with IAS 28 *Investments in Associates and Joint Ventures* (see Chapters 12 and 13). [IAS 21.46].

The rationale for this approach is not explained in IAS 21. The initial treatment is that required by US GAAP and the reason given in that standard is that this presents the functional currency performance of the subsidiary during the subsidiary's financial year and its position at the end of that period in terms of the parent company's reporting (presentation) currency. The subsidiary may have entered into transactions in other currencies, including the functional currency of the parent, and monetary items in these currencies will have been translated using rates ruling at the end of the subsidiary's reporting period. The income statement of the subsidiary will reflect the economic consequences of carrying out these transactions during the period ended on that date. In order that the effects of these transactions in the subsidiary's financial statements are not distorted, the financial statements are translated using the closing rate at the end of the subsidiary's reporting period.

However, an alternative argument could have been advanced for using the closing rate ruling at the end of the parent's reporting period. All subsidiaries within a group will normally prepare financial statements up to the same date as the parent entity so that the parent can prepare consolidated financial statements that present fairly the financial performance and financial position about the group as that of a single entity. The use of financial statements of a subsidiary made up to a date earlier than that of the parent is only an administrative convenience and a surrogate for financial statements made up to the proper date. Arguably, therefore the closing rate to be used is that which would have been used if the financial statements were made up to the proper date, i.e., that ruling at the end of the reporting period of the parent. Another reason for using this rate is that there may be subsidiaries that have the same functional currency as the subsidiary with the non-coterminous year end that do make up their financial statements to the same date as the parent company and therefore in order to be consistent with them the same rate is to be used.

6.5 Goodwill and fair value adjustments

The treatment of goodwill and fair value adjustments arising on the acquisition of a foreign operation depends on whether they are part of: *[IAS 21.BC27]*

(a) The assets and liabilities of the acquired entity (which would imply translating them at the closing rate)
Or

(b) The assets and liabilities of the parent (which would imply translating them at the historical rate)

In the case of fair value adjustments these clearly relate to the acquired entity. However, in the case of goodwill, historically different views have been held as set out in the following Illustration.

Illustration 6-8: Translation of goodwill

A UK company acquires all of the share capital of an Australian company on 30 June 20X2 at a cost of A\$3m. The fair value of the net assets of the Australian company at that date was A\$2.1m. In the consolidated financial statements at 31 December 20X2 the goodwill is recognised as an asset in accordance with IFRS 3. The relevant exchange rates at 30 June 20X2 and 31 December 20X2 are £1=A\$2.61 and £1=A\$2.43 respectively. At what amount is the goodwill on consolidation to be included in the statement of financial position?

		(i)	(ii)
	A\$	£	£
Goodwill	900,000	344,828	370,370
(i) This method regards goodwill as being an asset of the parent and therefore translated at the historical rate. Supporters of this view believe that, in economic terms, the goodwill is an asset of the parent because it is part of the acquisition price paid by the parent, particularly in situations where the parent acquires a multinational operation comprising businesses with many different functional currencies. <i>[IAS 21.BC30].</i>			
(ii) This method regards goodwill as being part of the parent's net investment in the acquired entity and therefore translated at the closing rate. Supporters of this view believe that goodwill is treated no differently from other assets of the acquired entity, in particular intangible assets, because a significant part of the goodwill is likely to comprise intangible assets that do not qualify for separate recognition; the goodwill arises only because of the investment in the foreign entity and has no existence apart from that entity; and the cash flows that support the continued recognition of the goodwill are generated in the entity's functional currency. <i>[IAS 21.BC31].</i>			

The IASB was persuaded by the arguments set out in (ii) above. *[IAS 21.BC32]*. Accordingly, IAS 21 requires that any goodwill arising on the acquisition of a foreign operation and any fair value adjustments to the carrying amounts of assets and liabilities arising on the acquisition of that foreign operation are treated as assets and liabilities of the foreign operation. Thus they are expressed in the functional currency of the foreign operation and are translated at the closing rate in accordance with the requirements discussed in section 6.1 above. *[IAS 21.47]*.

Clearly, if an entity acquires a single foreign entity this will be a straightforward exercise. Where, however, the acquisition is of a multinational operation comprising a number of businesses with different functional currencies this will not be the case. The goodwill needs to be allocated to the level of each functional currency of the acquired operation. However, the standard gives no guidance on how this is to be done.

In our experience, the most commonly applied way of allocating goodwill to different functional currencies is an economic value approach. This approach effectively calculates the goodwill relating to each different functional currency operation by allocating the cost of the acquisition to the different functional currency operations on the basis of the relative economic values of those businesses and then deducting the fair values that have been attributed to the net assets of those businesses as part of the fair value exercise in accounting for the business combination (see Chapter 10).

How we see it

We consider that any basis for allocating goodwill to different functional currencies other than one based on the economic value as set out above would need to be substantiated.

The level to which goodwill is allocated for the purpose of foreign currency translation may be different from the level at which the goodwill is tested for impairment under IAS 36 (see Chapter 21). [IAS 21.BC32]. In many cases the allocation under IAS 21 will be at a lower level. This will apply not only on the acquisition of a multinational operation but could also apply on the acquisition of a single operation where the goodwill is allocated to a larger cash generating unit under IAS 36 that is made up of businesses with different functional currencies.

As a consequence of this different level of allocation one particular difficulty that entities are likely to face is how to deal with an impairment loss that is recognised in respect of goodwill under IAS 36. If the impairment loss relates to a larger cash generating unit made up of businesses with different functional currencies, again some allocation of this impairment loss will be required to determine the amount of the remaining carrying amount of goodwill in each of the functional currencies for the purposes of translation under IAS 21.

6.6 Disposal or partial disposal of a foreign operation

The requirements relating to disposals and partial disposals of foreign operations have been amended a number of times in recent years and the current requirements are considered in sections 6.6.1 and 6.6.2 below. However, these amendments have given rise to a number of application issues, some of which were considered by the IFRS IC in 2010, although their deliberations were ultimately inconclusive.

6.6.1 Disposals and transactions treated as disposals

6.6.1.A Disposals of a foreign operation

Exchange differences resulting from the translation of a foreign operation to a different presentation currency are to be recognised in other comprehensive income and accumulated within a separate component of equity (see section 6.1 above).

On the disposal of a foreign operation, the exchange differences relating to that foreign operation that have been recognised in other comprehensive income and accumulated in the separate component of equity are recognised in profit or loss when the gain or loss on disposal is recognised. [IAS 21.48]. This will include exchange differences arising on an intragroup balance that, in substance, forms part of an entity's net investment in a foreign operation (see section 6.3 above).

Illustration 6-9: Disposal of a foreign operation

A German entity has a Swiss subsidiary which was set up on 1 January 20X0 with a share capital of CHF200,000 when the exchange rate was €1=CHF1.55. The subsidiary is included in the parent's separate financial statements at its original cost of €129,032. The profits of the subsidiary, all of which have been retained by the subsidiary, for each of the three years ended 31 December 20X2 were CHF40,000, CHF50,000 and CHF60,000 respectively, so that the net assets at 31 December 20X2 are CHF350,000. In the consolidated financial statements the results of the subsidiary have been translated at the respective average rates of €1=CHF1.60, €1=CHF1.68 and €1=CHF1.70 and the net assets at the respective closing rates of €1=CHF1.71, €1=CHF1.65 and €1=CHF1.66. All exchange differences have been recognised in other comprehensive income and accumulated in a separate exchange reserve. The consolidated reserves have therefore included the following amounts in respect of the subsidiary:

	Retained profit	Exchange reserve
	€	€
1 January 20X0	-	-
Movement during 20X0	25,000	(13,681)
31 December 20X0	25,000	(13,681)
Movement during 20X1	29,762	5,645
31 December 20X1	54,762	(8,036)
Movement during 20X2	35,294	(209)
31 December 20X2	90,056	(8,245)

The net assets at 31 December 20X2 of CHF350,000 are included in the consolidated financial statements at €210,843.

On 1 January 20X3 the subsidiary is sold for CHF400,000 (€240,964), thus resulting in a gain on disposal in the parent entity's books of €111,932, i.e., €240,964 less €129,032.

In the consolidated financial statements for 20X3, IAS 21 requires the cumulative exchange losses of €8,245 to be recognised in profit or loss for that year. Assuming they were included as part of the gain on disposal (which was explicitly required by earlier versions of IAS 27)¹⁵ this gain would be reduced to €21,876, being €30,121 (the difference between the proceeds of €240,964 and net asset value of €210,843 at the date of disposal) together with the cumulative exchange losses of €8,245.

In this example, this gain on disposal of €21,876 represents the parent's profit of €111,932 less the cumulative profits already recognised in group profit or loss of €90,056.

The accounting policies of Pearson plc reflect these requirements as shown below.

Practical example 6-3: Pearson plc (2023)	United Kingdom
Annual report and accounts 2023 [extract] Financial statements [extract] Notes to the consolidated financial statements [extract] 1a. Accounting policies [extract] Foreign currency translation [extract]	
<p>3. Group companies – The results and financial position of all Group companies that have a functional currency different from the presentation currency are translated into the presentation currency as follows:</p> <ul style="list-style-type: none"> — Assets and liabilities are translated at the closing rate at the date of the balance sheet; — Income and expenses are translated at average exchange rates; and — All resulting exchange differences are recognised as a separate component of equity. <p>On consolidation, exchange differences arising from the translation of the net investment in foreign entities, and of borrowings and other currency instruments designated as hedges of such investments, are taken to shareholders' equity. The Group treats specific inter-company loan balances, which are not intended to be repaid in the foreseeable future, as part of its net investment. When a foreign operation is sold, such exchange differences are recognised in the income statement as part of the gain or loss on sale.</p> <p>The principal overseas currency for the Group is the US dollar. The average rate for the year against sterling was \$1.25 (2022: \$1.24; 2021: \$1.38) and the year-end rate was \$1.27 (2022: \$1.21; 2021: \$1.35).</p>	

This treatment is to be adopted not only when an entity sells an interest in a foreign entity, but also when it disposes of its interest through liquidation, repayment of share capital, or abandonment of that entity.

[IAS 21.49].

The requirement to reclassify the cumulative exchange differences to profit or loss cannot be avoided, for example, by an entity merely disposing of the net assets and business of the foreign operation, rather than disposing of its interest in the legal entity that is the foreign operation. This is because IAS 21.49 refers to the disposal of a foreign operation, and a foreign operation as defined by IAS 21 must have 'activities' (see section 2.3 above). Following the disposal of the net assets and business, there no longer are 'activities'. Furthermore, a foreign operation need not be an incorporated entity but may be a branch, the disposal of which would necessarily take the form of an asset sale. The legal form of the entity makes no difference to the accounting treatment of exchange differences, including the reclassification of cumulative exchange differences from equity to profit or loss. It also follows that reclassification of exchange differences could potentially be required on the disposal of a branch or similar operation within a legal entity if it represents a separate foreign operation (see section 4.4 above).

15 IAS 27 (2007), Consolidated and Separate Financial Statements, IASB, 2007 Bound Volume, para. 30.

Where it is a subsidiary that is disposed of, the related exchange differences that have been attributed to the non-controlling interests are derecognised and therefore included in the calculation of the gain or loss on disposal, but are not reclassified to profit or loss. [IAS 21.48B]. This is shown in the following Illustration.

Illustration 6-10: Disposal of a partially owned foreign subsidiary

Entity P, which is incorporated in France and has the euro as its functional currency, owns 80% of Entity S which has US dollars as its functional currency. In P's consolidated financial statements, the following amounts have been recognised in relation to its investment in S:

- Net assets of €1,000 and associated non-controlling interests of €200
- Foreign exchange gains of €100 were recognised in other comprehensive income, of which €20 was attributable to non-controlling interests and is therefore included in the €200 non-controlling interests
- €80 of foreign exchange gains have therefore been accumulated in a separate component of equity relating to P's 80% share in S

P sells its 80% interest in S for €1,300 and records the following amounts:

Dr	Cash	€1,300	
Dr	NCI	€200	
Dr	OCI	€80	
	Cr	Net assets	€1,000
	Cr	Profit on disposal	€580

It can be seen that €80 of the foreign currency gains previously recognised in OCI, i.e., the amount attributed to P, is reclassified to profit or loss (profit on disposal) and reported as a loss in OCI. However, the €20 of such gains attributed to the non-controlling interests is not reclassified in this way and is simply derecognised along with the rest of the NCI balance.

If Entity P had originally held a 60% interest in Entity S and subsequently increased its holding to 80%, the accounting set out in the above Illustration would not change. In other words, although some of the €80 of accumulated foreign exchange gains would originally have been allocated to non-controlling interests, those gains would have been reallocated to the parent when the interest in Entity S increased and therefore are reclassified to profit or loss when control of the subsidiary is lost (see Chapter 8, including Illustration 4-3).

6.6.1.B Transactions treated as disposals

In addition to the disposal of an entity's entire interest in a foreign operation, the following partial disposals are accounted for as disposals: [IAS 21.48A]

- (a) When the partial disposal involves the loss of control of a subsidiary that includes a foreign operation, regardless of whether the entity retains a non-controlling interest in its former subsidiary after the partial disposal
- (b) When the retained interest after the partial disposal of an interest in a joint arrangement or a partial disposal of an interest in an associate that includes a foreign operation is a financial asset that includes a foreign operation

Therefore, all exchange differences accumulated in the separate component of equity relating to that foreign operation are reclassified on its disposal even if the disposal results from a sale of only part of the entity's interest in the operation, for example if a parent sold 60% of its shares in a wholly owned subsidiary which as a result became an associate.

The requirement at (a) above mirrors IFRS 10 which specifies that an entity recognises in full gains and losses when an entity loses control of a subsidiary but retains an interest in that subsidiary that is subject to equity accounting. However, as a result of a conflict between IFRS 10 and IAS 28, there are circumstances in which such an entity might recognise a gain or loss in respect of only the proportion of the subsidiary disposed of (see Chapter 8).

How we see it

In the circumstances an entity recognises only a proportionate gain or loss in respect of the proportion disposed of, our view is that only a proportion of the accumulated exchange differences is reclassified (see Chapter 8).

The treatment of exchange differences relating to an investment in an associate or joint venture that becomes a subsidiary in a business combination is not clearly specified in IAS 21.

How we see it

In these circumstances, IAS 28 clearly requires the reclassification of equity accounted exchange differences of the associate or joint venture that were recognised in other comprehensive income (see Chapter 10 and Chapter 12) and, in our view, the same treatment applies to the exchange differences arising on the associate or joint venture itself.

6.6.2 Partial disposals

6.6.2.A What constitutes a partial disposal?

A partial disposal of an entity's interest in a foreign operation is any reduction in its ownership interest, except for those that are accounted for as disposals (see section 6.6.1 above). [IAS 21.48D].

A write-down of the carrying amount of a foreign operation, either because of its own losses or because of an impairment recognised by the investor, does not constitute a partial disposal, therefore no deferred exchange difference is reclassified from equity to profit or loss at the time of the write-down. [IAS 21.49]. Similarly, it is implicit in the requirement of IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* for separate disclosure of cumulative gains and losses recognised in equity relating to a disposal group (see Chapter 5) that the classification of a foreign operation as held for sale under IFRS 5 does not give rise to a reclassification of foreign exchange differences to profit or loss at that time.

Also, a dividend made by a foreign operation that is accounted for as revenue by its parent, investor or venturer in its separate financial statements (see Chapter 9) is not treated as a disposal or partial disposal of a net investment. [IAS 21.BC35].

The term 'ownership interest' is not defined within IFRS accounting standards, although it is used in a number of standards,¹⁶ normally to indicate an investor's proportionate interest in an entity. This might seem to indicate that a partial disposal arises only when an investor reduces its proportionate interest in the foreign operation. However, the IFRS IC has indicated that a partial disposal may also be interpreted to mean an absolute reduction in ownership interest¹⁷ (other than those indicated above), for example the repayment by a foreign operation of a permanent as equity loan made to it by the reporting entity.

How we see it

In our view, entities will need to apply judgement and select an appropriate accounting policy for determining what constitutes a partial disposal, particularly whether an absolute reduction in ownership interest represents a partial disposal.

6.6.2.B Partial disposal of a proportionate interest in a subsidiary

On the partial disposal of a proportionate interest in a subsidiary that includes a foreign operation, the proportionate share of the cumulative amount of exchange differences recognised in other comprehensive income is reattributed to the non-controlling interests in that foreign operation. [IAS 21.48C]. In other words, these exchange differences will not be reclassified to profit or loss. Further, if the entity subsequently disposes of the remainder of its interest in the subsidiary, the exchange differences reattributed will not be reclassified to profit or loss at that point either (see section 6.6.1 above).

6.6.2.C Repayment of a permanent as equity loan by a subsidiary

Where an entity considers the repayment by a subsidiary of a permanent as equity loan a partial disposal (see section 6.6.2.A above), IAS 21 is unclear whether related foreign currency differences are reclassified from equity to profit and loss.

IAS 21 requires only that an entity reattribute to the non-controlling interests any exchange differences in that foreign operation. [IAS 21.48C]. Following this approach would lead an entity not to reclassify exchange differences on the repayment of a permanent as equity loan.

¹⁶ For example, IAS 27 *Separate Financial Statements*, IASB, paras. 16(b)(iii) and 17(b)(iii), IFRS 3 *Business Combinations*, IASB, para. B63(e) and IFRS 10 *Consolidated Financial Statements*, IASB, para. 23.

¹⁷ [IFRIC Update](#), September 2010, p.2. Available on the IFRS Foundation's website.

However, in analysing the issue for the IFRS IC in 2010, the IFRIC staff indicated, albeit without any technical analysis, that in their opinion exchange differences are to be reclassified to profit or loss on settlement of such a monetary item¹⁸ and the IFRS IC, which did not take the issue onto its agenda, noted that diversity may exist in practice.¹⁹

How we see it

In our opinion, an entity may select either of the above two approaches as its accounting policy, although in our experience the first is the one most commonly applied.

A logical extension of the second approach would be that exchange differences are reclassified as a result of similar transactions, for example the repayment of share capital by a foreign subsidiary.

6.6.2.D Partial disposal of interest in an associate or joint arrangement

In a partial disposal of an associate or joint arrangement where the retained interest remains or becomes an associate or joint arrangement, the proportionate share of the cumulative amount of exchange differences recognised in other comprehensive income are reclassified from equity to profit or loss. [IAS 21.48C]. There is an equivalent requirement in IAS 28 applying to all gains and losses recognised in other comprehensive income that would be reclassified to profit or loss on disposal of the related assets or liabilities. [IAS 28.25]. In this context, the IFRS IC has concluded that this treatment applies however an investor's ownership interest is reduced, for example if an associate that is a foreign operation issues shares to third parties.²⁰

Whether the repayment by an associate or joint arrangement of a permanent as equity loan made to it by the reporting entity results in reclassification of exchange differences to profit or loss depends on whether the reporting entity considers such a transaction to represent a partial disposal (see section 6.6.2.A above). In other words, it will be an entity's accounting policy choice.

6.6.3 Comparison of the effect of step-by-step and direct methods of consolidation on accounting for disposals

We illustrated the basic requirement to reclassify cumulative exchange differences from equity to profit or loss on the disposal of a foreign operation in Illustration 6-9 in section 6.6.1.A above where a parent sold a direct interest in a subsidiary. This requirement also applies on the sale of an indirect subsidiary. However, where the intermediate holding company and the subsidiary each have different functional currencies, the method of consolidation can have an impact on the amount of exchange differences reclassified from equity to profit or loss on the disposal of the subsidiary.

If the step-by-step method is used, this amount will have been measured based on the functional currencies of the intermediate holding company and the subsidiary. The translation of that amount into the presentation currency of the ultimate parent will not be the same as if the ultimate parent had consolidated the subsidiary individually. In this second case (the direct method), the exchange differences on translation of the subsidiary would have been measured based on the functional currency of the subsidiary and the presentation currency used by the ultimate parent. This is shown in the following Illustration.

Illustration 6-11: Disposal of an indirectly held foreign operation

On 1 January 20X1, Entity A is incorporated in the UK with share capital of £300m. It sets up a wholly-owned Swiss subsidiary, Entity B, on the same day with share capital of CHF200m. Entity B in turn sets up a wholly-owned German subsidiary, Entity C, with share capital of €45m. All of the capital subscribed in each of the entities, to the extent that it has not been invested in a subsidiary, is used to acquire operating assets in their country of incorporation. The functional currency of each of the entities is therefore pound sterling, the Swiss franc and the euro respectively. The relevant exchange rates at 1 January 20X1 are £1=CHF2.50=€1.50.

For the purposes of the example, it is assumed that in the year ended 31 December 20X1 each of the entities made no profit or loss. The relevant exchange rates at that date were £1=CHF3.00=€1.25.

18 [IASB Staff Paper 7D](#): Project: IAS 21 The Effects of Changes in Foreign Exchange Rates, Topic: CTA Recycling in IAS 27R Transactions, IFRS IC Meeting, March 2010; and [IASB Staff Paper 11](#): Project: IAS 21 The Effects of Changes in Foreign Exchange Rates, Topic: Repayment of investment/CTA, IFRS IC Meeting, July 2010, paras. 10(a) and 11. Available on the IFRS Foundation's website.

19 [IFRIC Update](#), September 2010, p.2. Available on the IFRS Foundation's website.

20 [IFRIC Update](#), July 2009, available on the IFRS Foundation's website.

On 1 January 20X2, the German subsidiary, Entity C, is sold by Entity B for €45m.

The exchange differences relating to Entity C that will be reclassified from equity to profit or loss in the consolidated financial statements of the Entity A group for the year ended 31 December 20X2 on the basis that each of the subsidiaries are consolidated individually (the direct method) will be as follows:

Consolidating each subsidiary individually (the direct method)

The opening consolidated statement of financial position of the Entity A group at 1 January 20X1 is as follows:

	Entity A		Entity B		Entity C	Adjustments	Consolidated
Millions	£	CHF	£	€	£	£	£
Investment in B	80.0					(80.0)	
Investment in C		75.0	30.0			(30.0)	
Other net assets	220.0	125.0	50.0	45.0	30.0		300.0
	300.0	200.0	80.0	45.0	30.0		300.0
Share capital	300.0						300.0
Share capital		200.0	80.0			(80.0)	
Share capital				45.0	30.0	(30.0)	

The consolidated statement of financial position of the Entity A group at 31 December 20X1 is as follows:

	Entity A		Entity B		Entity C	Adjustments	Consolidated
Millions	£	CHF	£	€	£	£	£
Investment in B	80.0					(80.0)	
Investment in C		75.0	25.0			(25.0)	
Other net assets	220.0	125.0	41.7	45.0	36.0		297.7
	300.0	200.0	66.7	45.0	36.0		297.7
Share capital	300.0						300.0
Share capital		200.0	80.0			(80.0)	
Share capital				45.0	30.0	(30.0)	
Exchange - B			(13.3)			5.0	(8.3)
Exchange - C					6.0		6.0
	300.0	200.0	66.7	45.0	36.0		297.7

The exchange differences in respect of Entity B and Entity C are only shown for illustration purposes; the consolidated statement of financial position would only show the net amount of £(2.3)m as a separate component of equity. The exchange difference of £6.0m in respect of Entity C is that arising on the translation of its opening net assets of €45m into the presentation currency of pound sterling based on the opening and closing exchange rates of £1=€1.50 and £1=€1.25 respectively, as required by IAS 21.39. Accordingly, it is this amount of £6.0m that will be reclassified from equity to profit or loss for the year ended 31 December 20X2 upon the disposal of Entity C as required by IAS 21.48.

If the consolidated statement of financial position for the Entity A group at 31 December 20X1 had been prepared on the basis of a sub-consolidation of the Entity B sub-group incorporating Entity C, the position would have been as follows.

Consolidating using a sub-group consolidation (the step-by-step method)

The exchange rates at 1 January 20X1 and 31 December 20X1 are the equivalent of €1=CHF1.667 and €1=CHF2.400.

The sub-consolidation of Entity B and Entity C at 31 December 20X1 is as follows:

	Entity B		Entity C	Adjustments	Consolidated
Millions	CHF	€	CHF	CHF	CHF
Investment in C	75.0			(75.0)	
Other net assets	125.0	45.0	108.0		233.0
	200.0	45.0	108.0		233.0
Share capital	200.0				200.0
Share capital		45.0	75.0	(75.0)	
Exchange - C			33.0		33.0
	200.0	45.0	108.0		233.0

The exchange difference of CHF33.0m in respect of Entity C is that arising on the translation of its opening net assets of €45m into the functional currency of that of Entity B, the Swiss franc, based on the opening and closing exchange rates of €1=CHF1.667 and €1=CHF2.400 respectively.

In the consolidated financial statements of the Entity B sub-group for the year ended 31 December 20X2, it is this amount of CHF33.0m that would be reclassified from equity to profit or loss upon the disposal of Entity C.

The consolidated statement of financial position of the Entity A group at 31 December 20X1 prepared using this sub-consolidation would be as follows:

	Entity A		Entity B sub-group	Adjustments	Consolidated
Millions	£	CHF	£	£	£
Investment in B	80.0			(80.0)	
Other net assets	220.0	233.0	77.7		297.7
	300.0	233.0	77.7		297.7
Share capital	300.0				300.0
Share capital		200.0	80.0	(80.0)	
Exchange - C		33.0	11.0		11.0
Exchange - B group			(13.3)		(13.3)
	300.0	233.0	77.7		297.7

The exchange differences in respect of Entity C and those for the Entity B sub-group are only shown for illustration purposes; the consolidated statement of financial position would only show the net amount of £(2.3)m as a separate component of equity. As can be seen, the consolidated position for the Entity A group is the same as that using the direct method. However, using the step-by-step method, the exchange difference of £11.0m in respect of Entity C is the exchange difference of CHF33.0m included in the Entity B sub-consolidation translated into the presentation currency used in the Entity A consolidated financial statements.

As indicated above, it is this amount of CHF33.0m that would be reclassified from equity to profit or loss upon the disposal of Entity C in the consolidated financial statements of the Entity B sub-group for the year ended 31 December 20X2. In the consolidated financial statements of the Entity A group for the year ended 31 December 20X2, it would be the translated amount of exchange differences of £11.0m that would be reclassified from equity to profit or loss on the disposal of Entity C.

Although the IFRS IC has indicated that the direct method is conceptually correct, IFRIC 16 permits the use of either approach as an accounting policy choice (see section 6.1.4 above).

In certain situations, the methods of consolidation seem to result in more extreme differences. For example, consider the disposal of a US subsidiary by a US intermediate holding company (both of which have the US dollar as their functional currency) within a group headed by a UK parent (which has sterling as its functional and presentation currency). The US subsidiary that is disposed of is a foreign operation so exchange differences accumulated in the separate component of equity relating to it are reclassified from equity to profit or loss on its disposal. Under the direct method of consolidation, this amount will represent exchange differences arising from translating the results and net assets of the US subsidiary directly into sterling. However, under the step-by-step method, these exchange differences will be entirely attributable to the intermediate parent undertaking and so there would be no reclassification from equity to profit or loss.

7 Lack of exchangeability

In most cases determining an exchange rate will be a relatively straightforward exercise, but this will not always be the case, particularly where there are restrictions on entities wishing to exchange one currency for another, typically a local currency for a foreign currency. For example:

- Legal restrictions might permit sales of local currency only at an official rate rather than a rate that reflects more fully market participants' views of the currency's relative value or its underlying economics. Those official rates might or might not be pegged to another country's currency, for example the US dollar.
- Exchange rates set by governments might vary according to the nature of the underlying transaction.
- The volume of currency that can be exchanged through official mechanisms may be limited by formal or informal restrictions imposed by government, often designed to help manage the government's sometimes scarce foreign exchange reserves.

These situations are often encountered in countries that have more of a closed economy and which may be experiencing a degree of economic strain. High inflation or even hyperinflation and devaluations can be symptomatic of these situations as can the development of a so called 'black market' in foreign currencies, the use of which could to some extent be unlawful. Determining an appropriate exchange rate to use in these circumstances can be difficult.

In more extreme cases of economic strain or hyperinflation a country may eventually replace its local currency completely or even adopt a third country's currency as its own. Examples of the latter include Ecuador and Zimbabwe which have both in recent times effectively adopted the US dollar as their official currency for periods of time. In addition to the underlying economic problems these actions are designed to address they may also go some way towards addressing some of the associated financial reporting issues.

It is also important to recognise that economic characteristics such as those mentioned above are not always associated with difficult economic conditions, e.g., many successful economies have a currency that to some extent is, or has been, pegged to another currency or is otherwise linked to a different currency.

Following a number of submissions to the IFRS IC over several years, the IASB embarked on a project to address the issue of determining the spot exchange rate an entity uses when a currency lacks exchangeability. As a result, amendments to IAS 21 were published in August 2023 with a mandatory effective date of periods commencing on or after 1 January 2025, and these are discussed in more detail in sections 7.1 to 7.5 below. The position prior to these amendments being applied, including guidance issued by the IFRS IC, is addressed in section 7.6 below.

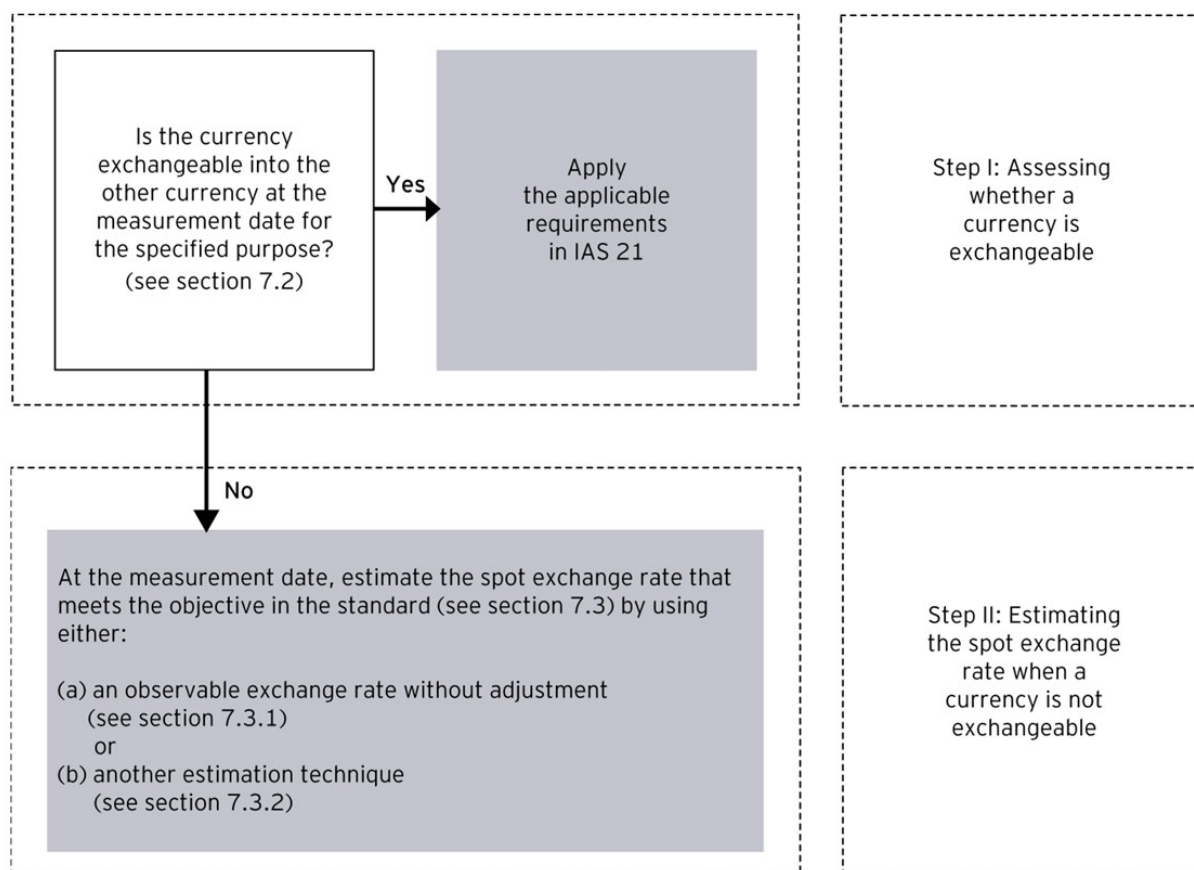

It is clear that the new requirements and transitional relief cannot be seen as mere interpretations of the previous version of IAS 21. Consequently, entities applying a version of IFRS accounting standards that require local endorsement of new and amended standards and for which this is a material issue, cannot apply accounting in line with the amendments until they have been endorsed.

7.1 Overview of approach required by the amendments

The amendments first require an entity to assess whether a currency is exchangeable into another currency at a measurement date and for a specified purpose (Step I). [IAS 21.8A]. A currency is defined as being exchangeable into another currency when an entity is able to obtain the other currency within a time frame that allows for a normal administrative delay and through a market or exchange mechanism in which an exchange transaction would create enforceable rights and obligations. [IAS 21.8]. If the entity is able to obtain no more than an insignificant amount of the other currency at the measurement date for the specified purpose, the currency is not considered exchangeable into the other currency. [IAS 21.8B]. Step I is considered further in section 7.2 below.

When a currency is not exchangeable into another currency at a particular measurement date, the entity is required to estimate the spot exchange rate (Step II). The objective in estimating the spot exchange rate is to reflect the rate at which an orderly exchange transaction would take place at the measurement date between market participants under prevailing economic conditions. [IAS 21.19A]. Step II is considered further in section 7.3 below.

The following diagram, based on the application guidance to IAS 21, is intended to help entities assess whether a currency is exchangeable and estimate the spot exchange rate when a currency is not exchangeable. [IAS 21.A1].

Figure 7-1: Assessing exchangeability and estimating a spot exchange rate

7.2 Assessing whether a currency is exchangeable (Step I)

The standard acknowledges that an entity might determine a currency is not exchangeable into another currency, even though that other currency might be exchangeable in the other direction. For example, an entity might determine that currency PC is not exchangeable into currency LC, even though currency LC is exchangeable into currency PC. [IAS 21.A2]. This reflects a commonly experienced situation whereby it is much easier to exchange a hard currency such as the US dollar into a weaker currency than vice versa.

A spot exchange rate is defined as the exchange rate for immediate delivery (see section 2.3 above). However, an exchange transaction might not always complete instantaneously because of legal or regulatory requirements, or for practical reasons such as public holidays. A normal administrative delay in obtaining the other currency does not preclude a currency from being exchangeable into that other currency. What constitutes a normal administrative delay will depend on facts and circumstances [IAS 21.A3] and this concept is illustrated below.

Illustration 7-1: Time frame

In the following illustration, Entity X's functional and presentation currency is PC and it prepares consolidated financial statements. Entity X has a subsidiary, Entity Y, that is a foreign operation. Entity Y's functional currency is LC, the currency of the jurisdiction in which Entity Y operates. The relevant authority administers the exchangeability of LC for other currencies. [IAS 21.IE2].

The relevant authority in Entity Y's jurisdiction makes PC available to entities in exchange for LC only after completion of an administrative process. The authority requires entities wishing to obtain PC to explain how they intend to use PC when submitting a request for PC. In usual circumstances, an entity obtains PC after N days, i.e., N days is the time the authority needs, under its administrative process, to perform checks and provide PC. [IAS 21.IE3].

Entity X considers N days to be a normal administrative delay applying to a transaction to exchange LC for PC through this exchange mechanism. Subject to the other requirements addressed in this section 7.2 (those in paragraphs A2 to A10), Entity X considers LC to be exchangeable into PC if it is able to obtain PC within N days of requesting it. [IAS 21.IE4].

This illustration, and subsequent ones that build on it, explain how an entity might apply some of the requirements in IAS 21 in hypothetical situations based on the limited facts presented. Although some aspects of the illustrations might be present in actual fact patterns, the fact patterns in the illustrations are simplified and an entity would need to evaluate all relevant facts and circumstances when applying IAS 21. [IAS 21.IE1].

In assessing whether a currency is exchangeable into another currency, an entity is required to consider its ability to obtain the other currency, rather than its intention or decision to do so. Subject to the other requirements addressed in this section, a currency is exchangeable into another currency if an entity is able to obtain the other currency, either directly or indirectly, even if it intends or decides not to do so. For example, subject to the other requirements addressed in this section, regardless of whether the entity intends or decides to obtain PC, currency LC is exchangeable into currency PC if an entity is able to either exchange LC for PC, or exchange LC for another currency (FC) and then exchange FC for PC. [IAS 21.A4].

In assessing whether a currency is exchangeable into another currency, an entity is permitted to consider only markets or exchange mechanisms in which a transaction to exchange the currency for the other currency would create enforceable rights and obligations. Enforceability is a matter of law. Whether an exchange transaction in a market or exchange mechanism would create enforceable rights and obligations depends on facts and circumstances. [IAS 21.A5]. Although the IASB doesn't use these terms in the standard, this effectively means that many so-called unofficial, parallel or black markets are not to be considered in Step 1.²¹

Illustration 7-2: Markets and exchange mechanisms

Continuing from Illustration 7-1 above, the relevant authority in Entity Y's jurisdiction is now unable to meet demand for PC and temporarily stops making PC available through the exchange mechanism it administers. In the absence of this exchange mechanism, individual resellers settle transactions to exchange LC for PC at an exchange rate that is not set by the authority. These exchange transactions do not create enforceable rights and obligations, and no other markets or exchange mechanisms exist in which a transaction to exchange LC for PC would create such rights and obligations. [IAS 21.IE5].

In assessing whether LC is exchangeable into PC, Entity X considers only markets or exchange mechanisms in which a transaction to exchange LC for PC would create enforceable rights and obligations. Entity X concludes that LC is not exchangeable into PC because the exchange transactions with individual resellers do not create enforceable rights and obligations, and no other markets or exchange mechanisms exist in which a transaction to exchange LC for PC would create such rights and obligations. [IAS 21.IE6].

In determining what rights an exchange mechanism creates, it could be helpful to consider the rights an entity would have if it agreed with a reseller to exchange LC1,000,000 for FC200,000, but the reseller transferred only FC180,000. If it were the case that the entity could not pursue the reseller through the courts for the missing FC20,000, e.g. because the courts would not recognise the agreement, this would indicate the exchange mechanism does not create enforceable rights and obligations.

The standard explains that different exchange rates might be available for different uses of a currency. For example, a jurisdiction facing pressure on its balance of payments might wish to deter capital remittances (such as dividend payments) to other jurisdictions but encourage imports of specific goods from those jurisdictions. In such circumstances, the relevant authorities might: [IAS 21.A6]

- Set a preferential exchange rate for imports of those goods and a 'penalty' exchange rate for capital remittances to other jurisdictions, thus resulting in different exchange rates applying to different exchange transactions
- Or
- Make the other currency available only to pay for imports of those goods and not for capital remittances to other jurisdictions

Accordingly, therefore, whether a currency is exchangeable into another currency could depend on the purpose for which the entity obtains (or hypothetically might need to obtain) the other currency. In assessing exchangeability: [IAS 21.A7]

- When an entity reports foreign currency transactions in its functional currency the entity is required to assume its purpose in obtaining the other currency is to realise or settle individual foreign currency transactions, assets or liabilities.
- When an entity uses a presentation currency other than its functional currency, the entity assumes its purpose in obtaining the other currency is to realise or settle its net assets or net liabilities.

²¹ [IASB Update](#), December 2022, available on the IFRS Foundation's website.

- When an entity translates the results and financial position of a foreign operation into the presentation currency, the entity assumes its purpose in obtaining the other currency is to realise or settle its net investment in the foreign operation.

It is further explained that an entity's net assets or net investment in a foreign operation might be realised by, for example:

- The distribution of a financial return to the entity's owners
- The receipt of a financial return from the entity's foreign operation
- The recovery of the investment by the entity or the entity's owners, such as through disposal of the investment [IAS 21.A8]

This assessment of whether a currency is exchangeable into another currency is required to be performed separately for each of the three purposes specified above. For example, an entity assesses exchangeability for the purpose of reporting foreign currency transactions in its functional currency separately from exchangeability for the purpose of translating the results and financial position of a foreign operation.

[IAS 21.A9].

Illustration 7-3: Purpose of obtaining the other currency

Continuing from Illustration 7-2 above, the relevant authority in Entity Y's jurisdiction continues to prevent entities from obtaining PC for most purposes, but does allow it for importing food and medicine. [IAS 21.IE7].

In translating the results and financial position of Entity Y, Entity X assesses whether it is able to obtain PC for the purpose of realising its net investment in Entity Y. Because Entity X is prevented from obtaining PC for this purpose, Entity X concludes that LC is not exchangeable into PC. Entity X's ability to obtain PC for the purpose of importing food and medicine is irrelevant to the assessment. [IAS 21.IE8].

As noted in section 7.1 above, a currency is not considered exchangeable into another currency if, for a particular purpose, an entity is able to obtain no more than an insignificant amount of the other currency. Significance is to be assessed by reference to the amount of the other currency the entity is able to obtain for a specified purpose by comparing that amount with the total amount of the other currency required for that purpose. For example, consider an entity with a functional currency of LC that has liabilities denominated in currency FC. The entity assesses whether the total amount of FC it can obtain for the purpose of settling those liabilities is no more than an insignificant amount compared with the aggregated amount (the sum) of its liability balances denominated in FC. [IAS 21.A10].

At the time of writing, few entities had applied the amendments, but it seems likely a number of practical issues will arise when they do. It is demonstrably the case that exchangeability can be lost or gained over a very short period of times, normally because of government actions. For example, exchange controls that are necessary to maintain an artificially high exchange rate are often relaxed once a government decides to accept a devaluation of the currency. It is also apparent from the requirements above that the answer to the question: Is currency X exchangeable into currency Y? is entity specific and will depend on specific circumstances, not just the identity of currency X and currency Y. In particular, not all entities or sectors will have equal access to exchange mechanisms with entities such as banks or other financial institutions often having a greater practical ability to exchange currencies than other entities.

7.3 Estimating the spot rate when a currency is not exchangeable (Step II)

As noted in section 7.1 above, where an entity is required to estimate a spot exchange rate, the objective is to reflect the rate at which an orderly exchange transaction would take place at the measurement date between market participants under prevailing economic conditions. [IAS 21.19A]. However, IAS 21 does not specify how an entity estimates the spot exchange rate to meet this objective, stating only that an entity can use an observable exchange rate without adjustment (see section 7.3.1 below) or another estimation technique (see section 7.3.2 below). [IAS 21.A11]. In selecting an appropriate estimation method, entities will need to consider whether estimates are capable of being replicated on a consistent basis in future periods, especially in the light of evolving situations, and whether the chosen method is sufficiently robust to mitigate the risk of bias in the estimates.

7.3.1 Using an observable rate without adjustment

When estimating a spot exchange rate, an entity may use an observable exchange rate without adjustment if that observable exchange rate meets the objective in the standard, i.e., it reflects the rate at which an orderly exchange transaction would take place at the measurement date between market participants under prevailing economic conditions. Examples of an observable exchange rate include: [IAS 21.A12]

- A spot exchange rate for a purpose other than that for which an entity assesses exchangeability
- The first exchange rate at which an entity is able to obtain the other currency for the specified purpose after exchangeability of the currency is restored (referred to as the first subsequent exchange rate)

A currency that is not exchangeable into another currency for one purpose might, the standard explains, be exchangeable into that currency for another purpose. For example, an entity might be able to obtain a currency to import specific goods but not to pay dividends. In such situations, the entity might conclude that an observable exchange rate for another purpose meets the objective in the standard. If the rate meets that objective, an entity may use that rate as the estimated spot exchange rate. [IAS 21.A13].

In assessing whether such an observable exchange rate meets the objective, an entity is required to consider, among other factors: [IAS 21.A14]

- whether several observable exchange rates exist

The existence of more than one observable exchange rate might indicate that exchange rates are set to encourage, or deter, entities from obtaining the other currency for particular purposes. These observable exchange rates might include an 'incentive' or 'penalty' and therefore might not reflect the prevailing economic conditions.
- the purpose for which the currency is exchangeable

If an entity is able to obtain the other currency only for limited purposes (such as to import emergency supplies), the observable exchange rate might not reflect the prevailing economic conditions.
- the nature of the exchange rate

A free-floating observable exchange rate is more likely to reflect the prevailing economic conditions than an exchange rate set through regular interventions by the relevant authorities.
- the frequency with which exchange rates are updated

An observable exchange rate unchanged over time is less likely to reflect the prevailing economic conditions than an observable exchange rate that is updated on a daily basis (or even more frequently).

The following illustration shows how these factors might be considered in practice.

Illustration 7-4: Using an observable exchange rate for another purpose

Fact pattern

Continuing from Illustrations 7-1 to 7.3 in section 7.2 above, at 31 December 20X1 the relevant authority in Entity Y's jurisdiction continues to prevent entities from obtaining PC for the purpose of realising a net investment in an entity operating in that jurisdiction. However, other than that restriction, entities are now able to obtain PC and the LC:PC exchange rate is free-floating. Only one exchange rate applies to transactions for exchanges of LC for PC and it is updated several times a day. [IAS 21.IE9].

At the measurement date of 31 December 20X1 Entity X is unable to obtain PC to realise its net investment in Entity Y. Therefore, Entity X concludes that LC is not exchangeable into PC. [IAS 21.IE10].

Estimating the spot exchange rate

Because Entity X concludes that LC is not exchangeable into PC, Entity X is required to estimate the spot exchange rate that meets the objective in the standard. [IAS 21.IE11].

Applying the guidance above, Entity X considers whether it might use the observable LC:PC exchange rate for the purpose of realising a net investment in an entity. To do so, it assesses whether that observable exchange rate meets the specified objective and considers: [IAS 21.IE12]

- whether several exchange rates exist
In this case, only one observable exchange rate exists between LC and PC.
- the purpose for which the currency is exchangeable
Entity X is able to obtain PC for any transaction other than a transaction that would result in the realisation of its net investment in Entity Y.
- the nature of the exchange rate
The observable exchange rate here is free-floating.
- the frequency with which exchange rates are updated
The observable exchange rate is updated several times a day.

Considering these factors, Entity X determines that the observable LC:PC exchange rate meets the objective in the standard. Therefore, Entity X may use that observable exchange rate as the estimated spot exchange rate when it translates the results and financial position of Entity Y. [IAS 21.IE13].

A currency that is not exchangeable into another currency at the measurement date for a specified purpose might subsequently become exchangeable into that currency for that purpose. In such situations, an entity might conclude that the first subsequent exchange rate meets the objective in the standard. If the rate meets that objective, an entity may use that rate as the estimated spot exchange rate. [IAS 21.A15].

In assessing whether the first subsequent exchange rate meets the objective, an entity is required to consider, among other factors:

- the time between the measurement date and the date at which exchangeability is restored
The shorter this period, the more likely the first subsequent exchange rate will reflect the prevailing economic conditions.
And
- inflation rates
When an economy is subject to high inflation, including when an economy is hyperinflationary (as specified in IAS 29), prices often change quickly, perhaps several times a day. Accordingly, the first subsequent exchange rate for a currency of such an economy might not reflect the prevailing economic conditions. [IAS 21.A16].

The following illustration shows how these factors might be considered in practice.

Illustration 7-5: Using the first subsequent exchange rate

Fact pattern

Continuing from Illustration 7-4 above, and as previously noted, at 31 December 20X1 the relevant authority in Entity Y's jurisdiction prevents entities from obtaining PC for the purpose of realising a net investment in an entity operating in that jurisdiction. The jurisdiction in which Entity Y operates is also subject to hyperinflation. However, from 30 April 20X2, the authority allows entities to obtain PC for the purpose of realising a net investment. [IAS 21.IE14].

At the measurement date of 31 December 20X1 Entity X is unable to obtain PC to realise its net investment in Entity Y. Therefore, Entity X concludes that LC is not exchangeable into PC. [IAS 21.IE15].

Estimating the spot exchange rate

Because Entity X concludes that LC is not exchangeable into PC, Entity X is required to estimate the spot exchange rate that meets the objective set out in section 7.3 above. [IAS 21.IE16].

Applying the guidance above, Entity X considers whether it might use the first exchange rate at which it is able to obtain the other currency after exchangeability of the currency is restored (i.e., the first subsequent exchange rate). To do so, it assesses whether the first subsequent exchange rate meets the objective and considers: [IAS 21.IE17]

- the time between the measurement date and the date at which exchangeability is restored
Exchangeability in this case is restored four months after the measurement date.
- inflation rate

The jurisdiction in which Entity Y operates is subject to hyperinflation.

Considering these factors, Entity X determines that the first subsequent exchange rate does not reflect the prevailing economic conditions at the measurement date. Therefore, the first subsequent exchange rate does not meet the objective in the standard for the purpose of realising Entity X's net investment in Entity Y.

However, Entity X could adjust that rate, as necessary, to estimate a rate that meets the objective for realising its net investment in Entity Y. [IAS 21.IE18].

7.3.2 Using another estimation technique

An entity using another estimation technique may use any observable exchange rate, including rates from exchange transactions in markets or exchange mechanisms that do not create enforceable rights and obligations, and adjust that rate, as necessary, to meet the objective set out in section 7.3 above. [IAS 21.A17]. In other words, in contrast to the position in Step I, entities are not prohibited from considering many so-called unofficial, parallel or black markets in Step II.

If both exchange rates and inflation rates are required to be estimated for a currency that is hyperinflationary (see Chapter 17), consistent assumptions should be used in making both estimates.

7.4 Disclosure requirements when a currency is not exchangeable

When an entity estimates a spot exchange rate because a currency is not exchangeable into another currency, the entity is required to disclose information that enables users of its financial statements to understand how the currency not being exchangeable into the other currency affects, or is expected to affect, the entity's financial performance, financial position and cash flows. To achieve this objective, an entity discloses information about: [IAS 21.57A]

- The nature and financial effects of the currency not being exchangeable into the other currency
- The spot exchange rate(s) used
- The estimation process
- The risks to which the entity is exposed because of the currency not being exchangeable into the other currency

An entity considers how much detail is necessary to satisfy the disclosure objective above. It also discloses the information set out below and any additional information necessary to meet the disclosure objective.

[IAS 21.57B, IAS 21.A18].

To comply with the requirements above, an entity discloses: *[IAS 21.57B, IAS 21.A19]*

- The currency and a description of the restrictions that result in that currency not being exchangeable into the other currency
- A description of affected transactions
- The carrying amount of affected assets and liabilities
- The spot exchange rates used and whether those rates are observable exchange rates without adjustment (see section 7.3.1 above) or spot exchange rates estimated using another estimation technique (see section 7.3.2 above)
- A description of any estimation technique the entity has used, and qualitative and quantitative information about the inputs and assumptions used in that estimation technique
- Qualitative information about each type of risk to which the entity is exposed because the currency is not exchangeable into the other currency, and the nature and carrying amount of assets and liabilities exposed to each type of risk

When a foreign operation's functional currency is not exchangeable into the presentation currency or, if applicable, the presentation currency is not exchangeable into a foreign operation's functional currency, an entity is required to disclose: *[IAS 21.57B, IAS 21.A20]*

- The name of the foreign operation; whether the foreign operation is a subsidiary, joint operation, joint venture, associate or branch; and its principal place of business
- Summarised financial information about the foreign operation
- The nature and terms of any contractual arrangements that could require the entity to provide financial support to the foreign operation, including events or circumstances that could expose the entity to a loss

7.5 Effective date and transition

Entities are required to apply the amendments for annual reporting periods beginning on or after 1 January 2025. Earlier application is permitted, although if an entity does so, that fact is to be disclosed. *[IAS 21.60L]*.

The transition requirements use the term 'date of initial application' which is the beginning of the annual reporting period in which an entity first applies the amendments. *[IAS 21.60L]*. An entity does not restate comparative information when first applying the amendments. Instead: *[IAS 21.60M]*

- When the entity reports foreign currency transactions in its functional currency, and, at the date of initial application, concludes that its functional currency is not exchangeable into the foreign currency or, if applicable, concludes that the foreign currency is not exchangeable into its functional currency, at the date of initial application, the entity:
 - Translates affected foreign currency monetary items, and non-monetary items measured at fair value in a foreign currency, using the estimated spot exchange rate at that date
 - And
 - Recognises any effect of initially applying the amendments as an adjustment to the opening balance of retained earnings
- When the entity uses a presentation currency other than its functional currency, or translates the results and financial position of a foreign operation, and, at the date of initial application, concludes that its functional currency (or the foreign operation's functional currency) is not exchangeable into its presentation currency or, if applicable, concludes that its presentation currency is not exchangeable into its functional currency (or the foreign operation's functional currency), at the date of initial application, the entity:
 - Translates affected assets and liabilities using the estimated spot exchange rate at that date
 - Translates affected equity items using the estimated spot exchange rate at that date if the entity's functional currency is hyperinflationary
 - And
 - Recognises any effect of initially applying the amendments as an adjustment to the cumulative amount of translation differences accumulated in a separate component of equity

7.6 Relevant guidance prior to adopting the amendments

Prior to adoption of the amendments discussed in sections 7.1 to 7.5 above, the extant standard addresses the situation where for some reason exchangeability between two currencies is temporarily lacking at the transaction date or subsequently at the end of the reporting period. In this case, IAS 21 requires that the rate to be used is “the first subsequent rate at which exchanges could be made” [IAS 21.26] (a requirement that is withdrawn once the amendments are applied). However, the standard did not address the situation where there is a longer-term lack of exchangeability and the rate has not been restored.

The IFRS IC considered this in the context of a number of issues associated with the Venezuelan currency, the Bolivar. A number of official exchange mechanisms have been operating in the country, each with different exchange rates and each theoretically available for specified types of transaction. In practice, however, there have for a number of years been significant restrictions on entities’ ability to make more than limited remittances out of the country using these mechanisms.

When the IFRS IC considered the issue in 2018 it described the circumstances in Venezuela in the following terms:

- The exchangeability of the foreign operation’s functional currency with other currencies is administered by jurisdictional authorities and this exchange mechanism incorporates the use of (an) exchange rate(s) set by the authorities, i.e., (an) official exchange rate(s)
- The foreign operation’s functional currency is subject to a long-term lack of exchangeability with other currencies, i.e., the exchangeability is not temporarily lacking; it has not been restored after the end of the reporting period
- The lack of exchangeability with other currencies has resulted in the foreign operation being unable to access foreign currencies using the exchange mechanism described above

In order to comply with IAS 21, the IFRS IC decided the rate to be used in these circumstances is the one which an entity would have access to through a legal exchange mechanism at the end of the reporting period (or at the date of a transaction). Consequently, an entity assesses whether any of the official exchange rates represent such a rate and uses that rate if it does.²²

The IFRS IC did not say what rates are to be used if using the official exchange rate(s) did not comply with IAS 21. However, some entities have used an estimated exchange rate, an approach that is not precluded in the circumstances described above and which has been accepted by at least one European regulator.²³

The IFRS IC noted that in general economic conditions are constantly evolving and highlighted the importance of reassessing at each reporting date whether any of the official exchange rates are to be used. It also drew attention to disclosure requirements in IFRS accounting standards that might be relevant in these circumstances and these are covered in section 11.4 below.²⁴

The extreme circumstances in Venezuela which has led some entities to estimate an exchange rate rather than use an official or otherwise observable rate could in theory arise elsewhere. However, such situations would occur only rarely.²⁵

Until the amendments are applied, the standard made no reference to the problems noted above in the context of translating the results and financial position of an entity into a different presentation currency, particularly where the results and financial position of a foreign operation are being translated for inclusion in the financial statements of the reporting entity by consolidation or the equity method.

25 [IASB Staff Paper 10](#): Project: *IAS 21 - Determination of the exchange rate when there is a long-term lack of exchangeability*, Paper topic: *Agenda decision to finalise*, IFRS IC Meeting, September 2018. Available on the IFRS Foundation’s website.

Where the problem is one of a temporary suspension of rates, the IFRS IC noted that the predominant practice is for the requirement in IAS 21 relating to transactions and balances to be followed; i.e., by using 'the first subsequent rate at which exchanges could be made'. In this context the rate will be the one at which future cash flows could be settled when viewing the net investment as a whole.²⁶ This approach is broadly consistent with US GAAP which states that the rate to be used to translate foreign financial statements is, in the absence of unusual circumstances, the rate applicable to dividend remittance.

Where there is a longer-term lack of exchangeability, the discussion above will be relevant and determining the appropriate exchange rate to use will require the application of judgement. The rate selected will depend on the entity's individual facts and circumstances, particularly its legal ability to convert currency or to settle transactions using a specific rate and its intent to use a particular mechanism, including whether the rate available through that mechanism is published or readily determinable. The disclosure requirements highlighted by the IFRS IC and covered in section 11.4 below will also be relevant in these circumstances.

8 Change of presentation currency

IAS 21 does not address how an entity approaches presenting its financial statements if it changes its presentation currency. This is a situation that is commonly faced when the reporting entity determines that its functional currency has changed (the accounting implications of which are set out in IAS 21 and discussed in section 5.5 above). However, it can occur in other situations too.

How we see it

Changing presentation currency is, in our view, similar to a change in accounting policy, the requirements for which are set out in IAS 8. Therefore, when an entity chooses to change its presentation currency, we consider it appropriate to follow the approach in IAS 8 which requires retrospective application except to the extent that this is impracticable (see Chapter 3).

Consequently, changing presentation currency will also require the presentation of a statement of financial position at the beginning of the comparative period (see Chapter 3). However, the fact that IAS 21 allows a free choice of presentation currency means an entity need not demonstrate that using a different presentation currency provides reliable and more relevant information as it would for a voluntary change of accounting policy (see Chapter 3).

It almost goes without saying that the comparatives are restated and presented in the new presentation currency. Further, applying the change retrospectively in line with IAS 8 means they are determined as if this had always been the entity's presentation currency (at least to the extent practicable). The SEC, the US regulator, also requires a change in presentation currency to be approached in this way.²⁷

The main issue arising in practice is determining the amount of the different components of equity, particularly the exchange differences that IAS 21 requires to be accumulated in a separate component of equity, and how much of those differences relate to each operation within the group. The following Illustration shows the impact of a change in presentation currency of a relatively simple group.

Illustration 8-1: Change of presentation currency

A Canadian parent, P, was established on 1 January 20X0 and issued new shares for C\$20 million. On the same date it established two wholly owned subsidiaries, S1 and S2 incorporated in Canada and the UK respectively and subscribed C\$10 million and £4.5 million for their entire share capital. The functional currency of each group company was determined to be its local currency, i.e., Canadian dollars for P and S1 and the pound sterling for S2.

During 20X0, S1 made a profit of C\$800,000, S2 made a profit of £350,000 and P made a loss of C\$25,000. On 30 September 20X0, P issued new shares for C\$10 million of which £4 million was used immediately to subscribe for additional shares in S2.

During 20X1, S1 made a profit of C\$700,000, S2 made a profit of £750,000 and P made a loss of C\$30,000 before dividends received from S2. On 30 June 20X1, S2 paid dividends (out of profits then made) of £700,000 to P and on 30 September 20X1 P paid dividends of C\$1,000,000 to its shareholders.

The relevant exchange rates for C\$1=£ were as follows:

1 January 20X0	2.10
30 September 20X0	2.28
31 December 20X0	2.35
Average for 20X0	2.24
30 June 20X1	2.55
30 September 20X1	2.63
31 December 20X1	2.40
Average for 20X1	2.52

²⁷ Financial Reporting Manual, SEC, July 2019, para. 6630.1.

Consequently, the statement of changes in equity in P's consolidated financial statements for 20X0 and 20X1 can be summarised as follows:

	Paid-in capital	Retained earnings	Foreign exchange	Total
	C\$	C\$	C\$	C\$
1 January 20X0	-	-	-	-
Issue of shares	30,000,000	-	-	30,000,000
Comprehensive income	-	1,559,000	1,443,500	3,002,500
31 December 20X0	30,000,000	1,559,000	1,443,500	33,002,500
Comprehensive income	-	2,560,000	457,500	3,017,500
Dividends	-	(1,000,000)	-	(1,000,000)
31 December 20X1	30,000,000	3,119,000	1,901,000	35,020,000

The comprehensive income reflected within retained earnings represents the profit for each year, calculated as follows:

$$20X0: C\$800,000 + (£350,000 \times 2.24) - C\$25,000 = C\$1,559,000$$

$$20X1: C\$700,000 + (£750,000 \times 2.52) - C\$30,000 = C\$2,560,000$$

The foreign exchange differences recognised in other comprehensive income, which are entirely attributable to S2, can be calculated as follows:

	20X0			20X1		
	£	Rate	C\$	£	Rate	C\$
Opening net assets*	4,500,000	2.10	9,450,000	8,850,000	2.35	20,797,500
		2.35	10,575,000		2.40	21,240,000
Exchange gain			1,125,000			442,500
Additional capital	4,000,000	2.28	9,120,000	-	-	-
		2.35	9,400,000		-	-
Exchange gain			280,000			-
Dividend	-	-	-	(700,000)	2.55	(1,785,000)
		-	-		2.40	(1,680,000)
Exchange gain			-			105,000
Profit	350,000	2.24	784,000	750,000	2.52	1,890,000
		2.35	822,500		2.40	1,800,000
Exchange gain/(loss)			38,500			(90,000)
	8,850,000		1,443,500	8,900,000		457,500

* For 20X0, includes the proceeds received for issuing shares on 1 January.

For the year ended 31 December 20X2, P decided to change its presentation currency to sterling. This might or might not have coincided with a change of P's functional currency. In P's consolidated financial statements for the year ended 31 December 20X2, what amounts are to be included in respect of the comparative period?

Direct method

If P's accounting policy was to use the direct method of consolidation (see section 6.1.4 above), its financial statements for 20X0 and 20X1 would have been prepared by translating the financial statements of each entity within the group directly into sterling (where necessary). The revised statement of changes in equity in P's consolidated financial statements can be summarised as follows and these are the amounts that will be reflected as comparative amounts in P's consolidated financial statements for the year ended 31 December 20X2:

	Paid-in capital	Retained earnings	Foreign exchange	Total
	£	£	£	£
1 January 20X0	-	-	-	-
Issue of shares	13,909,775	-	-	13,909,775
Comprehensive income	-	695,982	(562,140)	133,842
31 December 20X0	13,909,775	695,982	(562,140)	14,043,617
Comprehensive income	-	1,015,873	(87,595)	928,278
Dividends	-	(380,228)	-	(380,228)
31 December 20X1	13,909,775	1,331,627	(649,735)	14,591,667

The table above assumes that P will record its paid-in capital at historical exchange rates (£13,909,775 = C\$20,000,000 ÷ 2.10 + C\$10,000,000 ÷ 2.28). Alternatively, P could retranslate those amounts at year end rates although any difference arising would simply be recorded in another component of equity (but not the foreign exchange reserve) and this difference would not affect profit or loss or other comprehensive income in any period (see sections 6.2.1 and 6.2.2 above).

The calculations showing how these amounts have been determined are shown below.

The comprehensive income reflected within retained earnings represents the profit for each year, calculated as follows:

$$20X0: (C\$800,000 \div 2.24) + £350,000 - (C\$25,000 \div 2.24) = £695,982$$

$$20X1: (C\$700,000 \div 2.52) + £750,000 - (C\$30,000 \div 2.52) = £1,015,873$$

In this case, the profit calculated in this way results in the same amount as translating the consolidated profit of C\$1,559,000 and C\$2,560,000 presented in Canadian dollars at the average rate for the period of C\$2.24=£1 and C\$2.52=£1 respectively. In practice minor differences can arise as a result of imperfections in the average rates used.

Similarly, the net assets presented above are the same as the amounts obtained by translating consolidated net assets of C\$33,002,500 and C\$35,020,000 at the closing rates at the end of the relevant period, C\$2.35=£1 and C\$2.40=£1 respectively. This would always be the case.

However, the foreign exchange reserve is fundamentally different to that in the financial statements presented in Canadian dollars. In this case it represents exchange differences arising from the translation of both P's and S1's financial statements into sterling whereas previously it represented exchange differences arising from the translation of S2's financial statements into Canadian dollars.

The foreign exchange differences recognised in other comprehensive income that are attributable to P can be calculated as follows:

	20X0			20X1		
	C\$	Rate	£	C\$	Rate	£
Opening net assets*	550,000	2.10	261,905	1,405,000	2.35	597,872
		2.35	234,042		2.40	585,417
Exchange loss			(27,863)			(12,455)
Additional capital**	880,000	2.28	385,965	-	-	-
		2.35	374,468		-	-
Exchange loss			(11,497)			-
Dividend received	-	-	-	1,785,000	2.55	700,000
		-	-		2.40	743,750
Exchange gain			-			43,750
Dividend paid	-	-	-	(1,000,000)	2.63	(380,228)
		-	-		2.40	(416,667)
Exchange loss			-			(36,439)
Loss	(25,000)	2.24	(11,161)	(30,000)	2.52	(11,905)
		2.35	(10,638)		2.40	(12,500)
Exchange gain/(loss)			523			(595)
	<u>1,405,000</u>		<u>(38,837)</u>	<u>2,160,000</u>		<u>(5,739)</u>

* For 20X0, includes the proceeds received for issuing shares on 1 January (C\$20,000,000) less amounts invested in S1 (C\$10,000,000) and S2 (C\$9,450,000 = £4,500,000 × 2.10) on the same date.

** Reduced by the amounts invested in S2 on the same date.

The foreign exchange differences recognised in other comprehensive income that are attributable to S1 can be calculated as follows:

	20X0			20X1		
	C\$	Rate	£	C\$	Rate	£
Opening net assets*	10,000,000	2.10	4,761,905	10,800,000	2.35	4,595,745
		2.35	4,255,319		2.40	4,500,000
Exchange loss			(506,586)			(95,745)
Profit	800,000	2.24	357,143	700,000	2.52	277,778
		2.35	340,426		2.40	291,667
Exchange (loss)/gain			(16,717)			13,889
	<u>10,800,000</u>		<u>(523,303)</u>	<u>11,500,000</u>		<u>(81,856)</u>

* For 20X0, includes the proceeds received for issuing shares on 1 January.

Therefore the total foreign exchange loss arising in 20X0 is £562,140 (£38,837 + £523,303) and in 20X1 is £87,595 (£5,739 + £81,856).

Under this method amounts in the foreign exchange reserve would be reclassified to profit or loss on the subsequent disposal of S1, but not on the subsequent disposal of S2.

Step-by-step method

If P's accounting policy was to use the step-by-step method of consolidation (see section 6.1.4 above), the first step in producing its consolidated financial statements for 20X0 and 20X1 would have been to translate the financial statements of S2 into Canadian dollars, the functional currency of P, to produce consolidated financial statements in Canadian dollars (effectively those that P had prepared historically). The second step involves translating these consolidated financial statements into sterling.

These financial statements (and hence the comparative amounts included in the financial statements for the year ended 31 December 20X2) will appear to be the same as those produced under the direct method (assuming equity items are dealt with similarly, i.e., paid-in capital is translated at the relevant rate at the date of issue and that retained earnings represent each element translated at the relevant rates, being 20X0 and 20X1 profit at the average rate for the year, and dividends at the date of payment). However, the balance on the foreign exchange reserve will be attributable to different entities within the group (see section 6.6.3 above). The calculations showing how these amounts have been determined are shown below.

The foreign exchange differences recognised in other comprehensive income in the financial statements presented in Canadian dollars that are attributable to S2 will remain attributable to S2, albeit that they are translated into sterling at the average rate:

$$20X0: C\$1,443,500 \div 2.24 = £644,420$$

$$20X1: C\$457,500 \div 2.52 = £181,548$$

The remaining exchange differences recognised in other comprehensive income, which arise from retranslating P's consolidated financial statements presented in Canadian dollars into sterling, are attributable to P. They can be calculated as follows:

20X0				20X1			
	C\$	Rate	£		C\$	Rate	£
Opening net assets*	20,000,000	2.10	9,523,809	33,002,500	2.35	14,043,617	
		2.35	8,510,638		2.40	13,751,042	
Exchange loss			(1,013,171)				(292,575)
Additional capital	10,000,000	2.28	4,385,965	-	-	-	-
		2.35	4,255,319		-	-	-
Exchange loss			(130,646)				-
Dividend paid	-	2.24	-	(1,000,000)	2.63	(380,228)	
		2.35	-		2.40	(416,667)	
Exchange loss			-				(36,439)
Comprehensive Income	3,002,500	2.24	1,340,402	3,017,500	2.52	1,197,421	
		2.35	1,277,660		2.40	1,257,292	
Exchange (loss)/gain			(62,742)				59,871
	<u>33,002,500</u>		<u>(1,206,559)</u>	<u>35,020,000</u>		<u>(269,143)</u>	

* For 20X0, includes the proceeds received for issuing shares on 1 January.

In contrast to the direct method, under this method amounts in the foreign exchange reserve would be reclassified to profit or loss on the subsequent disposal of S2, but not on the subsequent disposal of S1.

In the Illustration above, it was reasonably straightforward to recreate the consolidated equity balances and identify the amounts of accumulated exchange differences related to each entity within the group using the new presentation currency. This is because the group had a very simple structure with operations having only two functional currencies, a short history and few (external and internal) equity transactions. Whilst a theoretically perfect restatement is the goal to aim for, in practice it is unlikely to be such an easy exercise.

As noted above, where an accounting policy is changed, IAS 8 requires retrospective application except to the extent that this is impracticable, in which case an entity adjusts the comparative information to apply the new accounting policy prospectively from the earliest practicable date.

How we see it

Applying a similar approach to that in IAS 8 is, in our view, appropriate when an entity changes its presentation currency. In this context the most important component of equity to determine correctly (or as near correctly as possible) is normally the foreign exchange reserve because that balance, or parts of it, are reclassified from equity to profit or loss in the event of any future disposal of the relevant foreign operation, and could therefore affect future earnings.

Where an entity applies the direct method of consolidation, it could be impracticable to determine precisely the amount of exchange differences accumulated within the separate component of equity relating to each individual entity within the group. In these circumstances, approximations will be necessary to determine the amounts at the beginning of the earliest comparative period presented, although all subsequent exchange differences are accumulated in accordance with the requirements of IAS 21. For an entity that set its foreign exchange reserve to zero on transition to IFRS accounting standards (see Chapter 6) it may be able to go back to that date and recompute the necessary components of equity. This is likely to be less of an issue for entities applying the step-by-step method.

UBS and CRH changed their presentation currency in 2018 and 2020 respectively and included the following explanations in their accounting policies.

Practical example 8-1: UBS Group AG (2018)

Switzerland

Annual Report 2018 [extract]

Notes to the UBS Group AG consolidated financial statements [extract]

Note 1 Summary of significant accounting policies [extract]

1) Changes in functional and presentation currency [extract]

1) Changes in functional and presentation currency

Change in functional currencies

As a consequence of legal entity structural changes over recent years – notably the transfer of the Personal & Corporate Banking and Global Wealth Management businesses booked in Switzerland from UBS AG to UBS Switzerland AG, and the creation of UBS Business Solutions AG, which houses a significant portion of the employees and associated costs that were previously held in UBS AG's Head Office in Switzerland and UBS AG's London Branch – a concentration of US dollar-influenced and -managed business activities now exist in UBS AG's Head Office in Switzerland and UBS AG's London Branch. In addition, from the fourth quarter of 2018, for risk management purposes UBS adopted the US dollar as the risk-neutral currency and has adjusted its structural risk positions accordingly. As a result of these changes, effective from 1 October 2018, the functional currency of UBS Group AG and UBS AG's Head Office in Switzerland changed prospectively from Swiss francs to US dollars and that of UBS AG's London Branch changed from British pounds to US dollars, in compliance with the requirements of IAS 21, *The Effects of Changes in Foreign Exchange Rates*.

Change in presentation currency

In 2018, the presentation currency of UBS Group AG's consolidated financial statements has changed from Swiss francs to US dollars to align with the functional currency changes of significant Group entities. UBS has restated prior periods for this voluntary presentational change in line with IAS 8, *Accounting Policies, Changes in Accounting Estimates and Errors*, from 1 January 2004. This point in time represented the earliest date from which it was practicable to perform a restatement, given the lack of sufficiently reliable data for earlier periods. As a consequence, foreign currency translation (FCT) gains or losses prior to 2004 have been disregarded, with FCT effects first calculated from 1 January 2004 onward. In addition, UBS has included a second comparative balance sheet as of 1 January 2017 in line with IAS 1, *Presentation of Financial Statements*.

Income and expenses as well as *Other comprehensive income* (OCI) were translated to US dollars at the respective average exchange rates prevailing for the relevant periods. Additionally, *Other income* was restated to reflect releases of FCT gains or losses from OCI to the income statement when calculated under the new US dollar presentation currency. The effect of such restatements for 2018, 2017 and 2016 was not material to the income statements of these periods.

Assets, liabilities and total equity were translated at closing exchange rates prevailing on the respective balance sheet dates, after reflection of deferred tax effects relating to the restatement. Share capital issued, share premium and treasury shares held were translated at historic average rates, whereby differences between historic average rate and closing exchange rate realized upon repayment of share capital or disposal of treasury shares were reported as *Share premium*. Cumulative amounts recognized in OCI in respect of cash flow hedges and financial assets measured at FVOCI (prior to 1 January 2018: financial assets classified as available for sale) were translated at closing exchange rate as of respective balance sheet dates, with any translation effects adjusted through *Retained earnings*.

The restated FCT balance as of 1 October 2018 included a cumulative gain of USD 767 million related to previously applied net investment hedges entered into by UBS Group AG or UBS AG's Head Office to hedge investments in foreign operations against their former Swiss franc functional currency.

The restated basic and diluted earnings per share (EPS) were USD 0.26 and USD 0.25 for the year ended 31 December 2017, which compares to CHF 0.28 and CHF 0.27 basic and diluted EPS under the previous Swiss franc presentation currency. For the year ended 31 December 2016, restated basic and diluted EPS were USD 0.90 and USD 0.88, which compares to CHF 0.86 and CHF 0.84 basic and diluted EPS under the previous Swiss franc presentation currency.

Practical example 8-2: CRH public limited company (2020)

Ireland

2020 Annual Report and Form 20-F [extract]**Financials [extract]****Accounting policies (including key accounting estimates and assumptions) [extract]****Change in presentation currency**

On 28 February 2020, the Group announced that with effect from 1 January 2020 it would be changing the currency in which it presents its financial results from euro to US Dollar. Within our current portfolio of businesses, our euro denominated earnings, while sizeable, are a relatively lower proportion of overall earnings. To reduce the potential for foreign exchange volatility in our future reported earnings, the Board determined that, with effect from 1 January 2020, CRH will present its results in US Dollar. Given the current composition of the Group's activities, this change is expected to reduce the impact of currency movements on reported results.

Accordingly, to satisfy the requirements of IAS 21 *The Effects of Changes in Foreign Exchange Rates*, the reported results for the years ended

31 December 2019 and 31 December 2018 have been translated from euro to US Dollar using the following procedures:

- Assets and liabilities denominated in non-US Dollar currencies were translated into US Dollar at the relevant closing rates of exchange;
- The trading results of subsidiaries whose functional currency was other than US Dollar were translated into US Dollar at the relevant average rates of exchange;
- Movements in other reserves were translated into US Dollar at the relevant average rates of exchange;
- Significant business divestments were translated at the spot rates prevailing on the date of divestment;
- Share capital, share premium, Treasury Shares/ own shares and dividends were translated at the historic rates prevailing on the date of each transaction; and
- The cumulative translation reserve was set to nil at 1 January 2004, the date of transition to IFRS, and has been restated on the basis that the Group has reported in US Dollar since that date

A change in presentation currency represents a change in accounting policy under IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* which is accounted for retrospectively. An opening balance sheet has been presented showing the impact of the change in presentation currency on 31 December 2018. The average and closing rates used for this exercise are provided on page 146.

9 Introduction of the euro

From 1 January 1999, the effective start of Economic and Monetary Union (EMU), the euro became a currency in its own right and the conversion rates between the euro and the national currencies of those countries who were going to participate in the first phase were irrevocably fixed, such that the risk of subsequent exchange differences related to these currencies was eliminated from that date on.

In October 1997, the SIC issued SIC-7 which deals with the application of IAS 21 to the changeover from the national currencies of participating Member States of the European Union to the euro. Consequential amendments have been made to this interpretation as a result of the IASB's revised version of IAS 21.

Although the Interpretation is no longer relevant with respect to the national currencies of those countries that participated in the first phase, SIC-7 makes it clear that the same rationale applies to the fixing of exchange rates when countries join EMU at later stages. [SIC-7.3].

Under SIC-7, the requirements of IAS 21 regarding the translation of foreign currency transactions and financial statements of foreign operations are to be strictly applied to the changeover. [SIC-7.3].

This means that, in particular:

- (a) Foreign currency monetary assets and liabilities resulting from transactions continue to be translated into the functional currency at the closing rate. Any resultant exchange differences are recognised as income or expense immediately, except that an entity continues to apply its existing accounting policy for exchange gains and losses related to hedges of the currency risk of a forecast transaction. [SIC-7.4].

The effective start of the EMU after the reporting period does not change the application of these requirements at the end of the reporting period; in accordance with IAS 10 *Events after the Reporting Period* it is not relevant whether or not the closing rate can fluctuate after the reporting period. [SIC-7.5].

Like IAS 21, the Interpretation does not address how foreign currency hedges are accounted for. The effective start of EMU, of itself, does not justify a change to an entity's established accounting policy related to hedges of forecast transactions because the changeover does not affect the economic rationale of such hedges. Therefore, the changeover does not alter the accounting policy where gains and losses on financial instruments used as hedges of forecast transactions are initially recognised in other comprehensive income and reclassified from equity to profit or loss to match with the related income or expense in a future period. [SIC-7.6].

- (b) Cumulative exchange differences relating to the translation of financial statements of foreign operations recognised in other comprehensive income remain accumulated in a separate component of equity and be reclassified from equity to profit or loss only on the disposal (or partial disposal) of the net investment in the foreign operation. [SIC-7.4].

The fact that the cumulative amount of exchange differences will be fixed under EMU does not justify immediate recognition as income or expenses since the wording and the rationale of IAS 21 clearly preclude such a treatment. [SIC-7.7].

10 Tax effects of all exchange differences

Extract from IAS 21

Tax effects of all exchange differences

- 50 Gains and losses on foreign currency transactions and exchange differences arising on translating the results and financial position of an entity (including a foreign operation) into a different currency may have tax effects. IAS 12 *Income Taxes* applies to these tax effects.

The requirements of IAS 12 are discussed in Chapter 29. [IAS 21.50]. In broad terms the tax effects of exchange differences will follow the reporting of the exchange differences, i.e., they will be recognised in profit or loss except to the extent they relate to exchange differences recognised in other comprehensive income, in which case they will also be recognised in other comprehensive income. [IAS 12.58].

The tax base of a non-monetary asset such as property, plant or equipment, will sometimes be determined in a currency other than the entity's functional currency. Consequently, changes in the exchange rate will give rise to temporary differences that result in a recognised deferred tax liability or asset (subject to recoverability). The resulting deferred tax is recognised in profit or loss, [IAS 12.41], and presented with other deferred taxes rather than with foreign exchange gains or losses (see Chapter 29).²⁸

28 [IFRIC Update](#), January 2016, available on the IFRS Foundation's website.

11 Presentation and disclosure requirements

11.1 Exchange differences

IAS 21 requires the amount of exchange differences recognised in profit or loss (except for those arising on financial instruments measured at fair value through profit or loss in accordance with IFRS 9) to be disclosed. *[IAS 21.52]*.

Neither IAS 21 nor IAS 1 specify where such exchange differences are presented in the income statement and, prior to adoption of IFRS 18, entities apply judgement in the light of the requirements of IAS 1 to determine the appropriate line item(s) in which exchange differences are included. For example, an entity which has an operating and a financing section within its income statement might include exchange differences arising on operating items (such as trade payables and receivables) in other operating income or expense and exchange differences on financing items (such as loans and borrowings) in the financing section.

How we see it

In the light of this need to apply judgement, we recommend that entities in disclosing the amount of such exchange differences indicate the line item(s) in which they are included.

Further, the classification of exchange differences (both gains and losses) arising from transactions of a similar nature are to be classified consistently throughout the periods presented.

IFRS 18 replaces IAS 1 for periods commencing on or after 1 January 2027. It is more prescriptive about the structure of the income statement and where within that structure foreign exchange gains and losses are presented. In summary, exchange differences are normally presented in the same category of the income statement as the income and expenses from the items that gave rise to them. The main exception is when this would involve undue cost or effort, in which case the foreign exchange differences are presented in the operating category. *[IFRS 18.48, IFRS 18.B65, IFRS 18.B68]*. The standard contains further requirements and guidance on presenting exchange differences within profit and loss categories, including those that are reclassified to profit or loss on disposal of a foreign operation. When disclosing the amount of exchange differences recognised in profit or loss, IFRS 18 also codifies the recommendation above to indicate the line item(s) within the statement of comprehensive income in which those exchange differences are included. *[IFRS 18.114, IFRS 18.BC324]*. These matters are addressed more fully in Chapter 4.

IAS 21 also requires disclosure of the net exchange differences recognised in other comprehensive income and accumulated in a separate component of equity, and a reconciliation of such amounts at the beginning and end of the period. *[IAS 21.52]*.

11.2 Presentation and functional currency

IAS 21 requires: *[IAS 21.53]*

Extract from IAS 21

53 When the presentation currency is different from the functional currency, that fact shall be stated, together with disclosure of the functional currency and the reason for using a different presentation currency.

For this purpose, in the case of a group, the references to 'functional currency' are to that of the parent. *[IAS 21.51]*.

When there is a change in the functional currency of either the reporting entity or a significant foreign operation, that fact and the reason for the change in functional currency is disclosed. *[IAS 21.54]*.

11.3 Convenience translations of financial statements or other financial information

Paragraph 55 of IAS 21 indicates that when an entity presents its financial statements in a currency that is different from its functional currency, it describes the financial statements as complying with IFRS accounting standards only if they comply with all the requirements of each applicable standard and interpretation of those standards, including the translation method set out in IAS 21 (see section 6.1 above). [IAS 21.55].

However, the standard recognises that an entity sometimes presents its financial statements or other financial information in a currency that is not its functional currency without meeting the above requirements. Examples noted by IAS 21 are where an entity converts into another currency only selected items from its financial statements or where an entity whose functional currency is not the currency of a hyperinflationary economy converts the financial statements into another currency by translating all items at the most recent closing rate. Such conversions are not in accordance with IFRS accounting standards; nevertheless IAS 21 requires disclosures to be made. [IAS 21.56].

The standard requires that when an entity displays its financial statements or other financial information in a currency that is different from either its functional currency or its presentation currency and the requirements of IAS 21.55 are not met, it is to: [IAS 21.57]

- (a) Clearly identify the information as supplementary information to distinguish it from the information that complies with IFRS accounting standards
- (b) Disclose the currency in which the supplementary information is displayed
- (c) Disclose the entity's functional currency and the method of translation used to determine the supplementary information

For the purpose of these requirements, in the case of a group, the references to 'functional currency' are to that of the parent. [IAS 21.51].

11.4 Judgements made in applying IAS 21 and related disclosures

IAS 1 or, for entities applying IFRS 18, IAS 8 requires disclosure of the significant judgements that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements (see Chapter 3). [IAS 1.122, IAS 8(2027).27G]. The application of IAS 21 can, in certain circumstances, require the exercise of significant judgement, particularly the determination of functional currency (see section 4 above) and assessing whether intragroup monetary items are permanent as equity (see section 6.3.1 above). Where relevant, information about these particular judgements is disclosed.

Section 7.4. sets out the disclosure requirements for entities applying the amendments to IAS 21 issued in August 2023 that address a currency's lack of exchangeability. For entities not yet adopting those amendments the IFRS IC drew attention to a number of disclosure requirements in IFRS accounting standards that might be relevant when an entity has material foreign operations subject to extensive currency controls, multiple exchange rates and/or a long-term lack of exchangeability. In particular, the IFRS IC highlighted the importance of providing information that is relevant to an understanding of the entity's financial statements. [IAS 1.122].

In addition to disclosing the significant judgements in applying an entity's accounting policies, the IFRS IC also considered the following disclosures to be important:²⁹

- Significant accounting policies applied [IAS 1.117-121]
- Sources of estimation uncertainty that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year, which may include a sensitivity analysis [IAS 1.125-133]
- The nature and extent of significant restrictions on an entity's ability to access or use assets and settle the liabilities of the group, or in relation to its joint ventures or associates [IFRS 12.10, IFRS 12.13, IFRS 12.20, IFRS 12.22]

29 [IFRIC Update](#), November 2014 and [IFRIC Update](#), September 2018. Available on the IFRS Foundation's website.

Finally, the following may also be relevant:³⁰

- The nature and extent of risks (including foreign exchange risk) arising from financial instruments (from a qualitative and quantitative perspective and including sensitivity analyses) [IFRS 7.31-42, IFRS 7.B6-B24]
- Significant cash held by the entity that is not available for use by the group, including due to exchange controls [IAS 7.48, IAS 7.49]
- The amount of foreign exchange differences recognised in profit or loss and other comprehensive income [IAS 21.52]

11.5 Subsidiaries without public accountability

IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosure while still applying the recognition, measurement and presentation requirements in other IFRS Accounting Standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). Further details on IFRS 19, including the relevant eligibility criteria, are addressed in Chapter 4.

The disclosure requirements in IAS 21 are substantially repeated in IFRS 19, the main exception being that those addressing convenience translations and related information (see section 11.3 above) are not included. In addition, when a currency lacks exchangeability (see section 7.4 above), the disclosure objective, along with guidance about the level of detail to be given to achieve that objective, are removed, but all other requirements remain.

30 [IASB Staff Paper 16](#): Project: *IAS 21-The Effects of Changes in Foreign Exchange Rates*, Paper topic: *Foreign exchange restrictions and hyperinflation*, IFRS IC Meeting, July 2014. Available on the IFRS Foundation's website.

12 Future developments

12.1 Translation to a Hyperinflationary Presentation Currency

As set out in section 6.1 above, in July 2024 the IASB published *Translation to a Hyperinflationary Presentation Currency*, an exposure draft of proposals to amend IAS 21 that would specify how a parent with a hyperinflationary presentation currency accounts for a non-hyperinflationary foreign operation. It would also specify the approach to be taken in the related situation where an entity whose functional currency is the currency of a non-hyperinflationary economy presents its financial statements in the currency of a hyperinflationary economy.

The exposure draft proposed the following:

- When an entity's presentation currency is the currency of a hyperinflationary economy, but its functional currency is the currency of a non-hyperinflationary economy, all amounts relating to the entity's results and financial position (i.e., assets, liabilities, equity items, income and expenses, including comparatives) are translated into the presentation currency at the closing rate at the date of the entity's most recent statement of financial position. This same approach would be required when translating a foreign operation with a functional currency of a non-hyperinflationary economy into a hyperinflationary presentation currency.
- In those circumstances, the following disclosures would be required:
 - The fact that all amounts (i.e., assets, liabilities, equity items, income and expenses, including comparatives) in the entity's financial statements or in the results and financial position of its foreign operation (or operations) have been translated at the closing rate at the date of its most recent statement of financial position.
 - Summarised financial information about the foreign operation(s) for which the results and financial position have been translated using the above approach, to enable users of the financial statements to assess the effect of these foreign operations on the entity's results and financial position.
- If the economy whose currency is the entity's presentation currency ceases to be hyperinflationary and the entity's functional currency continues to be the currency of a non-hyperinflationary economy, in the reporting period in which the change occurs the entity would apply the normal approach set out in section 6.1.1 above (paragraph 39 of IAS 21), prospectively from the beginning of that reporting period without restating amounts arising before the beginning of that reporting period. The entity would also be required to disclose that its presentation currency ceased to be the currency of a hyperinflationary economy.

These requirements would be applied retrospectively in accordance with IAS 8, although disclosure of the effect on each financial statement line item of these requirements would not be required.

After considering responses to its exposure draft, the most significant change the IASB has tentatively agreed to make is in respect of the comparative information when a foreign operation with a non-hyperinflationary functional currency is translated into a hyperinflationary presentation currency. In this situation, the comparative information of the foreign operation would be restated by applying the same change in the general price index as applied to other corresponding figures, in accordance with IAS 29. At the time of writing, the IASB was indicating it expected to publish the final amendments to IAS 21 by the end of 2025.

12.2 Other developments

The IASB's Feedback Statement to its Third Agenda Consultation, published in July 2022, explained that many respondents identified projects on foreign currency as low priority and as a result no such project was added to the IASB's work plan. The IASB's Fourth Agenda Consultation began in March 2025, but in July 2025 the IASB had recently expressed support for a concurrent agenda consultation with the ISSB which would involve not initiating the process until late 2026 with a request for information following only in 2027. Therefore, it seems unlikely there will be any major standard setting work in the area of foreign currencies over the next few years.

The IASB's other projects can touch on the application of IAS 21. For example, an IFRS accounting standard is being developed to address rate regulated activities and, at the time of writing, this is expected to be published in the first half of 2026. In May 2023, it was tentatively agreed that any regulatory assets or regulatory liabilities arising from regulated rates denominated in a foreign currency would be treated as monetary items when applying IAS 21.³¹

Appendix B - Defined terms

Extract from IAS 21

- 8 The following terms are used in this Standard with the meanings specified:
- Closing rate* is the spot exchange rate at the end of the reporting period.
- A currency is *exchangeable* into another currency when an entity is able to obtain the other currency within a time frame that allows for a normal administrative delay and through a market or exchange mechanism in which an exchange transaction would create enforceable rights and obligations.
- Exchange difference* is the difference resulting from translating a given number of units of one currency into another currency at different exchange rates.
- Exchange rate* is the ratio of exchange for two currencies.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)
- Foreign currency* is a currency other than the functional currency of the entity.
- Foreign operation* is an entity that is a subsidiary, associate, joint arrangement or branch of a reporting entity, the activities of which are based or conducted in a country or currency other than those of the reporting entity.
- Functional currency is the currency of the primary economic environment in which the entity operates.
- A *group* is a parent and all its subsidiaries.
- Monetary items* are units of currency held and assets and liabilities to be received or paid in a fixed or determinable number of units of currency.
- Net investment in a foreign operation* is the amount of the reporting entity's interest in the net assets of that operation.
- Presentation currency* is the currency in which the financial statements are presented.
- Spot exchange rate* is the exchange rate for immediate delivery.

Overview

This chapter addresses the requirements of IAS 29 *Financial Reporting in Hyperinflationary Economies*.

In an environment where significant levels of inflation exist, the usefulness of reporting is hindered. Changes in the 'real' growth of revenues and expenses cannot be discerned, and the values of assets and liabilities ordinarily measured on an historical cost basis are not reflective of their true value at the reporting date. In addition, the loss in value of items of a monetary nature is not reflected.

IAS 29 addresses these challenges by providing a framework for identifying currencies that are sufficiently inflationary to warrant adjustment for inflation, as well as the methods for making such adjustments. The standard outlines when hyperinflation exists, as identified by a number of common characteristics of the economy. For periods when hyperinflation is present, IAS 29 requires that all items are restated from their amounts as determined by other standards, by a measure of the inflation from the transaction or measurement date to the reporting date. This also applies to comparative figures, which are to be restated in terms of the measuring unit current at the end of the current reporting period.

To perform the required restatement of financial statements, assets and liabilities are separated into those that are monetary and non-monetary, with non-monetary items further divided into those measured on either a current or historical basis. Monetary items and non-monetary but current items are already measured at the monetary unit present at the reporting date and therefore do not require restatement. The restatement required by the standard therefore applies to non-monetary historical value assets and liabilities, as well as transactions. This process has consequential impacts on a number of items, including the calculation of deferred tax and the testing for impairments. The gain or loss in the value of monetary items for the period is reflected in profit or loss.

The application of this standard requires numerous judgements. Some of these require consensus with the broader reporting community, such as when the use of IAS 29 is required, while others would need to be evaluated based on the circumstances of a particular entity. The standard acknowledges this complexity by conceding that the consistent application of these inflation accounting procedures and judgements from period to period is more important than the precise accuracy of the resulting amounts included in the restated financial statements.

The application of IAS 29 is particularly complex where a significant amount of historical information is required. In addition, areas that may require additional attention from preparers include the first-time application of the standard; the computation of deferred tax; groups with both hyperinflationary and non-hyperinflationary entities; and interim reporting.

Entities facing hyperinflation are often also affected by complexities relating to foreign currency translation, which are discussed further in Chapter 16.

What you need to know

- The need to apply IAS 29 is assessed at a currency level, rather than a reporting entity level, and therefore this standard shall only be applied where consensus has been reached for a given currency.
- The application of this standard requires judgement in both the interpretation, where specific guidance is not provided, as well as application, and therefore consistency is prioritised over precision.
- Given the complexity of the reporting process, preparers of IAS 29 financial statements should be mindful of the requirement to disclose significant judgements and estimates.

1 Introduction

1.1 Background

Accounting standards are applied on the assumption that the value of money (the unit of measurement) is constant over time, which normally is an acceptable practical assumption. However, when the effect of inflation on the value of money is no longer negligible, the usefulness of historical cost based financial reporting is often significantly reduced. High rates of inflation give rise to a number of problems for entities that prepare their financial statements on a historical cost basis, for example:

- Historical cost figures expressed in terms of monetary units do not show the 'value to the business' of assets.
 - Holding gains on non-monetary assets that are reported as operating profits do not represent real economic gains.
 - Financial information presented for the current period is not comparable with that presented for the prior periods.
- And
- 'Real' capital can be reduced because profits reported do not take account of the higher replacement costs of resources used in the period. Therefore, if calculating a nominal 'return on capital' based on profit, and not distinguishing this properly from a real 'return of capital', the erosion of capital may go unnoticed in the financial statements. This is the underlying point in the concept of capital maintenance.

The IASB's *The Conceptual Framework for Financial Reporting* discusses the concept of capital maintenance, which raises the issue of how an entity defines capital. In general terms, an entity maintains its capital if it has as much capital at the end of the period as it had at the beginning, the issue being how this evaluation is measured. Whilst there are different concepts of capital maintenance, the IFRS accounting standards are ultimately based on the financial capital maintenance concept.

Under the financial capital maintenance concept, the capital of the entity will be maintained if the financial amount of net assets at the end of a period is at least equal to the financial amount of net assets at the beginning of that period, excluding contributions from and distributions to owners during the period.

[CF 8.3(a)]. To facilitate the evaluation of capital maintenance in a hyperinflationary environment, IAS 29 was adopted in April 2001.

The IASB and IFRS IC subsequently made changes to the standards regarding the subject of hyperinflation only to clarify the provisions of the standard. In 2005, IFRIC 7 *Applying the Restatement Approach under IAS 29 Financial Reporting in Hyperinflationary Economies* was issued to provide guidance on applying IAS 29 in the reporting period in which an entity's functional currency first becomes hyperinflationary (see section 10.1 below). In 2010 the IASB issued an amendment to IFRS 1 *First-time Adoption of International Financial Reporting Standards* for countries that exit severe hyperinflation (see section 10.3 below).

FASB differences

Differences between the IFRS and US GAAP guidance on this topic are not addressed in this chapter as the standards are not converged. Therefore, differences between IFRS and US GAAP may exist that are not discussed in this chapter.

1.2 Hyperinflationary economies

In some countries, inflation has reached such levels that the local currency is no longer a useful measure of value in the economy and the general population may prefer not to hold its wealth in the local currency. Instead, they hold their wealth in a stable foreign currency or non-monetary assets. Such a condition is often referred to as hyperinflation.

There are several characteristics that need to be considered under IFRS accounting standards to determine whether hyperinflation exists. The IASB does not monitor inflation rates in specific jurisdictions, nor does it conclude on the applicability of the characteristics to these jurisdictions. Where the assessment of the characteristics is unclear, consensus is at times facilitated by local regulators and professional bodies.

1.3 Restatement approach

The problems of historical cost based financial reporting may reach such a magnitude under hyperinflationary circumstances that financial reporting in the hyperinflationary currency is no longer useful. Therefore, a solution is needed to allow meaningful financial reporting by entities that operate in these hyperinflationary economies.

IAS 29 requires a restatement approach, whereby financial information recorded in the hyperinflationary currency is adjusted by applying a general price index and expressed in the measuring unit current at the end of the reporting period (i.e., the accounting value is adjusted for a factor of current purchasing power). This process aims to improve comparability between periods by restating financial information for changes in the purchasing power of money.

2 The requirements of IAS 29

2.1 The context of IAS 29

The underlying premise of IAS 29 is that “reporting of operating results and financial position in the local [hyperinflationary] currency without restatement is not useful”. [IAS 29.2]. The standard’s approach is therefore to require that:

- (a) The financial statements of an entity whose functional currency is the currency of a hyperinflationary economy shall be stated in terms of the measuring unit current at the end of the reporting period.
- (b) The corresponding figures for the previous period required by IAS 1 *Presentation of Financial Statements* and any information in respect of earlier periods shall also be stated in terms of the measuring unit current at the end of the reporting period.

And

- (c) The gain or loss on the net monetary position shall be included in profit or loss and separately disclosed. [IAS 29.8, IAS 29.9].

IAS 29 requires amounts recorded in the statement of financial position, not already expressed in terms of the measuring unit current at the end of the reporting period, to be restated in terms of the current measuring unit at the end of the reporting period, by applying a general price index. [IAS 29.11]. The illustration below illustrates how this would apply to the statement of financial position of an entity:

Illustration 2-1: Accounting for hyperinflation under IAS 29

An entity that operates in a hyperinflationary economy is required under IAS 29 to restate all non-monetary items in its statement of financial position to the measuring unit current at the end of the reporting period by applying a general price index as follows:

	Before restatement (HC)	Historical general price index*	Year-end general price index	After restatement (HC)
Plant and equipment	225	150	600	900
Inventory	250	500	600	300
Cash	100			100
Total assets	575			1,300
Accounts payable	180			180
Long-term debt	250			250
Equity **	145			870
	575			1,300

* General price index at the date of purchase

** The restatement of equity is not illustrated here, but is discussed in section 5 below.

The simplified Illustration above already raises a number of questions, such as:

- Which items are monetary, and which are non-monetary?
- How does the entity select the appropriate general price index?
- What was the general price index when the assets were acquired?

The standard provides guidance on the restatement to the measuring unit current at the end of the reporting period, but concedes that the consistent application of these inflation accounting procedures and judgements from period to period is more important than the precise accuracy of the resulting amounts included in the restated financial statements. [IAS 29.10]. The requirements of the standard look deceptively straightforward but their application may represent a considerable challenge. These difficulties and other aspects of the practical application of the IAS 29 method of accounting for hyperinflation are discussed below.

2.2 Scope

IAS 29 must be applied by all entities whose functional currency is the currency of a hyperinflationary economy. [IAS 29.1].

The standard should be applied in an entity's separate financial statements (if prepared) and its consolidated financial statements, as well as by parents that include such an entity in their consolidated financial statements.

If an entity whose functional currency is that of a hyperinflationary economy wishes to present the financial statements in a different presentation currency, or if their parent has a different presentation currency, the financial statements of the entity first must be restated under IAS 29. Only then, can the financial statements be translated under IAS 21 *The Effects of Changes in Foreign Exchange Rates* (see section 11 below).

Almost all entities operating in hyperinflationary economies will be subject to the accounting regime of IAS 29, unless they can legitimately argue that the local hyperinflationary currency is not their functional currency as defined by IAS 21 (see Chapter 16). [IAS 21.14].

2.3 Definition of hyperinflation

Determining whether an economy is hyperinflationary in accordance with IAS 29, and when it becomes so, requires judgement. [IAS 29.3, IAS 29.4].

Extract from IAS 29

- | | |
|---|---|
| 3 | This Standard does not establish an absolute rate at which hyperinflation is deemed to arise. It is a matter of judgement when restatement of financial statements in accordance with this Standard becomes necessary. Hyperinflation is indicated by characteristics of the economic environment of a country which include, but are not limited to, the following: |
| | <ul style="list-style-type: none"> (a) the general population prefers to keep its wealth in non-monetary assets or in a relatively stable foreign currency. Amounts of local currency held are immediately invested to maintain purchasing power; (b) the general population regards monetary amounts not in terms of the local currency but in terms of a relatively stable foreign currency. Prices may be quoted in that currency; (c) sales and purchases on credit take place at prices that compensate for the expected loss of purchasing power during the credit period, even if the period is short; (d) interest rates, wages and prices are linked to a price index; and (e) the cumulative inflation rate over three years is approaching, or exceeds, 100%. |
| 4 | It is preferable that all entities that report in the currency of the same hyperinflationary economy apply this Standard from the same date. Nevertheless, this Standard applies to the financial statements of any entity from the beginning of the reporting period in which it identifies the existence of hyperinflation in the country in whose currency it reports. |

Identifying when a currency becomes hyperinflationary, and, just as importantly, when it ceases to be so, is not easy in practice and is frequently hampered by a lack of reliable statistics. The consideration of trends and the application of common sense is important in this judgement, as are consistency of measurement and of presentation. In June 2025, the IFRS IC issued an agenda decision on assessing when an economy becomes hyperinflationary.¹ The IFRS IC found evidence that stakeholders use judgement in assessing the indicators in paragraph 3 of IAS 29 and might assign different weights to those, or other, indicators. Stakeholders do not reach different conclusions for different levels within a group when preparing financial statements using the same basis of preparation.

Transition into and out of hyperinflationary economies are discussed further in section 10 below.

¹ [IFRIC Update](#), June 2025, available on the IFRS Foundation's website.

How we see it

As at June 2025, the currencies of the following countries were widely considered to be hyperinflationary: Argentina, Burundi, Ghana, Haiti, Islamic Republic of Iran, Lao P.D.R., Lebanon, Malawi, Sierra Leone, South Sudan, Sudan, Suriname, Turkey, Venezuela and Zimbabwe. Preparers should be aware that this list may change by the time of their reporting date. Countries whose currencies should be more closely monitored for a change in the hyperinflationary status of their currency at this date were Angola, Egypt, Myanmar, Nigeria, Pakistan and Syria.

2.4 The IAS 29 restatement process

Restatement of financial statements in accordance with IAS 29 can be seen as a process comprising the following steps:

- (a) Selection of a general price index (see section 3 below)
- (b) Analysis and restatement of the statement of financial position (see section 4 below)
- (c) Restatement of the statement of changes in equity (see section 5 below)
- (d) Restatement of the statement of profit or loss and other comprehensive income (see section 6 below)
- (e) Calculation of the gain or loss on the net monetary position (see section 6.3 below)

And

- (f) Restatement of the statement of cash flows (see section 7 below)

IAS 29 requires comparative figures to be restated to the monetary unit current at the reporting date (see section 8 below). In practice, the restatement of comparatives is integral to the restatement of current year figures, and thus is the first step in the process after a general price index has been selected.

In the year of initial application of the standard, the retrospective nature of IAS 29 requires the restatement of all historical amounts from varying dates at which they were last current - which is often the date of acquisition, many years ago - and is generally a time consuming and complex process.

In subsequent years, the restatement process is considerably less onerous, as the previously reported figures are only adjusted for the inflation in the current period, and information about items recognised in the current period is more readily available. The restatement of comparative information is best completed as the first step in applying IAS 29 as certain items rely on this restated information to determine current year amounts. Some examples would include the closing balance of property plant and equipment, which is often calculated as the sum of the restated opening balance and movements (see Illustration 4-1 in section 4.1.4 below), and fair value gains on non-monetary items, which are determined taking into consideration the restated opening balance (as discussed in section 6.2 below).

3 Selection of a general price index

The standard requires entities to use a general price index that reflects changes in general purchasing power. Ideally all entities that report in the same hyperinflationary currency should use the same price index. [IAS 29.37].

3.1 Selecting a general price index

It is generally accepted practice to use a Consumer Price Index (CPI) for this purpose, unless that index is clearly flawed. National statistical offices in most countries issue several price indices that potentially could be used for the purposes of IAS 29. Important characteristics of a good general price index include the following:

- A wide range of goods and services has been included in the price index
- Reflective of currency-wide, rather than regional, purchasing power
- Continuity and consistency of measurement techniques and underlying assumptions
- Free from bias
- Frequently updated
- And
- Available for a long period

The entity shall use the above criteria to choose the most reliable and most readily available general price index and use that index consistently. It is important that the index selected is representative of the real position of the hyperinflationary currency concerned.

In practice, a country's national price index that is monitored by the International Monetary Fund, and is incorporated in its World Economic Outlook publication, is used as the basis for IAS 29 accounting.

3.2 General price index not available for all periods

IAS 29 requires an entity to make an estimate of the price index if the general price index is not available for all periods for which the restatement of long-lived assets is required. The entity could base the estimate, for example, on the movements in the exchange rate between the functional currency and a relatively stable foreign currency. [IAS 29.17]. It should be noted that this method is only appropriate if the currency of the hyperinflationary economy is freely exchangeable, i.e., not subject to currency controls and 'official' exchange rates. Entities should also be mindful that, especially in the short term, the exchange rate may fluctuate significantly in response to factors other than changes in the domestic price level.

How we see it

In a scenario where there is a wide spread consensus that all available general price indices do not meet the minimum criteria for reliability (e.g., because the national statistical office in the hyperinflationary economy may be subject to significant political bias) and thus are fatally flawed, or in the absence of a general price index, entities could use an estimate based on currency movements, similar to the approach to that described in IAS 29.17.

In these instances, preparers must consider the reliability of the movements in the currency as an inflation proxy. Where this is also not appropriate, the use of other sources of economic data or even the use of experts may be required.

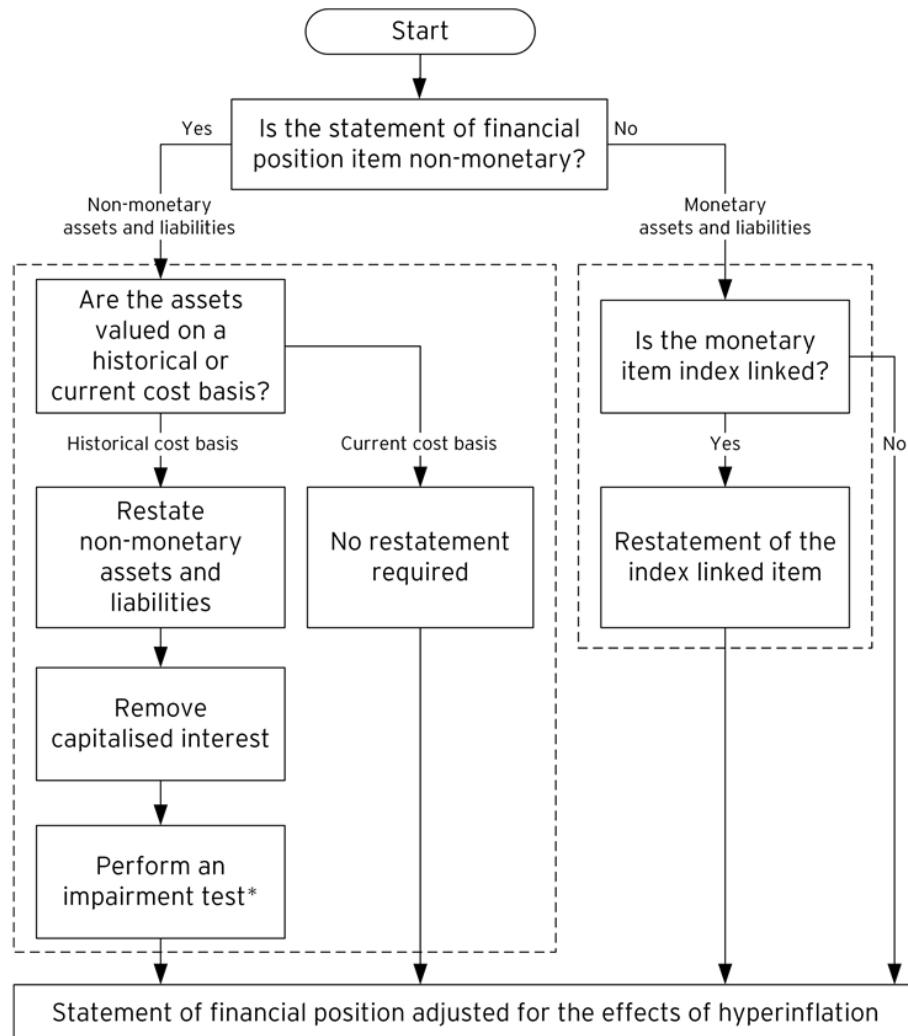

3.3 Delayed availability of a general price index

Inflation statistics are published shortly after the end of the reporting period, but in some jurisdictions the statistics are published several weeks or months later. When considering the requirements of IAS 10 *Events after the Reporting Period*, the release of this data is an event after the reporting date that provides evidence of conditions that existed at the end of the reporting period (see Chapter 34). This is therefore an adjusting event that is to be taken into consideration in preparing the financial statements.

If the publication of these statistics is significantly delayed, preparers may either need to wait for the statistics to become available or will need to make an estimate of the inflation index at the reporting date. The basis of such an estimate could be previous months' inflation statistics, movements in foreign exchange rates for the period in question, or the opinion of economic experts.

4 Analysis and restatement of the statement of financial position

A broad outline of the process to restate assets and liabilities in the statement of financial position in accordance with the requirements of IAS 29 is shown in the diagram below:

* IAS 29 requires the restated amount of a non-monetary item to be reduced in accordance with the appropriate IFRS when the restated amount exceeds its recoverable amount. [IAS 29.19].

The above flowchart does not illustrate the restatement of investees and subsidiaries (see section 4.3 below), deferred taxation (see section 4.4 below) and equity (see section 5 below).

4.1 Monetary and non-monetary items

4.1.1 Monetary or non-monetary distinction

Monetary items are not restated as they are already expressed in the measurement unit current at the end of the reporting period. Therefore, an entity needs to determine whether or not an item is monetary in nature. Most statement of financial position items are readily classified as either monetary or non-monetary as is shown in the table below:

Monetary items	Non-monetary items
Assets	Assets
Cash and cash equivalents Debt securities Loans Trade and other receivables	Property, plant and equipment Right-of-use assets Intangible assets Investments in equity securities Inventories Construction contract work-in-progress Prepaid costs Investment properties
Liabilities	Liabilities
Trade and other payables Borrowings Tax payable	Deferred income

However, there are instances where classification of items as either monetary or non-monetary is not always straightforward. IAS 29 defines monetary items as “money held and items to be received or paid in money”. [IAS 29.12]. IAS 21 expands on this definition by defining monetary items as: [IAS 21.8]

Extract from IAS 21

8 The following terms are used in this Standard with the meanings specified:

...

Monetary items are units of currency held and assets and liabilities to be received or paid in a fixed or determinable number of units of currency.

...

IAS 21 further states that the essential feature of a monetary item is a right to receive (or an obligation to deliver) a fixed or determinable number of units of currency. Examples given by IAS 21 are pensions and other employee benefits to be paid in cash, provisions that are to be settled in cash and cash dividends that are recognised as a liability. [IAS 21.16]. More obvious examples are cash and bank balances, trade receivables and payables, and loan receivables and payables.

IAS 21 also states that “a contract to receive (or deliver) a variable number of the entity’s own equity instruments or a variable amount of assets in which the fair value to be received (or delivered) equals a fixed or determinable number of units of currency is a monetary item.” [IAS 21.16]. Although no examples of such contracts are given in IAS 21, it should include those contracts settled in the entity’s own equity shares that would be presented as financial assets or liabilities under IAS 32 *Financial Instruments: Presentation*.

Conversely, the essential feature of a non-monetary item is the absence of a right to receive (or an obligation to deliver) a fixed or determinable number of units of currency. Examples given by IAS 21 are amounts prepaid for goods and services (e.g., prepaid rent); goodwill; intangible assets; inventories; property, plant and equipment; right-of-use assets; and provisions that are to be settled by the delivery of a non-monetary asset. [IAS 21.16]. IFRS 9 *Financial Instruments* states that all equity instruments are non-monetary. [IFRS 9.B5.7.3]. Therefore, equity investments in subsidiaries, associates or joint ventures would also be considered non-monetary items. IAS 29 provides separate rules on restatement of such investees (see section 4.3 below).

Even with this guidance there may be situations where the distinction is not clear. Certain assets and liabilities may require careful analysis before they can be classified. Examples of items that are not easily classified as either monetary or non-monetary include:

- (a) *Provisions*: these can be monetary, non-monetary or partly monetary. For example, a warranty provision would be:
 - (i) Entirely monetary when customers only have a right to return the product and obtain a cash refund equal to the amount they originally paid
 - (ii) Non-monetary when customers have the right to have any defective product replaced
 - And
 - (iii) Partly monetary if customers can choose between a refund and a replacement of the defective product

Classification as either a monetary or a non-monetary item is not acceptable in (iii) above. To meet the requirements of IAS 29, part of the provision should be treated as a non-monetary item and the remainder as a monetary item.
- (b) *Deferred tax assets and liabilities*: characterising these as monetary or non-monetary can be difficult as explained in section 4.4 below.
- (c) *Associates and joint ventures*: IAS 29 provides separate rules on restatement of investees that do not rely on the distinction between monetary and non-monetary items (see section 4.3 below).
- (d) *Deposits or progress payments paid or received*: if the payments made are regarded as prepayments or as progress payments then the amounts should be treated as non-monetary items. However, if the payments made are in effect refundable deposits, then the amounts should probably be treated as monetary items.
- (e) *Insurance contract assets and liabilities*: While IFRS 17 *Insurance Contracts* states that groups of insurance contracts, including the contractual service margin should be treated as a monetary item when applying IAS 21, [IFRS 17.30], it is not clear from the wording in the standard if insurance contracts should also be considered monetary for the purposes of the application of IAS 29.
- And
- (f) *Index-linked assets and liabilities*: classification is particularly difficult when interest rates, lease payments or prices are linked to a price index.

How we see it

The practical application of the monetary/non-monetary distinction, discussed above, can be complex and will require judgement on the part of preparers of financial statements. Further examples of problem areas in the application of the monetary/non-monetary distinction are discussed in Chapter 16.

4.1.2 Monetary items

Generally, monetary items are not restated to reflect the effect of inflation because they already reflect their purchasing power at the end of the reporting period. However, monetary assets and liabilities linked by agreement to changes in prices, such as index-linked bonds and loans, should be adjusted in accordance with the terms of the underlying agreement to show the repayment obligation at the end of the reporting period. [IAS 29.13]. This adjustment should be offset against the gain or loss on the net monetary position (see section 6.3 below). [IAS 29.28].

This type of restatement is not a hyperinflation accounting adjustment, but rather a gain or loss on a financial instrument. Accounting for inflation-linked bonds and loans under IFRS 9 may well lead to complexity in financial reporting. Depending on the specific wording of the inflation adjustment clause, such contracts may give rise to embedded derivatives and gains or losses will have to be recorded either in profit or loss or other comprehensive income depending on how the instrument is classified under IFRS 9 (see Chapter 42 and Chapter 44).

4.1.3 Non-monetary items carried at current cost

Non-monetary items carried at current cost are not restated because they are already expressed in terms of the measuring unit current at the end of the reporting period. [IAS 29.29]. Current cost is not defined by the standard, but the IASB's *Conceptual Framework* provides the following definition: "The current cost of an asset is the cost of an equivalent asset at the measurement date, comprising the consideration that would be paid at the measurement date plus the transaction costs that would be incurred at that date. The current cost of a liability is the consideration that would be received for an equivalent liability at the measurement date minus the transaction costs that would be incurred at that date". [CF 6.21]. IAS 29 expands this definition by including net realisable value and fair value into the concept of "amounts current at the end of the reporting period". [IAS 29.14]. In summary, this would include items carried at a value that reflects purchasing power at the balance sheet date.

It is important to note that non-monetary items that were revalued at some earlier date are not necessarily carried at current cost, and need to be restated from the date of their latest revaluation. [IAS 29.18]. This may include items such as assets impaired to a recoverable amount in an earlier reporting period, which should be adjusted for inflation from the date of such impairment. Likewise, in the case of a non-monetary prepayment for an asset, it may be that the date of the prepayment, rather than the date of initial recognition of the asset, is the date at which the value was current, and therefore the date from which the asset should be adjusted for inflation. Categorisation of prepayments as monetary or non-monetary is discussed in section 4.1.1 above.

In hyperinflationary economies, national legislation may require entities to adjust historical cost based financial information in a way that is not in accordance with IAS 29 (for example, national legislation may require entities to adjust the carrying amount of tangible fixed assets by applying a multiplier). Though financial information adjusted in accordance with national legislation is sometimes described as 'current cost' information, it will seldom meet the definition of current cost in accordance with the *Conceptual Framework*. [CF 6.21]. Where this is the case, entities must first determine the carrying value on the historical cost basis for these assets and liabilities before applying the requirements of IAS 29.

4.1.4 Non-monetary items carried at historical cost

Non-monetary items carried at historical cost, or cost less depreciation, are stated at amounts that were current at the date of their acquisition. The restated cost, or cost less depreciation, of those items is calculated as follows:

$$\begin{array}{ccccc} \text{net book} & & \text{net book} & & \text{general price index at the} \\ \text{value} & & \text{value based} & & \text{end of the reporting period} \\ \text{restated for} & = & \text{on historical} & \times & \hline \text{hyperinflation} & & \text{cost} & & \text{general price index at} \\ & & & & \text{the date of acquisition} \end{array}$$

This formula would be applied to property, plant and equipment, inventories of raw materials and merchandise, goodwill, patents, trademarks and similar assets. [IAS 29.15]. While this appears to be straightforward, it does require detailed records of the acquisition dates of these assets and accurate price indices at those dates. It should be noted though that IAS 29 permits certain approximations as long as the procedures and judgements are consistent from period to period. [IAS 29.10]. Where sufficiently detailed records are not available or capable of estimation, IAS 29 suggests that it may be necessary to obtain an 'independent professional assessment' of the value of the items as the basis for their restatement in the first period of application of the standard, but also notes that this will only be in rare circumstances. [IAS 29.16].

Illustration 4-1: Restatement of property, plant and equipment

The table below illustrates how the restatement of a non-monetary item (for example, property, plant and equipment or right-of-use assets) would be calculated in accordance with the requirements of IAS 29. When IAS 29 is first applied, the item is restated from the date of acquisition. In subsequent periods it is restated from the previous reporting period as shown below.

	Historical restatements	Conversion factor	Restated for hyperinflation	
Net book value of property, plant and equipment				
Opening balance, 1 January	510	2.40	1,224	(a)
- Additions (May)	360	1.80	648	(b)
- Disposals (March)	(105)	2.40	(252)	(c)
- Depreciation	(200)		(448)	(d)
Closing balance, 31 December	565		1,172	(e)

(a) The opening balance is restated by adjusting the balance reported per IAS 29 in the prior period for the increase in the price index between the beginning and the end of the reporting period.

(b) The additions are restated for the increase in the price index from May to December.

(c) The disposals are restated for the increase in the price index between the beginning and the end of the reporting period, assuming all disposals were acquired in a previous reporting period.

(d) Depreciation has been recalculated using the cost balance restated for hyperinflation on an asset-by-asset basis as a starting point.

(e) The closing balance is in practice determined by adding up items (a)-(d). Alternatively, the entity could calculate the closing balance by restating the acquisition cost and related accumulated depreciation of the individual assets for the change in the price index during the period of ownership.

The calculations described under (a)-(e) all require estimates regarding the general price index at given dates and are sometimes based on averages or best estimates of the actual date of the transaction.

When an entity purchases an asset and payment is deferred beyond normal credit terms, it would normally recognise the present value of the cash payment as its cost. [IAS 16.23]. When it is impracticable to determine the amount of interest, IAS 29 provides relief by allowing such assets to be restated from the payment date rather than the date of purchase. [IAS 29.22].

Once the calculation discussed above has been completed, additional adjustments may need to be made. To arrive at the final restated cost of the non-monetary items, the provisional restated cost needs to be adjusted for borrowing costs and impairment, if applicable, as follows: [IAS 29.19, IAS 29.21]

$$\begin{array}{rclcl} \text{restated} & = & \text{net book value} & & \text{borrowing costs that} \\ \text{costs} & & \text{restated for} & - & \text{compensate for inflation} \\ & & \text{hyperinflation} & & \text{capitalised under IAS 23} \\ & & & & - \text{adjustment to} \\ & & & & \text{recoverable} \\ & & & & \text{amount} \end{array}$$

IAS 29 only permits partial capitalisation of borrowing costs, unlike the full capitalisation that is ordinarily required by IAS 23 *Borrowing Costs* (see Chapter 22), because of the risk of double counting as the entity would both restate the capital expenditure financed by borrowing and capitalise that part of the borrowing costs that compensates for the inflation during the same period. [IAS 29.21]. The difficulty when borrowing costs are capitalised is that IAS 29 only permits capitalisation of borrowing costs to the extent that those costs do not compensate for inflation. The standard does not provide any guidance on how an entity should go about determining the component of borrowing costs that compensates for the effects of inflation. Therefore, entities will need to develop an appropriate methodology.

It is possible that an IAS 29 inflation adjustment based on the general price index leads to non-monetary assets being stated above their recoverable amount. Therefore, IAS 29 requires that the restated amount of a non-monetary item is reduced, in accordance with the appropriate accounting standard, when it exceeds its recoverable amount from the item's future use (including sale or other disposal). [IAS 29.19]. Any overstatement of non-monetary assets not within the scope of IFRS 9 is calculated and accounted for in accordance with IAS 36 *Impairment of Assets* or the measurement provisions of IAS 2 *Inventories* (see section 4.2 below). That is, the asset is written down to its recoverable amount or net realisable value and the loss is recognised in profit or loss.

The existence of hyperinflation in an economy is not explicitly mentioned as an indicator of impairment, but the resulting economic conditions increase the likelihood of other indicators of impairment being present, so additional care and attention will need to be paid to the impairment testing process.

The Illustration below illustrates how, after it has restated the historical cost based carrying amount of property, plant and equipment by applying the general price index, an entity adjusts the net book value restated for hyperinflation for these considerations:

Illustration 4-2: Borrowing costs and net realisable value adjustments

After the entity has restated the historical cost based carrying amount of property, plant and equipment by applying the general price index, it needs to adjust the net book value restated for hyperinflation to take account of borrowing costs capitalised since the acquisition of the asset as follows:

Net book value restated for hyperinflation (inclusive of borrowing costs)		1,725	
Borrowing costs capitalised at historical cost under IAS 23	42		
Borrowing costs that compensated for inflation	(30)		
Borrowing costs permitted to be capitalised under IAS 29	12		
Borrowing costs that compensated for inflation	(30)		
Restate borrowing cost assuming conversion factor of 2.1		(63)	(a)
Net book value restated for hyperinflation and after adjustment of capitalised borrowing costs		1,662	
Net book value restated for hyperinflation and after adjustment of capitalised borrowing costs	1,662		
Amount recoverable from the item's future use	1,550		
	112		
Adjustment to lower recoverable amount		(112)	(b)
Carrying amount restated under IAS 29		1,550	

(a) The portion of the borrowing costs capitalised in the original historical cost financial statements that compensate for inflation are reversed, as they are not permitted to be capitalised under IAS 29.

(b) To the extent that the 'net book value restated for hyperinflation and after adjustment of capitalised borrowing costs' exceeds the 'amount recoverable from the item's future use', the restated amount should be reduced to the lower 'amount recoverable from the item's future use'.

Where an entity's functional currency becomes hyperinflationary and it applies IAS 29 for the first time, IFRIC 7 requires the application of IAS 29 as if the economy had always been hyperinflationary. [IFRIC 7.3]. Therefore, in the year of initial application of the standard, such an entity should consider whether an impairment trigger is present at the beginning of the current period and, if any impairment is identified, determine whether it relates to the current period or whether it should have been recognised earlier. In making such a determination in practice there are likely to be a number of complexities including the degree of hindsight that might be involved.

4.2 Inventories

Inventories of finished and partly finished goods are restated from the dates on which the costs of purchase and of conversion were incurred. [IAS 29.15]. This means that the individual components of finished goods are restated from their respective purchase dates. Similarly, if production takes place in several distinct phases, the costs associated with each of those phases are restated from the date that the cost was incurred.

Given the large number of transactions affecting an entity's inventory position, it may be difficult to determine the date of acquisition of individual items of inventory. Therefore, entities commonly approximate the ageing of inventories based on inventory turnover. Similarly, the level of the general price index at the date of acquisition is often determined at the average level for the month because an up-to-date price index is not available for each day of the month. Determining the appropriate level of the general price index can be difficult when the price index is updated relatively infrequently and the entity's business is highly seasonal.

IAS 29 requires restatement of inventory by applying a general price index, which could result in an overvaluation when the price of inventory items increases at a different rate from the general price index. Although the restatement principle is the same, the application of different costing methods under IAS 2 could result in differences in the IAS 29 restatement. At the end of each period, it is therefore essential to ensure that items of inventory are not valued in excess of their net realisable value. Any overstated inventories shall be written down to net realisable value under IAS 2. [IAS 29.19].

4.3 Restatement of associates, joint ventures and subsidiaries

IAS 29 provides separate rules for the restatement of associates and joint ventures that are accounted for under the equity method. If the investee itself operates in a hyperinflationary currency, the entity restates the statement of financial position, statement of profit or loss and other comprehensive income of the investee in accordance with the requirements of IAS 29 in order to calculate its share of the investee's net assets and results of operations. [IAS 29.20]. The standard does not permit the investment in the investee to be treated as a single indivisible item for the purposes of the IAS 29 restatement. In addition, IAS 29 requires that when financial statements with different reporting dates are consolidated, all items, whether non-monetary or monetary are restated into the measuring unit current at the date of the consolidated financial statements. [IAS 29.36].

Restating the financial statements of an associate before application of the equity method will often be difficult because the investor may not have access to the detailed information required. The fact that the investor can exercise significant influence or has joint control over an investee often does not mean that the investor has unrestricted access to the investee's books and records at all times.

The various combinations of investors and investees are discussed below.

4.3.1 Non-hyperinflationary investor and hyperinflationary investee

When the investor does not operate in the hyperinflationary currency, but the investee does, the same processes described above are still required to be completed prior to the equity accounting process.

Once restated, the results of a foreign currency investee are translated into the investor's presentation currency at the closing rate. [IAS 29.20]. IAS 21 contains a similar provision that requires that all current year amounts related to an entity (i.e., investee), whose functional currency is the currency of a hyperinflationary economy, to be translated at the closing rate at the date of the most recent statement of financial position (see Chapter 16). [IAS 21.42]. However, unlike a hyperinflationary entity, a non-hyperinflationary investor does not restate its comparative information for the effect of inflation or exchange rate changes in the current period.

4.3.2 Hyperinflationary investor and investee

If a parent that reports in the currency of a hyperinflationary economy has a subsidiary that also reports in the currency of a hyperinflationary economy, then the financial statements of that subsidiary must first be restated by applying a general price index of the country in whose currency it reports before they are included in the consolidated financial statements issued by its parent. [IAS 29.35]. When an investor has a subsidiary whose functional currency is the currency of a hyperinflationary economy, IAS 21 further clarifies that all current year amounts related to the subsidiary are translated at the closing rate at the date of the most recent statement of financial position (see Chapter 16). [IAS 21.42]. The restatement of related comparative amounts is discussed in section 11.3 below.

4.3.3 Hyperinflationary investor and non-hyperinflationary investee

If a parent that reports in the currency of a hyperinflationary economy has a subsidiary that reports in a currency that is not hyperinflationary, the financial statements of that subsidiary are translated in accordance with IAS 21.39 (see Chapter 16). [IAS 21.39]. This is discussed in further detail in section 12 below.

4.4 Calculation of deferred taxation

Determining whether deferred tax assets and liabilities are monetary or non-monetary is difficult because:

- Deferred taxation could be seen as a valuation adjustment that is either monetary or non-monetary depending on the asset or liability it relates to.

Or

- It could also be argued that any deferred taxation payable or receivable in the very near future is almost identical to current tax payable and receivable. Therefore, at least the short-term portion of deferred taxation, if payable or receivable, is treated as if it were monetary.

IFRIC 7 provides guidance to facilitate the first-time application of IAS 29. Although the interpretation notes that there continues to be a difference of opinion as to whether deferred taxation is monetary or non-monetary, [IFRIC 7.BC21, IFRIC 7.BC22], the debate has been settled for practical purposes because:

- IAS 12 *Income Taxes* requires deferred taxation in the closing statement of financial position for the year to be calculated based on the difference between the carrying amount and the tax base of assets and liabilities, without making a distinction between monetary and non-monetary items.

And

- IFRIC 7 requires an entity to remeasure the deferred tax items in any comparative period in accordance with IAS 12 after it has restated the nominal carrying amounts of its non-monetary items at the date of the opening statement of financial position of the reporting period by applying the measuring unit at that date. These remeasured deferred tax items are then restated for the change in the measuring unit between the beginning and the end of reporting period. [IFRIC 7.4].

The following Illustration, which is based on the illustrative example in IFRIC 7, shows how an entity restates its deferred taxation in the comparative period. [IFRIC 7.IE1-IE6].

Illustration 4-3: Restatement of deferred taxation

Entity A owns a building that it acquired in December 20X0. The carrying amount and tax base of the building, and the deferred tax liability are as follows:

Before IAS 29 restatement	20X2	20X1
Building (not restated)	300	400
Tax base	200	333
Tax rate	30%	30%
Deferred tax liability:		
$(300 - 200) \times 30\% =$	30	
$(400 - 333) \times 30\% =$		20

Entity A has identified the existence of hyperinflation in 20X2 and therefore applies IAS 29 retrospectively and is required to calculate the deferred tax balance at the beginning of 20X2. Entity A will use the following general price index and conversion factors to restate its financial statements:

General price index	
December 20X0	95
December 20X1	135
December 20X2	223

reporting period only to the restated financial statements for the previous reporting period. [IFRIC 7.5].

The table below shows the method required by IFRIC 7:

	20X2	20X1
Building (not restated)	300	400
Building (restated in 20X2 financial statements):		
$300 \times (223 \div 95) =$	704	
$400 \times (223 \div 95) =$		939
Building (restated in 20X1 financial statements):		
$400 \times (135 \div 95) =$		568 (a)
Tax base	200	333 (b)
Deferred tax liability (restated in 20X2 financial statements):		
$(704 - 200) \times 30\% =$	151	
$(568 - 333) \times 30\% = 71; 71 \times (223 \div 135) =$		117

Entity A measures the temporary difference at the end of 20X1 by comparing (a) the restated carrying amount of the building in 20X1 accounts to (b) its tax base at that date. The temporary difference calculated in that manner is then multiplied by the applicable tax rate and the resulting amount is then adjusted for the hyperinflation during 20X2, resulting in a deferred tax liability of 117.

After Entity A has restated its financial statements for a given year, all corresponding figures in the financial statements for a subsequent reporting period, including deferred tax items, are restated by applying the change in the measuring unit for that subsequent reporting period only to the restated financial statements for the previous reporting period. [IFRIC 7.5].

IAS 29 refers to IAS 12 for guidance on the calculation of deferred taxation by entities operating in hyperinflationary economies. [IAS 29.32]. IAS 12 recognises that IAS 29 restatements of assets and liabilities may give rise to temporary differences when equivalent adjustments are not allowed for tax purposes. [IAS 12.IE.A18]. Where IAS 29 adjustments give rise to temporary differences, IAS 12 requires the following accounting treatment:

- The deferred tax income or expense is recognised in profit or loss.
- And
- If, in addition to the restatement, non-monetary assets are also revalued, the deferred tax movement relating to the revaluation is recognised in other comprehensive income and the deferred tax relating to the restatement is recognised in profit or loss. [IAS 12.IE.A18].

For example, deferred taxation arising on the revaluation of property, plant and equipment is recognised in other comprehensive income, just as it would be if the entity were not operating in a hyperinflationary economy. On the other hand, a restatement in accordance with IAS 29 of property, plant and equipment that is measured at historical cost is recognised in profit or loss. Thus, the treatment of deferred taxation related to non-monetary assets valued at historical cost and those that are revalued, is consistent with the general requirements of IAS 12.

Tax authorities in countries that are hyperinflationary may give taxpayers some relief from taxation on inflated nominal profits by increasing tax bases of assets. The implications of such increases in the tax bases, which in turn affect temporary differences, are discussed in Chapter 29.

5 Restatement of the statement of changes in equity

When an entity first applies IAS 29, it restates the components of owners' equity at the beginning of the earliest period presented as follows:

- The components of owners' equity, except retained earnings and any revaluation surplus, are restated by applying a general price index from the dates the components were contributed or otherwise arose.
 - Any revaluation surplus that arose in previous periods is eliminated.
- And
- Restated retained earnings are derived from all the other amounts in the restated statement of financial position. [IAS 29.24].

At the end of the first period and in subsequent periods, all components of owners' equity are restated by applying a general price index from the beginning of the period or the date of contribution, if later. [IAS 29.25]. Subsequent revaluations may give rise to a revaluation surplus within equity.

IFRS does not define a revaluation surplus and it is not always clear which reserves might meet this definition. Depending on how broadly the concept of 'revaluation' is applied, this may include reserves relating to, for example, financial instruments at fair value through other comprehensive income, or actuarial gains and losses, if these are presented separately. The approach taken on initial application as well as in subsequent years affects, in particular, those reserves reclassified to profit or loss, and is discussed in section 6.4 below.

Likewise, IFRS does not define retained earnings and many jurisdictions require entities to appropriate part of the balance into specific (often non-distributable) reserves. In such cases, entities will need to apply judgement to determine whether these reserves are essentially part of retained earnings (and so are not restated by applying the general price index as described in IAS 29.24). If they are considered a separate component of equity, then they are restated by applying the general price index as explained above, both at the beginning of the first period when an entity applies IAS 29 and at the end of the first period and subsequent periods.

Where entities have made such judgements concerning the types of reserves held and these judgements have a significant effect on the amounts recognised in the financial statements, IAS 1 requires disclosure to users of the financial statements. [IAS 1.122].

Though IAS 29 provides guidance on the restatement of assets, liabilities and individual components of shareholders' equity, national laws and regulations with which the entity needs to comply might not permit such revaluations. This can mean that IAS 29 may require restatement of distributable reserves, but that from the legal point of view in the jurisdiction concerned, those same reserves remain unchanged. That is, it is possible that 'restated retained earnings' under IAS 29 will not all be legally distributable.

It may therefore be unclear to users of financial statements restated under IAS 29 to what extent components of equity are distributable. Because of its global constituents, the IASB's standards cannot deal with specific national legal requirements relating to a legal entity's equity.

How we see it

In jurisdictions with laws or regulations governing the categories of equity and particularly, which categories of equity may be distributed, entities reporting under IAS 29 should disclose the extent to which components of equity are distributable where this is not obvious from the financial statements. In our view, it is important for entities to give supplementary information in the circumstances where the IAS 29 adjustments have produced large apparently distributable reserves that are in fact not distributable.

Illustration 5-1: Restatement of equity

The table below shows the effect of a hypothetical IAS 29 restatement on individual components of equity on initial application of IAS 29. Issued share capital and share premium increase by applying the general price index, the revaluation reserve is eliminated as required, and retained earnings is the balancing figure derived from all other amounts in the restated statement of financial position.

	Amounts before restatement	Amounts after IAS 29 restatement	Components of equity under national law
Issued capital and share premium	1,500	3,150	1,500
Revaluation reserve	800	-	800
Retained earnings	350	1,600	350
Total equity	2,650	4,750	2,650

A user of the financial statements of the entity might get the impression, based on the information restated in accordance with IAS 29, that distributable reserves have increased from 350 to 1,600. However, if national law does not permit revaluation of assets, liabilities and components of equity, then distributable reserves remain unchanged.

6 Restatement of the statement of profit or loss and other comprehensive income

IAS 29 requires that all items in historical cost-based statements of profit and loss and other comprehensive income be expressed in terms of the measuring unit current at the end of the reporting period. [IAS 29.26]. The standard contains a similar requirement for current cost-based statements of profit and loss and other comprehensive income, because the underlying transactions or events are recorded at current cost at the time they occurred rather than in the measuring unit current at the end of the reporting period. [IAS 29.30]. Therefore, all amounts in the statement of profit or loss and other comprehensive income need to be restated as follows:

$$\text{restated amount} = \text{amount before restatement} \times \frac{\text{general price index at the end of the reporting period}}{\text{general price index when the underlying income or expenses were initially recorded}}$$

Actually performing the above calculation on a real set of financial statements is often difficult because an entity would need to keep a very detailed record of when it entered into transactions and when it incurred expenses. Instead of using the exact price index for a transaction it may be more practical to use an average price index that approximates the actual rate at the date of the transaction. For example, an average rate for a week or a month might be used for all transactions occurring during that period. However, it must be stressed that if price indices fluctuate significantly, the use of an average for the period may be inappropriate.

There may be items in statements of profit and loss and other comprehensive income, e.g., interest income and expense that comprise an element that is intended to compensate for the effect of hyperinflation. However, even those items need to be restated as IAS 29 specifically requires that 'all amounts need to be restated' (see section 6.1 below). [IAS 29.26, IAS 29.30].

Illustration 6-1 below shows how an entity might, for example, restate its revenue to the measuring unit current at the end of the reporting period. A similar calculation would work well for other items in statements of profit and loss and other comprehensive income, with some exceptions, as discussed in sections 6.2 and 6.4 below:

Illustration 6-1: Restatement of historical cost statement of profit or loss and other comprehensive income

An entity would restate its revenue for the period ending 31 December 20X2, when the general price index was 2,880, as shown in the table below.

	General price index	Conversion factor	Revenue before restatement	Restated revenue
31 January 20X2	1,315	(2,880 ÷ 1,315) = 2.19	40	87.6
28 February 20X2	1,345	(2,880 ÷ 1,345) = 2.14	35	74.9
31 March 20X2	1,371	etc. = 2.10	45	94.5
30 April 20X2	1,490	1.93	45	86.9
31 May 20X2	1,600	1.80	65	117.0
30 June 20X2	1,846	1.56	70	109.2
31 July 20X2	1,923	1.50	70	105.0
31 August 20X2	2,071	1.39	65	90.4
30 September 20X2	2,163	1.33	75	99.8
31 October 20X2	2,511	1.15	75	86.3
30 November 20X2	2,599	1.11	80	88.8
31 December 20X2	2,880	1.00	80	80.0
			745	1,120.4

How we see it

Inevitably, in practice there is some approximation in this process because of the assumptions that the entity is required to make, for example the use of weighted averages rather than more detailed calculations and assumptions as to the timing of the underlying transactions (e.g., the calculation above assumes the revenues for the month are earned on the final day of the month, which is not realistic). A number of factors may need to be considered in determining the appropriate level of detail to be applied:

- The level of data available: most jurisdictions only make inflation statistics available on a monthly basis. In addition, when the hyperinflation process requires data from long ago e.g., for a property that was purchased decades ago), even monthly information may not be available.
- The materiality of the item being adjusted for inflation: a more detailed calculation should be performed for more material items. For example, revenue should be adjusted for inflation using a more detailed calculation than a low value expense account.
- Frequency of transactions: more specific inflation data would be more appropriate for one-off transactions, especially where these are material. For example, more attention should be paid to the inflation data on the date of a material business combination than to data related to purchases made relatively consistently throughout the year.

Other factors to be considered would include the regularity of transactions and the level of variation in the inflation rate.

6.1 Restatement of interest and exchange differences

A common question is whether an entity should restate exchange differences under IAS 29, because the standard considers that “foreign exchange differences related to invested or borrowed funds, are also associated with the net monetary position”. [IAS 29.28]. Nevertheless, the standard requires that all items in the statement of profit or loss and other comprehensive income are expressed in terms of the measuring unit current at the end of the reporting period. “Therefore, all amounts need to be restated by applying the change in the general price index from the dates when the items of income and expenses were initially recorded in the financial statements”. [IAS 29.26].

Interest and exchange differences are therefore restated for the effect of inflation, consistent with most other items in the statement of profit or loss and other comprehensive income, and are separately disclosed. However, it may be helpful if they are presented together with the gain or loss on net monetary position in the statement of profit or loss and other comprehensive income. [IAS 29.28].

6.2 Income and expenses where the general approach is not applied

Certain items of income and expenses cannot be adjusted for inflation by applying the general approach discussed in section 6 above. This typically is the case where the line item is derived from the value of an asset or liability and therefore the application of IAS 29 to the asset or liability drives the measurement of the income or expense, for example:

- *Cost of sales* is a calculation based on opening and closing inventory balances as well as purchases during the period. To reflect the IAS 29 value of inventory sold, each component in this calculation is restated and the calculation reperformed.
 - *Depreciation and amortisation* are recalculated using the cost for the related asset restated for hyperinflation on an asset-by-asset basis. The alternative approach, to restate the depreciation charge by applying a conversion factor to the charge for the year, might seem easier to apply but this factor would not reflect all inflation since this cost was last current (i.e., the acquisition date of the asset). Similarly, the gain or loss on disposal on such assets must be calculated based on the proceeds restated from the disposal date less the carrying value restated as shown in Illustration 4-1 above.
 - *Gains and losses on non-monetary items* measured at fair value are typically calculated as the difference between the restated opening balance, or if acquired during the year, the restated acquisition date value, and the fair value on the reporting date.
 - *Deferred taxation* amounts in profit or loss are calculated based on the movements in the deferred tax balance, determined as per Illustration 4-3 above.
- And
- The *net monetary gain or loss* that results from the IAS 29 restatements (see section 6.3 below).

6.3 Calculation of the gain or loss on the net monetary position

In theory, hyperinflation only affects the value of money and monetary items and does not affect the value, as distinct from the price, of non-monetary items. Therefore, any gain or loss because of hyperinflation will be the gain or loss on the net monetary position of the entity. By arranging the items in an ordinary statement of financial position, it can be shown that the monetary position minus the non-monetary position is always equal to zero:

	Total	Monetary items	Non-monetary items
Monetary assets	280	280	
Non-monetary assets	170		170
Monetary liabilities	(200)	(200)	
Non-monetary liabilities	(110)		(110)
Assets minus liabilities	140		
Shareholders' equity	(140)		(140)
Net position	0	80	(80)

Theoretically, the gain or loss on the net monetary position can be calculated by applying the general price index to the entity's monetary assets and liabilities. This would require the entity to determine its net monetary position on a daily basis, which would be entirely impracticable given the resources required to prepare daily IFRS compliant accounts as well as the difficulties in making the monetary/non-monetary distinction (see section 4.1 above). The standard therefore allows the gain or loss on the net monetary position to be estimated by applying the change in a general price index to the weighted average for the period of the difference between monetary assets and monetary liabilities. [IAS 29.27, IAS 29.31]. Due care should be exercised in estimating the gain or loss on the net monetary position, as a calculation based on averages for the period (or monthly averages) can be unreliable if addressed without accurate consideration of the pattern of hyperinflation and the volatility of the net monetary position.

However, as shown in the above table, any restatement of the non-monetary items must be met by an equal restatement of the monetary items. Therefore, in preparing financial statements it is more practical to assume that the gain or loss on the net monetary position is exactly the reverse of the restatement of the non-monetary items, equity items and items in the statement of comprehensive income. A stand-alone calculation of the net gain or loss can be used to verify the reasonableness of the restatement of the non-monetary items.

The gain or loss on the net monetary position as calculated above, as well as any adjustments on inflation-linked instruments (see section 4.1.2 above), is included in profit or loss and disclosed separately. It may be helpful to present it together with items that are also associated with the net monetary position such as interest income and expense, and foreign exchange differences related to invested or borrowed funds. [IAS 29.28]. Entities that apply IFRS 18 *Presentation and Disclosure in Financial Statements*, which is mandatory for annual reporting periods beginning on or after 1 January 2027, should consider the presentation requirements for profit and loss as any result on net monetary position should be classified in financing or operating category. [IFRS 18.B69].

6.4 Measurement of reclassification adjustments within equity

IAS 29 does not provide guidance on the measurement basis of reclassifications from other comprehensive income. For example, it is not clear when a debt instrument at fair value through other comprehensive income is sold, whether the amount reclassified into profit and loss is based on the amounts historically recorded in other comprehensive income, or alternatively based on an inflation adjusted amount. Another example is the case of cash flow hedges where gains or losses in an earlier reporting period are recycled to profit and loss to offset against the gains or losses of the hedged item at a later date.

The conflict arises due to the need to classify items in other comprehensive income as amounts to be recycled, or not. This requirement would indicate that amounts initially recorded in other comprehensive income should be recycled at the amounts originally recorded. While this may satisfy the requirements for other comprehensive income, this leads to a loss of relevant information in the statement of profit or loss and other comprehensive income. Using the examples cited above, the gain or loss on disposal of a debt instrument at fair value through other comprehensive income would no longer be presented in terms of the index being used for purposes of restating amounts in profit or loss. In the case of a cash flow hedge, the offset that would also be expected in profit or loss is also lost. The alternative view would be to recycle amounts that have been restated in terms of the current index that is being applied. This is demonstrated in the Illustration below.

Illustration 6-2: Measurement of reclassification adjustments

An entity issued a three-year CU100,000 fixed (15%) rate bond on 31 December 20X0. Before the bond was issued, the entity entered into a fully effective cash flow hedge of changes in three-year interest rates that resulted in a gain of CU6,000 being recognised in other comprehensive income. The entity would reclassify this gain from equity to profit or loss as a reclassification adjustment in the same period or periods during which the bond affects profit or loss, i.e., over three years assuming it is repaid at maturity. Therefore, in a non-hyperinflationary environment, for each of these three years, CU2,000 would be reclassified from other comprehensive income to profit or loss as an adjustment to interest expense (assuming a straight-line approach was considered appropriate).

IAS 29 is not explicit on whether the reclassification from other comprehensive income should be adjusted for the effects of hyperinflation. The following example illustrates the difference between adjusting and not adjusting the reclassification of the cash flow hedge gains for the effect of hyperinflation. For the purpose of this example, assume the general price index was 100 at 31 December 20X1 and 150 at 31 December 20X2.

	20X2 Hyperinflationary	20X2 Hyperinflationary	20X2 Non- hyperinflationary
	Adjusted	Non-Adjusted	
	CU	CU	CU
Net profit:			
Interest expense
Reclassification of cash flow hedge gains	(a) 3,000	2,000	2,000
Other comprehensive income:			
Reclassification of cash flow hedge gains	(3,000)	(2,000)	(2,000)
(a) $6,000 \times (150/100) \div 3$			

The basic accounting requirements before the application of IAS 29 for this example is currently contained in IFRS 9 (or IAS 39 *Financial Instruments: Recognition and Measurement* if the hedge accounting requirements of IFRS 9 have not yet been adopted).

While the approach of adjusting for hyperinflation would ensure relevant information in the statement of profit or loss and other comprehensive income, it would lead to different amounts being originally recorded and subsequently recycled in other comprehensive income.

How we see it

As no direct guidance is given in IAS 29, the development of an accounting policy for measuring reclassifications from other comprehensive income in terms of the IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* hierarchy would be required. In developing such an accounting policy an entity would need to apply judgement and consider the objective of the standard that gives rise to the amounts that are recycled to profit or loss.

Understanding the objective of hedge accounting and what risks have been hedged in the designated relationship would be relevant inputs in developing an appropriate accounting policy.

Once developed, the general recommendation of IFRS accounting standards to apply procedures and judgements consistently should be followed for a particular class of equity reclassification. As there are numerous different types of reclassifications within equity, an entity may need to determine a relevant policy for each class of adjustment that could occur. [IAS 8.10].

7 Restatement of the statement of cash flows

The standard requires that all items in the statement of cash flows be expressed in terms of the measuring unit current at the end of the reporting period. [IAS 29.33]. This is a difficult requirement to fulfil in practice.

IAS 7 *Statement of Cash Flows* requires the following information to be presented:

- Cash flows from operating activities, which are the principal revenue-producing activities of the entity and other activities that are not investing or financing activities.
- Cash flows from investing activities, which are the acquisition and disposal of long-term assets and other investments not included in cash equivalents.

And

- Cash flows from financing activities, which are activities that result in changes in the size and composition of the equity capital and borrowings of the entity. [IAS 7.6, IAS 7.10].

In effect IAS 29 requires restatement of most items in a statement of cash flows, therefore implying that the actual cash flows at the time of the transactions will be different from the numbers presented in the statement of cash flows itself. However, not all items are restated using the same method and many of the restatements are based on estimates. For example, items in the statement of profit or loss and other comprehensive income are restated using an estimate of the general price index at the time that the revenues were earned and the costs incurred. Unavoidably, this will give rise to some inconsistencies. Similarly, the restatement of statement of financial position items will give rise to discrepancies because some items are not easily classified as either monetary or non-monetary. This raises the question of how an entity should classify the monetary gain or loss relating to a statement of financial position item in its statement of cash flows.

It is not clear from IAS 29 how a monetary gain or loss should be presented in the statement of cash flows. In practice, the most commonly applied approach restates cash flows by attributing the effect of inflation on operating, investing and financing cash flows to the underlying item and presenting the monetary gain or loss on cash and cash equivalents separately. However, given the lack of guidance in the IFRS accounting standards, and given the complexity of determining the monetary gains or losses specific to cash and cash equivalents, other approaches might be acceptable.

How we see it

Irrespective of the method chosen to present a statement of cash flows under IAS 29, users of such statement prepared in the currency of a hyperinflationary economy should be mindful of the fact that figures presented in the statement may have been restated in accordance with IAS 29 and may differ from the actual underlying cash flows on the date of the transaction.

In our view, it is important for entities that have a significant proportion of their activities in hyperinflationary economies to consider whether it provides sufficient additional disclosures to ensure that the financial statements can be understood correctly. Whether this is limited to a general explanation of the mismatch between reported and actual amounts, or specific information on major transactions is provided, would depend on the nature and materiality of transactions affected.

8 Restatement of comparative figures

The standard requires that all financial information be presented in terms of the measurement unit current at the end of the current reporting period, therefore:

- Corresponding figures for the previous reporting period, whether they were based on a historical cost approach or a current cost approach, are restated by applying a general price index.

And

- Information that is disclosed in respect of earlier periods is also expressed in terms of the measuring unit current at the end of the reporting period. [IAS 29.34].

Where IAS 29 was applied in the previous reporting period, this will be a straightforward mathematical computation to apply the measuring unit current at the end of the reporting period to the prior year comparative figures. An example of this can be seen in the restatement of the opening balance of property, plant and equipment in Illustration 4-1 above. When IAS 29 is applied for the first time, this is a more complex process, as discussed in section 10.1 below.

9 Interim reporting

The illustrative examples to IAS 34 *Interim Financial Reporting* state that interim financial reports in hyperinflationary economies are prepared using the same principles as at financial year end. [IAS 34.IE B32]. This means that the financial statements must be stated in terms of the measuring unit current at the end of the interim period and that the gain or loss on the net monetary position is included in net income (profit or loss). The comparative financial information reported for prior periods must also be restated to the current measuring unit. [IAS 34.IE B33]. Hence, an entity that reports quarterly information must restate the comparative statements of financial position, statement of profit or loss and other comprehensive income, and other primary financial statements each quarter.

In restating its financial information an entity may not 'annualise' the recognition of the gain or loss on the net monetary position or use an estimated annual inflation rate in preparing an interim financial report in a hyperinflationary economy. [IAS 34.IE B34].

Interim reporting of a group containing a subsidiary that reports in a hyperinflationary currency results in particular issues in the year that the subsidiary's functional currency becomes hyperinflationary. These are discussed further in section 11.3 below.

10 Transition

10.1 Economies becoming hyperinflationary

When the functional currency of an entity becomes hyperinflationary it must start applying IAS 29. The standard requires that the financial statements and any information in respect of earlier periods are stated in terms of the measuring unit current at the end of the reporting period. [IAS 29.8]. IFRIC 7 clarifies that items are restated fully retrospectively. In the first year in which the entity identifies the existence of hyperinflation, the requirements of IAS 29 are applied as if the economy had always been hyperinflationary. The opening statement of financial position at the beginning of the earliest period presented in the financial statements are restated as follows:

- Non-monetary items measured at historical cost are restated to reflect the effect of inflation from the date the assets were acquired and the liabilities were incurred or assumed.
- And
- Non-monetary items carried at amounts current at dates other than those of acquisition or incurrence are to be restated to reflect the effect of inflation from the dates those carrying amounts were determined. [IFRIC 7.3].

In practice, the process of applying IAS 29 fully retrospectively requires a number of steps to determine the appropriate comparative values, and specifically the opening equity reserves, to ensure the correct balances at the reporting date.

Supposing an entity, with a 31 December reporting date, became hyperinflationary in its 20X2 reporting period, the statement of financial position at 1 January 20X1 (i.e., the beginning of the earliest comparative period), restated to the monetary unit present at that date, would need to be calculated, as well as the components of equity restated to derive the restated retained earnings position at that date (as discussed in section 5 above). This process would require an entity to consider whether the restated values of items subject to comparison against a recoverable amount, as discussed in section 4.1.4 above, would require impairment. In completing this assessment, care should be taken to ensure that such a test is performed by comparing carrying and recoverable amounts stated using financial information measured at consistent dates. For example, the restated carrying amount as calculated at 1 January 20X1 (i.e., the beginning of the earliest comparative period) is compared to the recoverable amount determined at that date. The resulting carrying value would then be restated to the monetary unit present at 31 December 20X2.

To calculate the gain or loss on net monetary position for the 20X1 comparative statement of profit or loss and other comprehensive income:

- All items in the opening statement of financial position, including items carried at amounts current at that date, are adjusted for the inflation during the year to the monetary unit present at 31 December 20X1.
- The 20X1 financial statements are restated to the monetary unit at 31 December 20X1.
- And
- The gain or loss on the net monetary position is calculated as discussed in section 6.3 above.

The financial information determined in this way would then be adjusted for hyperinflation during 20X2 to the monetary unit present at 31 December 20X2, including items carried at amounts current at the previous reporting dates, to correctly establish the comparatives to be reported.

Other areas that are more complex in the period of initial application arise in group reporting environments where a non-hyperinflationary parent controls a hyperinflationary subsidiary. This raises questions on the accounting for the initial restatement process (discussed in Section 11 below) as well as the impact on interim reporting considerations in the period the subsidiary becomes hyperinflationary (discussed in Section 11.3 below).

10.1.1 Presentation of statement of financial position at the beginning of the comparative period

As discussed above, upon transition to IAS 29, the statement of financial position at the beginning of the earliest comparative period is required to be calculated as the base of all subsequent reporting. IAS 1 requires an entity to present a statement of financial position as at the beginning of the preceding period when it “applies an accounting policy retrospectively” or “makes retrospective restatements of items” and this has a material effect on the information in the statement of financial position at the beginning of the preceding period. [IAS 1.10(f)].

This raises the question as to whether the initial application of IAS 29 should be seen as the adoption of a new accounting policy. The application of IFRS requires all standards to be adopted, whether applicable or not. Therefore, the initial application of IAS 29 is not a change in accounting policy but rather the first time that the standard is required to be used. IFRIC 7 describes the initial application of IAS 29 as both a change in status as well as “similar to the retrospective application of a change in accounting policy”. [IFRIC 7.BC17]. This could be interpreted to excuse preparers from the requirement to present the statement of financial position at the beginning of the earliest comparative period, on the grounds that is it not a policy change, or alternatively, to imply that the similarity is such that the disclosure is required.

How we see it

Preparers of financial statements should consider the extent to which the presentation of a statement of financial position as at the beginning of the preceding period provides information that is useful to the users thereof. Where this additional statement would add meaningful context to the financial statements that is not provided in the notes thereto, its inclusion would be beneficial. In practice, we see limited instances of this additional statement being presented.

Where such an opening statement would be required for another reason, such as the retrospective application of a change in policy, the initial application of IAS 29 would not absolve preparers of this requirement.

10.2 Economies ceasing to be hyperinflationary

Determining when a currency stops being hyperinflationary is not easy in practice. It is important to review trends, not just at the end of the reporting period but also subsequently. In addition, consistency demands that the financial statements do not unnecessarily fall in and out of a hyperinflationary presentation, where a more careful judgement would have avoided it.

When an economy ceases to be hyperinflationary, entities discontinue preparation and presentation of financial statements in accordance with IAS 29. The amounts expressed in the measuring unit current at the end of the previous reporting period will be treated as the basis of the carrying amounts of items in its subsequent statement of financial position. [IAS 29.38].

The previous reporting period used as the basis for the carrying amounts going forward may be the last annual reporting period or it may be an interim period depending on whether the entity prepares interim reports. Therefore, for interim reporters, it should be noted that, an amalgamation of interim periods during which IAS 29 was applied with those where it was not, may result in financial statements that are difficult to interpret. This is shown in Illustration 10-1 below.

Illustration 10-1: Economies ceasing to be hyperinflationary in an interim period

An entity has a financial year end of 31 December and prepares interim financial statements on a quarterly basis. The last annual financial statements were prepared for the period ending 31 December 20X1 when the economy was hyperinflationary. In August 20X2 the economy ceased to be hyperinflationary. The table below shows the impact on the financial statements.

Period	Impact on financial statements
Annual 31 December 20X1	Hyperinflationary accounting.
Interim 31 March 20X2	Hyperinflationary accounting.
Interim 30 June 20X2	Hyperinflationary accounting.
Interim 30 September 20X2	No longer in the scope of IAS 29. Balances at 30 June 20X2 used as the basis for carrying amounts going forward. Comparatives will include adjustments for hyperinflation up to 30 June 20X2.
Annual 31 December 20X2	No longer in the scope of IAS 29. Balances at 31 December 20X2 will use 30 June 20X2 as the basis for carrying amounts going forward. Comparatives will include adjustments for hyperinflation up to 30 June 20X2.

10.3 Economies exiting severe hyperinflation

IFRS 1 includes an exemption for entities that have been subject to severe hyperinflation before the date of transition to IFRS, or on reapplication into IFRS after being unable to prepare IFRS compliant financial statements. [IFRS 1.D26, IFRS 1.D27].

Extract from IFRS 1

- D26 If an entity has a functional currency that was, or is, the currency of a hyperinflationary economy, it shall determine whether it was subject to severe hyperinflation before the date of transition to IFRSs. This applies to entities that are adopting IFRSs for the first time, as well as entities that have previously applied IFRSs.
- D27 The currency of a hyperinflationary economy is subject to severe hyperinflation if it has both of the following characteristics:
- (a) a reliable general price index is not available to all entities with transactions and balances in the currency.
 - (b) exchangeability between the currency and a relatively stable foreign currency does not exist.

This exemption was included in response to a specific issue that occurred in Zimbabwe in 2008. In Zimbabwe the ability to produce financial statements had been completely undermined by severe hyperinflation. In response to this situation, an exemption was created in IFRS 1 which would be available to any entity that is either adopting IFRS for the first time, or is reapplying IFRS due to severe hyperinflation. This exemption allows an entity in this situation to elect to measure all assets and liabilities held before the functional currency normalisation date at fair value on the date of transition to IFRSs. [IFRS 1.D29]. In practice, the existence of severe hyperinflation (as described by the standard) is a rare economic occurrence (see Chapter 6).

The characteristics of severe hyperinflation were changed slightly with the issuance of *Lack of Exchangeability* (Amendments to IAS 21 *The Effects of Changes in Foreign Exchange Rates*) in August of 2023.

11 Translation of a hyperinflationary entity into a different presentation currency

IAS 21 requires an entity to determine its functional currency as the currency of the primary economic environment in which it operates. If the functional currency is that of a hyperinflationary economy, the entity's financial statements are restated in accordance with IAS 29. An entity cannot avoid restatement by adopting as its functional currency, a currency other than the functional currency as determined in accordance with IAS 21. [IAS 21.14].

However, an entity is permitted to present its financial statements in any presentation currency it chooses. Likewise, when a group contains individual entities with different functional currencies, the results and financial position of each entity are expressed in a common currency so that consolidated financial statements may be presented. [IAS 21.38]. A different presentation currency will not alter the entity's functional currency or the requirement to apply IAS 29.

It is noted that jurisdictions considered to be hyperinflationary are frequently subject to severe exchange controls and therefore determining an appropriate exchange rate for translation to a presentation currency may be difficult. Where judgement has been used to determine an appropriate rate, this should be disclosed. In 2014, the IFRS IC noted that predominant practice is to apply by extension the principle in IAS 21.26 (see Chapter 16), which gives guidance on which exchange rate to use when reporting foreign currency transactions in the functional currency when several exchange rates are available.² In August 2023, the IASB issued *Lack of Exchangeability* (Amendments to IAS 21 *The Effects of Changes in Foreign Exchange Rates*). These amendments propose more detailed guidance on determining appropriate exchange rates in such situations (see Chapter 16). If both exchange rates and inflation rates are required to be estimated, consistent assumptions should be used in making both estimates.

If an entity, whose functional currency is hyperinflationary, wants to translate its financial statements into a different presentation currency it must first restate its financial statements in accordance with IAS 29, [IAS 21.43], and then apply the following procedures under IAS 21: [IAS 21.42].

Extract from IAS 21

- 42** The results and financial position of an entity whose functional currency is the currency of a hyperinflationary economy shall be translated into a different presentation currency using the following procedures:
- (a) all amounts (ie assets, liabilities, equity items, income and expenses, including comparatives) shall be translated at the closing rate at the date of the most recent statement of financial position, except that
 - (b) when amounts are translated into the currency of a non-hyperinflationary economy, comparative amounts shall be those that were presented as current year amounts in the relevant prior year financial statements (ie not adjusted for subsequent changes in the price level or subsequent changes in exchange rates).

² [IFRIC Update](#), November 2014, p.8. Available on the IFRS Foundation's website.

In other words, when an entity that applies IAS 29 translates its financial statements into a non-hyperinflationary presentation currency, the comparative information is not restated under IAS 29. Instead, IAS 21 should be applied and the comparative amounts are those that were presented as current year amounts in the prior period. The following table summarises the impact of hyperinflation on various scenarios of translation into an alternative presentation currency.

	Translation to non-hyperinflationary presentation currency	Consolidation into non-hyperinflationary group	Consolidation into hyperinflationary group
Example	Argentinian entity* presenting its financial statements in euros	Argentinian subsidiary consolidated by parent presenting its financial statements in euros	Argentinian subsidiary consolidated by a Venezuelan parent*
Restate comparatives for hyperinflation	No	No	Yes
Exchange rate to use for comparative period	Closing rate at comparative balance sheet date	Closing rate at comparative balance sheet date	Closing rate at current balance sheet date
Restatement upon initial application of IAS 29 recognised in	Opening balance sheet of current period	Opening balance sheet of current period	Opening balance sheet of earliest comparative period

* At the time of writing both the Argentinian Peso and Venezuelan Bolivar were considered to be hyperinflationary.

All exchange differences that arise on the translation of an entity whose functional currency is not the currency of a hyperinflationary economy are recognised in other comprehensive income (see Chapter 16). [IAS 21.39]. IAS 21 does not however stipulate the same treatment for exchange differences arising on translation of an entity whose functional currency is hyperinflationary. [IAS 21.42].

In March 2020, the IFRS IC issued an agenda decision on the appropriate treatment of such exchange differences. It was noted that the translation of a hyperinflationary entity into a non-hyperinflationary currency may result in a change in the entity's net investment in the hyperinflationary foreign operation. This change would include two effects:

- A restatement effect resulting from restating the entity's interest in the equity of the hyperinflationary foreign operation as required by IAS 29.
- And
- A translation effect resulting from translating the entity's interest in the equity of the hyperinflationary foreign operation (excluding the effect of any restatement required by IAS 29) at a closing rate that differs from the previous closing rate.

They noted that IAS 1 states that components of other comprehensive income include gains and losses arising from translating the financial statements of a foreign operation. [IAS 1.7]. IAS 21 explains that exchange differences arising from translating the financial statements of a non-hyperinflationary foreign operation are recognised in other comprehensive income and not in profit or loss because the changes in exchange rates have little or no direct effect on the present and future cash flows from operations. [IAS 21.41]. The IFRS IC observed that this explanation is also relevant if the foreign operation's functional currency is hyperinflationary. Accordingly, the Committee concluded that an entity presents:

- The IAS 29 restatement effect and the IAS 21 translation effect in other comprehensive income, if the entity considers that the combination of those two effects meets the definition of an exchange difference in IAS 21.
- Or
- The IAS 21 translation effect in other comprehensive income if the entity considers that only the translation effect meets the definition of an exchange difference in IAS 21. In this case, consistent with the requirements in IAS 29.25, the entity presents the IAS 29 restatement effect in equity. [IAS 29.25].³

³ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

The illustration below shows the changes of the net assets of an entity with a hyperinflationary functional currency being translated into a non-hyperinflationary presentation currency.

Illustration 11-1: Translation to non-hyperinflationary presentation currency

The table below illustrates the translation of the financial information of an entity with a hyperinflationary functional currency (FC) to a non-hyperinflationary presentation currency (assumed to be Australian dollars), focusing on the impact on the statement of changes in equity. For the purposes of the illustration these currencies are indicated as FC and A\$ respectively. In this example, the entity is assumed to be in scope of IAS 29 in both the current and prior periods and to have a 31 December year end.

Financial information in hyperinflationary functional and presentation currency:

Statement of financial position

Reporting period and date of reporting	20x5 at 20x5	20x4 at 20x5	20x4 at 20x4
Currency	FC	FC	FC
- Land	400	400	267
- Bank	1,000	1,500	1,000
- Equity	1,400	1,900	1,267

Statement of profit or loss

Monetary loss	- 500
Net profit	- 500

Assumed foreign exchange rates (FC: A\$)

1 January 20x5	1.0
31 December 20x5	0.8

Movements in net asset value in presentation currency

	Functional currency		Presentation currency	
	FC	Exchange rate	A\$	
Opening equity at 1 January 20x5	1,267 (a)	1 (b)	1,267	
Movement in foreign exchange rate (OCI)			- 253 (c)	
Uplift to IAS 29 opening balance (OCI / Equity)	633 (d)	0.8 (e)	507 (f)	
Net profit	- 500 (g)	0.8 (e)	- 400	
Closing equity at 31 December 20x5	1,400	0.8 (e)	1,120	

(a) As comparative amounts are those that were presented as current year amounts in the relevant prior year financial statements, the opening balance for the current year is the closing balance reported in 20x4 as restated to this date. This will not be the same as the opening balance as reported in the 20x5 year in the financial statements presented in the hyperinflationary currency (i.e., the FC 1,900).

(b) As comparative amounts are those that were presented as current year amounts in the relevant prior year financial statements, the opening balance for the current year translated at the closing exchange rate of the prior period.

- (c) This amount represents the change in currency for the opening balance and is calculated as the opening balance multiplied by the closing exchange rate less the opening exchange rate, in this case $FC\ 1,269 \times (0.8 - 1) = A\$ 253$ loss, representing the devaluation of the FC currency during the year. This would be an IAS 21 translation effect and is presented in other comprehensive income.
- (d) This amount represents the difference between the closing balance of net assets as reported in the prior year in the hyperinflationary functional currency and the opening balance of net assets as reported in the current year. The difference results from the restatement of the comparative information as described in sections 5 and 8 above.
- (e) As required by IAS 21.42, all amounts other than those relating to comparatives shall be translated at the closing rate at the date of the most recent statement of financial position, in this case the rate at 31 December 20x5.
- (f) The movement in net assets for the uplift to the IAS 29 opening balance as reported in the functional currency financial information, translated into the presentation currency could be presented within either other comprehensive income or equity depending on whether the adjustment is considered to meet the definition of an exchange difference in IAS 21 or not, respectively, as discussed above.
- (g) Net profit is based on the amounts as reported in the hyperinflationary functional currency. No adjustments to this amount are required as a result of the process of translating to the non-hyperinflationary functional currency.

Had the entity not been in scope of IAS 29 in the prior period, the same principles would be applied, but the amount calculated in (d) above would be the cumulative catch up from the number previously reported without any inflationary uplift to the current period opening balance restated in terms of IAS 29.

In practice, clearly differentiating between an exchange difference and equity adjustment (per notes c and d in the illustration above) can be difficult, particularly as hyperinflation and exchange rate effects are inversely correlated and that the split may differ depending on the timing and frequency of reporting.

11.1 Translation on initial application and ceasing application of IAS 29

Related questions arise in the year an entity first becomes hyperinflationary, as the retrospective application of IAS 29 gives rise to an adjustment for the initial application of the standard. As discussed in section 5 above, retained earnings are restated to an amount derived from all the other amounts in the statement of financial position. It could be argued that the impact of initial adoption of IAS 29, being the net asset value reported at the end of the prior year and the opening net asset value as restated per IAS 29, should be recognised directly in equity similar to a change in accounting policy. However, as the adjustment is normally closely related to (past) changes in exchange rates, an argument could also be made that this adjustment could be presented in other comprehensive income.

It is also unclear how to deal with the accumulated foreign currency translation reserve that relates to the now hyperinflationary foreign operation. The agenda decision issued in March 2020 by the IFRS IC also addresses the question whether an entity reclassifies within equity the cumulative pre-hyperinflation exchange differences when a foreign operation becomes hyperinflationary. That is, whether the entity transfers the cumulative pre-hyperinflation exchange differences to a component of equity that is not subsequently reclassified to profit or loss.

Paragraph 41 of IAS 21 requires an entity to present the cumulative amount of exchange differences recognised in other comprehensive income in a separate component of equity until disposal of the foreign operation. [IAS 21.41]. Furthermore, IAS 21.48 and 48C require an entity to reclassify the cumulative amount of those exchange differences from equity to profit or loss on disposal or partial disposal of a foreign operation in certain circumstances.

Accordingly, the IFRS IC concluded that an entity presents the cumulative amount of the exchange differences as a separate component of equity until disposal or partial disposal of the foreign operation and does not reclassify within equity the cumulative pre-hyperinflation exchange differences once the foreign operation becomes hyperinflationary.⁴ If an entity considers that the combination of the IAS 29 restatement effect and the IAS 21 translation effects meet the definition of an exchange difference in IAS 21 (as discussed in section 11 above) then, upon initial application of IAS 29, both those effects are accounted as part of the cumulative amount of the exchange differences.

⁴ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

When the economy ceases to be hyperinflationary, and restatement in accordance with IAS 29 is no longer required, an entity uses the amounts restated to the price level at the date it ceased restating its financial statements as the historical costs for translation into the presentation currency. [IAS 21.43].

11.2 Fair value adjustments and goodwill on business combinations

When a hyperinflationary foreign operation that was acquired in a business combination (as defined in IFRS 3 *Business Combinations*) is being consolidated, the provisions of IAS 29 also need to be considered.

As described in Chapter 10, most identifiable assets acquired and liabilities assumed of the acquiree are initially recognised by the acquirer at fair value at the acquisition date, and goodwill may be recognised. Any goodwill arising on the acquisition of a foreign operation and any fair value adjustments to the carrying amounts of assets and liabilities arising on the acquisition of that foreign operation shall be treated as assets and liabilities of the foreign operation. [IAS 21.47]. Therefore, as assets and liabilities of the foreign operation (which were current at the date of acquisition), it follows that these are restated for any subsequent inflation in accordance with the provisions of IAS 29. Any related deferred tax is to be remeasured as discussed in section 4.4 above.

11.3 Presentation currency considerations for comparative information

Given that IAS 29 requires a hyperinflationary entity to restate its comparative figures, the question arises as to how an entity (a parent) that does not operate in a hyperinflationary economy, should account for the restatement of an entity (a subsidiary) that operates in an economy that became hyperinflationary in the current reporting period when incorporating it within its consolidated financial statements. This issue has been clarified by IAS 21 which specifically prohibits restatement of comparative figures when the presentation currency is not hyperinflationary. [IAS 21.42(b)]. This means that when the financial statements of a hyperinflationary subsidiary are translated into the non-hyperinflationary presentation currency for consolidation into the financial statements of the parent, the comparative amounts in annual and interim financial statements are not adjusted.

However, the impact on interim financial statements of such a parent may be more difficult to resolve. For example, a non-hyperinflationary parent (with a December year-end) may own a subsidiary whose functional currency is considered hyperinflationary from, say, 1 July 20X2 onwards. The subsidiary's second quarter results would not have been adjusted for the impact of hyperinflation, while its third quarter results would reflect the effects of hyperinflation for the period from the beginning of the year to the reporting date. This results in the parent needing to reflect a 'catch up effect' in its third quarter or full year reporting. As the prior year comparative figures cannot be restated under IAS 21, the full effect would be included in the current period. [IAS 21.42(b)]. However, IAS 29.4 specifically states that the standard "...applies to the financial statements of any entity from the beginning of the reporting period in which it identifies the existence of hyperinflation in the country in whose currency it reports".

If separate information is presented for each quarter, it is not clear how this effect should be taken into consideration in preparing the parent's third quarter results, specifically whether the year-to-date results are adjusted as though the subsidiary was hyperinflationary from the beginning of the year or only from the beginning of the third quarter. Possible approaches would include:

- Reporting the difference between the year-to-date profit for the third quarter and the year-to-date profit for the second quarter in which the subsidiary is restated under IAS 29 (i.e., with purchasing power adjustments to 30 June).
- Or
- Reporting the third quarter profits as the difference between the year-to-date profit in which the subsidiary is restated under IAS 29, less the year-to-date second quarter profits as they were actually reported (i.e., non-hyperinflation based results).

The first approach is consistent with the requirement that the year-end accounts will be prepared as if the economy had been hyperinflationary from the beginning of 20X2, will provide a better basis for comparison in 20X2 and will result in individual quarters in 20X1 being more comparable. Nevertheless, IAS 34 does not specifically address the issue of restating previous interim periods upon first application of IAS 29 and we consider the second approach to also be acceptable.

How we see it

As there is no clear guidance on the appropriate method of quantification, entities shall adopt a consistent approach and disclose this judgement and the impact thereof on the financial statements if it has a significant impact, as required by IAS 1. If the hyperinflationary subsidiary is relatively small within the overall consolidated accounts of the parent, the benefit of restating previous interim periods will often be limited.

Additional questions arising in respect of the preparation of quarterly interim financial statements in the scenario described above would include:

- Would the parent entity need to re-issue interim reports that had been issued earlier in the current year?
- In the period that the subsidiary's economy becomes hyperinflationary, would the parent entity adjust the comparative interim information for hyperinflation (and year to date interim information) for the same interim period in the prior year?
- In the first quarter of the following financial period (20X3), would the parent entity adjust the comparative information for hyperinflation (and year to date interim information) for the same interim period in the prior year (20X2)?

Although the subsidiary will apply the requirements of IAS 29 on a retrospective basis, the parent will incorporate the results of the subsidiary into the group financial statements as required by IAS 21. Hyperinflation only commenced after the end of the interim reports. This is a non-adjusting event in accordance with IAS 10. Hence, in response to the first question, the interim financial statements were compliant with the requirements of the standards, and the parent would not be required to re-issue prior interim financial statements in the year that the subsidiary's functional currency becomes hyperinflationary, although we believe re-issue is permissible.

Hyperinflationary adjustments would only occur in the interim financial statements of the parent from the date that the subsidiary became hyperinflationary onwards. Further, IAS 21 would preclude the restatement of comparative interim financial statements as contemplated in the second question above. [IAS 21.42(b)].

The issue addressed in the third question is not specifically addressed by IAS 21 or IAS 34. We consider that the parent entity is allowed but not required to restate its comparative (20X2) interim statements in its 20X3 reporting. The IFRS IC discussed a request on this issue, noting little diversity in practice with the majority of respondents not restating comparative information, and therefore declined to add the matter to its standard setting agenda.⁵ These specific requirements of IAS 34 are considered in Chapter 37.

⁵ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

12 Translation of a non-hyperinflationary entity into a hyperinflationary group

In June 2022, the IFRS IC discussed a paper about the accounting applied by a parent whose functional currency is the currency of a hyperinflationary economy, when it consolidates a subsidiary whose functional currency is the currency of a non-hyperinflationary economy. The Committee considered whether, in preparing its consolidated financial statements, the parent applies IAS 29 to restate the current year and comparative amounts presented for its non-hyperinflationary subsidiary. If the parent were to restate the current year and comparative amounts, it would express those amounts in terms of the measuring unit current at the end of the reporting period (the reporting date).

The two approaches discussed by the Committee were⁶:

- *The parent does not restate the results and financial position of its non-hyperinflationary subsidiary in terms of the measuring unit current at the reporting date:* the current year financial information is only adjusted by applying the appropriate exchange rate for the period, as discussed in Chapter 16. When the current year becomes the comparative period, the financial information of the hyperinflationary parent is restated while the financial information of the non-hyperinflationary subsidiary is not, and therefore, the consolidation for this period, as well as the opening statement of financial performance, is required to be reperformed.
- *The parent restates the results and financial position of its non-hyperinflationary subsidiary in terms of the measuring unit current at the reporting date:* the current year financial information is adjusted by applying the appropriate exchange rate for the period, as discussed in Chapter 16. The information in the statement of financial position is considered current and therefore, does not require restatement, while the statement of comprehensive income is adjusted for inflation and expressed in the measuring unit current at the reporting date. When the current year becomes the comparative period, the consolidated comparatives are restated by applying the measuring unit current at the end of the reporting period.

The Committee commented that, applying the requirements in IAS 21 and IAS 29 to the submitted fact pattern, the parent could restate or not restate the subsidiary's results and financial position in terms of the measuring unit current at the end of the reporting period.⁷ The IFRS IC recommended that the IASB develop a narrow-scope amendment addressing the matter above as well as the related matter of an entity whose functional currency is the currency of a non-hyperinflationary economy but that presents its financial statements in the currency of a hyperinflationary economy.⁸ In July 2024, an exposure draft, IASB ED/2024/4 *Translation to a Hyperinflationary Presentation Currency*, addressing this issue was released.

This exposure draft proposes that when an entity translates amounts from a functional currency that is the currency of a non-hyperinflationary economy to a presentation currency that is the currency of a hyperinflationary economy, the entity translates those amounts, including comparative amounts, using the closing rate at the date of the most recent statement of financial position. The IASB expects this translation method would result in an entity presenting amounts subject to translation in terms of a current measuring unit. The document also proposes certain disclosures for groups in this scenario.⁹

Until this exposure draft is finalised, preparers should ensure that the approach taken is clearly outlined in the accounting policies.

13 Elimination of intergroup transactions

When transactions take place between hyperinflationary and non-hyperinflationary entities within a group, the restatement process of IAS 29 and the translation requirements of IAS 21 result in complexities in eliminating these transactions on consolidation as required by IFRS 10 *Consolidated Financial Statements* and discussed at (Chapter 8). [IFRS 10.B86(c)].

The elimination of intercompany receivables or payables is straightforward, as balances are translated at closing rates and therefore, the amounts reflected for each entity in the consolidation would be equal to that reflected by the counterparty. In contrast, an intercompany income or expense is affected by the requirement to use different exchange rates and the restatement for inflation. For example, if a management fee, denominated in a hyperinflationary currency, is charged by a subsidiary in a hyperinflationary currency to a fellow subsidiary in a non-hyperinflationary currency:

- *The hyperinflationary subsidiary would restate its income for the effects of hyperinflation (see section 6 above) and translate the income at the closing rate into the presentation currency for consolidation purposes (see section 4.3.1 above).*
- *The non-hyperinflationary subsidiary would not restate its expense for hyperinflation and likely apply the average exchange rate to translate the expense into the presentation currency for consolidation purposes (see Chapter 16).*

As a result, the amounts reflected for each entity in the consolidation would not be equal to that reflected by the counterparty. The question therefore arises as to how this difference should be treated upon consolidation. The IFRS IC observed in March 2020 that an entity presents in other comprehensive income any exchange difference resulting from the translation of a hyperinflationary foreign operation.¹⁰

How we see it

In the absence of specific guidance, the Committee's observation, as discussed in more detail in section 11 above, provides the clearest guidance. To the extent the difference caused by the IAS 29 restatement effect and the IAS 21 translation effect in combination meet the definition of an exchange difference, applying the principles of this observation, the difference would be eliminated against other comprehensive income. To the extent that the entity considers only the IAS 21 impact to meet the definition of an exchange difference, this portion is eliminated against other comprehensive income and the impact of the restatement for inflation is recognised directly in equity. Under this approach, as only the hyperinflationary entity is exposed to a monetary gain or loss, this is not eliminated on consolidation.

¹⁰ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

14 Disclosures

Extract from IAS 29

- 39 The following disclosures shall be made:
- (a) the fact that the financial statements and the corresponding figures for previous periods have been restated for the changes in the general purchasing power of the functional currency and, as a result, are stated in terms of the measuring unit current at the end of the reporting period;
 - (b) whether the financial statements are based on a historical cost approach or a current cost approach; and
 - (c) the identity and level of the price index at the end of the reporting period and the movement in the index during the current and the previous reporting period.

[IAS 29.39].

It should be noted that disclosure of financial information that is restated under IAS 29 as a supplement to unrestated financial information is not permitted. This is to prevent entities from giving the historical cost based financial information greater prominence than the information that is restated under IAS 29. The standard also discourages separate presentation of unrestated financial information, but does not explicitly prohibit it. [IAS 29.7]. However, such unrestated financial statements would not be in accordance with IFRS and shall be clearly identified as such. An entity that is required (for example by local tax authorities or stock exchange regulators) to present unrestated financial statements needs to ensure that the IFRS financial statements are perceived to be the main financial statements rather than mere supplemental information.

The following excerpts illustrate the disclosure of the gain or loss on net monetary position, the basis of preparation and the required disclosures in respect of the relevant price index.

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS AT 31 DECEMBER 2023, 2022 AND 2021 [extract]

NOTE 2 - BASIS OF PRESENTATION OF CONSOLIDATED FINANCIAL STATEMENTS [extract]

2.1 Basis of preparation [extract]

The consolidated financial statements are prepared in accordance with International Financial Reporting Standards (“IFRS”) as issued by the International Accounting Standards Board (“IASB”). Hepsiburada and its subsidiaries maintain their books of account in Turkish Lira (“TRY”) based on the Turkish Commercial Code (“TCC”), Turkish tax legislation and the Uniform Chart of Accounts issued by the Ministry of Finance of Türkiye. These consolidated financial statements are based on the statutory records, which are maintained under the historical cost convention except for the financial investments which are measured at fair value, with adjustments and reclassifications for the purpose of fair presentation in accordance with IFRS.

The preparation of consolidated financial statements in accordance with IFRS requires the use of certain critical accounting estimates. It also requires judgment in the process of applying the Group’s accounting policies. The areas involving a higher degree of judgment or complexity, or areas where assumptions and estimates are significant to the consolidated financial statements are disclosed in Note 2.2.

Financial reporting in hyperinflationary economy

Since the beginning of 2021, inflation in Türkiye has increased significantly. With the cumulative effect of increasing inflation in recent three years, it has become necessary for entities operating in Türkiye to apply International Accounting Standards (“IAS”) 29 – Financial Reporting in Hyperinflationary Economies starting from 30 June 2022. One of the important indicators for the application of IAS 29 is a three-year compound inflation rate approaching or exceeding 100%. Three-year cumulative increase in Consumer Price Index (CPI) as of June 2022 has been 136% in Türkiye according to inflation data published by Statistical Institute of Türkiye on 4 July 2022.

Adjustments have been made in accordance with the terms of IAS 29 “Financial Reporting in Hyperinflationary Economies” regarding the changes in the general purchasing power of the Turkish Lira as of 31 December 2023. The terms of IAS 29 require that financial statements prepared in the currency in the economy with hyperinflation should be expressed in terms of the measuring unit current at the end of the reporting period and the amounts for the corresponding previous periods should also be stated in terms of the measuring unit current at the end of the reporting period.

For the application of IAS 29, the Group used the conversion coefficient derived from the CPI in Türkiye published by the Statistical Institute of Türkiye. The indices and coefficients used to prepare the consolidated financial statements are as follows:

Date	Index	Adjustment Coefficient	Three years compound inflation rates
31 December 2023	1859.38	1.000	268 %
31 December 2022	1128.45	1.648	156 %
31 December 2021	686.95	2.707	74 %

...

Telefónica, S.A. is an example of a parent entity that has subsidiaries that operate in an economy subject to hyperinflation. As a parent entity, Telefónica, S.A. would not restate the comparative amounts and, therefore, has reported a reconciling item for the effect of hyperinflation adjustments.

Practical example 14-2: Telefónica, S.A. (2023)

Spain

Consolidated Annual Report 2023 [extract]

Consolidated financial statements 2023 [extract]

Notes to the consolidated financial statements (consolidated annual accounts) for the year ended December 31, 2023 [extract]

Note 25. Tax matters [extract]

Deferred taxes movement

The movements in deferred taxes in the Telefónica Group in 2023 and 2022 are as follows:

Millions of euros	Deferred tax assets	Deferred tax liabilities
Balance at December 31, 2022	4,884	3,067
Additions	2,040	383
Disposals	(760)	(673)
Transfers	15	21
Translation differences and hyperinflation adjustments	61	(92)
Company movements and others	—	(4)
Balance at December 31, 2023	6,240	2,702

...

Overview

IAS 38 *Intangible Assets* prescribes the accounting treatment for intangible assets that are not specifically dealt with by another standard. There is a wide range of intangible assets, including software, brands and trademarks, customer relationship assets, licences and intellectual property.

This chapter explains the recognition and measurement requirements under IAS 38, providing detailed guidance on when an intangible asset must be recognised and what forms part of the cost of such an asset. These requirements differ depending on whether an intangible asset is acquired separately, acquired as part of a business combination, or is internally developed by an entity. IAS 38 also requires that certain costs must be recognised as an expense by an entity, for example training and start-up costs.

This chapter also covers the requirements in IAS 38 in relation to subsequent measurement, including detailed guidance on determining an appropriate amortisation period and method. IAS 38 has extensive disclosure requirements and this chapter contains several Practical examples of these disclosures.

The chapter also provides guidance on specific issues that affect many entities, including rate-regulated activities, emissions trading schemes and green certificates, Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) costs, crypto-assets, and cloud computing arrangements.

What you need to know

- The objective of IAS 38 is to prescribe the accounting treatment for intangible assets that are not specifically dealt with in another standard.
- An intangible asset is defined as “an identifiable non-monetary asset without physical substance”.
- The essential characteristics of intangible assets are that they are controlled by the entity, will give rise to future economic benefits for the entity, lack physical substance, and are identifiable.
- The recognition and measurement rules under IAS 38 differ depending on whether an intangible asset is acquired separately, acquired as part of a business combination, or is internally developed by an entity.
- IAS 38 specifies that certain costs must be expensed, including start-up costs (unless they qualify for recognition as an asset under IAS 16 *Property, Plant and Equipment*), training costs, advertising and promotional costs, and relocation and reorganisation costs.
- After initial recognition, intangible assets are subsequently measured using either the cost model, or the revaluation model.
- Intangible assets with an indefinite life must not be amortised, and instead are subject to an annual impairment test.

1 Introduction

1.1 Background

IAS 38 is structured along similar lines as IAS 16.

Prior to IAS 38, accounting practice for intangible assets had largely developed on an issue-by-issue basis, with the result being a variety of treatments for particular types of intangible assets. There have been many topical issues over the years: research and development (as long ago as the 1970s), brands and similar assets (particularly those arising in business combinations), and assets and costs that are directly and indirectly related to the internet and personal communications. In time, it became apparent that two different types of intangible rights shared characteristics that made a single standard meaningful.

Firstly, there are internal costs incurred by entities from which they expect to benefit in the future. The critical issue is identifying whether, when and how much of these costs must be recognised as assets, and how much must be recognised immediately as expenses. For example, there are many types of expenditure from which an entity may expect to benefit in the future, but it is not possible to identify an asset, or the relationship between the cost and future benefits is too tenuous to allow capitalisation.

Secondly, there are intangible rights acquired separately or as part of business combinations. For intangible rights acquired in a business combination, a key issue is whether the intangible rights are distinguishable from goodwill and must be recognised separately. This became more important as a consequence of goodwill not being amortised, which means that entities must identify as separate intangible assets certain rights, e.g., customer relationships that had historically been subsumed within goodwill.

Unlike IAS 16, the scope of which is defined by its title (it applies to property, plant and equipment), IAS 38 includes a definition of the assets to which it applies. However, this is so general (an intangible asset is an identifiable non-monetary asset without physical substance) that the standard must exclude certain assets and items of expenditure that would otherwise fall within it. The definition could include assets generated by other standards, which are therefore excluded from scope. Incidentally, this shows just how broad the definition could be as the list of scope exemptions includes deferred tax assets, leases and assets arising from employee benefits which are within scope of, respectively, IAS 12 *Income Taxes*, IFRS 16 *Leases*, and IAS 19 *Employee Benefits*. [IAS 38.3]. Additional clarification comes from the prohibition on recognising internally generated goodwill. This means that expenditure on brands and similar assets cannot be recognised as an intangible asset, as it is not possible to distinguish these costs from the costs of developing the business as a whole. [IAS 38.63, IAS 38.64]. However, arguably the opposite approach is taken with the intangible assets identified in a business combination, where the standard encourages separate recognition through a broad approach given to concepts such as separability. This remains a difficult and controversial area, discussed in section 5 below. The requirements of IFRS 3 *Business Combinations* are discussed in Chapter 10.

This chapter addresses the specific provisions of IAS 38, with the requirements relating to intangible assets acquired as part of a business combination being covered both in section 5 below and in Chapter 10. IFRS 13 *Fair Value Measurement* includes the guidance relating to the determination of fair values (see Chapter 15). Impairment of intangible assets is addressed in IAS 36 *Impairment of Assets*, covered in Chapter 21.

Other intangible assets are dealt with by specific accounting pronouncements. The amount spent on the operation and development of websites led to the issue of SIC-32 *Intangible Assets - Web Site Costs*, which is discussed in section 6.2.5 below. Although IAS 38 addresses acquisition by way of government grant, this has not proved sufficient to address accounting for various schemes designed to influence business behaviour, especially in environmental areas. Emissions trading schemes give rise to intangible rights and the attempts to devise a satisfactory accounting model for these and similar schemes are considered in section 11.2 below.

Recent years have seen an increase in the use and trading of crypto-assets such as Bitcoin and Ether. These may meet the relatively wide definition of intangible assets and can be accounted for under IAS 38. Crypto-assets are discussed in section 11.6 below.

Cloud computing arrangements, which are becoming increasingly common as an alternative to on-site software and computing infrastructure, are discussed in section 11.7 below.

In April 2024, the IASB announced that it had commenced a comprehensive review of the accounting requirements for intangibles.¹ This project will assess whether the requirements of IAS 38 remain relevant and continue to fairly represent current business models, or if improvements to the standard are required. The initial research and planning phase of the project aims to define the scope of issues to be explored and determine the most appropriate approach to plan and organise the work to be carried out under the project. This project is in response to feedback received as part of the IASB's Third Agenda Consultation, which notes that stakeholders highlighted deficiencies in the reporting of intangibles, and the fact that some of the matters raised have a pervasive effect given that they affect so many companies in many jurisdictions.² In June 2024, the IFRS IC discussed the proposed project and provided input to the IASB on a number of areas.³ Common areas of suggested focus included the accounting for, crypto assets, carbon credits and emission rights, and cloud computing.

3 [IFRIC Update](#), June 2024, available on the IFRS Foundation's website.

1.2 Terms used in IAS 38

The following terms are used in IAS 38 with the meanings specified: [IAS 38.8, IAS 38.12]

Extract from IAS 38

- 8 The following terms are used in this Standard with the meanings specified:
- Amortisation* is the systematic allocation of the depreciable amount of an intangible asset over its useful life.
- An *asset* is a resource:
- (a) controlled by an entity as a result of past events; and
 - (b) from which future economic benefits are expected to flow to the entity.¹
- Carrying amount* is the amount at which an asset is recognised in the statement of financial position after deducting any accumulated amortisation and accumulated impairment losses thereon.
- Cost* is the amount of cash or cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction, or, when applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs, eg IFRS 2 *Share-based Payment*.
- Depreciable amount* is the cost of an asset, or other amount substituted for cost, less its residual value.
- Development* is the application of research findings or other knowledge to a plan or design for the production of new or substantially improved materials, devices, products, processes, systems or services before the start of commercial production or use.
- Entity-specific value* is the present value of the cash flows an entity expects to arise from the continuing use of an asset and from its disposal at the end of its useful life or expects to incur when settling a liability.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)
- An *impairment loss* is the amount by which the carrying amount of an asset exceeds its recoverable amount.
- An *intangible asset* is an identifiable non-monetary asset without physical substance.
- Monetary assets* are money held and assets to be received in fixed or determinable amounts of money.
- Research* is original and planned investigation undertaken with the prospect of gaining new scientific or technical knowledge and understanding.
- The *residual value* of an intangible asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.
- Useful life* is:
- (a) the period over which an asset is expected to be available for use by an entity; or
 - (b) the number of production or similar units expected to be obtained from the asset by an entity.
- 12 An asset is identifiable if it either:
- (a) is separable, ie is capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, identifiable asset or liability, regardless of whether the entity intends to do so; or
 - (b) arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.

¹ The definition of an asset in this Standard was not revised following the revision of the definition of an asset in the *Conceptual Framework for Financial Reporting* issued in 2018.

In addition to the above definitions, IAS 38 also defines control as “the power to obtain the future economic benefits flowing from the underlying resource and to restrict the access of others to those benefits”. [IAS 38.13].

2 Objective and scope of IAS 38

The objective of IAS 38 is to prescribe the accounting treatment for intangible assets that are not specifically dealt with in another standard. [IAS 38.1].

IAS 38 does not apply to accounting for:

- (a) Intangible assets that are within the scope of another standard
 - (b) Financial assets, as defined in IAS 32 *Financial Instruments: Presentation*
 - (c) The recognition and measurement of exploration and evaluation assets within the scope of IFRS 6 *Exploration for and Evaluation of Mineral Resources*
- And
- (d) Expenditure on the development and extraction of, minerals, oil, natural gas and similar non-regenerative resources. [IAS 38.2].

Examples of specific types of intangible asset that fall within the scope of another standard include: [IAS 38.3]

- (a) Intangible assets held by an entity for sale in the ordinary course of business, to which IAS 2 *Inventories* applies (see Chapter 23).
 - (b) Deferred tax assets, which are governed by IAS 12 (see Chapter 29).
 - (c) Leases of intangible assets accounted for in accordance with IFRS 16 (see Chapter 24). Rights held by a lessee under licensing agreements for such items as motion picture films, video recordings, plays, manuscripts, patents and copyrights that are outside the scope of IFRS 16, [IFRS 16.3(e)], are within the scope of IAS 38. [IAS 38.6].
 - (d) Assets arising from employee benefits, for which IAS 19 is relevant (see Chapter 31).
 - (e) Financial assets as defined in IAS 32. The recognition and measurement of some financial assets are covered by IFRS 10 *Consolidated Financial Statements*, IAS 27 *Separate Financial Statements*, and IAS 28 *Investments in Associates and Joint Ventures* (see Chapter 7, Chapter 9, Chapter 12 and Chapter 40 to Chapter 50).
 - (f) Goodwill acquired in a business combination, which is determined under IFRS 3 (see Chapter 10).
 - (g) Contracts within the scope of IFRS 17 *Insurance Contracts* and any assets for insurance acquisition cash flows as defined in IFRS 17 (see Chapter 51).
 - (h) Non-current intangible assets classified as held for sale, or included in a disposal group that is classified as held for sale, in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* (see Chapter 5).
- And
- (i) Assets arising from contracts with customers that are recognised in accordance with IFRS 15 *Revenue from Contracts with Customers* (see Chapter 28).

IAS 38 excludes insurance contracts and expenditure on the exploration for, or development and extraction of oil, gas and mineral deposits in extractive industries from its scope, because activities or transactions in these areas are so specialised that they give rise to accounting issues that need to be dealt with in a different way. However, the standard does apply to other intangible assets used in extractive industries or by insurers (such as computer software), and other expenditure incurred by them (such as start-up costs). [IAS 38.7].

Finally, the standard makes it clear that it applies to expenditures on advertising, training, start-up and research and development activities. [IAS 38.5].

2.1 What is an intangible asset?

IAS 38 defines an asset as “a resource controlled by an entity as a result of past events; and from which future economic benefits are expected to flow to the entity⁴”. [IAS 38.8]. Intangible assets form a sub-section of this group and are further defined as “an identifiable non-monetary asset without physical substance”. [IAS 38.8]. The IASB considers that the essential characteristics of intangible assets are that they are:

- Controlled by the entity
 - Will give rise to future economic benefits for the entity
 - Lack physical substance
- And
- Are identifiable

An item with these characteristics is classified as an intangible asset regardless of the reason why an entity might hold that asset. [IAS 38.BC5]. There is one exception: intangible assets held for sale (either in the ordinary course of business or as part of a disposal group) and accounted for under IAS 2 or IFRS 5 are specifically excluded from the scope of IAS 38. [IAS 38.3].

Businesses frequently incur expenditure on all sorts of intangible resources such as scientific or technical knowledge, design and implementation of new processes or systems, licences, intellectual property, market knowledge, trademarks, brand names and publishing titles. Examples that fall under these headings include computer software, patents, copyrights, motion picture films, customer lists, mortgage servicing rights, fishing licences, import quotas, franchises, customer or supplier relationships, customer loyalty schemes, market share and marketing rights. [IAS 38.9].

Although these items are mentioned by the standard, not all of them will meet the standard’s eligibility criteria for recognition as an intangible asset, which requires identifiability, control over a resource and the existence of future economic benefits. Expenditure on items that do not meet all three criteria will be expensed when incurred, unless they have arisen in the context of a business combination as discussed in section 5 below. [IAS 38.10].

2.1.1 Identifiability

IAS 38’s requirement that an intangible asset must be ‘identifiable’ was introduced to try to distinguish it from internally generated goodwill (which, outside a business combination, must not be recognised as an asset [IAS 38.48]), but also to emphasise that, especially in the context of a business combination, there will be previously unrecorded items that must be recognised in the financial statements as intangible assets separately from goodwill. [IAS 38.BC7, IAS 38.BC8].

IFRS 3 defines goodwill as “representing the future economic benefits arising from other assets acquired in a **business combination** that are not individually identified and separately recognised”. [IFRS 3 Appendix A]. For example, future economic benefits may result from synergy between the identifiable assets acquired or from assets that, individually, do not qualify for recognition in the financial statements. [IAS 38.11].

IAS 38 states: [IAS 38.12]

Extract from IAS 38

12 An asset is identifiable if it either:

- (a) is separable, ie is capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, identifiable asset or liability, regardless of whether the entity intends to do so; or
- (b) arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.

4 “The definition of an asset in this Standard was not revised following the revision of the definition of an asset in the *Conceptual Framework for Financial Reporting* issued in 2018.”

The explicit requirement to recognise assets arising from contractual rights alone confirms the IASB's position that the existence of contractual or legal rights is a characteristic that distinguishes an intangible asset from goodwill, even if those rights are not readily separable from the entity as a whole. The Board cites as an example of such an intangible asset a licence that, under local law, is not transferable except by sale of the entity as a whole. [IAS 38.BC10]. Therefore, the search for intangible assets is not restricted to rights that are separable.

However, preparers must not restrict their search for intangible assets to those embodied in contractual or other legal rights, since the definition of identifiability merely requires such rights to be capable of separation. Non-contractual rights are required to be recognised as an intangible asset if the right could be sold, transferred, licensed, rented or exchanged. In considering the responses to Exposure Draft *ED 3 Business Combinations*, the Board observed that the existence of an exchange transaction for a non-contractual relationship provides evidence both that the item is separable, and that the entity is able to control the expected future economic benefits flowing from it, meaning that the relationship must be recognised as an intangible asset. Only in the absence of exchange transactions for the same or similar non-contractual customer relationships would an entity be unable to demonstrate that such relationships are separable, or that it can control the expected future economic benefits flowing from those relationships. [IAS 38.BC13].

2.1.2 Control

IAS 38 defines control as the power to obtain the future economic benefits generated by the resource and the ability to restrict the access of others to those benefits. Control normally results from legal rights, in the way that copyright, a restraint of trade agreement or a legal duty on employees to maintain confidentiality protects the economic benefits arising from market and technical knowledge. [IAS 38.13, IAS 38.14]. While it will be more difficult to demonstrate control in the absence of legal rights, the standard is clear that legal enforceability of a right is not a necessary condition for control, because an entity may be able to control the future economic benefits in some other way. [IAS 38.13]. The existence of exchange transactions for similar non-contractual rights can provide sufficient evidence of control to require separate recognition as an asset. [IAS 38.16]. Obviously, determining that this is the case in the absence of observable contractual or other legal rights requires the exercise of judgement based on an understanding of the specific facts and circumstances involved.

For example, the standard acknowledges that an entity usually has insufficient control over the future economic benefits arising from an assembled workforce (i.e., a team of skilled workers, or specific management or technical talent) or from training, for these items to meet the definition of an intangible asset. [IAS 38.15]. There would have to be other legal rights before control could be demonstrated.

Illustration 2-1: Demonstrating control over the future services of employees

Entity A acquires a pharmaceutical company. A critical factor in the entity's decision to acquire the company was the reputation of its team of research chemists, who are renowned in their field of expertise. However, in the absence of any other legal rights, it would not be possible to show that the entity can control the economic benefits embodied in that team and its skills because any or all of those chemists could leave. Therefore, it is most unlikely that Entity A could recognise an intangible asset in relation to the acquiree's team of research chemists.

Entity B acquires a football club. A critical factor in the entity's decision to acquire the club was the reputation of its players, many of whom are regularly selected to play for their country. A footballer cannot play for a club unless he is registered with the relevant football authority. It is customary to see exchange transactions involving players' registrations. The payment to a player's previous club in connection with the transfer of the player's registration enables the acquiring club to negotiate a playing contract with the footballer that covers a number of seasons and prevents other clubs from using that player's services. In these circumstances, Entity B would be able to demonstrate sufficient control to recognise the cost of obtaining the players' registrations as an intangible asset.

In neither of the above examples is an asset being recognised for the assembled workforce. In the case of the football team, the asset being recognised comprises the economic benefits embodied in the players' registrations, arising from contractual rights. In particular, it is the ability to prevent other entities from using that player's services (i.e., restricting the access of others to those benefits), [IAS 38.13], combined with the existence of exchange transactions involving similar players' registrations, [IAS 38.16], that distinguishes this type of arrangement from a normal contract of employment. In cases when the transfer fee is a stand-alone payment and not part of a business combination, i.e., when an entity separately acquires the intangible resource, it is much more likely that it can demonstrate that its purchase meets the definition of an asset (see section 4 below).

Similarly, an entity would not usually be able to recognise an asset for an assembled portfolio of customers or a market share. In the absence of legal rights to protect or other ways to control the relationships with customers or the loyalty of its customers, the entity usually has insufficient control over the expected economic benefits from these items to meet the definition of an intangible asset. However, exchange transactions, other than as part of a business combination, involving the same or similar non-contractual customer relationships may provide evidence of control over the expected future economic benefits in the absence of legal rights. In that case, those customer relationships could meet the definition of an intangible asset. [IAS 38.16]. IFRS 3 includes a number of examples of customer-related intangible assets acquired in business combinations that meet the definition of an intangible asset, which are discussed in more detail in section 5 below. [IFRS 3.IE23-IE31].

It is worth emphasising that intangible assets must be recognised, if and only if, they meet both the definition of an intangible asset and the applicable recognition criteria in IAS 38, [IAS 38.18], which are discussed in section 3.1 below. All that is established in the discussion above is whether the intangible right meets the definition of an asset.

The Practical example below illustrates the range of intangible assets that require recognition under IAS 38.

Practical example 2-1: RELX PLC (2023)	United Kingdom
Annual Report including Financial Statements and Corporate Responsibility Report [extract] Financial statements and shareholder information [extract] Financial statements and other information [extract] Notes to the consolidated financial statements [extract] 14 Intangible assets [extract] Accounting policy [extract]	
<p style="text-align: center;">...</p> <p>Management judgement is required to identify intangible assets acquired as part of business combinations which comprise: market-related assets (e.g. trademarks, imprints, brands); customer-related assets (e.g. subscription bases, customer lists, customer relationships); editorial content; software and systems (e.g. application infrastructure, product delivery platforms, in-process research and development); and other intangible assets mainly comprising contract and rights-related assets.</p> <p style="text-align: center;">...</p>	

2.1.3 Future economic benefits

Future economic benefits include not only future revenues from the sale of products or services but also cost savings or other benefits resulting from the use of the asset by the entity. For example, the use of intellectual property in a production process may reduce future production costs rather than increase future revenues. [IAS 38.17].

2.2 Determining whether there is an intangible asset

In IAS 38 an asset is defined as “a resource controlled by an entity as a result of past events; and from which future economic benefits are expected to flow to the entity”. [IAS 38.8]. Intangible assets form a sub-section of this group and are further defined as “an identifiable non-monetary asset without physical substance”. [IAS 38.8]. As we have discussed earlier, this definition could include assets covered by another standard which are therefore excluded from its scope (see section 2 above). However, in some circumstances it is not clear whether IAS 38 or another standard applies.

2.2.1 Whether to record a tangible or intangible asset

Before the advent of IAS 38 many entities used to account for assets without physical substance in the same way as property, plant and equipment. Indeed, the standard notes that intangible assets can be contained in or on a physical medium such as a compact disc (in the case of computer software), legal documentation (in the case of a licence or patent) or film, requiring an entity to exercise judgement in determining whether to apply IAS 16 or IAS 38. [IAS 38.4]. For example:

- Software that is embedded in computer-controlled equipment that cannot operate without it is an integral part of the related hardware and is treated as property, plant and equipment. [IAS 38.4].
- Application software that is being used on a computer is treated as an intangible asset because it is generally easily replaced and is not an integral part of the related hardware, whereas the operating system normally is integral to the computer and is included in property, plant and equipment. [IAS 38.4].
- A database that is stored digitally is considered to be an intangible asset where the value of the physical medium is wholly insignificant compared to that of the data collection.
- Research and development expenditure may result in an asset with physical substance (e.g., a prototype), but as the physical element is secondary to its intangible component, the related knowledge, it is treated as an intangible asset. [IAS 38.5].

It is worthwhile noting that the 'parts approach' in IAS 16 requires an entity to account for significant parts of an asset separately because they have a different economic life or are often replaced, [IAS 16.44], (see Chapter 19). This raises 'boundary' problems between IAS 16 and IAS 38 when software and similar expenditure is involved.

How we see it

We believe that where IAS 16 requires an entity to identify parts of an asset and account for them separately, the entity needs to evaluate whether any intangible-type part is actually integral to the larger asset or whether it is really a separate asset in its own right. The intangible part is more likely to be an asset in its own right if it was developed separately or if it can be used independently of the item of property, plant and equipment of which it apparently forms part.

This view is consistent with that taken in IFRS 3, when it asserts that related tangible and intangible components of an asset with similar useful lives (meaning that IAS 16 would not require separate accounting of parts of an asset) can be combined into a single asset for financial reporting purposes. [IFRS 3.B32(b)].

2.2.2 Classification of programme and other broadcast rights as inventory or intangible assets

Broadcasters purchase programmes under a variety of different arrangements. Often, they commit to purchasing programmes that are at a very early stage of development, perhaps merely being concepts. The broadcaster may have exclusive rights over the programme or perhaps only have the rights to broadcast for a set period of time or on a set number of occasions. IFRS accounting standards are not clear on how these rights must be classified and when they must be recognised.

Programme and other broadcast rights meet the definition of intangible assets because they are identifiable non-monetary assets without physical substance. IAS 38 specifically includes within its scope rights under licensing agreements for items such as motion picture films and video recordings. [IAS 38.6]. In addition, a broadcast right meets the other criteria for recognition as an intangible asset, being identifiable, as it arises from contractual rights, [IAS 38.12(b)], and is controlled by the entity. [IAS 38.13].

Rights to programmes held exclusively for sale to other parties also meet the definition of inventory and are therefore within the scope of IAS 2 (see Chapter 23). [IAS 38.3]. It is possible to argue that programmes held with a view to broadcasting them to an audience are comparable to "materials or supplies to be consumed in the production process or in the rendering of services", [IAS 2.6], which would mean that they could also be treated as inventory. Equally, it can be argued that such programme rights are intangible assets as they are used in the production or supply of services but are not necessarily consumed because they can be used again.

Without specific guidance in IFRS accounting standards, there is diversity among broadcasters in practice when classifying broadcast rights as either inventories or intangible assets. Entities will have to consider the particular facts and circumstances when classifying such rights, for example, it may be more appropriate to classify a right acquired for a single broadcast of a movie or sporting event without a rerun as inventory. In contrast, it may be more appropriate to classify acquired rights to an episodic series with a high rerun value, for example children's cartoons, as an intangible asset.

How we see it

The appropriate classification of broadcast rights depends on the particular facts and circumstances applicable to each case. We believe that an entity may either treat these rights as intangible assets and classify them under IAS 38 or classify them as inventory under IAS 2 (see Chapter 23), depending on the particular facts and circumstances applicable to the entity.

Accordingly, where a broadcast right is classified as an intangible asset:

- It is classified in the statement of financial position as current or non-current according to the entity's operating cycle (see section 10.2 below).
- The intangible asset is amortised, with amortisation included in the statement of profit or loss within the depreciation and amortisation expense, or within a functional expense category (such as cost of sales).
- In the cash flow statement, payments for the acquisition of intangible broadcast rights are classified as an investing activity (if the asset is classified as non-current on acquisition) or as an operating activity if the asset is classified as current. This is because cash flows from operating activities are primarily derived from the principal revenue-producing activities of the entity. Therefore, they generally result from the transactions and events that enter into the determination of profit or loss. [IAS 7.14].

And

- Rights are measured at a revalued amount only if the criteria in IAS 38 are met (see section 8.2 below). Otherwise, the asset is carried at cost less accumulated amortisation and impairments. Any impairment of the asset is determined in accordance with IAS 36.

When classified as inventory, the rights would be presented within current assets if the rights are expected to be sold, consumed or realised as part of the normal operating cycle, even if the intention is not to consume them within 12 months. [IAS 1.66, IAS 1.68].

Paragraph 68 of IAS 1 *Presentation of Financial Statements*⁵ defines the operating cycle of an entity as "the time between the acquisition of assets for processing and their realisation in cash or cash equivalents. When the entity's normal operating cycle is not clearly identifiable, it is assumed to be twelve months". [IAS 1.68]. The distinction between current and non-current assets is discussed in Chapter 3.

As with costs of other inventory, the cash outflows from acquisition will be classified as operating cash flows as they are primarily derived from the principal revenue-producing activities and the expense will be presented within cost of sales when the right is consumed.

Given the typical significance of broadcast rights for broadcasters, presenting these assets as a separate line item in the statement of financial position is also an alternative presentation observed in practice in accordance with IAS 1.57(a).

Both of these classifications are found in practice. Vivendi SE accounts for its film and television rights catalogues as intangible assets (see Practical example 3-1 in section 3.1.1 below). ITV plc on the other hand, presents its programme rights as current assets under the caption 'Programme rights and other inventory'.

⁵ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024.

Practical example 2-2: ITV plc (2023)

United Kingdom

ITV plc Annual Report and Accounts 2023 [extract]

Financial Statements [extract]

Notes to the Financial Statements [extract]

Section 3: Operating Assets and Liabilities [extract]

3.1. Working capital [extract]

3.1.1 Programme rights and commitments [extract]

Programme rights [extract]

The Group's policies with respect to programme rights recognise that the pattern of consumption on linear and streaming (ITVX) varies. Consumption of content varies based on the type of programme right as well as the type of platform it is transmitted on. Programme rights are expensed through operating costs reflecting the pattern in which management expects the right to be consumed.

The Group has defined policies on how programme rights are allocated to linear and streaming based on a pattern of viewing. There are also distinct policies across the platforms when these programme rights are recognised in the Consolidated Statement of Financial Position; when these costs are released to the Consolidated Income Statement; and the impairment review of the carrying values of programme rights held.

Type of programme	Streaming policy	Linear policy
Acquired content	Cost charged to the Income Statement on a declining-balance method over the licence period	Cost charged to the Income Statement over a number of linear transmissions (episodic)
Commissioned content	Cost charged to the Income Statement on a declining-balance method over the licence period	Cost charged to the Income Statement on first linear transmission (episodic)
Sports rights	Cost charged to the Income Statement on first transmission	Cost charged to the Income Statement on first linear transmission
Current affairs, live events, soaps	Cost charged to the Income Statement on first transmission	Cost charged to the Income Statement on first linear transmission
Library of content (ITVX only)	Straight-line amortisation over licence windows	

Acquired programme rights are purchased for the primary purpose of broadcasting on the ITV family of channels, including ad-funded streaming service and subscription streaming service platforms. These are recognised within current assets the earlier of when payments are made or when the rights are ready for exploitation.

Commissions, which primarily comprise programmes purchased, based on editorial specification and over which the Group has some control, are recognised in current assets as payments are made.

...

Programme rights and other inventory at the year end are shown in the table below:

	2023 £m	2022 £m
Acquired programme rights	284	225
Commissions	83	103
Sports rights	46	49
	413	377

Enil relates to stock that will be transmitted in 2025 and beyond (2022: £6 million transmitted in 2024 and beyond).

...

3 Recognition and measurement

3.1 Recognition

An item that meets the definition of an intangible asset (see section 2.1 above) must be recognised, if and only if, at the time of initial recognition of the expenditure:

- (a) It is probable that the expected future economic benefits that are attributable to the asset will flow to the entity

And

- (b) The cost of the asset can be measured reliably [IAS 38.21]

Although IAS 38 does not define 'probable', it is defined in other standards as "more likely than not".

[IAS 37.23, IFRS 5 Appendix A]. In assessing whether expected future economic benefits are probable, the entity must use reasonable and supportable assumptions that represent management's best estimate of the set of economic conditions that will exist over the useful life of the asset. [IAS 38.22]. In making this judgement the entity considers the evidence available at the time of initial recognition, giving greater weight to external evidence. [IAS 38.23].

This test (that the item meets both the definition of an intangible asset and the criteria for recognition) is performed each time an entity incurs potentially eligible expenditures, whether to acquire or internally generate an intangible asset or to add to, replace part of, or service it subsequent to initial recognition. [IAS 38.18]. If these criteria are not met at the time the expenditure is incurred, an expense is recognised and it is never reinstated as an asset. [IAS 38.68, IAS 38.71].

The guidance in IAS 38 on the recognition and initial measurement of intangible assets takes account of the way in which an entity obtained the asset. Separate rules for recognition and initial measurement apply for intangible assets depending on whether they were:

- Acquired separately (see section 4 below)
- Acquired by way of government grant (see section 4.6 below)
- Obtained in an exchange of assets (see section 4.7 below)
- Acquired as part of a business combination (see section 5 below)

Or

- Generated internally (see section 6 below) [IAS 38.19]

The difficulties that may arise in applying these criteria when an entity enters into a contract to buy an intangible asset for delivery in some future period are discussed in detail (in the context of programme and other broadcast rights) in section 3.1.1 below.

For recognition purposes IAS 38 does not distinguish between an internally generated and an acquired intangible asset other than when considering the treatment of goodwill. When the definition of an intangible asset and the relevant recognition criteria are met, all such assets must be recognised. [IAS 38.BCZ40].

Preparers do not have the option to decide, as a matter of policy, that costs relating to internally generated intangible assets are expensed if the recognition criteria in the standard are met. [IAS 38.BCZ41].

3.1.1 When to recognise programme and other broadcast rights

Television stations frequently enter into contracts to buy programme rights related to long-running television series or future sports events that are not yet available for broadcast, sometimes over a specified period or for a certain number of showings or viewings. Payments might be made at the beginning of or during the broadcast period, which raises the question of when those programme rights and the related obligations for payment must be recognised in the statement of financial position.

In accordance with paragraph 4.3 of the *Conceptual Framework for Financial Reporting* (revised in 2018), an asset is a present economic resource controlled by an entity as a result of past events. [CF 4.3].

Hence, it is necessary to determine when control is obtained. Under IFRS accounting standards, executory contracts, where both parties are still to perform (such as purchase orders where neither payment nor delivery has taken place), do not generally result in the recognition of assets and liabilities. When a broadcaster initially contracts to purchase a programme, it will not usually result in immediate recognition of an asset relating to that programme. At this point there will not normally be an asset under the control of the broadcaster. A broadcaster may have to consider whether the underlying resource is sufficiently developed to be identifiable (for example, whether the manuscript or screenplay has been written, and whether directors and actors have been hired).

How we see it

In the absence of specific guidance in IAS 38 on how to determine the timing of obtaining control of broadcast rights, an entity must make reference to the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*⁶ (see Chapter 3) when deciding on an accounting policy and refer to guidance in other standards, for example IFRS 15, to determine the point in time when control of broadcast rights is obtained.

Where there is difficulty in determining when control of the asset is obtained it may be helpful to assess at what point any liability arises, since a liability will generally indicate that an asset has been acquired. In practice an entity might recognise an asset and a liability for a specific broadcast right, for example:

- When a screening certificate is obtained
- When programming is available for exhibition
- At the beginning of the season
- At the beginning of the licence period
- Or
- At the date the event occurs (e.g., on a game-by-game basis)

The issue of when a licensor recognises revenue under IFRS 15 on the sale of such broadcast rights is covered in Chapter 28.

Illustration 3-1: Determining when to recognise a broadcast right

A sporting competition - rights secured over a number of seasons

Entity A (the licensee) signs a contract with a licensor for the exclusive rights to broadcast matches in a long-established sporting competition covering the whole season for a number of years. The entity is required to pay agreed amounts at the start of each season, with the rights to that season and future seasons reverting to the licensor if payment is not made on time. Entity A concludes that an obligation does not exist until the beginning of each season for the amount payable to secure rights for that season.

The entity concludes that it has an asset for the rights to broadcast matches in each season and recognises that asset at the start of each season. The entity discloses a commitment for amounts payable in future years without recognising any asset or liability at that time.

Rights to broadcast the future output of a film production company

Entity B (the licensee) signs a contract with a film production company (the licensor) whereby the entity agrees to pay amounts in the future for a specified number of films that the licensor will release in that year, but neither the licensee nor the licensor knows which films will be released when they sign the contract.

Based on an evaluation of the facts and circumstances, Entity B concludes that the underlying resource (the films) is not sufficiently developed to be identifiable at the time of signing the contract. Instead, the entity concludes that the criteria for recognising an intangible asset are not met until delivery of the films by the licensor.

⁶ The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

This approach is illustrated in the extract from Vivendi SE's annual report below, which distinguishes between contracts requiring recognition and commitments to pay amounts in future periods when content is delivered.

Practical example 3-1: Vivendi SE (2023)					France
FINANCIAL REPORT FOR THE YEAR 2023 [extract]					
Financial Report and Audited Consolidated Financial Statements for the year ended December 31, 2023 [extract]					
III- Audited Consolidated Financial Statements for the year ended December 31, 2023 [extract]					
Notes to the Consolidated Financial Statements [extract]					
Note 11 Content assets and commitments [extract]					
11.2 Contractual content commitments [extract]					
Commitments given recorded in the Statement of Financial Position: content liabilities					
Content liabilities are mainly recorded in "Trade accounts payable and other" or in "Other non-current liabilities" whether they are current or non-current, as applicable.					
	Minimum future payments as of December 31, 2023				Total minimum future payments as of December 31, 2022
		Payments due in			
(in millions of euros)	Total	2024	2025-2028	After 2028	
Film and television rights	213	213	-	-	183
Sports rights	476	476	-	-	520
Other	319 (a)	319	-	-	15
Content liabilities	1,008	1,008	-	-	718
...					
Off-balance sheet commitments given/(received)					
	Minimum future payments as of December 31, 2023				Total minimum future payments as of December 31, 2022
		Payments due in			
(in millions of euros)	Total	2024	2025-2028	After 2028	
Film and television rights (a)	2,761	1,241	1,505	15	3,234
Sports rights (b)	3,217 (b)	841	2,248	128	3,912
Other	-	-	-	-	5
Given commitments	5,978	2,082	3,753	143	7,151
Film and television rights (a)	(248)	(159)	(89)	-	(204)
Sports rights	(81)	(75)	(6)	-	(224)
Other	-	-	-	-	-
Received commitments	(329)	(234)	(95)	-	(428)
Total net	5,649	1,848	3,658	143	6,723
...					

As illustrated in Practical example 2-2 in section 2.2.2 above, ITV plc follows a similar type of approach for acquired programme rights under which an asset is recognised as payments are made and is recognised in full when the acquired programming is available for transmission.

3.2 Measurement

On initial recognition an intangible asset must be measured at cost. [IAS 38.24]. The standard defines this as the amount of cash or cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction. When the nature of the consideration given is governed by other IFRS accounting standards, the cost of the asset is the amount initially recognised in accordance with the specific requirements of that standard, e.g., IFRS 2 *Share-based Payment*. [IAS 38.8].

IAS 38's initial measurement depends, in part, on the manner in which the asset is acquired, this is discussed in more detail in sections 4 to 6 below. The components of the cost of an internally generated intangible asset are discussed in more detail in section 6.3 below.

3.3 Subsequent expenditure

Although IAS 38 is based on a general recognition principle that applies to both initial acquisition and subsequent expenditures, the hurdle for the recognition of subsequent expenditure as an addition to an intangible asset is set higher, because it must first be confirmed that the expenditure is not associated with the replacement of an existing asset (see section 9.5.1 below) or the creation of an internally generated intangible that would not be eligible for recognition under the standard (see section 6 below). The standard presumes that only rarely will subsequent expenditure, i.e., expenditure incurred after the initial recognition of an acquired intangible asset or after completion of an internally generated intangible asset, be recognised in the carrying amount of an asset. In most cases, subsequent expenditures are likely to maintain the expected future economic benefits embodied in an existing intangible asset rather than meet the definition of an intangible asset and the recognition criteria in IAS 38. The standard also notes that it is often difficult to attribute subsequent expenditure directly to a particular intangible asset rather than to the business as a whole. *[IAS 38.20]*.

Capitalisation of subsequent expenditure on brands, mastheads, publishing titles, customer lists and similar items is expressly forbidden even if they were initially acquired externally, which is consistent with the general prohibition on recognising them if internally generated. This is because the standard argues that such expenditure cannot be distinguished from the cost of developing the business of which they are a part. *[IAS 38.20, IAS 38.63]*. Thus, at best such expenditure creates unrecognised internally generated goodwill that might be crystallised only in a business combination.

4 Separate acquisition

4.1 Recognition

Separately acquired intangible rights will normally be recognised as assets. IAS 38 assumes that the price paid to acquire an intangible asset usually reflects expectations about the probability that the future economic benefits embodied in it will flow to the entity. In other words, the entity always expects there to be a flow of economic benefits, even if it is uncertain about the timing or amount. [IAS 38.25]. Therefore, the standard assumes that the cost of a separately acquired intangible asset can usually be measured reliably, especially in the case of cash or other monetary purchase considerations. [IAS 38.26].

Not all external costs incurred to secure intangible rights automatically qualify for capitalisation as separately acquired assets, because they do not meet the definition of an intangible asset in the first place. An entity that subcontracts the development of intangible assets (e.g., development-and-supply contracts or research and development contracts) to other parties (its suppliers) must exercise judgement in determining whether it is acquiring an intangible asset or whether it is obtaining goods and services that are being used in the development of an intangible asset by the entity itself. In the latter case, the entity will only be able to recognise an intangible asset if the expenditure meets IAS 38's requirements for internally generated assets (see section 6 below).

In determining whether a supplier is providing services to develop an internally generated intangible asset, the terms of the supply agreement must be examined to see whether the supplier is bearing a significant proportion of the risks associated with a failure of the project. For example, if the supplier is always compensated under a development-and-supply contract for development services and tool costs irrespective of the project's outcome, the entity on whose behalf the development is undertaken must account for those activities as its own.

If the entity pays the supplier upfront or by milestone payments during the course of a project, it will not necessarily recognise an intangible asset on the basis of those payments. Some payments may represent prepayments for goods and services to be received in the future, and are recognised as prepayments when made. The entity then recognises the goods or services when received. In addition, only costs incurred after it becomes probable that economic benefits are expected to flow to the entity will be part of the cost of an intangible asset (see section 6.2 below).

4.2 Components of cost

The standard sets out what the cost of a separately acquired intangible asset comprises: [IAS 38.27, IAS 38.28]

Extract from IAS 38

- | | |
|-----|---|
| 27 | The cost of a separately acquired intangible asset comprises: |
| (a) | its purchase price, including import duties and non-refundable purchase taxes, after deducting trade discounts and rebates; and |
| (b) | any directly attributable cost of preparing the asset for its intended use. |
| 28 | Examples of directly attributable costs are: |
| (a) | costs of employee benefits (as defined in IAS 19) arising directly from bringing the asset to its working condition; |
| (b) | professional fees arising directly from bringing the asset to its working condition; and |
| (c) | costs of testing whether the asset is functioning properly. |

Capitalisation of expenditure ceases when the asset is in the condition necessary for it to be capable of operating in the manner intended by management. [IAS 38.30]. This may well be before the date on which it is brought into use.

If payment for an intangible asset is deferred beyond normal credit terms, its cost is the cash price equivalent. The difference between this amount and the total payments is recognised as interest expense over the period of credit unless it is capitalised in accordance with IAS 23 *Borrowing Costs* (see Chapter 22). [IAS 38.32].

4.3 Costs to be expensed

The following types of expenditure are not considered to be part of the cost of a separately acquired intangible asset:

- Costs of introducing a new product or service, including costs of advertising and promotional activities
- Costs of conducting business in a new location or with a new class of customer, including costs of staff training
- Administration and other general overhead costs
- Costs incurred in using or redeploying an intangible asset
- Costs incurred while an asset capable of operating in the manner intended by management has yet to be brought into use

And

- Initial operating losses, such as those incurred while demand for the asset's output builds up [IAS 38.29, IAS 38.30]

Accordingly, start-up costs, training costs, advertising and promotional activities, and relocation or reorganisation costs must be expensed (see section 7 below).

4.4 Income from incidental operations while an asset is being developed

When an entity generates income while it is developing or constructing an asset, the question arises as to whether this income must reduce the initial carrying value of the asset being developed or be recognised in profit or loss. IAS 38 requires an entity to consider whether the activity giving rise to income is necessary to bring the asset to the condition necessary for it to be capable of operating in the manner intended by management, or not. The income and related expenses of incidental operations (being those not necessary to develop the asset for its intended use) must be recognised immediately in profit or loss and included in their respective classifications of income and expense. [IAS 38.31]. Such incidental operations can occur before or during the development activities. The example below illustrates these requirements.

Illustration 4-1: Incidental operations

Entity A is pioneering a new process for the production of a certain type of chemical. Entity A will be able to patent the new production process. During the development phase, A is selling quantities of the chemical that are produced as a by-product of the development activities that are taking place. The expenditure incurred comprises labour, raw materials, assembly costs, costs of equipment and professional fees.

The revenues and costs associated with the production and sale of the chemical are accounted for in profit or loss for the period, while the development costs that meet the strict recognition criteria of IAS 38 are recognised as an intangible asset. Development costs that fail the IAS 38 recognition test are also expensed.

As the above example suggests, identifying the revenue from incidental operations will often be much easier than allocating costs to incidental operations. Furthermore, it will often be challenging to determine when exactly a project moves from the development phase into its start-up phase.

IAS 38 is not explicit on how to account for income earned in relation to activity that is determined necessary to bring the intangible asset into its intended use. IAS 16 however does provide guidance in relation to this for items of property, plant and equipment that are under construction (see Chapter 19). IAS 16 requires that the proceeds, together with the cost of those items measured in accordance with IAS 2, from selling items produced while bringing an asset to the location and condition necessary for it to be capable of operating in the manner intended by management, are to be recognised in profit or loss in accordance with applicable standards. [IAS 16.20A]. In the absence of specific guidance in IAS 38, an entity must refer to the hierarchy in IAS 8 to develop an appropriate accounting policy (see Chapter 3). The hierarchy requires an entity to firstly consider the requirements in IFRS accounting standards dealing with similar and related issues. [IAS 8.11]. Therefore, an entity should consider the extent to which it could apply the guidance in IAS 16, discussed above, to income earned in relation to activity that is determined necessary to bring the intangible asset into its intended use.

An example of such income would be where income is generated from the sale of samples produced during the testing of a new process or from the sale of a production prototype. However, care must be taken to confirm whether the incidence of income indicates that the intangible asset is ready for its intended use, in which case capitalisation of costs would cease, revenue would be recognised in profit or loss and the related costs of the activity would include a measure of amortisation of the asset.

4.5 Measurement of intangible assets acquired for variable or contingent consideration

The purchase price of an intangible asset might include variable or contingent amounts. Transactions involving variable or contingent consideration are often very complex and payment may depend on a number of factors. Examples include variable or contingent payments based on an index or rate, variable or contingent payments that depend on the purchasers' future actions, variable or contingent payments related to the condition of the asset, or variable or contingent payments related to the asset's performance. Some arrangements may contain more than one source of variability or contingency. Further complexity can also arise when arrangements are akin to profit sharing agreements, which are not addressed in any standard.

The topic of variable payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The Committee's discussions considered both the accounting at the date of purchasing the asset and subsequently, and distinguished between variable payments that depend on the purchaser's future activity and those that do not. The Committee determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively. In May 2016, the IASB tentatively agreed that this issue would be included in the research pipeline between 2017 and 2021.⁷ At the time of writing this is not listed as an active research project on the IASB's work plan.⁸

A critical step in analysing the accounting for the purchase of an intangible asset in an arrangement involving variable or contingent consideration is to fully understand the contractual arrangements, and understanding the nature of the contingent or variable payments. This includes developing a full understanding of whether those contingent or variable payments are linked to the initial value of the asset or to its future performance, whether the contingency or variability is within or outside of the purchaser's control and whether the variable or contingent payment is a payment for some other goods or services from the seller. Sometimes a contract may establish an obligation for the variable or contingent payment at the outset, whilst in others it might be determined that the arrangement is an executory contract, and the liability for the variable or contingent payments is only recognised later once either party fulfils its obligations under the contract.

The two key questions with regards to the accounting for variable or contingent consideration in an asset purchase are 1) whether and when to recognise a liability for that variable or contingent consideration, and 2) whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset.

Looking at the first question of when a liability to make variable or contingent payments would be recognised, if the arrangement is not considered to be an executory contract, one consideration is whether those payments are dependent on the entity's future activity, or not. IAS 32 stipulates that where the contingency is outside the control of both the issuer and the holder, a contingent obligation to deliver cash meets the definition of a financial liability (see Chapter 43). [IAS 32.25]. Therefore, if the obligation to make the variable payment does not depend on the acquiring entity's future activity, it would seem appropriate to recognise a financial liability in respect of the contingent amounts. However, it is acknowledged that whilst this view was tentatively agreed during the course of the IFRS IC discussions on the topic, ultimately, this was not clarified or confirmed as part of the final agenda decision. Furthermore, the final agenda decision notes that there are questions about the accounting for variable payments subsequent to the purchase of the asset, and in making that statement the IFRS IC did not distinguish between the different types of variable payments.

How we see it

In light of the discussions held by the IFRS IC, and in the absence of clear guidance in the final agenda decision, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions. If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

⁷ [IASB Update](#), May 2016, available on the IFRS Foundation's website.

⁸ [IFRS Foundation work plan](#), available on the IFRS Foundation's website (accessed 25 September 2024).

As described above, there is no explicit guidance on the treatment of variable or contingent consideration in the acquisition of an asset and there is diversity in practice for these types of arrangements. Therefore, examples of some accounting policies an entity may want to consider regarding initial recognition of the asset include the following:

- The cost of the asset on initial recognition includes the fair value of all variable or contingent consideration at the date of acquisition. A corresponding liability is recognised for the same amount.
- The cost of the asset on initial recognition excludes any variable or contingent payments. Accordingly, no liability is recognised for those contingent or variable amounts.

The second question that needs to be addressed is how the entity must account for subsequent payments and changes to the estimate of variable or contingent consideration. Depending on the facts and circumstances of the arrangement an entity may determine that:

- 1) Variability arises from exchange rates, time value of money, or embedded derivatives - Changes in the carrying amount of a recognised liability that arise from exchange rates are accounted for in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* and IFRIC 22 *Foreign Currency Transactions and Advance Consideration*, while the time value of money and embedded derivatives are accounted for in accordance with IFRS 9 *Financial Instruments*;
- 2) Variability is directly linked to the quality or quantity of the asset(s) received - In these cases, the initial recognition of the asset and liability would have been based on an accounting estimate that is subsequently updated in accordance with IAS 8.37; or
- 3) The variability in the arrangement does not fall under (1) or (2) above and an accounting policy needs to be developed to address it.

In the latter case, an entity will need to apply the requirements of IAS 8 to develop an accounting policy that it should apply consistently to all similar transactions. The accounting policy developed will need to address whether the change in the estimate of variable or contingent consideration should be capitalised as part of the cost of the asset or expensed. This determination is usually based on the reason for the contingent payment and entities should consider the substance of the arrangement in determining the appropriate treatment.

It is only appropriate for subsequent changes to a recognised liability to be recognised as part of the cost of the asset to the extent that it relates to future economic benefits embodied in the asset initially received. For example, if the contingency or variability is viewed as being linked to the quality or quantity of the asset initially received. Variability arising due to other factors, such as its use over time, would generally be expensed.

How we see it

Until this matter is resolved by the IASB, where the accounting for the variability or contingency is not prescribed in another standard, an entity should develop and apply a consistent accounting policy in relation to whether subsequent payments or changes to the measurement of a recognised liability to make contingent or variable payments are included as part of the cost of an acquired asset or expensed as incurred, in accordance with the hierarchy in IAS 8.

An entity should exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

For intangible assets, the approaches discussed above are shown in the following Illustration. Note that this example does not include a number of common contingent payments, e.g., those related to usage or revenue, or those related to changes in exchange rates or the time value of money.

Illustration 4-2: Contingent consideration relating to a football player's registration

Entity A is a football club which signs a new player on a 4 year contract. In securing the registration of the new player, Entity A agrees to make the following payments to the player's former club:

- (1) CU5.5 million on completion of the transfer
- (2) CU2.8 million on the first anniversary of the transfer
- (3) CU1 million as soon as the player has made 25 appearances for the club
- (4) CU0.2 million if the player is first selected to play for his country

And

- (5) 25% of the gross proceeds from any onward sale of the player before the expiry of the initial contract term

It is determined that the expenditure meets the definition of an intangible asset because it allows Entity A to negotiate a playing contract with the footballer that covers 4 seasons and prevents other clubs from using that player's services over that time. How does Entity A determine the cost of the player registration?

Example accounting policy 1

All of the above payments are contractual, and a financial liability arises under IFRS 9 as soon as that player signs for the club. Accordingly, Entity A selects an accounting policy where the cost of the intangible asset comprises the initial payment of CU5.5 million, plus an amount representing the present value of the CU2.8 million deferred consideration payable in one year and an amount to reflect the fair value of the other contingent payments (for example, determined using some kind of probability-weighted estimation technique). Entity A will need to select an accounting policy to recognise subsequent changes in the liability either as part of the cost of the intangible asset (because the contingency or variability is considered to be linked to the quality or quantity of the asset initially received), or in profit or loss (because the contingency or variability is considered to be due to other factors, such as its use over time).

Example accounting policy 2

Entity A selects an accounting policy in which both the CU5.5 million payable on completion of the transfer, and the CU2.8 million deferred consideration, is recognised as part of the initial cost of the intangible asset. No liability is recognised at acquisition for the contingent and variable payments that have been agreed. Once the contingency or variability is resolved Entity A will need to select an accounting policy to recognise the payment as either as part of the cost of the intangible asset (because the contingency or variability is considered to be linked to the quality or quantity of the asset initially received), or in profit or loss (because the contingency or variability is considered to be due to other factors, such as its use over time).

MERCK Kommanditgesellschaft auf Aktien has developed an accounting policy for contingent consideration linked to both milestone payments, and sales-based royalties, in relation to the acquisition of intangible assets outside of a business combination.

Practical example 4-1: MERCK Kommanditgesellschaft auf Aktien (2023) Germany**ANNUAL REPORT 2023 [extract]**

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

Operating Assets, Liabilities, and Contingent Liabilities [extract]

(19) Other intangible assets [extract]

Accounting and measurement policies [extract]

Recognition and initial measurement of purchased intangible assets [extract]

...

Contingent consideration linked to milestone payments in connection with the purchase of intangible assets arising outside a business combination is recognized as an intangible asset and as a financial liability once the milestone is reached. Contingent consideration in the form of sales-based royalties is expensed when incurred.

...

4.6 Acquisition by way of government grant

An intangible asset may sometimes be acquired free of charge, or for nominal consideration, by way of a government grant. Governments frequently allocate airport-landing rights, licences to operate radio or television stations, emission rights (see section 11.2 below), import licences or quotas, or rights to access other restricted resources. [IAS 38.44].

Government grants must be accounted for under IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* which permits initial recognition of intangible assets received either at fair value or a nominal amount. [IAS 20.23].

This represents an accounting policy choice for an entity that must be applied consistently to all intangible assets acquired by way of a government grant.

It may not be possible to measure reliably the fair value of all of the permits allocated by governments because they may have been allocated for no consideration, may not be transferable and may only be bought and sold as part of a business. Some of the issues surrounding the determination of fair value in the absence of an active market are considered in Chapter 15. Other allocated permits, such as milk quotas in certain countries, are freely traded and therefore do have a readily ascertainable fair value.

4.7 Exchanges of assets

Asset exchanges are transactions that have challenged standard-setters for many years. An entity might swap certain intangible assets that it does not require or is no longer allowed to use for those of a counterparty that has other surplus assets. For example, it is not uncommon for airlines and media groups to exchange landing slots and newspaper titles, respectively, to meet demands of competition authorities. It is also not uncommon for professional football clubs to exchange player registration rights. The question arises whether such transactions must be recorded at cost or fair value, which in the latter case would give rise to a gain in circumstances where the fair value of the incoming asset exceeds the carrying amount of the outgoing one. Equally, it is possible that a transaction could be arranged with no real commercial substance, solely to boost apparent profits (see section 4.7.2 below).

Three separate standards contain virtually identical guidance on accounting for exchanges of assets: IAS 16 (see Chapter 19), IAS 40 *Investment Property* (see Chapter 20) and IAS 38.

4.7.1 Measurement of assets exchanged

In the context of asset exchanges, the standard contains guidance on the reliable determination of fair values in the circumstances where market values do not exist. Note that while fair value is defined by reference to IFRS 13 (see Chapter 15), the requirements in this section are specific to asset exchanges in IAS 38.

IAS 38 requires all acquisitions of intangible assets in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value. The acquired intangible asset is measured at fair value unless: [IAS 38.45]

(a) The exchange transaction lacks commercial substance

Or

(b) The fair value of neither the asset received, nor the asset given up, is reliably measurable

The acquired asset is measured in this way even if an entity cannot immediately derecognise the asset given up. If an entity is able to reliably determine the fair value of either the asset received or the asset given up, then it uses the fair value of the asset given up to measure cost unless the fair value of the asset received is more clearly evident. [IAS 38.47]. If the fair value of neither the asset given up, nor the asset received can be measured reliably, the acquired intangible asset is measured at the carrying amount of the asset given up. [IAS 38.45].

In this context, the fair value of an intangible asset is reliably measurable if the variability in the range of reasonable fair value measurements is not significant for that asset or the probabilities of the various estimates within the range can be reasonably assessed and used when measuring fair value. [IAS 38.47].

4.7.2 Commercial substance

A gain or loss is only recognised on an exchange of non-monetary assets if the transaction is determined to have commercial substance. Otherwise, the acquired asset is measured at the cost of the asset given up. [IAS 38.45].

The commercial substance test for asset exchanges was put in place to prevent gains being recognised in income when the transaction had no discernible effect on the entity's economics. [IAS 16.BC21]. The commercial substance of an exchange is determined by forecasting and comparing the future cash flows expected to be generated by the incoming and outgoing assets. Commercial substance means that there must be a significant difference between the two forecasts.

The standard explains when an exchange transaction has commercial substance: [IAS 38.46]

Extract from IAS 38

- 46 An entity determines whether an exchange transaction has commercial substance by considering the extent to which its future cash flows are expected to change as a result of the transaction. An exchange transaction has commercial substance if:
- (a) the configuration (ie risk, timing and amount) of the cash flows of the asset received differs from the configuration of the cash flows of the asset transferred; or
 - (b) the entity-specific value of the portion of the entity's operations affected by the transaction changes as a result of the exchange; and
 - (c) the difference in (a) or (b) is significant relative to the fair value of the assets exchanged.
- For the purpose of determining whether an exchange transaction has commercial substance, the entity-specific value of the portion of the entity's operations affected by the transaction shall reflect post-tax cash flows. The result of these analyses may be clear without an entity having to perform detailed calculations.

IAS 38 defines the entity-specific value of an intangible asset as the present value of the cash flows an entity expects to arise from its continuing use and from its disposal at the end of its useful life. [IAS 38.8]. In determining whether an exchange transaction has commercial substance, the entity-specific value of the portion of the entity's operations affected by the transaction must reflect post-tax cash flows. [IAS 38.46]. This is different from the calculation of an asset's value in use under IAS 36 (see Chapter 21), as it uses a post-tax discount rate based on the entity's own risks rather than IAS 36, which requires use of the pre-tax rate that the market would apply to a similar asset.

The standard acknowledges that the result of this analysis might be clear without having to perform detailed calculations. [IAS 38.46].

5 Acquisition as part of a business combination

The requirements of IFRS 3 apply to intangible assets acquired in a business combination. The recognition and initial measurement requirements are discussed in detail in Chapter 10 and a summary is given below. The emphasis in IFRS 3 is that, in effect, it does not matter whether assets meeting the definition of an intangible asset have to be combined with other intangible assets, incorporated into the carrying value of a complementary item of property, plant and equipment with a similar useful life or included in the assessment of the fair value of a related liability. The important requirement is that the intangible asset is recognised separately from goodwill.

The process of identifying intangible assets in a business combination might involve, for example:

- Reviewing the list of items that meet the definition of an intangible asset in IFRS 3 (see section 5.2 below)
- A review of documents such as those related to the acquisition, other internal documents produced by the entity, public filings, press releases, analysts' reports, and other externally available documents
- And
- Comparing the acquired business to similar businesses and their intangible assets

Intangible assets that are used differ considerably between industries and between individual entities. Therefore, considerable expertise and careful judgement is required in determining whether there are intangible assets that need to be recognised and valued separately.

IFRS 3 provides a long list of items that must be recognised separately from goodwill (see section 5.2 below). The list is not intended to be exhaustive.

5.1 Recognition of intangible assets acquired in a business combination

As noted in section 3.1 above, an intangible asset must only be recognised if: *[IAS 38.21]*

- (a) It is probable that the expected future economic benefits that are attributable to the asset will flow to the entity
- And
- (b) The cost of the asset can be measured reliably

5.1.1 Probable inflow of benefits

In the case of a business combination, the probability recognition criterion is always considered to be satisfied. The cost of the intangible asset is its fair value at the acquisition date. The standard indicates that the fair value reflects expectations about the probability that the future economic benefits embodied in the asset will flow to the entity. *[IAS 38.33]*. In other words, the existence of a fair value means that an inflow of economic benefits is considered to be probable, in spite of any uncertainties about timing or amount.

5.1.2 Reliability of measurement

Under IFRS 3, the cost of the intangible asset acquired in a business combination can always be measured reliably. *[IAS 38.BC19A]*.

In developing IFRS 3, the Board concluded that the needs of users were better served by recognising intangible assets, on the basis of an estimate of fair value, rather than subsuming them in goodwill, even if a significant degree of judgement is required to estimate fair value. *[IAS 38.BC19B]*. Accordingly, if an asset acquired in a business combination is separable or arises from contractual or other legal rights, there is sufficient information to measure reliably the fair value of the asset. Thus, the requirement in section 3.1 above for reliable measurement of cost is always considered to be satisfied for intangible assets acquired in business combinations. *[IAS 38.33]*.

5.1.3 Identifiability in relation to an intangible asset acquired in a business combination

Intangible assets need to be identifiable to distinguish them from goodwill. The two elements of identifiability are the existence of contractual or other legal rights and separability. Separability means that the asset is capable of being sold, transferred, licensed, rented or exchanged without having to dispose of the whole business. An intangible asset is considered to be separable regardless of whether the entity intends to sell or otherwise transfer it. *[IAS 38.12]*.

If an intangible asset acquired in a business combination is separable or arises from contractual or other legal rights, sufficient information exists to measure reliably the fair value of the asset. Where there are a range of possible outcomes with different probabilities in estimating an intangible asset's fair value, this uncertainty must be factored into the measurement of the asset's fair value. [IAS 38.35].

The IASB recognised that an intangible asset acquired in a business combination might be separable, but only together with a related contract, identifiable asset or liability. In such cases, IAS 38 requires the acquirer to recognise the intangible asset separately from goodwill, but together with the related contract, asset or liability. [IAS 38.36].

Acquirers are permitted to recognise a group of complementary intangible assets as a single asset provided the individual assets in the group have similar useful lives. For example, the terms 'brand' and 'brand name' are often used as synonyms for trademarks and other marks. However, 'brands' are regarded as general marketing terms that are typically used to refer to a group of complementary assets such as a trademark or service mark and its related trade name, formulas, recipes and technological expertise. [IAS 38.37]. Anheuser-Busch InBev NV/SA, for example, acknowledges the relationship between trademarks and other complementary assets such as formulas, recipes or technological expertise acquired in business combinations.

Practical example 5-1: Anheuser-Busch InBev NV/SA (2023)	Belgium
Annual Report 2023 [extract] Financial report [extract] Consolidated financial statements [extract] Notes to the consolidated financial statements [extract] 3. Summary of significant accounting policies [extract] (F) INTANGIBLE ASSETS [extract] Brands If part of the consideration paid in a business combination relates to trademarks, trade names, formulas, recipes or technological expertise these intangible assets are considered as a group of complementary assets that is referred to as a brand for which one fair value is determined. Expenditure on internally generated brands is expensed as incurred.	

IFRS 3 contains additional guidance on the application of the contractual-legal and separability criteria that indicate how far the IASB expects entities to go to ensure that intangible assets acquired in a business combination are recognised separately from goodwill.

5.1.3.A Contractual-legal rights

An intangible asset that arises from contractual or other legal rights is recognised separately from goodwill even if it is not transferable or separable from the acquiree or from other rights and obligations. For example:

- (a) An acquiree owns and operates a nuclear power plant. The licence to operate that power plant is an intangible asset that meets the contractual-legal criterion for recognition separately from goodwill, even if the acquirer cannot sell or transfer it separately from the acquired power plant. However, IFRS 3 goes on to say that an acquirer may recognise the fair value of the operating licence and the fair value of the power plant as a single asset for financial reporting purposes if the useful lives of those assets are similar.
- (b) An acquiree owns a technology patent. It has licensed that patent to others for their exclusive use outside the domestic market, receiving a specified percentage of future foreign revenue in exchange. Both the technology patent and the related licence agreement meet the contractual-legal criterion for recognition separately from goodwill even if selling or exchanging the patent and the related licence agreement separately from one another would not be practical. [IFRS 3.B32].

5.1.3.B Separability

IFRS 3 emphasises that the separability criterion means that an acquired intangible asset is capable of being separated or divided from the acquiree, regardless of the intentions of the acquirer. It adds that an acquired intangible asset is recognised separately from goodwill if there is evidence of exchange transactions for that type of asset or an asset of a similar type, even if those transactions are infrequent and regardless of whether the acquirer is involved in them. For example, customer and subscriber lists are frequently licensed and thus merit recognition as intangible assets. The standard acknowledges that an acquiree might try to distinguish its customer lists from those that are frequently licensed generally, in order to justify no recognition. However, in the absence of a truly distinguishing feature, such as confidentiality or other agreements that prohibit an entity from selling, leasing or otherwise exchanging information about its customers, these non-contractual rights must be recognised separately from goodwill. [IFRS 3.B33].

An intangible asset that is not individually separable from the acquiree or combined entity must still be recognised separately from goodwill if it could be separable in combination with a related contract, identifiable asset or liability. For example, an acquiree owns a registered trademark and documented but unpatented technical expertise used to manufacture the trademarked product. The entity could not transfer ownership of the trademark without everything else necessary for the new owner to produce an identical product or service. Because the unpatented technical expertise must be transferred if the related trademark is sold, it is separable and not included in the carrying value of goodwill. [IFRS 3.B34].

The requirements described above demonstrate how IFRS 3 and IAS 38 define intangible assets in a way that eliminates as much as possible any barrier to recognising them separately from goodwill.

5.2 Examples of intangible assets acquired in a business combination

IFRS 3 provides a long list of examples of items acquired in a business combination that meet the definition of an intangible asset and must therefore be recognised separately from goodwill. [IFRS 3.IE16-IE44]. The list is not intended to be exhaustive and other items acquired in a business combination might still meet the definition of an intangible asset. [IFRS 3.IE16].

The table below summarises the items included in the IASB's Illustrative Example. Reference should be made to the Illustrative Example itself for any further explanation about some of these items.

Intangible assets arising from contractual or other legal rights (regardless of being separable)	Other intangible assets that are separable
Marketing-related	
<ul style="list-style-type: none"> ▪ Trademarks, trade names, service marks, collective marks and certification marks ▪ Internet domain names ▪ Trade dress (unique colour, shape or package design) ▪ Newspaper mastheads ▪ Non-competition agreements 	
Customer-related	
<ul style="list-style-type: none"> ▪ Order or production backlog ▪ Customer contracts and the related customer relationships 	<ul style="list-style-type: none"> ▪ Customer lists ▪ Non-contractual customer relationships
Artistic-related	
<ul style="list-style-type: none"> ▪ Plays, operas and ballets ▪ Books, magazines, newspapers and other literary works ▪ Musical works such as compositions, song lyrics and advertising jingles ▪ Pictures and photographs ▪ Video and audio-visual material, including films, music videos and television programmes 	

Intangible assets arising from contractual or other legal rights (regardless of being separable)	Other intangible assets that are separable
Contract-based <ul style="list-style-type: none"> ▪ Licensing, royalty and standstill agreements ▪ Advertising, construction, management, service or supply contracts ▪ Construction permits ▪ Franchise agreements ▪ Operating and broadcast rights ▪ Servicing contracts such as mortgage servicing contracts ▪ Employment contracts that are beneficial contracts from the perspective of the employer because the pricing of those contracts is below their current market value ▪ Use rights such as drilling, water, air, mineral, timber-cutting and route authorities ▪ Advertising, construction, management, service or supply contracts 	
Technology-based <ul style="list-style-type: none"> ▪ Patented technology ▪ Computer software and mask works ▪ Trade secrets such as secret formulas, processes and recipes 	
<ul style="list-style-type: none"> ▪ Unpatented technology ▪ Databases, including title plants 	

Further details on the requirements relating to intangible assets acquired as part of a business combination are covered in Chapter 10.

5.3 Measuring the fair value of intangible assets acquired in a business combination

IFRS 3 assumes that there will always be sufficient information to measure reliably the fair value of an intangible asset acquired in a business combination if it is separable or arises from contractual or other legal rights.

The issues underlying the initial measurement of these intangible assets are discussed further in Chapter 10. The requirements of IFRS 13 are discussed in Chapter 15, which also addresses the challenges of applying IFRS 13 at initial recognition since fair value is defined as an exit price. In particular, the selection of appropriate valuation techniques, inputs to those valuation techniques and the application of the fair value hierarchy are discussed in Chapter 15.

5.4 Customer relationship intangible assets acquired in a business combination

Further guidance on customer relationships acquired in a business combination is provided by IFRS 3 in the Illustrative Examples, which form the basis of the example below. These demonstrate how the contractual-legal and separability criteria, discussed in section 2.1.1 above, interact in the recognition of acquired customer relationships. [IFRS 3.IE30].

Illustration 5-1: Customer relationship intangible assets acquired in a business combination**Supply agreement**

Acquirer Company (A) acquires Target Company (T) in a business combination. T has a five-year agreement to supply goods to Customer (C). Both T and A believe that C will renew the supply agreement at the end of the current contract. The supply agreement is not separable.

Because T establishes its relationship with C through a contract, not only the supply agreement (whether cancellable or not) but also T's customer relationship with C meet the contractual-legal criterion for identification as an intangible asset. Therefore, both the supply agreement and the customer relationship intangible asset are recognised separately from goodwill.

Sporting goods and electronics

A acquires T in a business combination. T manufactures goods in two distinct lines of business: sporting goods and electronics. Customer (C) purchases both sporting goods and electronics from T. T has a contract with C to be its exclusive provider of sporting goods, but has no contract for the supply of electronics to C. Both T and A believe that there is only one overall customer relationship between T and C.

As in the previous example, both the contract for the exclusive supply of sporting goods (whether cancellable or not) and the related customer relationship qualify for identification as an intangible asset because the contractual-legal criterion is met. Because T and A believe that there is only one customer relationship, the fair value of the intangible asset incorporates assumptions regarding T's relationship with C for both sporting goods and electronics.

However, if A determined that there were two customer relationships with C - one for sporting goods and another for electronics - the customer relationship for electronics would only be recognised if it meets the separability criterion for identification as an intangible asset (because there is not a current or past contract it can be linked to).

Order backlog and recurring customers

A acquires T in a business combination on 31 December 20X1. T does business with its customers solely through purchase and sales orders. At 31 December 20X1, T has a backlog of customer purchase orders from 60% of its customers, all of whom are recurring customers. The other 40% of T's customers are also recurring customers. However, as of 31 December 20X1, T has no open purchase orders or other contracts with those customers.

The purchase orders from 60% of T's customers (whether cancellable or not) meet the contractual-legal criterion, so the order backlog is recognised as an intangible asset separate from goodwill. Additionally, because T has a practice of establishing contracts (purchase and sales orders) with all of its customers, its relationship with all of its customers (not just the 60% in respect of which there is a backlog of purchase orders) also arises through contractual rights, and therefore meets the contractual-legal criterion for identification as an intangible asset, even though T does not have contracts with 40% of those customers at 31 December 20X1.

Motor insurance contracts

A acquires T, an Insurer, in a business combination. T has a portfolio of one-year motor insurance contracts that are cancellable by policyholders.

Because T establishes its relationships with policyholders through insurance contracts, the customer relationship with policyholders meets the contractual-legal criterion for identification as an intangible asset.

One of the most difficult areas of interpretation is whether an arrangement is contractual or not. Contractual customer relationships are always recognised separately from goodwill, but non-contractual customer relationships are recognised only if they are separable. Consequently, determining whether a relationship is contractual is critical to identifying and measuring customer relationship intangible assets and different conclusions could result in substantially different accounting outcomes. This is discussed in more detail in Chapter 10.

Given the widespread confusion, the matter was referred to the IASB and the FASB with a recommendation to review and amend IFRS 3 by:

- Removing the distinction between 'contractual' and 'non-contractual' customer-related intangible assets recognised in a business combination
- And
- Reviewing the indicators that identify the existence of a customer relationship in IFRS 3.IE28 and including them in the standard

When it considered the issue in March 2009, the IFRS IC was unable to develop an interpretation clarifying the distinction between contractual and non-contractual.

The IASB deferred both recommendations of the IFRS IC to the post-implementation review (PIR) of IFRS 3, which was completed in June 2015. As a result of the PIR of IFRS 3 the issue of the identification and fair value measurement of intangible assets such as customer relationships and brand names was added to the IASB's active agenda within its *Goodwill and Impairment* research project. In April 2018, the IASB decided not to consider allowing any identifiable intangible assets acquired in a business combination to be included within goodwill.⁹ The Exposure Draft *Business Combinations-Disclosures, Goodwill and Impairment* is covered in further detail in Chapter 10.

Despite the IASB's decision there will be divergent treatments in practice, depending on how entities interpret 'contractual' and 'non-contractual' customer-related intangible assets in a particular business combination.

5.5 In-process research and development

The term 'in-process research and development' (IPR&D) refers to those identifiable intangible assets resulting from research and development activities that are acquired in a business combination. An acquirer must recognise IPR&D separately from goodwill if the project meets the definition of an intangible asset. This is the case when the IPR&D project meets the definition of an asset and is identifiable, i.e., it is separable or arises from contractual or other legal rights. [IAS 38.34].

IPR&D projects, whether or not recognised by the acquiree, are protected by legal rights and are clearly separable, as they can be bought and sold by entities in the normal course of business.

Any subsequent expenditure incurred on the project after its acquisition must be accounted for in accordance with the general rules in IAS 38 on internally generated intangible assets which are discussed in section 6.2 below. [IAS 38.42]. In summary, this means that the subsequent expenditure is accounted for as follows: [IAS 38.43]

- Research expenditure is recognised as an expense when incurred.
- Development expenditure that does not satisfy the criteria for recognition as an intangible asset is recognised as an expense when incurred.

And

- Development expenditure that satisfies the recognition criteria is added to the carrying value of the acquired in-process research or development project.

This approach results in some IPR&D projects acquired in business combinations being treated differently from similar projects started internally because there are different criteria for recognition. The IASB acknowledged this point but decided that it could not support a treatment that allowed acquired IPR&D to be subsumed within goodwill. [IAS 38.BC82]. Until the Board finds time to address this issue, users of financial statements will have to live with the problem that an asset can be recognised for acquired research and development projects despite the fact that the entity might recognise as an expense the costs of internal projects at a similar stage of development.

The implication is that if an acquired project is ultimately successful, the asset recognised will have a higher carrying amount and related amortisation charged to profit and loss over its useful life than an equivalent internal project.

If the carrying value cannot be justified, the acquired asset will be impaired. An impairment test will be performed before the end of the period of acquisition and annually thereafter in accordance with the requirements of IAS 36 for intangible assets not yet available for use (see Chapter 21). [IAS 36.10]. Any impairment loss will be reflected in the entity's statement of profit or loss as a post-acquisition event.

⁹ [IASB Update](#), April 2018, available on the IFRS Foundation's website.

6 Internally generated intangible assets

6.1 Internally generated goodwill

IAS 38 explicitly prohibits the recognition of internally generated goodwill as an asset because internally generated goodwill is neither separable nor does it arise from contractual or legal rights. [IAS 38.48]. As such, it is not an identifiable resource controlled by the entity that can be measured reliably at cost. [IAS 38.49]. It therefore does not meet the definition of an intangible asset under the standard or that of an asset under the IASB's *Conceptual Framework*. The standard maintains that the difference between the fair value of an entity and the carrying amount of its identifiable net assets at any time may capture a range of factors that affect the fair value of the entity, but that such differences do not represent the cost of intangible assets controlled by the entity. [IAS 38.50].

6.2 Internally generated intangible assets

The IASB recognises that it may be difficult to decide whether an internally generated intangible asset qualifies for recognition because of problems in:

- (a) Confirming whether and when there is an identifiable asset that will generate expected future economic benefits
And
- (b) Determining the cost of the asset reliably, especially in cases where the cost of generating an intangible asset internally cannot be distinguished from the cost of maintaining or enhancing the entity's internally generated goodwill or of running day-to-day operations [IAS 38.51]

To avoid the inappropriate recognition of an asset, IAS 38 requires that internally generated intangible assets are not only tested against the general requirements for recognition and initial measurement (discussed in section 3 above), but also meet criteria which confirm that the related activity is at a sufficiently advanced stage of development, is both technically and commercially viable and includes only directly attributable costs. [IAS 38.51]. Those criteria comprise detailed guidance on accounting for intangible assets in the research phase (see section 6.2.1 below), the development phase (see section 6.2.2 below) and on components of cost of an internally generated intangible asset (see section 6.3 below).

If the general recognition and initial measurement requirements are met, the entity classifies the generation of the internally developed asset into a research phase and a development phase. [IAS 38.52]. Only expenditure arising from the development phase can be considered for capitalisation, with all expenditure on research being recognised as an expense when it is incurred. [IAS 38.54]. If it is too difficult to distinguish an activity between a research phase and a development phase, all expenditure is treated as research. [IAS 38.53].

The standard distinguishes between research and development activities as follows:

"Research is original and planned investigation undertaken with the prospect of gaining new scientific or technical knowledge and understanding." [IAS 38.8].

The standard gives examples of research activities: [IAS 38.56]

Extract from IAS 38

- 56 Examples of research activities are:
- (a) activities aimed at obtaining new knowledge;
 - (b) the search for, evaluation and final selection of, applications of research findings or other knowledge;
 - (c) the search for alternatives for materials, devices, products, processes, systems or services; and
 - (d) the formulation, design, evaluation and final selection of possible alternatives for new or improved materials, devices, products, processes, systems or services.

"Development is the application of research findings or other knowledge to a plan or design for the production of new or substantially improved materials, devices, products, processes, systems or services before the start of commercial production or use." [IAS 38.8].

The standard gives examples of development activities: [IAS 38.59]

Extract from IAS 38

- 59 Examples of development activities are:
- (a) the design, construction and testing of pre-production or pre-use prototypes and models;
 - (b) the design of tools, jigs, moulds and dies involving new technology;
 - (c) the design, construction and operation of a pilot plant that is not of a scale economically feasible for commercial production; and
 - (d) the design, construction and testing of a chosen alternative for new or improved materials, devices, products, processes, systems or services.

6.2.1 Research phase

An entity cannot recognise an intangible asset arising from research or from the research phase of an internal project. Instead, any expenditure on research or the research phase of an internal project must be expensed as incurred because the entity cannot demonstrate that there is an intangible asset that will generate probable future economic benefits. [IAS 38.54, IAS 38.55].

If an entity cannot distinguish the research phase from the development phase, it must treat the expenditure on that project as if it were incurred in the research phase only and recognise an expense accordingly. [IAS 38.53].

6.2.2 Development phase

The standard requires recognition of an intangible asset arising from development (or the development phase of an internal project), while it imposes stringent conditions that restrict recognition. These tests create a balance, ensuring that the entity does not recognise unrecoverable costs as an asset. The criteria, all of which need to be met, are set out in the extract from the standard below: [IAS 38.57]

Extract from IAS 38

- 57 An intangible asset arising from development (or from the development phase of an internal project) shall be recognised if, and only if, an entity can demonstrate all of the following:
- (a) the technical feasibility of completing the intangible asset so that it will be available for use or sale.
 - (b) its intention to complete the intangible asset and use or sell it.
 - (c) its ability to use or sell the intangible asset.
 - (d) how the intangible asset will generate probable future economic benefits. Among other things, the entity can demonstrate the existence of a market for the output of the intangible asset or the intangible asset itself or, if it is to be used internally, the usefulness of the intangible asset.
 - (e) the availability of adequate technical, financial and other resources to complete the development and to use or sell the intangible asset.
 - (f) its ability to measure reliably the expenditure attributable to the intangible asset during its development.

The fact that an entity can demonstrate that the asset will generate probable future economic benefits distinguishes development activity from the research phase, where it is unlikely that such a demonstration would be possible. [IAS 38.58].

It may be challenging to obtain objective evidence on each of the above conditions because:

- Condition (b) relies on management intent.
 - Conditions (c), (e) and (f) are entity-specific (i.e., whether development expenditure meets any of these conditions depends both on the nature of the development activity itself and the financial position of the entity).
- And
- Condition (d) above is more restrictive than is immediately apparent because the entity needs to assess the probable future economic benefits using the principles in IAS 36, i.e., using discounted cash flows. If the asset will generate economic benefits only in conjunction with other assets, the entity must apply the concept of cash-generating units. [IAS 38.60]. The application of IAS 36 is discussed in Chapter 21. Even if a discounted cash flow estimate, applying the principles of IAS 36, indicates that the asset under development will generate future economic benefits, there may exist significant uncertainties in relation to the successful completion of the project, estimated costs, future regulatory approvals, and future market conditions, that may call into question whether the expected future economic benefits can be deemed to be probable. This is illustrated in Illustration 6-1 below.

IAS 38 indicates that evidence may be available in the form of:

- A business plan showing the technical, financial and other resources needed and the entity's ability to secure those resources
 - A lender's indication of its willingness to fund the plan confirming the availability of external finance [IAS 38.61]
- And
- Detailed project information demonstrating that an entity's costing systems can measure reliably the cost of generating an intangible asset internally, such as salary and other expenditure incurred in securing copyrights or licences or developing computer software [IAS 38.62]

In any case, an entity must maintain books and records in sufficient detail that allow it to prove whether it meets the conditions set out by IAS 38.

Certain types of product (e.g., pharmaceuticals, aircraft and electrical equipment) require regulatory approval before they can be sold. Regulatory approval is not one of the criteria for recognition under IAS 38 and the standard does not prohibit an entity from capitalising its development costs in advance of approval. However, in some industries, regulatory approval is vital to commercial success and its absence indicates significant uncertainty around the possible future economic benefits. This is the case in the pharmaceuticals industry, where it is rarely possible to determine whether a new drug will secure regulatory approval until it is actually granted. Accordingly, it is common practice in this industry for costs to be expensed until such approval is obtained. See Illustration 6-1, Practical example 6-2 and the discussion in section 6.2.3 below.

Illustration 6-1: Recognition of development costs in a pharmaceutical projects

Entity X is a pharmaceutical company that is developing a drug (drug A) to treat a rare disease. Development of drug A is its only project. It has no sales revenues but expects to have sufficient cash to be able complete development without raising additional capital.

Entity X classifies drug development into three different phases, clinical Phase 1, 2 and 3. In clinical Phase 3 a large-scale trial is undertaken to verify the results achieved in clinical Phase 1 and 2. Before the drugs can be sold in the market Regulatory review and approval must be obtained, and such approval requires a positive outcome in the clinical Phase 3 trial.

At the end of 20X1 drug A is in clinical Phase 1. Phase 2 is expected to commence in 20X2, and Phase 3 expected to commence in 20X4. Regulatory approval is not expected to be obtained until 20X8 following the completion of successful trials in Phase 3.

During 20X1 as development costs are incurred, Entity X considers whether the expenditure meets the recognition criteria in paragraph 57 of IAS 38. Throughout 20X1, Entity X determines that criteria (b), (c), (f) and (e) are met. Criteria (a) and (d) however are not deemed to be met. As a result Entity X expenses all development costs incurred in the 20X1.

Criteria (a), the technical feasibility of completing the intangible asset, is not met. This is on the basis that final regulatory approval is dependent on external parties and is not within the control of Entity X. In addition, the remaining development activities for drug A are subject to a complex verification and registration process that require a significant amount of work and time, which also indicates that technical feasibility is not certain.

Criteria (d), that the intangible asset will generate probable future economic benefits, is not met. Although Entity X obtains an external valuation based on a discounted cash flow estimate, applying the principles of IAS 36, which indicates that the asset under development will generate future economic benefits, there exist significant uncertainties in relation to the successful completion of the project, estimated costs, future regulatory approvals, and future market conditions. These uncertainties result in Entity X being unable to conclude during 20X1 that it is probable that future economic benefits will be generated.

The standard does not define the terms 'research phase' and 'development phase' but explains that they have a broader meaning than 'research' and 'development' which it does define. [IAS 38.52]. The features characterising the research phase have less to do with what activities are performed, but relate more to an inability to demonstrate at that time that there is an intangible asset that will generate probable future benefits. [IAS 38.55]. This means that the research phase may include activities that do not necessarily meet the definition of 'research'. For example, the research phase for IAS 38 purposes may extend to the whole period preceding a product launch, regardless of the fact that activities that would otherwise characterise development are taking place at the same time, because certain features that would mean the project has entered its development phase are still absent (such as confirming an ability to use or sell the asset;

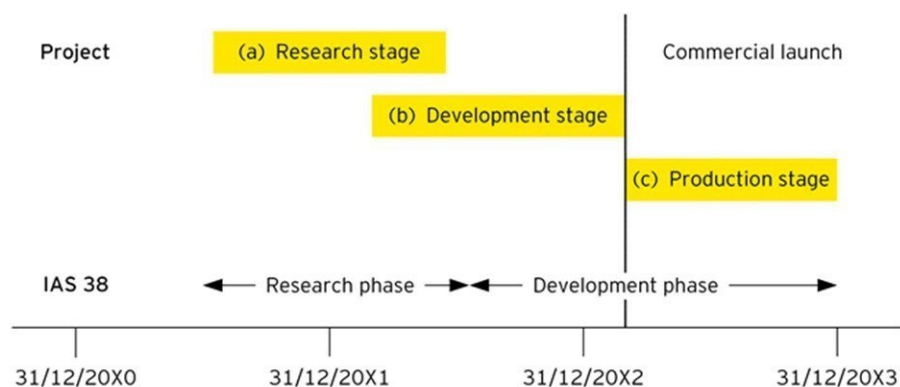

demonstrating sufficient market demand for a product; or uncertainty regarding the source of funds to complete the project). As a result, an entity might not be able to distinguish the research phase from the development phase of an internal project to create an intangible asset, in which case it must treat the expenditure on that project as if it were incurred in the research phase only and recognise an expense accordingly. [IAS 38.53]. It also means that the development phase may include activities that do not necessarily meet the definition of 'development'. The example below illustrates how an entity would apply these rules in practice.

Illustration 6-2: Research phase and development phase under IAS 38

Entity K is working on a project to create a database containing images and articles from newspapers around the world, which it intends to sell to customers over the internet. K has identified the following stages in its project:

- (a) Research stage - gaining the technical knowledge necessary to transfer images to customers and assessing whether the project is feasible from a technological point of view
 - (b) Development stage - performing market analysis to identify potential demand and customer requirements; developing the ability to exploit the image capture technology, including configuration of the required database software and acquiring the required data to populate the database, designing the customer interface and testing a prototype of the system
- And
- (c) Production stage - before and after the commercial launch of the service, debugging the system and improving functionality to service higher user volumes; updating and managing the database to ensure its currency

The above can be summarised as follows:

The activities in the research stage included under (a) meet the definition of research under IAS 38 and would be accounted for as part of the research phase of the project, as an expense.

The activities in the development stage included under (b) meet the definition of development under IAS 38. However, whilst K has started to plan the commercial exploitation of its image and data capture technology, it will not be immediately apparent that the project is economically viable. Until this point is reached, for example when the entity has established there is demand for the database and it is likely that a working prototype of the system will be available, the development activities cannot be distinguished from the research activities taking place at the same time. Accordingly, the initial development activities are accounted for as if they were incurred in the research phase. Only once it becomes possible to demonstrate the existence of an intangible asset that will generate future income streams, can project expenditure be accounted for under IAS 38 as part of the development phase.

There may be a period after the commercial launch of the service that would still be accounted for as part of the development phase. For example, activities to improve functionality to deal with higher actual customer volumes could constitute development. This does not necessarily mean that K can capitalise all this expenditure because it needs to pass the double hurdle of:

- The presumption in IAS 38.20 that "there are no additions to such an asset or replacements of part of it"
- And
- The six criteria in IAS 38.57 for recognition of development costs as an asset (see above)

Activity to ensure that the database is up-to-date is a routine process that does not involve major innovations or new technologies. Therefore, these activities in the production stage do not meet the definition of 'research' or 'development' and the related costs are recognised as an expense.

As the above example illustrates, the guidance in IAS 38 seems to take a somewhat restricted view as to how internally generated intangible assets are created and managed in practice, as well as the types of internally generated intangible assets. It requires activity to be classified into research and development phases, but this analysis does not easily fit with intangible assets that are created for use by the entity itself. The standard therefore does not address the everyday reality for entities such as software companies, television production companies, newspapers and data vendors that produce intangible assets in industrial-scale routine processes.

Many of the intangible assets produced in routine processes (e.g., software, television programmes, newspaper content and databases) meet the recognition criteria in the standard, but no specific guidance is available that could help an entity in dealing with the practical problems that arise when accounting for them. Generally, entities disclose little detail of the nature of their research and development activities and the costs that they incur, instead focusing on the requirements of IAS 38 that must be met before development expenditure can be capitalised. This is illustrated in Practical example 6-1 below:

Practical example 6-1: Sanofi (2023)	France
FORM 20-F [extract] 2023 Consolidated financial statements [extract] Notes to the Consolidated Financial Statements [extract] B/ Summary of significant accounting policies [extract] B.4. Other intangible assets [extract] B.4.1. Research and development not acquired in a business combination [extract] Internally generated research and development Under IAS 38, research expenses are recognized in profit or loss when incurred. Internally generated development expenses are recognized as an intangible asset if, and only if, all the following six criteria can be demonstrated: (a) the technical feasibility of completing the development project; (b) Sanofi's intention to complete the project; (c) Sanofi's ability to use the project; (d) the probability that the project will generate future economic benefits; (e) the availability of adequate technical, financial and other resources to complete the project; and (f) the ability to measure the development expenditure reliably. ...	

The difficulty in applying the IAS 38 recognition criteria for development costs in the pharmaceutical industry are discussed further in section 6.2.3 below. Technical and economic feasibility are typically established very late in the process of developing a new product, which means that usually only a small proportion of the development costs is capitalised.

When the development phase ends will also influence how the entity recognises revenue from the project. As noted in section 4.4 above, during the development phase an entity must recognise income from incidental operations, being those not necessary to develop the asset for its intended use, as revenue in profit or loss. [IAS 38.31].

IAS 38 is not explicit on how to account for income earned in relation to activity that is determined necessary to bring the intangible asset into its intended use. IAS 16 however does provide guidance in relation to this for items of property, plant and equipment that are under construction (see Chapter 19). IAS 16 requires that the proceeds, together with the cost of those items measured in accordance with IAS 2, from selling items produced while bringing an asset to the location and condition necessary for it to be capable of operating in the manner intended by management, are to be recognised in profit or loss in accordance with applicable standards. [IAS 16.20A]. In the absence of specific guidance in IAS 38, an entity must refer to the hierarchy in IAS 8 to develop an appropriate accounting policy (see Chapter 3). The hierarchy requires an entity to firstly consider the requirements in IFRS accounting standards dealing with similar and related issues. [IAS 8.11]. Therefore, an entity considers the extent to which it could apply the guidance in IAS 16, discussed above, to income earned in relation to activity that is determined necessary to bring the intangible asset into its intended use.

Examples of income earned in relation to activity that is determined necessary to bring the intangible asset into its intended use include income from the sale of samples produced during the testing of a new process or from the sale of a production prototype.

Care must be taken to confirm whether the incidence of income indicates that the intangible asset is ready for its intended use, in which case capitalisation of costs would cease, revenue would be recognised in profit or loss and the related costs of the activity would include a measure of amortisation of the asset.

Many entities use third parties to perform limited or substantial parts of their research and development activities. Contracts relating to research and development activities can be structured in many ways, but in many cases, include upfront and/or milestone payments. The entity pays specific amounts upon completion of a pre-determined amount of work or upon achievement of a target milestone by the third party. Considerations related to such situations are discussed in section 4.1 above.

6.2.3 Research and development in the pharmaceutical industry

Entities in the pharmaceutical industry consider research and development to be of primary importance to their business. Consequently, these entities spend a considerable amount on research and development every year and one might expect them to carry significant internally generated development intangible assets on their statement of financial position. However, their financial statements reveal that they often consider the uncertainties in the development of pharmaceuticals to be too great to permit capitalisation of development costs.

One of the problems is that, in the case of true ‘development’ activities in the pharmaceutical industry, the final outcome can be uncertain and the technical and economic feasibility of new products or processes is typically established very late in the development phase, which means that only a small proportion of the total development costs can ever be capitalised. In particular, many products and processes require approval by a regulator such as the US Food and Drug Administration (FDA) before they can be applied commercially and until that time, the entity may be uncertain of their success. After approval, of course, there is often relatively little in the way of further development expenditure.

In the pharmaceutical sector, the capitalisation of development costs for new products or processes usually begins at the date on which the product or process receives regulatory approval. In most cases that is the point when the IAS 38 criteria for recognition of intangible assets are met. It is unlikely that these criteria will have been met before approval is granted by the regulator.

Practical example 6-2 and Practical example 6-3 below illustrate some of the difficulties in applying the IAS 38 recognition criteria for development costs in the pharmaceutical industry.

Practical example 6-2: MERCK Kommanditgesellschaft auf Aktien (2023) Germany

ANNUAL REPORT 2023 [extract]

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

Operating Assets, Liabilities, and Contingent Liabilities [extract]

(19) Other intangible assets [extract]

Accounting and measurement policies [extract]

Recognition and initial measurement of internally generated intangible assets

Owing to the high level of uncertainty until pharmaceutical products are approved, the criteria for the capitalization of development costs in accordance with IAS 38 are not met in the Healthcare business sector for the development of drug candidates. Costs incurred after regulatory approval are insignificant and are therefore not recognized as intangible assets. In the Life Science and Electronics business sectors, development expenses are capitalized as soon as all the recognition criteria are met and can be verified accordingly. This also includes expenses that are required for REACH registration. Furthermore, development expenses for internal software projects and the enhancement of purchased ERP programs are capitalized providing that the relevant criteria have been fulfilled.

Practical example 6-3: Roche Holding Ltd (2023)**Switzerland****Finance Report 2023 [extract]****Roche Group Consolidated Financial Statements [extract]****Notes to the Roche Group Consolidated Financial Statements [extract]****34. Accounting policies [extract]****Research and development**

Internal research and development activities are expensed as incurred for the following:

- Internal research costs incurred for the purpose of gaining new scientific or technical knowledge and understanding.
- Internal development costs incurred for the application of research findings or other knowledge to plan and develop new products for commercial production. The development projects undertaken by the Group are subject to technical, regulatory and other uncertainties, such that, in the opinion of management, the criteria for capitalisation as intangible assets are not met prior to obtaining marketing approval by the regulatory authorities in major markets.
- Post-marketing studies after regulatory approval, such as phase IV costs in the pharmaceuticals business, generally involve safety surveillance and ongoing technical support of a drug after it receives marketing approval to be sold. They may be required by regulatory authorities or may be undertaken for safety or commercial reasons. The costs of such post-marketing studies are not capitalised as intangible assets as, in the opinion of management, they do not generate separately identifiable incremental future economic benefits that can be reliably measured.

...

6.2.4 Internally generated brands, mastheads, publishing titles and customer lists

IAS 38 considers internally generated brands, mastheads, publishing titles, customer lists and items similar in substance to be indistinguishable from the cost of developing a business as a whole, so it prohibits their recognition. [IAS 38.63, IAS 38.64]. As discussed in section 3.3 above, the same applies to subsequent expenditures incurred in connection with such intangible assets even when originally acquired externally. [IAS 38.20]. For example, expenditure incurred in redesigning the layout of newspapers or magazines, which represent subsequent expenditure on publishing titles and mastheads, must not be capitalised.

6.2.5 Website costs (SIC-32)

SIC-32 clarifies how IAS 38 applies to costs in relation to websites designed for use by the entity in its business. An entity's own website that arises from development and is for internal or external access is an internally generated intangible asset under the standard. [SIC-32.7]. A website designed for external access may be used for various purposes such as to promote and advertise an entity's own products and services, provide electronic services to customers, and sell products and services. A website may be used within the entity to give staff access to company policies and customer details, and allow them to search for relevant information. [SIC-32.1].

SIC-32 does not apply to items that are accounted for under another standard, such as the development or operation of a website (or website software) for sale to another entity (IAS 2 and IFRS 15); acquiring or developing hardware supporting a website (IAS 16); or a website (or website software) subject to a leasing arrangement (IFRS 16). [SIC-32.5, SIC-32.6].

Under SIC-32, an intangible asset must be recognised for website development costs if and only if it meets the general recognition requirements in IAS 38 (see section 3.1 above) and the six conditions for recognition as development costs (see section 6.2.2 above). Most important of these is the requirement to demonstrate how the website will generate probable future economic benefits. [SIC-32.8]. The interpretation deems an entity unable to demonstrate this for a website developed solely or primarily for promoting and advertising its own products and services. All expenditure on developing such a website must be recognised as an expense when incurred. Accordingly, it is unlikely that costs will be eligible for capitalisation unless an entity can demonstrate that the website is used directly in the income-generating process, for example where customers can place orders on the entity's website. [SIC-32.8].

The following stages of a website's development are identified by the interpretation: [SIC-32.2, SIC-32.9]

- (a) *Planning* includes undertaking feasibility studies, defining objectives and specifications, evaluating alternatives and selecting preferences. Expenditures incurred in this stage are similar in nature to the research phase and must be recognised as an expense when they are incurred.
- (b) *Application and infrastructure development* includes obtaining a domain name, purchasing and developing hardware and operating software, installing developed applications and stress testing. The requirements of IAS 16 are applied to expenditure on physical assets. Other costs are recognised as an expense, unless they can be directly attributed, or allocated on a reasonable and consistent basis, to preparing the website for its intended use and the project to develop the website meets the SIC-32 criteria for recognition as an intangible asset.
- (c) *Graphical design development* includes designing the appearance of web pages. Costs incurred at this stage must be accounted for in the same way as expenditure incurred in the 'application and infrastructure development' stage described under (b) above.
- (d) *Content development* includes creating, purchasing, preparing and uploading information, either textual or graphical in nature, on the website before the completion of the website's development. The costs of content developed to advertise and promote an entity's own products and services are always expensed as incurred. Other costs incurred in this stage must be recognised as an expense unless the criteria for recognition as an asset described in (b) above are satisfied.

And

- (e) The *operating stage*, which starts after completion of the development of a website, when an entity maintains and enhances the applications, infrastructure, graphical design and content of the website. [SIC-32.3]. Expenditure incurred in this stage must be expensed as incurred unless it meets the asset recognition criteria in IAS 38.

In making these assessments, the entity must evaluate the nature of each activity for which expenditure is incurred, independently of its consideration of the website's stage of development. [SIC-32.9]. This means that even where a project has been determined to qualify for recognition as an intangible asset, not all costs incurred in relation to a qualifying stage of development are eligible for capitalisation. For example, whilst the direct costs of developing an online ordering system might qualify for recognition as an asset, the costs of training staff to operate that system must be expensed because training costs are deemed not necessary to creating, producing or preparing the website for it to be capable of operating (see section 6.3 below). [IAS 38.67]. Examples of other costs that would be recognised as an expense regardless of the stage of the project are given in the Illustrative Example to SIC-32, including:

- (a) Selling, administrative and other general overhead expenditure unless it can be directly attributed to preparing the website for use to operate in the manner intended by management
- (b) Clearly identified inefficiencies in the project, such as those relating to alternative solutions explored and rejected

And

- (c) Initial operating losses incurred before the website achieves planned performance

A website qualifying for recognition as an intangible asset must be measured after initial recognition by applying the cost model or the revaluation model in IAS 38 as discussed in sections 8.1 and 8.2 below. In respect of the useful life of website assets, the expectation is that it should be short. [SIC-32.10].

The criteria for recognition as an asset are restrictive. On-line fashion retailer, ASOS Plc, does not capitalise website development costs, as demonstrated in the Practical example below.

Practical example 6-4: ASOS Plc (2023)

United Kingdom

ASOS Plc Annual Report and Accounts 2023 [extract]

Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

11 GOODWILL AND OTHER INTANGIBLE ASSETS [extract]

Accounting policy [extract]

Computer software [extract]

...

The cost of acquiring and developing software that is not integral to the related hardware is capitalised separately as an intangible asset. This does not include internal website development and maintenance costs, which are expensed as incurred unless representing a technological advance leading to future economic benefit. Capitalised software costs include external direct costs of material and services and the payroll and payroll-related costs for employees who are directly associated with the project. Software under development is held at cost less any recognised impairment loss.

6.2.6 Agile software development

A similar assessment process to that discussed in section 6.2.5 above needs to be undertaken in accounting for agile software development, where there are similar challenges in determining whether expenditures must be recognised as an intangible asset or be expensed as incurred. Agile software development is an iterative development process, where the software is delivered in small, but functional, increments. This is in contrast to traditional software development where the sequence of the phases in which the software is developed is linear and focuses on the delivery of a fully functioning complete software product in accordance with the original plans and specifications. Agile software development also has further complexities that must be carefully considered, for example:

- It is difficult to determine a relevant unit of account (i.e., the unit of account could be the entire suite of software applications, individual applications, functional elements, or lines of code). The determination of the unit of account is likely to have an impact on the determination as to the whether the recognition criteria in paragraph 57 of IAS 38 have been met (see section 6.2.2 above), the determination of the costs eligible for capitalisation (see section 6.3.2 below), the useful economic life of the asset (see section 9.1 below), the amortisation period (see section 9.2.1 below), and impairment (see section 9.4 below) and derecognition (see section 9.5 below) considerations.
- An entity may not have clear budgets for its agile software development, so there is an increased risk of incorrectly recognising inefficiencies and cost overruns as part of the resulting intangible asset. Identified inefficiencies do not form part of the cost of an internally generated asset (see section 6.3.2 below). [IAS 38.67].
- It can be difficult to maintain the appropriate balance between capitalising new development costs (see section 6.3 below), derecognising past development costs (see section 9.5 below), and determining the amortisation period of the asset (see section 9.2.1 below).

And

- Some of the steps in the continuous update process applied in agile software development are more akin to maintenance and must therefore be expensed as incurred.

6.3 Cost of an internally generated intangible asset

On initial recognition, an intangible asset must be measured at cost, [IAS 38.24], which the standard defines as the amount of cash or cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction. When applicable, cost is the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRS accounting standards, e.g., IFRS 2. [IAS 38.8]. It is important to ensure that cost includes only the expenditure incurred after the recognition criteria are met and to confirm that only costs directly related to the creation of the asset are capitalised.

6.3.1 Establishing the time from which costs can be capitalised

The cost of an internally generated intangible asset is the sum of the expenditure incurred from the date when the intangible asset first meets the recognition criteria of the standard, [IAS 38.65], and meets the detailed conditions for recognition of development phase costs as an asset (see section 6.2.2 above).

Costs incurred before these criteria are met are expensed, [IAS 38.68], and cannot be reinstated retrospectively, [IAS 38.65], because IAS 38 does not permit recognition of past expenses as an intangible asset at a later date. [IAS 38.71].

The following Illustration, which is taken from IAS 38, shows how these above rules must be applied in practice.

Illustration 6-3: Recognition of internally generated intangible assets

An entity is developing a new production process. During 20X1, expenditure incurred was CU1,000, of which CU900 was incurred before 1 December 20X1 and CU100 was incurred between 1 December 20X1 and 31 December 20X1. The entity is able to demonstrate that, at 1 December 20X1, the production process met the criteria for recognition as an intangible asset. The recoverable amount of the know-how embodied in the process (including future cash outflows to complete the process before it is available for use) is estimated to be CU500.

At the end of 20X1, the production process is recognised as an intangible asset at a cost of CU100 (expenditure incurred since the date when the recognition criteria were met, that is, 1 December 20X1). The CU900 expenditure incurred before 1 December 20X1 is recognised as an expense because the recognition criteria were not met until 1 December 20X1. This expenditure does not form part of the cost of the production process recognised in the statement of financial position.

During 20X2, expenditure incurred is CU2,000. At the end of 20X2, the recoverable amount of the know-how embodied in the process (including future cash outflows to complete the process before it is available for use) is estimated to be CU1,900.

At the end of 20X2, the cost of the production process is CU2,100 (CU100 expenditure recognised at the end of 20X1 plus CU2,000 expenditure recognised in 20X2). The entity recognises an impairment loss of CU200 to adjust the carrying amount of the process before impairment loss (CU2,100) to its recoverable amount (CU1,900). This impairment loss will be reversed in a subsequent period if the requirements for the reversal of an impairment loss in IAS 36 are met.

6.3.2 Determining the costs eligible for capitalisation

The cost of an internally generated intangible asset comprises all directly attributable costs necessary to create, produce, and prepare the asset to be capable of operating in the manner intended by management. Examples of directly attributable costs are:

- (a) Costs of materials and services used or consumed in generating the intangible asset
- (b) Costs of employee benefits arising from the generation of the intangible asset
- (c) Fees to register a legal right
- (d) Amortisation of patents and licences that are used to generate the intangible asset

And

- (e) Borrowing costs that meet the criteria under IAS 23 for recognition as an element of cost [IAS 38.66]

The standard also specifically prohibits recognition of the following items as a component of cost:

- (a) Selling, administrative and other general overhead expenditure unless this expenditure can be directly attributed to preparing the asset for use
- (b) Identified inefficiencies and initial operating losses incurred before the asset achieves planned performance

And

- (c) Expenditure on training staff to operate the asset [IAS 38.67]

For these purposes it does not make any difference whether the costs are incurred directly by the entity or relate to services provided by third parties.

An example of administrative and other general overhead expenditure that may be considered directly attributable to preparing an asset for use would be the depreciation of a research and development facility and the associated overheads such as electricity or insurance, if this facility was used in the creation of internally generated intangible assets.

7 Recognition of an expense

Unless expenditure is incurred in connection with an item that meets the criteria for recognition as an intangible asset, and is an eligible component of cost, it must be expensed. The only exception is in connection with a business combination, where the cost of an item that cannot be recognised as an intangible asset will form part of the carrying amount of goodwill at the acquisition date. [IAS 38.68].

Some of the ineligible components of cost are identified in sections 4.3 and 6.3.1 above and include costs that are not directly related to the creation of the asset, such as costs of introducing a new product or costs incurred to redeploy an asset. IAS 38 provides other examples of expenditure that is recognised as an expense when incurred:

- (a) Start-up costs, unless they qualify for recognition as part of the cost of property, plant and equipment under IAS 16 (see Chapter 19). Start-up costs recognised as an expense may consist of establishment costs such as legal and secretarial costs incurred in setting up a legal entity, expenditure to open a new facility or business or expenditures for starting new operations or launching new products or processes
 - (b) Training costs
 - (c) Advertising and promotional activities (including mail order catalogues)
- And
- (d) Relocation or reorganisation costs [IAS 38.69]

For these purposes no distinction is made between costs that are incurred directly by the entity and those that relate to services provided by third parties. However, the standard does not prevent an entity from recording a prepayment if it pays for the delivery of goods before obtaining a right to access those goods. Similarly, a prepayment can be recognised when payment is made before the services are received. [IAS 38.70].

In March 2020 the IFRS IC considered whether training costs to fulfil a contract must be recognised as an asset or expensed. The costs in the fact pattern submitted to the IFRS IC were those incurred to train an entity's employees so that they understand the customer's equipment and processes. The IFRS IC noted that IAS 38.69(b) includes expenditure on training activities as an example of expenditure that is incurred to provide future economic benefits to an entity, but no intangible asset or other asset is acquired or created that can be recognised. Consequently, IAS 38.69 states that such expenditure on training activities is recognised as an expense when incurred. Paragraph 15 of IAS 38 explains that an entity usually has insufficient control over the expected future economic benefits arising from a team of skilled staff and from training for these items to meet the definition of an intangible asset. In addition, in explaining the requirements in IFRS 15 regarding costs to fulfil a contract, IFRS 15.BC307 states that "if the other Standards preclude the recognition of any asset arising from a particular cost, an asset cannot then be recognised under IFRS 15". Accordingly, the IFRS IC concluded that, in the fact pattern submitted, the entity recognises the training costs to fulfil the contract with the customer as an expense when incurred. The IFRS IC noted that the entity's ability to charge to the customer the costs of training does not affect that conclusion.¹⁰ This issue is discussed in more detail in Chapter 28.

7.1 Catalogues and other advertising costs

The Board considers that advertising and promotional activities do not qualify for recognition as an intangible asset because their purpose is to enhance or create internally generated brands or customer relationships, which themselves cannot be recognised as intangible assets. [IAS 38.BC46B]. An entity has a different asset, a prepayment, if it has paid for goods or services before they are provided, as described above. However, the Board did not believe this justified an asset being recognised beyond the point at which the entity gained the right to access the related goods or had received the related services. [IAS 38.BC46D]. Entities cannot, therefore, maintain a prepayment asset and defer recognising an expense in the period between receiving the material from a supplier and delivery to its customers or potential customers. [IAS 38.BC46E].

¹⁰ [IFRIC Update](#), March 2020, available on the IFRS Foundation's website.

Accordingly, the IASB is deliberate in using the phrase ‘obtaining the right to access those goods’ when it defines the point at which an expense is recognised. This is because the date of physical delivery could be altered without affecting the substance of the commercial arrangement with the supplier. [IAS 38.BC46E]. Recognition is determined by the point when the goods have been constructed by the supplier in accordance with the terms of the customer contract and the entity could demand delivery in return for payment. [IAS 38.69A]. Therefore, an entity must recognise an expense for customer catalogues once they are ready for delivery from the printer, even if the entity has arranged for the printer to send catalogues directly to customers when advised by the entity’s sales department. Similarly, in the case of services, an expense is recognised when those services are received by the entity, and not deferred until the entity uses them in the delivery of another service, for example, to deliver an advertisement to its customers. [IAS 38.69A].

The Board rejected calls to make a special case for mail order catalogues, where it was argued that they created a distribution network, on the grounds that their primary objective was to advertise goods to customers. [IAS 38.BC46G]. For this reason, the wording in the standard cites mail order catalogues as an example of expenditure on advertising and promotional activities that is recognised as an expense. [IAS 38.69].

Standard marketing activities may consist of mailings, advertisements in print media, TV and a continuous internet presence. The respective contractual agreements usually include a clearly identifiable service or asset and include only advertising and promotional costs. As discussed above, the costs must be expensed when the goods or services are received. However, the timing of the receipt of the goods and services may be unclear, particularly in situations where multiple suppliers are used to deliver the marketing activity. For example, where an entity engages an advertising agency to conceptualise a television, radio or print media advertisement, but also engages other parties to produce the material. An entity will need to carefully examine such arrangements to determine when it obtains the right to access to the goods and services provided by the respective party(ies) to determine when the cost must be expensed.

Advertising and promotional activities can take a number of different forms, encompassing multiple rights and obligations. For example, some sponsorship arrangements may include separable rights that are not advertising and promotional costs, such as exclusive distribution rights of products at an event or in a location, or the right to use the logo of the event. Providing the recognition criteria in IAS 38 are met, these rights may be eligible to be recognised as an intangible asset. Entities need to consider in each case what service or right is being received, together with when the payments are made and, in some circumstances, it may be appropriate to recognise a prepayment or intangible asset for those expenditures.

Some companies use celebrities (e.g., athletes, models and actors) to promote their brands and products. Contracts often cover a term of several years and may contain multiple performance obligations for the celebrity and several different payment obligations for the company. Entities will need to apply judgement and consider the facts and circumstances of each contract to determine whether it has received the services at a point in time or whether there is an ongoing performance for which an intangible asset must be recognised.

Some companies, especially in the food and beverages and personal care sector, provide their customers with marketing and promotional materials ranging from samples (e.g., small perfume bottles that are distributed free of charge to the end customers) to long-lived assets (e.g., large umbrellas with the logo of the beverage brand used in garden restaurants or large advertising signs). These costs are usually expensed when the company has a right to access those goods (not when they are distributed to customers), as it does not get any benefit from them other than marketing and brand promotion.

8 Measurement after initial recognition

IAS 38, in common with a number of other IFRS accounting standards, provides an entity the option to choose between two alternative treatments: [IAS 38.72]

- The *cost model*, which requires measurement at cost less any accumulated amortisation and any accumulated impairment losses [IAS 38.74]
- Or
- The *revaluation model*, which requires measurement at a revalued amount, being its fair value at the date of the revaluation, less any subsequent accumulated amortisation and any subsequent accumulated impairment losses [IAS 38.75]

The revaluation option is only available if there is an active market for the intangible asset. [IAS 38.75, IAS 38.81, IAS 38.82]. Active market is defined by IFRS 13: [IFRS 13 Appendix A]

Extract from IFRS 13

Appendix A Defined terms

active market

A market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis.

There are no provisions in IAS 38 that allow fair value to be determined indirectly, for example by using the techniques and financial models applied to estimate the fair value of intangible assets acquired in a business combination. Therefore, in accordance with IFRS 13, an entity must measure the fair value of an intangible under the revaluation model using the price in an active market for an identical asset, i.e., a Level 1 price. For further guidance on the price in an active market, see Chapter 15. If an entity chooses an accounting policy to measure an intangible asset at revalued amount, it must apply the revaluation model to all the assets in that class, unless there is no active market for those other assets. [IAS 38.72]. A class of intangible assets is a grouping of assets of a similar nature and use in an entity's operations. [IAS 38.73]. Examples of separate classes of intangible asset are given in the standard: [IAS 38.119]

Extract from IAS 38

119 A class of intangible assets is a grouping of assets of a similar nature and use in an entity's operations. Examples of separate classes may include:

- (a) brand names;
- (b) mastheads and publishing titles;
- (c) computer software;
- (d) licences and franchises;
- (e) copyrights, patents and other industrial property rights, service and operating rights;
- (f) recipes, formulae, models, designs and prototypes; and
- (g) intangible assets under development.

The classes mentioned above are disaggregated (aggregated) into smaller (larger) classes if this results in more relevant information for the users of the financial statements.

The standard requires assets in the same class to be revalued at the same time, as to do otherwise would allow selective revaluation of assets and the reporting of a mixture of costs and values as at different dates within the same asset class. [IAS 38.73].

8.1 Cost model for measurement of intangible assets

Under the cost model, after initial recognition, the carrying amount of an intangible asset is its cost less any accumulated amortisation and accumulated impairment losses. [IAS 38.74]. The rules on amortisation of intangible assets are discussed in sections 9.2 and 9.3 below; and impairment is discussed in section 9.4 below.

8.2 Revaluation model for measurement of intangible assets

An entity can only apply the revaluation model if the fair value can be determined by reference to an active market. [IAS 38.75, IAS 38.81, IAS 38.82]. An active market will rarely exist for intangible assets (see section 8.2.1 below). [IAS 38.78].

After initial recognition an intangible asset must be carried at a revalued amount, which is its fair value at the date of the revaluation less any subsequent accumulated amortisation and any subsequent accumulated impairment losses. [IAS 38.75]. To prevent an entity from circumventing the recognition rules of the standard, the revaluation model does not allow:

- The revaluation of intangible assets that have not previously been recognised as assets
- Or
- The initial recognition of intangible assets at amounts other than cost [IAS 38.76]

These rules are designed to prevent an entity from recognising at a 'revalued' amount an intangible asset that was never recorded because its costs were expensed, as they did not at the time meet the recognition rules. As noted in section 6.3.1 above, IAS 38 does not permit recognition of past expenses as an intangible asset at a later date. [IAS 38.71].

However, it is permitted to apply the revaluation model to the whole of an intangible asset even if only part of its cost was originally recognised as an asset because it did not meet the criteria for recognition until part of the way through the process. [IAS 38.77]. Since the prohibition on initial recognition of intangible assets at amounts other than cost would also prevent the revaluation of quotas and permits allocated by governments and similar bodies - which are amongst the few intangible assets that do have an active market - the standard specifically makes an exception and allows the revaluation model to be applied to "an intangible asset that was received by way of a government grant and recognised at a nominal amount". [IAS 38.77].

The example below illustrates how this would work in practice.

Illustration 8-1: Application of revaluation model to intangible assets that are partially recognised or received by way of government grant

Entity C spent CU12,000,000 in preparing its application for a number of taxi licences, which it expensed because of the uncertain outcome of the process. The application was successful, and C was granted a number of freely transferable taxi licences and paid a nominal registration fee of CU50,000, which it recognised as an asset. There is an active and liquid market in these taxi licences.

C can apply the revaluation model under IAS 38 to these taxi licences, because it previously recognised the licence (even if it only recognised part of the costs as an asset) and there is an active market in these licences.

Entity D obtained a number of freely transferable fishing quotas free of charge, which it recognised at a nominal amount as permitted under IAS 20. There is an active and liquid market in these quotas.

D can apply the revaluation model under IAS 38 to these fishing quotas, because it previously recognised the quota (even if it only recognised it at a nominal amount) and there is an active market in these quotas.

8.2.1 Revaluation is only allowed if there is an active market

An entity can only elect to apply the revaluation model if the fair value can be determined by reference to an active market for the intangible asset. [IAS 38.81, IAS 38.82]. An active market is defined in IFRS 13 as one in which transactions for the item take place with sufficient frequency and volume to provide pricing information on an ongoing basis. [IFRS 13 Appendix A].

Few intangible assets will be eligible for revaluation and indeed the standard concedes that such an active market would be uncommon. Nevertheless, in some jurisdictions, an active market may exist for freely transferable taxi licences, fishing licences or production quotas. [IAS 38.78]. However, by their very nature most intangible assets are unique or entity-specific. The standard lists brands, newspaper mastheads, music and film publishing rights, patents or trademarks as items that are ineligible for revaluation because each such asset is unique. [IAS 38.78]. The existence of a previous sale and purchase transaction is not sufficient evidence for the market to be regarded as active because of the requirement in the definition for a sufficient frequency and volume of transactions to allow the provision of ongoing pricing information. The standard notes that where contracts are negotiated between individual buyers and sellers or when transactions are relatively infrequent, the price of a previous transaction for one intangible asset may not provide sufficient evidence of the fair value of another. In addition, if prices are not available to the public, this is taken as evidence that an active market does not exist. [IAS 38.78].

An entity must stop revaluing an asset if the market used to determine its fair value ceases to meet the criteria for an active market. The valuation is 'frozen' from that date, and reduced thereafter by subsequent amortisation and any subsequent impairment losses. [IAS 38.82]. The IASB believes that the disappearance of a previously active market may indicate that the asset needs to be tested for impairment in accordance with IAS 36. [IAS 38.83].

If an active market for the previously revalued asset emerges at a later date, the entity is required to apply the revaluation model from that date. [IAS 38.84].

8.2.2 Frequency of revaluations

IAS 38 requires revaluations to be performed "with such regularity that at the end of the reporting period the carrying amount of the asset does not differ materially from its fair value". [IAS 38.75]. The standard lets entities judge for themselves the frequency of revaluations depending on the volatility of the fair values of the underlying intangible assets. Significant and volatile movements in fair value would necessitate annual revaluation, whereas a less frequent update would be required for intangibles whose price is subject only to insignificant movements. [IAS 38.79]. Nevertheless, since an entity can only revalue assets for which a price is quoted in an active market, there must be no impediment to updating that valuation at each reporting date. As noted above, when an entity has a number of items in the same class of intangible assets, the standard requires that they are all valued at the same time. [IAS 38.73].

8.2.3 Accounting for revaluations

Increases in an intangible asset's carrying amount as a result of a revaluation must be credited to other comprehensive income, except to the extent that the revaluation reverses a revaluation decrease of the same asset that was previously recognised in profit or loss. [IAS 38.85]. Conversely, decreases in an intangible asset's carrying amount as a result of a revaluation must be recognised in profit or loss, unless the decrease reverses an earlier upward revaluation, in which case the decrease must first be recognised in other comprehensive income to extinguish the revaluation surplus in respect of the asset. [IAS 38.86]. The example below illustrates how this works.

Illustration 8-2: Accounting for upward and downward revaluations

Entity E acquired an intangible asset that it accounts for under the revaluation model. The fair value of the asset changes as follows:

	CU	CU Change
Acquisition	530	-
Date A	550	+20
Date B	520	-30
Date C	510	-10
Date D	555	+45

The table below shows how Entity E must account for the upward and downward revaluations.

	Value of asset CU	Cumulative revaluation reserve CU	Revaluation recognised in other comprehensive income CU	Revaluation recognised in profit or loss CU
Acquisition	530	-	-	-
Date A	550	20	20	-
Date B	520	-	(20)	(10)
Date C	510	-	-	(10)
Date D	555	25	25	20

The diagram below summarises this information (the impact of amortisation on the carrying amount and revaluation surplus has been ignored in this example for the sake of simplicity).

The upward revaluation at Date A is accounted for in other comprehensive income. The downward revaluation at Date B first reduces the revaluation reserve for that asset to nil and the excess of CU10 is recognised as a loss in profit or loss. The second downward revaluation at Date C is recognised as a loss in profit or loss. The upward revaluation at Date D first reverses the cumulative loss recognised in profit or loss and the excess is accounted for in other comprehensive income.

In the Illustration above, the impact of amortisation on the carrying amount of the assets and the revaluation surplus was ignored for the sake of simplicity. However, the cumulative revaluation surplus included in other comprehensive income may be transferred directly to retained earnings when the surplus is realised, which happens either on the retirement or disposal of the asset, or as the asset is used by the entity. [IAS 38.87]. In the latter case, the amount of the surplus regarded as realised is the amount of amortisation in excess of what would have been charged based on the asset's historical cost. [IAS 38.87]. See Chapter 19 for an example. In practice this means two things:

- An entity applying the revaluation model would need to track both the historical cost and revalued amount of an asset to determine how much of the revaluation surplus has been realised.
- And
- Any revaluation surplus is amortised over the life of the related asset. Therefore, in the case of a significant downward revaluation there is a smaller revaluation surplus available against which the downward revaluation can be offset before recognition in the statement of profit or loss.

The transfer from revaluation surplus to retained earnings is not made through profit or loss. [IAS 38.87]. It is not the same as recycling a gain or loss previously recognised in other comprehensive income. Accordingly, the transfer will appear as a line item in the Statement of Changes in Equity rather than in other comprehensive income.

When an intangible asset is revalued, the carrying amount of that asset is adjusted to the revalued amount. At the date of the revaluation, the asset is treated in one of the following ways:

- (a) The gross carrying amount is adjusted in a manner that is consistent with the revaluation of the carrying amount of the asset. For example, the gross carrying amount may be restated by reference to observable market data or it may be restated proportionately to the change in the carrying amount. The accumulated amortisation at the date of the revaluation is adjusted to equal the difference between the gross carrying amount and the carrying amount of the asset after taking into account accumulated impairment losses.
- Or
- (b) The accumulated amortisation is eliminated against the gross carrying amount of the asset. [IAS 38.80].

The example below illustrates how the adjustments are calculated.

Illustration 8-3: Restatement of accumulated amortisation after a revaluation

Entity F revalued an intangible asset from its carrying amount of CU120 to its fair value of CU150. The gross carrying amount is adjusted to CU345 by reference to the observable market data. The adjustment is in a manner consistent with the revaluation of the intangible asset. Under the observable market data approach (in the column, approach (a)), the accumulated amortisation is adjusted to CU195, which is the difference between the gross revalued amount of CU345 and the net revalued amount of CU150. The proportionate restatement approach (in the column, approach (b)) leads to 'grossing-up' of both the gross carrying amount and the accumulated amortisation. The elimination approach (in the column, approach (c)) results in elimination of the accumulated amortisation.

	Before revaluation	After revaluation		
		<i>Observable market data</i> (a)	<i>Proportionate restatement</i> (b)	<i>Eliminating amortisation</i> (c)
	CU	CU	CU	CU
Gross carrying amount	300	345	375	150
Accumulated amortisation	(180)	(195)	(225)	-
Net carrying amount	120	150	150	150

9 Amortisation of intangible assets

9.1 Assessing the useful life of an intangible asset as finite or indefinite

IAS 38 defines the useful life of an intangible asset as:

- (a) The period over which an asset is expected to be available for use by an entity

Or

- (b) The number of production or similar units expected to be obtained from the asset by an entity [IAS 38.8]

The standard requires an entity to assess whether the useful life of an intangible asset is finite or indefinite. [IAS 38.88]. An intangible asset with a finite useful life is amortised over its useful life or the number of production units (or similar units) constituting that useful life, whereas an intangible asset with an indefinite useful life is not amortised. [IAS 38.89].

The standard requires an intangible asset to be classified as having an indefinite useful life “when, based on an analysis of all of the relevant factors, there is no foreseeable limit to the period over which the asset is expected to generate net cash inflows for the entity”. [IAS 38.88]. Therefore, for this purpose the term ‘indefinite’ does not mean ‘infinite’. [IAS 38.91].

Entities must not confuse the absence of a foreseeable limit to an asset’s life with an ability to renew, refresh or upgrade an asset to ensure it continues to generate future cash flows. Some intangible assets are based on legal rights that are conveyed in perpetuity rather than for finite terms, whether or not those terms are renewable. If the cash flows are expected to continue indefinitely, the useful life is indefinite. [IAS 38.BC62].

An important underlying assumption in making the assessment of the useful life of an intangible asset is that it “reflects only that level of future maintenance expenditure required to maintain the asset at its standard of performance assessed at the time of estimating the asset’s useful life, and the entity’s ability and intention to reach such a level. A conclusion that the useful life of an intangible asset is indefinite must not depend on planned future expenditure in excess of that required to maintain the asset at that standard of performance.” [IAS 38.91]. Determining exactly what constitutes the level of expenditure ‘required to maintain the asset at that standard of performance’ is a matter of judgement. However, a clear distinction exists between this type of expenditure and costs that might be incurred to renew, refresh or upgrade an asset to ensure it continues to generate future cash flows. Expenditure to ensure that an intangible asset does not become obsolete is not the type of maintenance expenditure that, though very necessary to ensure continuing future cash flows, would be indicative of an indefinite life. Indeed, the standard asserts that assets subject to technological change would be expected to have a short useful life. [IAS 38.92].

9.1.1 Factors affecting the useful life

The standard identifies a number of factors that may affect the useful life of an intangible asset: [IAS 38.90]

Extract from IAS 38

- 90 Many factors are considered in determining the useful life of an intangible asset, including:
- (a) the expected usage of the asset by the entity and whether the asset could be managed efficiently by another management team;
 - (b) typical product life cycles for the asset and public information on estimates of useful lives of similar assets that are used in a similar way;
 - (c) technical, technological, commercial or other types of obsolescence;
 - (d) the stability of the industry in which the asset operates and changes in the market demand for the products or services output from the asset;
 - (e) expected actions by competitors or potential competitors;
 - (f) the level of maintenance expenditure required to obtain the expected future economic benefits from the asset and the entity’s ability and intention to reach such a level;
 - (g) the period of control over the asset and legal or similar limits on the use of the asset, such as the expiry dates of related leases; and
 - (h) whether the useful life of the asset is dependent on the useful life of other assets of the entity.

The standard explicitly warns against both:

- Overestimating the useful life of an intangible asset. For example, a history of rapid changes in technology means that the useful lives of computer software and many other intangible assets that are susceptible to technological obsolescence will be short. [IAS 38.92].
- And
- Underestimating the useful life of an intangible asset. Whilst uncertainty justifies estimating the useful life of an intangible asset on a prudent basis, it does not justify choosing a life that is unrealistically short. [IAS 38.93].

Where an intangible asset is acquired in a business combination, but the acquiring entity does not intend to use it to generate future cash flows, it is unlikely that it could have anything other than a finite useful life.

How we see it

In our view, where an intangible asset is acquired in a business combination, but the acquiring entity does not intend to use it to generate future cash flows, an entity would not recognise an immediate impairment loss on acquisition. However, the estimated useful life of the asset is likely to be relatively short (see Chapter 10).

The following Illustrations, based on those in IAS 38's Illustrative Examples, show how some of the features that affect the useful life are taken into account in assessing that life.

Illustration 9-1: Assessing the useful life of an intangible asset

Acquired customer list

A direct-mail marketing company acquires a customer list and expects that it will be able to derive benefit from the information on the list for at least one year, but no more than three years.

The customer list would be amortised over management's best estimate of its useful life, say 18 months. Although the direct-mail marketing company may intend to add customer names and other information to the list in the future, the expected benefits of the acquired customer list relate only to the customers on that list at the date it was acquired. The customer list also would be reviewed for indicators of impairment in accordance with IAS 36 at the end of each reporting period. [IAS 36.9].

An acquired trademark used to identify and distinguish a leading consumer product that has been a market-share leader for the past eight years

The trademark has a remaining legal life of five years but is renewable every 10 years at little cost. The acquiring entity intends to renew the trademark continuously and evidence supports its ability to do so. An analysis of product life cycle studies, market, competitive and environmental trends, and brand extension opportunities provides evidence that the trademarked product will generate net cash inflows for the acquiring entity for an indefinite period.

The trademark would be treated as having an indefinite useful life because it is expected to contribute to net cash inflows indefinitely. Therefore, the trademark would not be amortised until its useful life is determined to be finite. It would be tested for impairment in accordance with IAS 36 annually and whenever there is an indication that it may be impaired. [IAS 36.10].

It is clear from the above discussion that despite the fairly detailed guidance in the standard, an entity will need to exercise judgement in estimating the useful life of intangible assets.

9.1.2 Useful life of contractual or other legal rights

Where an intangible asset arises from contractual or other legal rights, the standard requires an entity to take account of both economic and legal factors influencing its useful life and determine the useful life as the shorter of:

- The period of the contractual or other legal rights
- And
- The period (determined by economic factors) over which the entity expects to obtain economic benefits from the asset [IAS 38.94, IAS 38.95]

If the contractual or other legal rights can be renewed, the useful life of the intangible asset must include the renewal period only if there is evidence to support renewal by the entity without significant cost. [IAS 38.94]. If this is not the case, then the original asset's useful life ends at the contracted renewal date and the renewal cost is treated as the cost to acquire a new intangible asset. [IAS 38.96]. An entity needs to exercise judgement in assessing what it regards as a significant cost.

The existence of the following factors may indicate that an entity is able to renew the contractual or other legal rights without significant cost:

(a) There is evidence, possibly based on experience, that the contractual or other legal rights will be renewed. If renewal is contingent upon the consent of a third party, this includes evidence that the third party will give its consent.

(b) There is evidence that any conditions necessary to obtain renewal will be satisfied.

And

(c) The cost to the entity of renewal is not significant when compared with the future economic benefits expected to flow to the entity from renewal. [IAS 38.96].

In the case of a reacquired contractual right recognised as an intangible asset in a business combination accounted for under IFRS 3, its useful life is the remaining contractual period of the contract in which the right was granted. Renewal periods must not be taken into account. [IAS 38.94].

The following Illustrations are derived from those in IAS 38's Illustrative Examples and show the effect of contractual or other legal rights on the useful life of an intangible asset, when assessed together with other factors. The useful life may be shorter than the legal rights or, if supported by facts and circumstances, renewal rights could mean that the intangible asset's life is indefinite.

Illustration 9-2: Legal rights and useful life

An acquired copyright that has a useful life that is shorter than its remaining legal life of 50 years

An analysis of consumer habits and market trends provides evidence that the copyrighted material will generate net cash inflows for only 30 more years.

The copyright would be amortised over its 30-year estimated useful life and not over the term of the legal rights of 50 years. The copyright also would be reviewed for impairment in accordance with IAS 36 by assessing at the end of each reporting period whether there is any indication that it may be impaired.

An acquired broadcasting licence that expires in five years but is assessed as having an indefinite useful life

The broadcasting licence is renewable every 10 years if the entity provides at least an average level of service to its customers and complies with the relevant legislative requirements. The licence may be renewed indefinitely at little cost and has been renewed twice before the most recent acquisition. The acquiring entity intends to renew the licence indefinitely and evidence supports its ability to do so. Historically, there has been no compelling challenge to the licence renewal. The technology used in broadcasting is not expected to be replaced by another technology at any time in the foreseeable future. Therefore, the licence is expected to contribute to the entity's net cash inflows indefinitely.

The broadcasting licence would be treated as having an indefinite useful life because it is expected to contribute to the entity's net cash inflows indefinitely. Therefore, the licence would not be amortised until its useful life is determined to be finite. The licence would be tested for impairment in accordance with IAS 36 annually (as part of a cash-generating unit) and whenever there is an indication that it may be impaired.

An acquired airline route authority between two European cities that expires in three years but is assessed as having an indefinite useful life

The route authority may be renewed every five years, and the acquiring entity intends to comply with the applicable rules and regulations surrounding renewal. Route authority renewals are routinely granted at a minimal cost and historically have been renewed when the airline has complied with the applicable rules and regulations. The acquiring entity expects to provide service indefinitely between the two cities from its hub airports and expects that the related supporting infrastructure (airport gates, slots, and terminal facility leases) will remain in place at those airports for as long as it has the route authority. An analysis of demand and cash flows supports those assumptions.

Because the facts and circumstances support the acquiring entity's ability to continue providing air service indefinitely between the two cities, the intangible asset related to the route authority is treated as having an indefinite useful life. Therefore, the route authority would not be amortised until its useful life is determined to be finite. It would be tested for impairment in accordance with IAS 36 annually (as part of a cash-generating unit) and whenever there is an indication that it may be impaired.

9.2 Intangible assets with a finite useful life

9.2.1 Amortisation period and method

Amortisation is the systematic allocation of the depreciable amount of an intangible asset over its useful life. The depreciable amount is the cost of an asset, or other amount substituted for cost (e.g., revaluation), less its residual value. [IAS 38.8]. The depreciable amount of an intangible asset with a finite useful life must be allocated on a systematic basis over its useful life in the following manner: [IAS 38.97]

- Amortisation must begin when the asset is available for use, i.e., when it is in the location and condition necessary for it to be capable of operating in the manner intended by management. Therefore, even if an entity is not using the asset, it must still be amortised because it is available for use, although there may be exceptions from this general rule (see section 9.2.3 below).
- Amortisation must cease at the earlier of:
 - The date that the asset is classified as held for sale, or included in a disposal group that is classified as held for sale, in accordance with IFRS 5.
 - And
 - The date that the asset is derecognised.
- The amortisation method must reflect the pattern of consumption of the economic benefits that the intangible asset provides. If that pattern cannot be reliably determined, a straight-line basis must be used.

Amortisation of an intangible asset with a finite useful life continues until the asset has been fully depreciated or is classified as held for sale, as noted above, or derecognised. Amortisation does not cease simply because an asset is not being used, [IAS 38.117], although this fact might give rise to an indicator of impairment.

The standard allows a variety of amortisation methods to be used to depreciate the asset on a systematic basis over its useful life, such as the straight-line method, the diminishing balance method, and the unit of production method. [IAS 38.98]. The factors to consider in determining the most appropriate amortisation method are similar to those that are relevant for the depreciation of property, plant and equipment in accordance with IAS 16 (see Chapter 19). For example, entities can adopt a 'sum of the digits' methodology, where amortisation reflects higher consumption of benefits in the earlier part of the asset's useful life, as this is a variant of the diminishing balance method (see Chapter 19).

In selecting an appropriate amortisation method for intangible assets acquired in a business combination, entities must ensure consistency with any assumptions that were used in determining the fair value of the asset. For example, a customer relationship asset may be valued by taking into account an assumed churn-rate that implies a higher level of customer relationships ending in the earlier periods following the business combination. These factors may indicate that a straight-line method of amortisation is not the most appropriate method to reflect the pattern of consumption of the economic benefits that the intangible asset provides, as the valuation assumed that benefit to be frontloaded.

The amortisation charge for each period must be recognised in profit or loss unless an IFRS accounting standard specifically permits or requires it to be capitalised as part of the carrying amount of another asset (e.g., inventory or work in progress). [IAS 38.97, IAS 38.99].

There is a rebuttable presumption that an amortisation method based on the pattern of expected revenues is not appropriate. This is because a revenue-based method reflects a pattern of generation of economic benefits from operating the business (of which the asset is a part), rather than the consumption of the economic benefits embodied in the asset itself (see section 9.2.2 below). By contrast, an amortisation method based on estimated total output (a unit of production method) is appropriate.

The future economic benefits of some intangible assets are clearly consumed on a declining balance basis. This often applies to customer relationships and similar assets acquired as part of a business combination. Both the fair value and the future economic benefits from the customer relationship or similar asset decline over time as the consumption of the economic benefits embodied in the asset declines. Therefore, amortising the customer relationship on a declining balance method would be appropriate.

It is important to distinguish this from an asset whose fair value shows a declining balance profile over its life but where the future economic benefits are consumed on a time basis, e.g., a motor vehicle where the entity will obtain as much benefit in year 4 as in year 1. A straight-line method of amortisation properly reflects the consumption of benefits from the motor vehicle.

9.2.1.A Amortising customer relationships and similar intangible assets

As discussed above, in selecting an appropriate amortisation method for intangible assets acquired in a business combination, entities must ensure consistency with any assumptions used in determining the fair value of the asset.

In practice entities rarely use declining balance methods for amortisation. One reason for customer relationships and similar intangible assets is the uncertainty about the future economic benefits that might arise several years in the future and the difficulty in distinguishing them from cash flows that have been generated by internally generated assets of the business. As a pragmatic solution, supported by valuations experts, entities often use a straight-line method over a shorter period so that at all points the amortised carrying amount of the asset is below the curve for the expected benefits. This is shown in the following illustration and chart. As long as the benefits expected to arise in the period after the intangible asset is fully amortised are not expected to be significant and the entity applies the requirements of IAS 38 to review the useful life and amortisation method (see section 9.2.3 below), this method will give a reasonable approximation of the consumption of economic benefits.

Illustration 9-3: Amortisation method and useful life for customer relationships

An entity identifies a customer relationship on acquiring another business. The entity completes its initial accounting at the end of 20X0 and the customer relationship is valued at CU4 million. The valuations expert consulted by the entity assesses the total period from which benefits will be derived from the customer relationship to be 9 years, but that the benefits will show a declining balance over this period. After discussions with the valuer, the entity concludes that the best estimate of the useful life of the customer relationship for accounting purposes is 5 years and a straight-line method over this period will adequately reflect the consumption of future economic benefits from the customer relationship, given that the amount and timing of benefits after 5 years is inherently uncertain as to timing or amount. The entity notes that a straight-line method over 9 years would not adequately reflect the consumption of future economic benefits. The relationship between the total economic life, useful life and amortisation method is illustrated in the following chart.

9.2.1.B Amortisation of programme and other broadcast rights

The value of programme and other broadcast rights diminishes because the programmes or events have been broadcast to the same audience before and as result of the passage of time, e.g., audiences lose interest in old programmes or repeats of events for which the result is known or the right is for a limited period. In accounting for this diminution in value, in practice, entities usually take into account how often a programme has been broadcast and, less frequently, the passage of time as such.

When an entity accounts for broadcast rights as inventory, the problem arises that IAS 2 requires valuation 'at the lower of cost and net realisable value' and does not appear to recognise the concept of amortisation of inventories. [IAS 2.9]. However, it has been argued that a programme right embodies a series of identifiable components, i.e., first transmission, second transmission, etc., which an entity would account for separately. This appears to be the approach that ITV plc applies in writing off its programme rights (see Practical example 2-2 in section 2.2.2 above).

An entity that accounts for programme and other broadcast rights as intangible assets would need to comply with the requirements of IAS 38, which requires that the amortisation method reflects the pattern in which the asset's future economic benefits are expected to be consumed by the entity. [IAS 38.97]. As discussed in section 9.2.1 above, the standard permits a range of amortisation methods (e.g., the straight-line method, the diminishing balance method and the unit of production method), provided that the chosen method reflects the pattern in which the asset's future economic benefits are expected to be consumed. [IAS 38.97, IAS 38.98].

RAI - Radiotelevisione italiana SpA. is an example of a company that amortises some of its programme rights on a straight-line basis.

Practical example 9-1:	RAI - Radiotelevisione italiana SpA. (2022)	Italy
Report and Financial Statements as at 31 December 2022 [extract] Consolidated Financial Statements as at 31 December 2022 [extract] Financial statements of the Rai Group [extract] Notes to the Consolidated Financial Statements as at 31 December 2022 [extract] 4 Evaluation criteria [extract] Activities [extract] Intangible assets [extract]		
...		
<p>The intangible assets having a defined useful life are systematically amortised along their useful life meant as the estimate of the period in which the assets will be used by the Group, and are broken down into:</p> <p>a) Programmes – Audiovisual Works: the costs for acquiring and producing TV programmes, of audiovisual, cinema and multimedia works, made up of the external costs directly allocated to each production and the costs of the internal resources used to make single programmes, are represented according to the following criteria:</p> <p>1) costs referring to television productions with repeat utility and with contractual rights exceeding 12 months are capitalised as intangible assets and, if these productions are ready for use at year-end, are amortised on a straight-line basis, starting from the month they are ready or the right becomes available, with regard to the duration of their expected useful life. If, on the other hand, these productions with repeat utility are not yet usable at year-end or rights become available in the future, their costs are deferred as work in progress and payments on account.</p>		
...		

The above is in contrast to Vivendi SE, which has rebutted the presumption in IAS 36 that a revenue-based amortisation method is inappropriate (see section 9.2.2 below), and amortises its film and television rights to be sold to third parties using such a method.

Practical example 9-2:	Vivendi SE (2023)	France
FINANCIAL REPORT FOR THE YEAR 2023 [extract] Financial Report and Audited Consolidated Financial Statements for the year ended December 31, 2023 [extract] III- Audited Consolidated Financial Statements for the year ended December 31, 2023 [extract] Notes to the Consolidated Financial Statements [extract] NOTE 1 Accounting policies and valuation methods [extract] 1.3 Principles governing the preparation of the Consolidated Financial Statements [extract] 1.3.6 Assets [extract] 1.3.6.3 Content assets [extract] Canal+ Group [extract]		
<i>Theatrical films and television rights produced or acquired to be sold to third parties</i>		
<p>Theatrical films and television rights produced or acquired before their initial exhibition, which are to be sold to third parties, are recorded as content assets at capitalized cost (mainly direct production and overhead costs) or at their acquisition cost. The cost of theatrical films and television rights are amortized, and other related costs are expensed, pursuant to the estimated revenue method (i.e., based on the ratio of the current period's gross revenues to estimated total gross revenues from all sources on an individual production basis). Vivendi considers that amortization pursuant to the estimated revenue method reflects the rate at which the entity plans to consume the future economic benefits related to the asset, and that there is a high correlation between revenue and the consumption of the economic benefits embodied in the intangible assets.</p>		
...		

Only in specific circumstances will it be appropriate to use a revenue-based method of amortisation. These circumstances are discussed in section 9.2.2 below.

9.2.2 Revenue-based amortisation

Consumption of the future economic benefits of an asset is the principle on which amortisation is based. Whether this completely precluded revenue-based methods of amortisation had become a matter of debate, particularly in the context of service concession arrangements that are accounted for using the intangible asset model (see Chapter 26).

In May 2014, the IASB clarified IAS 38 by introducing a rebuttable presumption that a revenue-based approach is not appropriate. Revenue reflects the output of the intangible asset, but it also measures the impact of other factors, such as changes in sales volumes and selling prices, the effects of selling activities and changes to inputs and processes. The price component of revenue may be affected by inflation.

[IAS 38.98A].

The following Illustration shows how a revenue-based method of amortisation diverges from the units-of-production method when the price per unit is not fixed.

Illustration 9-4: Output-based versus revenue-based amortisation

Entity Z acquires a five-year licence to manufacture a product for a cost of CU1,220,000. It is expected that the production line used for making the product has a capacity of 100,000 units per year. The entity plans to produce at full capacity each year and to sell all of its output. However, it expects the price per unit to be CU10 in year 1 and increase by 10% each year thereafter. On this basis, the profile of amortisation on a units of production (UoP) basis and on a revenue basis would be as follows:

	Units	UoP charge	Revenue	Charge
		CU	CU	CU
Year 1	100,000	244,000	1,000,000	200,000
Year 2	100,000	244,000	1,100,000	220,000
Year 3	100,000	244,000	1,210,000	242,000
Year 4	100,000	244,000	1,330,000	266,000
Year 5	100,000	244,000	1,460,000	292,000
Total	500,000	1,220,000	6,100,000	1,220,000

The IASB acknowledged certain 'limited circumstances' that would allow revenue-based amortisation. Therefore, the presumption that they are not acceptable is rebuttable only:

- (a) When the rights embodied in that intangible asset are expressed as a measure of revenue
Or
- (b) When it can be demonstrated that revenue and the consumption of the economic benefits embodied in the intangible asset are highly correlated [IAS 38.98A]

A 'highly correlated' outcome would only be achieved where a revenue-based method of amortisation is expected to give a similar answer as one of the other methods permitted by IAS 38. For example, if revenue is earned evenly over the expected life of the asset, the pattern of amortisation would be similar to a straight-line basis. In situations where unit prices are fixed and all production is sold, the pattern of amortisation would replicate the use of the units-of-production method (i.e., there is a high degree of correlation between revenue and the consumption of the economic benefits embodied in the asset). However, when unit prices are not fixed, revenue would not provide the same answer and its use would therefore be inappropriate (as in the Illustration above). [IAS 38.98B, IAS 38.98C]. The revised standard notes that revenue is the predominant limiting factor that is inherent in the intangible asset in circumstances in which it is appropriate to use it as the basis of amortisation. In other words, in these circumstances, revenue determines the useful life of the asset, rather than, for example, a number of years or the number of units produced.

The amended standard includes two examples in which revenue earned can be regarded as a measure of consumption of an intangible asset:

- A contract may allow the extraction of gold from a mine until total cumulative revenue from the sale of gold reaches CU2 billion
Or
- The right to operate a toll road could be based on a fixed total amount of revenue to be generated from cumulative tolls, i.e., the operator can collect up to CU100 million from the tolls collected [IAS 38.98C]

Some respondents had argued that a units of production method did not seem practicable when the units of production were not homogeneous. For example, a producer of a motion picture generates revenue through showing the picture in theatres, selling DVDs, licensing the rights to characters to toy manufacturers and licensing the broadcast rights to television. The IASB acknowledges that such situations require the exercise of judgement. The Board did consider whether an intangible asset must be divided into components for amortisation purposes “but refrained from developing guidance in this respect for intangible assets”. [IAS 38.BC72H, IAS 38.BC72I].

9.2.3 Review of amortisation period and amortisation method

An entity must review the amortisation period and the amortisation method for an intangible asset with a finite useful life at least at each financial year-end. If the expected useful life of the asset has changed, the amortisation period must be changed accordingly. [IAS 38.104]. An entity may, for example, consider its previous estimate of the useful life of an intangible asset inappropriate upon recognition of an impairment loss on the asset. [IAS 38.105].

If the expected pattern of consumption of the future economic benefits embodied in the asset has changed, the amortisation method must be changed to reflect the new pattern. [IAS 38.104]. The standard provides two examples of when this might happen:

- If it becomes apparent that a diminishing balance method of amortisation is appropriate rather than a straight-line method. [IAS 38.106].

And

- If use of the rights represented by a licence is deferred pending action on other components of the business plan. In this case, economic benefits that flow from the asset may not be received until later periods. [IAS 38.106]. This implies that circumstances may exist in which it is appropriate not to recognise an amortisation charge in relation to an intangible asset, because the entity may not yet be ready to use it. For example, telecommunication companies acquired UMTS (3G) licences, before constructing the physical network necessary to use the licence. Note that an entity must perform an impairment test at least annually for any intangible asset that has not yet been brought into use. [IAS 36.10].

Both changes in the amortisation period and the amortisation method must be accounted for as changes in accounting estimates in accordance with IAS 8, which requires such changes to be recognised prospectively by revising the amortisation charge in the current period and for each future period during the asset's remaining useful life. [IAS 8.36, IAS 8.38, IAS 38.104].

9.2.4 Residual value

The residual value of an intangible asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life. [IAS 38.8].

IAS 38 requires entities to assume a residual value of zero for an intangible asset with a finite useful life, unless there is a commitment by a third party to purchase the asset at the end of its useful life, or there is an active market (as defined by IFRS 13) for the asset from which to determine its residual value and it is probable that such a market will exist at the end of the asset's useful life. [IAS 38.100]. This presumption has been retained from the previous version of IAS 38 as an anti-abuse measure to prevent entities from circumventing the requirement to amortise all intangible assets. [IAS 38.BC59].

Given the definition of ‘active market’ (see section 8.2.1 above) it seems highly unlikely that, in the absence of a commitment by a third party to buy the asset, an entity will ever be able to prove that the residual value is other than zero. A residual value other than zero implies that the entity intends to dispose of the asset before the end of its economic life. [IAS 38.101]. Third party commitments can be found in contracts in the scope of IFRIC 12 *Service Concession Arrangements* (see Chapter 26) and one of IAS 38's Illustrative Examples includes a residual value; see Illustration 9-5 below.

If an entity can demonstrate a case for estimating a residual value other than zero, its estimate must be based on current prices for the sale of a similar asset that has reached the end of its useful life and has operated under conditions similar to those in which the asset will be used. [IAS 38.102]. The standard requires a review of the residual value at each financial year end. This review can result in an upward or downward revision of the estimated residual value and thereby affect the depreciable amount of the asset; that change to depreciation must be accounted for prospectively as a change in an accounting estimate in accordance with IAS 8. [IAS 38.102].

The following Illustration is based on one of IAS 38's Illustrative Examples. The intangible asset being considered has a residual value at the end of its useful life.

Illustration 9-5: Amortisation of an intangible asset with a residual value

An acquired patent that expires in 15 years

A product protected by patented technology is expected to be a source of net cash inflows for at least 15 years. The entity has a commitment from a third party to purchase that patent in five years for 60% of the fair value of the patent at the date it was acquired, and the entity intends to sell the patent to that third party in five years.

The patent will be amortised over its five-year useful life to the entity, with a residual value equal to 60% of the patent's fair value at the date it was acquired. The patent will also be reviewed for impairment in accordance with IAS 36 by assessing at the end of each reporting period whether there is any indication that it may be impaired.

The standard does not permit negative amortisation in the event that the residual value of an intangible asset increases to an amount greater than the asset's carrying amount. Instead, the asset's amortisation charge will be zero until its residual value decreases to an amount below the asset's carrying amount. [IAS 38.103].

9.3 Intangible assets with an indefinite useful life

IAS 38 prohibits amortisation of an intangible asset with an indefinite useful life. [IAS 38.107]. Instead, IAS 36 requires such an asset to be tested for impairment annually and whenever there is an indication that the intangible asset may be impaired. [IAS 38.108].

An entity must review and validate at the end of each reporting period its decision to classify the useful life of an intangible asset as indefinite. [IAS 38.109]. If events and circumstances no longer support an indefinite useful life, the change from indefinite to finite life must be accounted for as a change in accounting estimate under IAS 8, [IAS 38.109], which requires such changes to be recognised prospectively (i.e., in the current and future periods). [IAS 8.36]. Furthermore, reassessing the useful life of an intangible asset as finite rather than indefinite is an indicator that the asset may be impaired. [IAS 38.110]. See Chapter 21 for a discussion on impairment.

The following Illustrations from IAS 38's Illustrative Examples show circumstances in which an entity considers whether the useful life of an intangible asset is still indefinite.

Illustration 9-6: Review of indefinite useful lives

A broadcasting licence is no longer to be renewed

The facts are as in Illustration 9-2 (see section 9.1.2 above). A licensing authority has allowed broadcast licences to be renewed indefinitely at little cost and an entity, having renewed the licence twice, had concluded that it had an indefinite useful life. However, the licensing authority subsequently decides that it will no longer renew broadcasting licences, but rather will auction the licences. At the time the licensing authority's decision is made, the entity's broadcasting licence has three years until it expires. The entity expects that the licence will continue to contribute to net cash inflows until the licence expires.

Because the broadcasting licence can no longer be renewed, its useful life is no longer indefinite. Thus, the acquired licence would be amortised over its remaining three-year useful life and immediately tested for impairment in accordance with IAS 36.

A trademark for a line of products acquired several years ago in a business combination

At the time of the business combination, the acquiree had been producing the line of products for 35 years with many new models developed under the trademark. At the acquisition date, the acquirer expected to continue producing the line, and an analysis of various economic factors indicated there was no limit to the period the trademark would contribute to net cash inflows, so the trademark was not amortised by the acquirer. However, management has recently decided that production of the product line will be discontinued over the next four years.

Because the useful life of the acquired trademark is no longer regarded as indefinite, the carrying amount of the trademark would be tested for impairment in accordance with IAS 36, written down to recoverable amount as appropriate and the carrying amount amortised over its remaining four-year useful life.

9.4 Impairment losses

An impairment loss is the amount by which the carrying amount of an asset exceeds its recoverable amount. [IAS 38.8]. An entity applies IAS 36 in determining whether an intangible asset is impaired (see Chapter 21). [IAS 38.111].

IAS 36 requires an entity to perform an annual impairment test on every intangible asset that has an indefinite useful life and every intangible asset that is not yet available for use. Many intangible assets with indefinite lives do not generate independent cash inflows as individual assets and so are tested for impairment with other assets of the cash-generating unit of which they are part (see Chapter 21). [IAS 36.10, IAS 36.22]. This means that impairment losses, if any, will be allocated in accordance with IAS 36 and, if any goodwill allocated to the cash-generating unit has been written off, the other assets of the cash-generating unit, including the intangible asset, will be reduced *pro rata* to their carrying amount (see Chapter 21). [IAS 36.104].

Illustration 9-7: Impairment of an intangible asset with an indefinite useful life

A trademark acquired 10 years ago that distinguishes a leading consumer product

The trademark was regarded as having an indefinite useful life when it was acquired because the trademarked product was expected to generate cash inflows indefinitely. However, unexpected competition has recently entered the market and will reduce future sales of the product. Management estimates that cash inflows generated by the product will be 20% less for the foreseeable future. However, management expects that the product will continue to generate cash inflows indefinitely at those reduced amounts.

As a result of the projected decrease in future cash inflows, the entity determines that the estimated recoverable amount of the trademark and the assets that comprise the cash-generating unit is less than its carrying amount. An impairment loss is recognised for the cash-generating unit of which it is a part. Because it is still regarded as having an indefinite useful life, the trademark would continue not to be amortised but would be tested for impairment in accordance with IAS 36 annually, i.e., as part of the cash-generating unit, and whenever there is an indication that it may be impaired.

Note that a trademark may generate independent cash inflows if, for example, it is licenced to another party; otherwise, as in Illustration 9-7 above, it will be part of a cash-generating unit.

9.5 Retirements and disposals

An intangible asset must be derecognised on disposal (e.g., by sale, by entering into a finance lease, or by donation) or when no future economic benefits are expected from its use or disposal. [IAS 38.112, IAS 38.114].

The date of disposal of an intangible asset is the date the recipient obtains control of that asset in accordance with the requirements for determining when a performance obligation is satisfied in IFRS 15. [IAS 38.114]. In the case of a disposal by a sale and leaseback, an entity must apply IFRS 16 (see Chapter 24).

The gain or loss on derecognition, which is determined as the difference between the net disposal proceeds and the carrying amount of the asset, must be accounted for in profit or loss unless IFRS 16 requires otherwise on a sale and leaseback. Gains on disposal must not be presented as revenue. [IAS 38.113]. For intangible assets measured under the revaluation model, any gain or loss on disposal is not expected to be significant. This is due to the fact that IAS 38 requires revaluations to be performed with such regularity that at the end of a reporting period the carrying amount of the asset does not differ materially from its fair value (see section 8.2.2 above). [IAS 38.75].

In June 2020, the IFRS IC issued an agenda decision on the recognition of player transfer payments received by a football club. In the fact pattern considered by the IFRS IC, the entity recognised the player registration right as an intangible asset applying IAS 38. Accordingly, the IFRS IC concluded that the entity must apply the requirements of IAS 38.113 and recognise the transfer payment received as part of the gain or loss arising from the derecognition of the registration right. The agenda decision stated that the entity must not recognise the transfer payment received, or any gain arising, as revenue applying IFRS 15.¹¹

¹¹ [IFRIC Update](#), June 2020, available on the IFRS Foundation's website.

Although the agenda decision only addressed the accounting for intangible assets in connection with player registration rights, the same accounting would also apply to other types of intangible assets that are sold. For an entity whose ordinary activities include the development and transfer of players, it is conceivable that circumstances exist in which registration rights associated with some players meet the definition of inventories. In applying that definition, on initial recognition such an entity would consider whether the registration right is acquired for development and sale in the ordinary course of business (and therefore would be recognised as inventory under IAS 2, rather than an intangible asset under IAS 38). Whether a registration right meets the definition of inventories requires an assessment of the facts and circumstances.¹²

The consideration to be included in the calculation of the gain or loss is determined in accordance with the requirements for determining the transaction price in IFRS 15.47 to IFRS 15.72 (see Chapter 28). [IAS 38.116]. If the transaction price includes variable consideration, subsequent changes to the estimated amount of the consideration included in the gain or loss on disposal are accounted for in accordance with the requirements for changes in the transaction price in IFRS 15 (see Chapter 28). [IAS 38.116].

If the receipt of the consideration does not match the timing of the transfer of the asset (e.g., the consideration is prepaid or paid after the date of disposal), then the arrangement may also contain a financing component for which the transaction price will need to be adjusted, if significant (see Chapter 28).

In the case of a reacquired contractual right, recognised as an intangible asset in a business combination accounted for under IFRS 3, if the right is subsequently reissued or sold to a third party, any gain or loss is determined using the remaining carrying amount of the reacquired right. [IAS 38.115A].

9.5.1 Derecognition of parts of intangible assets

The standard requires an entity to recognise the cost of replacing a part of an intangible asset as a component of the asset's carrying amount and to derecognise that component when the part is replaced: [IAS 38.115]

Extract from IAS 38

115 If in accordance with the recognition principle in paragraph 21 an entity recognises in the carrying amount of an asset the cost of a replacement for part of an intangible asset, then it derecognises the carrying amount of the replaced part. If it is not practicable for an entity to determine the carrying amount of the replaced part, it may use the cost of the replacement as an indication of what the cost of the replaced part was at the time it was acquired or internally generated.

As noted by the standard, the nature of intangible assets is such that, in many cases, there are no additions or replacements that would meet its recognition criteria, so this will be an unlikely event (see section 3.3 above). [IAS 38.20].

However, this requirement raises the question of how to account for the disposal of a part of a larger intangible item, acquired in a single transaction but capable of being subdivided for separate disposal. An example would be the division of the global rights to sell a particular product into a number of agreements providing exclusive rights over a particular continent or other geographic territory. In this case, the part disposed of is an identifiable and separable part of the original intangible asset. Because the rights are exclusive, the part still meets the definition of an intangible asset because it is embodied in legal rights that allow the acquirer to control the benefits arising from the asset, either by providing access to earn revenues in that geographic market or by restricting the access of others to that market. [IAS 38.13]. In that case, an entity would apply the requirements above for the derecognition of a replacement part of an asset, by determining the carrying amount of the separate part or, if to do so is impracticable, deducting the proceeds of disposal from the depreciated replacement cost of the original asset as a whole (in effect treating the value of the newly separated part as an indicator of its original cost within the whole original asset) to estimate the book value of the part being disposed of.

¹² [IFRIC Update](#), November 2019, available on the IFRS Foundation's website.

Where the subdivision of rights is not established on an exclusive basis, it would be more difficult to regard a separable component of the original intangible as having been disposed of. For example, rights might be assigned to a third party over a geographic area, but the entity retains the ability to sell goods in that market as well. In such circumstances it may not be appropriate to derecognise a portion of the original intangible asset. Instead, the entity may have transferred a right of use (or lease) over the asset to the third party, or entered into a form of joint arrangement. The issues raised by the partial disposal of previously undivided interests in property, plant and equipment are discussed in Chapter 19.

Accounting for the partial derecognition of goodwill on the disposal of an operation that forms part of a cash-generating unit is discussed in Chapter 21.

10 Disclosure

The main disclosure requirements in IAS 38 are set out below, but it may be necessary to refer to:

- The disclosure requirements of IFRS 5 in Chapter 5.
- The disclosure requirements of IAS 36 in Chapter 21 in the event of a disposal or impairment.
- The fair value disclosures in IFRS 13 in Chapter 15 when fair value is used or disclosed.

10.1 General disclosures

IAS 38 requires certain disclosures to be presented by class of intangible assets. A class of intangible assets is defined as a grouping of assets of a similar nature and use in an entity's operations. The standard provides examples of classes of assets, which may be disaggregated (or aggregated) into smaller (or larger) groups if this results in more relevant information for the users of the financial statements (see section 8 above for examples of classes of intangible assets). [IAS 38.119]. Although separate information is required for internally generated intangible assets and other intangible assets, these categories are not considered to be separate classes when they relate to intangible assets of a similar nature and use in an entity's operations. Hence the standard requires the following disclosures to be given for each class of intangible assets, distinguishing between internally generated intangible assets and other intangible assets: [IAS 38.118]

Extract from IAS 38

- 118** An entity shall disclose the following for each class of intangible assets, distinguishing between internally generated intangible assets and other intangible assets:
- (a) whether the useful lives are indefinite or finite and, if finite, the useful lives or the amortisation rates used;
 - (b) the amortisation methods used for intangible assets with finite useful lives;
 - (c) the gross carrying amount and any accumulated amortisation (aggregated with accumulated impairment losses) at the beginning and end of the period;
 - (d) the line item(s) of the statement of comprehensive income in which any amortisation of intangible assets is included;
 - (e) a reconciliation of the carrying amount at the beginning and end of the period showing:
 - (i) additions, indicating separately those from internal development, those acquired separately, and those acquired through business combinations;
 - (ii) assets classified as held for sale or included in a disposal group classified as held for sale in accordance with IFRS 5 and other disposals;
 - (iii) increases or decreases during the period resulting from revaluations under paragraphs 75, 85 and 86 and from impairment losses recognised or reversed in other comprehensive income in accordance with IAS 36 (if any);
 - (iv) impairment losses recognised in profit or loss during the period in accordance with IAS 36 (if any);
 - (v) impairment losses reversed in profit or loss during the period in accordance with IAS 36 (if any);
 - (vi) any amortisation recognised during the period;
 - (vii) net exchange differences arising on the translation of the financial statements into the presentation currency, and on the translation of a foreign operation into the presentation currency of the entity; and
 - (viii) other changes in the carrying amount during the period.

The standard permits an entity to present the reconciliation required under (e) above either for the net carrying amount or separately for the gross carrying amount and the accumulated amortisation and impairments.

Paragraph 38 of IAS 1 requires comparative information for the reconciliation in (e) above.

An entity may want to consider separate disclosure of intangible assets acquired by way of government grant or obtained in an exchange of assets, even though disclosure is not specifically required under (e)(i) above.

An example of these general disclosures is given by International Consolidated Airlines Group, S.A.

**Practical example 10-1: International Consolidated Airlines Group, S.A.
(2023)**

Spain

ANNUAL REPORT AND ACCOUNTS 2023 [extract]

Financial Statements [extract]

Notes to the accounts [extract]

2. Significant accounting policies [extract]

Intangible assets

a Goodwill

Goodwill arises on the acquisition of subsidiaries, associates and joint ventures and represents the excess of the consideration paid over the net fair value of the identifiable assets and liabilities of the acquiree. Where the net fair value of the identifiable assets and liabilities of the acquiree is in excess of the consideration paid, a gain on bargain purchase is recognised immediately in the Income statement.

For the purpose of assessing impairment, goodwill is grouped at the lowest levels for which there are separately identifiable cash flows (cash generating units). Goodwill is tested for impairment annually and whenever indicators exist that the carrying value may not be recoverable.

b Brands

Brands arising on the acquisition of subsidiaries are initially recognised at fair value at the acquisition date. Long established brands that are expected to be used indefinitely are not amortised but assessed annually for impairment.

c Customer loyalty programmes

Customer loyalty programmes arising on the acquisition of subsidiaries are initially recognised at fair value at the acquisition date. A customer loyalty programme with an expected useful life is amortised over the expected remaining useful life. Established customer loyalty programmes that are expected to be used indefinitely are not amortised but assessed annually for impairment.

d Landing rights

Landing rights acquired in a business combination are recognised at fair value at the acquisition date. Landing rights acquired from other airlines are capitalised at cost.

Capitalised landing rights based outside of the UK and the EU are amortised on a straight-line basis over a period not exceeding 20 years. Capitalised landing rights based within the UK and the EU are not amortised, as regulations provide that these landing rights are perpetual.

e Contract-based intangibles

Contract-based intangibles acquired in a business combination are recognised initially at fair value at the acquisition date and amortised over the remaining life of the contract.

f Software

The cost to purchase or develop computer software that is separable from an item of related hardware is capitalised separately and amortised on a straight-line basis generally over a period not exceeding five years, with certain specific software developments amortised over a period of up to ten years.

In certain instances, the Group enters into cloud computing arrangements with third-party providers, such as software as a service (SaaS), where the Group is provided the right to access and use the application software over the contract term. At inception of the contract, the Group will assess whether such an arrangement gives rise to the recognition of a software intangible asset.

Where the Group determines that no software intangible asset should be recognised, the cloud computing arrangement is determined to be a service contract and the associated fees paid are expensed as incurred. In addition, the costs incurred for both the customisation and configuration of the application software are generally expensed as incurred.

31 December 2023	249	-	-	153	1,326	-	70	1,798
Net book values								
31 December 2023	347	451	253	1,440	837	577	4	3,909
31 December 2022	346	451	253	1,442	637	407	20	3,556

1 The net book value includes non-UK and non-EU based landing rights of €63 million (2022: €69 million) that have a definite life. The remaining average life of these landing rights is 12 years.

In addition to the disclosures required above, any impairment of intangible assets is to be disclosed in accordance with IAS 36, which is discussed in Chapter 21, [IAS 38.120], while the nature and amount of any change in useful life, amortisation method or residual value estimates must be disclosed in accordance with the provisions of IAS 8 (see Chapter 3). [IAS 38.121].

There are a number of additional disclosure requirements, some of which only apply in certain circumstances:

- For an intangible asset assessed as having an indefinite useful life, the carrying amount of that asset and the reasons supporting the assessment of an indefinite useful life. In giving these reasons, the entity must describe the factor(s) that played a significant role in determining that the asset has an indefinite useful life
- A description, the carrying amount and remaining amortisation period of any individual intangible asset that is material to the entity's financial statements
- For intangible assets acquired by way of a government grant and initially recognised at fair value (see section 4.6 above):
 - The fair value initially recognised for these assets
 - Their carrying amount
 And
 - Whether they are measured after recognition under the cost model or the revaluation model
- The existence and carrying amounts of intangible assets whose title is restricted and the carrying amounts of intangible assets pledged as security for liabilities
- The amount of contractual commitments for the acquisition of intangible assets [IAS 38.122]

In describing the factors (as required under (a) above) that played a significant role in determining that the useful life of an intangible asset is indefinite, an entity considers the list of factors in IAS 38.90 (see section 9.1.1 above). [IAS 38.123].

Finally, an entity is encouraged, but not required, to disclose the following information:

- A description of any fully amortised intangible asset that is still in use
- And
- A brief description of significant intangible assets controlled by the entity but not recognised as assets because they did not meet the recognition criteria in this Standard or because they were acquired or generated before the version of IAS 38 issued in 1998 was effective [IAS 38.128]

10.2 Statement of financial position presentation

IAS 1 uses the term 'non-current' to include tangible, intangible and financial assets of a long-term nature, although it does not prohibit the use of alternative descriptions as long as the meaning is clear. [IAS 1.67]. Although most intangible assets are non-current, an intangible asset may meet the definition of a current asset (i.e., it has an economic life of less than 12 months) when it is acquired and must be classified accordingly.

IAS 1 requires intangible assets to be shown as a separate category of asset on the face of the statement of financial position. [IAS 1.54]. Intangible assets will, therefore, normally appear as a separate category of asset in the statement of financial position at a suitable point within non-current assets, or at a point in an undifferentiated statement of financial position that reflects their relative liquidity, [IAS 1.60], that is, the time over which they are to be amortised or sold. An entity that holds a wide variety of different intangible assets may need to present these in separate line items on the face of the statement of financial position if such presentation is relevant to an understanding of the entity's financial position. [IAS 1.55].

While the figure for intangible assets may include goodwill, the relevant standards require more detailed disclosures of the constituent elements to be included in the notes to the financial statements. In many cases though, entities will be able to aggregate the intangible assets into slightly broader categories in order to reduce the number of lines items on the face of their statement of financial position.

Nestlé S.A. is an example of an entity that chooses to present goodwill separately from other intangible assets on the face of the statement of financial position.

Practical example 10-2: Nestlé S.A. (2023)

Switzerland

Financial Statements 2023 [extract]

Consolidated Financial Statements of the Nestlé Group 2023 [extract]

Consolidated balance sheet as at December 31, 2023 [extract]

Total non-current assets		95 693	100 120
Total assets		126 550	135 182

10.3 Profit or loss presentation

No specific guidance is provided within IAS 1, and only limited guidance is available within IAS 38, on the presentation of amortisation, impairment, and gains or losses related to intangible assets in the statement of profit or loss:

- Gains on the sale of intangible assets must not be presented within revenue. [IAS 38.113].
- An entity must disclose the line item(s) of the statement of comprehensive income in which any amortisation of intangible assets is included. [IAS 38.118(d)].

In the absence of detailed guidance on how to present such items in the statement of profit or loss, it will, in practice, usually be appropriate to present them in a similar way as those related to property, plant and equipment.

10.4 Additional disclosures when the revaluation model is applied

IAS 38 requires an entity, which accounts for intangible assets at revalued amounts, to disclose the following additional information: [IAS 38.124]

Extract from IAS 38

- 124** If intangible assets are accounted for at revalued amounts, an entity shall disclose the following:
- (a) by class of intangible assets:
 - (i) the effective date of the revaluation;
 - (ii) the carrying amount of revalued intangible assets; and
 - (iii) the carrying amount that would have been recognised had the revalued class of intangible assets been measured after recognition using the cost model in paragraph 74; and
 - (b) the amount of the revaluation surplus that relates to intangible assets at the beginning and end of the period, indicating the changes during the period and any restrictions on the distribution of the balance to shareholders.
 - (c) [deleted]

Classes of revalued assets can be aggregated for disclosure purposes. However, an entity cannot combine classes of intangible asset measured under the revaluation model with other classes measured at cost. [IAS 38.125]. Where assets are carried at fair value, an entity will also have to comply with the disclosure requirements of IFRS 13, as appropriate. These requirements are discussed in Chapter 15.

10.5 Disclosure of research and development expenditure

An entity must disclose the aggregate total amount of research or development expenditure (see section 6.2 above) that is recognised in profit or loss as an expense during the period. [IAS 38.126, IAS 38.127].

11 Specific issues regarding intangible assets

11.1 Rate-regulated activities

In many countries the provision of utilities (e.g., water, natural gas or electricity) to consumers is regulated by the national government. Regulations differ between countries but often regulators operate a cost-plus system under which a utility is allowed to make a fixed return on investment. A regulator may allow a utility to recoup its investment by increasing the prices over a defined period. Consequently, the future price that a utility is allowed to charge its customers may be influenced by past cost levels and investment levels.

Under a number of national GAAPs accounting practices have developed whereby an entity accounts for the effects of regulation by recognising a 'regulatory' asset or liability that reflects the increase or decrease in future prices approved by the regulator. Such 'regulatory assets' may have been classified as intangible assets under those national GAAPs.

This issue has been a matter of significant interest for entities in those countries adopting IFRS, because the recognition of these regulatory assets and liabilities is prohibited under IFRS. Just as the requirement to charge a lower price for the delivery of goods and services in the future does not meet the definition of a past obligating event, or a liability, in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 27), the ability to charge higher prices for goods services to be rendered in the future does not meet the definition of an intangible asset in IAS 38. In particular, the right obtained from the regulator to set higher prices is not accompanied by a legal requirement for a customer to buy those goods and services in future, meaning that the entity cannot demonstrate sufficient control over the related benefits to meet the definition of an intangible asset.

IFRS 14 *Regulatory Deferral Accounts* permits certain assets and liabilities to be recognised under very limited circumstances to ease the adoption of IFRS for rate-regulated entities. It allows rate-regulated entities to continue recognising regulatory deferral accounts in connection with their first-time adoption of IFRS, e.g., Canadian utility entities. First-time adopters do not need to make major changes in accounting policy for regulatory deferral accounts on transition to IFRS until a comprehensive IASB project is completed, but existing IFRS preparers are prohibited from adopting the standard. Entities that adopt IFRS 14 must present the regulatory deferral accounts as separate line items on the statement of financial position and present movements in these account balances as separate line items in the statement of profit or loss and other comprehensive income. The standard requires disclosures on the nature of, and risks associated with, the entity's rate regulation and the effects of that rate regulation on its financial statements. The further application of IFRS 14 is discussed in Chapter 6.

The Board is currently undertaking a standard-setting project to develop a new accounting model to provide users of financial statements with useful information about an entity's rights and obligations arising from a defined rate regulation that are not captured by existing IFRS accounting standards requirements.

On 28 January 2021, the Board issued an exposure draft (ED) *Regulatory Assets and Regulatory Liabilities*. The ED set out proposals for the recognition, measurement, presentation and disclosure of regulatory assets, regulatory liabilities, regulatory income and regulatory expense.

Under the accounting model proposed in the ED, when an entity has an enforceable right to add an amount in determining the regulated rate in future periods, because part of the total allowed compensation for goods and services already supplied will be included in revenue in the future, it must recognise this as a regulatory asset. Conversely, a regulatory liability exists when an entity has an enforceable present obligation to deduct an amount in determining the regulated rate in future periods because the revenue already recognised includes an amount that will provide part of the total allowed compensation for goods or services to be supplied in the future.

Comments on the ED were due by 30 July 2021 and since then the Board has been discussing the feedback received and redeliberating the proposals in the ED. The Board completed its deliberations in July 2024 and the new standard, which will replace IFRS 14, is expected to be published in the first half of 2026. Until a new standard is issued and becomes effective, regulatory assets and liabilities continue not to be eligible for recognition under IFRS accounting standards, unless the entity is a first-time adopter that can apply IFRS 14.

For further discussion of the IASB's rate-regulated activities project see Chapter 28.

11.2 Emissions trading schemes

Governments around the world have introduced, or are in the process of developing, schemes to encourage corporations and individuals to reduce emissions of pollutants. These schemes comprise tradable emissions rights or allowances, an example of which is a 'cap and trade' model whereby participants are allocated emission rights or allowances equal to a cap (i.e., a maximum level of allowable emissions, usually less than the entity's current quantity) and are permitted to trade those rights/allowances.

There are variants to these arrangements, which may differ from jurisdiction to jurisdiction.

Cap and trade emission rights schemes typically have the following features:

- An entity participating in the scheme (the participant) sets a target to reduce its Greenhouse Gases emissions to a specified level (the cap). The participant is issued emission rights equal in number to its cap by a government or government agency. These rights may be issued free of charge, or participants may have to pay the government for them (see below).
 - The scheme operates for defined compliance periods.
 - Participants are free to buy and sell emission rights at any time.
 - If, at the end of the compliance period, a participant's actual emissions exceed its emission rights, the participant will have to buy additional rights in the market, or it will incur a penalty.
 - In some schemes, emission rights surpluses and deficits may be carried forward to future periods.
- And
- The scheme may provide for brokers - who are not themselves participants - to buy and sell emission rights.

The EU Emissions Trading Scheme ("EU ETS"), still by far the biggest international scheme for trading greenhouse gas emission rights, now allocates many rights by auction, not free allocation.¹³

The terms and conditions of the emissions schemes may also determine the way the rights granted to an entity may be used. This may affect the measurement of a provision for an entity's emission obligation under a so-called 'net liability' approach (see section 11.2.3 below). As noted above, under the EU ETS, entities can use the rights to settle their emissions liability or sell them in the market. Other schemes might restrict use of the rights by the entity to settling their emission liability only.

A number of attempts have been made by the IFRS IC and the IASB to formulate guidance on how these schemes might be accounted for without reaching a definitive conclusion. IFRIC 3 *Emission Rights* was issued in 2004 (see section 11.2.2 below). However, the interpretation met with significant resistance and was withdrawn in 2005, despite the IASB considering it to be an appropriate interpretation of existing IFRS.¹⁴

Until the IASB completes a new project on emissions trading schemes, an entity has the option either:

- (a) To apply IFRIC 3, which despite having been withdrawn, is considered to be an appropriate interpretation of existing IFRS
- Or
- (b) To develop its own accounting policy for cap and trade schemes based on the hierarchy of authoritative guidance in IAS 8

¹³ [European Commission website](#) (accessed on 25 September 2024).

¹⁴ [IASB Update](#), June 2005, available on the IFRS Foundation's website.

In April 2016, the IASB provided an update on its Pollutant Pricing Mechanisms (formerly referred to as Emissions Trading Schemes) Project in which it noted the diversity in how Pollutant Pricing Mechanisms (which include emissions trading schemes) are accounted for and that some of the issues identified related to possible gaps and inconsistencies in IFRSs.¹⁵ In July 2022, the IASB concluded its third agenda consultation, which set out the IASB's priorities for its work plan and activities for the period 2022 - 2026. While many respondents considered this a high priority, the Board concluded that it should be included on the reserve list and noted that additional research would be needed before considering whether to undertake a standard setting project.¹⁶ The IASB met in June 2024 to discuss information gathered as part of horizon scanning activities to help it decide in the future whether to prioritise a project on Pollutant Pricing Mechanisms.¹⁷ At the time of writing no further work on the project had been performed by the IASB and this was not an active research project.¹⁸ The IFRS IC however did issue an agenda decision on negative low emission vehicle credits in July 2022. That agenda decision discussed the existence of events that create a present obligation leading to the recognition of a liability and how held resources (e.g., carbon credits or allowances) should be considered in the process of liability recognition (see section 11.2.3. below).¹⁹ The FASB has an ongoing project in relation the accounting for environmental credits under compliance and voluntary programmes. The FASB intends to draft a proposed Accounting Standards Update for comment.²⁰

11.2.1 Emissions schemes - Schemes that only include a cap on emissions

Emissions schemes that only have a cap might have the following features:

- The entity is subject to monitoring with regards to its emissions. The monitoring is mostly carried out by the responsible government authorities.
- The entity is assigned an emission limit.
- The entity is either not granted any rights by the government or government agency or it receives emissions rights corresponding to the assigned emission limit.
- Although the entity is not permitted to sell the emission rights granted to it, it can purchase additional rights from the government at a price set by the government. These purchased rights may be used to offset its emissions made.
- If the entity has emissions above the assigned limit, it is required to offset the excess by paying the government or by surrendering purchased emission rights. The amount to be transferred to the government is determined based on only the excess of actual emissions over the set limit.
- If the entity stays below the predetermined limit, there is no obligation to pay the government, nor is the entity eligible to receive any compensation; the entity is also not eligible to sell the surplus of emissions rights to a third party if it has emissions below the predetermined limit.

In such schemes, no liability is recognised until the limit is exceeded. Upon exceeding the set limit, the liability is measured at the best estimate of the cost to settle it. This is consistent with IFRIC 21 Levies.

Illustration 11-1: Emissions trading schemes - no rights received from the government and liability based on excess of emissions over a specified level

Company B has been permitted by the government to emit 10,000 tonnes of CO₂ for the year to 31 December 20X1. It has not received any emission rights from the government. The emission scheme requires the entity to pay the government in cash for any emissions above the 10,000 tonnes limit. The government has set a charge of CU12 per tonne of CO₂ emitted above this limit.

The expected emissions for the full year are 12,000 tonnes of CO₂. At the end of the third quarter, Company B has emitted 9,000 tonnes of CO₂.

While the entity has emissions during the year, until it exceeds the limit set by the government, there is no obligating event. Therefore, the liability at the end of the first, second and third quarters would be nil, because the set 10,000 tonnes limit has not yet been exceeded.

Once the entity exceeds the emissions limit of 10,000 tonnes of CO₂, the company would estimate the cost to settle its emissions liability. At year end, the total emissions above the set limit amounted to 2,000 tonnes and the company is obliged to pay CU12 per tonne emitted above the set limit. It, therefore, recognises a liability of CU24,000.

Illustration 11-2: Emissions trading schemes - rights granted are non-tradeable

Company A received from the government emission rights representing the right to emit 10,000 tonnes of CO₂ for the year to 31 December 20X1. The received rights were recorded at their nominal amount (i.e., nil). The expected emissions for the full year are 12,000 tonnes of CO₂. At the end of the third quarter, Company A has emitted 9,000 tonnes of CO₂.

The terms and conditions of the emission scheme require the entity to only use the received rights to settle its emission liability. Additional rights however can be purchased from the government at a price set by the government. The price to purchase additional rights from the government at the end of each quarter is CU7/tonne.

The liability at the end of the first, second and third quarters would be nil as the emission limit of 10,000 tonnes of CO₂ has not been exceeded. Although the entity holds rights, these cannot be traded, and therefore do not represent economic resources of the entity. Until the emission limit is exceeded, there is no liability to recognise as there is not transfer of economic resources required.

In the fourth quarter, there is an obligating event upon exceeding the emission limit of 10,000 tonnes of CO₂ and a liability is recognised. It is measured at the cost of purchasing additional rights to settle the liability in relation to the excess tonnage emitted, at 2,000 tonnes × CU7/tonne = CU14,000.

In both Illustration 11-1 and Illustration 11-2 above, the company cannot anticipate the future shortfall of 2,000 tonnes before the fourth quarter by accreting the provision over the year, nor can it recognise on day one the full provision for the 2,000 tonnes expected shortfall. This is because the entity is unable to trade the rights received from the government and must use them to settle the liability. As a result, until the emission limit is exceeded there is no obligating event and, therefore, no liability should be recognised.

11.2.2 'Cap and trade' emissions trading schemes - IFRIC 3

IFRIC 3 dealt with accounting for cap and trade schemes by entities that participated in them.²¹ The provisions of the interpretation were also considered to be relevant to other schemes designed to encourage reduced levels of emissions and share some of the features outlined above.²²

IFRIC 3 took the view that a cap and trade scheme did not give rise to a net asset or liability, but that it gave rise to various items that were to be accounted for separately:²³

- (a) *An asset for rights held* - Rights, whether allocated by government or purchased, were to be regarded as intangible assets and accounted for under IAS 38. Rights issued for less than fair value were to be measured initially at their fair value.²⁴
- (b) *A government grant* - When rights are issued for less than fair value, the difference between the amount paid and fair value was a government grant that must be accounted for under IAS 20. Initially the grant was to be recognised as deferred income in the statement of financial position and subsequently recognised as income on a systematic basis over the compliance period for which the rights were issued, regardless of whether the rights were held or sold.²⁵
- (c) *A liability for the obligation to deliver rights equal to emissions that have been made* - As emissions are made, a liability was to be recognised as a provision that falls within the scope of IAS 37. The liability was to be measured at the best estimate of the expenditure required to settle the present obligation at the reporting date. This would usually be the present market price of the number of rights required to cover emissions made up to the reporting date.²⁶

The interpretation also noted that the existence of an emission rights scheme could represent an indicator of impairment of the related assets, requiring an IAS 36 impairment test to be performed, because the additional costs of compliance could reduce the cash flows expected to be generated by those assets.²⁷

²¹ IFRIC 3, *Emission Rights*, 2005 Bound Volume, IASB, para. 2.

²² IFRIC 3.3.

²³ IFRIC 3.5.

²⁴ IFRIC 3.6.

²⁵ IFRIC 3.7.

²⁶ IFRIC 3.8.

²⁷ IFRIC 3.9.

Those who called for the withdrawal of IFRIC 3 identified a number of accounting mismatches arising from its application:²⁸

- A measurement mismatch between the assets and liabilities recognised in accordance with IFRIC 3
 - A mismatch in the location in which the gains and losses on those assets are reported
- And
- A possible timing mismatch because rights would be recognised when they are obtained - typically at the start of the year - whereas the emission liability would be recognised during the year as it is incurred

In light of these accounting mismatches, it is perhaps no surprise that in practice very few companies have applied IFRIC 3 on a voluntary basis. Instead, companies have developed a range of different approaches in accounting for cap and trade emission rights schemes, which are discussed below:

- The so-called 'Net liability' approaches
- 'Government grants' approach

Whatever approach is used, companies must disclose their accounting policies regarding grants of emission rights, the emission rights themselves, the liability for the obligation to deliver rights equal to emissions that have been made and the presentation in the statement of profit or loss. [IAS 1.117].

11.2.3 'Cap and trade' emissions trading schemes - Net liability approaches

Under IAS 37, a provision can only be recorded if the recognition criteria in that standard are met, including that the entity has a present obligation as a result of a past event, that it is probable that an outflow of economic resources will be required to settle the obligation, and that a reliable estimate can be made, [IAS 37.14], (see Chapter 27).

The obligating event and the probability of outflow of resources will depend on the specific terms and conditions of each emission scheme. Under IAS 37 the entire obligation to deliver rights must be measured on the basis of the best estimate of the expenditure required to settle the present obligation at the end of the reporting period (see Chapter 27) taking into account the cost of any allowances currently held (both granted and purchased). Or, if lower, any regulatory penalty. [IAS 37.36].

In 'cap and trade' schemes every tonne of emissions made creates an obligation. In such schemes, allowances received from the government represent economic resources of the entity (because they can be used for an alternative purpose, for example sale to a third party) and, therefore, as the entity emits it is probable there will be an outflow of economic resources (i.e., the allowances) to settle the obligation. In this situation, a liability is recognised as the entity emits.

In practice, two net liability approaches have gained acceptance:

(1) The 'net liability/carrying value' approach:

Under this approach, the allowances (or emission rights) received by way of a grant are recorded at a nominal amount (in most cases nil) and purchased rights are initially recognised at cost; the liability component is the best estimate of the cost to settle the liability taking into account the cost of any allowances currently held (both granted and purchased);

(2) The 'net liability/reimbursement rights' approach:

Under this approach, the allowances (or emission rights) received by way of a grant are also recorded initially at a nominal amount (in most cases nil) and purchased rights are also initially recognised at cost, but the entity remeasures (to fair value) the emission rights (or allowances) that it holds and can use to settle the liability up the amount of emission made in the period; the liability component is measured at the best estimate of the cost to settle the liability taking into account the cost of any allowances currently held (and remeasured to fair value).

How we see it

On initial recognition, we believe that an entity can apply the approaches as described above because in the absence of specific guidance on the accounting for emission rights, IAS 20 allows non-monetary government grants and the related asset (in this case, the emission rights) received to be measured at a nominal amount (i.e., nil).

²⁸ [IASB Update](#), June 2005, available on the IFRS Foundation's website.

(1) The 'net liability/carrying value' approach

Under a 'net liability/carrying value' approach, an entity measures the liability at the best estimate of the cost to settle the liability taking into account the cost of any allowances currently held. For example, if the entity holds allowances granted to it by a government and recorded at their nominal amount, then the measurement of the liability will be the nominal amount of the rights held (in most cases nil). The liability for any emissions exceeding the allowances held are measured at the current market price of the required number of emission allowances.

The emission rights received by way of a grant are recorded at a nominal amount (in most cases nil)

Purchased rights are initially recognised at cost. The measurement of the emissions liability can be estimated on a FIFO (see Illustration 11-3 below) or on a weighted average basis (see Illustration 11-4 below).

In its July 2022 agenda decision on negative low emission vehicle credits,²⁹ the IFRS IC noted that the existence of a liability depends on an entity's past actions and not on its future actions, which will only determine the means by which the entity settles its present obligation. This liability is measured by reference to the assets and costs required to settle it, taking into account both the assets held by the entity and/or the cost to acquire any additional assets necessary to settle the liability. The IFRS IC clarified that an outflow of resources embodying economic benefits occurs when an entity surrenders existing rights as these credits could have been used by the entity for other purposes, for example sale to a third party.

FIFO basis

Using FIFO basis, an entity measures the liability taking into account the allowances held at the end of the (interim or annual) reporting period first, and then includes the expected cost per unit, using the current market price, for the actual shortfall at the end of the reporting period.

Illustration 11-3: Application of 'net liability/carrying value' approach - granted allowances are tradeable - FIFO basis

Company C received allowances representing the right to emit 10,000 tonnes of CO₂ for the year to 31 December 20X1. The received allowances were recorded at the nominal amount (i.e., nil). The expected emissions for the full year are 12,000 tonnes of CO₂. At the end of the third quarter, Company C has emitted 9,000 tonnes of CO₂. The market price of the allowances at the end of each quarter is CU10/tonne, CU12/tonne, CU14/tonne and CU16/tonne respectively. The scheme permits Company C to freely sell and buy allowances.

Scenario A - Company C does not sell any of its allowances

Under the 'net liability/carrying value' approach using a FIFO basis, the liability at the end of the first, second and third quarters would be nil. The obligating event occurred in the first quarter by emitting the first tonne of CO₂, and it was probable that there would be an outflow of resources, being the allowances received. The measurement of the liability first takes into consideration only the carrying value of allowances held. Therefore, as the carrying value of the allowances held is nil, the best estimate of outflow of resources was nil for each quarter.

In the fourth quarter, the liability is remeasured. Company C calculates the best estimate of the amount to settle the obligation first using the allowances held (10,000 tonnes × nil) and then the actual shortfall at the current market price (2,000 tonnes × CU16/tonne = CU32,000). As a result, the liability at year end is CU32,000.

Scenario B - Company C sells allowances during the third quarter

Consistent with Scenario A, under the 'net liability/carrying value' approach using a FIFO basis, the liability at the end of the first and second quarters would be nil in this scenario.

At the end of the third quarter, Company C sells allowances received representing the right to emit 2,000 tonnes of CO₂ (see section 11.2.7 for discussion on sale of emission rights) resulting in the recognition of a gain of CU28,000 (2,000 tonnes × CU14). At the end of the third quarter, Company C remeasures the liability, calculating the best estimate of the amount to settle the obligation first using the allowances held (8,000 tonnes × nil) and then the actual shortfall at the current market price (1,000 tonnes × CU14/tonne = CU14,000). As a result, the liability at the end of the third quarter is CU14,000, and Company C recognises an expense of CU14,000.

In the fourth quarter, the liability is remeasured first using the allowances held (8,000 tonnes × nil) and then the actual shortfall at the current market price (4,000 tonnes × CU16/tonne = CU64,000). As a result, the liability in at year end is CU64,000, and Company C recognises an expense of CU50,000 in the fourth quarter.

²⁹ [IFRIC Update](#), June 2022, available on the IFRS Foundation's website

Weighted average basis

Using weighted average basis, an entity measures the liability by calculating the weighted average cost per unit of expected emissions over the entire compliance period (i.e., including the estimated shortfall).

Therefore, the entity would need to:

- Estimate the expected total emissions for the entire compliance period
 - Compare the total expected emissions for the compliance period with the number of allowances held by the entity for that compliance period (either granted by the government or/and purchased) to determine the expected shortfall (if any) in the compliance period
 - Measure the value of shortfall of allowance by reference to the market value as at the end of the (interim or annual) reporting period
- And
- Calculate the weighted average cost per unit of emissions for the compliance period by determining the sum of: (i) carrying amount of allowances held and (ii) cost of shortfall of allowances, and dividing that amount by the estimated expected total emissions for the compliance period

The liability at the end of the reporting period is then calculated by multiplying the cost per unit of emissions as determined based on the above steps with the cumulative volume of emissions at the end of that period.

Illustration 11-4: Application of 'net liability/carrying value' approach - granted allowances are tradeable - weighted average basis

Company D received allowances representing the right to emit 10,000 tonnes of CO₂ for the year to 31 December 20X1. The received allowances were recorded at nil. The expected emissions for the full year are 12,000 tonnes of CO₂.

The emissions at each of the quarter are as follows:

- First quarter - 2,500 tonnes (cumulative emissions for the compliance period - 2,500 tonnes)
- Second quarter - 3,500 tonnes (cumulative emissions for the compliance period - 6,000 tonnes)
- Third quarter - 3,000 tonnes (cumulative emissions for the compliance period - 9,000 tonnes)
- Fourth quarter - 3,000 tonnes (cumulative emissions for the compliance period - 12,000 tonnes)

The market price of the allowances at the end of each quarter is CU10/tonne, CU12/tonne, CU14/tonne and CU16/tonne respectively. The scheme permits Company D to freely sell and buy allowances.

Scenario A - Company D does not sell any of its allowances

Under the 'net liability/carrying value' approach using a weighted average basis, the liability at the end of each quarter and for the annual period would be:

- First quarter - CU4,166 $((10,000 \times 0 + 2,000 \times 10)/12,000 \times 2,500)$
- Second quarter - CU12,000 $((10,000 \times 0 + 2,000 \times 12)/12,000 \times 6,000)$
- Third quarter - CU21,000 $((10,000 \times 0 + 2,000 \times 14)/12,000 \times 9,000)$
- Fourth quarter - CU32,000 $((10,000 \times 0 + 2,000 \times 16)/12,000 \times 12,000)$

Therefore, a liability of CU32,000 would be reported in the annual financial statements.

Scenario B - Company D sells allowances during the third quarter

Consistent with Scenario A, under the 'net liability/carrying value' approach on a weighted average basis, the liability at the end of the first and second quarters would be CU4,166 and CU12,000, respectively.

At the end of the third quarter, Company D sells allowances received representing the right to emit 2,000 tonnes of CO₂ (see section 11.2.7 for discussion on sale of emission rights), resulting in the recognition of a gain of CU28,000 (2,000 tonnes x CU14). The liability for the remaining quarters would be as follows:

- Third quarter - CU42,000 $((8,000 \times 0 + 4,000 \times 14)/12,000 \times 9,000)$
- Fourth quarter - CU64,000 $((8,000 \times 0 + 4,000 \times 16)/12,000 \times 12,000)$

How we see it

The measurement of the liability should reflect the best estimate of the expenditure required to settle the obligation, taking into account the terms and conditions of the emission schemes. Or, if lower, any regulatory penalty.

Some schemes operate over a period of more than one year, such that the entity is unconditionally entitled to receive emission rights for, say, a 3-year period, and it is possible to carry over unused emission rights from one year to the next.

These circumstances would justify application of the net liability approaches for the entire period covered by the scheme, not just the reporting period for which emission rights have been transferred to the entity.

The entity can measure the liability either using a FIFO or weighted average basis as described above. Whichever basis is followed, it should be applied consistently in both annual periods and in the entity's interim reporting under IAS 34 *Interim Financial Reporting*.

(2) The 'net liability/reimbursement rights' approach

As discussed above, the measurement of purchased emission rights would generally follow the requirements of the applicable standard (IAS 2 or IAS 38) under the 'net liability/carrying value' approach. However, the entity may consider the emission rights it holds as a reimbursement right under IAS 37.53, which is recognised at an amount not exceeding the related provision (see Chapter 27).

Therefore, under this alternative 'net liability/reimbursement rights' approach, the entity would remeasure through profit or loss (to fair value) the emission rights that it holds up to the amount of emissions made in the period. Remeasuring (to fair value) all rights held, including those in excess of the emissions made, would be inconsistent with the principles of the net liability approach, and the requirement in IAS 37 for reimbursement rights not to exceed the value of the associated provision.

The liability component is measured at the best estimate of the cost to settle the liability taking into account the cost of any allowances currently held (and remeasured to fair value).

Illustration 11-5: Application of a 'net liability/reimbursement rights' approach

Company E received allowances representing the right to emit 10,000 tonnes of CO₂ for the year to 31 December 20X1. The received allowances were recorded at the nominal amount (i.e., nil). The expected emissions for the full year are 12,000 tonnes of CO₂. At the end of the third quarter, it has emitted 9,000 tonnes of CO₂. The market price of the allowances at the end of each quarter is CU10/tonne, CU12/tonne, CU14/tonne and CU16/tonne respectively. The scheme permits Company E to freely sell and buy allowances.

The emissions at each of the quarter are as follows:

- First quarter - 2,500 tonnes (cumulative emissions for the compliance period - 2,500 tonnes)
- Second quarter - 3,500 tonnes (cumulative emissions for the compliance period - 6,000 tonnes)
- Third quarter - 3,000 tonnes (cumulative emissions for the compliance period - 9,000 tonnes)
- Fourth quarter - 3,000 tonnes (cumulative emissions for the compliance period - 12,000 tonnes)

At the end of the third quarter the entity purchased emission rights corresponding to 2,000 tonnes of CO₂ at the cost of CU14/tonne and recognised the emission rights assets at CU28,000.

Under the 'net liability/carrying value' approach using a FIFO basis, the liability at the end of the first, second and third quarters would be nil. The obligating event occurred in the first quarter by emitting the first tonne of CO₂, and it was probable that there would be an outflow of resources, being the allowances received. The measurement of the liability first takes into consideration only the value of allowances held. Therefore, as the carrying value of the allowances held is nil, the best estimate of outflow of resources was nil for each quarter. In the fourth quarter, a liability is recognised. The entity measures the liability at the value of emission rights purchased, i.e., 2,000 tonnes × CU14/tonne = CU28,000.

However, applying the 'net liability/reimbursement rights' approach, the entity remeasures the emission rights it holds up to the amount of emissions made in the period and recognises the provision at the amount of estimated resource outflow taking into account the value of any allowances held.

Under the 'net liability/reimbursement rights' approach, the value of the emission rights held and provision at the end of each quarter and for the annual period would be:

	First quarter	Second Quarter	Third quarter	Fourth quarter
Reimbursement rights	2,500 tonnes x CU10/tonne = CU25,000	6,000 tonnes x CU12/tonne = CU72,000	9,000 tonnes x CU14/tonne = CU126,000	12,000 tonnes x CU16/tonne = CU192,000
Emissions Liability	2,500 tonnes x CU10/tonne = CU25,000	6,000 tonnes x CU12/tonne = CU72,000	9,000 tonnes x CU14/tonne = CU126,000	12,000 tonnes x CU16/tonne = CU192,000
<i>Income statement impact</i>				
Rights remeasurement	CU25,000 ¹	CU47,000 ¹	CU54,000 ¹	CU38,000 ²
Expense - Remeasurement of emissions liability	(25,000) ³	(47,000) ³	(54,000) ³	(66,000) ³
Net expense	0	0	0	(28,000)
1	This is the difference between the balances at the end of reporting periods.			
2	12,000 tonnes x CU16/tonne - 11,000 tonnes x CU14/tonne (Q3 valuation) = CU38,000			
3	The expense is the quarterly difference of the value of emissions liability recognised in the statement of financial position.			

At the end of the fourth quarter, the value of expense recognised in profit or loss under both approaches is the same.

In the Practical example below, MOL Hungarian Oil and Gas Plc. applies a 'net liability/carrying value' approach, i.e., emission rights granted free of charge are accounted for at their nominal value of zero and no government grant is recognised. A liability for the obligation to deliver emission rights is only recognised when the level of emissions exceed the level of rights granted. MOL Hungarian Oil and Gas Plc. measures the liability at the cost of purchased rights up to the level of purchased rights held, and then at the market price of rights ruling at the reporting date, with movements in the liability recognised in operating profit.

Practical example 11-1: MOL Hungarian Oil and Gas Plc. (2023)

Hungary

MOL GROUP INTEGRATED ANNUAL REPORT 2023 [extract]

CONSOLIDATED FINANCIAL STATEMENTS 2023 [extract]

NOTES TO THE FINANCIAL STATEMENTS [extract]

NON-FINANCIAL ASSETS AND LIABILITIES [extract]

9. Property, plant and equipment, investment property and intangible assets [extract]

c) Intangible assets [extract]

Accounting policies [extract]

...

Free granted quotas are not recorded in the financial statements, while purchased emission quotas are initially recorded as intangible assets at cost less impairment, if any, taking into consideration the residual value. The quotas recognised are not amortised if the residual value is at least equal to carrying value.

16. Provisions [extract]

Provision for Emission quotas

The Group recognises provision for the estimated CO₂ emissions costs when actual emission exceeds the emission rights granted and still held. When actual emission exceeds the amount of emission rights granted, provision is recognised for the exceeding emission rights based on carrying amount of purchased quotas held for compliance, the purchase price of allowance concluded in forward contracts, and for any residual excess at market quotations at the reporting date. In addition, the Group recognises provision for estimated costs of Upstream emission reduction quotas (UER) intended to be used to fulfil obligations stipulated by EU Fuel Quality Directive.

11.2.4 Emissions trading schemes - Government grant approach

Another approach which has gained acceptance in practice is to recognise the emission rights granted by the government initially at their fair value and record a corresponding government grant in the statement of financial position. The government grant element is subsequently recognised as income in accordance with the requirements of IAS 20. To that extent, the approach follows that required by IFRIC 3. However, rather than measuring the liability for the obligation to deliver allowances at the present market price of those allowances, the liability is measured instead by reference to the amounts recorded when those rights were first granted.

Critics have argued that the government grant approach would not be in line with the 'best estimate' determined under IAS 37 as the amount that an entity would rationally pay to settle the obligation at the reporting date or to transfer it to a third party at that time. [IAS 37.37]. The counter argument to this is that the allowances held that an entity will use to settle the obligation are not revalued, therefore if the measurement of the liability reflects the market price of the allowances held then there would be a mismatch.

Repsol, S.A. initially recognises the emission rights at fair value as a government grant under IAS 20 and illustrates clearly that the measurement of the liability follows that of the related emission rights. To the extent that emissions are not covered by emission rights, the liability is recognised at the fair value of such rights at the reporting date.

Practical example 11-2: Repsol, S.A. (2022)	Spain
Consolidated financial statements at 31 December 2022 [extract] NOTES TO THE 2022 FINANCIAL STATEMENTS [extract] CURRENT ASSETS AND LIABILITIES [extract] (16) Inventories [extract]	
<p>Emission allowances are recognized as inventory and are initially recognized at acquisition cost. Those allowances free of charge received under the emissions trading system for the 2013-2020 period, are initially recognized as inventory at the market price prevailing at the beginning of the year in which they are issued, against deferred income as a grant. As the corresponding tons of CO₂ are issued, the deferred income is reclassified to profit or loss.</p> <p>The Group records an expense under "Other operating expenses" in the income statement for the CO₂ emissions released during the year, recognizing a provision calculated based on the tons of CO₂ emitted above those emission allowances at zero cost, measured at: (i) their carrying amount in the case of the allowances that the Group has at year end; and (ii) the closing list price in the case of allowances that it does not yet have at year end.</p> <p>When the emissions allowances for the tons of CO₂ emitted are delivered to the authorities, the inventories and their corresponding provision are derecognized from the balance sheet without any effect on the income statement. When CO₂ emission allowances are actively managed to take advantage of market trading opportunities, the trading allowances portfolio is classified as "trading" inventories.</p> <p style="text-align: center;">...</p>	

The fair value on initial recognition of emission rights that are accounted as intangible assets will be based on the requirements of IFRS 13 which are discussed in Chapter 15. If there is no active market for emission rights, the selection of appropriate valuation techniques, inputs to those valuation techniques and the application of the fair value hierarchy are discussed in Chapter 15.

11.2.5 Amortisation and impairment testing of emission rights

In the case of cap and trade schemes, emission rights that are accounted for as intangible assets are unlikely to be amortised as their depreciable amount is usually nil. Their expected residual value at inception will be equal to their fair value. Thereafter, although their residual value is equal to their market value, there is no consumption of economic benefit while the emission right is held. The economic benefits are realised instead by surrendering the rights to settle obligations under the scheme for emissions made, or by selling rights to another party. It is necessary to perform an IAS 36 impairment test whenever there is an indication of impairment (see Chapter 21). If the market value of an emission right drops below its carrying amount, this does not automatically result in an impairment charge because emission rights are likely to be tested for impairment as part of a larger cash generating unit.

11.2.6 Emission rights acquired in a business combination

At the date of acquisition of a business, an acquirer is required to recognise the acquiree's identifiable intangible assets, which would include any emission rights, at their fair values. *[IFRS 3.18]*.

However, an acquirer must only recognise a provision for actual emissions that have occurred up to that date. This means that an acquirer can apply the 'net liability' approach (see section 11.2.3 above) to emission rights acquired in a business combination. However, an acquirer must treat acquired emission rights in the same way as purchased emission rights and initially recognise them at their fair value. An acquirer that applies IFRIC 3 or the 'government grant' approach would recognise acquired emission rights at their fair value, but cannot recognise a deferred credit for a 'government grant' as it acquired the emission rights by way of a business combination.

Consequently, an acquirer may report a higher emission expense in its statement of profit or loss in the compliance period in which it acquires a business.

11.2.7 Sale of emission rights

The sale of emission rights that are accounted for as intangible assets must be recognised in accordance with IAS 38. This means that they must be derecognised on disposal or when no future economic benefits are expected from their use or disposal. *[IAS 38.112]*. The gain or loss arising from derecognition of the emission rights must be determined as the difference between the net disposal proceeds and the carrying amount of emission rights. *[IAS 38.113]*.

Prior to the sale the entity may not have recognised the obligation, to deliver emission rights equal to the emissions caused, at its fair value at the date of derecognition. If that were the case, then the entity would need to ensure that the liability in excess of the emission rights held by the company after the sale is recognised at the present fair value of the emission rights.

Both the gain or loss on the derecognition of the emission rights and the adjustment of the liability must be recognised when the emission rights are derecognised. Any gain must not be classified as revenue. *[IAS 38.113]*.

If an entity that applies the 'net liability' approach were to sell all its emission rights at the start of the compliance period, it would not be permitted to defer the gain on that sale even if it was certain that the entity would need to repurchase emission rights later in the year to cover actual emissions. A gain is recognised immediately on the sale and a provision is recognised as gases are emitted.

If an entity enters into a forward contract to sell an emission right, it may be acting effectively as a broker-trader. The entity must determine whether the contract is a derivative within the scope of IFRS 9 by applying the requirements in that standard (see Chapter 42).

11.2.8 Accounting for emission rights by brokers and traders

IFRIC 3 did not address accounting by brokers and traders that are not themselves participants in a cap and trade scheme. However, they hold emission rights as assets held for sale in the ordinary course of business, which means that they meet the definition of inventories in IAS 2. *[IAS 2.6]*. Under that standard a broker-trader may choose between measuring emission rights at the lower of cost and net realisable value or at fair value less costs to sell. Commodity broker-traders who measure their inventories at fair value less costs to sell recognise changes in fair value less costs to sell in profit or loss in the period of the change. *[IAS 2.3]*.

When an entity trades derivatives based on the emission rights, they fall within the scope of IFRS 9 and are accounted for at fair value through profit or loss unless they hedge the fair value of the emission rights granted to the entity or qualify for the 'own use exemption'. *[IFRS 9.2.4]*.

When an entity holds emission rights for own use and also has a trading department trading in emission rights, the entity must split the books between emission rights held for own use and those held for trading. An entity can elect, as its accounting policy, to classify the emission rights held for own use as either intangible assets or inventory (if they are held for sale in the ordinary course of business or to settle an emissions liability in the ordinary course of business). The emission rights held for trading must be classified as inventory. This is illustrated in Practical example 11-2 (see section 11.2.4 above).

Income from the sale of emission rights that are accounted for as inventories must be recognised as revenue in accordance with IFRS 15.

11.3 Accounting for green certificates or renewable energy certificates - government schemes

Some governments have launched schemes to promote power production from renewable sources, based on green certificates, renewable energy certificates, green tags or tradable renewable certificates. There are similarities between green certificates and emission rights, except that whilst emission rights are granted to reflect a future limit on emissions, green certificates are awarded on the basis of the amount of green energy already produced.

In a typical scheme, producers of electricity are granted certificates by the government based on the power output (kWh) derived from renewable sources. The producer may use these certificates in the current and future compliance periods, as defined by the particular scheme. Entities distributing electricity (produced from both renewable and traditional sources) are required to hand over to the government a number of certificates based on the total kWh of electricity sold to consumers during the year, or pay a penalty to the extent that an insufficient number of certificates is rendered. It is this requirement that creates a valuable market for the certificates, allowing producers to sell their certificates to distributors, using the income to subsidise in effect the higher cost of generation from renewable sources. The value of the green certificates depends on many variables but primarily on the required number of certificates that have to be delivered relative to the amount of power that is produced from renewable sources, and the level of penalty payable if the required number of certificates are not remitted.

11.3.1 Accounting by producers using renewable energy sources

As in the case of emission rights, the award of green certificates is treated as a government grant by a producer. The producer may elect, as its accounting policy, to recognise either an intangible asset or inventory (if the green certificates are held for sale in the ordinary course of business or to settle an emissions liability in the ordinary course of business) representing an entitlement to that grant the point in time when the green electricity is produced. As with any government grant, the entitlement is initially measured at either fair value or a nominal amount, depending on the entity's chosen policy. [IAS 20.23].

Where the entitlement asset is initially recognised at fair value, a credit entry is recorded in the statement of profit or loss as either a reduction in production costs for the period (on the basis that the purpose of the grant is to compensate the producer for the higher cost of using renewable energy sources) or as other income, but not as revenue. [IAS 20.29]. Subsequent revaluation of the intangible asset is only allowed if an active market exists for the green certificates, and the other requirements of IAS 38 are applied (see section 8.2 above). The intangible asset (or inventory) is derecognised when the certificate is sold by the producer.

11.3.2 Accounting by distributors of renewable energy

When the distributor is also a producer of renewable energy, it has the option to use certificates granted to it or to sell them in the market. Accordingly, the permissible accounting treatments of green certificates are in principle the same as those for emission rights discussed in section 11.2 above. The distributor is obliged to remit certificates and therefore recognises a provision as sales are recorded (in the same way that a provision for emission rights is recognised as emissions are made). The distributor might apply a 'net liability' approach, discussed in section 11.2.3 above, and only start to recognise a provision once it has achieved a level of sales exceeding that covered by certificates granted to the entity in its capacity as a producer.

If a distributor is not also a producer of renewable energy, it recognises a provision as sales are made, measured at the fair value of green certificates to be remitted. A corresponding cost is included in cost of sales. The provision is remeasured to fair value at each reporting date. If the entity purchases certificates in the market, the distributor can elect, as its accounting policy, to recognise them as either an intangible asset or inventory (if the green certificates are held for sale in the ordinary course of business or to settle an emissions liability in the ordinary course of business), initially measured at cost. Subsequent revaluation is only allowed if they are classified as an intangible asset and an active market exists for the green certificates, and the other requirements of IAS 38 are applied (see section 8.2 above). IAS 36 is applied to determine when an entity must recognise an impairment in relation to the green certificates held.

Alternatively, as discussed in Illustration 11-5 in section 11.2.3 above, the asset held may be designated by management as a reimbursement right in respect of the associated liability, allowing remeasurement to fair value. Similarly, the entity could apply a carrying value method, measuring the provision based on the value and extent of certificates already held and applying fair value only to the extent that it has an obligation to make further purchases in the market or to incur a penalty if it fails to do so.

11.3.3 Accounting by brokers and traders

As discussed in section 11.2.8 above, brokers and traders must apply IAS 2 where green certificates are held for sale in the ordinary course of business; account for derivatives based on green certificates in accordance with IFRS 9; and properly distinguish those held for own use (which an entity can elect, as its accounting policy, to classify as either intangible assets, or inventory if they are held for sale or to settle an emissions liability in the ordinary course of business) from certificates held for trading (included in inventory).

11.4 Accounting considerations for voluntary carbon credits

Carbon markets are broadly split into two types of markets: compliance markets and voluntary markets. Hybrid markets are also possible and can include governments strongly encouraging the use of voluntary markets, or governments accepting voluntary carbon credits in lieu of cash payments to settle emissions obligations.

Voluntary markets function outside the compliance markets. Carbon credits are verified by independent verifiers (e.g., Gold Standard, Verra), each with their own models and verification requirements, and credits in these markets are not intended to be used for compliance purposes. Entities are not required by law or regulation to use these markets, but do so voluntarily, for example, to be able to state to their clients that they are carbon neutral.

Projects that generate carbon credits are generally categorised into those that reduce emissions (e.g., generation of energy from renewable sources) and those that remove emissions (e.g., regenerative farming projects, carbon capture and storage).

Currently, there are no explicit requirements that address the accounting for voluntary carbon credits. The IASB has a project in its pipeline for pollutant pricing mechanisms in which it would aim to develop specific requirements for such mechanisms. At the time of writing, this was not an active research project and was on the IASB's reserve list of projects. Projects on the reserve list will only be added to the work plan if additional capacity becomes available before the IASB's next five-yearly agenda consultation.³⁰

While there are no explicit requirements, several standards provide relevant guidance that entities need to consider. Appropriately accounting for voluntary carbon credits depends on the specific features (e.g., whether the credits can be traded.) and the role the entity plays in those markets (e.g., project developer, broker/dealer, emitter).

As with mandatory carbon credits, voluntary carbon credits might be inventory or intangible assets for the entity, depending on whether the credits are held for sale in the ordinary course of business, or the entity intends to use the credit itself.

How an entity obtains the credit will be important in determining when to recognise an asset and at what value.

The accounting considerations for voluntary carbon credits are discussed in further detail in our publication *Applying IFRS Connected Financial Reporting: Accounting for Climate Change*.³¹

11.5 Accounting for REACH costs

The European Regulation³² concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) requires manufacturers or importers of substances to register them with a central European Chemicals Agency (ECHA).³³ An entity will not be able to manufacture or supply unregistered substances. As a consequence, entities will incur different types of costs, such as:

- Costs of identifying the substances that need to be registered
- Testing and other data collection costs, including outsourcing services from external laboratories, costs of tests in own laboratories - testing materials, labour costs and related overheads
- Registration fees payable to ECHA
- And
- Legal fees

30 IFRS Foundation website, [IASB pipeline projects](#) (accessed 25 September 2024).

31 Available on [ey.com/IFRS](#), accessed 26 September 2024.

32 Regulation (EC) No. 1907/2006 of the European Parliament and of the Council of 18 December 2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH), establishing a European Chemicals Agency, amending Directive 1999/45/EC and repealing Council Regulation (EEC) No. 793/93 and Commission Regulation (EC) No. 1488/94 as well as Council Directive 76/769/EEC and Commission Directives 91/155/EEC, 93/67/EEC, 93/105/EC and 2000/21/EC.

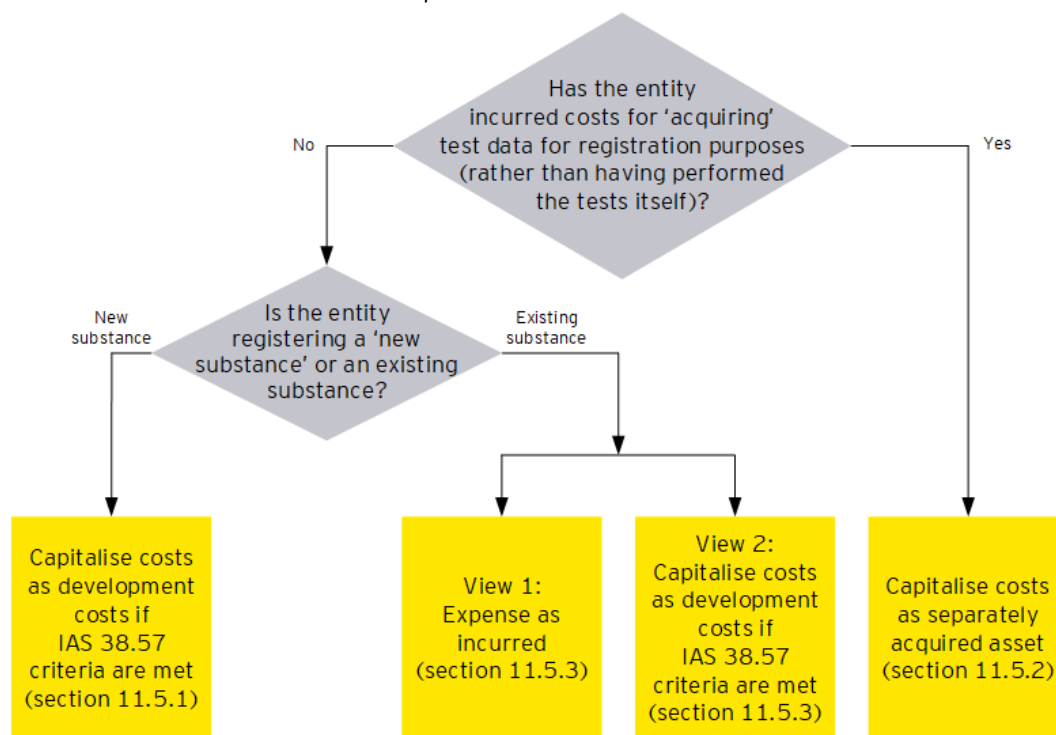

33 The key principles of the EU REACH Regulation were retained in UK REACH following the UK's withdrawal from the EU, however both regulations operate independently from each other.

These costs may be part of the development of a new manufacturing process or product, or in the use of a new chemical in an existing manufacturing process or product. They might be incurred solely by an entity or shared with other entities (clients, partners or even competitors). Under the REACH legislation, cost sharing might be achieved by the submission of a joint registration (whereby testing and other data collection costs are shared before the registration is filed) or by reimbursement (whereby an entity pays an existing registrant for access to the registration and testing data used in its earlier application for registration). Accordingly, questions arise as to whether such costs must be capitalised or recognised as an expense and, if capitalised, on what basis the related intangible asset must be amortised.

How we see it

In our view, a registration under the REACH regulation is an intangible asset as defined by IAS 38. As it gives rise to a legal right, the registration is identifiable. Because a registration cannot be arbitrarily withdrawn and also establishes intellectual property rights over the data used in the application for registration, a resource is controlled. The future economic benefits relating to the registration arise from either the right to reimbursement for the use by others of data supporting the entity's earlier application; or from the revenues to be earned and cost savings to be achieved by the entity from the use of registered substances in its business activities.

The appropriate accounting treatment under IAS 38 depends upon whether the required data is collected by the entity or acquired from an existing registrant and on whether the registration being completed is for a substance already used in an existing process or product (an existing substance) or intended to be used for the first time or in a new process or product (a new substance). The flow chart below demonstrates how these different features interact with the requirements of IAS 38.

11.5.1 Costs of registering a new substance performed by the entity itself

If the entity itself incurs REACH costs, these activities meet the definition of development in IAS 38. [IAS 38.8]. Accordingly, the entity must also meet the rigorous rules in the standard described in section 6.2.2 above which confirm that the related development project is at a sufficiently advanced stage, is economically viable and includes only directly attributable costs. [IAS 38.57].

Costs of identifying the substances that need to be registered would have to be recognised as an expense when incurred, as this activity is regarded as research. [IAS 38.56].

11.5.2 Costs of acquiring test data from an existing registrant

An entity may acquire test data from an existing registrant that has already been used by it in its earlier application for registration. These costs must be capitalised as a separately acquired intangible asset (see section 4 above).

11.5.3 Costs of registering an existing substance performed by the entity itself

How we see it

Two alternative treatments are acceptable. If the costs of obtaining a REACH registration for existing substances used in existing processes are regarded as subsequent expenditure on an existing intangible asset, the related costs must be recognised as an expense as incurred, (see section 3.3 above). As unregistered substances will no longer be available for use, this might indicate that the registration maintains the economic benefits associated with the related production process or product and does not improve it.

Alternatively, it could be argued that the cost of registering existing substances must be regarded as no different to the cost of registering a new product. Accordingly, for the reasons noted in section 11.5.1 above, such costs must be capitalised as an internally generated intangible asset.

11.6 Crypto-assets

At the time of writing, many different crypto-coins and tokens were traded or listed on various crypto exchanges. The terms and application of these crypto-assets vary widely and could change over time. It is important to re-evaluate the accounting as terms and conditions change.

Some crypto-assets entitle the holder to an underlying good or service from an identifiable counterparty. For example, some crypto-assets entitle the holder to a fixed weight of gold from a custodian bank. In those cases, the holder is able to obtain economic benefits by redeeming the crypto-asset for the underlying. While not money as such, these crypto-assets share many characteristics with representative money.

Other crypto-assets (e.g., Bitcoin) do not entitle the holder to an underlying good or service and have no identifiable counterparty. The holder of such a crypto-asset has to find a willing buyer that will accept the crypto-asset in exchange for cash, goods or services in order to realise the economic benefits from the crypto-asset.

How we see it

Crypto-assets have diverse terms and conditions. The purpose for holding crypto-assets also differs among the entities, and even among business models within the same entities, that hold them. Hence, the accounting treatment will depend on the particular facts and circumstances and the relevant analysis could be complex.

Many crypto-assets would meet the relatively wide definition of an intangible asset. However, not all crypto-assets that meet the definition of an intangible asset are within the scope of IAS 38, as the standard is clear that it does not apply to items that are in the scope of another standard. For example, some entities could hold crypto-assets for sale in the ordinary course of business and, as such, would be able to recognise these as inventory. Commodity broker-traders, who acquire and sell crypto-assets principally to generate profit from fluctuations in price or broker-traders' margin, and recognise these crypto-assets as inventory, also have the option of measuring them at fair value less costs to sell.

In addition to sections 11.6.1 to 11.6.3 below, refer to our publication [Applying IFRS: Accounting by holders of crypto assets](#) for further guidance on accounting for crypto-assets.

This section deals with crypto-assets that meet the definition of intangible assets and have been classified as such. For crypto-assets that are classified as inventories refer to Chapter 23.

11.6.1 Crypto-assets - Recognition and initial measurement

Crypto-assets that meet the definition of an intangible asset and are being accounted for under IAS 38 are only recognised if it is probable that future economic benefits will flow to the entity and its cost can be measured reliably (see section 3.1 above). Separately acquired intangible assets will normally be recognised, as IAS 38 assumes that the acquisition price reflects the expectation about future economic benefits. Thus, an entity always expects future economic benefits, for these intangibles, even if there is uncertainty about the timing or amount (see section 4.1 above).

Crypto-assets that meet the definition of an intangible asset and are being accounted for under IAS 38 are initially measured at cost (see section 3.2 above).

The cost of acquiring crypto-assets would typically include the purchase price (after deducting trade discounts and rebates if any) and the related transaction costs, which could include blockchain processing fees. Where an intangible asset is acquired in exchange for another non-monetary asset, the cost is measured at fair value, unless the transaction lacks commercial substance or the fair value of neither the asset acquired nor the asset given up can be measured reliably. In such instances, the cost of the intangible asset is measured as the carrying amount of the asset given up.

11.6.2 Crypto-assets - Subsequent measurement

As discussed in section 8 above, there are two subsequent measurement approaches under IAS 38 that can be applied as an accounting policy choice to each class of intangible asset, namely:

- Cost model
- Revaluation model (subject to criteria as discussed below)

An entity that holds different types of crypto-assets would need to assess whether they constitute different classes of intangible assets as the rights and underlying economics of different crypto-assets vary widely.

11.6.2.A Crypto-assets - Cost model

The cost model under IAS 38 entails subsequent measurement at cost less any amortisation and impairment (see section 8.1 above).

Many crypto-assets such as Bitcoin do not have an expiry date, and there appears to be no foreseeable limit to the period over which they could be exchanged with a willing counterparty for cash or other goods or services.

A holder will therefore need to consider if there is a foreseeable limit to the period over which such a crypto-asset is expected to generate net cash inflows for the entity. If there is no foreseeable limit, such a crypto-asset could be considered to have an indefinite useful life and, as a result, no amortisation is required. However, intangible assets with an indefinite useful life need to be tested for impairment at least annually and whenever there is an indication of impairment (see section 9.3 above).

Where there is a foreseeable limit to the period over which a crypto-asset is expected to generate net cash inflows for the holder, a useful life must be estimated and the cost of the crypto-asset, less any residual value, must be amortised on a systematic basis over this useful life (see section 9.2 above). In addition, such a crypto-asset is also subject to IAS 36 impairment testing whenever there is an indication of impairment.

11.6.2.B Crypto-assets - Revaluation model

An entity can only apply the revaluation model if the fair value can be determined by reference to an active market (see section 8.2 above), which IFRS 13 defines as “a market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis”.

There are no provisions in IAS 38 that allow for the fair value of an intangible asset to be determined indirectly, for example by using valuation techniques and financial models with less observable inputs such as those applied to estimate the fair value of intangible assets acquired in a business combination. Consequently, if no observable price in an active market for an identical asset exists (i.e., a Level 1 price under IFRS 13), the holder will need to apply the cost method to crypto-assets held.

How we see it

Entities need to consider the guidance in IFRS 13 (see Chapter 15) to determine whether the market is active for their crypto-assets. Many trades on crypto-exchanges are non-cash transactions in which one crypto-asset is exchanged for another and the holder may find it difficult to convert the crypto-asset into cash.

Under the revaluation model, intangible assets are measured at their fair value on the date of revaluation less any subsequent amortisation and impairment losses.

The net increase in fair value over the initial cost of the intangible asset is recorded in the revaluation reserve via other comprehensive income. A net decrease below cost is recorded in profit or loss. The cumulative revaluation reserve may be transferred directly to retained earnings upon derecognition, and possibly by transferring the additional amortisation on the revalued amount to retained earnings as the asset is used, but IAS 38 does not allow the revaluation reserve to be transferred via profit or loss.

11.6.3 Crypto-assets - Standard setter activity

Accounting standard setters are monitoring the development of crypto-assets and the related accounting practices by holders. Some standard setters have undertaken research into the accounting for crypto-assets, while some have expressed a view on what they consider to be appropriate accounting under IFRS accounting standards. For example, in Japan the standard setter has issued guidance for the accounting of virtual currencies under local GAAP.

In November 2018, the IASB decided not to add to its work plan a project on holdings of cryptocurrencies or initial coin offerings, but instead would monitor the development of crypto-assets. The IASB asked the IFRS IC to consider publishing an agenda decision on how entities apply existing IFRS accounting standards to holdings of cryptocurrencies, a subset of crypto assets.³⁴

In June 2019, the IFRS IC published an agenda decision on this matter. The IFRS IC observed that a holding of cryptocurrency meets the definition of an intangible asset under IAS 38 because it is capable of being separated from the holder and sold or transferred individually, and does not give the holder a right to receive a fixed or determinable number of units of currency. The IFRS IC concluded that where cryptocurrencies are held for sale in the ordinary course of business, then IAS 2 applies, otherwise they must be accounted for under IAS 38.

The IFRS IC determined that cryptocurrencies are not financial assets as they are not cash or equity instruments of another entity. They also do not give rise to a contractual right for the holder, and they are not a contract that will or may be settled in the holder's own equity instruments.³⁵

In March 2023, the accounting standard setter in the United States of America, the FASB, issued an exposure draft that proposed requiring entities to measure certain crypto assets at fair value each reporting period and reflect the changes in fair value in net income. Entities would have to present crypto assets measured at fair value separately from other intangible assets on the balance sheet and changes in fair value of crypto assets separately from changes in the carrying amounts of other intangible assets in the income statement. They would also be required to provide interim and annual disclosures about the type of crypto assets they hold and changes in their holdings of crypto assets. However, it is important to note that IFRS reporters cannot analogise to future FASB accounting standards when determining an appropriate accounting treatment under IFRS accounting standards.

³⁴ [IASB Update](#), November 2018, available on the IFRS Foundation's website.

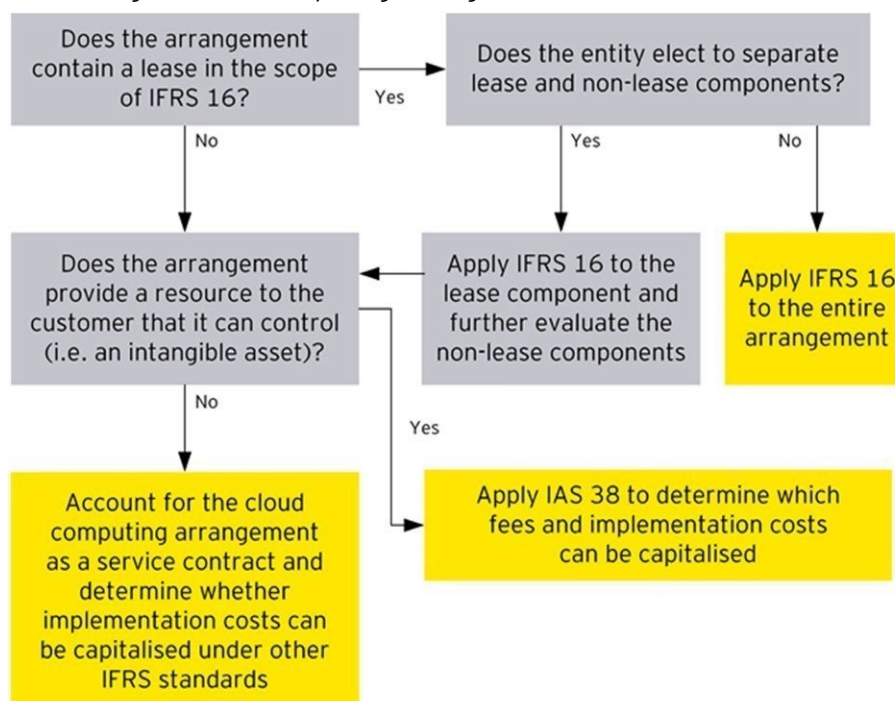

³⁵ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

11.7 Cloud computing

The guidance set out in sections 11.7.1 to 11.7.5.B below summarises the detailed guidance on accounting for cloud based arrangements and the associated costs that can be found in our publication, [Applying IFRS: Accounting for cloud computing costs](#).

11.7.1 Types of cloud computing arrangement and determination of applicable IFRS accounting standards

As the use of technology, data and connectivity expands, cloud computing arrangements are becoming more common. Cloud computing arrangements are arrangements in which the customer does not currently have possession of the underlying software used in the arrangement. Rather, the customer accesses and uses the software on an as-needed basis (e.g., through the internet, or via a dedicated line). Examples of cloud computing arrangements include software as a service, platform as a service, infrastructure as a service and other hosting arrangements. IFRS accounting standards do not contain explicit guidance on a customer's accounting for cloud computing arrangements or the costs to implement them. A customer in a cloud computing arrangement will need to carefully evaluate which IFRS accounting standards to apply when accounting for the costs of a cloud computing arrangement, and may need to apply various IFRS accounting standards, including IAS 16, IAS 38, IFRS 15, and IFRS 16. The following diagram summarises the accounting for cloud computing arrangements.

The IFRS IC received a submission about the customer's accounting for a 'Software as a service' cloud computing arrangement, which was discussed at IFRS IC meetings in September 2018, November 2018, and March 2019. In the IASB staff's analysis of the submission, it noted that an entity should first evaluate whether the rights granted in the cloud computing arrangement are within the scope of IAS 38 or IFRS 16. Otherwise, the arrangement is generally a service contract.³⁶

11.7.2 Evaluating whether a cloud computing arrangement contains a lease

IFRS 16 defines a lease as "a contract, or part of a contract, that conveys the right to use an asset (the **underlying asset**) for a period of time in exchange for consideration". [IFRS 16 Appendix A]. A contract conveys the right to use an asset if, throughout the period of use, the customer has both:

- (a) The right to obtain substantially all the economic benefits from use of the asset (an identified asset)
And
- (b) The right to direct the use of that asset [IFRS 16.9, IFRS 16.B9]

³⁶ [IASB Staff Paper 5](#), Project: *Cloud computing arrangements*, Paper topic: *Initial consideration*, IFRS IC meeting, September 2018; and [IFRIC Update](#), September 2018, available on the IFRS Foundation's website.

Paragraphs B9 to B31 of IFRS 16 provide application guidance on the definition of a lease. Among other requirements, that application guidance specifies that a customer generally has the right to direct the use of an asset by having decision-making rights to change how and for what purpose the asset is used throughout the period of use. Accordingly, in a contract that contains a lease the supplier has given up those decision-making rights and transferred them to the customer at the lease commencement date.

Therefore, an entity should evaluate whether a cloud computing arrangement includes the right to use an asset (e.g., underlying servers or other tangible assets) for which it has the right to obtain substantially all the economic benefits from use of the asset and the right to direct the use of that asset. There are differing views about whether a licence of software is excluded from the scope of IFRS 16 based on interpretations of IFRS 16.3(e). If an entity determines a licence of software is not excluded from the scope of IFRS 16, IFRS 16.4 permits, but does not require, an entity to account for the licence of software as a lease.

If the cloud computing arrangement contains a lease of an asset other than a licence of software (or the entity has determined a licence of software is not excluded from the scope of IFRS 16 and has elected to account for leases of intangible assets under IFRS 16), an entity should apply the provisions of IFRS 16 to the cloud computing arrangement (see Chapter 24). This includes identifying and separating lease and non-lease components and allocating contract consideration.

An entity that elects to separate non-lease components will then need to evaluate whether the non-lease components provide a resource to the customer that it can control (i.e., an intangible asset). See section 11.7.3 below.

In evaluating whether the right to use underlying software in a cloud computing arrangement is a lease, the IFRIC agenda decision issued in March 2019 stated, “The Committee observed that a right to receive future access to the supplier’s software running on the supplier’s cloud infrastructure does not in itself give the customer any decision-making rights about how and for what purpose the software is used - the supplier would have those rights by, for example, deciding how and when to update or reconfigure the software, or deciding on which hardware (or infrastructure) the software will run. Accordingly, if a contract conveys to the customer only the right to receive access to the supplier’s application software over the contract term, the contract does not contain a software lease.”³⁷

11.7.3 Evaluating whether a cloud computing arrangement contains an intangible asset

IAS 38 defines an intangible asset as “an identifiable non-monetary asset without physical substance”. [IAS 38.8]. An asset is a resource controlled by the entity, and an entity controls an intangible asset if it has the power to obtain the future economic benefits flowing from the underlying resource and to restrict the access of others to those benefits. [IAS 38.13].

Therefore, an entity should evaluate whether a cloud computing arrangement provides the customer a resource that it can control (i.e., if the customer has the power to obtain the future economic benefits flowing from the underlying resource and to restrict the access of others to those benefits). If the customer receives a resource that it can control, then it should apply the guidance in IAS 38 to that resource (assuming it is not accounting for the intangible asset as a lease - see section 11.7.2 above).

IFRS accounting standards do not provide specific guidance on whether a cloud computing arrangement provides the customer a resource that it can control (i.e., an intangible asset). One situation in which an intangible asset for a software licence exists in a cloud computing arrangement (and is therefore substantive) is when both of the following are met at the inception of the arrangement:

- The customer has the contractual right to take possession of the software during the hosting period without significant penalty
- And
- It is feasible for the customer to run the software on its own hardware or contract with another party unrelated to the supplier to host the software

These facts indicate that the customer controls the underlying licence even if it is hosted by the supplier. There may be other possible situations in which a customer concludes that a cloud computing arrangement provides the customer with a resource that it can control. However, the fact that an arrangement conveys to the customer a licence of software hosted by the supplier is not, in and of itself, a sufficient basis to conclude that the arrangement contains an intangible asset. The licence must be substantive.

³⁷ [IFRIC Update](#), March 2019, available on the IFRS Foundation’s website.

The evaluation of the facts listed above is performed at the inception of the arrangement (or upon a modification of the arrangement) because the evaluation of whether an arrangement includes an intangible asset should be based on the facts and circumstances when the arrangement is entered into.

In evaluating whether the customer has the right to take possession of the software during the hosting period without a significant penalty, and the right is therefore substantive, an entity may consider whether it has both of the following:

- The ability to take delivery of the software without incurring significant costs
- And
- The ability to use the software separately without a significant diminution in utility or value

This evaluation is reflected in Tesco PLC's accounting policy for cloud software arrangements:

Practical example 11-3: Tesco PLC (2024)	United Kingdom
<p>TESCO PLC Annual Report and Financial Statements 2024 [extract]</p> <p>Financial statements [extract]</p> <p>Notes to the Group financial statements [extract]</p> <p>Note 1 Accounting policies, judgements and estimates [extract]</p> <div style="background-color: #e6f2ff; padding: 10px; margin: 10px 0;"> <p>Cloud software licence agreements</p> <p>Licence agreements to use cloud software are treated as service contracts and expensed in the Group income statement, unless the Group has both a contractual right to take possession of the software at any time without significant penalty, and the ability to run the software independently of the host vendor. In such cases the licence agreement is capitalised as software within intangible assets.</p> <p>Costs to configure or customise a cloud software licence are expensed alongside the related service contract in the Group income statement, unless they create a separately identifiable resource controlled by the Group, in which case they are capitalised.</p> </div> <p style="text-align: center;">...</p>	

To support the view that a customer has the ability to take delivery of software included in a cloud computing arrangement without incurring significant costs, an entity may consider the following factors:

- Whether financial penalties or operational barriers act as a significant disincentive to the customer taking possession of the software. An example of such a barrier is a contractual requirement that significant fees or penalties must be paid to the supplier in connection with taking possession of the software. Another form of penalty may be a requirement to pay or forfeit a significant amount of 'unused' hosting fees on cancellation of the cloud computing contract. Accordingly, a cloud computing arrangement should be evaluated carefully to determine if the amount of fees that the customer must either 1) pay on cancellation, or 2) forfeit if fees are prepaid represents a 'significant cost'.
- The evaluation of whether a penalty is significant should be based on whether the amount of the penalty creates a sufficiently large disincentive such that the customer would not incur the penalty to take possession of the software. In evaluating whether any fees or penalties are significant, an entity may evaluate the amount of the fees or penalties in the context of the overall arrangement economics.
- Whether there is an explicit, reasonable mechanism in the contractual arrangement by which the customer can exercise a right to take possession of the software.
- Whether other economic barriers or costs exist that act as a significant disincentive to the customer taking possession of the software. For example, new hardware may be required to run the software, but the cost of obtaining that hardware is so high that a significant disincentive exists. Furthermore, if specialised technicians are needed to run the software, the cost to hire the technicians also may be a significant disincentive.
- And
- Whether there is an absence of an adequate number of qualified replacement service providers. A lack of service providers that could host the licenced software due to: (i) unique features, functionality or operating system requirements of the software; (ii) the need to hire specialised technicians to run the software at a significant cost; or (iii) other factors that may be significant disincentives.

To support the view that a customer has the ability to use the software separately without a significant diminution in utility or value, an entity may consider the following factors:

- Whether the customer can utilise all of the functionality of the software if the software is not hosted by the supplier. For example, if the software would not be able to process substantially the same number of transactions in approximately the same period if not hosted by the supplier, this may indicate that the customer cannot use the software separately from the supplier's hosting services without a significant diminution in utility or value.
- And
- Whether software upgrades are only available to customers for whom the supplier hosts the software. If the functionality provided by upgrades to the software is important to customers, and such upgrades would not be made available if the software is not hosted by the supplier, the utility of the software to a customer is likely significantly diminished if the supplier's hosting services are discontinued.

If the cloud computing arrangement does not provide the customer with an intangible asset for the software (and does not contain a lease), then the right to access the underlying software in the cloud computing arrangement is generally a service contract. However, when an arrangement conveys to the customer only a right to access and the customer pays the supplier before it receives the service, that prepayment gives the customer a right to future service and would be recognised as a prepaid asset by the customer.

11.7.4 Accounting for a cloud computing arrangement that includes an intangible asset

11.7.4.A Fees in the arrangement

Under IAS 38, an item that meets the definition of an intangible asset should only be recognised if, at the time of initial recognition of the expenditure it meets the following criteria: [IAS 38.21]

Extract from IAS 38

- 21 An intangible asset shall be recognised if, and only if:**
- (a) it is probable that the expected future economic benefits that are attributable to the asset will flow to the entity; and
 - (b) the cost of the asset can be measured reliably.

This test (that the item meets both the definition of an intangible asset and the criteria for recognition) is performed when an entity incurs potentially eligible expenditures, whether to acquire or internally generate an intangible asset or to add to, replace part of, or service it subsequent to initial recognition.

Separately acquired intangible rights (i.e., software licences in cloud computing arrangements) will normally be recognised as assets. IAS 38 assumes that the price paid to acquire an intangible asset usually reflects expectations about the probability that the future economic benefits embodied in it will flow to the entity. That is, the entity always expects there to be a flow of economic benefits, even if it is uncertain about the timing or amount. Therefore, the standard assumes that the cost of a separately acquired intangible asset can usually be measured reliably, especially where the purchase consideration is in the form of cash or other monetary assets.

In some cases, entities enter into a cloud computing arrangement that requires them to pay the cloud computing supplier or other third party to provide implementation activities and other services such as training employees to use the software, maintenance work to be performed by the third party, rights to future upgrades and enhancements, data conversion, and hardware.

An entity should allocate the fee in a cloud computing arrangement to these implementation activities and other services. One way an entity could allocate the fees in a cloud computing arrangement to each element in the contract (e.g., software licence, hosting, implementation activities) is based on the relative standalone price or relative fair value of each element in the contract. The statement of work for the implementation activities can often be complicated, so an entity will need to apply judgement to determine the components of implementation costs to which the purchase consideration should be allocated, which will determine the amounts that should be capitalised and the amounts that should be expensed as incurred.

Elements that meet both the definition of an intangible asset and the criteria for recognition should be accounted for in accordance with IAS 38. Elements outside the scope of IAS 38 (e.g., hosting) should be accounted for based on other IFRS accounting standards. In addition, IAS 38 specifically states that certain expenditures should be expensed as incurred (i.e., training costs, start-up costs), see section 7 above.

The asset recognised for the software licence should be the present value of the licence obligation if the cloud computing arrangement is to be paid for over time. An entity should record a liability to the extent that all or a portion of the amount allocated to the software licence is not paid on or before the recognition of the licence.

11.7.4.B Implementation costs

Customers often incur implementation costs to get a cloud computing arrangement ready for use. Implementation costs can include the following:

- Research costs (e.g., needs assessment and software evaluation)
- Hardware costs
- Costs to configure or customise the underlying software
- Changes to other entity systems
- Training costs
- Data conversion
- And
- Testing

Costs incurred by customers to implement a cloud computing arrangement that includes a software licence are accounted for based on the nature of the costs. The guidance in IAS 38 should be applied by customers that obtain software licences to evaluate whether to capitalise or expense certain costs.

Costs that are recognised as an asset for developing software or obtaining a software licence included in a cloud computing arrangement include external direct costs of materials and services incurred in developing or obtaining the software and payroll and payroll related costs (benefits) for employees who are directly involved with and who devote time to developing the cloud computing system, to the extent the time is spent directly on the project's development activities. External direct costs include, among others, fees paid to develop the software or supplemental software (e.g., to write programme code), cost to purchase the cloud computing software licence from third parties and travel expenses incurred by employees in their duties directly associated with developing the cloud computing system. Examples of employee activities include programme coding and testing during development.

11.7.5 Accounting for a cloud computing arrangement that does not include an intangible asset

11.7.5.A Fees in the arrangement

If a cloud computing arrangement does not contain a lease in the scope of IFRS 16 and does not contain an intangible asset in the scope of IAS 38, then the right to access the underlying software in the cloud computing arrangement is generally a service contract. Therefore, an entity should expense the fees paid for the cloud computing arrangement as the service is provided.

Entities generally recognise an asset for costs they prepay that relate to a service they will receive over time, which may be the case for cloud computing arrangements. For example, a customer that makes payments to a supplier of cloud computing services in advance of the related service period may determine that it is appropriate to recognise a prepaid asset (e.g., prepaid service contract) for those costs. Importantly, these costs are considered a prepaid asset that should be subsequently recognised as operating expense (and not presented as amortisation that is used to calculate EBITDA) as the services are provided.

Up-front payments the customer makes to the cloud computing supplier that relate to enhancing the functionality of the cloud computing service to be received over time should also generally be treated as a prepaid asset that is expensed over the term of the arrangement.

Careful consideration of the services provided under a long-term cloud computing service or other arrangement is required to determine the appropriate accounting for the related costs. This includes gaining an understanding of what the services are (e.g., the long-term service versus component implementation services rendered at the start of the arrangement) and when they are provided so that the costs of the service arrangement are recognised in the appropriate period.

In situations where the cloud computing supplier provides component implementation services, it may be difficult to identify and allocate consideration to the component implementation services.

11.7.5.B Internal and third-party implementation costs

In a cloud computing service arrangement (i.e., an arrangement without a software licence), a customer may incur implementation and other up-front costs to get the cloud computing arrangement ready for use and directly or indirectly relate to the software service received over time. These costs may relate to activities performed by the customer's internal personnel or third parties.

Implementation costs can include the following:

- Research costs (e.g., needs assessment and software evaluation)
- Hardware costs
- Costs to configure the underlying software
- Customisation of software
- Changes to other entity systems
- Training costs
- Data conversion
- Testing

The guidance in IAS 38 addresses how customers that obtain software licences evaluate whether to capitalise or expense certain costs, but it does not apply when software is accounted for as a service (i.e., service arrangements that do not include a software licence). Entities incur implementation and other up-front costs for a variety of service arrangements. As a result, entities will need to carefully review both the services they will receive, and the implementation costs they will incur.

Careful consideration will be required if a customer contracts with a third-party supplier (unrelated to the software service supplier), or incurs internal costs to perform certain activities that are directly or indirectly related to a software service arrangement. Customers should carefully evaluate these types of costs to determine whether the costs should be expensed, recognised as a prepaid asset, or capitalised.

As part of this evaluation, an entity first needs to determine which goods or services should be accounted for separately. IAS 38 does not include guidance on identifying separate goods or services that the customer receives. The IFRS IC received a submission about the customer's accounting for configuration and customisation costs in a cloud computing arrangement, which was discussed at IFRS IC meetings in December 2020 and March 2021. The IFRS IC's agenda decision published as an addendum to the March 2021 *IFRIC Update* indicated the following about the identification of separate services the customer receives:

"IAS 38 includes no requirements that deal with the identification of the services the customer receives in determining when the supplier performs those services in accordance with the contract to deliver them. Paragraphs 10-11 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* require the customer to refer to, and consider the applicability of, the requirements in IFRS Standards that deal with similar and related issues. The Committee observed that IFRS 15 *Revenue from Contracts with Customers* includes requirements that suppliers apply in identifying the promised goods or services in a contract with a customer. For the fact pattern described in the request, those requirements in IFRS 15 deal with issues similar and related to those faced by the customer in determining when the supplier performs the configuration or customisation services in accordance with the contract to deliver those services."

IFRS 15 requires an entity to identify the promised goods or services in a contract. The statement of work for implementation activities performed by the cloud computing service supplier or a third-party can often be complicated, so customers need to apply judgement to identify the promised implementation goods or services received.

How we see it

The Committee's agenda decision that states that IFRS 15 is applied to determine the identification of the separate services the customer receives in a cloud computing arrangement that does not include an intangible asset, may result in a change in accounting policy for some entities.

In March 2019, the IFRS IC discussed the circumstance in which an entity might determine that it needs to change an accounting policy as a result of an agenda decision issued by the IFRS IC. Under IAS 8, a change of accounting policy is applied retrospectively; that is, it is applied to transactions, other events and conditions as if it had always been applied. The particular point of discussion by the IFRS IC was the timing of such a change in accounting policy. In announcing its decision not to add the matter to its agenda in the March 2019 *IFRIC Update*, it stated: "The Board expects that an entity would be entitled to sufficient time to make that determination and implement any change (for example, an entity may need to obtain new information or adapt its systems to implement a change)".

IFRS 15 requires promised goods or services to be accounted for separately (i.e., as performance obligations) if the goods or services are distinct (by themselves, or as part of a bundle of goods or services). If a promised good or service is not distinct, an entity is required to combine that good or service with other promised goods or services until it identifies a bundle of goods or services that, together, is distinct.

Refer to Chapter 28, and our publication, [*Applying IFRS: A closer look at IFRS 15 the revenue recognition standard*](#), for a further discussion of the determination of whether a good or service is distinct.

It is important to note that IFRS 15 is applied at the contract level. Therefore, if the implementation services are provided internally or by a party unrelated to the cloud computing service supplier (and neither party is acting as an agent, such as some subcontractors), the third-party service contract cannot be combined with the cloud computing arrangement. That is, the implementation services received from an unrelated third party would always be considered distinct from the cloud computing service. However, an entity would still need to determine whether the specific implementation services received from the unrelated third party are distinct from each other.

An entity should allocate the fee in a cloud computing arrangement (if the implementation services are received from the cloud computing supplier) or the fee in the third-party service contract (if the implementation services are received from a third party) to distinct goods or services identified to determine when the allocated amounts should be recognised as an expense. One way an entity could allocate the fees to each element in the contract (e.g., right to access the application software of the supplier, implementation activities) is based on the relative standalone price or relative fair value of each element in the contract.

How we see it

Careful consideration of the services received under a long-term cloud computing service or other arrangement is required to determine the appropriate accounting for the related costs. This includes gaining an understanding of what the services are (e.g., the long-term service versus component implementation services rendered at the start of the arrangement) and when they are received so that the costs of the service arrangement are recognised in the appropriate period.

In situations where the cloud computing supplier provides component implementation services, it may be difficult to identify and allocate consideration to the component implementation services.

Appendix B - Defined terms

Extract from IAS 38

- 8 The following terms are used in this Standard with the meanings specified:
- Amortisation* is the systematic allocation of the depreciable amount of an intangible asset over its useful life.
- An *asset* is a resource:
- (a) controlled by an entity as a result of past events; and
 - (b) from which future economic benefits are expected to flow to the entity.¹
- Carrying amount* is the amount at which an asset is recognised in the statement of financial position after deducting any accumulated amortisation and accumulated impairment losses thereon.
- Cost* is the amount of cash or cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction, or, when applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs, eg IFRS 2 *Share-based Payment*.
- Depreciable amount* is the cost of an asset, or other amount substituted for cost, less its residual value.
- Development* is the application of research findings or other knowledge to a plan or design for the production of new or substantially improved materials, devices, products, processes, systems or services before the start of commercial production or use.
- Entity-specific value* is the present value of the cash flows an entity expects to arise from the continuing use of an asset and from its disposal at the end of its useful life or expects to incur when settling a liability.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)
- An *impairment loss* is the amount by which the carrying amount of an asset exceeds its recoverable amount.
- An *intangible asset* is an identifiable non-monetary asset without physical substance.
- Monetary assets* are money held and assets to be received in fixed or determinable amounts of money.
- Research* is original and planned investigation undertaken with the prospect of gaining new scientific or technical knowledge and understanding.
- The *residual value* of an intangible asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.
- Useful life* is:
- (a) the period over which an asset is expected to be available for use by an entity; or
 - (b) the number of production or similar units expected to be obtained from the asset by an entity.
- 12 An asset is identifiable if it either:
- (a) is separable, ie is capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, identifiable asset or liability, regardless of whether the entity intends to do so; or
 - (b) arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.

¹ The definition of an asset in this Standard was not revised following the revision of the definition of an asset in the *Conceptual Framework for Financial Reporting* issued in 2018.

Overview

IAS 16 *Property, plant and equipment* prescribes the accounting treatment for property, plant and equipment (PP&E).

The principal issues in accounting for PP&E are determining the appropriate initial recognition and cost of assets, subsequent measurement of carrying amounts and depreciation charges and impairment losses to be recognised in relation to them. [IAS 16.1]. IAS 16 also prescribes the disclosures that an entity should provide about PP&E.

This chapter discusses how IAS 16 is applied, and covers important aspects of the standard, including the recognition of PP&E, measurement at recognition, measurement after recognition under the cost model and under the revaluation model respectively, depreciation, derecognition and disposal of PP&E, as well as the disclosure requirements.

Impairment is a major consideration in accounting for PP&E, as this is intended to ensure PP&E costs that are not fully recoverable are immediately written down to a level that is recoverable. Impairment is covered by IAS 36 *Impairment of Assets* and dealt with as a separate topic in Chapter 21. In addition, there is a separate standard, IAS 40 *Investment Property* that deals with that particular category of PP&E which is discussed in Chapter 20.

IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* deals with the accounting required when items of PP&E are held for sale and is discussed in Chapter 5.

What you need to know

- IAS 16 applies to all property, plant and equipment, unless explicitly excluded from its scope.
- Other standards may require items similar to PP&E to be recognised on a different basis from that required by IAS 16 (e.g., IFRS 16 *Leases* which prescribes the accounting treatment for right-of-use assets).
- The standard allows one of two alternatives to be chosen as the accounting policy for measurement of PP&E after initial recognition:
 - The cost model
 - Or
 - The revaluation model

The choice must be applied to an entire class of PP&E.

1 Introduction

One fundamental topic in financial reporting is how to account periodically for performance when many of the expenditures an entity incurs in the current period also contribute to that in future accounting periods. Expenditure on property, plant and equipment ('PP&E') is among the best examples of this issue.

The accounting conventions permitted by the IASB under IAS 16 are the subject of this chapter, with the underlying broad principles involved being among the first that accountants learn in their professional life.

The cost of an item of PP&E is capitalised when acquired (i.e., recorded in the statement of financial position as an asset); then subsequently a proportion of the cost is charged each year to profit or loss (i.e., the cost is spread over the future accounting periods expected to benefit from the item). After initial recognition, entities have an accounting policy choice for measurement of PP&E, applying either the cost model or the revaluation model (by class of asset). Ideally, at the end of the item's working life the carrying amount remaining on the statement of financial position should be equal to the disposal proceeds of the item or be zero if there are none.

The principal standard is IAS 16. The objective of this standard is to prescribe the accounting treatment for PP&E so that users of the financial statements can discern information about an entity's investment in its PP&E and the changes in such investment over time. The principal issues in accounting for PP&E are the recognition of the assets, the determination of their carrying amounts and the depreciation charges and impairment losses to be recognised in relation to them. *[IAS 16.1]*.

FASB differences

Differences between the IFRS and US GAAP guidance on this topic are generally not addressed in this chapter as the standards are not converged. Therefore, differences between IFRS and US GAAP may exist that are not discussed in this chapter. For more information, refer to our [US GAAP/IFRS accounting differences identifier tool](#), which helps entities to identify some of the more common accounting differences between US GAAP and IFRS.

2 The requirements of IAS 16

2.1 Scope

IAS 16 defines PP&E as tangible items that are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes and are expected to be used during more than one period. [IAS 16.6]. All PP&E is within the scope of IAS 16 except as follows:

- When another standard requires or permits a different accounting treatment, for example, IAS 40 for investment properties held at fair value (but investment properties held using the cost model under IAS 40 should use the cost model in IAS 16 which is discussed in section 5 below)
- PP&E classified as held for sale in accordance with IFRS 5
- Biological assets related to agricultural activity (covered by IAS 41 *Agriculture*) other than bearer plants (see section 3.1.7 below)
- The recognition and measurement of exploration and evaluation assets (covered by IFRS 6 *Exploration for and Evaluation of Mineral Resources*)
- Mineral rights and mineral reserves such as oil, natural gas, and similar 'non-regenerative' resources [IAS 16.2, IAS 16.3, IAS 16.5]

Although the standard scopes out non-bearer plant biological assets, exploration and evaluation assets and mineral rights and reserves, it includes any PP&E used in developing or maintaining such resources. [IAS 16.3]. Therefore, PP&E used in exploration activities is included in the scope of the standard (see Chapter 39), as is agricultural PP&E (see Chapter 38).

The accounting treatment of collectibles, for example paintings or sculptures, depends on the purpose for which the entity is holding the collectibles. Items collected for administrative or aesthetic purposes and not traded in the ordinary course of business meet the definition of an item of property, plant, and equipment in IAS 16. [IAS 16.6]. For further discussion see Chapter 23.

Other standards may require an item of PP&E to be recognised on a basis different from that required by IAS 16. For example under IFRS 16, lessees will recognise most leases in their statement of financial position as lease liabilities with corresponding right-of-use assets (see section 8.4 below). Consequently, accounting for right-of-use assets should be in accordance with IFRS 16 (see Chapter 24).

2.2 Definitions used in IAS 16

IAS 16 defines the main terms it uses throughout the standard as follows: [IAS 16.6]

Extract from IAS 16

Definitions

6 The following terms are used in this Standard with the meanings specified:

A bearer plant is a living plant that:

- (a) is used in the production or supply of agricultural produce;
- (b) is expected to bear produce for more than one period; and
- (c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales.

(Paragraphs 5A-5B of IAS 41 elaborate on this definition of a bearer plant.)

Carrying amount is the amount at which an asset is recognised after deducting any accumulated depreciation and accumulated impairment losses.

Cost is the amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs, eg IFRS 2 *Share-based Payment*.

Depreciable amount is the cost of an asset, or other amount substituted for cost, less its residual value.

Depreciation is the systematic allocation of the depreciable amount of an asset over its useful life.

Entity-specific value is the present value of the cash flows an entity expects to arise from the continuing use of an asset and from its disposal at the end of its useful life or expects to incur when settling a liability.

Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)

An impairment loss is the amount by which the carrying amount of an asset exceeds its recoverable amount.

Property, plant and equipment are tangible items that:

- (a) are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes; and
- (b) are expected to be used during more than one period.

Recoverable amount is the higher of an asset's fair value less costs of disposal and its value in use.

The *residual value* of an asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.

Useful life is:

- (a) the period over which an asset is expected to be available for use by an entity; or
- (b) the number of production or similar units expected to be obtained from the asset by an entity.

These definitions are discussed in the relevant sections below.

3 Recognition

An item of PP&E should be recognised (i.e., its cost included as an asset in the statement of financial position) only if it is probable that future economic benefits associated with the item will flow to the entity and its cost can be measured reliably. [IAS 16.7].

Practical example 3-1 below describes Skanska AB's criteria for the recognition of PP&E, as disclosed in their 2022 Annual and Sustainability Report.

Practical example 3-1: Skanska AB (2022)	Sweden
<p>Annual and Sustainability Report 2022 [extract]</p> <p>Financial information [extract]</p> <p>Notes including accounting and valuation principles [extract]</p> <p>Note 1. Consolidated accounting and valuation principles [extract]</p> <p>IAS 16 Property, Plant and Equipment [extract]</p> <div data-bbox="416 656 1177 1966"> <p>Property, plant and equipment are recognized as assets if it is probable that future economic benefits from them will flow to the Group and the cost of the assets can be reliably calculated. Property, plant and equipment are recognized at cost minus accumulated depreciation and any impairment losses.</p> <p>Cost includes the purchase price plus expenses directly attributable to the asset in order to bring it to the location and condition to be used in the intended manner. Examples of directly attributable expenses are delivery and handling costs, installation, ownership documents, consultant fees and legal services. Borrowing costs are included in the cost of property, plant and equipment produced by the Group. Impairment losses are applied in accordance with IAS 36.</p> <p>The cost of property, plant and equipment produced by the Group includes expenditures for materials and remuneration to employees, and other applicable manufacturing costs that are considered attributable to the asset.</p> <p>Further expenditures are added to cost only if it is probable that the Group will derive future economic benefits from the asset and the cost can be reliably calculated. All other further expenditures are recognized as expenses in the period when they arise.</p> <p>The decisive factor in determining when a further expenditure is added to cost is whether the expenditure is related to replacement of identified components, or parts thereof, at which time such expenditures are capitalized. In cases where a new component is created, this expenditure is also added to cost. Any undepreciated carrying amounts for replaced components, or parts thereof, are disposed of and recognized as an expense at the time of replacement. If the cost of the removed component cannot be determined directly, its cost may be estimated as the cost of the new component adjusted by a suitable price index to take into account inflation. Repairs are recognized as expenses on a continuous basis.</p> </div>	

3.1 Aspects of recognition

3.1.1 Spare parts and minor items

Items such as spare parts, stand-by equipment and servicing equipment are inventory unless they meet the definition of PP&E (see section 2.2 above). [IAS 16.8]. This treatment is illustrated in Practical example 3-2 below.

Practical example 3-2: Heineken N.V. (2023)	The Netherlands
Annual Report 2023 [extract] Financial Statements 2023 [extract] Notes to the Consolidated Financial Statements [extract] 8. Non-current assets [extract] 8.2 Property, plant and equipment [extract] Accounting policies [extract]	
<p>Owned assets</p> <p>A fixed asset is recognised when it is probable that future economic benefits associated with the P,P&E item will flow to HEINEKEN and when the cost of the P,P&E can be reliably measured. The majority of the P,P&E of HEINEKEN are owned assets, rather than leased assets.</p> <p>P,P&E are recognised at historical cost less accumulated depreciation and impairment losses. Historical cost includes all costs directly attributable to the purchase of an asset. The cost of self-constructed assets includes all directly attributable costs to make the asset ready for its intended use. Spare parts that meet the definition of P,P&E are capitalised and accounted for accordingly. If spare parts do not meet the recognition criteria of P,P&E, they are either carried in inventory or consumed and recorded in profit or loss.</p> <p>Subsequent costs are capitalised only when it is probable that the expenses will lead to future economic benefits and can be measured reliably. The carrying amount of any component accounted</p> <p>...</p>	

Materiality judgements are considered when deciding how an item of PP&E should be accounted for. Major spare parts may, for example, be considered as qualifying as PP&E, while smaller spares may be carried as inventory and as a practical matter many companies have a minimum value for capitalising assets.

Some types of business may have a very large number of minor items of PP&E such as spare parts, tools, pallets and returnable containers, which nevertheless are used in more than one accounting period. There are practical problems in recording them on an asset-by-asset basis in an asset register; they are difficult to control and frequently lost. The main consequence is that it becomes very difficult to depreciate them. Generally, entities write off such immaterial assets as expenses in the period of addition. Skanska AB in Practical example 5-1 (see section 5.2 below) immediately depreciates such minor equipment, achieving the same result. The standard notes that there are issues concerning what constitutes a single item of PP&E. The 'unit of measure' for recognition is not prescribed and entities have to apply judgement in defining an item of PP&E in their specific circumstances. The standard suggests that it may be appropriate to aggregate individually insignificant items (such as tools, moulds and dies) and to apply the standard to the aggregate amount (presumably without having to identify the individual assets). [IAS 16.9].

3.1.2 Environmental and safety equipment

The standard acknowledges that there may be expenditures forced upon an entity by legislation that requires it to buy items of PP&E that do not directly increase the future economic benefits expected to flow to the entity. Examples would be safety or environmental protection equipment. IAS 16 explains that these expenditures qualify for recognition as they allow an entity to derive future economic benefits from related assets in excess of those that would flow if such expenditure had not been made. For example, a chemical manufacturer may install new chemical handling processes to comply with environmental requirements for the production and storage of dangerous chemicals; related plant enhancements are recognised as an asset because without them the entity is unable to manufacture and sell the chemicals or a plant might have to be closed down if these safety or environmental expenditures were not made. [IAS 16.11].

How we see it

An entity may voluntarily invest in environmental equipment even though it is not required by law to do so. Although not explicitly stated in IAS 16, we believe the entity can capitalise those investments in environmental and safety equipment in the absence of a legal requirement as long as:

- The expenditure meets the definition of an asset.
- Or
- There is a constructive obligation to invest in the equipment.

If the entity can demonstrate that the equipment is likely to increase the economic life of the related asset, or enables the entity to derive additional economic benefit from other assets, the expenditure meets the definition of an asset. Otherwise, the expenditure can be capitalised when the entity can demonstrate all of the following:

- That a constructive obligation exists to invest in environmental and safety equipment (e.g., it is standard practice in the industry, environmental groups are likely to raise issues or employees demand certain equipment to be present).
- The expenditure is directly related to improvement of the asset's environmental and safety standards.
- And
- The expenditure is not related to repairs and maintenance or form part of period costs or operational costs.

Whenever safety and environmental assets are capitalised, the standard requires the resulting carrying amount of the asset, and any related asset, to be reviewed for impairment in accordance with IAS 36 (see section 5.7 below). [IAS 16.11].

3.1.3 Economic benefits and costs associated with property developments

The standard requires that PP&E only be recognised when it is probable that future economic benefits associated with the item will flow to the entity. [IAS 16.7].

For example, in relation to property development, many jurisdictions require permissions prior to development whilst developers, including entities developing property for their own use, typically incur significant costs prior to such permissions being granted.

In assessing whether such pre-permission expenditures can be capitalised - assuming they otherwise meet the criteria - a judgement must be made at the date the expenditure is incurred of whether it is sufficiently probable that the relevant permission will be granted. Such expenditure does not become part of the cost of the land; to the extent that it can be recognised it is part of the costs of a separate building.

How we see it

If during the application and approval process of such permits it is no longer expected that necessary permits will be granted, capitalisation of pre-permission expenditure should cease, any related amounts that were previously capitalised should be written off in accordance with IAS 36 and accordingly, the carrying amount of any related item of PP&E subject to development or redevelopment (or, if appropriate, the cash generating unit where such an asset belongs) should be tested for impairment, where applicable (see section 5.7 below).

3.1.4 Classification as PP&E or intangible asset

Certain intangible assets may be embedded or contained within an item of PP&E, and this can raise questions in determining whether such assets should be accounted for under IAS 16 or IAS 38 *Intangible Assets*. In practice, items such as computer software purchased by entities are frequently capitalised as part of a tangible asset, for example as part of an accounting or communications infrastructure. Equally, internally written software may be capitalised as part of a tangible production facility, and so on. Judgement must be exercised in deciding whether such items are to be accounted for under IAS 16 or IAS 38 and this distinction becomes increasingly important if the two standards prescribe differing treatments in any particular case.

IAS 16 does not refer to this type of asset. In contrast, IAS 38 contains explicit guidance, stating that where an asset incorporates both intangible and tangible elements, an entity needs to exercise judgement to assess which element is more significant in order to determine whether the asset should be treated as PP&E under IAS 16 or as an intangible asset under IAS 38, for example:

- Computer software that is embedded in computer-controlled equipment that cannot operate without that specific software is an integral part of the related hardware and is treated as PP&E.
- Software which is not an integral part of the related hardware is treated as an intangible asset. For example, application software that is being used on a computer is generally easily replaced and is not an integral part of the related hardware. In contrast, the operating system normally is integral to the computer and is included in PP&E.
- A database that is stored on a compact disc is considered to be an intangible asset because the value of the physical medium is wholly insignificant compared to that of the data collection. [IAS 38.4].

It is worthwhile noting that as the 'parts approach' in IAS 16 requires an entity to account for significant parts of an asset separately, this raises 'boundary' problems between IAS 16 and IAS 38 when software and similar expenditure are involved.

How we see it

We believe that where IAS 16 requires an entity to identify significant parts of an asset and account for them separately, the entity needs to evaluate whether any software-type intangible part is integral to the larger asset or whether it is really a separate asset in its own right. The intangible part is more likely to be an asset in its own right if it was developed separately or if it can be used independently of the item of PP&E.

3.1.5 Classification of items as inventory or PP&E when minimum levels are maintained

Entities may acquire items of inventory on a continuing basis, either for sale in the ordinary course of business or to be consumed in a production process or when rendering services.

This means there will always be a core stock of that item (i.e., a minimum level of inventory is maintained). This does not in itself turn that inventory into an item of PP&E since each individual item will be consumed within a single operating cycle. However, there may be cases where it is difficult to judge whether an item is part of inventory or is an item of PP&E. This may have implications on measurement because, for example, PP&E has a revaluation option (see section 6 below) that is not available for inventory.

How we see it

In our view, an item of inventory is accounted for as an item of PP&E if it:

- Is not held for sale in the ordinary course of business or consumed in a production process or during the process of rendering services
 - Is necessary to operate or benefit from another asset during more than one operating cycle
- And
- Either cannot be recouped through sale (or is significantly impaired after it has been used to operate the asset or benefit from that asset)

This applies even if the part of inventory that is an item of PP&E cannot be physically separated from the rest of inventories.

Consider the following examples:

- An entity acquires the right to use an underground cave for gas storage purposes for a period of 50 years. The cave is filled with gas, but a substantial part (25%) of that gas will only be used to keep the cave under pressure in order to be able to get gas out of the cave. It is not possible to distinguish the gas that will be used to keep the cave under pressure from the rest of the gas. Gas will be turned around on a continuing basis. Still, it is possible to measure the part of the gas that will not be recoupable from the cave for selling purposes.
- An entity operates an oil refining plant. In order for the refining process to take place, the plant must contain a certain minimum quantity of oil. This can only be taken out once the plant is abandoned and would then be polluted to such an extent that the oil's value is significantly reduced (it can only be sold as sludge).
- An entity sells gas and has at any one time a certain quantity of gas in its gas distribution network.

In the first example the total volume of gas must be virtually split into (i) gas held for sale and (ii) gas held to keep the cave under pressure. The former must be accounted for under IAS 2 *Inventories*. The latter must be accounted for as PP&E and depreciated over the period the cave is expected to be used.

In the second example the part of the crude that is necessary to operate (in technical terms) the plant and cannot be recouped (or can be recouped but would then be significantly impaired), even when the plant is abandoned, should be considered as an item of PP&E and amortised over the life of the plant.

The arguments for the conclusions in these two examples are that the items do not meet the definition of inventories, and although it is not possible to identify the molecules in each of the two categories, there is no reason why one should not distinguish assets with a different use, and account for them differently. Further, the items are necessary to bring another item of PP&E to the condition necessary for it to be capable of operating in the manner intended by management and this meets the definition of cost of an item of PP&E in IAS 16.16(b). Recognising these items as inventories would lead to an immediate loss because these items cannot be sold or consumed in a production process or during the process of rendering services. This does not properly reflect the fact that the items are necessary to operate another asset over more than one operating cycle. [IAS 2.6, IAS 16.6, IAS 16.16(b)].

In the third example the gas in the pipeline is not necessary to operate the pipeline. It is held for sale or to be consumed in the production process or process of rendering services. Therefore, this gas is accounted for as inventory.

3.1.6 Production stripping costs of surface mines

IFRIC 20 *Stripping Costs in the Production Phase of a Surface Mine* states that costs associated with a 'stripping activity asset' (i.e., the costs associated with gaining access to a specific section of an ore body) are accounted for as an additional component of an existing asset. [IFRIC 20.10]. Other routine stripping costs are accounted for as current costs of production (i.e., inventory).

The IFRS IC's intention was to maintain the principle of IAS 16 by requiring identification of the component of the ore body for which access had been improved, as part of the criteria for recognising stripping costs as an asset. An entity will have to allocate the stripping costs between the amount capitalised (as it reflects the future access benefit) and the amount that relates to the current-period production of inventory. This allocation should be based on a relevant production measure. [IFRIC 20.13].

This component approach follows the principle of separating out parts of an asset that have costs that are significant in relation to the entire asset and when the useful lives of those parts are different. [IAS 16.43, IAS 16.44, IAS 16.45].

This interpretation is discussed in more detail in Chapter 39.

3.1.7 Bearer plants

Bearer plants are defined as living plants that are used in the production or supply of agricultural produce, are expected to bear produce for more than one period and have a remote likelihood of being sold as a plant or harvested as agricultural produce (except for incidental scrap sales such as for use as firewood). [IAS 16.6, IAS 41.5, IAS 41.5B]. Examples of bearer plants may include tea bushes, grape vines, oil palms and rubber trees.

Bearer plants are within the scope of IAS 16 and subject to all of the requirements therein. This includes the ability to choose between the cost model and revaluation model for subsequent measurement. Agricultural produce growing on bearer plants, e.g., the fruit growing on a tree, remains within the scope of IAS 41 (see Chapter 38). [IAS 16.3(b), IAS 41.5C].

The following are not included within the definition of bearer plants and instead fall under the scope of IAS 41:

- Plants cultivated to be harvested as agricultural produce, e.g., trees grown for use as lumber.
- Plants cultivated to produce agricultural produce when there is more than a remote likelihood that the entity will also harvest and sell the plant as agricultural produce, other than as incidental scrap sales, e.g., trees that are cultivated both for their fruit and their lumber.
- Annual crops such as maize and wheat. [IAS 41.5A].

Bearer plants are accounted for in the same way as self-constructed items of PP&E before they are brought to the location and condition necessary to be capable of operating in the manner intended by management. Consequently, references to 'construction' in IAS 16, with respect to bearer plants, cover the activities that are necessary to cultivate such plants before they are brought to the location and condition necessary to be capable of operating in the manner intended by management, which is typically when they are mature. [IAS 16.22A].

Bearer plants are subject to the requirements of IAS 16, and so entities will need to consider the correct unit of account, analyse which costs can be capitalised prior to maturity, set useful lives for depreciation purposes and consider the possibility of impairment.

For a more detailed discussion of the requirements, including some of the measurement challenges for bearer plants under IAS 16, see Chapter 38.

3.1.8 Accounting for trees held to generate carbon offsets for use or sale

As part of their sustainability related activities, some entities are buying or planting trees that will absorb carbon dioxide (i.e., act as 'carbon sinks'). Others are choosing to defer or cease planned harvests to generate carbon offsets. The entities undertaking these activities can then sell or use the carbon offsets generated. An entity that directly owns such trees (rather than indirectly through investments in entities that own the trees) will need to determine whether the trees are:

- Biological assets related to agricultural activity to which IAS 41 applies
 - Bearer plants related to agricultural activity to which IAS 16 applies
- Or
- Assets not related to agricultural activity, in which case, it is likely an entity would apply the requirements in IAS 16.

Determining the nature of the asset is fundamental to this assessment. To be within the scope of IAS 41 or to be a bearer plant within the scope of IAS 16, the trees must relate to agricultural activity, which is defined as "the management by an entity of the biological transformation and harvest of biological assets for sale or for conversion into agricultural produce or into additional biological assets". [IAS 41.1(a), IAS 41.5].

For the definition of agricultural activity in IAS 41 to be met, both the management of change (which may include activities such as planting, pruning, thinning, and fertilising) and the harvest of agricultural produce are required. As such, whether the entity manages the trees and harvests any agricultural produce will be key to determining the nature of the asset and the appropriate standard to apply.

How we see it

While carbon dioxide is absorbed and oxygen is produced by the trees, the oxygen cannot be captured at the point of production and detached in the manner contemplated by the definition of agricultural produce in IAS 41. Similarly, in our view, carbon offsets are not the agricultural produce of trees.

IAS 41 does not provide guidance on the extent of harvest needed to qualify as an agricultural activity. As a result, it may not always be clear the extent to which any felling undertaken might constitute harvesting of agricultural produce and entities will need to apply judgement in determining whether the trees are engaged in agricultural activity. Further guidance on assessing the nature of the asset in such cases is provided at Chapter 38. Where it is determined that the trees are bearer plants, the requirements at section 3.1.7 above would apply. Where it is determined that the trees are not held in relation to agricultural activity, it is likely an entity would apply the general requirements in IAS 16.

How we see it

If the trees are held solely to generate carbon offsets, whether these are sold or used by the entity, determining the nature of the asset may require judgement.

After initial recognition, it is not clear whether reassessment might be required should circumstances change. For example, assume an entity had no intention of felling the trees, but that subsequently changed for some of the trees due to windthrow. If a change in circumstances were to arise, an entity would need to apply the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* to develop an appropriate policy.

If, having assessed the nature of the assets, it is determined that IAS 16 applies and the asset is not a bearer plant, the assets shall be initially measured at their accumulated cost until they are available for use, which, in contrast to the treatment outlined above for bearer plants, will generally be as soon as they are planted.

3.1.9 Expenditure on the development of infrastructure relating to new technologies

An entity may incur expenditure on the development of infrastructure relating to new technologies. One instance in which this may be particularly relevant is those entities incurring expenditure arising from the need to address impacts of climate change (e.g., hydrogen processing or carbon capture and storage (CCS) facilities). Such development costs are recognised as an item of PP&E if it is probable that future economic benefits associated with the item will flow to the entity and the cost of the item can be measured reliably. The entity will need to consider at which point there is sufficient and reliable information to meet the PP&E recognition criteria. This is key as there will likely be more uncertainty about the total project costs of assets relating to new technologies compared to existing technologies. Therefore, there is greater potential for significant time and cost overruns.

3.1.10 Aggregation of items of PP&E

Entities may have items of PP&E that are considered insignificant at group level because the group is of such a size that the individual assets are considered insignificant to the group as a whole. As described in section 3.1.1 above, IAS 16 does not prescribe the 'unit of measure' for recognition, i.e., what constitutes an item of PP&E and the extent to which items can be aggregated. [IAS 16.9]. The standard notes that it may be appropriate to aggregate individually insignificant items such as moulds, tools and dies, and to apply the standard to the aggregate value, but is silent on whether this approach may be used to aggregate properties or similar assets that are individually immaterial.

There are instances in which the aggregation of items on the grounds that they are immaterial to the entity purely by virtue of their size may result in accounting that is inconsistent with the broader requirements of IAS 16. For example, the aggregation of individually immaterial assets into a single asset could lead to a factory being considered a single asset, instead of distinguishing between the land, buildings, plant and machinery, which would clearly be against both the letter and spirit of IAS 16. The following Illustration shows another situation:

Illustration 3-1: Aggregation of individual properties

An entity owns a large number of individual properties from which it earns both rental income and other trading income, such that the properties do not meet the definition of investment properties under IAS 40. The entity applies the revaluation model for subsequent measurement of its properties.

Each property is individually immaterial to the entity. Nevertheless, each property is recorded separately in the entity's books and records, is monitored separately by management and generates individual cash flows. Therefore, each individual property is regarded as a separate item of PP&E under IAS 16.

If such an entity did aggregate all its properties, any downward revaluations on individual properties to the income statement would be inappropriately offset by revaluation gains arising on other properties within the aggregated group.

How we see it

Paragraph 9 of IAS 16 applies to small items (such as tools) that are capitalised together into a single amount and are not subsequently viewed by management or monitored as single assets. In our view, the paragraph cannot be used to justify the aggregation of individual assets if the entity itself views and monitors the assets individually, the assets generate separately identifiable cashflows or the assets are subject to separate contractual arrangements.

3.2 Accounting for parts ('components') of assets

IAS 16 requires 'significant parts' of an asset to be depreciated separately. These are parts that have a cost that is significant in relation to the total cost of the asset. Therefore, on initial recognition, an entity will have to identify the significant parts of the asset in order to depreciate each part of the asset properly. [IAS 16.43, IAS 16.44]. There is no requirement to identify all parts. The process of identifying and separately recognising the major parts of an item PP&E is often referred to as 'componentisation'.

'Parts' are distinguished from day-to-day servicing, but they are not otherwise defined by the standard; moreover, as described in section 3.1.1, the unit of measurement to which the standard applies (i.e., what comprises an item of PP&E) is not itself defined.

Components may be physical components, but where relevant, non-physical parts may also be identified to reflect the need for the asset to undergo major inspections or overhauls. Major inspections are discussed further in section 3.3.2 below. The separation of an asset into major physical components is illustrated in illustration 3-2:

Illustration 3-2: Identification of component parts

An entity buys a property with an estimated useful life of 25 years for CU4 million. The property's roof is expected to require replacement every 10 years at an estimated cost of CU250,000. The building is also internally configured using partition walls in order to create the required workspaces (such as open plan areas and meeting rooms), and this internal configuration is expected to be replaced every 7 years at an estimated cost of CU350,000.

The entity is required under IAS 16 to allocate the amount initially recognised to its significant parts, and therefore it determines that it shall:

- Regard the roof as a significant part with a cost of CU250,000 and a useful life of 10 years;
- Regard the internal partitioning as a significant part with a cost of CU350,000 and a useful life of 7 years; and
- The remaining cost of CU3.4 million should be allocated to the building component with a useful life of 25 years.

This parts approach is illustrated by International Consolidated Airlines Group, S.A. in Practical example 3-3 below and by Skanska AB in Practical example 5-1 (see section 5.2 below).

Practical example 3-3: International Consolidated Airlines Group, S.A. (2023) Spain

Annual Report and Accounts 2023 [extract]

Financial Statements [extract]

Notes to the consolidated financial statements [extract]

2 Significant accounting policies [extract]

Property, plant and equipment [extract]

a Fleet

All aircraft are stated at the fair value of the consideration given after taking account of manufacturers' credits and pre-delivery instalment payments (referred to as progress payments). Fleet assets owned or right of use ('ROU') assets are disaggregated into separate components and depreciated at rates calculated to write down the cost of each component to the estimated residual value at the end of their planned operational lives (which is the shorter of their useful life or lease term) on a straight-line basis. Depreciation rates are specific to aircraft type, based on the Group's fleet plans, within overall parameters of 23 years and up to 5 per cent residual value for short-haul aircraft and between 23 and 29 years (depending on aircraft) and up to 5 per cent residual value for long-haul aircraft.

Right of use assets are depreciated over the shorter of the lease term and the aforementioned depreciation rates. Where the lease includes a purchase option, at the discretion of the Group, where it is expected that the purchase option will be exercised, the associated right of use asset is depreciated using the aforementioned depreciation rates to reflect the reasonably certain life of the aircraft, irrespective of the lease term.

Cabin interior modifications, including those required for brand changes and relaunches, are depreciated over the lower of 12 years and the remaining economic life of the aircraft, whether owned or leased.

Aircraft and engine spares acquired on the introduction or expansion of a fleet, as well as rotatable spares purchased separately, are carried as property, plant and equipment and generally depreciated in line with the fleet to which they relate.

In addition to the requirement to componentise for depreciation purposes, IAS 16 requires entities to derecognise an existing part when it is replaced, regardless of whether it has been depreciated separately. The accounting for subsequent expenditure on replacement of parts is discussed further at 3.3.1 below.

3.3 Initial and subsequent expenditure

IAS 16 makes no distinction in principle between the initial costs of acquiring an asset and any subsequent expenditure relating to it. In both cases, any and all expenditure has to meet the recognition criteria and be expensed in profit or loss if it does not. [IAS 16.10].

Extract from IAS 16

- | | |
|----|---|
| 10 | An entity evaluates under this recognition principle all its property, plant and equipment costs at the time they are incurred. These costs include costs incurred initially to acquire or construct an item of property, plant and equipment and costs incurred subsequently to add to, replace part of, or service it. The cost of an item of property, plant and equipment may include costs incurred relating to leases of assets that are used to construct, add to, replace part of or service an item of property, plant and equipment, such as depreciation of right-of-use assets. |
|----|---|

The standard draws a distinction between servicing and more major expenditures. Day-to-day servicing, by which is meant the repair and maintenance of PP&E that largely comprises labour costs, consumables and other minor parts, should be recognised in profit or loss as incurred. [IAS 16.12]. However, if the expenditure involves replacing a significant part of the asset, this part should be capitalised as part of the PP&E, if the recognition criteria are met. The carrying amount of the part that has been replaced should be derecognised (see section 3.3.1 and section 7). [IAS 16.13].

Examples of the treatment of major maintenance expenditure are shown in Practical example 3-4 and Practical example 3-5 below (see section 3.3.2). Further guidance on the accounting for major inspections and overhauls is provided at 3.3.2.

Practical example 3-4:	Akzo Nobel N.V. (2023)	The Netherlands
Akzo Nobel Report 2023 FINANCIAL STATEMENTS [extract] NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract] Note 1: SUMMARY OF MATERIAL ACCOUNTING POLICIES [extract] Property, plant and equipment (Note 11) [extract]		
<p>Costs of major maintenance activities are capitalized and depreciated over the estimated useful life. Maintenance costs which cannot be separately defined as a component of property, plant and equipment are expensed in the period in which they occur. We</p> <p>...</p>		

3.3.1 Subsequent expenditure on replacement of parts

When discussing subsequent expenditure, IAS 16 identifies two particular types of 'parts' of assets. The first is an item that requires replacement at regular intervals during the life of the asset such as relining a furnace after a specified number of hours of use, or replacing the interiors of an aircraft (e.g., seats and galleys) several times during the life of the airframe. The second type involves less frequently recurring replacements, such as replacing the interior walls of a building.

IAS 16 does not state that replacement expenditures necessarily qualify for recognition. Rather, it says that an entity recognises the cost of replacing part of such an item in the carrying amount of an item of PP&E when that cost is incurred, if the recognition criteria are met. Some of its examples, such as aircraft interiors, are clearly best treated as separate assets as they have a useful life different from that of the asset of which they are part. With the other examples, such as interior walls, it may be less clear why they meet the recognition criteria. However, replacing internal walls or similar expenditures may extend the useful life of a building while upgrading machinery may increase its capacity, improve the quality of its output, or reduce operating costs. Hence, this type of expenditure may give rise to future economic benefits.

Entities are required to derecognise the carrying amount of an existing part when it is replaced, regardless of whether it has been depreciated separately, and the standard allows the carrying value of the part that has been replaced to be estimated, if necessary:

"If it is not practicable for an entity to determine the carrying amount of the replaced part, it may use the cost of the replacement as an indication of what the cost of the replaced part was at the time it was acquired or constructed." [IAS 16.70]

As such, if the entity has no better information than the cost of the replacement part, it is permitted to use a depreciated replacement cost basis to calculate the amount derecognised in respect of the original asset.

As a consequence, an entity may not actually identify the parts of an asset until it incurs the replacement expenditure, as in the following Illustration:

Illustration 3-3: Recognition and derecognition of replacement parts
<p>An entity buys a piece of machinery with an estimated useful life of ten years for CU10 million. The asset contains two identical pumps, which are assumed to have the same useful life as the machine of which they are a part. After seven years one of the pumps fails and is replaced at a cost of CU200,000. The entity had not identified the pumps as separate parts and does not know the original cost. It uses the cost of the replacement part to estimate the carrying value of the original pump. With the help of the supplier, it estimates that the cost would have been approximately CU170,000 and that this would have a remaining carrying value after seven year's depreciation of CU51,000. Accordingly, it derecognises CU51,000 and capitalises the cost of the replacement.</p>

3.3.2 Major inspections and overhauls

It may be necessary to perform major inspections of an item of PP&E at regular intervals as a condition of continuing to use the asset. In such circumstances, when a major inspection or overhaul is performed, the standard allows a separate part (distinct from physical parts) to be recognised for the cost of such inspections if the recognition criteria are satisfied, regardless of whether any physical parts of the asset are replaced. [IAS 16.14].

The reason for this approach is to maintain a degree of consistency with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* which prohibits an entity from making provisions if there are no obligations. Therefore, an entity is prohibited by IAS 37 from making, for example, a provision to overhaul an owned aircraft engine by annually providing for a quarter of the cost for four years and then utilising the provision when the engine is overhauled in the fourth year. [IAS 37 IE Example 11A, IAS 37 IE Example 11B]. Instead, the cost of a major inspection is added to the asset's cost if the recognition criteria are satisfied and then depreciated over the period until the next major inspection. This approach is illustrated in Practical example 3-5:

Practical example 3-5: International Consolidated Airlines Group, S.A. (2023) Spain

Annual Report and Accounts 2023 [extract]

Financial Statements [extract]

Notes to the consolidated financial statements [extract]

2 Significant accounting policies [extract]

Property, plant and equipment [extract]

f Maintenance, repairs and overhaul [extract]

Owned aircraft

Major overhaul expenditure, including replacement spares and labour costs for airframes and engines, is capitalised and amortised over the expected life between major overhauls or to the end of the useful life of the asset.

All other replacement spares and other costs relating to maintenance of owned fleet assets (including maintenance provided under 'pay-as-you-go' contracts) are charged to the Income statement on consumption or as incurred respectively.

'Pay-as-you-go' contracts, as referenced in the above examples, are common in the aerospace industry and refer to comprehensive turbine engine maintenance and overhaul contracts, which are usually based on a fixed fee for each hour flown and include loan engines when required.

When a major inspection or overhaul is performed, any amount remaining from the previous inspection (as distinct from physical parts) is derecognised. In the same way as described at 3.3.1 for replacement parts more generally, this process of recognition and derecognition should take place regardless of whether the cost of the previous inspection was identified (and considered a separate part) when the asset was originally acquired or constructed.

If the element relating to the inspection had previously been identified, it would have been depreciated between that time and the current overhaul and its carrying amount would be known. However, if it had not previously been identified, the carrying amount of the component to be derecognised will need to be estimated. In arriving at this estimate, the standard allows the cost of a future similar inspection to be used as an indication of what the cost of the existing inspection component was when the item was acquired or constructed. [IAS 16.14]. However, an entity is not precluded from reconstructing the carrying amount of the previous inspection (i.e., to estimate the net depreciated carrying value of the previous inspection that will be derecognised) rather than simply using a depreciated replacement cost approach.

These principles may need to be considered by entities which are required to undertake major overhauls or redesigns of items of PP&E as a result of the impacts of climate change on their business. To the extent that such activities result in the replacement of asset parts, entities will need to apply the 'major inspection and overhaul' principles of IAS 16 in determining the appropriate treatment.

4 Measurement at recognition

IAS 16 draws a distinction between measurement at recognition (i.e., the initial recognition of an item of PP&E on acquisition) and measurement after recognition (i.e., the subsequent treatment of the item). Measurement after recognition is discussed in sections 5 and 6 below.

The standard states that “an item of property, plant and equipment that qualifies for recognition as an asset shall be measured at its cost”. [IAS 16.15]. What may be included in the cost of an item is discussed below.

4.1 Elements of cost and cost measurement

IAS 16 sets out what constitutes the cost of an item of PP&E on its initial recognition: [IAS 16.16]

Extract from IAS 16

- 16 The cost of an item of property, plant and equipment comprises:
- (a) its purchase price, including import duties and non-refundable purchase taxes, after deducting trade discounts and rebates.
 - (b) any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management.
 - (c) the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period.

One practical example of (c) above may arise in connection with dilapidation obligations in lease agreements, under which a lessee is obliged to return premises to the landlord in an agreed condition. Arguably, a provision is required whenever the ‘damage’ is incurred. Therefore, if an entity rents a building and constructs a dividing wall to convert the single building into two premises and has an obligation to make good at the end of the lease term, the tenant should immediately provide for the costs of so doing. The ‘other side’ of the provision entry is capitalised and will be amortised over the lease term. This reflects the fact that the cost to the tenant of the leasehold improvement includes both the cost of constructing the dividing wall, but also the resulting costs which the entity will have to incur in the future to restore the property.

Dilapidation and other provisions relating to leased assets are discussed in more detail in Chapter 27.

Obligations that arise, for example due to damage caused, as a result of using the asset to produce inventories during a particular period are not capitalised as part of the item of PP&E. These are production costs and are included in the cost of inventories. [IAS 16.18]. Obligations that arise due to general use (for example, costs associated with wear and tear arising from the use of a leasehold building for administrative purposes) are expensed as incurred.

4.1.1 ‘Directly attributable’ costs

This is the key issue in the measurement of cost. [IAS 16.16]. The standard gives examples of types of expenditure that are, and are not, considered to be directly attributable: [IAS 16.17, IAS 16.19]

Extract from IAS 16

- 17 Examples of directly attributable costs are:
- (a) costs of employee benefits (as defined in IAS 19 *Employee Benefits*) arising directly from the construction or acquisition of the item of property, plant and equipment;
 - (b) costs of site preparation;
 - (c) initial delivery and handling costs;
 - (d) installation and assembly costs;
 - (e) costs of testing whether the asset is functioning properly (ie assessing whether the technical and physical performance of the asset is such that it is capable of being used in the production or supply of goods or services, for rental to others, or for administrative purposes); and
 - (f) professional fees.

Only costs that are directly attributable can be capitalised, and capitalisation must cease when the asset is in the location and condition necessary for it to be capable of operating in the manner intended by management. For further discussion see sections 4.1.3 and 4.1.4.

IAS 16 requires the costs of testing to be added to the carrying value of the asset. Directly attributable testing costs comprise testing costs incurred when assessing whether the technical and physical performance of the asset is such that it is capable of being used in the production or supply of goods or services, for rental to others, or for administrative purposes. [IAS 16.17(e)]. IAS 16 does not provide guidance on assessing the point at which an asset is capable of being used in the manner intended, and therefore, judgement may be required in determining the period during which testing costs should be capitalised.

The cost of an item of PP&E includes costs incurred relating to leases of assets that are used to construct, add to, or replace part of an item of PP&E, such as depreciation of right-of-use assets, where those lease costs are “directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management ...”. [IAS 16.10, IAS 16.16].

When, for example, an entity leases real estate (land or building) in relation to the construction of real estate or leasehold improvements that meet the definition of PP&E, the entity needs to determine whether the depreciation cost of the right-of-use asset represents a cost that is directly attributable to bringing the asset to a condition necessary for it to be capable of operating in a manner intended by management. If the entity concludes this is the case, the depreciation expense incurred in relation to the right-of-use asset for the lease during the construction period would be capitalised as part of the construction cost of the item of PP&E. [IAS 16.10, IAS 16.16(b)].

Depreciation of a right-of-use asset begins at commencement of the lease, which may be before the completed asset is available for use in circumstances in which real estate or leasehold improvements are being constructed. This differs from the requirement in respect of PP&E, where depreciation of the asset begins when it is available for use in the manner intended by management (see further discussion in section 5.5 below).

Where an entity concludes that the depreciation cost of the right-of-use asset does not represent a directly attributable cost of the asset, the entity should expense the costs as incurred.

Examples of such considerations are shown in Illustration 4-1 and Illustration 4-2 below.

How we see it

The cost of an item of PP&E includes the depreciation of right-of-use assets, where that depreciation expense is directly attributable to bringing the item to the location and condition necessary for it to be capable of operating in the manner intended by management. Determining whether the depreciation expense associated with a right-of-use asset is directly attributable requires judgement, taking into account all relevant facts and circumstances.

Certain types of expenditure are not directly attributable costs associated with an item of PP&E and therefore, cannot be recognised as part of the cost of an asset. This should be considered in assessing whether a lease cost is included in the cost of an item of PP&E. Some specific examples of ineligible costs are discussed further at section 4.1.3 below.

Illustration 4-1: Depreciation charge for right-of-use asset - owner-occupied building

On 1 January 20X0, an entity enters into a lease of land for a term of 40 years.

The entity intends to construct a building on the land and plans to occupy the building itself once construction is completed. The entity must obtain planning permission for the building, and this process takes three years. Therefore, the land lease commences on 1 January 20X0. Construction of the building begins on 1 January 20X3 and is completed two years later, on 1 January 20X5. The entity applies the cost model for its PP&E.

The entity needs to determine whether the depreciation cost of the right-of-use asset represents a cost that is directly attributable to bringing the asset to a condition necessary for it to be capable of operating in the manner intended by management as specified in IAS 16. [IAS 16.16(b)]. In this scenario the depreciation charge during the construction period is an unavoidable cost of developing the property, because without the lease of the land no construction of the building can occur.

Therefore, the depreciation charge related to the right-of-use asset for the land lease incurred during the period from 1 January 20X3 to 31 December 20X4 is capitalised. Thereafter, the depreciation charge is recognised in expense. Depreciation in the period prior to 1 January 20X3 is expensed as incurred as depreciation during that time is not directly attributable to the construction of the asset itself.

Illustration 4-2: Depreciation charge for right-of-use asset - leasehold improvements

On 1 January 20X0, an entity enters into a 10-year lease of a building. To make the building suitable for its requirements, the entity makes leasehold improvements beginning on the commencement date of the lease. From lease commencement, the entity cannot begin its intended operations until the work to construct the leasehold improvements is completed. On 1 April 20X0, the building is available to begin the entity's operations.

Considerable judgement may be required in examples such as this one, where an entity is required to assess whether the depreciation expense incurred on a leased building is directly attributable to the cost of associated leasehold improvements. Factors an entity needs to consider may include the condition of the leased asset prior to making the leasehold improvements (for example, whether it is merely a shell building which cannot be operated), the nature of the asset prior to the leasehold improvements and the significance of the improvements to be made (for example, whether the changes are relatively minor or superficial, or whether they involve a full repurposing of the asset to enable its use). In addition, IAS 16 is clear that certain 'start up' costs, which include 'the costs of opening a new facility' are not costs of an item of PP&E. Therefore, there may also be significant judgement in determining whether the depreciation should be viewed as a 'start-up' cost and expensed as incurred on that basis.

If, having made this assessment, the entity concludes that the depreciation is directly attributable to bringing the asset to a condition necessary for it to be capable of operating in the manner intended by management, the entity would capitalise the depreciation expense as part of construction costs. Otherwise, the entity should expense the costs as incurred.

Once the entity begins operations, the depreciation charge related to right-of-use asset is expensed as incurred.

4.1.2 Borrowing costs

Borrowing costs must be capitalised in respect of certain qualifying assets if those assets are measured at cost. A qualifying asset is "an asset that necessarily takes a substantial period of time to get ready for its intended use or sale". [IAS 23.5]. Assets that are ready for their intended use or sale when acquired are not qualifying assets. [IAS 23.7]. Therefore, an entity will capitalise borrowing costs on a self-constructed item of PP&E if it meets the criteria in IAS 23 *Borrowing Costs*. [IAS 16.22]. Further considerations in respect of self-built assets are discussed in section 4.1.5 below.

The treatment of borrowing costs is discussed separately in Chapter 22.

Entities are not required to capitalise borrowing costs in respect of assets that are measured at fair value. This includes revalued PP&E which is measured at fair value through Other Comprehensive Income ('OCI'). Generally, an item of PP&E within the scope of IAS 16 will only be carried at revalued amount once construction is completed, so capitalisation of borrowing costs will have ceased (see section 4.1.4 below). This is not necessarily the case with investment property in the course of construction (see Chapter 20).

The cost of an asset, before adopting a policy of revaluation, will include capitalised borrowing costs. Thereafter, IAS 23 does not prohibit capitalisation of eligible borrowing costs for assets carried at fair value as a matter of accounting policy. [IAS 23.4(a), IAS 23.BC4]. To the extent that entities choose to capitalise borrowing costs in respect of assets still in the course of construction that are carried at fair value, the methods allowed by IAS 23 should be followed.

For disclosure purposes, an entity will still need to monitor the carrying amount of PP&E measured under the revaluation model, including those borrowing costs that would have been recognised, had such an asset been carried under the cost model (see section 8.2 below).

4.1.3 Start up costs, administration and other general overheads

Administration and other general overhead costs are not costs of an item of PP&E. This means that employee costs not related to a specific asset, such as site selection activities and general management time do not qualify for capitalisation. Entities are also not allowed to recognise so-called 'start up costs' as part of the item of PP&E. These include costs related to opening a new facility, introducing a new product or service (including costs of advertising and promotional activities), conducting business in a new territory or with a new class of customer (including costs of staff training) and similar items. [IAS 16.19]. These costs should be accounted for in the same way as similar costs incurred as part of the entity's on-going activities (in general, expensed as incurred).

4.1.4 Cessation of capitalisation

Cost recognition ceases once an item of PP&E is in the location and condition necessary for it to be capable of operating in the manner intended by management. This will usually be the date of practical completion of the physical asset. IAS 16, therefore prohibits the recognition of relocation and reorganisation costs, costs incurred in using the asset or during the run up to full use once the asset is ready to be used, and any initial operating losses. [IAS 16.20].

An entity is not precluded from continuing to capitalise costs during an initial commissioning period that is necessary for running in machinery or testing equipment. In contrast, no new costs should be capitalised if the asset is fully operational but is not yet achieving its targeted output, usage or profitability because demand is still building up, for example in a new hotel that initially has high room vacancies or a partially let investment property. In these cases, the asset is clearly in the location and condition necessary for it to be capable of operating in the manner intended by management.

Entities need to identify the point at which major assets are considered to be in the location and condition necessary for it to be capable of operating in the manner intended by management and apply that policy consistently.

4.1.5 Self-built assets

If an asset is self-built by the entity, the same general principles apply as for an acquired asset. The costs of abnormal amounts of wasted resources, whether labour, materials or other resources, are not included in the cost of such self-built assets. If the same type of asset is made for resale by the business, the cost of such an asset to be held as property, plant and equipment is usually the same as the cost of constructing that asset for sale, i.e., without including any internal profit element but including attributable overheads in accordance with IAS 2 (see Chapter 23). IAS 23, discussed in Chapter 22, contains criteria relating to the recognition of any interest as a component of the carrying amount of a self-built item of PP&E. [IAS 16.22].

Kendrion N.V. provides an example of an accounting policy for self-built assets.

Practical example 4-1: Kendrion N.V. (2023)	The Netherlands
Annual Integrated Report 2023 [extract] FINANCIAL STATEMENTS [extract] NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract] Significant accounting policies [extract] (c) Property, plant and equipment [extract] (i) Owned assets [extract] (i) Owned assets Items of property, plant and equipment are measured at cost or assumed cost less accumulated depreciation and accumulated impairment losses (see accounting policy g). The cost includes expenditure that is directly attributable to the acquisition of the asset. The cost of self-constructed assets includes the cost of materials, direct labour, the initial estimate, where relevant, of the costs of dismantling and removing the items and reinstating the site on which they are located, a reasonable proportion of production overheads, and capitalized borrowing costs.	
...	

4.1.6 Deferred payment

IAS 16 specifically precludes the capitalisation of hidden credit charges as part of the cost of an item of PP&E, so the cost of an item of PP&E is its cash price equivalent at the recognition date. This means that if payment is made in some other manner, the cost to be capitalised is the normal cash price. Thus, if the payment terms are extended beyond 'normal' credit terms, the cost to be recognised must be the cash price equivalent and any difference between the cash price equivalent and the total payment must be treated and recognised as an interest expense over the period of credit unless such interest is capitalised in accordance with IAS 23 (see section 4.1.2 above). [IAS 16.23]. Right-of-use assets under IFRS 16 are discussed in Chapter 24. Assets partly paid for by government grants are discussed in Chapter 25.

4.1.7 Land and buildings to be redeveloped

It is common for property developers to acquire land with an existing building where the planned redevelopment necessitates the demolition of that building and its replacement with a new building that is to be held to earn rentals or will be owner occupied.

How we see it

IAS 16 requires that the building and land be classified as two separate items (see section 5.4.2 below). In our view it is appropriate, if the existing building is unusable or likely to be demolished by any party acquiring it, that the entire or a large part of the purchase price be allocated to the land. Similarly, subsequent demolition costs should be treated as being attributable to the cost of the land.

Entities replacing an existing building with a building held to earn rentals or capital appreciation or a building to be sold in the ordinary course of their business will deal with the land and buildings under IAS 40 (see Chapter 20) or IAS 2 (see Chapter 23), respectively.

Owner-occupiers may also take the decision to replace existing buildings which they have previously occupied with new facilities for their own use, to rent to others or to be held for capital appreciation or sold in the ordinary course of the entity's business.

How we see it

Here the consequences are different and the carrying amount of the existing building cannot be rolled into the costs of the new development. In this case, the land and buildings have already previously been separately recognised as assets under IAS 16. The existing building must be depreciated over its remaining useful life to reduce the carrying amount of the asset to its residual value (presumably nil) at the point at which it is demolished.

Consideration will have to be given as to whether the asset is impaired in accordance with IAS 36 (see section 5.7 below). Many properties do not directly generate independent cash inflows (i.e., they are part of a cash-generating unit) and reducing the useful life will not necessarily lead to an impairment of the cash-generating unit (meaning the property itself may initially be shielded from impairment). However, by the time the asset has been designated for demolition it may no longer be part of a cash-generating unit (see Chapter 21).

4.1.8 Transfers of assets from customers

An entity may be entitled to consideration in the form of goods, services or other non-cash consideration (e.g., PP&E), in exchange for transferring goods or services to a customer. Examples include:

- A supplier who receives a contribution to the development costs of specific tooling equipment from another manufacturer to whom the supplier will sell parts, using that specific tooling equipment under a supply agreement.
- Suppliers of utilities who receive items of PP&E from customers that are used to connect them to a network through which they will receive ongoing services (e.g., electricity, gas, water or telephone services). A typical arrangement is one in which a builder or individual householder must pay for power cables, pipes, or other connections.
- In outsourcing arrangements, the existing assets are often contributed to the service provider, or the customer must pay for assets, or both.

This raises questions about recognising assets for which the entity has not paid. In what circumstances should the entity recognise these assets, how should it be measured on initial recognition and how is the 'other side' of the accounting entry dealt with? Is it revenue and if so, how and over what period is it recognised? There are a number of potential answers to this and, unsurprisingly, there is variety in practice.

When an entity (i.e., the seller or vendor) receives, or expects to receive, non-cash consideration from a customer in relation to a revenue contract that is within the scope of IFRS 15 *Revenue from Contracts with Customers*, the fair value of the non-cash consideration is included in the transaction price. [IFRS 15.66]. The IFRS 15 requirements regarding non-cash consideration are discussed in detail in Chapter 28. The Basis for Conclusions on IFRS 15 states that "once recognised, any asset arising from the non-cash consideration would be measured and accounted for in accordance with other relevant requirements ..." (e.g., IAS 16). [IFRS 15.BC253]. As such, the fair value measured in accordance with IFRS 15 would be the deemed cost of the item of PP&E on initial recognition.

4.1.9 Variable and contingent consideration

The purchase price of an item of PP&E might include variable or contingent amounts. Transactions involving variable or contingent consideration are often very complex and payment may depend on a number of factors. Examples include variable or contingent payments based on an index or rate, variable or contingent payments which depend upon the purchasers' future actions, variable or contingent payments related to the condition of the asset, or variable or contingent payments related to the asset's performance. Some arrangements may contain more than one source of variability. Further complexity can also arise when arrangements are akin to profit sharing agreements which are not addressed in any standard.

The topic of variable payments for an asset purchase was discussed by the IFRS IC between 2011 and 2016, and an agenda decision was published in March 2016. The IFRS IC's discussions considered both the accounting at the date of purchasing the asset and subsequently, and distinguished between those variable payments that depend on the purchaser's future activity and those that do not. The IFRS IC determined that the issue was too broad for it to address within the confines of existing standards and recommended that the IASB address the accounting for variable payments comprehensively. In May 2016, the IASB tentatively agreed that this issue would be included in the research pipeline between 2017 and 2021. At the time of writing this is not listed as an active research project on the IASB's work plan.

A critical step in analysing the accounting for the purchase of an item of PP&E in an arrangement involving variable or contingent consideration is to fully understand the contractual arrangements, understanding the nature of the contingent or variable payments. This includes developing a full understanding of whether those contingent payments are linked to the initial value of the asset, or to its future performance, whether the contingency or variability is within or outside of the purchasers' control and whether the variable payment is a payment for some other goods or services from the seller. In some cases, the contract may establish an obligation for the contingent payment at the outset, whilst in others it might be determined that the arrangement is an executory contract, and the liability to make the contingent payments is only recognised later once either party fulfils its obligations under the contract.

The two key issues with regards to the accounting for variable consideration in an asset purchase are 1) whether and when to recognise a liability for that variable consideration, and 2) whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset.

Looking at the first question of when a liability to make variable or contingent payments would be recognised, if the arrangement is not considered to be an executory contract, one consideration is whether those payments are dependent on the entity's future activity, or not.

IAS 32.25 stipulates that where the contingency is outside the control of both the issuer and the holder, a contingent obligation to deliver cash meets the definition of a financial liability (see Chapter 43). Therefore, if the obligation to make the variable payment does not depend on the acquiring entity's future activity, it would seem appropriate to recognise a financial liability in respect of the contingent amounts. [IAS 32.25]. However, it is acknowledged that whilst this view was tentatively agreed during the course of the IFRS IC discussions on the topic, ultimately, this was not clarified or confirmed as part of the final agenda decision. Furthermore, the final agenda decision notes that there are questions about the accounting for variable payments subsequent to the purchase of the asset, and in making that statement the IFRS IC did not distinguish between the different types of variable payments.

How we see it

In light of the discussions held by the IFRS IC and the absence of clear guidance in the final agenda decision, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. In doing so, entities will need to apply the hierarchy in IAS 8. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

As described above, there is no explicit guidance on the treatment of variable or contingent consideration in the acquisition of an asset and there is diversity in practice for these types of arrangements. Therefore, examples of some accounting policies an entity may want to consider regarding initial recognition of the asset include the following:

- The cost of the asset on initial recognition includes the fair value of all variable or contingent consideration at the date of acquisition. A corresponding liability is recognised for the same amount.
- The cost of the asset on initial recognition excludes any variable or contingent payments. Accordingly, no liability is recognised for those contingent or variable amounts.

The second question that needs to be addressed is how the entity must account for subsequent payments and changes to the estimate of variable or contingent consideration. Depending on the facts and circumstances of the arrangement an entity may determine that:

1. Variability arises from exchange rates, time value of money, or embedded derivatives - Changes in the carrying amount of a recognised liability that arise from exchange rates are accounted for in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* and IFRIC 22 *Foreign Currency Transactions and Advance Consideration*, while the time value of money and embedded derivatives are accounted for in accordance with IFRS 9 *Financial Instruments*;
2. Variability is directly linked to the quality or quantity of the asset(s) received - In these cases the initial recognition of the asset and liability were based on an accounting estimate that is subsequently updated in accordance with IAS 8.37; or
3. The variability in the arrangement does not fall under (1) or (2) above and an accounting policy needs to be developed to address it.

In the latter case, an entity will need to apply the requirements of IAS 8 to develop an accounting policy that it should apply consistently to all similar transactions. The accounting policy developed will need to address whether the change in the estimate of variable or contingent consideration should be capitalised as part of the cost of the asset or expensed. This determination is usually based on the reason for the contingent payment and entities should consider the substance of the arrangement in determining the appropriate treatment.

It is only appropriate for subsequent changes to a recognised liability to be recognised as part of the cost of the asset to the extent that it relates to future economic benefits embodied in the asset initially received. For example, if the contingency or variability is viewed as being linked to the quality or quantity of the asset initially received. Variability arising due to other factors, such as its use over time, would generally be expensed.

How we see it

Until this matter is resolved by the IASB, where the accounting for the variability or contingency is not prescribed in another standard, an entity should adopt and apply a consistent accounting policy in relation to whether subsequent payments or changes to the measurement of a recognised liability to make contingent or variable payments are included as part of the cost of an acquired asset or expensed as incurred, in accordance with the hierarchy in IAS 8.

An entity should exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

4.1.10 Acquisition of a group of assets

The purchase price of an individual item of PP&E may be an allocation of the price paid for a group of assets. If an entity acquires a group of assets that do not comprise a business ('the group'), such a transaction is outside the scope of IFRS 3 *Business Combinations*, but nonetheless, IFRS 3 sets out specific principles to be applied in order to allocate the entire cost to individual items (see Chapter 10). These principles differ from the approach required for a business combination. In such cases, the acquirer should identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for, intangible assets in IAS 38) and liabilities assumed. The cost of the group should be allocated to the individual identifiable assets and liabilities based on their relative fair values at the date of purchase. Such a transaction or event does not give rise to goodwill. [IFRS 3.2(b)].

Frequently asked questions

Question 4-1: How does an entity account for the acquisition of a group of assets that does not constitute a business?

In November 2017, the IFRS IC issued an agenda decision that clarified how to account for a group of assets that does not constitute a business. The agenda decision more specifically addressed how to allocate the transaction price to the identifiable assets acquired and liabilities assumed when the sum of the individual fair values of the identifiable assets and liabilities is different from the transaction price, and the group includes identifiable assets and liabilities initially measured both at cost and at an amount other than cost.

The IFRS IC concluded that a reasonable reading of the requirements in IFRS 3.2(b) (as described above) on the acquisition of the group, is that there are two possible approaches.¹ These two approaches are discussed in detail in Chapter 10. See also similar discussion relating to investment property in Chapter 20.

4.1.11 Dismantling and restoration costs

If an asset is used to produce inventories during a particular period, the costs of obligations that are incurred during that period to dismantle, remove or restore the site on which such asset has been located are not capitalised as part of the item of PP&E. Instead, these are costs of producing inventory and are dealt with in accordance with IAS 2 (see Chapter 23). [IAS 16.18].

Site restoration costs and other environmental restoration and similar costs arising from the construction or commissioning of an asset must be estimated and capitalised at initial recognition, even if the expenditure will only be incurred at the end of the item's life. In addition, in some cases an obligation for such costs may arise later in the asset's life, for example as a result of changes in legislation. Such costs would also be capitalised as part of the cost of the item of PP&E. The obligations are calculated in accordance with IAS 37 and IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* (see section 4.3 below and Chapter 27). [IAS 16.16]. This is illustrated in Practical example 4-2 below.

Integrated Annual Report 2023 [extract]

Consolidated Financial Statements [extract]

Notes [extract]

(1) Summary of Significant Accounting Policies [extract]

Property, Plant and Equipment [extract]

Property, plant and equipment are initially measured at acquisition or production cost, including decommissioning or restoration cost that must be capitalized, and are depreciated over the expected useful lives of the components, generally using the straight-line method, unless a different method of depreciation is deemed more suitable in certain exceptional cases. Useful lives are regularly

...

¹ [IFRIC Update](#), November 2017, available on the IFRS Foundation's website.

Provisions for Asset Retirement Obligations and Other Miscellaneous Provisions [extract]

Obligations arising from the decommissioning or dismantling of property, plant and equipment are recognized during the period of their occurrence at their discounted settlement amounts, provided that the obligation can be reliably estimated, whereby no negative discount rates are applied. The carrying amounts of the respective property, plant and equipment are increased by the same amounts. In subsequent periods, capitalized asset retirement costs are amortized over the expected remaining useful lives of the assets, and the provision is accreted to its present value on an annual basis. Advance payments remitted are deducted from the provisions.

...

4.1.12 Cost of property, plant and equipment acquired in a business combination

When property, plant and equipment is acquired as part of a business combination, those items are initially measured at their acquisition-date fair values. This acquisition date fair value forms the cost of the asset for the purposes of subsequent measurement. The accounting for business combinations under IFRS 3 is discussed in Chapter 10.

4.2 Incidental and non-incidental income

Under IAS 16, the cost of an item of PP&E includes any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management. [IAS 16.16(b)]. However, before or during the construction of an asset, an entity may enter into incidental operations that are not, in themselves, necessary to meet this objective. [IAS 16.21].

The standard gives the example of income earned by using a building site as a car park prior to starting construction. Because these incidental operations are not required in order to bring an asset to the location or condition necessary for it to be capable of operating in the manner intended by management, the resulting income and related expenses are recognised in profit or loss and included in their respective classifications of income and expense. [IAS 16.21]. Such incidental income and related expenses are not included in determining the cost of the asset.

If the asset is already in the location and condition necessary for it to be capable of being used in the manner intended by management then IAS 16 requires capitalisation to cease and depreciation to start. [IAS 16.20, IAS 16.55]. In these circumstances, all income earned from using the asset must be recognised as revenue in profit or loss and the related costs should include an element of depreciation of the asset.

4.2.1 Income earned before the asset is available for use

Proceeds from selling items produced whilst bringing an item of PP&E into the location and condition necessary for it to be capable of operating in the manner intended by management, and the cost of those items, shall be recognised in profit or loss. The cost of those items shall be determined by applying the measurement requirements of IAS 2. [IAS 16.20A].

The Board decided to require the application of IAS 2 in determining the cost of selling such items because:

- IAS 2 sets out a framework for measuring cost without being overly prescriptive; and
- an entity would already be required to apply IAS 2 in measuring cost if the entity were to determine that the sale of items produced is an output of its ordinary activities - in this case, the items produced would meet IAS 2's definition of inventories. The Board noted that it would be useful to apply the same requirements to the cost of items produced irrespective of whether the sale of those items is an output of an entity's ordinary activities. [IAS 16.BC16].

How we see it

IAS 16 requires entities to apply IAS 2 in determining the cost of output produced while bringing an item of PP&E to the location and condition necessary for it to be capable of operating in the manner intended by management.

IAS 2 sets out a framework to identify production costs, but its application requires judgement. The cost of inventories comprises all costs of purchase, costs of conversion and other costs incurred in bringing the inventories to their present location and condition, which includes a systematic allocation of fixed and variable production overheads. In our view, it would not be appropriate for entities to limit the costs included in the measurement of such items to only those that are incremental. The term 'incremental costs' is not defined in IAS 2 and therefore judgement will be required. The measurement of cost of inventories is discussed in further detail in Chapter 23.

4.2.2 Liquidated damages during construction

Income may arise in other ways, for example, liquidated damages received as a result of delays by a contractor constructing an asset.

Normally, purchasing PP&E does not give rise to income. Therefore, in the absence of specific reference to compensating for losses in a liquidated damage clause, the liquidated damages received are treated as a reduction in the cost of the related assets.

The rationale for this approach is consistent with the conclusion that, rather than damages for delay, the contract provides for an additional payment in the event of early completion. For example, a contract having a value of CU1,000 in which the supplier incurs a CU100 penalty for late delivery after 1 January 20X0 is in substance the same as a contract with a value of CU900 in which the supplier is entitled to an additional payment of CU100 for an early completion before 1 January 20X0. Therefore, the cost of the asset is the total price paid to acquire it, including the premium for early completion (i.e., CU1,000 if finished before 1 January 20X0 and CU900 if finished after 1 January 20X0). This gives the same result as with liquidated damages.

However, when the liquidated damages clause in a contract refers to compensating the affected party for any revenue lost or reimbursement of specific costs incurred because of delay in the completion of the project, then recognising as income or deducting against specifically reimbursed costs is more consistent with the purpose of the liquidated damages clause.

How we see it

Normally, such damages received should be set off against the asset cost - the purchase price of the asset is reduced to compensate for delays in delivery. However, if the agreement specifically provides liquidated damages to compensate for loss of revenue arising because of contract delays, and the basis is clearly related to income lost, then the damages received are recognised as income.

4.3 Accounting for changes in decommissioning and restoration costs

IAS 16 requires the initial estimate of the costs of dismantling and removing an item of PP&E and restoring the site on which it is located to be included as part of the item's cost. This applies regardless of whether the obligation is incurred when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period. [IAS 16.16]. See section 4.1.11 above. However, IAS 16 does not address the extent to which an item's carrying amount should be affected by changes in the estimated amount of dismantling and site restoration costs that occur after the estimate made upon initial measurement. This issue is the subject of IFRIC 1, which applies to any decommissioning, restoration or similar liability that has been both included as part of the cost of an asset measured in accordance with IAS 16 and recognised as a liability in accordance with IAS 37. [IFRIC 1.2]. IFRIC 1 deals with the impact of events that change the measurement of an existing decommissioning, restoration or similar liability. Events include a change in the estimated cash flows, a change in the discount rate and the unwinding of the discount. [IFRIC 1.3]. Changes to the measurement of a decommissioning liability arising from the periodic unwinding of the discount must be recognised in profit or loss as a finance cost, and thus do not impact the measurement of the related asset. The impact of other changes depends on whether the cost or the revaluation model has been applied.

This is discussed in detail in Chapter 27.

The effects of climate change may have implications for an entity's decommissioning liabilities. If the useful life of an item of PP&E is shorter than previously expected (see section 5.4.5 below), this would result in earlier decommissioning and would increase both the decommissioning provision and the decommissioning component of the asset as a result of the discounting effect. In addition, it should be noted that IFRIC 1 creates profit and loss volatility in the case of end-of-life assets, which have a carrying amount that is small compared to the potential movements in the decommissioning liability.

4.4 Exchanges of assets

An entity might swap an asset it does not require in a particular area, for one it does in another - the opposite being the case for the counterparty. Such exchanges are not uncommon in the telecommunications, media and leisure businesses, particularly after an acquisition, as well as in extractive industries (see Chapter 39). Governmental competition rules sometimes require such exchanges. The question arises whether such transactions give rise to a gain in circumstances where the carrying value of the outgoing facility is less than the fair value of the incoming one. This can occur when carrying values are less than market values, although it is possible that a transaction with no real commercial substance could be arranged solely to boost apparent profits.

IAS 16 requires all acquisitions of PP&E in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value, subject to conditions:

"The cost of such an item of property, plant and equipment is measured at fair value unless (a) the exchange transaction lacks commercial substance or (b) the fair value of neither the asset received, nor the asset given up is reliably measurable. The acquired item is measured in this way even if an entity cannot immediately derecognise the asset given up." [IAS 16.24].

The IASB concluded that the recognition of income from an exchange of assets does not depend on whether the assets exchanged are dissimilar. [IAS 16.BC19].

If at least one of the two fair values can be measured reliably, then the fair value of the asset given up is used to measure the cost of the asset received, unless the fair value of the asset received is more clearly evident. [IAS 16.26]. If not, then the exchange is measured at the carrying value of the asset the entity no longer owns. [IAS 16.24]. For example, if the new asset's fair value is higher than the carrying amount of the old asset, a gain may be recognised.

This requirement is qualified by a 'commercial substance' test. If it is not possible to demonstrate that the transaction has commercial substance as defined by the standard (see section 4.4.1 below), assets received in exchange transactions will be recorded at the carrying value of the asset given up. [IAS 16.24].

If the transaction passes the 'commercial substance' test, then IAS 16 requires the exchanged asset to be recorded at its fair value, as shown in illustration 4-3 below:

Illustration 4-3: Exchange of assets

An entity has land and office buildings with an aggregate carrying value of CU600,000 and a fair value of CU750,000. It exchanges the land and buildings for land and buildings (a manufacturing facility) in another location with a fair value of CU1 million, and makes an additional cash payment of CU250,000. The transaction has commercial substance.

The entity should recognise the land and buildings received at a cost of CU1 million (its fair value) and should recognise a profit on disposal of the land and buildings of CU150,000, calculated as shown below:

Fair value of asset received	1,000,000
Less:	
Carrying value of asset given up	(600,000)
Cash paid	(250,000)
Gain on disposal	150,000

As discussed in section 7 below, the standard requires gains or losses on items that have been derecognised to be included in profit or loss in the period of derecognition but does not allow gains on derecognition to be classified as revenue, except for certain assets previously held for rental. [IAS 16.68, IAS 16.68A]. It gives no further indication regarding their classification in profit or loss. Such exchanges of goods and services are also excluded from the scope of IFRS 15 if the non-monetary exchange is between entities in the same line of business to facilitate sales to customers or potential customers (see Chapter 28). [IFRS 15.5(d)].

4.4.1 Commercial substance

The commercial substance test was put in place as an anti-abuse provision to prevent gains from being recognised in income when the transaction had no discernible effect on the entity's economics. [IAS 16.BC21]. The commercial substance of an exchange is to be determined by forecasting and comparing the future cash flows budgeted to be generated by the incoming and outgoing assets. For there to be commercial substance, there must be a significant difference between the two forecasts. The standard sets out this requirement as follows: [IAS 16.25]

Extract from IAS 16

- 25 An entity determines whether an exchange transaction has commercial substance by considering the extent to which its future cash flows are expected to change as a result of the transaction. An exchange transaction has commercial substance if:
- (a) the configuration (risk, timing and amount) of the cash flows of the asset received differs from the configuration of the cash flows of the asset transferred; or
 - (b) the entity-specific value of the portion of the entity's operations affected by the transaction changes as a result of the exchange; and
 - (c) the difference in (a) or (b) is significant relative to the fair value of the assets exchanged.
- For the purpose of determining whether an exchange transaction has commercial substance, the entity-specific value of the portion of the entity's operations affected by the transaction shall reflect post-tax cash flows. The result of these analyses may be clear without an entity having to perform detailed calculations.

As set out in the definitions of the standard, entity-specific value in item (b) above is the net present value of the future predicted cash flows from continuing use and disposal of the asset (see section 2.2 above). Post-tax cash flows should be used for this calculation. The standard contains no guidance on the discount rate to be used for this exercise, nor on any of the other parameters involved, but it does suggest that the result of these analyses might be clear without having to perform detailed calculations. [IAS 16.25].

Particular care will have to be taken to ensure that the transaction has commercial substance as defined in the standard if an entity receives an item of PP&E in exchange for a similar asset of its own. Commercial substance may be difficult to demonstrate if the entity is exchanging an asset for a similar one in a similar location. In many cases, the risk, timing and amount of cash flows associated with similar assets in similar locations would not be significantly different. Similarly, it would be unusual if the entity-specific values of similar assets differed enough in any arm's length exchange transaction to meet condition (c). However, the risk, timing and amount of cash flows could differ if one asset were available for sale and the entity intended to sell it whereas the previous asset could not be realised by sale or only sold over a much longer timescale. It is feasible that such a transaction could meet conditions (a) and (c) above.

Other types of exchange are more likely to pass the 'commercial substance' test, for example exchanging an interest in an investment property for one that the entity uses for its own purposes. The entity has exchanged a rental stream and instead has an asset that contributes to the cash flows of the cash-generating unit of which it is a part. In this case, it is probable that the risk, timing and amount of the cash flows of the asset received would differ from the configuration of the cash flows of the asset transferred.

4.4.2 Reliably measurable

In the context of asset exchanges, the standard contains guidance on the reliable determination of fair values in the circumstances where market values do not exist. The 'reliable measurement' test for using fair value was included to measure these exchanges to minimise the risk that entities could 'manufacture' gains by attributing inflated values to the assets exchanged. [IAS 16.BC23]. Note that fair value is defined by reference to IFRS 13 *Fair Value Measurement* and that the requirements below are specific to asset exchanges in IAS 16.

Extract from IAS 16

- 26 The fair value of an asset is reliably measurable if (a) the variability in the range of reasonable fair value measurements is not significant for that asset or (b) the probabilities of the various estimates within the range can be reasonably assessed and used when measuring fair value. If an entity is able to measure reliably the fair value of either the asset received or the asset given up, then the fair value of the asset given up is used to measure the cost of the asset received unless the fair value of the asset received is more clearly evident.

If the fair value of neither the asset given up nor the asset received can be measured reliably (i.e., neither (a) nor (b) above are met), the cost of the asset is measured at the carrying amount of the asset given up; this means there is no gain on the transaction. [IAS 16.24].

No further guidance is given in IAS 16 on how to assemble a “range of reasonable fair value measurements” and the guidance in IFRS 13 should be followed (see Chapter 15). [IAS 16.26].

4.5 Assets held under leases

IFRS 16 requires lessees to initially measure the right-of-use asset at the amount of the initial measurement of the lease liability, adjusted for lease prepayments, lease incentives received, initial direct costs and an estimate of restoration, removal and dismantling costs. IFRS 16 is discussed in detail in Chapter 24.

4.6 Assets acquired with the assistance of government grants

The carrying amount of an item of PP&E may be reduced by government grants in accordance with IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance*. [IAS 16.28]. This is one of the accounting treatments available which are discussed further in Chapter 25.

5 Measurement after recognition: Cost model and depreciation

IAS 16 allows one of two alternatives to be chosen as the accounting policy for measurement of PP&E after initial recognition. The choice made must be applied to an entire class of PP&E, which means that not all classes are required to have the same policy. [IAS 16.29].

The first alternative is the cost model whereby the item, after recognition as an asset, is carried at cost less any accumulated depreciation and less any accumulated impairment losses. [IAS 16.30]. The second alternative is the revaluation model, whereby items of PP&E are carried at fair value at the date of the revaluation, less any subsequent accumulated depreciation and subsequent accumulated impairment losses. [IAS 16.31] The revaluation model is discussed in section 6 below.

An entity that uses the cost model for its investment property, as allowed by IAS 40, should apply the cost model in IAS 16 for owned investment property. [IAS 16.5]. Investment property held by a lessee as a right-of-use asset will be measured in accordance with IFRS 16 (see Chapter 24).

Upon adoption of IFRS 17, an exemption from the requirement to apply either the cost model or the revaluation model under IAS 16 was introduced, which permits entities to elect to measure certain owner-occupied properties as if they were investment properties measured at fair value through profit or loss in accordance with IAS 40. [IAS 16.29A, IAS 16.29B]. This election is only available in certain specific circumstances and is discussed further in section 6 below.

5.1 Depreciation

After initial recognition, the standard requires the depreciable amount of an asset 'to be allocated on a systematic basis over its useful life'. [IAS 16.50]. Depreciable amount, residual value and useful life are all key concepts in determining the depreciation charge and are discussed at sections 5.3 and 5.4 below. Depreciation methods are discussed at section 5.6.

The standard makes it clear that depreciation must be charged on all items of PP&E, including those carried under the revaluation model, even if the fair value of an asset is higher than its carrying amount, as long as the residual value of the asset is lower than its carrying amount. [IAS 16.30, IAS 16.31, IAS 16.52]. If the residual value exceeds the carrying amount, no depreciation is charged until the residual value once again decreases to less than the carrying amount (see section 5.3 below). [IAS 16.54]. IAS 16 makes it clear that the repair and maintenance of an asset do not, of themselves, negate the need to depreciate it. [IAS 16.52].

There is no requirement in IAS 16 for an automatic impairment review if no depreciation is charged.

The depreciation charge for each period is recognised in profit or loss unless it forms part of the cost of another asset and is included in its carrying amount. [IAS 16.48]. Sometimes, the future economic benefits embodied in an asset are absorbed in producing other assets, for example, the depreciation of manufacturing plant and equipment is included as part of the cost of conversion of finished manufactured goods held in inventory in accordance with IAS 2, and similarly, depreciation of PP&E used for development activities may be included as part of the cost of an intangible asset recognised in accordance with IAS 38. [IAS 16.49].

5.2 Depreciation of component parts of assets

Each part of an asset with a cost that is significant in relation to the total cost of the item must be depreciated separately, which means that the initial cost must be allocated between the significant parts by the entity. [IAS 16.43, IAS 16.44]. The standard refers to the airframe and engines of an aircraft as an example of parts that may be appropriate to depreciate separately. It also notes that similarly if an entity acquires PP&E subject to an operating lease in which it is the lessor, it may be appropriate to depreciate separately amounts reflected in the cost of that item that are attributable to favourable or unfavourable lease terms relative to market terms (see section 5.2.1 below). [IAS 16.44].

A determination of the significant parts of office buildings can be seen in Practical example 5-1 below from Skanska AB. This policy may have been based on the construction methods used for the particular buildings as it is unusual to see a separation between foundation and frame for office buildings.

Practical example 5-1: Skanska AB (publ) (2023)

Sweden

Annual and Sustainability Report 2023 [extract]

Financial information [extract]

Notes including accounting and valuation principles [extract]

Note 1. Consolidated accounting and valuation principles [extract]

IAS 16 Property, Plant and Equipment [extract]

IAS 16 Property, Plant and Equipment

Property, plant and equipment that consist of parts with different useful lives are treated as separate components of property, plant and equipment. Depreciation is performed on a straight-line basis during the estimated useful life, or based on degree of use, taking into account any residual value at the end of the period. The depreciation periods applied for office buildings breaks down as follows: foundation and frame, 50 years; installations, 35 years; and non-weight-bearing components, 15 years. In general, industrial buildings are depreciated over a 20-year period without allocation into separate components. Stone crushing and asphalt plants as well as concrete mixing plants are depreciated over 10 to 25 years depending on their condition when acquired and without being divided into separate components. For other buildings and equipment, division into separate components occurs only if major components with different useful lives can be identified. For other plant and equipment, the depreciation period is normally between three and 10 years. Minor equipment is recognized as an expense immediately. Gravel pits and stone quarries are depreciated as materials are removed. Land is not depreciated. Assessments of an asset's residual value and useful life are performed annually.

...

Because parts of an item of PP&E are identified by reference to the significance of their cost rather than their effect on depreciation, some parts may have the same useful lives and depreciation method as other significant parts of the same item. The standard allows them to be grouped for depreciation purposes. [IAS 16.45]. To the extent that an entity separately depreciates some parts of an item of PP&E, it also separately depreciates the remainder of the item. The remainder of such an asset consists of other parts that are individually not significant. If the entity has varying expectations for these parts, it may need to use approximation techniques to calculate an appropriate depreciation method for these parts in order to depreciate the remainder in a manner that faithfully represents the consumption pattern and/or useful life of such parts. [IAS 16.46]. The standard also allows an entity to separately depreciate such parts that are not significant in relation to the total cost of the whole asset. [IAS 16.47].

5.2.1 Component accounting for in-place leases

IAS 16 sets out that if an entity acquires PP&E subject to an operating lease in which it is the lessor, it may be appropriate to separately depreciate amounts reflected in the cost of that item that are attributable to favourable or unfavourable lease terms relative to market terms. [IAS 16.44].

This could be interpreted to mean that the 'favourable or unfavourable lease terms relative to market terms' should be considered as the only additional component other than the components that represent the physical substance of the building. However, the phrase could also be interpreted to mean that the intangible components are not limited to 'favourable or unfavourable lease terms relative to market terms', but that further components can be identified in respect of in-place leases at market terms. This component would reflect the potential cost savings with respect to direct costs associated with obtaining a new tenant and opportunity costs associated with lost rentals.

Two approaches have developed in practice:

- Identify the favourable/unfavourable leases as a separate component, but do not identify the in-place leases at market terms as a separate component.
- Or
- Identify both the favourable/unfavourable leases and the in-place leases at market terms as separate components.

Under either approach, the entity includes the depreciation of any identified component in depreciation expense rather than revenue.

These approaches are shown in Illustration 5-1 below.

How we see it

For the purpose of applying the component approach with respect to in-place leases, we believe either of the two approaches referred to above is acceptable. The accounting policy must be applied consistently.

Illustration 5-1: Applying the component approach for in-place leases

As part of a business combination, an entity acquires a building that is currently let to several lessees under operating leases (i.e., the acquirer is the lessor). Some of the in-place leases are at non-market terms (i.e., are at favourable or unfavourable terms relative to current market terms). The building itself is considered to be one component.

The entity initially measures the investment property at fair value in accordance with IFRS 3. After initial recognition, the entity applies the cost model to the investment property under IAS 40. The entity may use either of the two following approaches when applying the component approach with respect to in-place leases:

Approach 1

After initial recognition, the entity identifies the favourable/unfavourable leases as a separate component of the investment property in accordance with IAS 16.44 but does not identify the in-place leases at market terms as a separate component. The carrying amount of the tangible components of the building (e.g., roof, façade, electricity cables, and remaining structure), would in this case exclude the effects of favourable and unfavourable leases, but would include the in-place leases at market terms. The combined amount of all components will equal the carrying amount of the investment property. Each component is depreciated separately.

Approach 2

After initial recognition, the entity identifies both the favourable/unfavourable leases and the in-place leases at market terms as separate components. The carrying amount of the tangible components of the building would in this case exclude both the effects of favourable and unfavourable leases as well as the in-place leases at market terms. The combined amount of all components will equal the carrying amount of the investment property. Each component is depreciated separately.

5.3 Depreciable amount and residual values

The depreciable amount of an item of PP&E is its cost, or other amount substituted for cost (e.g., valuation), less its estimated residual value. [IAS 16.6]. The standard states that an entity should review the residual value of an item of PP&E, and therefore all parts of it, at least at each financial year-end. If the estimated residual value differs from the previous estimate, the change should be accounted for prospectively as a change in accounting estimate in accordance with IAS 8 (see Chapter 3). [IAS 16.51].

The residual value of an item of PP&E is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and assuming that it was already in the condition it will be in at the end of its useful life. [IAS 16.6].

Therefore, IAS 16 contains an element of continuous updating of residual values because it is the current disposal amount (e.g., value at financial reporting date) of an asset's future state (i.e., asset's condition in the future when the entity expects to dispose of it). This means that only the changes up to the financial reporting date are taken into account and that expected future changes in residual value other than the effects of expected wear and tear are not taken into account. [IAS 16.BC29].

Climate change has the potential to affect the residual value of PP&E and such considerations should form a part of an entity's continuous assessment of residual values. For example, while residual values of PP&E assets are generally fairly predictable, this is not necessarily the case if there are relatively few buyers of second-hand PP&E assets that use technologies that are being phased out before a legal deadline. In Practical example 5-2 below, easyJet Plc describes how the residual values of its fleet are affected by climate change:

Practical example 5-2: easyJet plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]**Financials statements [extract]****NOTES TO THE FINANCIAL STATEMENTS [extract]****1. ACCOUNTING POLICIES, JUDGEMENTS AND ESTIMATES [extract]****1A. SIGNIFICANT ACCOUNTING POLICIES [extract]****Property, plant and equipment [extract]**

Residual values are reviewed annually, at the end of the reporting period, against prevailing market rates for assets of an equivalent age, and the depreciation applied is adjusted accordingly on a prospective basis. The carrying value of PPE assets is part of the Airline CGU and is therefore reviewed for impairment at least annually or when there is any indication of impairment within the CGU. For aircraft, easyJet is dependent on Airbus as its sole supplier. This gives rise to an increased valuation risk, which crystallises when aircraft exit the fleet, where easyJet is reliant on the future demand for second-hand aircraft and specifically Airbus aircraft. Future developments, such as the impact of climate change on the market, technological, economic or legal environment, are considered when assessing residual values and UELs.

...

As any change in the residual value directly affects the depreciable amount, it may also affect the depreciation charge. This is because the depreciable amount (i.e., the amount actually charged to profit or loss over the life of the asset) is calculated by deducting the residual value from the cost (or other amount substituted for cost, such as valuation) of the asset. Sometimes, the residual value of an asset may increase to an amount equal to or greater than the asset's carrying amount. If it does, the residual value is capped at the asset's carrying amount. This means that in such a case, the asset's depreciation charge is zero unless and until its residual value subsequently decreases to an amount below the asset's carrying amount. [IAS 16.53, IAS 16.54].

In practice, many items of PP&E have a negligible residual value. This is usually because they are kept for substantially all of their economic lives, such that the useful life as assessed under IAS 16 is consistent with the assets' total economic life. Residual values are of no relevance if the entity intends to keep the asset until it is of no use to anyone else. If an entity uses residual values based on prices fetched in the market for a type of asset that it holds, it must be able to demonstrate that there is a viable manner and an intention to dispose of that asset before the end of its economic life. However, one example in which residual values are expected to be more significant would be in the case of collectibles meeting the definition of PP&E (see section 2.1 above). At initial recognition, the residual value of a collectible is often close to its purchase price, and therefore, the depreciable amount of such a collectible is negligible.

The requirement concerning the residual values of assets highlights how important it is that residual values are considered and reviewed in conjunction with the review of useful lives. The useful life is the period over which the entity expects to use the asset, not the asset's economic life.

As discussed above, the residual value of an item of PP&E is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal. IAS 16 does not define 'costs of disposal'. For many entities the estimated cost of disposal will be immaterial, but an entity that incurs more significant costs associated with disposing of PP&E will need to apply judgement in determining the appropriate costs to include. Entities may apply the hierarchy in IAS 8 to develop an appropriate policy in this area. This may be particularly relevant to certain types of entity, such as leasing companies that incur significant selling costs in routinely disposing of assets previously held for rental (see section 7.2 below for further discussion).

5.4 Useful lives

One of the critical assumptions on which the depreciation charge depends is the useful life of the asset. The standard requires the useful life of an asset to be estimated on a realistic basis and reviewed at least at the end of each financial year. The effects of changes in useful life are to be recognised prospectively as changes in accounting estimates in accordance with IAS 8 (see Chapter 3), over the remaining useful life of the asset. [IAS 16.51].

As described in section 2.2 above, the useful life of an asset is defined in terms of the asset's expected utility to the entity. [IAS 16.57]. It is the period over which the present owner will benefit from using the asset and not the total potential life of the asset; the two will often not be the same.

It is quite possible for an asset's useful life to be shorter than its economic life. The estimation of the useful life of the asset is a matter of judgement based on the experience of the entity with similar assets. Many entities have an asset management policy that may involve disposal of assets after a specified time or after consumption of a specified proportion of the future economic benefits embodied in the assets. [IAS 16.57]. This is particularly common with property and motor vehicles, where there are effective second-hand markets, but less usual for plant and machinery. For example, an entity may have a policy of replacing all of its motor vehicles after three years, so this will be their estimated useful life for depreciation purposes. The entity will depreciate them over this period down to the estimated residual value. The residual values of motor vehicles are often easy to obtain and the entity will be able to reassess these residuals in line with the requirements of the standard. Thus, the estimation of the useful life of the asset is a matter of judgement based on the experience of the entity with similar assets. [IAS 16.57].

The future economic benefits embodied in an asset are consumed principally through usage. Other factors, however, should be taken into account such as technical or commercial obsolescence and wear and tear while an asset remains idle because they often result in the diminution of the economic benefits expected to be obtained from the asset. Consequently, IAS 16 provides guidance that all the following factors are to be considered when estimating the useful life of an asset: [IAS 16.56]

Extract from IAS 16

- 56 The future economic benefits embodied in an asset are consumed by an entity principally through its use. However, other factors, such as technical or commercial obsolescence and wear and tear while an asset remains idle, often result in the diminution of the economic benefits that might have been obtained from the asset. Consequently, all the following factors are considered in determining the useful life of an asset:
- (a) expected usage of the asset. Usage is assessed by reference to the asset's expected capacity or physical output.
 - (b) expected physical wear and tear, which depends on operational factors such as the number of shifts for which the asset is to be used and the repair and maintenance programme, and the care and maintenance of the asset while idle.
 - (c) technical or commercial obsolescence arising from changes or improvements in production, or from a change in the market demand for the product or service output of the asset. Expected future reductions in the selling price of an item that was produced using an asset could indicate the expectation of technical or commercial obsolescence of the asset, which, in turn, might reflect a reduction of the future economic benefits embodied in the asset.
 - (d) legal or similar limits on the use of the asset, such as the expiry dates of related leases.

ArcelorMittal is an example of an entity depreciating an asset over its expected usage by reference to the production period:

Practical example 5-3: ArcelorMittal (2023)

NOTE 5: GOODWILL, INTANGIBLE AND TANGIBLE ASSETS [extract]

5.2 Property, plant and equipment and biological assets [extract]

Property, plant and equipment used in mining activities is depreciated over its useful life or over the remaining life of the mine, if shorter, and if there is no alternative use. For the majority of assets used in mining activities, the economic benefits from the asset are consumed in a pattern which is linked to the production level and accordingly, assets used in mining activities are primarily depreciated on a units-of-production basis. A unit-of-production is based on the available estimate of proven and probable reserves.

...

5.4.1 Repairs and maintenance

The initial assessment of the useful life of the asset will take into account the expected routine spending on repairs and expenditure necessary for it to achieve that life. Although IAS 16 implies that this refers to an item of plant and machinery, care and maintenance programmes are relevant to assessing the useful lives of many other types of assets. For example, an entity may assess the useful life of a railway engine at thirty-five years on the assumption that it has a major overhaul every seven years. Without this expenditure, the life of the engine would be much less certain and could be much shorter. Maintenance necessary to support the fabric of a building and its service potential will also be taken into account in assessing its useful life. Eventually, it will always become uneconomic for the entity to continue to maintain the asset so, while the expenditure may lengthen the useful life, it is unlikely to make it indefinite.

Note that this applies whether the expenditure is capitalised because it meets the definition of a 'major inspection' (see section 3.3.2 above) or if it is repairs and maintenance that is expensed as incurred.

5.4.2 Land

The standard requires the land and the building elements of property to be accounted for as separate components, even when they are acquired together. Land, which usually has an unlimited life, is not usually depreciated, while buildings are depreciable assets because they have limited useful life. IAS 16 states that the determination of the depreciable amount and useful life of a building is not affected by an increase in the value of the land on which it stands. [IAS 16.58].

There are circumstances in which depreciation may be applied to land. In those instances, in which land has a finite life (e.g., land that is used either for extractive purposes such as a quarry or mine, or for some purpose such as landfill), it will be depreciated in an appropriate manner that reflects the benefits to be derived from it. [IAS 16.58]. Further, the cost of land may include an element for site dismantlement, removal or restoration, e.g., the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, and any subsequent changes thereto (described in section 4.3 above). [IAS 16.16]. This element will have to be separated from the land element and depreciated over an appropriate period. The standard describes this as "the period of benefits obtained by incurring these costs ..." which will often be the estimated useful life of the site for its purpose and function. [IAS 16.59]. An entity engaged in landfill on a new site may make a provision for restoring it as soon as it starts preparation by removing the overburden. It will separate the land from the 'restoration asset' and depreciate the restoration asset over the landfill site's estimated useful life. If the land has an infinite useful life, an appropriate depreciation basis will have to be chosen that reflects the period of benefits obtained from the restoration asset.

If the estimated costs are revised in accordance with IFRIC 1, the adjusted depreciable amount of the asset is depreciated over its useful life. Therefore, once the related asset has reached the end of its useful life, all subsequent changes in the liability will be recognised in profit or loss as they occur, irrespective of whether the entity applies the cost or revaluation model. [IFRIC 1.7].

5.4.3 Technological change

A current or expected future reduction in the market demand for the product or service output of an asset may be evidence of technical or commercial obsolescence, which, in turn, might reflect a reduction of the future economic benefits embodied in the asset. If an entity anticipates such technical or commercial obsolescence, it should reassess both the useful life of an asset and the pattern of consumption of future economic benefits. [IAS 16.56(c), IAS 16.61]. In such cases, it might be more appropriate to use a diminishing balance method of depreciation to reflect the pattern of consumption (see section 5.6.3 below).

The effects of technological change are often underestimated. It affects many assets, not only high technology plant and equipment. For example, many offices that have been purpose-built can become obsolete long before their fabric has physically deteriorated, for reasons such as the difficulty of introducing computer network infrastructures or air conditioning, poor environmental performance or an inability to meet new legislative requirements such as access for people with disabilities. Another example might be climate-related factors driving technological change. Therefore, the estimation of an asset's useful life is a matter of judgement and the possibility of technological change must be taken into account. [IAS 16.56(c), IAS 16.57].

5.4.4 Depreciation period of leasehold improvements

All the factors listed in IAS 16.56 should be considered when estimating the useful life of an asset (see section 5.4 above). [IAS 16.56]. Factor (d)) states that the "expiry dates of related leases ..." is considered when determining the asset's useful life. Generally, the useful life of the leasehold improvement is the same or less than the lease term.

The interaction between the useful life of leasehold improvements and the term of the associated lease was discussed by the IFRS IC in November 2019. The IFRS IC concluded that an entity applies IAS 16.56 and 57 in determining the useful life of non-removable leasehold improvements. If the lease term of the related lease is shorter than the economic life of those leasehold improvements, the entity considers whether it expects to use the leasehold improvements beyond that lease term. If the leasehold improvements are not expected to be used beyond the lease term, then an entity should conclude that the useful life of the non-removable leasehold improvements is the same as the lease term.² This issue is discussed in Chapter 24 in the context of cancellable leases. ‘Lease term’ under IFRS 16 is discussed in Chapter 24.

However, if the leasehold improvements are expected to be used beyond the lease term, we believe two approaches to determine the useful life of the leasehold improvements are acceptable. The two approaches are shown in Illustration 5-2 below. The entity must adopt one of the approaches to determine the useful life of the leasehold improvement. This approach should be applied consistently to similar leasehold improvements with similar fact patterns.

Illustration 5-2: Depreciation period of leasehold improvements

A lessee enters into a lease for an office property. The lease has a non-cancellable term of 5 years and contains an option for the lessee to extend the lease for a further 5 years. The rentals for the period under the extension option (i.e., years 6-10) are at market rates.

Upon commencement of the lease term, the lessee incurs CU100,000 constructing immoveable leasehold improvements specific to the property. The useful life of the leasehold improvement is 7 years. At the commencement date of the lease, the lessee expects, but is not reasonably certain, to exercise the extension option. At the commencement date of the lease, the lessee appropriately considered the potential economic penalty associated with abandoning the leasehold improvements when determining the lease term is 5 years.

In our fact pattern, the lessee’s investment in the leasehold improvement does not create a significant economic penalty that would affect the lease term for accounting purposes. That is, the economic penalty of abandoning the leasehold improvement at the end of the non-cancellable term of the lease is not so significant as to make exercise of the renewal option reasonably certain.

The relevant requirements may be subject to two different interpretations:

Approach (1):

The lessee may depreciate the leasehold improvements over a period that is the shorter of the lease term or the assets’ useful life (i.e., the lessee depreciates the leasehold improvement over the lease term of 5 years in the fact pattern).

This approach is based on the following interpretation: In this fact pattern, at the commencement date of the lease, the lessee appropriately considered all relevant facts and circumstances (including the economic penalty associated with abandoning the leasehold improvements) and concluded it expects but is not reasonably certain to exercise the option to extend the lease. Therefore, for the purpose of IFRS 16, the lease term is 5 years. [IFRS 16 Appendix A]. One of the factors in determining the useful life of the leasehold improvement is the expiry date of the related lease. [IAS 16.6, IAS 16.56(d)]. The expected utility of the leasehold improvement should be consistent with the lease term as determined in accordance with IFRS 16. Therefore, the useful life of the leasehold improvements is 5 years.

Approach (2):

The lessee may depreciate the leasehold improvements over the expected useful life of the leasehold improvement (i.e., the lessee depreciates the leasehold improvement over 7 years in the fact pattern).

While IAS 16.56(d) should be considered when determining the asset’s useful life, the factor regarding “expected usage of the asset ...” in IAS 16.56(a) is equally relevant. The condition contained in IAS 16.56(d) reflects the necessity to consider the existence of legal or other externally imposed limitations on an asset’s useful life. However, in the fact pattern, the ability to extend the lease term is within the control of the lessee and is at market rates so there are no significant costs or impediments to renewal.

In this fact pattern, after considering the potential economic penalty associated with the loss of the leasehold improvements, the lease term as determined in accordance with IFRS 16 does not include the extension period because, at the commencement date of the lease, the lessee determined it is not reasonably certain it will exercise the renewal option. However, a different threshold (i.e., the expected usage of the asset) is used for the determination of the useful life of an asset in the scope of IAS 16 (i.e., the leasehold improvement).

² [IFRIC Update](#), November 2019, available on the IFRS Foundation’s website.

The term 'expected usage of the asset' for the determination of useful life of an asset indicates a lower threshold than the 'reasonably certain' threshold for including the extension period in the lease term for accounting purposes. As a result, although the accounting lease term is 5 years, the leasehold improvement is depreciated over the period over which the lessee expects to use the asset (as it expects to extend the lease to 10 years), which is 7 years.

How we see it

The relevant requirements may be subject to two different interpretations. Hence, when the leasehold improvements are expected to be used beyond the lease term, it is acceptable to depreciate the leasehold improvements either over (i) the shorter lease term or (ii) their expected useful life.

The determination of the useful life and lease term may require significant judgement. Hence, it is important to ensure that all facts and circumstances are taken into account when determining the useful life of the leasehold improvement and the lease term based on the relevant guidance under IAS 16 and IFRS 16 respectively and each conclusion needs to be supported with appropriate evidence.

For instance, if approach (2) is adopted in Illustration 5-2 above, the entity would have to carefully evaluate the reason to construct leasehold improvements with significant expected economic value at the end of 5 years, and yet conclude that the economic penalty associated with abandoning such assets at the end of year 5 is not so significant that it renders the renewal option reasonably certain of exercise. The useful life of the leasehold improvement generally would not exceed the total of the non-cancellable period and the period covered by (a) renewal option(s) (i.e., 10 years in the fact pattern). This conclusion is consistent with the requirement in IAS 38.94 (which addresses the assessment of the useful life of an intangible asset).

5.4.5 The effects of climate change

Climate change, including associated legislation, may affect how and for how long items of PP&E are used. Entities will need to consider climate-related factors annually when determining the expected useful life of their assets. An entity would need to assess whether it expects, for example, the early closure of fossil-fuel producing assets (e.g., coal producing assets) or continued use of carbon-emitting assets (e.g., high emission ships). Similarly, an entity would need to consider if its PP&E assets could be indirectly affected if, for example, it is used to provide services to customers in high emission industries.

In Practical example 5-4 A.P. Møller - Mærsk A/S explains that it considers the impact of decarbonisation and climate related risks as part of its assessment of useful lives:

Note 3.2 Property, plant and equipment [extract]

① SIGNIFICANT ACCOUNTING ESTIMATES

Useful life and residual values

Useful lives are estimated based on experience. When an asset's useful life changes, Management revises the estimates for individual assets or groups of assets with similar characteristics due to factors such as quality of maintenance and repair, technical development, or environmental requirements. Management has also considered the impact of decarbonisation and climate-related risks on the useful lives of existing assets. Such risks include new climate-related legislation restricting the use of certain assets, new technology demanded by climate-related legislation and the increase in restoration costs for terminal sites due to new and/or more comprehensive policies. The useful lives of vessels and related assets that operate on bunker fuel have been considered in conjunction with the net zero by 2040 target.

...

Changes to useful lives have a direct impact on depreciation charges. In Practical example 5-5 National Grid plc illustrates the sensitivity on the depreciation charge for certain of its segments, where a shorter UEL presumed for its gas assets:

13. Property, plant and equipment [extract]

(c) Gas asset lives

The role that our US gas networks play in the pathway to achieving the greenhouse gas emissions reductions targets set in the jurisdictions in which we operate is currently uncertain. In the year, policymakers in New York and Massachusetts have indicated an increase in electrification and a strategic downsizing of gas networks in their formal plans to meet their respective decarbonisation targets. As a result, there is a risk that the UELs of certain elements of our gas networks may be shortened in line with future legislation.

We believe the gas assets which we own and operate today will continue to have a crucial role in maintaining security, reliability and affordability of energy beyond 2050, although the scale and purpose for which the networks will be used is dependent on technological, legal and regulatory developments.

In the US, our gas distribution asset lives are assessed as part of detailed depreciation studies completed as part of each separate rate proceeding. Depreciation studies consider the physical condition of assets and the expected operational life of an asset. We believe these assessments are our best estimate of the UEL of our gas network assets in the US.

The weighted average remaining UEL for our US gas distribution fixed asset base is circa 52 years; however, a sizeable proportion of our assets are assumed to have UELs which extend beyond 2080. We continue to believe the lives identified by rate proceedings are the best estimate of the assets' UELs, although we continue to keep this assumption under review as we gain more certainty about policy-driven legislation. We continue to actively engage and support our regulators to enable the clean energy transition in a safe, reliable and affordable way.

Asset depreciation lives feed directly into our US regulatory recovery mechanisms, such that any shortening of asset lives and regulatory recovery periods as agreed with regulators should be recoverable through future rates, subject to agreement, over future periods, as part of wider considerations around ensuring the continuing affordability of gas in our service territories.

Given the uncertainty described relating to the UELs of our gas assets, below we provide a sensitivity on the depreciation charge for our New York and New England segments were a shorter UEL presumed. It should be noted that all net zero pathways suggest some role of gas in heating buildings beyond 2050, so our sensitivity analysis for 2050 illustrates an unlikely worst-case scenario:

	Increase in depreciation expense for the year ended 31 March 2023		Increase in depreciation expense for the year ended 31 March 2022	
	New York £m	New England £m	New York £m	New England £m
UELs limited to 2050	185	54	140	40
UELs limited to 2060	90	21	67	15
UELs limited to 2070	42	3	31	1

Note that this sensitivity calculation excludes any assumptions regarding the residual value for our asset base and the effect that shortening asset depreciation lives would be expected to have on our regulatory recovery mechanisms. In the event that any of the US gas distribution assets are stranded, the Group would expect to recover the associated costs. While recovery is not guaranteed and is determined by regulators in the US, there are precedents for stranded asset cost recovery for US utility companies.

5.5 When depreciation starts

The standard is clear on when depreciation should start and finish, and sets out the requirements as follows:

- Depreciation of an item of property, plant and equipment begins when it is available for use, which is defined by the standard as occurring when the asset is in the location and condition necessary for it to be capable of operating in the manner intended by management. This is usually the point at which capitalisation of costs relating to the asset ceases as the physical asset is operational or ready for intended use (see section 4.1.4 above). In contrast, depreciation of a right-of-use asset begins from the commencement date of the lease. [IFRS 16.32].
- Depreciation of an asset ceases at the earlier of the date that the asset is classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with IFRS 5 and the date that the asset is derecognised (see section 7 below). [IAS 16.55].

Therefore, an entity does not stop depreciating an asset merely because it has become idle or has been retired from active use unless the asset is fully depreciated. However, if the entity is using a usage method of depreciation (e.g., the unit-of-production method), the charge can be zero while there is no production. [IAS 16.55]. Of course, a prolonged period in which there is no production may raise questions as to whether the asset is impaired because an asset becoming idle is a specific example of an indication of impairment in IAS 36 (see Chapter 21). [IAS 36.12(f)].

Assets held for sale under IFRS 5 are discussed in section 7.1 below.

Depreciation of stand-by equipment commences from the date at which the equipment is available for use, and its useful life is determined based on the useful life of the item for which it serves as a back-up. Depreciation of spare parts commences when the part is put into use.

5.6 Depreciation methods

There are a variety of depreciation methods that can be used to allocate the depreciable amount of an asset on a systematic basis over its useful life. The standard is not prescriptive about what methods of depreciation should be used. It simply says that “the depreciation method used shall reflect the pattern in which the asset’s future economic benefits are expected to be consumed by the entity”, mentioning the possible methods that can be used such as the straight-line method (which is the most common method where the depreciation results in a constant charge over the useful life if the asset’s residual value does not change, see 5.6.1 below), the units of production method (see section 5.6.2 below) and the diminishing balance method (see section 5.6.3 below). [IAS 16.60, IAS 16.62]. The overriding requirement is to select the depreciation method that most closely reflects the expected pattern of consumption of the future economic benefits the asset brings over its useful life; and that the selected method is applied consistently from period to period unless there is a change in the expected pattern of consumption of those future economic benefits. [IAS 16.60, IAS 16.62].

The essence of choosing a fair depreciation method is to reflect the consumption of economic benefits provided by the asset concerned. In most cases the straight-line basis will give perfectly acceptable results, and the vast majority of entities use this method. Where there are instances, such as the extraction of a known proportion of a mineral resource, or the use of a certain amount of the total available number of working hours of a machine, it may be that a unit of production method will give fairer results. When assessing the appropriateness of any method, entities should consider how the economic benefits of a particular asset are consumed, for example, through wear and tear, output produced or other factors such as technological obsolescence.

IAS 16 contains an explicit requirement that the depreciation method be reviewed at least at each financial year-end to determine if there has been a significant change in the pattern of consumption of an asset’s future economic benefits. If there has been such a change, the depreciation method should be changed to reflect it. [IAS 16.61]. Under IAS 8, this change is a change in accounting estimate and not a change in accounting policy (see Chapter 3). [IAS 8.32(d)]. This means that the consequent depreciation adjustment should be made prospectively, i.e., the asset’s depreciable amount should be written off over current and future periods using the new and more appropriate method of depreciation. [IAS 8.36].

A revenue-based approach, e.g., using the ratio of revenue generated to total revenue expected to be generated, is not a suitable basis for depreciation. Depreciation is an estimate of the economic benefits of the asset consumed in the period. The revenue generated by an activity that requires the use of an asset generally reflects factors other than the consumption of the economic benefits of the asset. Revenue reflects the output of the asset, but it also reflects other factors that do not affect depreciation, such as changes in sales volumes and selling prices, the effects of selling activities and other inputs and processes. The price component of revenue may be affected by inflation or foreign currency exchange rates. This means that revenue does not, as a matter of principle, reflect how an asset is used or consumed. [IAS 16.62A]. While revenue-based methods of depreciation are considered inappropriate under IAS 16, the standard does permit other methods of depreciation that reflect the level of activity, such as the unit-of-production method (see section 5.6.2 below).

5.6.1 Straight line method

The straight-line method is the most common method and results in a constant charge over the useful life of the asset if it’s residual value does not change. Depreciation on a straight-line basis is explained in Illustration 5-3 below:

Illustration 5-3: Straight line depreciation

An asset costs CU12,000 and has a useful life of five years and a residual value of CU1,000. The depreciable amount is CU11,000 (CU12,000 - CU1,000). The annual depreciation charge under the straight-line method is calculated at 2,200 (CU11,000/5).

		CU
Year 1	Cost	12,000
	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	9,800
Year 2	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	7,600
Year 3	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	5,400
Year 4	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	3,200
Year 5	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	1,000

5.6.2 Units of production method

Under this method, the asset is written off in line with its expected use or estimated total output. [IAS 16.62]. By relating depreciation to the proportion of productive capacity utilised to date, it reflects the fact that the useful economic life of certain assets, principally machinery, is more closely linked to its usage and output than to time. This method is normally used in extractive industries, for example, to amortise the costs of development of productive oil and gas facilities. Further details of the units of production method can be found in Chapter 39.

5.6.3 Diminishing balance methods

The diminishing balance method involves determining a percentage depreciation that will write off the asset's depreciable amount over its useful life. This involves solving for a rate that will reduce the asset's net book value to its residual value at the end of the useful life. The diminishing balance method results in a decreasing depreciation charge over the useful life of the asset. [IAS 16.62]. One approach to applying the diminishing balance method is shown in Illustration 5-4:

Illustration 5-4: Diminishing balance depreciation

An asset costs CU6,000 and has a life of four years and a residual value of CU1,500. The entity calculates that the appropriate depreciation rate on the declining balance is 29.3% and that the depreciation charge in years 1-4 will be as follows:

		CU
Year 1	Cost	6,000
	Depreciation at 29.3% of CU6,000	(1,757)
	Net book value	4,243
Year 2	Depreciation at 29.3% of CU4,243	(1,243)
	Net book value	3,000
Year 3	Depreciation at 29.3% of CU3,000	(879)
	Net book value	2,121
Year 4	Depreciation at 29.3% of CU2,121	(621)
	Net book value	1,500

The sum of digits method is another form of the diminishing balance method, but one that is based on the estimated life of the asset, and which can easily be applied if the asset has a residual value. If an asset has an estimated useful life of four years then the digits 1, 2, 3, and 4 are added together, giving a total of 10. Depreciation of four-tenths, three-tenths and so on, of the cost of the asset, less any residual value, will be charged in the respective years. The method is sometimes called the 'rule of 78', 78 being the sum of the digits 1 to 12. Illustration 5-5 demonstrate the application of the sum of digits method:

Illustration 5-5: Sum of the digits depreciation

An asset costs CU10,000 and is expected to be sold for CU2,000 after four years. The depreciable amount is CU8,000 (CU10,000 - CU2,000). Depreciation is to be provided over four years using the sum of the digits method. The depreciation charge in years 1-4 will be as follows:

		CU
Year 1	Cost	10,000
	Depreciation at 4/10 of CU8,000	(3,200)
	Net book value	6,800
Year 2	Depreciation at 3/10 of CU8,000	(2,400)
	Net book value	4,400
Year 3	Depreciation at 2/10 of CU8,000	(1,600)
	Net book value	2,800
Year 4	Depreciation at 1/10 of CU8,000	(800)
	Net book value	2,000

5.7 Impairment

All items of PP&E accounted for under IAS 16 are subject to the impairment requirements of IAS 36. Impairment is discussed in Chapter 21. [IAS 16.63].

The question has arisen about the treatment of any compensation an entity may be due to receive as a result of an asset being impaired. For example, an asset that is insured might be destroyed in a fire, so repayment from an insurance company might be expected. IAS 16 states that these events - the impairments or losses of items of PP&E, the related claims for or payments of compensation from third parties and any subsequent purchase or construction of replacement assets - are 'separate economic events' and should be accounted for separately as follows:

- Impairments of PP&E are recognised in accordance with IAS 36 (see Chapter 21).
- Derecognition of items of PP&E retired or disposed of should be determined in accordance with IAS 16 (see section 7 below).
- Compensation from third parties for items of PP&E that were impaired, lost or given up is included in determining profit and loss when it becomes receivable.
- The cost of items of PP&E restored, purchased or constructed as replacements is determined in accordance with IAS 16 (see sections 3 and 4 above). [IAS 16.65, IAS 16.66].

6 Measurement after recognition: revaluation model

As discussed at section 5 above, after initial recognition, an accounting policy choice exists which is available to all entities (by class of asset) to measure PP&E using either the cost model or the revaluation model at the end of subsequent reporting periods. If the revaluation model is adopted, PP&E is initially recognised at cost and subsequently carried at a revalued amount, being its fair value (if it can be measured reliably) at the date of the revaluation, less subsequent accumulated depreciation and impairment losses. [IAS 16.29, IAS 16.31]. Fair value shall be determined in accordance with the requirements of IFRS 13, and is discussed further at section 6.1 below.

The use of the revaluation model can result in deferred taxation complexities. Examples in this chapter ignore the effects of deferred tax. See Chapter 29 for guidance on recognition of deferred tax in respect of assets carried at fair value or revalued amount.

How we see it

There is no requirement for a professional external valuation or even for a professionally qualified valuer to perform the appraisal, although in practice professional advice is often sought. Entities are required to disclose whether an independent valuer was involved.

Valuation frequency is not prescribed by IAS 16. Instead, it states that revaluations are to be made with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the end of the reporting period. [IAS 16.31]. Therefore, the frequency of revaluations depends upon the changes in fair values of the items of PP&E being revalued. When the fair value of a revalued asset differs materially from its carrying amount, a further revaluation is necessary. The standard suggests that some items of PP&E have frequent and volatile changes in fair value and these should be revalued annually. This is true for property assets in many jurisdictions, but even in such cases there may be quieter periods in which there is little movement in values. If there are only insignificant changes in fair value, frequent revaluations are unnecessary and it may only be necessary to perform revaluations at three or five-year intervals. [IAS 16.34].

If the revaluation model is adopted, IAS 16 specifies that all items within a class of PP&E are to be revalued simultaneously to prevent selective revaluation of assets and the reporting of amounts in the financial statements that are a mixture of costs and values as at different dates. However, revaluations of a class of assets on a rolling basis is permitted in certain circumstances, as discussed further below. [IAS 16.36, IAS 16.38]. A class of PP&E is a grouping of assets of a similar nature and use in an entity's operations. This is not a precise definition. IAS 16 suggests that the following are examples of separate classes of PP&E:

- (i) Land
- (ii) Land and buildings
- (iii) Machinery
- (iv) Ships
- (v) Aircraft
- (vi) Motor vehicles
- (vii) Furniture and fixtures
- (viii) Office equipment
- (ix) Bearer plants [IAS 16.37]

These are very broad categories of PP&E and it is possible for them to be classified further into groupings of assets of a similar nature and use. Office buildings and factories or hotels and fitness centres, could for instance be separate classes of asset.

If the entity used the same type of asset in two different geographical locations, e.g., clothing manufacturing facilities for similar products or products with similar markets, say in Sri Lanka and Guatemala, it is likely that these would be seen as part of the same class of asset. However, if the entity manufactured pharmaceuticals and clothing, both in European facilities, then few would argue that these could not be assets with a sufficiently different nature and use to be separate classes. Ultimately, whether similar assets are sufficiently different to be a separate class of assets is a matter of judgement in the context of the specific operations of individual entities. [IAS 16.37].

IAS 16 permits a rolling valuation of a class of assets provided the revaluation of such class of assets is completed within a short period of time and "provided the revaluations are kept up to date ...". [IAS 16.38].

The standard is clear that the required frequency of revaluations depends upon the changes in fair values of the PP&E being revalued, and that when the value changes very little, valuations may only be required every three to five years. No further guidance is provided on what is meant by the requirement that the revaluation of a class of assets be completed “within a short period.”

6.1 The meaning of fair value

Fair value is defined in IFRS 13. IFRS 13 does not prescribe when to measure fair value but provides guidance on how to measure it when fair value is required or permitted by IFRS Accounting Standards.

IFRS 13 clarifies that fair value is an exit price from the perspective of market participants. ‘Fair value’ is defined as: [IAS 16.6, IFRS 13 Appendix A]

Extract from IFRS 13

Appendix A

Defined terms

fair value

The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

6.1.1 Revaluing assets under IFRS 13

IFRS 13 specifies that “fair value is a market-based measurement, not an entity-specific measurement ...”. [IFRS 13.2]. Some of the principles that affect the revaluation of PP&E are the concept of highest and best use and the focus of the fair value hierarchy on the inputs used in valuation techniques, which are categorised into three levels. IFRS 13 also requires a significant number of disclosures, including the categorisation of a fair value measurement with the fair value measurement hierarchy.

The requirements of IFRS 13 are discussed in Chapter 15.

The following sections consider some of the key considerations when measuring the fair value of an item of PP&E.

6.1.1.A Highest and best use

Extract from IFRS 13

27 A fair value measurement of a non-financial asset takes into account a market participant’s ability to generate economic benefits by using the asset in its *highest and best use* or by selling it to another market participant that would use the asset in its highest and best use.

This evaluation will include uses that are “physically possible, legally permissible and financially feasible ...”. [IFRS 13.27, IFRS 13.28].

The highest and best use is determined from the perspective of market participants that would be acquiring the asset, but the starting point is the asset’s current use. It is presumed that an entity’s current use of the asset is the asset’s highest and best use, unless market or other factors suggest that a different use of the asset by market participants would maximise its value. [IFRS 13.29].

Prior to the adoption of IFRS 13, IAS 16 did not imply that fair value and market value were synonymous, which allowed a broader meaning of the term ‘fair value’. The term could certainly have been interpreted as encompassing the following two commonly used, market derived, valuation bases:

- Market value in existing use, an entry value for property in continuing use in the business which is based on the concept of net current replacement cost.
- Open market value, which is an exit value and based on the amount that a property that is surplus to requirements could reach when sold.

Both of these bases are market-derived, yet they can differ for a variety of reasons. A property may have a higher value on the open market if it could be redeployed to a more valuable use. On the other hand, the present owner may enjoy some benefits that could not be passed on in a sale, such as planning consents that are personal to the present occupier. Market value in existing use will be presumed to be fair value under IFRS 13 for many types of business property unless market or other factors suggest that open market value is higher (i.e., open market value represents highest and best use). For most retail sites market value in existing use will be fair value; if there is market evidence that certain types of property have an alternative use with a higher value, e.g., pubs or warehouses that can be converted to residential use, this will have to be taken into account.

The fair value of an item of PP&E will either be measured based on the value it would derive on a stand-alone basis or in combination with other assets or other assets and liabilities, i.e., the asset's 'valuation premise'. 'Valuation premise' is a valuation concept that addresses how a non-financial asset derives its maximum value to market participants. The highest and best use of an item of PP&E "might provide maximum value to market participants through its use in combination with other assets as a group (as installed or otherwise configured for use) or in combination with other assets and liabilities (e.g., a business) ..." or it "might have maximum value to market participants on a stand-alone basis ...".

[IFRS 13.31(a), IFRS 13.31(b)].

The following Illustration is derived from IFRS 13 and shows highest and best use in establishing fair value.

[IFRS 13.IE7, IFRS 13.IE8].

Illustration 6-1: Highest and best use

An entity acquires land in a business combination. The land is currently developed for industrial use as a site for a factory. The current use of land is presumed to be its highest and best use unless market or other factors suggest evidence for a different use.

Scenario (1):

In the particular jurisdiction, it can be difficult to obtain consents to change use from industrial to residential use for the land and there is no evidence that the area is becoming desirable for residential development. The fair value is based on the current industrial use of the land.

Scenario (2):

Nearby sites have recently been developed for residential use as sites for high-rise apartment buildings. On the basis of that development and recent zoning and other changes that facilitated the residential development, the entity determines that the land currently used as a site for a factory could also be developed as a site for residential use because market participants would take into account the potential to develop the site for residential use when pricing the land.

This determination can be highly judgemental. For further discussion on highest and best use and valuation premise see Chapter 15.

6.1.1.B Valuation approaches

IFRS 13 does not limit the types of valuation techniques an entity might use to measure fair value but instead focuses on the types of inputs that will be used. The standard requires the entity to use the valuation technique that maximises the use of relevant observable inputs and minimises the use of unobservable inputs. [IFRS 13.61]. The objective is that the best available inputs should be used in valuing the assets. These inputs could be used in any valuation technique provided they are consistent with the three valuation approaches in the standard: the market approach, the cost approach and the income approach.

[IFRS 13.62, IFRS 13.B5, IFRS 13.B8, IFRS 13.B10].

Extract from IFRS 13

B5 The market approach uses prices and other relevant information generated by market transactions involving identical or comparable (ie similar) assets, liabilities or a group of assets and liabilities, such as a business.

For PP&E, market techniques will usually involve market transactions in comparable assets or, for certain assets valued as businesses, market multiples derived from comparable transactions. [IFRS 13.B6].

Extract from IFRS 13

B8 The cost approach reflects the amount that would be required currently to replace the service capacity of an asset (often referred to as current replacement cost).

It is based on what a market participant buyer would pay to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence. Obsolescence includes physical deterioration, functional (technological) and economic (external) obsolescence so it is broader than and not the same as depreciation under IAS 16. [IFRS 13.B8, IFRS 13.B9].

Extract from IFRS 13

B10 The income approach converts future amounts (eg cash flows or income and expenses) to a single current (ie discounted) amount. When the income approach is used, the fair value measurement reflects current market expectations about those future amounts.

In the case of PP&E, this will usually mean using a present value (i.e., discounted cash flow) technique.

[IFRS 13.B11].

See Chapter 15 for a further discussion of these valuation techniques.

IFRS 13 does not place any preference on the techniques. An entity can use any valuation technique, or use multiple techniques, as long as it applies the valuation technique consistently. A change in a valuation technique is considered a change in an accounting estimate in accordance with IAS 8. [IFRS 13.66].

The inputs used to measure the fair value of an asset have a hierarchy. Level 1 inputs are those that are quoted prices in active markets (i.e., markets in which transactions take place with sufficient frequency and volume to provide pricing information on an ongoing basis) for identical assets that the entity can access at the measurement date. [IFRS 13.76]. Level 1 inputs have the highest priority, followed by inputs, other than quoted prices, that are observable for the asset either directly or indirectly (Level 2). The lowest priority inputs are those based on unobservable inputs (Level 3). [IFRS 13.86, IFRS 13.72]. The valuation techniques, referred to above, will use a combination of inputs to determine the fair value of the asset.

As stated above, land and buildings are the most commonly revalued items of PP&E. These types of assets use a variety of inputs such as other sales, multiples or discounted cash flows. While some of these may be Level 1 inputs, we generally expect the fair value measurement as a whole to be categorised within Level 2 or Level 3 of the fair value hierarchy for disclosure purposes (see section 8.2 below).

IFRS 13 also requires additional disclosure in the financial statements that are discussed in section 8.2 below and in Chapter 15.

6.1.1.C The cost approach - current replacement cost

IFRS 13 permits the use of a cost approach for measuring fair value, for example current replacement costs. Before using current replacement cost as a method to measure fair value, an entity should ensure that both:

- The highest and best use of the assets is consistent with their current use.
- And
- The exit market for the asset (i.e., the principal market or in its absence, the most advantageous market) is the same as the entry market (i.e., the market in which the asset was/will be purchased)

The principal market is the market for the asset that has the greatest volume or level of activity for the asset or liability. The most advantageous market is the one that maximises the amount that would be received to sell the asset or minimises the amount that would be paid to transfer the liability, after considering transaction costs and transport costs. [IFRS 13 Appendix A].

The resulting depreciated replacement cost should also be assessed to ensure market participants would actually transact for the asset in its current condition and location at this price. In particular, an entity should ensure that both:

- The inputs used to determine replacement cost are consistent with what market participant buyers would pay to acquire or construct a substitute asset of comparable utility.
- And
- The replacement cost has been adjusted for obsolescence that market participant buyers would consider so that the adjustment reflects all forms of obsolescence (i.e., physical deterioration, technological (functional) and economic obsolescence and environmental factors), which is broader than depreciation calculated in accordance with IAS 16.

For further discussion see Chapter 15.

How we see it

We believe depreciated replacement cost may be used to measure the fair value of an item of property, plant and equipment in accordance with IFRS 13, but only in limited circumstances (see Chapter 15).

6.2 Accounting for valuation surpluses and deficits

Increases in the carrying amount of PP&E as a result of revaluations should be credited to OCI and accumulated in a revaluation surplus account in equity, except to the extent that a revaluation increase of an asset reverses a revaluation decrease of the same asset that was previously recognised as an expense in profit or loss, whereby such increase should be credited to income in profit or loss. [IAS 16.39]. Decreases in valuation should be charged to profit or loss, except to the extent that they reverse the existing accumulated revaluation surplus on the same asset and therefore such decrease is recognised in OCI. The decrease recognised in OCI reduces the amount accumulated in equity under revaluation surplus account. [IAS 16.40]. This means that it is not permissible under the standard to carry a negative revaluation reserve in respect of any item of PP&E. Revaluation increases cannot be offset against revaluation decreases on other assets, even if they are within the same class of asset.

The same rules apply to impairment losses. An impairment loss on a revalued asset is first used to reduce the revaluation surplus for that asset. Only when the impairment loss exceeds the amount in the revaluation surplus for that same asset is any further impairment loss recognised in profit or loss (see Chapter 21). [IAS 36.61].

IAS 16 generally retains a model in which the revalued amount substitutes for cost in both the statement of financial position and the statement of profit or loss and on derecognition there is no recycling to profit and loss of amounts taken directly to OCI. The revaluation surplus included within equity in respect of an item of PP&E may be transferred directly to retained earnings when the asset is derecognised (i.e., transferring the whole of the surplus when the asset is retired or disposed of). [IAS 16.41].

IAS 16 also allows some of the revaluation surplus to be transferred to retained earnings as the asset is used by an entity. In such a case, the difference between depreciation based on the revalued carrying amount of the asset and depreciation based on its original cost may be transferred from revaluation surplus to retained earnings in equity. This is shown in Illustration 6-2 below. This recognises that any depreciation on the revalued part of an asset's carrying value has been realised by being charged to profit or loss. Thus, a transfer should be made of an equivalent amount from the revaluation surplus to retained earnings. Any remaining balance may also be transferred when the asset is disposed of. These transfers should be made directly from revaluation surplus to retained earnings and not through the statement of profit or loss. [IAS 16.41].

Illustration 6-2: Effect of depreciation on the revaluation reserve

On 1 January 20X0 an entity acquired an asset for CU1,000. The asset has an economic life of ten years and is depreciated on a straight-line basis. The residual value is assumed to be CU nil. At 31 December 20X3 (when the cost net of accumulated depreciation is CU600) the asset is valued at CU900. The entity accounts for the revaluation by debiting the carrying value of the asset (using either of the methods discussed in the section below this Illustration and further explained in Illustrations 6-3 to 6-5) CU300 and crediting CU300 to OCI and accumulating the increase in the revaluation reserve. At 31 December 20X3 the useful life of the asset is considered to be the remainder of its original life (i.e., six years) and its residual value is still considered to be CU nil. In the year ended 31 December 20X4 and in later years, the depreciation charged to profit or loss is CU150 (CU900/6 years remaining).

The usual treatment thereafter for each of the remaining 6 years of the asset's life, is to transfer CU50 (CU300/6 years) each year from the revaluation reserve to retained earnings (not through profit or loss). This avoids the revaluation reserve being maintained indefinitely even after the asset ceases to exist, which does not seem sensible.

The deferred tax impact of the revaluation of assets has been ignored for the purposes of the examples in this chapter. In practice, any effect on taxation, both current and deferred, resulting from the revaluation of PP&E is recognised and disclosed in accordance with IAS 12 *Income Taxes*. [IAS 16.42]. This is dealt with in Chapter 29.

When an item of PP&E is revalued, the carrying amount of that asset is adjusted to the revalued amount. As alluded to in Illustration 6-2 above, there are two methods of accounting for accumulated depreciation when an item of PP&E is revalued. At the date of revaluation, the asset is treated in one of the following ways:

- The accumulated depreciation is eliminated against gross carrying amount of the asset.
- Or
- The gross carrying amount is adjusted in a manner that is consistent with the revaluation of the carrying amount of the asset. For example, the gross carrying amount may be restated by reference to observable market data or it may be restated proportionately to the change in the carrying amount. The accumulated depreciation at the date of the revaluation is adjusted to equal the difference between the gross carrying amount and the carrying amount of the asset after taking into account accumulated impairment losses. [IAS 16.35].

These possible approaches are illustrated in Illustrations 6-3, 6-4 and 6-5 below. The first method available eliminates the accumulated depreciation against the gross carrying amount of the asset. After the revaluation, the gross carrying amount and the net carrying amount are same (i.e., reflecting the revalued amount). This is illustrated in Illustration 6-3:

Illustration 6-3: Revaluation by eliminating accumulated depreciation

On 31 December, a building has a carrying amount of CU40,000, being the original cost of CU70,000 less accumulated depreciation of CU30,000. A revaluation is performed and the fair value of the asset is CU50,000. The entity would record the following journal entry:

Dr	Accumulated depreciation	CU30,000	
	Cr	Building	CU20,000
	Cr	Asset revaluation reserve (through OCI)	CU10,000

	Before	After
	CU	CU
Building at cost	70,000	
Building at valuation		50,000
Accumulated depreciation	30,000	-
Net book value	40,000	50,000

Illustration 6-4 and 6-5 provide alternative approaches to recognising the revaluation of the asset by adjusting the gross carrying amount in a manner that is consistent with the revaluation of the carrying amount of the asset. In Illustration 6-4, the gross carrying amount is restated by reference to observable market data:

Illustration 6-4: Revaluation by restating the gross carrying amount by reference to observable market data

As in Illustration 6-3, on 31 December, a building has a carrying amount of CU40,000, being the original cost of CU70,000 less accumulated depreciation of CU30,000. A revaluation is performed, and the fair value of the asset is CU50,000.

Rather than accounting for the revaluation by eliminating the accumulated depreciation against gross carrying amount of the asset, the gross carrying amount is restated to CU75,000 by reference to observable market data. The accumulated depreciation then has to be adjusted to CU25,000 (i.e., the gross carrying amount of CU75,000 less the carrying amount adjusted to its revalued amount of CU50,000). As such, the entity would record the following journal entry:

Dr	Accumulated depreciation	CU5,000	
Dr	Building	CU5,000	
	Cr	Asset revaluation reserve (through OCI)	CU10,000

	Before	After
	CU	CU
Building at cost	70,000	
Building at valuation		75,000
Accumulated depreciation	30,000	25,000
Net book value	40,000	50,000

Illustration 6-5 provides another possible approach to recognising the revaluation of the asset by adjusting the gross carrying amount in a manner that is consistent with the revaluation of the carrying amount of the asset. In this case, the gross carrying amount is restated proportionately to the change in the carrying amount:

Illustration 6-5: Revaluation by restating the gross proportionately to the change in the carrying amount

As in Illustrations 6-3 and 6-4, on 31 December, a building has a carrying amount of CU40,000, being the original cost of CU70,000 less accumulated depreciation of CU30,000. A revaluation is performed, and the fair value of the asset is CU50,000.

In this case, the revaluation is recorded by restating gross carrying amount proportionately to the change in carrying amount. As the fair value of the asset is CU50,000 and the carrying amount is CU40,000 at the date of the revaluation, this gives rise to a 25% uplift. This method results in the same revaluation gain as the methods in Illustrations 6-3 and 6-4 above but the cost and accumulated depreciation carried forward reflect the gross cost of the asset of CU87,500 and accumulated depreciation of CU37,500. This method may be used if an asset is revalued using an index to determine its depreciated replacement cost (see section 6.1.1.C above).

As such, the entity would record the following journal entry:

Dr	Building	CU17,500	
	Cr	Accumulated depreciation	CU7,500
	Cr	Asset revaluation reserve (through OCI)	CU10,000

	Before	After
	CU	CU
Building at cost	70,000	
Building at valuation		87,500
Accumulated depreciation	30,000	37,500
Net book value	40,000	50,000

Notice that the revaluation gain recognised remained at CU10,000 whichever method described above is used.

6.3 Reversals of downward valuations

IAS 16 requires that, if an asset's carrying amount is increased as a result of a revaluation, the increase should be credited directly to OCI and accumulated in equity under the heading of revaluation surplus. However, the increase should be recognised in profit or loss to the extent that it reverses a revaluation decrease of the same asset previously recognised in profit or loss (see section 6.2 above). [IAS 16.39].

The same rules apply to a reversal of an impairment loss - see discussion in Chapter 21.

How we see it

If the revalued asset is being depreciated, we consider that the full amount of any reversal should not be taken to profit or loss. Rather, the reversal should take account of the depreciation that would have been charged on the previously higher book value.

The text of IAS 16 does not specify this treatment but other interpretations would be inconsistent with IAS 36, which states: [IAS 36.117]

Extract from IAS 36

- 117** The increased carrying amount of an asset other than goodwill attributable to a reversal of an impairment loss shall not exceed the carrying amount that would have been determined (net of amortisation or depreciation) had no impairment loss been recognised for the asset in prior years.

The following Illustration demonstrates a way in which this could be applied.

Illustration 6-6: Reversal of a downward valuation

An asset has a cost of CU1,000,000, a useful life of 10 years and a residual value of CU nil. At the end of year 3, when the asset's net book value (NBV) is CU700,000, it is revalued to CU350,000. This write down below cost of CU350,000 is taken through profit or loss.

The entity then depreciated its asset by CU50,000 per annum, so as to write off the carrying value of CU350,000 over the remaining 7 years.

At the end of year 6, the asset's depreciated cost is CU200,000 (being the carrying value at the end of year 3 of CU350,000, less three years of depreciation at CU50,000 per annum) but it is now revalued to CU500,000. The effect on the entity's asset is as follows (in this Illustration, the revaluation is recorded by eliminating accumulated depreciation):

	CU000
<i>Valuation</i>	
At the beginning of year 6	350
Surplus on revaluation	150
At the end of the year	500
<i>Accumulated depreciation</i>	
At beginning of year 6*	100
Charge for the year	50
Accumulated depreciation written back on revaluation	(150)
At the end of the year	-
Net book value at the end of year 6 based on valuation	500
Net book value immediately before revaluation	200

* Two years' depreciation (years 4 and 5) at CU50,000 per annum.

The total credit for the uplift in value is CU300,000 on the revaluation in year 6 (i.e., CU500,000 less CU200,000). However, only CU200,000 is taken through profit or loss. This is because the reversal recognised in profit and loss is restricted to take account of the depreciation that would have been charged on the previously higher book value, achieving the same overall effect that would have been reached had the original downward revaluation not occurred.

In this case, had the previous downwards revaluation not occurred, the total cumulative charges reported in profit or loss at the end of year 6 would have been CU600,000 (comprising 6 years of depreciation at CU100,000 per annum), and the carrying value of the asset would have been CU400,000.

Instead, a total of CU800,000 has been recognised in profit or loss, reflecting the CU350,000 downwards revaluation and a total of CU450,000 of depreciation (comprising 3 years of depreciation at CU100,000 per annum and 3 years at the reduced amount of CU50,000 per annum). Therefore, the total reversal through profit or loss is restricted to the difference between these two figures, of CU200,000. The remaining CU100,000 will be credited to OCI and taken to the revaluation surplus.

From the beginning of year 7, the asset at revalued amount of CU500,000 will be written off over the remaining four years at CU125,000 per annum.

In the Illustration the amount of the revaluation that is credited to the revaluation surplus through OCI represents the difference between the net book value that would have resulted had the asset been held on a cost basis (CU400,000) and the net book value on a revalued basis (CU500,000).

Of course, this is an extreme example. Most assets that are subject to a policy of revaluation would not show such marked changes in value and it would be expected that there would be valuation movements in the intervening years rather than dramatic losses and gains in years 3 and 6. However, we consider that in principle this is the way in which downward valuations should be recognised.

There may be major practical difficulties for any entity that finds itself in the position of reversing revaluation deficits on depreciating assets, although whether in practice this eventuality often occurs is open to doubt. If there is any chance that it is likely to occur, the business would need to continue to maintain asset registers on the original, pre-write down basis.

6.4 Adopting a policy of revaluation

Although the initial adoption of a policy of revaluation by an entity that has previously used the cost model is a change in accounting policy, it is not dealt with as a prior period adjustment in accordance with IAS 8. Instead, the change is treated as a revaluation during the current period as set out in section 6.2 above. [IAS 8.17]. This means that the entity is not required to obtain valuation information about comparative periods.

This is an exception to the general principle in IAS 8 (whereby changes in accounting policy shall be recognised retrospectively), and it only applies to a change to a policy of revaluation. If an entity changes its accounting policy from the revaluation model to the cost model, the usual requirements applicable to changes in accounting policies apply, meaning the effect of the change is calculated retrospectively as if the cost model had always been applied. For further discussion of changes in accounting policy, see Chapter 3.

6.5 Assets held under leases

Under IFRS 16 lessees are required to recognise most leases in their statement of financial position as lease liabilities with corresponding right-of-use assets. A lessee subsequently measures the right-of-use asset using a cost model under IFRS 16 (applying the depreciation requirements in IAS 16, but subject to the specific requirements in IFRS 16.32), unless it applies one of the following measurement models allowed by IFRS 16 (see Chapter 24):

- The fair value model in IAS 40, but only if the lessee applies this to its investment property and the right-of-use asset meets the definition of investment property in IAS 40.
- Or
- If the lessee applies the revaluation model in IAS 16 to a class of PP&E, the lessee would also have the option to revalue all of the right-of-use assets that relate to that class of PP&E. [IFRS 16.29, IFRS 16.34, IFRS 16.35].

6.6 Measurement alternative for certain owner-occupied properties held as investment fund assets or underlying items

On adoption of IFRS 17, the subsequent measurement requirements in IAS 16 were amended by adding paragraphs 29A and 29B. These paragraphs provide an exemption from the requirement to apply either the cost or the revaluation model under IAS 16, but this exemption is only available in certain specific circumstances.

Some entities operate, either internally or externally, an investment fund that provides investors with benefits determined by units in the fund. Similarly, some entities issue groups of insurance contracts with direct participation features and hold the underlying items. Some such funds or underlying items include owner-occupied property. For many contracts that specify a link to returns on underlying items, those underlying items include a mix of assets that are almost all measured at fair value through profit or loss. Accordingly, the IASB decided that measurement of such owner-occupied property at fair value through profit or loss would be consistent with the measurement of the majority of the underlying assets and would prevent accounting mismatches. [IFRS 17.BC65(c)].

Consequently, paragraphs 29A and 29B have been added to permit entities to elect to measure owner-occupied properties in such specified circumstances as if they were investment properties measured at fair value through profit or loss in accordance with IAS 40. For the purposes of this election, insurance contracts include investment contracts with discretionary participation features. An entity shall treat owner-occupied property measured using the investment property fair value model as a separate class of PP&E. [IAS 16.29A, IAS 16.29B].

7 Derecognition and disposal

Derecognition, i.e., removal of the carrying amount of an item of PP&E from the financial statements of the entity, occurs when an item of PP&E is either disposed of, or when no further economic benefits are expected to flow from its use or disposal. [IAS 16.67]. The disposal of an item of PP&E may occur in a variety of ways (e.g., by sale, by entering into a finance lease or by donation). The actual date of disposal of an item of PP&E is the date the recipient obtains control of that item, being when the performance obligation is satisfied in IFRS 15 (see Chapter 28). IFRS 16 applies to a disposal by way of a sale and leaseback. [IAS 16.69].

All gains and losses on derecognition must be included in profit and loss for the period when the item is derecognised, unless IFRS 16 requires otherwise. A sale and leaseback transaction might not give rise to a gain (see Chapter 24). [IAS 16.68].

Gains are not to be classified as revenue, although in some limited circumstances presenting gross revenue on the sale of certain assets may be appropriate (see section 7.2 below). [IAS 16.68, IAS 16.68A]. Gains and losses are to be calculated as the difference between any net disposal proceeds and the carrying value of the item of PP&E. [IAS 16.71]. This means that any revaluation surplus in equity relating to the asset disposed of is transferred directly to retained earnings when the asset is derecognised and not reflected in profit or loss (see section 6.2 above). [IAS 16.41].

Replacement of 'parts' of an asset requires derecognition of the carrying value of the replaced part, even if that part had not been depreciated separately. In these circumstances, the standard allows the cost of the replacement part to be a guide in estimating the original cost of the replaced part at the time it was acquired or constructed, if that cannot be determined. [IAS 16.70].

The amount of consideration to be included in the gain or loss arising from the derecognition of an item of PP&E is determined in accordance with the requirements for determining the transaction price in IFRS 15.47 to 72 (see Chapter 28). Any subsequent changes to the estimated amount of the consideration included in the gain or loss should be accounted for in accordance with the requirements for changes in the transaction price in IFRS 15 (see Chapter 28). [IAS 16.72].

7.1 IFRS 5 Non-current Assets Held for Sale and Discontinued Operations

IFRS 5 introduced a category of asset, 'held for sale', and PP&E within this category is outside the scope of IAS 16, although IAS 16 requires certain disclosures about assets held for sale to be made, as set out in section 8.1 below.

IFRS 5 requires that an item of PP&E should be classified as held for sale if its carrying amount will be recovered principally through a sale transaction rather than continuing use, though continuing use is not in itself precluded for assets classified as held for sale. [IFRS 5.6]. An asset can also be part of a 'disposal group' (that is a group of assets that are to be disposed of together as a group in a single transaction), in which case such a group can be treated as a whole. Once this classification has been made, depreciation ceases, even if the asset is still being used, but the assets must be carried at the lower of their previous carrying amount and fair value less costs to sell. [IFRS 5.15, IFRS 5.25]. For assets (or disposal group) to be classified as held for sale, they must be available for immediate sale in their present condition subject only to terms that are usual and customary for sales of such assets (or disposal groups), and the sale must be highly probable. [IFRS 5.7].

For the sale to be considered highly probable, the sale should be expected to complete within one year from the date of classification as held for sale, management at an 'appropriate level' must be committed to the plan, and an active programme of marketing the assets at current fair value must have been started. [IFRS 5.8].

The requirements of IFRS 5 are dealt with in Chapter 5. IFRS 5 does not apply when assets that are held for sale in the ordinary course of business are transferred to inventories (see section 7.2 below). [IAS 16.68A].

7.2 Sale of assets held for rental

If an entity, in the course of its ordinary activities, routinely sells PP&E that it has held for rental to others, it should transfer such assets to inventories at their carrying amount when they cease to be rented and are then held for sale. The proceeds from the sale of such assets should be recognised as revenue in accordance with IFRS 15. [IAS 16.68A]. In contrast, the sale of investment property is generally not recognised as revenue. The rationale and possible treatment of investment property in such cases is discussed in detail in Chapter 20.

A number of entities sell assets that have previously been held for rental, for example, car rental companies that may acquire vehicles with the intention of holding them as rental cars for a period of time and then selling them. An issue was whether the sale of such assets, which arguably have a dual purpose of being rented out and then sold, should be presented gross (revenue and cost of sales) or net (gain or loss) in profit or loss.

The IASB concluded that the presentation of gross revenue, rather than a net gain or loss, would better reflect the ordinary activities of such entities.

IAS 7 *Statement of Cash Flows* further requires that both (i) the cash payments to manufacture or acquire assets held for rental and subsequently held for sale; and (ii) the cash receipts from rentals and sales of such assets are presented as cash flows from operating activities. [IAS 7.14]. The intention behind this requirement is to avoid initial expenditure on purchases of assets being classified as investing activities while inflows from sales are recorded within operating activities.

As discussed in section 5.4 above, where an entity has a policy that involves disposing of assets after a specified time, the entity will depreciate them over this time period down to the estimated residual value. As set out in section 2.2 and 5.3, residual value is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.

IAS 16 does not define the 'estimated cost of disposal' or provide guidance on the costs to be included. In contrast, in respect of identifying the costs of disposal to be included when determining the net realisable value of inventories, the IFRS IC published an agenda decision in June 2021 (Costs Necessary to Sell Inventories (IAS 2 Inventories)) which provides specific guidance and makes it explicit that it is not appropriate for entities to limit such costs to only those that are incremental.

In the absence of a definition under IAS 16, an entity may apply the hierarchy in IAS 8 and consider the requirements in other standards in determining the cost of disposal when estimating residual value under IAS 16. There may be different outcomes depending which standard a preparer looks to. For example, whilst the IFRS IC's agenda decision in respect of costs of disposal under IAS 2 makes clear that entities should not limit such costs to only those that are incremental, the IFRS 5 definition of "costs to sell" a non-current asset and the IAS 36 definition of "costs of disposal" limit such costs to those that are incremental and directly attributable to the disposal of an asset. Therefore, an entity which has referred to the definition in IFRS 5 or IAS 36 may have assessed costs of disposal at a lower amount than those applying an IAS 2 definition, and as such, a loss could arise on the transfer of the asset from PP&E to inventories.

The interpretation of the definition of cost to sell may be particularly important, for example, for entities whose primary business is to lease assets (e.g., vehicles). Those entities may incur significant costs which are associated with the subsequent sale of the assets once they have reached the end of leases, but which are not incremental to an individual sale (e.g., costs associated with in-house teams or external support managing the sales process). Such costs would be considered in determining the cost to sell under IAS 2, but are non-incremental and therefore would not be included in costs of disposal under IFRS 5 or IAS 36.

How we see it

The absence of a consistent definition of costs of disposal could theoretically result in a loss arising when an entity transfers assets from PP&E to inventories. However, in our view, since the term is not defined in IAS 16, an entity would not be precluded from considering the guidance in IAS 2 in determining the costs necessary to sell inventories in its assessment of residual values.

7.3 Partial disposals and undivided interests

IAS 16 requires an entity to derecognise 'an item' of PP&E on disposal or when it expects no future economic benefits from its use or disposal. [IAS 16.67].

Items of PP&E are recognised when their costs can be measured reliably and it is probable that future benefits associated with the asset will flow to the entity. [IAS 16.7]. The standard "does not prescribe the unit of measure for recognition, i.e. what constitutes an item of property, plant and equipment ...". [IAS 16.9].

However, items that are derecognised are not necessarily items that were identified separately on initial recognition. The item that is being disposed of may be part of a larger 'item' bought in a single transaction that can be subdivided into parts (i.e., separate items) for separate disposal; an obvious example is land or many types of property. The principle is the same as for the replacement of parts, which may only be identified and derecognised so that the cost of the replacement part may be recognised (see section 3.3 above). The entity needs to identify the cost of the part disposed of by allocating the carrying value on a systematic and appropriate basis.

In these cases, the part disposed of is a physical part of the original asset. The standard assumes that disposal will be of a physical part (except in the specific case of major inspections and overhauls - see section 3.3.2 above). However, some entities enter into arrangements in which they dispose of part of the benefits that will be derived from the assets.

Although IAS 16 defines an asset by reference to the future economic benefits that will be controlled by the entity as a result of the acquisition, it does not address disposals of a proportion of these benefits. An entity may dispose of an undivided interest in the whole asset (sometimes called an ownership 'in common' of the asset). This means that all owners have a proportionate share of the entire asset (e.g., the purchaser of a 25% undivided interest in 100 acres of land owns 25% of the whole 100 acres). These arrangements are common in, but are not restricted to, the extractive and property sectors. Vendors have to determine how to account for the consideration they have received from the purchaser. This will depend on the details of the arrangement and, in particular, whether the entity continues to control the asset or there is joint control.

7.3.1 Joint control

In some cases, after a partial disposal of an item of PP&E there may be joint control over the asset, in which case IFRS 11 *Joint Arrangements* shall be considered in determining how the entity shall account for the disposal and the subsequent accounting. Joint control is discussed in detail in Chapter 13.

The accounting treatment may depend on whether the disposing entity holds an asset directly or holds it within a single-asset subsidiary.

If an entity sells a directly held asset into a joint operation in which it is a joint operator, it is entering into a transaction with the other parties to the joint operation and therefore the vendor will only recognise gains and losses to the extent of the other parties' interests. [IFRS 11.B34]. In other words, it will recognise a partial disposal. Similarly, if an entity sells a directly held asset into a joint venture in which it is a joint venturer, it recognises only the portion of the gain or loss attributable to the other parties to the joint venture.

An entity subsequently accounts for a joint operation by accounting for its own assets, liabilities, revenue etc. while it will apply the equity method to account for its interests in a joint venture (see Chapter 13).

However, in many jurisdictions it is common for certain assets, particularly properties, to be bought and sold by transferring ownership of a separate legal entity formed to hold the asset (a single-asset entity) rather than the asset itself. If the entity is disposing of an interest in an asset that is held within a single-asset subsidiary and if the retained interest represents an investment in an entity, a gain or loss is typically recognised as if 100% of asset had been sold because control of the subsidiary has been lost.

However, if the asset is held in a single-asset subsidiary entity that becomes a joint venture, there is a conflict between the requirements of IFRS 10 *Consolidated Financial Statements* and IAS 28 *Investments in Associates and Joint Ventures*.

This is because, under IFRS 10, if a parent entity loses control of a subsidiary a gain or loss is recognised as if 100% of asset had been sold. In contrast, under IAS 28, an investor is required to restrict any gain arising on disposal of its own assets to the amount attributable to the other party to the joint venture. That is, IFRS 10 requires full gain recognition whilst IAS 28 requires partial gain recognition.

In September 2014, the IASB issued amendments to IFRS 10 and IAS 28 on the recognition of the sale or contribution of assets between an investor and its associate or joint venture. The main consequence of the amendments is that a full gain or loss is recognised when a transaction involves a business (whether it is housed in a subsidiary or not). A partial gain or loss is recognised when a transaction involves assets that do not constitute a business, even if these assets are housed in a subsidiary. The amendments were to be applied prospectively for transactions occurring in annual periods commencing on or after 1 January 2016, with earlier application permitted.³ However, in December 2015, the IASB issued a further amendment *Effective Date of Amendments to IFRS 10 and IAS 28*. This amendment defers the effective date of the September 2014 amendment until the IASB has finalised any revisions that result from the IASB's research project on the equity method. [IFRS 10.BC190N]. Nevertheless, the IASB has continued to allow early application of the September 2014 amendment as it did not wish to prohibit the application of better financial reporting. [IFRS 10.BC190O]. This issue is discussed further in Chapter 8 and Chapter 12.

In May 2023 the IASB moved its Equity Method project from the research programme to the standard-setting work plan, and an Exposure Draft was issued in September 2024. See Chapter 12 for further discussion.

7.3.2 Vendor retains control

If the asset is not jointly controlled in the subsequent arrangement, the vendor might retain control over the asset. The vendor will recognise revenue or it will be a financing arrangement. If it is the former, then the issue is the period and pattern over which revenue is recognised.

If the vendor retains control, then it will not meet the requirements in IFRS 15 for treating the transaction as a sale of the asset, i.e., recognising revenue at a point in time on entering into the arrangement. IFRS 15 requires that revenue (and a gain or loss on disposal of a non-current asset not in the ordinary course of business) be recognised upon satisfaction of a performance obligation by transferring control (see Chapter 28).

The arrangement could be akin to a lease, especially if the disposal is for a period of time. However, arrangements are only within the scope of IFRS 16 if they relate to an identified asset. Generally, a portion of a larger asset that is not physically distinct is not considered to be an identified asset. The related detailed requirements of IFRS 16 are discussed in Chapter 24.

If it is not a lease and the vendor continues to control the asset, the arrangement might be best characterised as a performance obligation for services to be spread over the term of the arrangement. That is, the initial receipt would be a liability and recognised in profit and loss over time.

Alternatively, it could be a financing-type arrangement, in which case the proceeds would be classified as a financial liability. In effect, the vendor is trading a share of any revenue to which it is entitled in exchange for funding by the purchaser of one or more activities relating to the asset. The purchaser receives a return that is comparable to a lender's rate of return out of the proceeds of production. This could be by receiving a disproportionate share of output until it has recovered its costs (the financing it has provided) as well as the agreed rate of return for the funding. These arrangements are found in the extractive sector, e.g., carried interests and farm-outs (see Chapter 39). In the development stage of a project, the asset in question will be classified as PP&E or as an intangible asset under IAS 38. Under a carried interest arrangement, the carried party transfers a portion of the risks and rewards of a property, in exchange for a funding commitment from the carrying party.

7.3.3 Partial disposal

In some circumstances it is argued that the rights transferred by the vendor are such that it neither controls nor jointly controls the whole of the original asset and the question arises as to whether there is a part disposal of the asset. Classification as a joint operation would allow a part disposal of an item of PP&E, but the arrangement cannot be accounted for as a joint operation as there is no joint control. However, it is noted that a party that participates in a joint operation and has rights to the assets, and obligations for the liabilities, but does not have joint control records its interests in the same way as a participant in a joint operation, accounting for its own assets and liabilities. [IFRS 11.23]. This is unaffected by the fact that the asset in question may be an interest in an undivided asset; it will still classify its interest in the asset as an item of PP&E. In those sectors where these arrangements are common and where an entity will be simultaneously vendor and acquirer in different arrangements, it is argued that the transactions should be treated symmetrically, i.e., as a part disposal of the undivided asset and an acquisition of an interest in PP&E. However, this interpretation depends entirely on the vendor ceding control of part of its rights and applying IAS 16 principles to obtain symmetry of accounting between acquisitions and disposals.

3 *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture: Amendments to IFRS 10 and IAS 28*, IASB, September 2014, IFRS 10.C1C and IAS 28.45C.

7.4 Derecognition and replacement of insured assets

Situations may arise where insured assets are destroyed in a fire, or similar destructive incident, and compensation (either in the form of cash or a replacement asset) from an insurance company is expected.

IAS 16 states that these events - the losses of items of PP&E, the related claims for or payments of compensation from third parties and any subsequent purchase or construction of replacement assets - are 'separate economic events' and should be accounted for separately as follows:

- Derecognition of the items of PP&E that are destroyed with a corresponding loss recognised in profit and loss.
- Compensation from the insurer or other third parties for the items of PP&E that are destroyed is recognised as an asset when it becomes receivable with a corresponding gain recognised in profit and loss.
- The cost of items of PP&E restored, purchased or constructed as replacements are recognised in accordance with the requirements of IAS 16 (see sections 3 and 4 above). [IAS 16.65, IAS 16.66].

The items of PP&E that are destroyed will be reflected in the financial statements as a write-off rather than an impairment. Practical example 7-1 below illustrates these requirements.

Practical example 7-1: Avinor AS (2021)	Norway
Annual and Sustainability Report 2021 [extract] NOTES TO THE FINANCIAL STATEMENTS [extract] NOTE 20 Contingencies and uncertainties [extract]	
<p>INSURANCE SETTLEMENT PARKING GARAGE STAVANGER AIRPORT</p> <p>The parking garage at Stavanger Airport was damaged in a fire on 7 January 2020. The parking garage was fully insured, and the insurance covers the cost of rebuilding a similar building in accordance with current regulations. The building of a new parking garage started in January 2022. Expected completion of the parking garage is in the summer of 2023.</p> <p>In the financial statements for 2020, assets which were considered lost as a result of the fire based were fully impaired. The impairment as at 31 December 2020 amounted to NOK 176.1. Furthermore, a provision for expected demolition expenses of MNOK 20 was made. Avinor received in 2020 a preliminary insurance settlement that fully covered the costs mentioned. The preliminary insurance settlement was presented as a reduction of the impairment charge of MNOK 176.1 and demolition expenses of MNOK 20 in the income statement. The effect of the fire in the income statement for 2020 was therefore zero.</p> <p>Avinor is in dialogue with the insurance company regarding the rest of the insurance settlement, but the final financial and accounting consequences of the fire will not be known until the insurance settlement is fully completed.</p>	

8 IAS 16 presentation and disclosure requirements

The main disclosure requirements of IAS 16 are set out below, but it should be noted that the related disclosure requirements in other standards such as IFRS 13, IAS 1 *Presentation of Financial Statements* and IAS 36 may also be relevant. See Chapters 15, 3 and 21, respectively.

8.1 General disclosures

For each class of PP&E the following should be disclosed in the financial statements:

- (a) The measurement bases used for determining the gross carrying amount (e.g., cost or revaluation). [IAS 16.73(a)]. When more than one basis has been used, the gross carrying amount for that basis in each category may have to be disclosed (however the standard requires that if revaluation is adopted the entire class of PP&E must be revalued).
- (b) The depreciation methods used. Selection of the depreciation method adopted is a matter of judgement and its disclosure provides information that allows users of financial statements to review the policies selected by management and enables them to compare with other entities. For similar reasons, it is necessary to disclose depreciation (in item (e)(vii) below), whether recognised in profit or loss or as a part of the cost of other assets, during a period; and accumulated depreciation at the end of the period (in item (d) below). [IAS 16.73(b), IAS 16.75].
- (c) The useful lives or the depreciation rates used. Selection of the useful lives or depreciation rates used is a matter of judgement and its disclosure provides information that allows users of financial statements to review the policies selected by management and enables them to compare with other entities. [IAS 16.73(c), IAS 16.75].
- (d) The gross carrying amount and the accumulated depreciation (aggregated with accumulated impairment losses) at the beginning and end of the period. [IAS 16.73(d)].
- (e) A reconciliation of the carrying amount at the beginning and end of the period showing:
 - (i) Additions
 - (ii) Disposals, and assets classified as held for sale or included in a disposal group held for sale in accordance with IFRS 5
 - (iii) Acquisitions through business combinations
 - (iv) Increases or decreases resulting from revaluations and from impairment losses recognised or reversed directly in other comprehensive income under IAS 36
 - (v) Impairment losses recognised in profit or loss during the period under IAS 36
 - (vi) Impairment losses reversed in profit or loss during the period under IAS 36
 - (vii) Depreciation
 - (viii) The net exchange differences arising on the translation of the financial statements from the functional currency into a different presentation currency, including the translation of a foreign operation into the presentation currency of the reporting entity
 - And
 - (ix) Other changes [IAS 16.73(e)]

Practical example 8-1 below illustrates an accounting policy on PP&E together with the movement and reconciliation note (a comparative is provided in the financial statements but is not reproduced here).

Practical example 8-1: Lucas Bols N.V. (2023)

The Netherlands

ANNUAL REPORT 2022-2023 [extract]

Financial Statements [extract]

Consolidated financial statements 2022/23 [extract]

Notes to the consolidated financial statements [extract]

3. General accounting policies [extract]

(i) Property, plant and equipment

(I) Recognition and measurement

Items of property, plant and equipment are measured at cost less accumulated depreciation and accumulated impairment losses.

(II) Subsequent costs

The cost of replacing part of an item of property, plant and equipment is recognised in the carrying amount of the item if it is probable that the future economic benefits embodied within the part will flow to the Group and its cost can be measured reliably. The costs of the day-to-day servicing of property, plant and equipment are recognised in the profit or loss as incurred.

Any gain or loss on disposal of an item of property, plant and equipment is recognised in profit or loss.

(III) Depreciation

Depreciation is recognised in profit or loss on a straight-line basis over the estimated useful life of each part of an item of property, plant and equipment.

The estimated useful life is as follows:

- Fixtures and leasehold improvements 10 years
- Furniture 10 years
- Equipment 5 years
- Computers 3 years

The depreciation methods, residual value and useful life are reviewed annually and adjusted if appropriate.

17. Property, plant and equipment [extract]

AMOUNTS IN EUR '000	RIGHT-OF-USE ASSETS	EQUIPMENT	FIXTURES AND FITTINGS	FURNITURE	TOTAL
Cost					
Balance at 1 April 2022	8,799	3,008	3,956	189	15,952
Additions	–	191	98	11	300
Additions through acquisitions	–	–	65	–	65
Lease modifications and remeasurements	84	–	–	–	84
Disposals	–	–	–	–	–
Reclassification	–	–	–	–	–
Effect of movement in exchange rates	12	(56)	1	–	(43)
Balance at 31 March 2023	8,895	3,143	4,120	200	16,358
Accumulated depreciation					
Balance at 1 April 2022	(2,857)	(1,762)	(2,231)	(127)	(6,977)
Depreciation for the year	(786)	(223)	(404)	(6)	(1,419)
Additions through acquisitions	–	–	(35)	–	(35)
Disposals	–	–	–	–	–
Reclassification	–	–	–	–	–
Effect of movement in exchange rates	4	57	48	(18)	91
Balance at 31 March 2023	(3,639)	(1,928)	(2,622)	(151)	(8,340)
Carrying amounts					
At 1 April 2022	5,942	1,246	1,725	62	8,975
At 31 March 2023	5,256	1,215	1,498	49	8,018

...

The carrying value of right-of-use assets mainly consists of buildings and includes an amount of EUR 17 thousand relating to office equipment (31 March 2022: EUR 37 thousand) and EUR 34 thousand relating to lease cars (31 March 2022: EUR 46 thousand). Short-term lease expenses and low-value lease expenses of EUR 104 thousand (31 March 2022: EUR 54 thousand) are included in 'Other administrative expenses'. Refer to note 24 and note 27 for further details on the lease liability.

Security

At 31 March 2023 properties with a carrying amount of EUR 2,762 thousand (31 March 2022: EUR 3,033 thousand) were subject to a registered debenture that serves as security for bank loans (see note 23).

IAS 16 also requires the disclosure of the following information, which is useful to gain a fuller understanding of the entire position of the entity's holdings of and its commitments to purchase property plant and equipment: [IAS 16.74, IAS 16.74A]

Extract from IAS 16

- 74** The financial statements shall also disclose:
- (a) the existence and amounts of restrictions on title, and property, plant and equipment pledged as security for liabilities;
 - (b) the amount of expenditures recognised in the carrying amount of an item of property, plant and equipment in the course of its construction; and
 - (c) the amount of contractual commitments for the acquisition of property, plant and equipment.
- 74A** If not presented separately in the statement of comprehensive income, the financial statements shall also disclose:
- (a) the amount of compensation from third parties for items of property, plant and equipment that were impaired, lost or given up that is included in profit or loss; and
 - (b) the amounts of proceeds and cost included in profit or loss in accordance with paragraph 20A that relate to items produced that are not an output of the entity's ordinary activities, and which line item(s) in the statement of comprehensive income include(s) such proceeds and cost.

The standard also requires that, in accordance with IAS 8, an entity discloses the nature and effect of any change in an accounting estimate (e.g., depreciation methods, useful lives, residual values, and the estimated cost of dismantling, removing or restoring items of PP&E) that has an effect on the current period or is expected to have an effect in future periods. [IAS 16.76].

8.2 Additional disclosures for revalued assets

In addition to the disclosures required by IFRS 13, if the revaluation method is adopted IAS 16 requires an entity to disclose:

- (a) The effective date of the revaluation
- (b) Whether an independent valuer was involved
- (c) For each revalued class of PP&E, the carrying amount that would have been recognised had the assets been carried under the cost model
And
- (d) The revaluation surplus, indicating the change for the period and any restrictions on the distribution of the balance to shareholders [IAS 16.77]

In particular the requirement under (c) is quite onerous for entities, as it entails their keeping asset register information in some detail in order to meet it.

In May 2014, the IFRS IC received a request to clarify whether an entity is required to reflect the capitalisation of borrowing costs to meet the disclosure requirement of IAS 16 for assets stated at revalued amounts and for which borrowing costs are not capitalised. Since the capitalisation of borrowing costs for such assets is not required (see Chapter 22), the determination of the amount of borrowing costs that would have been capitalised under a cost model - solely to meet a disclosure requirement - might be considered burdensome.

The IFRS IC noted that the requirements in IAS 16.77(e) (i.e., item (c) above) are clear. This paragraph requires an entity to disclose the amount at which assets stated at revalued amounts would have been stated had those assets been carried under the cost model. The amount to be disclosed includes borrowing costs capitalised in accordance with IAS 23 (see Chapter 22).⁴

IFRS 13 has a number of disclosure requirements for assets measured at fair value. Some of the significant disclosures under IFRS 13 which would apply to revalued PP&E are: [IFRS 13.93]

- If the highest and best use differs from its current use, an entity must disclose that fact and why the asset is being used in a manner different from its highest and best use.
- The fair value measurement's categorisation within the fair value measurement hierarchy (i.e., Level 1, 2 or 3).
- If categorised within Level 2 or 3 of the fair value hierarchy (which most revalued PP&E is likely to be):
 - (i) A description of the valuation technique(s) used in the fair value measurement
 - (ii) The inputs used in the fair value measurement
 - (iii) If there has been a change in the valuation technique (e.g., changing from a market approach to an income approach or use of an additional technique):
 - The change
And
 - The reason(s) for making it
- Quantitative information about the significant unobservable inputs used in the fair value measurement for those categorised within Level 3 of the fair value measurement hierarchy.
- If categorised within Level 3 of the fair value measurement hierarchy, a description of the valuation processes used by the entity (including, for example, how an entity decides its valuation policies and procedures and analyses changes in fair value measurements from period to period).

⁴ [IFRIC Update](#), May 2014, available on the IFRS Foundation's website.

In addition to these requirements, an entity must also provide the disclosures depending on whether the fair value measurement is recurring or non-recurring. Revalued PP&E are considered recurring fair value measurements and are subject to additional disclosure requirements, which include a qualitative sensitivity analysis. The disclosures for revalued PP&E categorised under Level 3 include a reconciliation from the opening balance to the closing balance, disclosing separately changes during the period to the following:

- (i) Total gains and losses for the period recognised in profit or loss, and the line item(s) in profit or loss in which these gains or losses are recognised
- (ii) Total gains and losses for the period recognised in other comprehensive income, and the line item(s) in other comprehensive income in which those gains or losses are recognised
- (iii) Purchases, sales, issues and settlements (separately disclosing each of those types of changes)
- (iv) Transfers into or out of Level 3 of the fair value hierarchy (separately disclosing and discussing transfers into Level 3 from those out of Level 3) including:
 - The amounts of any transfers into or out of Level 3
 - The reasons for those transfers
 - The entity's policy for determining when transfers between levels are deemed to have occurred [IFRS 13.93]

These requirements and examples of the requirements are discussed in more detail in Chapter 15.

8.3 Other disclosures

In addition to the disclosures required by IAS 1, IAS 16 and IFRS 13 (i.e., those discussed in sections 8.1 and 8.2 above), the standard emphasises that entities are also required to disclose information on impaired PP&E in accordance with IAS 36 (see Chapter 21). [IAS 16.78].

As users of financial statements may find other information relevant to their needs, the standard encourages, but does not require, entities to disclose other additional information such as the carrying amount of any temporarily idle PP&E, the gross carrying amount of any fully depreciated PP&E that is still in use and the carrying amount of any PP&E retired from active use but not classified as held for disposal in accordance with IFRS 5. For any PP&E measured using the cost model, the disclosure of its fair value is also encouraged when this is materially different from the carrying amount. [IAS 16.79].

In addition, entities need to consider the impacts of climate change on PP&E and make disclosures as necessary to meet the needs of the users of the financial statements. The IASB has an active project that aims to improve the reporting of climate-related and other uncertainties in financial statements. In September 2023, the board identified a number of actions to achieve this objective, one of which was to develop examples to illustrate how to apply requirements in IFRS Accounting Standards to reporting the effects of climate-related and other uncertainties. With regards to PP&E, the examples that have since been developed by the staff highlight that where items of PP&E have sufficiently dissimilar risk characteristics, it may be necessary to disaggregate the information in the PP&E disclosures.

8.4 IFRS 16 and the presentation of right-of-use assets

Lessees can present right-of-use assets in the statement of financial position either:

- (a) Separately from other assets

Or

- (b) Include them within the same line item as that within which the corresponding assets would be presented if they were owned [IFRS 16.47]

Lessees can, therefore, include the leased right-of-use assets within PP&E on the face of the statement of financial position.

If right-of-use assets are not presented separately from other assets in the statement of financial position, an entity must disclose which line items include the right-of-use assets. [IFRS 16.47].

The requirements above do not apply to right-of-use assets that meet the definition of investment property, which are presented in the statement of financial position as investment property. [IFRS 16.48].

Presentation of right-of-use assets is discussed further in Chapter 24.

Appendix C - Defined terms

Extract from IAS 16

Definitions

6 The following terms are used in this Standard with the meanings specified:

A bearer plant is a living plant that:

- (a) is used in the production or supply of agricultural produce;
- (b) is expected to bear produce for more than one period; and
- (c) has a remote likelihood of being sold as agricultural produce, except for incidental scrap sales.

(Paragraphs 5A-5B of IAS 41 elaborate on this definition of a bearer plant.)

Carrying amount is the amount at which an asset is recognised after deducting any accumulated depreciation and accumulated impairment losses.

Cost is the amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs, eg IFRS 2 *Share-based Payment*.

Depreciable amount is the cost of an asset, or other amount substituted for cost, less its residual value.

Depreciation is the systematic allocation of the depreciable amount of an asset over its useful life.

Entity-specific value is the present value of the cash flows an entity expects to arise from the continuing use of an asset and from its disposal at the end of its useful life or expects to incur when settling a liability.

Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)

An impairment loss is the amount by which the carrying amount of an asset exceeds its recoverable amount.

Property, plant and equipment are tangible items that:

- (a) are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes; and
- (b) are expected to be used during more than one period.

Recoverable amount is the higher of an asset's fair value less costs of disposal and its value in use.

The *residual value* of an asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.

Useful life is:

- (a) the period over which an asset is expected to be available for use by an entity; or
- (b) the number of production or similar units expected to be obtained from the asset by an entity.

Overview

This chapter covers the requirements of IAS 40 *Investment Property* which prescribes the accounting treatment and related disclosures for investment property, i.e., a property (land or a building - or part of a building - or both) held (by the owner or by the lessee as a right-of-use asset) to earn rentals or for capital appreciation or both. [IAS 40.1, IAS 40.5]. Accordingly, this standard must be applied in the recognition, measurement and disclosure of investment property. [IAS 40.2].

On initial recognition, investment properties are measured at cost. Subsequently, these assets could be measured using a cost model or a fair value model as a policy choice. Fair value is determined in accordance with IFRS 13 *Fair Value Measurement* and any gains and losses from periodic revaluation under the fair value model are recognised in profit or loss. The requirements of IFRS 13 are discussed in detail in Chapter 15.

With certain exceptions, the chosen measurement model applies to all investment properties of an entity. IAS 40 provides a specific exception applicable to insurance companies and other entities that hold specified investment properties whose fair value or return is directly linked to the return paid on specific liabilities. IAS 40 also provides an exception when, and only in exceptional cases, the entity concluded on initial recognition that it will not be able to reliably measure the investment property's fair value on a continuing basis.

A property is required to be transferred to, or from, investment property but only when there is a change in use. This transfer occurs when the property meets, or ceases to meet, the definition of investment property and there is evidence of the change in use.

Accounting for properties in the scope of IAS 16 *Property, Plant and Equipment* is covered in Chapter 19 and accounting for properties in the scope of IAS 2 *Inventories* is covered in Chapter 23.

What you need to know

- IAS 40 applies to any property that meets the investment property definition, irrespective of the nature of the business of the reporting entity.
- Judgement is required in determining whether a property qualifies as investment property; an entity develops criteria so that it can exercise that judgement consistently, and, when classification is difficult, discloses these criteria.
- A Level 3 categorisation of IFRS 13 fair value hierarchy is likely to be the most common for investment property due to the lack of an active market for identical assets.
- The definition of 'fair value' in IFRS 13 is consistent with 'market value' as defined in International Valuation Standards (IVS). But, perhaps confusingly, it differs from the IVS definition of fair value. Management needs to be aware of the conceptual differences between IFRS 13 and IVS to ensure any values used for financial reporting that are obtained from appraisals, whether external or internal, are consistent with the objective of fair value measurement in accordance with IFRS 13.
- Whichever model is chosen, fair value or cost, IAS 40 requires all entities to disclose the fair value of their investment property. The extent and nature of IFRS 13 disclosures require exercise of judgement of management.

1 Introduction

IAS 40 is an example of the particular commercial characteristics of an industry resulting in the special accounting treatment of a certain category of asset, i.e., investment property. However, it is not only investment property companies that hold investment property; any property that meets the investment property definition in IAS 40 is so classified, irrespective of the nature of the business of the reporting entity. This standard must be applied in the recognition, measurement and disclosure of investment property. [IAS 40.1, IAS 40.2].

The original standard, which was approved in 2000, was the first international standard to introduce the possibility of applying a fair value model for non-financial assets where all valuation changes from one period to the next are reported in profit or loss. This contrasts with the revaluation approach allowed under IAS 16 (see Chapter 19) where increases above cost, and their reversals, are recognised in Other Comprehensive Income ('OCI').

The exposure draft that preceded IAS 40 proposed that fair value must be the sole measurement model for investment property. However, some respondents were concerned that, in certain parts of the world, property markets were not sufficiently liquid to support fair value measurement for financial reporting purposes. Consequently, the cost option was introduced into the standard, as the Board believed, at that stage, that it was impracticable to require a fair value model for all investment property.

Despite the free choice of model available, IAS 40 has a rebuttable presumption that, other than in exceptional cases, an entity can measure the fair value of a completed investment property reliably on a continuing basis.

The question of the reliability of valuations was given greater focus following the change in scope of the standard in 2009 to include investment property under construction (see section 2.5 below) because, following that change, the standard allows investment property under construction to be measured at cost until such time as the fair value becomes reliably measurable or construction is completed (whichever comes earlier) provided that the fair value of the investment property under construction is not reliably measurable but the fair value of such property is expected to be reliably measurable when construction is complete (see section 6.3 below).

This chapter discusses the revised version of IAS 40, which was published in December 2003, as subsequently updated by various narrow-scope amendments and minor consequential amendments arising from other standards.

Differences between IAS 40 and US GAAP guidance on accounting for investment property are not addressed in this chapter as the standards are not converged. Therefore, differences between IAS 40 and the corresponding US GAAP guidance may exist that are not discussed in this chapter.

2 Definitions and scope

The relevant terms defined by IAS 40 are as follows: [IAS 40.5]

Extract from IAS 40

Definitions

- 5 The following terms are used in this Standard with the meanings specified:
- Carrying amount* is the amount at which an asset is recognised in the statement of financial position.
- Cost* is the amount of cash or cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs, eg IFRS 2 *Share-based Payment*.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*).
- Investment property* is property (land or a building - or part of a building - or both) held (by the owner or by the lessee as a right-of-use asset) to earn rentals or for capital appreciation or both, rather than for:
- (a) use in the production or supply of goods or services or for administrative purposes; or
 - (b) sale in the ordinary course of business.
- Owner-occupied property* is property held (by the owner or by the lessee as a right-of-use asset) for use in the production or supply of goods or services or for administrative purposes.

The IAS 40 definition for investment property above means that any entity, whatever the underlying nature of its business, can hold investment property assets if its intention on initial recognition (either by acquisition or change in use - see section 9 below) is to hold them for rent or for capital appreciation or both. Subsequent to initial recognition, assets might be reclassified into and from investment property (see section 9 below). It is also worthy of note that a property interest held by a lessee as a right-of-use asset under an operating lease can be an investment property (see section 2.1 below).

How we see it

An entity's intention of holding a property plays an important role in determining whether it meets the definition of investment property or not. Such intention affects classification of the property at initial recognition, i.e., either when recognising an asset for the first time, or when an existing asset is to be transferred to, or from, investment property provided such change in intention is supported by evidence of change in use of that asset (see section 9 below).

In contrast, 'owner-occupied' property as defined above falls outside the scope of IAS 40 and is accounted for under IAS 16 (see section 2.4 below and Chapter 19), together with IFRS 16 *Leases* (see Chapter 24), if relevant. Property held, or being constructed, with the intention of sale in the ordinary course of business also falls outside the scope of IAS 40 and is accounted for under IAS 2 (see section 2.6 below and Chapter 23). Accordingly, the definition of investment property in IAS 40 ensures that all property is covered by one, and only one standard, that is either IAS 2, IAS 16 or IAS 40. [IAS 40.B30, IAS 40.B31].

IAS 40 applies to the measurement in a lessor's financial statements of investment property provided to a lessee under an operating lease (see section 2.3 below). IAS 40 also applies to the subsequent measurement in a lessee's financial statements of investment property interests held under a lease if the lessee applies the fair value model in IAS 40 to its investment property (see section 2.1 below). However, it does not deal with other accounting matters that are dealt with in IFRS 16 (see Chapter 24), including:

- Classification of leases as finance or operating leases by a lessor
- Recognition of lease income arising from the leasing of investment property
- Initial measurement in a lessee's financial statements of property interests held under a lease
- Measurement in a lessor's financial statements of its net investment in a finance lease
- Accounting for sale and leaseback transactions
- Disclosure of information about leases by lessors and lessees

IAS 40 does not apply to:

- Biological assets related to agricultural activity (see IAS 41 *Agriculture* and IAS 16)
- Mineral rights and mineral reserves such as oil, natural gas and similar non-regenerative resources [IAS 40.4]

Biological assets that are physically attached to land (for example, trees in a plantation forest) are measured at their fair value less estimated point-of-sale costs separately from the land. [IAS 41.12].

However, the land related to the agricultural activity is accounted for either as property under IAS 16 or investment property under IAS 40. [IAS 41.2].

What primarily distinguishes investment property from other types of property interest is that it generates cash flows (from rental or sale) that are largely independent of those from other assets held by the entity. By contrast, owner-occupied property used by an entity for administrative purposes or for the production or supply of goods or services does not generate cash flows that are attributable only to itself but does so only in conjunction with other assets used in the production or supply process. IAS 16 applies to owned owner-occupied property and IFRS 16 applies to owner-occupied property held by a lessee as a right-of-use asset. [IAS 40.7].

Even with the distinction described above, it is sometimes difficult to distinguish investment property from owner-occupied property. The standard therefore gives guidance to help determine whether or not an asset is an investment property (see sections 2.1 to 2.11 below).

Circumstances are not always straightforward particularly if at initial recognition the intention of holding a property is mixed or undetermined (except for land - see section 2.2 below). For example, entities that are not in the property industry may not be within the scope of IAS 40 if they sublease a property under an operating lease with the intention of subsequently using the property within their own business. Such a property would not meet the definition of an investment property in IAS 40 because it would not be held solely for rentals, capital appreciation or both. [IFRS 16.BC179(b)]. In this example, the intended use of the property as an owner-occupied property would even be clearer if the sublease of the property would only be for a short period of time in relation to the remaining lease term of the head lease.

How we see it

Considering how an entity's principal activities and its business strategy for the property, including the length of the lease to a tenant, impact the determination of the intended use of the property (and therefore, whether the property meets the definition of an investment property under IAS 40) may require the exercise of judgement based on specific facts and circumstances. An entity develops criteria so that it can exercise that judgement consistently in accordance with the definition of investment property and the related guidance in IAS 40. Such criteria are required to be disclosed when classification is difficult (see section 12.1 below).

It is also worthy of note that the IFRS IC has discussed the accounting for a structure that 'lacks the physical characteristics of a building', i.e., whether it should be accounted for as investment property in accordance with IAS 40. This primarily related to an emerging business model in which an entity owns telecommunication towers and leases spaces in the towers to telecommunication operators to which the operators attach their own devices. The entity may also provide some basic services to the telecommunication operators such as maintenance services.¹

The request specifically sought clarification on whether a telecommunication tower should be viewed as a 'building' and thus 'property', as described in IAS 40.5 and how any service element in the leasing agreement and business model of the entity should be taken into consideration when analysing the issue. The IFRS IC observed that the tower has some of the characteristics of investment property, in that spaces in the tower were let to tenants to earn rentals (e.g., leasing of spaces for telecommunication operators to which operators attach their own devices) but questioned whether the tower qualifies as a 'building' because it lacks features usually associated with a building such as walls, floors and a roof. They also observed that the same question could arise about other structures, such as gas storage tanks and advertising billboards.²

The IFRS IC observed that there would be merit in exploring approaches to amending IAS 40 to include structures that lack the physical characteristics associated with a building.³ However, following research on this issue, the IASB decided not to pursue this issue because there appeared to be limited demand for fair value accounting for these types of structures and limited diversity in practice.⁴

2.1 Property interest held under a lease

Leases of property are included in the scope of IFRS 16 (see Chapter 24). Under IFRS 16, lessees apply a single model for most leases, i.e., unlike lessors, lessees do not need to classify leases as finance leases or as operating leases. IFRS 16 requires lessees to recognise most leases in their statement of financial position as lease liabilities with corresponding right-of-use assets.

Properties held by lessees as right-of-use assets that meet the definition of investment property, as described in section 2 above, are included in the scope of IAS 40. This results in lessees using either the cost model and disclosing fair value, or using the fair value model, depending on whether the lessee accounts for the remainder of its investment property under the cost model or the fair value model. In the IASB's view, this approach will provide useful information to users of financial statements about the fair value of investment property held by a lessee as a right-of-use asset, which is consistent with information provided about owned investment property. [IFRS 16.BC178].

An investment property held by a lessee as a right-of-use asset is recognised in accordance with IFRS 16. [IAS 40.19A]. IFRS 16 requires a lessee to measure right-of-use assets arising from leased property in accordance with the fair value model of IAS 40 if the leased property meets the definition of investment property and the lessee elects to apply the fair value model in IAS 40 as an accounting policy (see sections 6 and 6.7 below). [IFRS 16.34].

When a lessee uses the fair value model to measure an investment property that is held as a right-of-use asset, it will measure the right-of-use asset, and not the underlying property, at fair value. [IAS 40.40A].

If the lessee elects to apply the cost model to measure its investment property, the lessee must measure its right-of-use assets that meet the definition of investment property in IAS 40 using the cost model in IFRS 16 (see section 7 below) unless such assets are held for sale in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* (see section 8 below). [IAS 40.56].

If the right-of-use assets meet the definition of investment property, these are presented in the statement of financial position as investment property (see Chapter 24). [IFRS 16.48]. In addition to the relevant disclosure requirements in IFRS 16 (see Chapter 24), a lessee also applies the disclosure requirements in IAS 40 for such right-of-use assets (see section 12 below). [IFRS 16.56].

Subsequent to initial recognition, the IASB indicated that a lease liability should be accounted for in a manner similar to other financial liabilities (i.e., on an amortised cost basis). [IFRS 16.BC182].

For further discussion on subsequent measurements of lease liabilities and right-of-use assets, see Chapter 24.

2.2 Land

Land is investment property if it is held to earn rentals or for capital appreciation or for both; or for a currently undetermined future use. This is in contrast to land that is held for sale in the ordinary course of business (typically in the shorter term) or held for the production or supply of goods and services or for administrative purposes. [IAS 40.7, IAS 40.8].

If, on initial recognition, land is held for a currently undetermined future use, i.e., if an entity has not determined whether it will use the land as owner-occupied property, or for sale in the ordinary course of business, or to earn rentals or for capital appreciation, it is deemed to be held for capital appreciation and must be classified as investment property. [IAS 40.8].

2.3 Property leased to others

Properties leased to other parties under one or more operating lease are generally investment properties, whether they are owned freehold by the reporting entity or are right-of-use assets relating to properties held by the reporting entity (see sections 2 and 2.1 above). This will also apply if the property is currently vacant while tenants are being sought. [IAS 40.8].

In the real estate industry, properties might have been held for sale in the ordinary course of business since their initial recognition (either by acquisition or change in use - see section 9 below) but are leased out prior to sale in order to minimise cash outflows whilst the entity seeks a buyer; and because prospective buyers may view the existence of such lease contracts positively, especially those that wish to acquire property for investment purposes.

How we see it

In our view, such properties described above - notwithstanding that they are leased to tenants under operating leases - are accounted for as inventories under IAS 2 as long as it remains the intention of the entity to hold such properties for sale in the ordinary course of business (see section 2.6 below). The rent received would be recorded as operating lease income in profit or loss and would not be treated as a reduction in the cost of inventory. See Chapter 23 for further discussion.

When an entity no longer intends to sell an inventory property, IAS 40 requires the property to be transferred from inventories to investment properties when, and only when, there is a change in use evidenced, for example, by the commencement of an operating lease to another party (see section 9 below).

Property that is leased to another party under a finance lease is not an investment property but is accounted for under IFRS 16 (see Chapter 24). [IAS 40.9].

2.4 Property held for own use ('owner-occupied')

As noted above, owner-occupied property, that is property held for use in the production or supply of goods or services or for administrative purposes, is specifically excluded from being treated as investment property and is subject to the provisions of IAS 16 and IFRS 16. Owner-occupied property includes (among other things):

- Property that is going to be owner-occupied in the future (whether or not it has first to be developed)
- Property occupied by employees (whether or not they pay rent at market rates)
- Owner-occupied property awaiting disposal [IAS 40.9]

Note that the treatment in the consolidated financial statements can be different from the treatment in standalone financial statements of individual group entities. For example, it may be the case that a property owned by one group company is held for occupation by another group company. This will be owner-occupied from the perspective of the group as a whole but can be classified as an investment property in the financial statements of the individual entity that owns it, provided it meets the definition of an investment property. [IAS 40.15]. This classification in the individual entity's financial statements will apply even if the rental is not at arm's length and the individual entity is not in a position to benefit from capital appreciation. [IAS 40.B23, IAS 40.B24].

How we see it

A property, that meets the investment property definition (see section 2 above), which is owned by a group but occupied by an associate or a joint venture would be accounted for as investment property in the consolidated financial statements. This is because associates and joint ventures are not part of the group.

2.5 Investment property under construction

Property that is being constructed or developed for future use as investment property ('investment property under construction') is in the scope of IAS 40. [IAS 40.8].

The fair value of investment property under construction is further discussed in section 6.3 below.

2.6 Property held or under construction for sale in the ordinary course of business

Property held, or being constructed, with the intention of sale in the ordinary course of business is not an investment property. This includes, for example, property acquired exclusively for sale in the near future or for development and resale (such property is accounted for as inventory under IAS 2 (see Chapter 23)). [IAS 40.9].

The Board rejected proposals of commentators to the Exposure Draft of IAS 40 to treat property held for sale in the ordinary course of business as investment property, rather than as inventories (covered by IAS 2). The arguments of these commentators, were that:

- “(a) it is difficult to distinguish property held for sale in the ordinary course of business from property held for capital appreciation; and
- “(b) it is illogical to require a fair value model for land and buildings held for long-term capital appreciation (investment property) when a cost model is still used for land and buildings held for short-term sale in the ordinary course of business (inventories).” [IAS 40.B32].

The Board rejected this suggestion because:

- “(a) if fair value accounting is used for property held for sale in the ordinary course of business, this would raise wider questions about inventory accounting that go beyond the scope of this project; and
- “(b) it is arguably more important to use fair value accounting for property that may have been acquired over a long period and held for several years (investment property) than for property that was acquired over a shorter period and held for a relatively short time (inventories). With the passage of time, cost-based measurements become increasingly irrelevant. Also, an aggregation of costs incurred over a long period is of questionable relevance.” [IAS 40.B33].

It was the Board’s clear intention that property held for short-term sale is covered only by IAS 2 and therefore be treated as inventories. This is also irrespective of whether the property is let out or not, as discussed in section 2.3 above.

How we see it

While the Board did not quantify ‘short-term’, it seems reasonable to define this period based on an entity’s operating cycle. That is, as long as an asset is a current asset in terms of paragraph 66 of IAS 1 *Presentation of Financial Statements*⁵ (see Chapter 3), an entity could conclude that the asset is held for a short term.

An entity, whose principal business activity is to buy and sell property for short-term gains, may, in some circumstances, buy property (or reclassify existing property following a change in use - see section 9 below) with the intention of holding it for long-term capital appreciation. Investment property is defined as property held to earn rentals or for capital appreciation or both, rather than for sale in the ordinary course of business (see section 2 above). [IAS 40.5]. The fact that the entity’s principal business activity is the buying and selling of property for short-term gains does not, under this definition, prohibit it from classifying properties that are held for long-term capital appreciation as investment properties.

In practice, the classification between investment property and property intended for sale in the ordinary course of business can be a difficult judgement. There is only a fine line between:

- A property held for capital appreciation, and therefore classified as investment property
- And
- A property intended for sale in the ordinary course of business, which would be classified as inventory

For example, the owner will undertake activities to increase the property’s value prior to sale or where there is uncertainty in obtaining permits required from relevant authorities prior to commencing construction activities. In the latter case, the property, e.g., land, may continue to appreciate in value during the period when there are no development activities - see section 3.1 below.

Another example is where an entity acquires a tenanted property with a view to redevelop the property and to resell it in the future, but active development will only commence after the existing lease reaches the end of its term, i.e., the entity receives rent payments during the intervening period. As set out in section 2.3 above, the receipt of rental income from a property would not necessarily be the deciding factor. Certainly, other than for land (see section 2.2 above), IAS 40 provides no explicit ‘default’ classification when the future use of a property has not yet been determined (see also discussion in section 2 above).

⁵ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted), was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

How we see it

While the IASB envisioned different treatments for short-term and long-term holdings of property, sometimes significant judgement is involved in determining whether a property qualifies as investment property or is inventory, not least because the intentions of management are a critical factor. Exercise of judgement is also important because whilst IAS 40.57 requires property held as inventory to be reclassified as investment property when, and only when, there is evidence of a change in use such as the inception of an operating lease to another party, in contrast, a reclassification from investment property to inventories would require a different evidence of a change in use such as the commencement of a development with a view to sale (see sections 8, 9 and 9.1 below).

Accordingly, an entity develops criteria so that it can exercise that judgement consistently in accordance with the definition of investment property and the related guidance in IAS 40. Such criteria are required to be disclosed when classification is difficult (see section 12.1 below). [IAS 40.14].

2.7 Property with dual uses

A property may be used partly to derive rental income and partly as owner-occupied property. For example, an office tower could be sub-divided by the owner with some floors being rented to tenants whilst retaining others for own use. Similarly with industrial/commercial property, an owner could sub-divide and subsequently sell or rent out some portions and retain other portions for own use.

IAS 40 states that if a property has both investment property and non-investment property uses, providing the parts of the property could be sold or leased out under a finance lease separately, they are accounted for separately. [IAS 40.10].

How we see it

To meet the above requirements, we consider that a property must actually be in a state and condition to enable the owner to dispose of it or lease it out separately at the end of the reporting period.

The fact that a property could be divided in future periods if the owner so chose is insufficient to conclude that the portions can be accounted for separately. Consequently, if a property requires sub-division before the portions could be disposed of separately, then those parts are not accounted for as separate portions and the entire property must be accounted for as either an investment property or as a non-investment property (e.g., as an owner-occupied property or as an inventory property) until such sub-division occurs or unless sub-division is a non-substantive legal requirement.

In certain instances, portions of a property are leased out under operating leases rather than under finance leases.

How we see it

In our view, an intention to lease out, or the action of leasing out a portion of a property under an operating lease (rather than a finance lease) is *prima facie* evidence that, if it so wished, the entity could also lease out the property under a finance lease - the difference between the two commonly being just the length of the lease. Accordingly, this does not prohibit the application of IAS 40 to that portion. If, however, there is evidence that the portion of the property could not be leased out under a finance lease, then IAS 40 could not be applied to that portion and further assessment of the facts and circumstances may be needed.

It also seems clear that 'separately' needs to be assessed both in terms of the physical separation (e.g., mezzanine floors and partitioning walls) of the property and to legal separation (e.g., legally defined property boundaries and/or registered separately).

In many jurisdictions, properties that are physically sub-divided into different portions (for example, different floors) are registered in a Land or Property registry as one single property and need to be legally sub-divided before a portion can be leased out to another party or disposed of. Often, these legal proceedings are undertaken only at or near the point of sale of, or the assignment of a lease on, that portion of the property concerned. At the end of the reporting period the legal sub-division might not have occurred.

How we see it

For a property that is already physically sub-divided into different portions, we believe that judgement is required to determine whether the legal separation is a substantive requirement that will restrict the portion of the property concerned being currently separable or whether it is a non-substantive requirement where it is currently separable.

For example:

- If the entity owning the property could not be prevented from legally sub-dividing the property, then it is already in a condition to be sold separately and this would not prevent the portion of the property concerned being accounted for as investment property. This would be the case where, for example: the process of sub-dividing the property was entirely within the control of the entity and did not require permission from a third party (which would include the relevant authorities); or if permission from a third party was required, but this was no more than a formality.
- Conversely, if the entity was required to obtain the permission of third parties before legally sub-dividing the property, and such permission could realistically be withheld, the portions of the property concerned are not accounted for separately until such legal sub-division occurs.

Therefore, if the portion of the property concerned otherwise meets the definition of investment property at the end of the reporting period, judgement is required to assess the legal position of the property in determining whether it is appropriate to account for a portion separately under IAS 40. Criteria used in the assessment are required to be disclosed and applied consistently (see section 12.1 below). [IAS 40.14].

In the event that no separation is possible (i.e., portions could not be sold or leased out separately under a finance lease), the property is an investment property only if an insignificant portion is used for non-investment property purposes. [IAS 40.10]. IAS 40 does not provide further guidance to clarify what constitutes an 'insignificant portion' for this purpose. The Board concluded that quantitative guidance would create arbitrary distinctions. [IAS 40.B39].

How we see it

If the portions could not be sold or leased out separately under a finance lease, classification and accounting of the entire property depends on the significance of the portions used for non-investment property purposes; but IAS 40 does not provide further guidance on this. Therefore, the setting of a threshold to evaluate whether or not something is 'significant' or 'insignificant' depends on judgement and circumstances. Significant judgement and criteria used in the assessment are required to be disclosed and applied consistently (see section 12.1 below).

In the Practical example 2-1 below, PSP Swiss Property Ltd discloses its judgement about dealing with property that it partially uses, but other entities will need to make their own assessment.

Practical example 2-1: PSP Swiss Property Ltd (2023)

Switzerland

Annual report 2023 [extract]

Consolidated financial statements [extract]

Notes to the consolidated financial statements [extract]

2 Summary of significant accounting policies [extract]

2.6 Accounting and valuation principles [extract]

Own-used properties

Own-used properties are carried at historical cost and depreciated over their useful economic life, broken down into significant components. The depreciation period (straight-line method) is 40 years for buildings and 20 years for operating equipment (such as air conditioning, elevators, ventilation, etc.). Associated land is not depreciated. In the case of partial own-use of a property, an area share of less than 25% is considered insignificant, with the result that the entire property is reported in the balance sheet as an investment property at fair value.

2.8 Property with the provision of ancillary services

If the owner supplies ancillary services to the user of the investment property, the property will not qualify as an investment property unless these services are an insignificant component of the arrangement as a whole. For example, security and maintenance services provided by the owner of an office building to the lessees who occupy that building are described by the standard as being insignificant. [IAS 40.11].

The crucial issue is the extent to which the owner is involved with the underlying business and retains significant exposure to the risks of running a business. IAS 40 does not provide further guidance on when ancillary services are 'significant' (which would result in exclusion of the property from its scope). The Board concluded that quantitative guidance would create arbitrary distinctions. [IAS 40.B39].

The standard, however, uses the example of a hotel. An owner-managed hotel, for example, would be precluded from being an investment property as the services provided to guests are a significant component of the commercial arrangement as a whole. Therefore, an owner-managed hotel is owner-occupied property, rather than investment property. [IAS 40.12].

It may be difficult to determine whether ancillary services are so significant that a property does not qualify as investment property. For example, the owner of a hotel sometimes transfers some responsibilities to third parties under a management contract and the terms of such contracts may vary widely. However, the nature of the asset in question is not the key factor; rather it is the nature of the owner's involvement and interest in the asset. If the owner's position is, in substance, that of a passive investor, a property would be treated as investment property. If, in contrast, the owner has outsourced day-to-day functions while retaining significant exposure to variation in the cash flows generated by the operations that are being executed in the property, such a property would rather be treated as owner-occupied property. [IAS 40.13].

How we see it

IAS 40 refers to owner-managed hotels as being precluded from being investment property. Hotel properties that are leased on arm's length terms to hotel operators may, however, fall to be accounted for as investment property. This is more likely to be the case when:

- The payments under the lease are not significantly determined by the results of the hotel operator (see section 2.9 below), rather they reflect the general market for such properties
- And
- The nature of the owner's rights in the arrangements with the operator is not divergent from those usually expected under a property lease

IAS 40 acknowledges that this question of significance can require judgements to be made. It specifies that an entity develops consistent criteria for use in such instances that reflect the provisions described above. These criteria must be disclosed in those cases where classification is difficult. [IAS 40.14].

2.9 Property where rentals are determined by reference to the operations in the property

It may also be inappropriate to consider a property as investment property if the owner is significantly exposed to the operation of the business in the property through a linkage between the rentals charged and the performance of the business.

For a property that is leased out to a retailer under a lease contract in which rentals are being determined by reference to turnover or profit, the appropriate classification of the property can be difficult.

How we see it

In the case described above, if the turnover- or profit-related element is a very significant proportion of total rental, then consideration must be given to whether the landlord is so involved with the underlying business as to make classification of the property as investment property inappropriate. This will be a matter of judgement based on any other specific facts and circumstances (for example, the length of the lease, the level of exposure to the performance of the underlying business or the degree of involvement in the management of the underlying business).

An entity develops criteria so that it can exercise that judgement consistently in accordance with the definition of investment property and the related guidance in IAS 40. Such criteria are required to be disclosed when classification is difficult (see section 12.1 below). [IAS 40.14].

2.10 Group of assets leased out under a single operating lease

It is sometimes the case in practice that a group of assets comprising land, buildings and 'other assets' is leased out by a lessor under a single lease contract in order to earn rental income. In such a case, the 'other assets' would generally comprise assets that relate to the manner in which the land and buildings are used under the lease. The issue that arises is under what circumstances the 'other assets' must be regarded by the lessor as part of an investment property rather than as a separate item of property, plant and equipment (or another asset). This is shown in the following illustration:

Illustration 2-1: Definition of an investment property: a group of assets leased out under a single operating lease

A lessor enters into the following two single contract leases in order to earn rental income. All the individual assets subject to the leases meet the test of being classified as an operating lease. The lessor applies the fair value measurement model for subsequent measurement of investment property.

Lease 1: Vineyard and winery

A vineyard including a winery is leased out under an operating lease. The vineyard comprises the following assets:

- Land
- Vineyard infrastructure (e.g., trellises)
- Winery building structures
- Winery plant and machinery (crushing equipment, distilling equipment)
- Vines (grapes are excluded, as they belong to the lessee)

Lease 2: Port

A port is leased out under an operating lease. The port comprises the following assets:

- Land
- Warehouses
- Transport infrastructure to and from the port (roads, rail tracks, bridges)
- Wharves
- Light towers (that enable the 24-hour operation of the port)
- Specialised container cranes (to be able to move containers around)

To what extent can the 'other assets' included in the leases (but which are not considered to constitute a piece of land or a building) be included in the investment property definition under IAS 40?

The consequence of including plant and equipment in the definition of investment property is that if the investment property is accounted for at fair value, changes in the fair value of that plant and equipment will, like changes in the fair value of the land and buildings, be recognised in profit or loss.

From a literal reading of the definition of an investment property in IAS 40.5, it could be argued that an investment property can consist only of a building (or part of a building), a piece of land, or both and cannot include 'other assets'. However, such an interpretation is inconsistent with IAS 40.50, which implies that a broader interpretation is more appropriate.

Paragraphs 50(a) and (b) of IAS 40 read as follows: [IAS 40.50(a), IAS 40.50(b)]

Extract from IAS 40

- | | |
|----|--|
| 50 | <p>In determining the carrying amount of investment property under the fair value model, an entity does not double-count assets or liabilities that are recognised as separate assets or liabilities. For example:</p> <p>(a) equipment such as lifts or air-conditioning is often an integral part of a building and is generally included in the fair value of the investment property, rather than recognised separately as property, plant and equipment.</p> <p>(b) if an office is leased on a furnished basis, the fair value of the office generally includes the fair value of the furniture, because the rental income relates to the furnished office. When furniture is included in the fair value of investment property, an entity does not recognise that furniture as a separate asset.</p> <p>(c) ...</p> |
|----|--|

Although IAS 40.50 addresses the fair valuation of investment property, it nevertheless implies that other assets that are integral to the land and buildings or are otherwise required to be included in the lease in order to generate rental income under the lease concerned must also be regarded as being part of the investment property. Further, the separation of this group of assets in two parts - one part being classified as investment property and the other part being classified as an item of property, plant and equipment - might be misleading, as the entire group of assets generates a single stream of revenue.

Consequently, an item other than a piece of land or a building must be regarded by a lessor as being part of an investment property if this item is an integral part of it, that is, it is necessary for the land and buildings to be used by a lessee in the manner intended and is leased to the lessee on the same basis (e.g., as a package with the same lease term) as the land and buildings. In determining whether all the assets can be classified as investment property, the following conditions must be considered:

- The land and buildings must be the 'dominant assets' that form the investment property.
- The 'other assets' are leased to the lessee together with the land and building as a whole.

And

- The entire group of assets is generating the income stream from the lease contract.

How we see it

The determination as to whether or not an item constitutes an integral part of an investment property requires judgement and will depend on the particular facts and circumstances. However, it is our view that in order for all the assets to be classified as investment property, all the conditions referred to above must be present.

This means that, in the case of Lease 1, if the entire group of assets is leased with the purpose of enabling the lessee to produce grapes and, subsequently, wine, the investment property comprises the land, the vineyard infrastructure, the winery building structures and the winery plant and machinery. The vineyard infrastructure (e.g., trellises as they are essential to support the vines) is integral to the investment property, as it is necessary in order for the property to function properly (it is necessary for growing the grapes). The winery plant and machinery (crushing equipment, distilling equipment) are also integral to the investment property, as plant and machinery are necessary to process the grapes in order to make wine. Vines, which meet the definition of biological assets, are subject to the requirements of IAS 41. They are excluded because 'biological assets related to agricultural activity' are outside the scope of IAS 40. [IAS 40.4(a)].

In the case of Lease 2, if the entire group of assets is leased with the purpose of enabling the lessee to use the assets to operate them as a port, the investment property comprises all of the assets, i.e., the land, the warehouses, the transport infrastructure, the wharves, the light towers, and the specialised container cranes. This is because all the assets are necessary for the port to function as intended.

2.11 Property acquired with the assistance of government grants

IAS 40 applies to a property acquired and let for social housing if it meets the definition of investment property (see section 2 above). Grants associated with investment property are accounted for in accordance with IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* (see Chapter 25). The model used to measure the investment property may impact the recognition of these grants as shown in Chapter 25.

3 Recognition

IAS 40 sets out the following recognition criteria for investment property: [IAS 40.16]

Extract from IAS 40

- 16** An owned investment property shall be recognised as an asset when, and only when:
- (a) it is probable that the future economic benefits that are associated with the investment property will flow to the entity; and
 - (b) the cost of the investment property can be measured reliably.

These recognition criteria apply for any costs incurred, whether initially or subsequently. This means that all costs related to investment property, whether on initial recognition or thereafter (for example, to add to, or replace part of, or service a property) must meet the recognition criteria at the point at which the expenditure is incurred if they are to be capitalised. [IAS 40.17].

An investment property held by a lessee as a right-of-use asset is recognised in accordance with IFRS 16. [IAS 40.19A].

3.1 Expenditure prior to planning permissions/zoning consents

In many jurisdictions, permissions from relevant authorities are required prior to development of new or existing property, and the ability to start physical construction of the development depends on these permissions.

Application for such permissions supports the entity's intention as to the use of the property and may be considered as a factor in classifying the asset. However, unless an entity is considering a number of possible uses of the asset at its initial recognition, the uncertainty in obtaining the relevant permission would usually not affect the classification of the property which, as set out in section 2 above, is mainly based on the entity's intention when the property is first acquired. Subsequent to initial recognition, assets might be reclassified into and from investment property (see section 9 below).

The likelihood of obtaining such permissions, however, is relevant in recognition and measurement of any additional costs to the property. Developers typically incur significant costs prior to such permissions being granted and such permissions are rarely guaranteed.

How we see it

In assessing whether pre-permission expenditure can be capitalised - assuming it otherwise meets the criteria - a judgement must be made, at the date the expenditure is incurred, of whether there is sufficient probability that the relevant permissions will be granted.

Conversely, if during the application and approval process of such permits it is no longer expected that necessary permits will be granted, capitalisation of pre-permission expenditure must cease and any related amounts that were previously capitalised and that will not be recovered in the future would be written off (either through determining the subsequent fair value of the property, if applying the fair value model in IAS 40 (see section 6 below), or through impairment assessment in accordance with IAS 36 *Impairment of Assets*, if the cost model is applied (see section 7.3 below)).

In addition to the discussion above, if the cost model is used, the carrying amount of any related property subject to development or redevelopment (or, if appropriate, the cash generating unit where such an asset belongs) must be tested for impairment, where applicable, in accordance with IAS 36 (see Chapter 21).

3.2 Other aspects of cost recognition

3.2.1 Repairs and maintenance

Day-to-day servicing, by which is meant the repairs and maintenance of the property which largely comprises labour costs, consumables and minor parts, are recognised in profit or loss as incurred. [IAS 40.18]. However, the treatment is different if large parts of the properties have been replaced - the standard cites the example of interior walls that are replacements of the original walls. In this case, the cost of replacing the original part will be recognised at the time that cost is incurred if the recognition criteria are met, while the carrying amount of the original part is derecognised (see section 10.3 below). [IAS 40.19].

The inference is that by restoring the asset to its originally assessed standard of performance, the new part will meet the recognition criteria and future economic benefits will flow to the entity once the old part is replaced. The inference is also that replacement is needed for the total asset to be operative. This being the case, the new walls will therefore meet the recognition criteria and the cost will therefore be capitalised.

Other than interior walls, large parts that might have to be replaced include elements such as lifts, escalators and air conditioning equipment.

3.2.2 Allocation into parts

IAS 40 does not explicitly require an analysis of investment properties into components or parts. However, this analysis is needed for the purposes of recognition and derecognition of all expenditure after the asset has initially been recognised and (if the parts are significant) for depreciation of those parts (see Chapter 19). Some of this is not relevant to property held under the fair value model that is not depreciated because the standard expects the necessary adjustments to the carrying amount of the asset as a whole to be made via the fair value mechanism (see section 6 below). However, entities that apply the cost model are obliged to account for properties after initial recognition in accordance with the requirements of IAS 16. The cost model is discussed further in section 7 below.

3.3 Acquisition of investment property or a business combination?

In July 2011, the IFRS IC discussed a request seeking clarification on whether the acquisition of a single investment property, with lease agreements with multiple tenants over varying periods and associated processes, such as cleaning, maintenance and administrative services such as rent collection, constitutes a business as defined in IFRS 3 *Business Combinations*.

The IFRS IC noted that the issue raises the question of whether there is any interaction between IAS 40 and IFRS 3. It discussed services that are ‘ancillary services’ (as discussed in IAS 40.11 to 14 - see section 2.8 above) that are not so significant as to disqualify a property from being an investment property but could nonetheless be considered ‘processes’ (as discussed in IFRS 3.B7 to B12) that could result in the acquired set of activities constituting a business.⁶

IAS 40 notes, in relation to the need to distinguish investment property from owner-occupied property, that where certain ancillary processes exist in connection with an investment property, they are often insignificant to the overall arrangement (see section 2.8 above). Consequently, it may be appropriate to conclude that, where such acquired processes are considered by IAS 40 to be insignificant, an investment property acquisition is within the scope of IAS 40 rather than IFRS 3. However, it should be noted that IAS 40 and IFRS 3 are not mutually exclusive and this determination is not the specific purpose of the standard’s observation about ancillary services. [IAS 40.BC19, IAS 40.BC20].

Consequently, the IASB issued the *Annual Improvements to IFRSs 2011-2013 Cycle* on 12 December 2013 which amended IAS 40 to state explicitly that the judgement required to determine whether the acquisition of investment property is the acquisition of an asset or a group of assets - or a business combination within the scope of IFRS 3 - should only be made with reference to IFRS 3. [IAS 40.14A].

This clarified that the discussion about ‘ancillary services’ in IAS 40.7 to 14 (see section 2.8 above) relates to whether or not a property is owner-occupied property or investment property and not to determining whether or not a property is a business as defined in IFRS 3. Determining whether a specific transaction meets the definition of a business combination as defined in IFRS 3 and includes an investment property as defined in IAS 40 requires the separate application of both standards. [IAS 40.14A].

IFRS 3 establishes different accounting requirements for a business combination as opposed to the acquisition of an asset or a group of assets that does not constitute a business (see section 4.1.1 below). Therefore, determining whether an acquired investment property is a business or not, could result in significantly different accounting outcomes, both at the date of acquisition (i.e., at initial recognition) and subsequently. If dealt with as an acquisition of a business, then the initial accounting for investment property is considerably more complex. For example, amongst other requirements:

- Initial direct costs are expensed (IAS 40 requires these to be capitalised - see section 4.1 below)
- The initial recognition exception for deferred taxation does not apply (IAS 12 *Income Taxes* does not allow deferred taxation to be provided on existing temporary differences for acquisitions that are not business combinations and at the time of the transaction, affect neither accounting profit nor taxable profit (tax loss))
- Goodwill is recognised (often itself ‘created’ by the provision of deferred taxation)

⁶ [IFRIC Update](#), July 2011, available on the IFRS Foundation’s website.

Judging whether an acquisition is a business combination or not is therefore of considerable importance. [IAS 40.14A].

How we see it

It will be a matter of judgement for preparers to conclude that, when applying the guidance in IFRS 3, if acquired processes are considered to be insignificant (whether by reference to guidance in IAS 40 or otherwise) an investment property acquisition is within the scope of IAS 40 rather than IFRS 3. This judgement will rest upon the facts and circumstances of each acquisition. If significant, disclosure of this judgement would be required by IAS 1.

The definition of a business (see section 3.3.1 below) is applied regardless of whether the entity purchases a property directly or, in the case of consolidated financial statements, via the shares in another entity.

See also discussion in Chapter 41 for forward contracts to purchase an entity that owns a single asset such as investment property which does not constitute a business.

3.3.1 Definition of a business

IFRS 3 defines a business as “An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities”. [IFRS 3 Appendix A].

The IASB recognises the difficulties in determining whether an acquisition of an integrated set of activities and assets meets the definition of a business - which are not just limited to acquisition of an investment property or a group of properties. Accordingly, IFRS 3 sets out an optional fair value concentration test (the ‘concentration test’) designed to simplify the evaluation of whether an acquired integrated set of activities and assets is not a business. Entities may elect whether or not to apply the concentration test on a transaction-by-transaction basis. [IFRS 3.B7A].

If the concentration test is met, the set of activities and assets is determined not to be a business and no further assessment is needed. If the concentration test is not met, or if an entity elects not to apply the concentration test, a detailed assessment must be performed applying the normal requirements in IFRS 3. As such, the concentration test never determines that a transaction is a business combination. [IFRS 3.B7A, IFRS 3.BC21Y].

IFRS 3 also provides a series of illustrative examples to assist in applying the guidance in IFRS 3 on the definition of business. These illustrative examples accompany the standard and address, among other things, the application of the optional concentration test and the assessment whether an acquired process is substantive. The concentration test and assessment of whether an acquired process is substantive are discussed in detail in Chapter 10.

One of the illustrative examples demonstrates the application of optional concentration test in the acquisition of real estate. It describes an entity that purchases a portfolio of 10 single-family homes that each have an in-place lease. The fair value of the consideration paid is equal to the aggregate fair value of the 10 single-family homes acquired. Each single-family home includes the land, building and property improvements. Each home has a different floor area and interior design. The 10 single-family homes are located in the same area and the classes of customers (e.g., tenants) are similar. The risks associated with operating in the real estate market of the homes acquired are not significantly different. No employees, other assets, processes or other activities are transferred. [IFRS 3.IE74].

After electing and applying the optional concentration test (see Chapter 10), the entity concludes that each single-family home is considered a single identifiable asset because the building and property improvements are attached to the land and cannot be removed without incurring significant cost. Also, the building and the in-place lease are considered a single identifiable asset because they would be recognised and measured as a single identifiable asset in a business combination. The entity also concludes that the group of 10 single-family homes is a group of similar identifiable assets because the assets (all single-family homes) are similar in nature and the risks associated with managing and creating outputs are not significantly different. This is because the types of homes and classes of customers are not significantly different.

Consequently, substantially all of the fair value of the gross assets acquired is concentrated in a group of similar identifiable assets. [IFRS 3.IE75]. Therefore, the entity concludes that the acquired set of activities and assets is not a business. [IFRS 3.IE76].

A second example assumes the same facts described above except that the entity also purchases a multi-tenant corporate office park with six 10-storey office buildings that are fully leased. The additional set of activities and assets acquired includes the land, buildings, leases and contracts for outsourced cleaning, security and maintenance. No employees, other assets, other processes or other activities are transferred. The aggregate fair value associated with the office park is similar to the aggregate fair value associated with the 10 single-family homes. The processes performed through the contracts for outsourced cleaning and security are ancillary or minor within the context of all the processes required to create outputs. [IFRS 3.IE77].

After electing and applying the optional concentration test, the entity concludes that the single-family homes and the office park are not similar identifiable assets because they differ significantly in the risks associated with operating the assets, obtaining tenants and managing tenants. In particular, the scale of operations and risks associated with the two classes of customers are significantly different. Consequently, the fair value of the gross assets acquired is not substantially all concentrated in a group of similar identifiable assets, because the fair value of the office park is similar to the aggregate fair value of the 10 single-family homes. In this case, the entity must perform a detailed assessment applying the normal requirements in IFRS 3.B8 to B12D and assess whether the acquired set of activities and assets meets the minimum requirements to be considered a business. [IFRS 3.IE78].

See Chapter 10 for the detailed guidance in determining whether an acquisition of an integrated set of activities and assets meets the definition of a business combination.

4 Initial measurement

4.1 Attributable costs

IAS 40 requires an owned investment property to be measured initially at cost, which includes transaction costs. [IAS 40.20]. If a property is purchased, cost means purchase price and any directly attributable expenditure such as professional fees, property transfer taxes and other transaction costs. [IAS 40.21].

How we see it

For investment property under construction (see section 2.5 above), although there is no specific reference to IAS 16, we consider that the principles in IAS 16 must still be applied to the recognition of costs in IAS 40. This means that only those elements of cost that were allowed by IAS 16 could be capitalised and that capitalisation ceases when the asset has reached the condition necessary for it to be capable of operating in the manner intended by management.

The recognition principles in IAS 16 referred to above, are set out in detail in Chapter 19.

For investment property held by a lessee as a right-of-use asset, see section 4.5 below.

4.1.1 Acquisition of a group of assets that does not constitute a business ('the group')

The purchase price of an investment property may result from an allocation of the price paid for a group of assets. If an entity acquires a group of assets that does not comprise a business, the principles in IFRS 3 are applied to allocate the entire cost to individual items (see Chapter 10). In such cases the acquirer must identify and recognise the individual identifiable assets acquired and liabilities assumed and allocate the cost of the group to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase. Such a transaction or event does not give rise to goodwill. [IFRS 3.2(b)].

In June 2017, the IFRS IC considered a request for clarification on how to allocate the transaction price to the identifiable assets acquired and liabilities assumed when:

- (a) The sum of individual fair values of the identifiable assets and liabilities is different from the transaction price
And
- (b) The group includes identifiable assets and liabilities initially measured both at cost and at an amount other than cost

The IFRS IC noted the requirement of IFRS 3.2(b) as described above and also noted that other IFRS accounting standards include initial measurement requirements for particular assets and liabilities, including IAS 40 for investment property. It observed that if an entity initially considers that there might be a difference as described in (a) above, the entity first reviews the procedures it has used to determine those individual fair values to assess whether such a difference truly exists before allocating the transaction price.

The IFRS IC considered two possible ways of accounting for the acquisition of the group of assets. These two approaches are discussed in detail in Chapter 10.

Under the first approach an entity:

- Identifies the individual identifiable assets acquired and liabilities assumed that it recognises at the date of the acquisition
- Determines the individual transaction price for each identifiable asset and liability by allocating the cost of the group based on the relative fair values of those assets and liabilities at the date of the acquisition
And then
- Applies the initial measurement requirements in applicable standards to each identifiable asset acquired and liability assumed. The entity accounts for any difference between the amount at which the asset or liability is initially measured and its individual transaction price applying the relevant requirements.

Applying the second approach, for any identifiable asset or liability initially measured at an amount other than cost, an entity initially measures that asset or liability at the amount specified by the applicable standard. The entity deducts from the transaction price of the group the amounts allocated to the assets and liabilities initially measured at an amount other than cost, and then allocates the residual transaction price to the remaining identifiable assets and liabilities based on their relative fair values at the date of acquisition.⁷

⁷ [IFRIC Update](#), June 2017, available on the IFRS Foundation's website.

In November 2017, the IFRS IC concluded that a reasonable reading of the requirements in IFRS 3.2(b) on the acquisition of the group results in one of the two approaches outlined above (i.e., a policy choice) and that an entity would apply its reading of the requirements consistently to all acquisitions of a group of assets that does not constitute a business. An entity would also disclose the selected approach applying IAS 1.117 to 124 if that disclosure would assist users of financial statements in understanding how those transactions are reflected in reported financial performance and financial position.

In the light of its analysis, the IFRS IC decided not to add this matter to its standard-setting agenda. However, the IFRS IC observed that the amendment to the definition of a business in IFRS 3 (see section 3.3.1 above) is likely to increase the population of transactions that constitute the acquisition of a group of assets so this matter will be monitored.⁸

4.1.2 Deferred taxes when acquiring a 'single asset' entity that is not a business

In many jurisdictions, it is usual for investment property to be bought and sold by transferring ownership of a separate legal entity formed to hold the asset (a 'single asset' entity) rather than the asset itself.

When an entity acquires all of the shares of another entity that has an investment property as its only asset (i.e., the acquisition of a 'single asset' entity that is not a business) and the acquiree had recognised in its statement of financial position a deferred tax liability arising from measuring the investment property at fair value as allowed by IAS 40, a specific issue arises as to whether or not the acquiring entity must recognise a deferred tax liability on initial recognition of the transaction.

This specific situation was considered by the IFRS IC and, in March 2017, it was concluded that the initial recognition exception in IAS 12.15(b) applies because the transaction is not a business combination.

Accordingly, on acquisition, the acquiring entity recognises only the investment property and not a deferred tax liability in its consolidated financial statements. The acquiring entity therefore allocates the entire purchase price to the investment property.⁹

For an example and further discussions on the application of the initial recognition exception to assets acquired in the circumstances described above, see Chapter 29.

4.2 Start-up costs and self-built property

IAS 40 specifies that start-up costs (unless necessary to bring the property into working condition) and operating losses incurred before the investment property achieves the planned occupancy level, are not to be capitalised. [IAS 40.23(a), IAS 40.23(b)].

IAS 40 therefore prohibits a practice of capitalising costs until a particular level of occupation or rental income is achieved because at the date of physical completion the asset would be capable of operating in the manner intended by management. This forestalls an argument, sometimes advanced in the past, that the asset being constructed was not simply the physical structure of the building but a fully tenanted investment property, and its cost correspondingly included not simply the construction period but also the letting period. If a property is self-built by an entity, the same general principles apply as for an acquired property (see section 4.1 above). However, IAS 40 prohibits capitalisation of abnormal amounts of wasted material, labour or other resources incurred in constructing or developing the property. [IAS 40.23(c)].

4.2.1 Cost of a building to be demolished in connection with the construction of a new building

It is not uncommon for property companies to acquire land with an existing building where the planned redevelopment requires the demolition of that building and its replacement with a new building that is to be held as investment property. Whether the acquired land and building will be accounted for as a single asset or two separate assets will depend on the subsequent accounting model applied by the entity.

If the entity measures the investment property under the fair value model (see section 6 below), the entity classifies the land and building on initial recognition as one item of investment property under IAS 40 and measures the investment property based on its cost (see section 4.1 above). [IAS 40.20]. Subsequently, the land and building are measured as one item at fair value at each reporting date (see section 6 below). [IAS 40.33]. If the entity measures the investment property under the cost model (see section 7 below), it will account for the land and building separately and measures the land and building based on cost, allocated to each of land and building on a relative fair value basis at the date of purchase (see Chapter 19). [IFRS 3.2(b), IAS 16.58].

⁸ [IFRIC Update](#), November 2017, available on the IFRS Foundation's website.

⁹ [IFRIC Update](#), March 2017, available on the IFRS Foundation's website.

How we see it

If an entity that measures investment property under the cost model acquires land with an existing building and, depending on the facts and circumstances, the existing building is unusable or likely to be demolished by any party acquiring it, then it would be appropriate, in our view, to allocate the entire or a large part of the purchase price to the land acquired. This is because the fair value of the existing building, if accounted for separately, will likely be minimal or the fair value of the combined investment properties, comprising both land and building, may be close to that of the land. Similarly, subsequent demolition costs are treated as being attributable to the cost of the land as part of site preparation costs (see Chapter 19).

Entities holding investment properties may also decide to replace existing buildings with new ones and continue to hold these as investment properties. If an entity uses the cost model to measure its investment properties, the carrying amount of the existing building cannot be rolled into the costs of the new building. This is because IAS 16 requires an asset to be derecognised when no future economic benefits are expected from its use. [IAS 16.67]. At that date, the entity is required to cease depreciation. [IAS 16.55]. Also, consideration will have to be given as to whether the asset is impaired in accordance with IAS 36 (see section 7.3 below and Chapter 19). Furthermore, IAS 16 requires the entity to review the useful life if expectations differ from previous estimates. [IAS 16.51]. The entity is therefore required to reassess the useful life at the date of the decision to demolish at a future point in time. [IAS 16.57]. Application of the new useful life would ensure that the carrying amount over the remaining life of the building is reduced to the expected residual value at the date on which the demolition is expected to take place or when appropriate, to the expected residual value at the date when it is expected to be derecognised (e.g., at the date when tenants moved out of the investment property and it is determined that no future economic benefits are expected from the use of such investment property). Therefore, the existing building must be depreciated over its remaining useful life (the period before it is expected to be demolished or derecognised) to reduce the carrying amount of the asset to its residual value at the point at which it is demolished or derecognised (presumably nil as it is being demolished). The above accounting is consistent with the accounting treatment for a scenario where an entity takes the decision to demolish an existing owner-occupied building, which is accounted for under IAS 16, and replace it with a new building which will be held as investment property measured using the cost model under IAS 40. For further IAS 16 guidance, see relevant discussions in Chapter 19.

In contrast, if an entity that uses the fair value model to measure its investment properties decides to replace an existing building with a new one but will continue to hold it as investment property, then the highest and best use of the land might not match the current use of the land. The value of the land may increase by constructing a different property (for example with more floors or with a different purpose). When determining the fair value of the investment property, the entity takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use (see section 6.8 below). [IFRS 13.27]. Therefore, the existing building and land will be measured as one single asset based on its fair value. As the new building is constructed, the property (land and building) will continue to be measured as one single asset based on fair value from a market participant's perspective.

Entities replacing an existing building with a building for their own use or a building to be sold in the ordinary course of their business will deal with the land and buildings under IAS 16 (see Chapter 19) or IAS 2 (see Chapter 23), respectively.

4.3 Deferred payments

If payment for a property is deferred, the cost to be recognised is the cash price equivalent at the recognition date. Any difference between the cash price and the total payments to be made is recognised as interest expense over the credit period. [IAS 40.24].

How we see it

In practice, 'cash price equivalent' means the present value of the deferred payments due. See also Chapter 19 for further discussion.

4.4 Reclassifications from property, plant and equipment or from inventory

When an entity uses the cost model, transfers between investment property, owner-occupied property and inventories do not change the carrying amount of the property transferred and they do not change the cost of that property for measurement or disclosure purposes. [IAS 40.59].

The treatment of transfers of properties measured using the revaluation option in IAS 16 to investment property is set out in section 9.2 below.

4.5 Initial measurement of property held under a lease

An investment property held by a lessee as a right-of-use asset must be measured initially at its cost in accordance with IFRS 16 (see Chapter 24). [IAS 40.29A]. The treatment of initial direct costs by a lessee applying IFRS 16 is discussed in section 4.9.2 below.

4.6 Initial measurement of assets acquired in exchange transactions

The requirements of IAS 40 for investment properties acquired in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, are the same as those of IAS 16. [IAS 40.27, IAS 40.28, IAS 40.29]. These provisions are discussed in detail in Chapter 19.

4.7 Initial recognition of tenanted investment property subsequently measured using the cost model

During the development of the current IFRS 3, the IASB considered whether it would be appropriate for any favourable or unfavourable lease aspect of an investment property to be recognised separately.

The IASB concluded that this was not necessary for investment property that will be measured at fair value because the fair value of investment property takes into account rental income from leases and therefore the contractual terms of leases and other contracts in place.

However, a different position has been taken for investment property measured using the cost model. In this case the IASB observed that the cost model requires:

- The use of a depreciation or amortisation method that reflects the pattern in which the entity expects to consume the asset's future economic benefits
- And
- Each part of an item of property, plant and equipment that has a cost that is significant in relation to the total cost of the item to be depreciated separately

Therefore, an acquirer of investment property in a business combination that is subsequently measured using the cost model will need to adjust the depreciation method for the investment property to reflect the timing of cash flows attributable to the underlying leases. [IFRS 3.BC148].

How we see it

In a business combination, an investment property is initially measured at fair value. If this investment property comprises favourable or unfavourable leases and is subsequently measured using the cost model, the acquirer will need to adjust the depreciation method for the investment property to reflect the timing of cash flows attributable to the underlying favourable or unfavourable leases. In effect, therefore, this requires that the favourable or unfavourable lease aspect of the investment property - measured with reference to market conditions at the date of the business combination - be separately identified in order that it may be subsequently depreciated or amortised, usually over the remaining lease term. Any such amount is not presented separately in the financial statements. Depreciation of any identified component is recognised as depreciation expense rather than as an adjustment to rental income.

The approach discussed above has also been extended to acquisition of all property, i.e., including those acquired outside a business combination (see section 7.1.2 below).

For more related discussions of key accounting considerations, including general approaches applied in practice, see Chapter 10 and Chapter 19.

4.8 Borrowing costs

IAS 23 *Borrowing Costs* generally mandates capitalisation of borrowing costs in respect of qualifying assets. However, application of IAS 23 to borrowing costs directly attributable to the acquisition, construction or production of qualifying assets that are measured at fair value, such as investment property, is not required because it would not affect the measurement of the investment property in the statement of financial position; it would only affect presentation of interest expense and fair value gains and losses in the income statement. Nevertheless, IAS 23 does not prohibit capitalisation of eligible borrowing costs to such assets as a matter of accounting policy. [IAS 23.4(a)].

To the extent that entities choose to capitalise eligible borrowing costs in respect of investment property measured under the fair value model, the methods allowed by IAS 23 must be followed.

The treatment of borrowing costs is discussed further in Chapter 22.

4.9 Lease incentives and initial direct costs of leasing a property

In negotiating a new or renewed operating lease, the lessor may provide incentives for the lessee to enter into the agreement. The lessor or the lessee (or both) may also incur costs that are directly attributable to negotiating and arranging a lease. However, IAS 40 provides no specific guidance on accounting for lease incentives and initial costs of obtaining a lease.

4.9.1 Lease incentives

Lease incentives are defined as: [IFRS 16 Appendix A]

Extract from IFRS 16

Appendix A Defined terms

lease incentives

Payments made by a **lessor** to a **lessee** associated with a **lease**, or the reimbursement or assumption by a lessor of costs of a lessee.

In practice, examples of such incentives are an up-front cash payment to the lessee or the reimbursement or assumption by the lessor of costs of the lessee (such as relocation costs, leasehold improvements and costs associated with a pre-existing lease commitment of the lessee). Alternatively, initial periods of the lease term may be agreed to be rent-free or at a reduced rent.

Under IFRS 16, lease incentives are deducted from 'lease payments' made by a lessee to a lessor relating to a right-of-use asset during the lease term. [IFRS 16 Appendix A]. Accordingly, for lessees, lease incentives that are received by the lessee at or before the lease commencement date reduce the initial measurement of a lessee's right-of-use asset. [IFRS 16.24(b)]. Lease incentives that are receivable by the lessee at lease commencement date reduce a lessee's lease liability (and therefore the right-of-use asset as well). [IFRS 16.27(a)].

For lessors, lease incentives that are paid or payable to the lessee are also deducted from lease payments. Lease payments under operating leases are recognised by lessors as income on either a straight-line basis or another systematic basis. [IFRS 16.81]. Accordingly, for operating leases, lessors defer any lease incentives paid or payable to the lessee and recognise the resulting accrual as a reduction to lease income over the lease term in order to recognise the lease payments as income at an amount that is net of lease incentives. This means that such accrued rental income will be recovered as part of the cash payments to be received from the lessee over the remaining lease term.

The accounting for lease incentives applied in practice by lessors of investment property measured at fair value is illustrated below.

Illustration 4-1: Lessor accounting for lease incentives under the IAS 40 fair value model

On 1 January 20X0, an investor acquires a property with an acquisition cost of CU80 million, which is assumed to be its fair value at the date of acquisition. On the same day, the investor leases the property under an operating lease to a lessee with a five-year term. The market rent for such a property is assessed to be CU4 million per annum, representing a yield of 5%. The lessor and lessee agree to the following lease payments and conditions:

- Year 1 (20X0): rent free
- Year 2: CU5 million
- Year 3: CU5 million
- Year 4: CU5 million
- Year 5: CU5 million

The rent for years 2 to 5 is paid at the beginning of each year. As the lease incentive (the rent-free period) is an integral component of the lease agreement it is assumed that, in exchange for the rent-free period, the lessee provides a flow of lease rental payments to the lessor in years 2 to 5 that are higher than what they would be if no incentive was provided.

The lessor measures its investment properties at fair value in accordance with IAS 40.33. Assume that the rent-free period is taken into account by the appraiser in arriving at the fair value of the property on the date of acquisition. In the example, the fair value of the investment property as at 31 December 20X0 (end of year 1) and 31 December 20X1 (end of year 2) is assumed to be CU82 million.

There are two acceptable approaches for a lessor of investment property measured at fair value to account for lease incentive (e.g., a rent-free period):

Approach A

The investment property is recorded at fair value (e.g., based on the expected cash flows). On the basis that the property is to be recorded at its fair value, the lease payments according to the operating lease contract are taken into account by the valuer in arriving at the fair value of the property. As the lease incentive is related to the consideration for the use of the asset, it affects the rental income as presented in the income statement. The lessor would record the following journal entries ('JE') in 20X0 and 20X1:

Extracts from the ledgers for the years ended 31 December 20X0 and 20X1

Reconciliation of the carrying amount of the investment property

Net book value	78	79
Plus: tenant lease incentives	<u>4</u>	<u>3</u>
Market value	<u>82</u>	<u>82</u>

Journals:

- (1) Paragraph 20 of IAS 40 requires investment property to be measured initially at its cost (see section 4.1 above), which is CU80 million in the fact pattern.
- (2) Since the fair value model is applied by the lessor, at the balance sheet date the investment property must be measured at fair value in accordance with IFRS 13, which is CU82 million. The change in fair value is recognised in profit and loss. See sections 5 and 6 below for further discussions on subsequent measurement of an investment property under the fair value model.
- (3) In line with IAS 40.40, the fair value of investment property reflects 'other assumptions that market participants would use when pricing investment property under current market conditions' (see section 6.1 below). A market participant, using an income approach to value its investment property, would consider the expected cash flows that the lessee will pay. It will not consider income recognised in prior periods associated with the lease incentive. As such, the expected future cash flows are taken into account in determining the fair value of the investment property.

Appendix A to IFRS 16 notes that lease payments are "Payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term, comprising the following: (a) fixed payments (including in-substance fixed payments), less any lease incentives...". Paragraph 81 of IFRS 16 states that "A lessor shall recognise lease payments from operating leases as income on either a straight-line basis or another systematic basis. The lessor shall apply another systematic basis if that basis is more representative of the pattern in which benefit from the use of the underlying asset is diminished."

Therefore, in order to recognise the lease payments from operating leases (including any deductions related to lease incentives) as income on a straight-line basis, the total rental income over the period of the lease (CU20 million) is apportioned evenly over the five-year period: rental income of CU4 million is recognised each year.
- (4) The cash received of CU5 million for the second year of the lease term is recorded.
- (5) To continue to recognise the rental income in accordance with IFRS 16, an entry is made reducing the rental income to the appropriate amount (i.e., CU4 million in the fact pattern). The offsetting entry is to the gain or loss from change in fair value of the investment property.

Approach B

A separate asset is recorded to straight line the cost of the consideration in the form of the lease incentive (rent-free period) over the term of the lease. To avoid double-counting, the lessor adjusts the carrying amount of the investment property downwards to take into account the fact that the actual return to the lessor will be lower because the lessor has agreed to offer a rent-free period and has recorded this lease incentive separately as an asset:

Extracts from the ledgers for the years ended 31 December 20X0 and 20X1

Net income	-	-	2	-	-	2	5	(1)	1	5

Journals:

(1), (2) and (3) are the same as in Approach A above.

- (4) Paragraph 50 of IAS 40 specifies that in determining the carrying amount of investment property under the fair value model, an entity does not double-count assets or liabilities that are recognised as separate assets or liabilities. For example, the fair value of investment property excludes prepaid or accrued operating lease income, because the entity recognises it as a separate liability or asset (see section 6.6 below). Therefore, a reclassification is made to separate the other asset (i.e., lease incentive) that arises from straight-lining the lease payments from the investment property.
- (5) The cash received of CU5 million for the second year of the lease term is recorded.
- (6) To continue to recognise the rental income in accordance with IFRS 16, the decrease of the carrying amount of the separate asset that arises from straight-lining the lease incentive is recognised as reduction of rental income over the lease term.
- (7) At the end of 20X1 the fair value of the investment property in the fact pattern is CU82 million. The combined carrying amount of the investment property and separately recognised lease incentive asset is CU81 million. Therefore, in order to continue to measure the investment property at fair value in accordance with IAS 40.33 and 50, an increase in the fair value of the investment property of CU1 million is recognised as a gain from fair value adjustments.

How we see it

For an entity using the fair value model to measure its investment property, Approach A and Approach B discussed above, in our view, are both acceptable approaches when accounting for lease incentives provided to lessees and thus, either can be applied as a matter of accounting policy choice. Such policy choice is applied consistently and if considered material to users of the financial statements, disclosure would be required by IAS 1.

Consequently, some lessors present any accrued rental income (i.e., outstanding unamortised deferred lease incentives) as a separate asset, but other lessors present these together with (or as part of) the related investment property - see Illustration 4-1 above. However, lease incentives do not form part of the cost of the investment property (see also section 6.6.1 below for the requirement to adjust the fair value of an investment property to avoid 'double counting' in circumstances where a lease incentive exists and is recognised separately). It is therefore relevant to distinguish between lease incentives and other capital expenditure.

There is no additional guidance in IFRS 16 to assist in the identification of incentives, but a similar requirement existed in previous United Kingdom GAAP (in UITF abstract 28 *Operating lease incentives*) and provides helpful additional detail:

“A payment (or other transfer of value) from a lessor to (or for the benefit of) a lessee should be regarded as a lease incentive when that fairly reflects its substance. A payment to reimburse a lessee for fitting-out costs should be regarded as a lease incentive where the fittings are suitable only for the lessee and accordingly do not add to the value of the property to the lessor. On the other hand, insofar as a reimbursement of expenditure enhances a property generally and causes commensurate benefit to flow to the lessor, it should be treated as reimbursement of expenditure on the property. For example, where the lifts in a building are to be renewed and a lease has only five years to run, a payment made by the lessor may not be an inducement to enter into a lease but payment for an improvement to the lessor’s property.”¹⁰

The distinction between costs that enhance the value of the property, and those that are of value to the tenant, can be seen in Practical example 4-1 below.

Practical example 4-1: The British Land Company PLC (2015)	United Kingdom
Annual Report and Accounts 2015 [extract] Primary statements and notes [extract] NOTES TO THE ACCOUNTS [extract] 1 Basis of preparation, significant accounting policies and accounting judgements [extract] Net rental income [extract]	
<p>Where a lease incentive payment, including surrender premia paid, does not enhance the value of a property, it is amortised on a straight-line basis over the period from the date of lease commencement to the earliest termination date. <i>Upon receipt of a surrender premium</i></p> <p>...</p>	

For further discussions on lease incentives, see Chapter 24.

4.9.2 Initial direct costs of obtaining a lease

Lessors and lessees apply the same definition of initial direct costs.

Under IFRS 16, the requirement on initial direct costs is consistent with the concept of incremental costs of obtaining a contract in IFRS 15 *Revenue from Contracts with Customers* (see Chapter 28). IFRS 16 defines initial direct costs as “Incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained ...”. [IFRS 16 Appendix A]. Examples of such costs are commissions and contingent fees that would not have been incurred if the lease had not been obtained. Accordingly, in addition to excluding allocated costs (e.g., salaries), initial direct costs exclude costs incurred regardless of whether the lease is successfully finalised (e.g., fees for certain legal advice, estate agent fees not contingent upon success). Example 13 of the Illustrative Examples to IFRS 16 also indicates that certain payments made by a lessee to an existing tenant to incentivise that tenant to terminate its lease could also be regarded by the lessee as initial direct costs incurred to obtain a new lease.

Under IFRS 16, lessors are required to add initial direct costs incurred in obtaining an operating lease to the carrying amount of the underlying asset. These initial direct costs are recognised as an expense over the lease term on the same basis as lease income. [IFRS 16.83]. For lessees, IFRS 16 requires initial direct costs to be included in the initial measurement of the right-of-use asset. [IFRS 16.24].

While IAS 40 does not contain specific guidance on the accounting treatment of initial direct costs of arranging leases over a property (e.g., legal and agency fees), due to the requirements of IFRS 16 mentioned above, such costs must be recognised as an expense over the term of the resultant lease. This treatment can also be seen in Practical example 4-2 below.

Accounting Policies [extract]

1.8 Leases [extract]***Accelerate as lessor – operating leases***

Operating lease income is recognised as income on a straight-line basis over the lease term.

Initial direct costs incurred in negotiating and arranging operating leases are added to the carrying amount of the leased asset and recognised as an expense over the lease term on the same basis as the lease income.

Income for leases is disclosed under revenue in profit or loss.

In practice, this means, if the cost model is used, such costs are presented as part of the cost of the investment property, even if they do not strictly form part of it and are then amortised separately over the lease term.

An entity using the fair value model must also initially include these costs as part of the carrying amount of the investment property. However, at the next reporting date such initial costs could be recognised in profit and loss in the reported fair value gain or loss, as they would otherwise exceed the fair value of the related investment property. This is consistent with the treatment of transaction costs incurred on acquisition of a property discussed in section 6.4 below.

Alternatively, for an entity using the fair value model, we also believe that the initial direct costs included in the carrying amount of the investment property could be recognised subsequently as an expense over the lease term on the same basis as the lease income. Accordingly, the amortisation of the initial direct costs is presented separately from the gain or loss from fair value adjustments on investment property. In addition, the gain or loss on fair value adjustments is credited by the same amount as the amortisation charge in each period to ensure that the carrying amount of the investment property (including the unamortised initial direct costs) is equal to its fair value at each reporting date.

The accounting for initial direct costs of operating leases applied in practice by lessors of investment property measured at fair value is illustrated below.

Illustration 4-2: Lessor accounting for initial direct costs of operating leases under the IAS 40 fair value model

On 1 January 20X0, an investor acquires a property at a cost of CU100 million. On the same day, the investor leases the property under an operating lease to a lessee with a five-year term for a yearly rent of CU5 million. The lessor incurs legal fees of CU4 million in arranging the lease contract. The lessor measures its investment properties at fair value in accordance with IAS 40.33. According to an appraisal by an independent valuer, the fair values of the property as at 31 December 20X0 and 31 December 20X1 is CU100 million.

There are two acceptable approaches for a lessor of investment property measured at fair value to account for initial direct costs of operating leases:

Approach A

On acquisition, the initial direct costs would be capitalised into the investment property, but subsequently, they are expensed through the change in the fair value of the investment property.

The lessor would record the following journal entries ('JE') in 20X0 and 20X1 (time value of money is ignored):

Extracts from the ledgers for the years ended 31 December 20X0 and 20X1

(All figures in CU millions)

	20X0					20X1		
	As at 1 Jan 20X0	JE (1)	JE (2)	JE (3)	JE (4)	As at 31 Dec 20X0	JE (5)	As at 31 Dec 20X1
Balance sheet								
Investment property	-	100	4	-	(4)	100	-	100
Cash	100	(100)	(4)	5	-	1	5	6
Net Assets	100	-	-	5	(4)	101	5	106
Share capital	100	-	-	-	-	100	-	100
Retained earnings	-	-	-	-	-	-	-	1
Net income	-	-	-	5	(4)	1	5	5
Total Equity	100	-	-	5	(4)	101	5	106
Income statement								
Gains or (losses) from fair value adjustments	-	-	-	-	(4)	(4)	-	-
Rental income	-	-	-	5	-	5	5	5
Net income	-	-	-	5	(4)	1	5	5

Journals:

- Paragraph 20 of IAS 40 states that an investment property is measured initially at its cost and transaction costs are included in the initial measurement (see section 4.1 above).
- IAS 40 does not contain specific guidance on the accounting treatment of initial direct costs that are incurred in arranging a lease contract for an investment property that is measured at fair value. Therefore, it seems appropriate to apply the guidance for the accounting of initial direct costs incurred by a lessor under an operating lease that is included in IFRS 16. Paragraph 83 of IFRS 16 requires a lessor to add initial direct costs incurred in obtaining an operating lease to the carrying amount of the underlying asset and recognise those costs as an expense over the lease term on the same basis as the lease income. Initial direct costs (e.g., legal fees) would initially be added to the carrying amount of the investment property when incurred, similar to transaction costs discussed in IAS 40.20 and 21 (see section 4.1 above). Therefore, the initial direct costs of CU4 million must be added to the carrying amount of the investment property.
- The rental income for the first year of the lease term (CU5 million) is recognised.

- (4) Subsequently, the investment property, which includes the initial direct costs, is measured at fair value. Paragraph 5 of IAS 40 refers to IFRS 13 and defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Paragraph 25 of IFRS 13 states that "The price in the principal (or most advantageous) market used to measure the fair value of the asset or liability shall not be adjusted for transaction costs...". Therefore, the subsequent measurement of the investment property would exclude transaction costs.

In order to adjust the investment property to its fair value (CU100 million), an adjustment of CU4 million is recognised in profit and loss as required by IAS 40.35.

- (5) The cash received of CU5 million for the second year of the lease term is recorded.

Approach B

On acquisition, the initial direct costs, generally, are added to the carrying amount of the leased asset and subsequently recognised as an expense over the lease term on the same basis as the lease income. The amortisation of the initial direct costs is presented separately from the gain or loss from fair value adjustments. In addition, the gain or loss on fair value adjustments is credited by the same amount as the amortisation charge in each period to ensure that the carrying amount of the investment property (including the unamortised initial direct costs) is equal to its fair value at each reporting date.

The lessor would record the following journal entries ('JE') in 20X0 and 20X1 (time value of money is ignored):

Extracts from the ledgers for the years ended 31 December 20X0 and 20X1

(All figures in CU millions)

	20X0						20X1			
	As at 1 Jan 20X0	JE (1)	JE (2)	JE (3)	JE (4)	JE (5)	As at 31 Dec 20X0	JE (6)	JE (7)	As at 31 Dec 20X1
Balance sheet										
Investment property	-	100	4	-	(4)	-	100	-	-	100

Income statement										
Gains or (losses) from fair value adjustments	-	-	-	-	(4)	0.8	(3.2)	-	0.8	0.8
Amortisation of initial direct costs	-	-	-	-	-	(0.8)	(0.8)	-	(0.8)	(0.8)
Rental income	-	-	-	5	-	-	5	5	-	5
Net income	-	-	-	5	(4)	-	1	5	-	5

Journals:

- (1), (2), (3) and (4) are the same as in Approach A above.

- (5) According to IFRS 16.83 and IAS 40.33, in order to recognise initial direct costs as an expense over a five-year term on a straight-line basis, the total amount of initial direct costs (CU4 million) is apportioned evenly over the five-year period and thus, an amortisation expense of CU0.8 million is recognised each year. It is appropriate to present this separately from the gain or loss from fair value adjustments. The gain or loss on fair value adjustments is credited by the same amount as the amortisation expense in each period to ensure that the carrying amount of the investment property (including the unamortised initial direct costs) is stated at fair value at reporting date.
- (6) The cash received of CU5 million for the second year of the lease term is recorded.
- (7) To continue to recognise amortisation of initial direct costs and the investment property at its fair value at each reporting date, as required by IAS 40.33, reclassifications of the appropriate amounts based on the amortisation expense are made at each reporting date (i.e., CU0.8 million in the fact pattern).

How we see it

For an entity using the fair value model to measure its investment property, Approach A and Approach B discussed above, in our view, are acceptable approaches when accounting for initial direct costs of operating leases and thus, either can be applied as a matter of accounting policy choice. Such policy choice is applied consistently and if considered material to users of the financial statements, disclosure would be required by IAS 1.

For further discussions on initial direct costs of obtaining a lease, see Chapter 24.

4.10 Variable and contingent consideration

The terms of purchase of investment property may sometimes include a variable or contingent amount that cannot be determined at the date of acquisition. For example, the vendor may have the right to additional consideration from the purchaser in the event that a certain level of income is generated from the property; or its value reaches a certain level; or if certain legislative hurdles, such as the receipt of zoning or planning permission, are achieved.

The two key issues with regards to the accounting for variable or contingent consideration in an asset purchase are 1) whether and when to recognise a liability for that variable or contingent consideration, and 2) whether subsequent changes to the estimate of that variable or contingent consideration are accounted for as part of the cost of the acquired asset.

IAS 40 has no explicit guidance on the treatment of variable or contingent payments to be incurred in connection with the purchase of investment property. As discussed in section 4.1 above, the principles in IAS 16 relating to determining the attributable costs in an asset purchase apply to the recognition of costs in IAS 40. Accordingly, for the detailed discussions of key accounting considerations related to the treatment of variable or contingent payments in an asset purchase, including the general approaches applied in practice and the related discussions by the IFRS IC and the IASB, see Chapter 19.

How we see it

Consistent with the discussions in Chapter 19, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. In doing so, entities will need to apply the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*¹¹. The policy selected must result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

Until explicit guidance is released by the IASB, where the accounting for variability or contingency is not prescribed in another IFRS accounting standard (see Chapter 19), an entity must adopt and apply a consistent accounting policy in relation to whether subsequent payments or subsequent changes to the measurement of a recognised liability to make variable or contingent payments are included as part of the cost of the acquired asset (e.g., investment property) or expensed as incurred, in accordance with the hierarchy in IAS 8. An entity must exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in its particular circumstances.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information must be disclosed.

¹¹ The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

Of course, for investment property held at fair value, capitalising or expensing the remeasurements of any liability recognised for the variable or contingent consideration primarily affects classification within the income statement.

It is important to note that developing a policy (as described above) is not available for the contingent costs of acquiring investment property as part of a business combination. The treatment of contingent costs in these circumstances is described in Chapter 10.

4.11 Income from tenanted property during development

An entity may have acquired an investment property, which has been generating rental income, but subsequently intends to redevelop it with the same purpose of renting it out in the future. An issue that can arise is whether rental and similar income generated by existing tenants in a property development may be capitalised and offset against the cost of developing that property.

IAS 16 requires that the income and related expenses of incidental operations are recognised in profit or loss and included in their respective classifications of income and expense (see Chapter 19). [IAS 16.21]. We consider that rental and similar income from existing tenants are incidental operations to the development. The existence of the tenant is not a necessary condition for the property to be developed to a state capable of operating in the manner intended by management; management could have developed the property in the absence of any existing tenants.

How we see it

In our view, there must not be a measurement difference between the cost of a property development dealt with under IAS 40 and the cost of a property development dealt with under IAS 16.

Therefore, rental and similar income generated by existing tenants in a property dealt with under IAS 40 and now intended for redevelopment must not be capitalised against the costs of the development. Rather, rental and similar income are recognised in profit or loss in accordance with the requirements of IFRS 16 (see Chapter 24), together with any related expenses. For these purposes, it is irrelevant whether the investment property is held at cost or fair value.

4.12 Payments by the vendor to the purchaser

On occasion, a transaction for the purchase of an investment property may include an additional element where the vendor repays fixed or variable amounts to the purchaser - e.g., when the vendor agrees to compensate the purchaser for specific transaction costs incurred or perhaps described as representing a rental equivalent for a period of time such as rental guarantees.

The question then arises whether, in the financial statements of the purchaser, these payments are recorded as income (albeit perhaps recognised over a period of time) or as a deduction from the acquisition cost of the investment property on initial recognition.

How we see it

In our view, such amounts described above are an integral part of the acquisition transaction and must invariably be treated as a deduction from the acquisition cost of the investment property because the payment is an element of a transaction between a vendor and purchaser of the property (rather than, for example, a landlord and tenant in respect of rental guarantees).

In the event that the repayments by the vendor are spread over time, the fair value of the right to receive those payments is deducted from the cost of the investment property and an equivalent financial asset is recognised. The financial asset would be accounted for in accordance with IFRS 9 *Financial Instruments* which could lead to it being classified as financial asset at amortised cost or at fair value through profit or loss (see Chapter 44).

5 Measurement after initial recognition

Once recognised, IAS 40 allows an entity to choose one of the two methods of accounting for investment property as its accounting policy:

- Fair value model (see section 6 below)
- Or
- Cost model (see section 7 below)

An entity has to choose one model or the other, and apply it to all its investment property (unless the entity is an insurer or similar entity, in which case there are exemptions that are described briefly in section 5.1 below). [IAS 40.30]. This is because measuring all investment properties on the same basis provides more useful information than allowing an entity to choose the measurement basis for each property. [IFRS 16.BC178].

The standard does not identify a preferred alternative; although the fair value model currently seems to be the more widely applied model among entities in the real estate sector (see section 7.2 below).

The standard discourages changes from the fair value model to the cost model, stating that it is highly unlikely that this will result in a more relevant presentation, which is a requirement of IAS 8 for any voluntary change in accounting policy. [IAS 40.31].

All entities, regardless of which measurement option is chosen, are required to determine the fair value of their investment property, because even those entities that use the cost model are required to disclose the fair value of their investment property (see section 12.3 below). [IAS 40.32, IAS 40.79(e)].

5.1 Measurement by insurers and similar entities

There is an exception to the requirement that an entity must apply its chosen measurement policy to all of its investment properties. This is applicable to insurance companies and other entities that hold specified assets, including investment properties, whose fair value or return is directly linked to the return paid on specific liabilities (i.e., liabilities that are secured by such investment properties). These entities are permitted to choose either the fair value or the cost model for all such properties without it affecting the choice available for all other investment properties that they may hold. [IAS 40.32A].

However, for some entities that operate, either internally or externally, an investment fund that provides investors with benefits determined by units in the fund, all properties within such a fund must be measured on the same basis because IAS 40.32A (as discussed above) does not permit an entity to measure the property held by the fund partly at cost and partly at fair value. Similarly, for some entities that issue insurance contracts with direct participation features, for which the underlying items include investment property, IAS 40.32A (as discussed above) does not permit an entity to measure property that is an underlying item partly at cost and partly at fair value. [IAS 40.32B].

For the purposes of applying the paragraphs above i.e., IAS 40.32A and IAS 40.32B only, insurance contracts include investment contracts with discretionary participation features. Note that the terms used in the amended IAS 40.32B are defined in IFRS 17 *Insurance Contracts* (see Chapter 51). [IAS 40.32B].

If an entity elected a model for those properties described in IAS 40.32A (as discussed above) that is different from the model used for the rest of its investment properties, sales of investment properties between these pools of assets are to be recognised at fair value with any applicable cumulative change in fair value recognised in profit or loss. Consequently, if an investment property is sold from a pool in which the fair value model is used into a pool in which the cost model is used, the fair value of the property sold at the date of the sale becomes its deemed cost. [IAS 40.32C].

For the detailed discussions and requirements of IFRS 17, see Chapter 51.

6 The fair value model

Under this model, all investment property is measured at its fair value at the end of the reporting period (except in the cases described in sections 6.2 and 6.3 below) and a gain or loss arising from changes in the fair value in the reporting period is recognised in profit or loss for that period. [IAS 40.33, IAS 40.35].

IFRS 13 provides a fair value measurement framework that applies whenever fair value measurement is permitted or required (see Chapter 15). IFRS 13 does not specify when an entity is required to use fair value, but rather, provides guidance on how to measure fair value under IFRS accounting standards when fair value is required or permitted by IFRS accounting standards.

IFRS 13 defines fair value as: [IFRS 13.9, IFRS 13 Appendix A, IAS 40.5]

Extract from IFRS 13

Appendix A Defined terms

fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.
------------	--

How we see it

While entities cannot presume this always to be the case, in practice, the fair value estimate arrived at under IFRS 13 may be similar to that estimated for 'market value' as defined by the Royal Institution of Chartered Surveyors ('RICS') and the International Valuation Standards Council ('IVSC'). Their definition of 'market value' being "the estimated amount for which an asset and/or liability should exchange on the valuation date between a willing buyer and a willing seller in an arm's-length transaction, after proper marketing and where the parties had each acted knowledgeably, prudently and without compulsion."¹²

The price in the principal (or most advantageous) market used to measure fair value must not be adjusted for transaction costs. This is because transaction costs are not a characteristic of an asset or a liability; rather, they are specific to a transaction and will differ depending on how an entity enters into a transaction for the asset or liability. [IFRS 13.25].

Transaction costs incurred by a purchaser on acquisition are dealt with in section 6.4 below and in Chapter 15.

6.1 Estimating fair value

Many entities use an external valuer to estimate fair value based on the RICS and/or IVSC Valuation Standards. Indeed, the use of an independent valuer with a recognised and relevant professional qualification and with recent experience in the location and category of the investment property being valued is encouraged by IAS 40, albeit not required. [IAS 40.32]. This approach is supported by the Board's conclusion that an independent valuation was not always necessary. [IAS 40.B56].

How we see it

Management needs to be aware of the conceptual differences between IFRS 13 and International Valuation Standards to ensure any values used for financial reporting that are obtained from appraisals, whether external or internal, are consistent with the objective of fair value measurement in accordance with IFRS 13.

Although an appraisal is normally undertaken by professionally qualified valuers and IAS 40 encourages entities to determine the fair value of investment property on the basis of a valuation by a recognised, professionally qualified and experienced independent valuer, an appraiser does not need to be independent of the reporting entity. If the internal appraisals are of such a quality that the fair values of investment property are reliably measured in accordance with IFRS 13, then no additional appraisals by an independent valuer are required.

¹² IVS 102 Bases of Value, International Valuation Standards, IVSC, effective 31 January 2025, Appendix: IVS-Defined Basis of Value, para. A10.01, p.24.

How we see it

We acknowledge that a fair value measured by the entity itself may be less reliable than a fair value measured by an independent valuer. However, we believe that the users of financial statements are made aware of this potential weakness and its possible impact on a true and fair presentation by the disclosure requirements in IAS 40.75(e) which requires disclosures to be made about the extent of involvement of independent valuers in measuring fair values (see section 12.1 below).

When estimating the fair value of the property in accordance with IFRS 13, the objective is to estimate the price that would be received to sell an investment property in an orderly transaction between market participants at the measurement date under current market conditions. [IFRS 13.2]. This objective applies regardless of the techniques and inputs used to measure fair value.

IAS 40 has certain requirements in addition to those in IFRS 13. In particular, IAS 40 requires that the fair value reflects, among other things, rental income from current leases and other assumptions that market participants would use when pricing investment property under current market conditions. [IAS 40.40]. For example, in a transaction to sell an investment property, it is likely that market participants would consider the existing lease agreements in place.

This is consistent with the general requirement in IFRS 13 that an entity must measure the fair value using the assumptions that market participants would use when pricing the asset or liability, assuming that market participants act in their economic best interest. [IFRS 13.22].

Practical example 6-1 below describes Unibail-Rodamco-Westfield SE's approach to valuations:

NOTE 5. INVESTMENT PROPERTIES, TANGIBLE AND INTANGIBLE ASSETS, GOODWILL [extract]

5.1 INVESTMENT PROPERTIES [extract]

5.1.1 ACCOUNTING PRINCIPLES

INVESTMENT PROPERTIES (IAS 40 AND IFRS 13)

In accordance with IAS 40, investment properties are shown at their fair value. According to IFRS 13, the fair value is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date (i.e. an exit price). Expectations about future improvements or modifications to be made to the property interest to reflect its highest and best use have to be considered in the appraisal, such as the renovation of or an extension to the property interest.

URW complies with the IFRS 13 fair value measurement rule and the position paper⁽¹⁾ on IFRS 13 established by the European Public Real Estate Association ("EPRA"), the representative body of the publicly listed real estate industry in Europe.

Transaction costs incurred for an asset deal are capitalised in the value of the investment property. Capitalised expenses include capital expenditures, eviction costs, capitalised financial interests, external letting fees invoiced by third parties and other internal costs related to development projects.

In accordance with IFRS 16 and IAS 40, the right-of-use assets arising from leased property which meet the definition of an investment property are measured at fair value.

IPUC are covered by IAS 40 and are eligible to be measured at fair value. In accordance with the Group's investment properties valuation method, they are measured at fair value by a qualified independent external appraiser twice a year. As part of the recommendations of the Royal Institution of Chartered Surveyors ("RICS"), URW applies a rotation on the appraisal mandates on a regular basis; the last rotation occurred in 2021. Projects for which the fair value is not reliably determinable are measured at cost until such time that a fair value measurement becomes reliable, or until 1 year before the construction completion.

According to the Group, a development project is eligible for a fair value measurement once all 3 of the following criteria are fulfilled:

- All administrative authorisations needed to complete the project are obtained;
- The construction has started and costs are committed toward the contractor; and
- Substantial uncertainty in future rental income has been eliminated.

If the time to delivery is less than 1 year, the project is accounted for at fair value.

For properties measured at fair value, the market value adopted by URW is determined on the basis of appraisals by qualified independent external experts, who value the Group's portfolio as at June 30 and December 31 of each year. The gross value is reduced by disposal

costs and transfer taxes⁽²⁾, depending on the country and on the tax situation of the property, in order to arrive at a net market value.

For the Shopping Centres and Offices & Others portfolios, the independent appraisers determine the fair market value based on the results of 2 methods: the discounted cash flow ("DCF") methodology as well as the yield methodology. Furthermore, the resulting valuations are cross-checked against the initial yield, value per square metre and the fair market values established through actual market transactions.

Appraisers have been given access to all information relevant for valuations, such as the Group's confidential rent rolls, including information on vacancy, break options, expiry dates and lease incentives, performance indicators (e.g. footfall and sales where available), letting evidence and the Group's cash flow forecasts from annually updated detailed asset business plans. A significant amount of information has been made available to the appraisers in relation to several ESG KPIs on an asset-by-asset basis⁽³⁾ in connexion with a new AFREXIM ESG scorecard built by main valuation firms, international shopping centres landlords and some French institutions representing a large scope of retail market participants (see 2.3.2 "Impact on financial statements").

On that basis, appraisers make their independent assessments of current and forward-looking cash flow profiles, and usually reflect risk either in the cash flow forecasts (e.g. future rental levels, growth, investment requirements, void periods and incentives, rent relief), in the applied required returns or discount rates and in the yield applied to capitalise the exit rent to determine an exit value.

The sites of the C&E portfolio are qualified as investment property.

For the C&E portfolio, the valuation methodology adopted is mainly based on a DCF model applied to the total net income projected over the life of the concession, or over the life of the long-term lease (notably the Porte de Versailles long-term lease) or leasehold if it exists, or otherwise over a 10-year period, with an estimate of the asset value at the end of the given time period, based either on the residual contractual value for concessions or on capitalised cash flows over the last year. The valuations carried out by the appraisers took into account total net income, which comprised net rents and ancillary services, as well as net income from car parks. The cost of maintenance works, major repairs, refurbishments, redevelopments and extensions, as well as concession or leasehold fees, are included in projected cash flow figures.

(1) EPRA position paper on IFRS 13 – Fair value measurement and illustrative disclosures, February 2013.

(2) Transfer taxes are valued on the assumption that the property is sold directly, even though the cost of these taxes would, in certain cases, be reduced if the property's holding company would be sold.

(3) For European shopping centres.

The income statement for a given year (Y) records the change in value for each property, which is determined as follows:
market value Y – market value Y-1 + amount of works and other costs capitalised in year Y.

Capital gains on disposals of investment properties are calculated by comparison with their latest market value recorded in the closing statement of financial position for the previous financial year.

Properties under construction carried at cost are subject to impairment tests, determined on the basis of the estimated recoverable value of the project. The recoverable value of a project is assessed, for significant projects by a qualified independent external appraiser

and for others internally by the Development & Investment teams through the expected delivery date, expected development costs, and considering a market exit capitalisation rate and the expected net rents. When the estimated recoverable value is lower than net book value, an impairment provision is recorded.

Properties held for sale are identified separately in the statement of financial position according to IFRS 5.

As discussed in section 2.1 above, the fair value of right-of-use assets that meet the definition of investment property will need to be determined (whether for disclosure and/or measurement purposes). The IASB acknowledged that there might be costs involved with determining the fair value of right-of-use assets, particularly for entities that are not in the property industry but sublease property, for example, because that property is not needed for use within their business. [IFRS 16.BC179]. However, the IASB views the determination of the fair value of right-of-use assets as relatively straightforward, even for an entity that is not in the property industry, if the sublease does not contain any options or variable lease payments. Determining the fair value would involve projecting the cash flows that the entity expects to receive from subleasing the asset. The IASB concluded that determining these cash flows would normally be relatively straightforward because it is likely that a sublease would already be in place. [IFRS 16.BC180].

Further, if leases have variable and optional payments, or if there is no active market for the right-of-use asset, the IASB views that the principles in IFRS 13 and IAS 40 are sufficient to help lessees to measure the fair value of those right-of-use assets. In particular, the IASB noted that IAS 40.50(d) explains when to include in the measurement of the right-of-use asset options and variable lease payments that are not included in the measurement of the lease liability. [IFRS 16.BC181]. Paragraph 40.50(d) of IAS 40 states that the fair value of investment property held by a lessee as a right-of-use asset reflects expected cash flows, including variable lease payments that are expected to become payable. Accordingly, if a valuation obtained for a property is net of all payments expected to be made, it will be necessary to add back any recognised lease liability, to arrive at the carrying amount of the investment property using the fair value model (see section 6.7 below). [IAS 40.50].

It is also worth noting that fair value measurement may be affected by economic and market disruptions caused by war and pandemics. Similarly, climate change can potentially affect the fair value of an asset or liability. Please refer to our publications *Applying IFRS: Accounting considerations related to geopolitical events and uncertainty* and *Applying IFRS: Connected Financial Reporting: Accounting for Climate Change* for further guidance on these topics.¹³

6.1.1 Methods of estimation

IFRS 13 does not specify or rank the techniques an entity must use to measure fair value. However, it requires them to be consistent with one or more of the three broad approaches: the market approach; the income approach; and the cost approach. [IFRS 13.62]. As discussed in section 6.1.2 below, IFRS 13 does require an entity to prioritise observable inputs over unobservable inputs. See Chapter 15 for further discussion on selecting appropriate techniques and inputs.

IFRS 16 specifies the basis for initial recognition of the cost of an investment property held by a lessee as a right-of-use asset (see section 4.5 above). In line with the discussion in section 6 above, IAS 40.33 requires the investment property held by a lessee as a right-of-use asset to be remeasured, if necessary, to fair value if the entity chooses the fair value model. [IAS 40.41]. When a lessee uses the fair value model to measure an investment property that is held as a right-of-use asset, it will measure the right-of-use asset, and not the underlying property, at fair value. [IAS 40.40A]. When lease payments are at market rates, the fair value of an investment property held by a lessee as a right-of-use asset at acquisition, net of all expected lease payments (including those relating to recognised lease liabilities), should be zero. Thus, remeasuring a right-of-use asset from cost in accordance with IFRS 16 to fair value (taking into account the requirements in IAS 40.50 - see section 6.1.4 below) should not give rise to any initial gain or loss, unless fair value is measured at different times. This could occur when an election to apply the fair value model is made after initial recognition. [IAS 40.41].

When an entity first acquires an investment property (or when an existing property first becomes investment property after a change in use - see section 9 below) there could be an indication that its fair value will not be reliably measurable on a continuing basis. For example, there might be clear evidence that the variability in the range of reasonable fair value measurements will be so great, and the probabilities of the various outcomes so difficult to assess, that the usefulness of a single measure of fair value will be negated. However, it cannot be over-emphasised that IAS 40 describes such circumstances as 'exceptional cases'. [IAS 40.48]. This is discussed further in section 6.2 below.

6.1.2 Observable data

When selecting the most appropriate inputs to a fair value measurement from multiple available inputs, those that maximise the use of observable data, rather than unobservable data, must be selected. [IFRS 13.67]. Just because the volume or level of activity in a market has significantly decreased, it does not mean that transactions in that market are not orderly or do not represent fair value. [IFRS 13.B43].

¹³ Available on [ey.com/IFRS](https://www.ey.com/IFRS).

Entities will need to consider the individual facts and circumstances in making this assessment. Notwithstanding the need for judgement, an entity must have a reasonable basis for concluding that a current observable market price can be ignored based on a view that it represents a liquidation or distressed sale value. [IFRS 13.B43]. This is discussed further in Chapter 15.

6.1.3 Comparison with value in use and net realisable value

Fair value is not the same as 'value in use' as defined in IAS 36. In particular, fair value does not take account of the entity specific factors of the holder that would not generally be available to knowledgeable willing buyers such as additional value derived from holding a portfolio of investment property assets, synergies between the properties and other assets or legal rights or tax benefits or burdens pertaining to the current owner. Fair value is also not the same as net realisable value as, for example, net realisable value does not have to take account of market required returns but would have to take into account cost to sell. [IFRS 13.6(c), IFRS 13.BC24]. See also Chapter 15 and the discussion in section 7.3 below.

6.1.4 'Double counting'

An entity must take care, when determining the carrying amount of investment property under the fair value model, not to double count assets or liabilities that are recognised separately. IAS 40 describes a number of situations where this might otherwise happen as follows:

- Equipment such as lifts or air-conditioning is often an integral part of a building and is generally included in the fair value of the investment property, rather than recognised separately as property, plant and equipment (see section 6.5 below).
- If an office is leased on a furnished basis, the fair value of the office generally includes the fair value of the furniture, because the rental income relates to the furnished office. When furniture is included in the fair value of investment property, an entity does not recognise that furniture as a separate asset (see section 6.5 below).
- The fair value of investment property excludes prepaid or accrued operating lease income, because the entity recognises it as a separate liability or asset (see section 6.6 below).
- The fair value of investment property held by a lessee as a right-of-use asset reflects expected cash flows, including variable lease payments that are expected to become payable. Accordingly, if a valuation obtained for a property is net of all payments expected to be made, it will be necessary to add back any recognised lease liability, to arrive at the carrying amount of the investment property using the fair value model (see section 6.7 below). [IAS 40.50].

6.2 Inability to determine fair value of completed investment property

It is a rebuttable presumption that an entity can determine the fair value of a property reliably on a continuing basis, that is, on each subsequent occasion in which it records the investment property in its financial statements. [IAS 40.53].

The standard emphasises that it is only in exceptional cases and only on initial recognition (either by acquisition or change in use - see section 9 below) that the entity will be able to conclude that it will not be able to reliably measure the investment property's fair value on a continuing basis. [IAS 40.53].

Additionally, entities are strongly discouraged from arguing that fair value cannot be reliably measured. It may be a possible argument when, and only when, the market for comparable properties is inactive (e.g., there are few recent transactions, price quotations are not current or observed transaction prices indicate that the seller was forced to sell) and alternative reliable measurements of fair value (for example, based on discounted cash flow projections) are not available. In such exceptional cases, the property must be measured using the cost model in IAS 16 for owned investment property (see Chapter 19), or cost model in accordance with IFRS 16 for investment property held by a lessee as a right-of-use asset (see Chapter 24), until its disposal and assumed to have a nil residual value. [IAS 40.53]. This means that an owned investment property has to be carried at cost and the building and its component parts depreciated over their useful lives (see section 7 below). In these circumstances, IAS 16's revaluation model, under which assets may be revalued to fair value, is specifically ruled out. If this exceptional situation occurs, the cost model in IAS 16 or in IFRS 16 must continue to be applied until disposal of such property. [IAS 40.53]. This also means that if this exceptional situation occurs, investment property will continue to be measured at cost even if a reliable measure of fair value subsequently becomes available (such treatment is different for investment property under construction - see section 6.3 below). Although an entity measures an individual property at cost for this reason, all other investment property must continue to be carried at fair value. [IAS 40.54].

The above exception is not permitted for investment property that has been previously measured using the fair value model. Once a property is initially recognised at its fair value, it must always be so recognised until disposed of or reclassified for owner-occupation or development for subsequent sale in the ordinary course of the business, even if comparable market transactions become less frequent or market prices become less easily available. [IAS 40.55].

6.3 The fair value of investment property under construction

Entities who wish to measure their completed investment property at fair value will also need to measure their investment property under construction at fair value (subject to fair value being reliably determinable). [IAS 40.33, IAS 40.53].

How we see it

Determining the fair value of investment property under construction will often be more judgemental than for completed property because:

- There are generally few or limited observable transactions for investment property under construction. Where such assets are transacted, this is typically when they are in the very early stages of development or when they are nearly complete and substantially let.
- Additional assumptions must be made about the risks and costs of any incomplete construction.

It is worth noting that, in light of the requirements of IFRS 13, an entity will have to determine whether fair value can be reliably measured or not under the requirements in that standard. This is discussed in Chapter 15.

In any event, some entities do consider that not all of their investment property under construction can be reliably measured and have developed criteria to make that assessment, see Practical example 6-1 above for an example.

There were persistent concerns that, in some situations, the fair value of investment property under construction could not be measured reliably. Where an entity that chooses the fair value model for its investment property determines that the fair value of an investment property under construction is not reliably measurable but it expects the fair value to be reliably measurable when construction is complete, the IASB decided to allow such investment property under construction to be measured at cost until such time as the fair value becomes reliably measurable or construction is completed (whichever comes earlier). [IAS 40.53].

IAS 40 also sets out the following:

- Once an entity becomes able to measure reliably the fair value of an investment property under construction that it has previously measured at cost (see section 7 below), it must measure that property at its fair value. [IAS 40.53A].
- Once construction of such property is complete, it is presumed that fair value can be measured reliably. If this is not the case, and this will be only in exceptional situations, the property must be accounted for using the cost model in accordance with IAS 16 for owned investment property (see section 7 below) or cost model in accordance with IFRS 16 for investment property held by a lessee as a right-of-use asset (see Chapter 24), together with the other requirements discussed in section 6.2 above, i.e., use the cost model until disposal of the property (even if subsequently its fair value becomes reliably determinable) and assume that it has a nil residual value. [IAS 40.53A].
- The presumption that the fair value of investment property under construction can be measured reliably can be rebutted only on initial recognition. Therefore, an entity that has measured an item of investment property under construction at fair value may not subsequently conclude that the fair value of the completed investment property cannot be measured reliably. [IAS 40.53B].

6.4 Transaction costs incurred by the purchaser of an investment property

An issue that arises in practice is whether transaction costs that have been incurred by the reporting entity on purchase of an investment property must be taken into account in determining the subsequent fair value of the property when applying the fair value model. This is shown in the following illustration:

Illustration 6-1: The fair value model and transaction costs incurred at acquisition

On 1 January 20X1 Entity A acquired an investment property for a purchase price of CU10,000. In addition, Entity A incurred legal costs of CU200 in connection with the purchase and paid property transfer tax of CU400. Accordingly, the investment property was initially recorded at CU10,600. Entity A applies the fair value model for subsequent measurement of investment property:

	Development of prices in property market	Appraised market value of property	Cost of property initially recognised	Difference
		CU	CU	CU
Scenario 1	Unchanged	10,000	10,600	(600)
Scenario 2	Slightly increased	10,250	10,600	(350)
Scenario 3	Significantly increased	11,000	10,600	400
Scenario 4	Decreased	9,500	10,600	(1,100)

The issue that arises in practice is whether or not the acquisition-related transaction costs that were incurred by Entity A on 1 January 20X1 can be considered in determining the fair value of the investment property at the next reporting date.

The acquisition-related transaction costs incurred by Entity A would not be considered separately in determining the fair value of an investment property in accordance with IFRS 13. In the example above, on the next reporting date the carrying amount to be recorded in the statement of financial position is its fair value, measured in accordance with IFRS 13. Changes from the initial carrying amount to the appraised market value at the subsequent reporting date (reflected in the 'Difference' column in the table) are recognised in profit or loss. [IAS 40.35].

Although IAS 40 states that transaction costs incurred by a purchaser on the acquisition of an investment property are included in the cost of the investment property at initial recognition, [IAS 40.21], if an entity applies the fair value model, the same investment property that was recorded at cost on initial recognition is subsequently measured at fair value in accordance with IFRS 13. The fact that the cost of the investment property recorded on initial recognition included legal and other transaction costs is irrelevant to the subsequent fair value measurement of the asset.

IFRS 13 clarifies that: [IFRS 13.25]

Extract from IFRS 13

- 25 The price in the principal (or most advantageous) market used to measure the fair value of the asset or liability shall not be adjusted for transaction costs. Transaction costs shall be accounted for in accordance with other IFRSs. Transaction costs are not a characteristic of an asset or a liability; rather, they are specific to a transaction and will differ depending on how an entity enters into a transaction for the asset or liability.

Likewise, when measuring the fair value of an investment property, it is not appropriate to add the acquisition-related transaction costs incurred by the purchaser to fair value, as these have no relevance to the fair value of the property. Therefore, some or all of the transaction costs incurred when acquiring the investment property that were capitalised in accordance with IAS 40 will effectively be expensed as part of the subsequent fair value gain or loss.

See Chapter 15 for further discussion.

6.5 Fixtures and fittings subsumed within fair value

Fixtures and fittings such as lifts or air conditioning units are usually reflected within the fair value of the investment property rather than being accounted for separately. [IAS 40.50(a)]. In other cases, additional assets may be necessary in order that the property can be used for its specific purposes. The standard refers to furniture within a property that is being let as furnished offices, and argues that this is not recognised as a separate asset if it has been included in the fair value of the investment property. [IAS 40.50(b)].

The entity may have other assets that have not been included within the valuation, in which case these will be recognised separately and accounted for in accordance with IAS 16.

6.6 Prepaid and accrued operating lease income

6.6.1 Accrued rental income and lease incentives

The requirement in IAS 40 not to double-count assets or liabilities recognised separately is most commonly encountered when the carrying amount of an investment property is reduced below its fair value to the extent that a separate asset arises under IFRS 16. For example, when an entity offers an initial rent-free period to a lessee, it will accrue an asset during the rent-free period and then amortise it over the remaining lease term, thereby spreading the reduction in rental income over the term of the lease. If such asset is separately recognised from the investment property, the amount of that separate asset is excluded from the fair value of the investment property in order to avoid double counting (see section 4.9.1 above). [IAS 40.50(c)].

Wereldhave N.V. explains the treatment in its accounting policies:

Practical example 6-2: Wereldhave N.V. (2023)	Netherlands
Integrated Annual Report 2023 [extract] Notes to the consolidated financial statements [extract] 3 Accounting policies [extract] 3.6 Investment property [extract]	
<p>Lease incentives, rent-free periods and other leasing expenses</p> <p>Rent-free periods and investments made, or allowances granted to tenants by Wereldhave ("lease incentives") are allocated on a linear basis over the lease term. The lease term consists of the period until the first break option for the tenants, which period can be extended by management with the expected prolongation of the leases. In determining the property at fair value capitalized lease incentives are adjusted for the valuation results, to avoid double counting.</p>	

This treatment can also be seen in Practical example 6-3 below where lease incentives, which are separately recognised, are excluded from the fair value of the investment property to arrive at the carrying amount of the investment property for the purposes of the financial statements.

6.6.2 Prepaid rental income

The same principles as discussed in sections 4.9.1 and 6.6.1 above are applied when rental income arising from an operating lease is received in advance i.e., as a policy choice, the resulting liability could be recognised either separately from, or included in, the carrying amount of the investment property. The latter treatment is demonstrated in the Illustration below:

Illustration 6-2: Investment property and rent received in advance						
<p>A company owns land with an estimated value of CU10 million as at 1 January 20X1 that is accounted for as investment property. The company applies the fair value option in IAS 40 and has a reporting period ending on 31 December each year.</p> <p>The land was not let until, on 30 December 20X1, a lease of 50 years was granted for consideration of CU9.5 million received in advance. The lease is considered to be an operating lease. No rental income was recognised in 20X1 as it was considered immaterial. An external valuer estimated that, after the grant of the 50-year lease, the fair value of the company's interest in the land as at 31 December 20X1 was CU1 million. As at 31 December 20X2 the external valuer estimated the fair value of the interest in the property was CU1.2 million.</p> <p>The resultant accounting entries are summarised below.</p> <p>Extracts from the ledgers for the year ended 31 December 20X1 <i>(All figures in CU millions)</i></p>						
	As at 1 January 20X1	Journal (1)	Journal (2)	Journal (3)	31 December 20X1	As at

Journals:

- (1) Amortise rent (one year of the CU9.5m received for 50 years).
- (2) Write down investment property to CU1.2m external valuation.
- (3) Write up the book value of property by the amount of unamortised deferred revenue in the statement of financial position (CU9.31m).

6.7 Valuation adjustment to the fair value of properties held under a lease

IAS 40 states that the fair value of investment property held by a lessee as a right-of-use asset will reflect expected cash flows, including variable lease payments that are expected to become payable. Accordingly, if a valuation obtained for a property is net of all payments expected to be made, it will be necessary to add back any recognised lease liability, to arrive at the carrying amount of the investment property using the fair value model. [IAS 40.50(d)].

Therefore, if the entity obtains a property valuation net of the valuer's estimate of the present value of future lease obligations (which is usual practice), to the extent that the lease obligations have already been accounted for in the statement of financial position as a lease obligation, an amount is to be added back to arrive at the carrying amount of the investment property for the purposes of the financial statements.

The valuation adjustment referred to above is achieved by adjusting for the lease liability recognised in the financial statements.

This is shown using the information in the following Illustration:

Illustration 6-3: Valuation of a property held under a lease

Entity A pays CU991,000 for a 50-year leasehold interest in a property which is classified as an investment property using the fair value model. In addition, a ground rent of CU10,000 is payable annually during the lease term, the present value of which is calculated at CU99,000 using a discount rate of 10% which reflects the rate implicit in the lease at that time. The company has initially recognised the investment property at the following amount:

	CU'000
Amount paid	991
Present value of the ground rent obligation on acquisition	99
Cost recorded for financial reporting purposes	1,090

Assume at the next reporting date the leasehold interest in the property has a fair value of CU1,006,000 measured (based on market participant assumptions) as follows:

	CU'000
Present value of estimated future lease income	1,089
Less: Present value of the ground rent obligation at the reporting date *	(83)
Fair value	1,006

* The market required yield has changed to 12%. Therefore, the present value of the ground rent obligations of CU10,000 per annum for the remaining 49 years is now CU83,000.

At the same time the ground rent lease liability has reduced to CU98,000 as payments are made.

This would give the following results:

	CU'000
Fair value	1,006
Add recognised lease liability	98
Carrying amount for financial reporting purposes	1,104

The statement of financial position of Entity A would therefore contain the following items:

	Investment property	Lease liability
	CU'000	CU'000
On acquisition	1,090	99
End of year 1	1,104	98

An example of this in practice can be seen in in Practical example 6-3 below where lease liabilities related to head leases, which are separately recognised, are added back to arrive at the carrying amount of the investment property for the purposes of the financial statements:

Practical example 6-3: Land Securities Group PLC (2024) United Kingdom**Landsec Annual Report 2024 [extract]****NOTES TO THE FINANCIAL STATEMENTS [extract]****SECTION 3 - PROPERTIES [extract]****14 › INVESTMENT PROPERTIES [extract]**

The market value of the Group's investment properties, as determined by the Group's external valuers, differs from the net book value presented in the balance sheet due to the Group presenting tenant finance leases, head leases and lease incentives separately. The following table reconciles the net book value of the investment properties to the market value.

	2024				2023			
	Group £m	Joint ventures ¹ £m	Adjustment for non-wholly owned subsidiaries £m	Combined Portfolio £m	Group £m	Joint ventures ¹ £m	Adjustment for non-wholly owned subsidiaries £m	Combined Portfolio £m
Market value	9,465	616	(118)	9,963	9,745	655	(139)	10,259
Less: properties treated as finance leases	(18)	–	–	(18)	(17)	–	–	(17)
Plus: head leases capitalised	77	1	–	78	107	1	–	108
Less: tenant lease incentives	(194)	(32)	–	(226)	(175)	(35)	–	(210)
Net book value	9,330	585	(118)	9,797	9,658	601	(139)	10,120

...

6.8 Future capital expenditure and development value ('highest and best use')

It is common for the value of land to reflect its potential future use and the value of land may increase in the event that the owner obtains any required permissions for a change in the use of that land.

It may be, for example, that a permission to change from an industrial to residential use will increase the value of the property as a whole, notwithstanding that the existing industrial buildings are still in place. This increase in value is typically attributable to the land, rather than the buildings.

It is therefore important to note that IFRS 13 requires consideration of all relevant factors in determining whether the highest and best use of a property can be something other than its current use at the measurement date. IFRS 13 presumes that an entity's current use of an asset is generally its highest and best use unless market or other factors suggest that a different use of that asset by market participants would maximise its value. [IFRS 13.29]. IFRS 13 states: [IFRS 13.27, IFRS 13.28]

Extract from IFRS 13

- 27 A fair value measurement of a non-financial asset takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use.**
- 28 The highest and best use of a non-financial asset takes into account the use of the asset that is physically possible, legally permissible and financially feasible, as follows:**
- (a) A use that is physically possible takes into account the physical characteristics of the asset that market participants would take into account when pricing the asset (eg the location or size of a property).
 - (b) A use that is legally permissible takes into account any legal restrictions on the use of the asset that market participants would take into account when pricing the asset (eg the zoning regulations applicable to a property).
 - (c) A use that is financially feasible takes into account whether a use of the asset that is physically possible and legally permissible generates adequate income or cash flows (taking into account the costs of converting the asset to that use) to produce an investment return that market participants would require from an investment in that asset put to that use.

How we see it

Considerable judgement may have to be applied in determining when an anticipated change is legally permissible. For example, if approval is required for rezoning land or for an alternative use of existing property interests, it may be necessary to assess whether such approval is a substantive legal requirement or not. See Chapter 15 for further discussion on determining highest and best use and the assessment of 'legally permissible'.

If management determines that the highest and best use of an asset differs from its current use, certain valuation matters must be considered. Appraisals that reflect the effect of a reasonably anticipated change in what is legally permissible must be carefully evaluated. If the appraised value assumes that a change in use can be obtained, the valuation must also reflect the cost associated with obtaining approval for the change in use and transforming the asset, as well as capture the risk that the approval might not be granted (that is, uncertainty regarding the probability and timing of the approval).

Expectations about future improvements or modifications to be made to the property to reflect its highest and best use may be considered in the appraisal, such as the renovation of the property or the conversion of an office into condominiums, but only if and when other market participants would also consider making these investments and reflect only the cash flows that market participants would take into account when assessing fair value.

See Chapter 15 for further discussion on application of IFRS 13 requirements to non-financial assets which includes determining highest and best use.

6.9 Negative present value

In some cases, an entity expects that the present value of its payments relating to an investment property (other than payments relating to recognised liabilities) will exceed the present value of the related cash receipts. An entity applies IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* to determine whether to recognise a liability and, if so, how to measure that liability. [IAS 40.52].

6.10 Deferred taxation for property held by a 'single asset' entity

It is common in many jurisdictions for investment property to be bought and sold by transferring ownership of a separate legal entity formed to hold the asset (a 'single asset' entity) rather than the asset itself. In addition to the issue on initial recognition discussed in section 4.1.2 above, this matter created diversity in practice when determining the expected manner of recovery of the asset for the purposes of IAS 12, i.e., whether or not the parent entity must reflect the fact that an asset held by a single asset entity is likely to be disposed of by selling the shares of the entity rather than the asset itself, and if so, whether the deferred taxation would be recognised with reference to the shares rather than the underlying property.

The IFRS IC clarified in July 2014 that IAS 12 requires the parent to recognise in its consolidated financial statements both the deferred tax related to the property inside the single asset entity and the deferred tax related to the shares of that single asset entity (the outside), if:

- Tax law attributes separate tax bases to the asset inside and to the shares
 - In the case of deferred tax assets, the related deductible temporary differences can be utilised
- And
- No specific exceptions in IAS 12 apply¹⁴

Accordingly, in determining the expected manner of recovery of a property held by a single asset entity for the purposes of IAS 12, the parent entity must have regard to both the asset itself and the shares (subject to the exemption relating to investments in subsidiaries in IAS 12.39). In line with this, the shares of the single asset entity and the underlying asset it holds cannot be treated as a single item for deferred taxation purposes. Accordingly, it would not be appropriate to measure the deferred taxation related to the underlying property with reference to selling the shares of the single asset entity.

How we see it

In a similar way to the principles discussed above, when determining the fair value of the underlying property, it would not be appropriate to include the related beneficial tax effects of purchasing shares of the single asset entity in the fair valuation of the underlying property. This is also because, when determining the fair value of the property, the unit of account is the underlying property itself (see Chapter 15).

For further discussions on recognition of deferred taxes for investment property and for single asset entities, see Chapter 29.

¹⁴ [IFRIC Update](#), July 2014, available on the IFRS Foundation's website.

7 The cost model

Extract from IAS 40

Cost model

- 56 After initial recognition, an entity that chooses the cost model shall measure investment property:
- (a) in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* if it meets the criteria to be classified as held for sale (or is included in a disposal group that is classified as held for sale);
 - (b) in accordance with IFRS 16 if it is held by a lessee as a right-of-use asset and is not held for sale in accordance with IFRS 5; and
 - (c) in accordance with the requirements in IAS 16 for the cost model in all other cases.

Except in the cases described in section 8 below, the cost model requires that investment property held by a lessee as a right-of-use asset be measured after initial recognition in accordance with IFRS 16 and under the cost model set out in IAS 16 for owned investment property. [IAS 40.56].

For further discussion on subsequent measurement of a right-of-use asset applying the cost model under IFRS 16, see Chapter 24.

Applying the cost model under IAS 16 means that the owned asset must be recognised at cost, depreciated systematically over its useful life and impaired when appropriate. [IAS 16.30]. The residual value and useful life of each owned investment property must be reviewed at least at each financial year-end and, if expectations differ from previous estimates, the changes must be accounted for as a change in accounting estimate in accordance with IAS 8. [IAS 16.51]. For further discussion on applying the cost model under IAS 16, see Chapter 19.

If an entity applies the cost model, the fair value of its investment property must be disclosed (see section 12.3 below).

7.1 Initial recognition

7.1.1 Identification of physical parts

The cost of the property must be analysed into appropriate significant components, each of which will have to be depreciated separately (see also Chapter 19).

The analysis into significant components is rarely a straightforward exercise since properties typically contain a large number of components with varying useful lives. Icade, which applied the cost model for measuring its investment property prior to 2021 (see section 7.2 below), disclosed the typical components it identified for its investment properties as well as the ranges of useful lives for each component - see Practical example 7-1 below.

Practical example 7-1: Icade (2020)

France

2020 UNIVERSAL REGISTRATION DOCUMENT [extract]**Notes to the consolidated financial statements [extract]****Note 5. Property portfolio and fair value [extract]****5.1. Property portfolio [extract]****5.1.1. Investment property [extract]****Accounting principles [extract]**

The gross value of an investment property is split into separate components which each have their own useful lives.

Investment property is depreciated using the straight-line method over periods which correspond to their expected useful life. Land is not depreciated. The depreciation periods used by the Group (in years) are as follows:

Components	Office and business parks		Healthcare facilities	Other assets ^(a)
	"Hausmann" buildings	Other properties		
Roads, networks, distribution	100	40-60	80	15-50
Structural works	100	60	80	30-50
External structures	30	30	20-40	20-25
General and technical equipment	20-25	10-25	20-35	10-25
Internal fittings	10-15	10-15	10-20	10-25
Specific equipment	10-30	10-30	20-35	10-25

(a) Other assets consist of hotels, homes and business premises.

Useful lives are revised at each reporting date, particularly in respect of investment property which is the subject of a restoration decision.

These assets are depreciated on a straight line basis over the course of the reasonably certain lease term.

...

An entity is also required to recognise replacement parts and derecognise the replaced part as described in Chapter 19.

7.1.2 Identification of non-physical parts

IAS 16 sets out that if an entity acquires property, plant and equipment subject to an operating lease in which it is the lessor, it may be appropriate to depreciate separately amounts reflected in the cost of that item that are attributable to favourable or unfavourable lease terms relative to market terms (see Chapter 19). [IAS 16.44]. This will therefore apply to investment property accounted for under the cost model (see section 4.7 above).

7.2 Incidence of use of the cost model

It appears less common for entities to measure investment property using the cost model than the fair value model.

How we see it

In previous years, EY real estate financial statement surveys have consistently found that over 90% of the companies in those surveys used the fair value model (e.g., about 98% based on the survey published in 2019). There also seems to be a general, although not universal, market consensus among existing entities reporting under IFRS accounting standards that the fair value model is the more appropriate. For example, in its latest *Best Practices Recommendations Guidelines* issued in September 2024, the European Public Real Estate Association ('EPRA') recommends to its members that "Real estate companies should account for their property investments based upon the fair value model."¹⁵

Some entities reporting under IFRS accounting standards have moved from the cost model. For example, Icade SA applied the cost model until 2021 when the fair value model was applied. It made the following disclosure in its 2021 financial statements:

15 [Best Practices Recommendations: Guidelines](#), EPRA, September 2024, section 4.1, p.35. Available on the EPRA's website.

2021 UNIVERSAL REGISTRATION DOCUMENT [extract]**1. Consolidated financial statements [extract]****NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****Note 1. General principles [extract]****1.2 Accounting standards [extract]****1.2.1. Change in accounting policy: valuation of investment property using the fair value model**

IAS 40 “Investment property” provides for two possible accounting policies to measure investment property after initial recognition:

- the fair value model measures investment property at fair value, in accordance with IFRS 13; or
- the cost model measures investment property using the cost model as set out in IAS 16 “Property, plant and equipment” (or in accordance with IFRS 16 in the case of a right to use, or IFRS 5 in the case of property classified as held for sale).

The latter method was the one applied by the Icade group in its historical financial statements.

The Group has elected to apply the fair value model for the measurement of investment property for the first time in the financial statements for the year ended December 31, 2021, believing that this change in policy provides more relevant information on the value of its property assets and aligns the Group with its peers. In accordance with IAS 8 “Accounting Policies, Changes in Accounting Estimates and Errors”, this change in policy was applied retrospectively, based on property asset valuations used for historical information. As a result, the 2020 financial statements presented have been restated using the new policy for comparative purposes.

The relevant accounting principles applied in accordance with IAS 40 are set out in note 5.

The main effects arising from this change in policy include:

- unless the standard requires otherwise, all investment property is measured using the fair value model in the statement of financial position;
- any gain or loss arising from a change in the fair value of investment property is presented as a separate line item in the consolidated income statement, between EBITDA and operating profit/(loss).

Such assets measured at fair value are no longer depreciated or impaired.

The impact of this change in policy on the Group’s opening consolidated equity as of January 1, 2020 amounted to €4,281.7 million, of which €3,530.4 million on a proportionate consolidation basis. The removal of the depreciation and impairment charges recognised in respect of investment property, the recognition of the change in the fair value of the property assets and adjustments to gains or losses on disposals led to an increase in the Group’s consolidated net profit for the financial year 2020 of €123.2 million, of which €55.3 million attributable to the Group (i.e. €0.75 per share).

...

How we see it

The use of the cost model (rather than the fair value model) removes the need to recognise gains from increases in the fair value of property within profit or loss. However, it is unlikely to insulate an entity from reporting falls in the fair value of investment property below the depreciated cost of the property, in profit or loss - see section 7.3 below.

7.3 Impairment

Investment property measured at cost is subject to the requirements of IAS 36 in respect of impairment. As set out in Chapter 21, IAS 36 requires a recoverable amount to be determined as the higher of (i) value in use and (ii) fair value less costs of disposal. [IAS 36.18].

Both value in use calculation and fair value calculation (where there is no price quoted for identical assets on an active market) are typically based on discounted cash flow models. The former will typically use entity specific cash flows, whilst the latter would generally use market expected cash flows. Both would use a market determined discount rate.

For a rental generating asset such as an investment property, the future cash flows to be taken into account in any projection would, in simple terms, be (i) the rental stream under the existing lease arrangements and (ii) an estimate of any rental stream and/or sales proceed from selling the investment property thereafter.

The cash flows expected to be generated from the existing lease would be the same whether the basis was entity specific or market expected cash flows.

The estimate of any rental stream thereafter would also be the same unless the entity forecast it would outperform the market and achieve superior cash flows. This is unlikely to be an acceptable basis for a forecast as no entity can realistically expect to outperform the market for its whole portfolio or do so for more than the short term. Therefore, a forecast that cash flows from individual properties will outperform the market would have to be considered with scepticism.

How we see it

We would regard it as being a rare circumstance where the value in use of an individual investment property could be said to be higher than the fair value of that property. Indeed, in some circumstances - for example, where a fair value is partly dependent on a gain from planned future development (see section 6.8 above) but where that expenditure is not to be allowed to be considered in a value in use calculation - value in use may be lower than fair value.

8 IFRS 5 and investment property

Investment property measured using the cost model (under IAS 16 or IFRS 16 - see section 7 above) which meets the criteria to be classified as held for sale or held for distribution to owners, or is included within a disposal group classified as held for sale or held for distribution to owners, is measured in accordance with IFRS 5. [IAS 40.56]. This means that such property will be held at the lower of carrying amount and fair value less costs to sell, and depreciation of the asset will cease. [IFRS 5.15, IFRS 5.25].

As set out in Chapter 5, investment property measured at fair value is not subject to the measurement requirements of IFRS 5. However, such property is subject to the classification and presentation requirements of that standard. Consequently, investment property that meets the criteria to be classified as held for sale or held for distribution to owners is required to be presented separately from other assets in the statement of financial position (see Chapter 5).

An example of an entity applying the presentation requirements of IFRS 5 to investment property measured at fair value is General Property Trust in its 2023 financial statements - see Practical example 8-1 below.

Investment property measured using the cost model is subject to the classification, measurement and presentation requirements of IFRS 5. Icade, which used the cost model for measuring its investment property prior to 2021 (see section 7.2 above), provided an accounting policy for such property held for sale in its 2017 financial statements - see Practical example 8-2 below.

REGISTRATION DOCUMENT 2017 [extract]**2. Notes to the consolidated financial statements [extract]****Note 1. Accounting principles [extract]****1.10. Assets held for sale
and discontinued operations**

In accordance with IFRS 5, if the Group decides to dispose of an asset or group of assets, it should be classified as held for sale if:

- the asset or group of assets is available for immediate sale in its present condition subject only to terms that are usual and customary for sales of such assets;
- it is highly likely to be sold within one year.

Consequently, this asset or group of assets is shown separately as "Assets held for sale" on the balance sheet. The liabilities related to this asset or group of assets are also shown separately on the liabilities side of the balance sheet.

For the Group, only assets meeting the above criteria and subject to a formal disposal decision at the appropriate management level are classified as assets held for sale. The accounting consequences are as follows:

- the asset (or group of assets) held for sale is measured at the lower of carrying amount and fair value less costs to sell;
- the asset stops being depreciated with effect from the date of transfer.

In addition to the disclosure requirements for investment property discussed in section 12 below, IFRS 5 requires further disclosures of applicable information in the notes to the financial statements in the period in which an investment property measured using the fair value model has been either classified as held for sale, or included in a disposal group classified as held for sale, or sold. These additional disclosures required by IFRS 5 are discussed in Chapter 5. [IFRS 5.41, IFRS 5.42].

On the other hand, IFRS 5 specifies the disclosures required in respect of investment property measured using the cost model that has been either classified as held for sale or included in a disposal group classified as held for sale (see Chapter 5). The disclosure requirements discussed in section 12 below do not apply to such investment property, except for the requirement in IAS 40.79(d)(iii) to show assets classified as held for sale, or included in a disposal group classified as held for sale, when disclosing the reconciliation of the carrying amount of investment property at the beginning and end of the period. [IFRS 5.5B].

9 Transfer of assets to or from investment property

IAS 40 specifies the circumstances in which a property, including property under construction or development, becomes, or ceases to be, an investment property as follows: [IAS 40.57]

Extract from IAS 40

- 57 An entity shall transfer a property to, or from, investment property when, and only when, there is a change in use. A change in use occurs when the property meets, or ceases to meet, the definition of investment property and there is evidence of the change in use. In isolation, a change in management's intentions for the use of a property does not provide evidence of a change in use. Examples of evidence of a change in use include:
- (a) commencement of owner-occupation, or of development with a view to owner-occupation, for a transfer from investment property to owner-occupied property;
 - (b) commencement of development with a view to sale, for a transfer from investment property to inventories;
 - (c) end of owner-occupation, for a transfer from owner-occupied property to investment property; and
 - (d) inception of an operating lease to another party, for a transfer from inventories to investment property.
 - (e) [deleted]

For the requirements of (d) above, see other considerations discussed in section 2.3 above.

Practical example 9-1 below describes how Land Securities Group PLC dealt with the requirements of (b) above.

Practical example 9-1: Land Securities Group PLC (2024)

United Kingdom

Landsec Annual Report 2024 [extract]

NOTES TO THE FINANCIAL STATEMENTS [extract]

SECTION 3 - PROPERTIES [extract]

A ACCOUNTING POLICY [extract]

TRANSFERS BETWEEN INVESTMENT PROPERTIES AND TRADING PROPERTIES

When the Group begins to redevelop an existing investment property for continued future use as an investment property, the property continues to be held as an investment property. When the Group begins to redevelop an existing investment property with a view to sell, the property is transferred to trading properties and held as a current asset. The property is remeasured to fair value as at the date of the transfer with any gain or loss being taken to the income statement. The remeasured amount becomes the deemed cost at which the property is then carried in trading properties.

Paragraph 57 of IAS 40, as described above, establishes a guiding principle regarding transfers to or from investment property based on whether there is evidence of a change in use and provides a non-exhaustive list of examples of such evidence. It reflects the principle that a change in use would involve:

- (a) An assessment of whether a property meets, or has ceased to meet, the definition of investment property
And
- (b) Supporting evidence that a change in use has occurred

Applying this principle, an entity transfers property under construction or development to, or from, investment property when, and only when, there is a change in the use of such property, supported by evidence. [IAS 40.BC25, IAS 40.BC26].

Accordingly, a change in management's intentions, in isolation, would not be enough to support a transfer of property. This is because management's intentions, alone, do not provide evidence of a change in use. Observable actions toward effecting a change in use must have been taken by the entity during the reporting period to provide evidence that such a change has occurred. [IAS 40.BC27].

The assessment of whether a change in use has occurred is based on an assessment of all the facts and circumstances, and judgement is needed to determine whether a property qualifies as investment property. [IAS 40.BC28]. If it is determined that a change in use has occurred, IAS 40 requires an entity to transfer the property to, or from, investment property.

We illustrate the application of this principle with an example below:

Illustration 9-1: Transfers from inventory

In 20X1, an entity purchased land with the intention of constructing an apartment building on the land and selling the apartments to private customers. Accordingly, the land was classified as inventory. During 20X1, the prices for residential properties decreased and the entity decided to change its original business plans at the beginning of 20X2. Instead of constructing an apartment building and selling the apartments, the entity decided to construct an office building that it would lease out to tenants. The entity holds and manages other investment property as well.

During the first half of 20X2, the entity obtained permission from the relevant authorities to commence the construction and hired an architect to design the office building. The physical construction of the office building began in August 20X2. No operating leases had been agreed with other parties for the lease of office space. However, negotiations had been held with potential tenants.

The inception of an operating lease is generally evidence of a change in use for a transfer from inventories to investment property. [IAS 40.57(d)]. However, even in the absence of the inception of an operating lease, there may be other circumstances that provide evidence of a change in use. In determining whether there is sufficient evidence for a change in use from inventory to investment property, all of the following criteria must be considered:

- The entity has prepared a business plan that reflects the future rental income generated by the property and this is supported with evidence that there is demand for rental space.
- The entity can demonstrate that it has the resources, including the necessary financing or capital, to hold and manage an investment property (which requires different skills than developing a property). If the entity also owns other investment property, this could be more easily demonstrated. However, if this property would be the entity's only investment property, it may be harder to demonstrate this.
- The change in use is legally permissible. That is, the entity has obtained permission from relevant authorities for the change in use. In cases where the approval of the change in use is merely a routine or a non-substantive legal requirement (i.e., not at the discretion of the authorities), the entity's request for permission may be sufficient evidence.

And

- If the property must be further developed for the change in use, development has commenced.

How we see it

Judgement is required when the change in use is evidenced by circumstances other than the inception of an operating lease. We would generally conclude that there is sufficient evidence for a change in use from inventory to investment property if all of the criteria referred to above are met.

For the scenario described in the fact pattern above, the entity met the above criteria at the point in time when it obtained permission from the relevant authorities to change the use of the property and commenced development of the property by hiring an architect. At that time, the land would be transferred from inventory to investment property as it is now held to earn rentals rather than sale proceeds.

9.1 Transfers from investment property to inventory

Transfers to inventory are more difficult to deal with by way of the application of a general principle since IFRS 5 explicitly deals with investment property held for sale. IAS 40 allows a transfer to inventory only when there is a change in use as evidenced, for example, by the start of development with a view to subsequent sale. [IAS 40.57].

If an entity decides to dispose of an investment property without development with a view to sale, it is unlikely to be transferred to inventory as IFRS 5 is applied to property held for sale to the extent that the requirements therein are met (see section 8 above).

The IASB is aware of this inconsistency in the application of IFRS 5 and IAS 2 to investment property and in 2010 it asked the IFRS IC to consider any necessary interpretation to resolve it. However, the IFRS IC decided to recommend proposals that indicated no change to existing practice.

Consequently, this means that, unless there is development with a view to sale, it will not be possible to reclassify investment property as inventory even if the entity holding that property changes its intentions and is no longer holding that property for rental or capital appreciation. Accordingly, when an entity decides to dispose of an investment property without development, it continues to classify the property as an investment property until it is derecognised (see section 10 below) and does not reclassify it as inventory. Similarly, if an entity begins to redevelop an existing investment property for continued future use as investment property, the property remains an investment property and is not reclassified as owner-occupied property during the redevelopment. [IAS 40.58].

9.2 Accounting treatment of transfers

When an entity uses the cost model for investment property, transfers between investment property, owner-occupied property and inventories do not change the carrying amount of the property transferred and they do not change the cost of that property for measurement or disclosure purposes. [IAS 40.59].

Transfers to and from investment property under the fair value model are accounted for as follows:

- *Transfers from inventory:* any difference between the fair value of the property at the date of change in use and its previous carrying amount must be recognised in profit or loss. [IAS 40.63]. This treatment is consistent with the treatment of sales of inventories. [IAS 40.64].
- *Transfers to inventory or owner-occupation:* the cost for subsequent accounting for inventories under IAS 2, or for owner-occupied property under IAS 16 or IFRS 16, must be the property's fair value at the date of change in use. [IAS 40.60].
- *Transfers from owner-occupation:* IAS 16 will be applied for owned property and IFRS 16 for property held by a lessee as a right-of-use asset up to the date of change in use. At that date, any difference between the carrying amount under IAS 16 or IFRS 16 and the fair value must be treated in the same way as a revaluation under IAS 16. [IAS 40.61].

How we see it

In relation to the first bullet point above, IAS 40.64 states that "The treatment of transfers from inventories to investment property that will be carried at fair value is consistent with the treatment of sales of inventories." However, this does not mean that revenue is recognised upon transfer of a property from inventory to investment property because control of the property is not transferred to a customer (i.e., the same property remains with the entity) and it is not a transaction that has commercial substance.

If the owner-occupied property had not previously been revalued, the transfer does not imply that the entity has now chosen a policy of revaluation for other property accounted for under IAS 16 in the same class. The treatment depends on whether it is a decrease or increase in value and whether the asset had previously been revalued or is impaired in value.

The treatment required by IAS 40 is as follows: [IAS 40.62]

Extract from IAS 40

- 62 Up to the date when an owner-occupied property becomes an investment property carried at fair value, an entity depreciates the property (or the right-of-use asset) and recognises any impairment losses that have occurred. The entity treats any difference at that date between the carrying amount of the property in accordance with IAS 16 or IFRS 16 and its fair value in the same way as a revaluation in accordance with IAS 16. In other words:
- (a) any resulting decrease in the carrying amount of the property is recognised in profit or loss. However, to the extent that an amount is included in revaluation surplus for that property, the decrease is recognised in other comprehensive income and reduces the revaluation surplus within equity.
 - (b) any resulting increase in the carrying amount is treated as follows:
 - (i) to the extent that the increase reverses a previous impairment loss for that property, the increase is recognised in profit or loss. The amount recognised in profit or loss does not exceed the amount needed to restore the carrying amount to the carrying amount that would have been determined (net of depreciation) had no impairment loss been recognised.
 - (ii) any remaining part of the increase is recognised in other comprehensive income and increases the revaluation surplus within equity. On subsequent disposal of the investment property, the revaluation surplus included in equity may be transferred to retained earnings. The transfer from revaluation surplus to retained earnings is not made through profit or loss.

IAS 40 also reconfirms that when an entity completes the construction or development of a self-constructed investment property that will be carried at fair value (i.e., no actual reclassification to investment property), any difference between the fair value of the property at that date and its previous carrying amount must be recognised in profit or loss. [IAS 40.65].

10 Disposal of investment property

IAS 40 requires: [IAS 40.66]

Extract from IAS 40

- 66** An investment property shall be derecognised (eliminated from the statement of financial position) on disposal or when the investment property is permanently withdrawn from use and no future economic benefits are expected from its disposal.

A disposal of an investment property may be achieved by:

- Its sale
- When it becomes the subject of a finance lease (the owner becoming the lessor)
- Or
- When it becomes the subject of a sale and leaseback deal (the original owner becoming the lessee) [IAS 40.67]

These derecognition rules also apply to a part of the investment property that has been replaced (see section 10.3 below).

IFRS 16 applies if a property is disposed of by the owner becoming a lessor in a finance lease (see Chapter 24), or if a property is the subject of a sale and leaseback transaction (see Chapter 24). [IAS 40.67].

If disposal of investment property is achieved by sale, the determination of the timing of recognition of any gain or loss must be in accordance with IFRS 15. Consequently, the date of disposal for investment property that is sold is the date the recipient obtains control of the investment property in accordance with the requirements for determining when a performance obligation is satisfied in IFRS 15. [IAS 40.67]. IFRS 15 requires revenue (and a gain or loss on disposal of a non-current asset not in the ordinary course of business) to be recognised when a performance obligation is satisfied, which will be when control of the asset is transferred to the customer. [IFRS 15.31]. Control may be transferred at a point in time or over time. [IFRS 15.32]. Accordingly, entities that dispose of an investment property through sale must recognise a gain or loss on disposal when control of the property transfers, which may be at a point in time. In many cases, control will transfer when the buyer obtains legal title and physical possession of the asset. However, this may occur prior to legal settlement if it can be demonstrated that control has passed to the buyer before that date.

Practical example 10-1 below describes how Land Securities Group PLC dealt with the requirements described above.

Practical example 10-1: Land Securities Group PLC (2024)

United Kingdom

Landsec Annual Report 2024 [extract]

NOTES TO THE FINANCIAL STATEMENTS [extract]

SECTION 3 - PROPERTIES [extract]

A ACCOUNTING POLICY [extract]

DISPOSAL OF PROPERTIES

Properties are treated as disposed when control of the property is transferred to the buyer. Typically, this will either occur on unconditional exchange or on completion. Where completion is expected to occur significantly after exchange, or where the Group continues to have significant outstanding obligations after exchange, the control will not usually transfer to the buyer until completion.

...

For the detailed discussion and requirements of IFRS 15 on satisfaction of performance obligations, see Chapter 28.

10.1 Calculation of gain or loss on disposal

Gains and losses on retirement or disposal of investment property are calculated based on the difference between the net disposal proceeds (after deducting direct costs of disposal) and the carrying amount of the asset. [IAS 40.69]. IAS 40 does not give guidance on how to determine the carrying amount of the asset. Possible alternatives would include the use of (i) the carrying amount in the financial statements of the last full period of account, or (ii) the carrying amount in the latest interim financial statements, or (iii) the updated carrying amount at the date of disposal.

How we see it

In our view, determining the carrying amount of the asset using any of the possible alternatives described above is a policy choice for an entity to make and is primarily a matter of income statement presentation to the extent that an entity presents gains and losses on disposal separately from gains and losses on revaluation.

This policy choice is illustrated in Practical example 6-1 above where Unibail-Rodamco-Westfield SE uses the 'full period of account' approach (i.e., alternative (i) above).

Gains and losses on retirement or disposal of investment property are recognised in profit or loss, unless it is a sale and leaseback and IFRS 16 requires a different treatment, in the period of retirement or disposal (see also section 12.4 below). [IAS 40.69]. Refer to Chapter 24 for a discussion of sale and leaseback under IFRS 16.

The amount of consideration to be included in the gain or loss arising from the derecognition of an investment property is determined in accordance with the requirements for determining the transaction price in IFRS 15.47 to 72. [IAS 40.70]. Under IFRS 15, an entity is required to consider the terms of the contract and its customary business practices in determining the transaction price. Transaction price is defined as the amount of consideration to which an entity expects to be entitled in exchange for transferring the property to a buyer, excluding amounts collected on behalf of third parties (e.g., sales taxes). The consideration in a contract may include fixed amounts, variable amounts, or both. [IFRS 15.47].

In many cases, the transaction price may be readily determined if the entity receives payment when it transfers the property and the price is fixed. In other situations, it could be more challenging as it may be affected by the nature, timing and amounts of consideration.

Determining the transaction price is discussed in detail in Chapter 28.

Subsequent changes to the estimated amount of the consideration included in the gain or loss must be accounted for in accordance with the requirements for changes in the transaction price in IFRS 15. [IAS 40.70]. This is further discussed in Chapter 28.

If an entity retains any liabilities after disposing of an investment property these are measured and accounted for in accordance with IAS 37 or other relevant standards, as appropriate. [IAS 40.71]. Accounting for such liabilities depends on specific facts and circumstances as such a liability may represent a provision (e.g., assurance-type warranty provisions) or a contingent liability under IAS 37, or a financial liability under IFRS 9, or a separate performance obligation (e.g., service-type warranties) or variable consideration (e.g., fines and penalties) under IFRS 15. See also related discussions in Question 5-4 in Chapter 28.

10.2 Sale prior to completion of construction

It should be noted that property that is subject to sale prior to completion of construction, if not previously classified as investment property, is likely to be property intended for sale in the ordinary course of business (see section 2.6 above) and is therefore not likely to be investment property. Accordingly, the requirements in IFRS 15 must be followed.

If, however, the property subject to sale prior to completion of construction is previously classified as investment property, guidance in IAS 40 would be followed - see discussions in sections 10 and 10.1 above. Any consequent construction services to be provided by the seller would likely be subjected to the requirements of IFRS 15.

For further discussion of IFRS 15, see Chapter 28.

10.3 Replacement of parts of investment property

When an entity that applies the fair value model wishes to capitalise a replacement part (provided it meets the criteria in section 3 above), the question arises of how to deal with the cost of the new part and the carrying amount of the original. The basic principle in IAS 40 is that the entity derecognises the carrying amount of the replaced part. However, the problem frequently encountered is that even if the cost of the old part is known, its carrying amount - at fair value - is usually by no means clear. It is possible also that the fair value may already reflect the loss in value of the part to be replaced, because the valuation reflected the fact that an acquirer would reduce the price accordingly. [IAS 40.68].

As all fair value changes are taken to profit or loss, the standard concludes that it is not necessary to identify separately the elements that relate to replacements from other fair value movements. Therefore, if it is not practical to identify the amount by which fair value should be reduced for the part replaced, the cost of the replacement is added to the carrying amount of the asset and the fair value of the investment property as a whole is reassessed. The standard notes that this is the treatment that would be applied to additions that did not involve replacing any existing part of the property. [IAS 40.68].

If the investment property is carried under the cost model, then the entity derecognises the carrying amount of the original part. A replaced part may not be a part that was depreciated separately, in which case, if it is not practicable to determine the carrying amount of the replaced part, the standard allows the entity to use the cost of the replacement as an indication of an appropriate carrying amount. This does not mean that the entity has to apply depreciated replacement cost, rather that it can use the cost of the replacement as an indication of the original cost of the replaced part in order to reconstruct a suitable carrying amount for the replaced part. [IAS 40.68].

10.4 Compensation from third parties

IAS 40 applies the same rules as IAS 16 to the treatment of compensation from third parties if property has been impaired, lost or given up (see Chapter 19). It stresses that impairments or losses of investment property, related claims for or payments of compensation from third parties and any subsequent purchase or construction of replacement assets are separate economic events that have to be accounted for separately. [IAS 40.73].

Impairment of investment property will be recorded automatically if the fair value model is used; but if the property is accounted for using the cost model, it is to be calculated in accordance with IAS 36 (see section 7.3 above and Chapter 21). If the entity no longer owns the asset, for example, because it has been destroyed or subject to a compulsory purchase order, it will be derecognised (see section 10 above). Compensation from third parties (for example, from an insurance company) for property that was impaired, lost or given up is recognised in profit or loss when it becomes receivable. The cost of assets restored, purchased or constructed as replacements is accounted for wholly on its own merits according to the recognition and measurement rules covered in sections 3 and 4 above. [IAS 40.72, IAS 40.73].

11 Interim reporting and IAS 40

IAS 34 *Interim Financial Reporting* requires the use of the same principles for the recognition and the definitions of assets, liabilities, income and expenses for interim periods as will be used in annual financial statements.

IAS 40 requires, for those entities using the fair value model, investment property to be presented at fair value at the end of the reporting period. Accordingly, investment property measured using the fair value model must also be measured at fair value in any interim financial reports. IAS 34 expects this as it includes the following guidance in Part C of the illustrative examples accompanying the standard:

"IAS 16 *Property, Plant and Equipment* allows an entity to choose as its accounting policy the revaluation model whereby items of property, plant and equipment are revalued to fair value. IFRS 16 *Leases* allows a lessee to measure right-of-use assets applying the revaluation model in IAS 16 if those right-of-use assets relate to a class of property, plant and equipment to which the lessee applies the revaluation model in IAS 16. Similarly, IAS 40 *Investment Property* requires an entity to measure the fair value of investment property. For those measurements, an entity may rely on professionally qualified valuers at annual reporting dates though not at interim reporting dates." [IAS 34.IE C7].

The United Kingdom regulator made a similar point in its 2009 report on its activities. It stated that:

"A key principle of IAS 34, 'Interim Financial Reporting', is that interim accounts should be prepared applying the same accounting policies as those applied to the annual accounts. IAS 40, 'Investment Property' requires companies applying the fair value model to carry their properties at fair value with changes reported in the income statement. Properties are therefore required to be carried at fair value at the half-year stage."¹⁶

For those entities using the cost model in annual financial statements, IAS 40 requires the disclosure of the fair value of investment property (see section 12.3 below). For interim financial statements prepared under IAS 34, there is no such explicit disclosure requirement. Preparers of the financial statements must therefore consider the principle of IAS 34 which is that:

"Timely and reliable interim financial reporting improves the ability of investors, creditors, and others to understand an entity's capacity to generate earnings and cash flows and its financial condition and liquidity." [IAS 34 Objective].

It is likely that an understanding of the fair value of investment property at the end of an interim reporting period would help this purpose.

In addition, Part C of the illustrative examples to IAS 34 sets out that IAS 40 requires an entity to estimate the fair value of investment property. It does not distinguish between those entities that measure investment property at fair value and those entities that use the cost model and disclose fair value.

How we see it

In line with the discussions above, it is our view that the fair value of investment property at the end of the interim period is usually expected to be disclosed in interim financial reports for those entities using the cost model in IAS 40.

IAS 34 is discussed in more detail in Chapter 37.

¹⁶ [Review Findings and Recommendations - 2009](#), Financial Reporting Review Panel, July 2009, p.11. Available on the Financial Reporting Council's website.

12 Presentation and disclosure requirements for investment property

The main disclosure requirements of IAS 40 are set out below, but it may be necessary to refer to relevant presentation and/or disclosure requirements in other standards such as IAS 1, IAS 10 *Events after the Reporting Period*, IFRS 5, IFRS 13 and IFRS 16.

When material, investment property is presented as a separate line item on the face of the statement of financial position as required by IAS 1 (see Chapter 3). [IAS 1.54(b)]. For fair value changes and gains or losses on disposal of investment property that may be presented on the face of the income statement, see discussions in sections 12.2.1 and 12.4 below. It is worth noting that IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted), was issued by the IASB in April 2024. IFRS 18 might have an impact on the income statement presentation of income and expenses of entities holding investment property, which will depend on an assessment of whether an entity has a specified main business activity of investing in investment property. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

For entities that apply the fair value option in IAS 40, attention will focus on the judgemental and subjective aspects of property valuations, because they will be reported in profit or loss. IFRS 13 also expands the disclosures related to fair value. Both IAS 40 and IFRS 13 require significant amounts of information to be disclosed about these judgements and the cash-related performance of the investment property, as set out below.

It is also worth noting that on 25 March 2021, the Board issued an Exposure Draft ED/2021/3, *Disclosure Requirements in IFRS Standards - A Pilot Approach (Proposed amendments to IFRS 13 and IAS 19)* (the ED), in which the Board proposed guidance for its own use when developing and drafting disclosure requirements in IFRS accounting standards. The proposed amendments to IFRS 13 suggested an overall disclosure objective which is supplemented by proposed specific disclosure objectives and items of information intended to ensure compliance with the overall disclosure objective. For further discussions related to the ED, see Chapter 15.

Note also that the disclosures below apply in addition to those in IFRS 16 which require the owner of an investment property to provide lessors' disclosures about leases into which it has entered. IAS 40 also requires a lessee that holds an investment property as a right-of-use asset to provide lessees' disclosures as required by IFRS 16 and lessors' disclosures as required by IFRS 16 for any operating leases into which it has entered. [IAS 40.74]. Accordingly, see Chapter 24 for the required disclosures of lessees and lessors, respectively.

For investment property that has been either classified as held for sale, or included in a disposal group classified as held for sale, or sold, additional disclosures are required by IFRS 5 (see Chapter 5) and, depending on the subsequent measurement model used for such investment property (fair value model or cost model), the disclosures discussed below may or may not be required. See further discussion in section 8 above.

If a decline in fair value of investment property between the end of the reporting period and the date when the financial statements are authorised for issue is material, an entity may need to give additional disclosure related to non-adjusting events as required by IAS 10 (see Chapter 34).

IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on the requirements of IFRS 19.

12.1 Disclosures under both fair value and cost models

Whichever model is chosen, fair value or cost, IAS 40 requires all entities to disclose the fair value of their investment property. Therefore, the following disclosures are required by IAS 40 in both instances: [IAS 40.75]

Extract from IAS 40

- 75** An entity shall disclose:
- (a) whether it applies the fair value model or the cost model.
 - (b) [deleted]
 - (c) when classification is difficult (see paragraph 14), the criteria it uses to distinguish investment property from owner-occupied property and from property held for sale in the ordinary course of business.
 - (d) [deleted]
 - (e) the extent to which the fair value of investment property (as measured or disclosed in the financial statements) is based on a valuation by an independent valuer who holds a recognised and relevant professional qualification and has recent experience in the location and category of the investment property being valued. If there has been no such valuation, that fact shall be disclosed.
 - (f) the amounts recognised in profit or loss for:
 - (i) rental income from investment property;
 - (ii) direct operating expenses (including repairs and maintenance) arising from investment property that generated rental income during the period;
 - (iii) direct operating expenses (including repairs and maintenance) arising from investment property that did not generate rental income during the period; and
 - (iv) the cumulative change in fair value recognised in profit or loss on a sale of investment property from a pool of assets in which the cost model is used into a pool in which the fair value model is used (see paragraph 32C).
 - (g) the existence and amounts of restrictions on the realisability of investment property or the remittance of income and proceeds of disposal.
 - (h) contractual obligations to purchase, construct or develop investment property or for repairs, maintenance or enhancements.

An example of the disclosure required in (e) above i.e., “If there has been no such valuation, that fact shall be disclosed.” would be a statement that the fair value of investment property is based on internal appraisals rather than on a valuation by an independent valuer as described in (e) above. See also discussion in section 6.1 above.

12.1.1 Methods and assumptions in fair value estimates

IFRS 13 includes a fair value hierarchy which prioritises the inputs used in a fair value measurement. The hierarchy is defined as follows:

- Level 1 inputs - Quoted prices (unadjusted) in active markets for identical assets or liabilities that the entity can access at the measurement date
 - Level 2 inputs - Inputs other than quoted prices included with Level 1 that are observable for the asset or liability, either directly or indirectly
- And
- Level 3 inputs - Unobservable inputs for the asset or liability [IFRS 13 Appendix A]

IFRS 13 also uses its fair value hierarchy to categorise each fair value measurement in its entirety for disclosure purposes. Categorisation within the hierarchy is based on the lowest level input that is significant to the fair value measurement as a whole. This is discussed further in Chapter 15.

Significant differences in disclosure requirements apply to fair value measurements categorised within each level of the hierarchy to provide users with insight into the observability of the fair value measurement (the full disclosure requirements of IFRS 13 are discussed further in Chapter 15).

How we see it

In our view, it would be rare for real estate to be categorised within Level 1 of the fair value hierarchy, as typically, there are no active markets for identical real estate assets (due to the uniqueness of each real estate asset).

In market conditions where similar real estate is actively purchased and sold, and the transactions are observable, the fair value measurement might be categorised within Level 2. This categorisation will be unusual for real estate, but that determination will depend on the facts and circumstances, including the significance of adjustments to observable data.

In this regard, IFRS 13 provides a real estate specific example stating that a Level 2 input would be the price per square metre for the property interest derived from observable market data, e.g., multiples derived from prices in observed transactions involving comparable (i.e., similar) property interests in similar locations. [IFRS 13.B35(g)]. Accordingly, in active and transparent markets for similar assets (perhaps those that exist in some of the capital cities of developed economies), real estate valuations might be able to be categorised within Level 2, provided that no significant adjustments have been made to the observable data.

However, and likely to be much more common for real estate, if an adjustment to an observed transaction is based on unobservable data and that adjustment is significant to the fair value measurement as a whole, the fair value measurement would be categorised within Level 3 of the fair value hierarchy for disclosure purposes.

How we see it

Considerable judgement may be required to determine whether the adjustments to the fair value measurement as a whole, are significant.

For fair value measurement of investment property, a Level 3 categorisation is likely to be the most common. For example, in February 2013, EPRA published its position paper on IFRS 13 - *EPRA Position Paper on IFRS 13, Fair Value Measurement & Illustrative Disclosures*. In this publication it is stated that:

“Estimating the fair value of an investment property inevitably requires a significant range of methodologies, inputs, and adjustments to reflect the wide range of factors which contribute towards the value of a property e.g. state and condition, location, in-place leases, development potential, infrastructure, etc. Consequently, even in the most transparent and liquid markets - and depending on the valuation technique - it is very likely that valuers will use one or more significant unobservable inputs or make at least one significant adjustment to an observable input. Accordingly, it is likely that the vast majority of property valuations will fall within the level 3 category.”¹⁷

IFRS 13 expands the disclosures related to fair value to enable users of financial statements to understand the valuation techniques and inputs used to develop fair value measurements.

17 [EPRA Position Paper on IFRS 13: Fair Value Measurement & Illustrative Disclosures](#), EPRA, February 2013, p.4. Available on the EPRA's website.

In summary, it requires the following additional disclosures for all entities regardless of the model of measurement or the valuation technique used in measuring investment property:

- The level of the fair value hierarchy within which the fair value measurement in its entirety is categorised [IFRS 13.93(b)]
- For Level 2 and Level 3 measurements, valuation technique and the inputs used, and changes in the valuation technique, if applicable, and the reasons for those changes [IFRS 13.93(d)]

And

- If the highest and best use of a non-financial asset differs from its current use, disclose that fact and the reason for it [IFRS 13.93(i)]

For entities applying the fair value model in measuring investment property, the following additional disclosure must be made:

- For Level 3 measurements, quantitative information regarding the significant unobservable inputs [IFRS 13.93(d)]
- Amount of transfers between Level 1 and Level 2, the reasons and related accounting policies [IFRS 13.93(c)]
- For Level 3 measurements, a reconciliation from the opening balances to the closing balances (including gains and losses, purchases, sales, issues, settlements, transfers in and out of Level 3 and reasons and policies for transfer and where all such amounts are recognised) [IFRS 13.93(e)]
- For Level 3 measurements, the total gains or losses included in profit or loss that are attributable to the change in unrealised gains or losses relating to those assets and liabilities held at the reporting date, and a description of where such amounts are recognised [IFRS 13.93(f)]
- For Level 3 measurements, a description of the valuation process used by the entity [IFRS 13.93(g)]

And

- For Level 3 measurements, a narrative description of the sensitivity of the fair value measurement to changes in unobservable inputs if a change in those inputs might result in a significantly different amount and, if applicable, a description of interrelationships between those inputs and other unobservable inputs and of how they might magnify or mitigate the effect of changes in the unobservable inputs [IFRS 13.93(h)]

Unibail-Rodamco-Westfield SE included the following disclosures in its 2023 financial statements, in addition to those disclosed in Practical example 6-1 above.

Practical example 12-1: Unibail-Rodamco-Westfield SE (2023)

France

Universal Registration Document 2023 [extract]

Dec. 31, 2023	32,015.9	2,404.2	2,492.7	36,912.8	33.9	36,946.7

(1) Relates to the change of consolidation method of Croydon and the entry of fully consolidated companies.

(2) Capitalised expenses mainly relate to:

- Shopping centres in Germany, France and US;
- Offices in France; and
- C&E sites such as the Parc des Expositions in Porte de Versailles.

(3) Includes the disposals of Polygone Riviera, Westfield Brandon, Versailles Chantiers and the foreclosure of San Francisco Centre (see note 1.1.1 Disposals in 2023).

(4) Includes mainly:

- The reclassification of Westfield Hamburg from IPUC at cost to IPUC at fair value; and
- The revaluation of the financial lease of LAX Airport (€92.8 Mn), the Parc des Expositions in Porte de Versailles (€55.3 Mn) and Le Bourget (€11.5 Mn).

VALUATION ASSUMPTIONS AND SENSITIVITY OF THE FULLY CONSOLIDATED ASSETS

Considering the limited public data available, the complexity of real estate asset valuations, as well as the fact that appraisers use in their valuations the non-public rent rolls of the Group's assets, URW believes it is appropriate to classify its assets under Level 3 as per IFRS 13. In addition, unobservable inputs, including appraisers' assumption on growth rates and exit capitalisation rates, are used by appraisers to determine the fair value of URW's assets.

As at December 31, 2023, 99% of URW's portfolio was appraised by qualified independent external appraisers.

The net outstanding balances of deferred lease incentives and key money amortised over the expected term of the lease, which corrected the appraisal value, represented -€185.8 Mn (-€159.3 Mn as at December 31, 2022).

The following tables provide a number of quantitative elements used by the appraisers to assess the fair valuation of the Group's assets.

SHOPPING CENTRES

All shopping centres are valued using the DCF and/or yield methodologies.

The table below only includes fully consolidated assets.

Shopping Centres – Dec. 31, 2023		Net Initial Yield	Rent in € per sqm ^(a)	Discount Rate ^(b)	Exit Capitalisation Rate ^(c)	CAGR of NRI ^(d)

Net Initial Yield ("NIY"), Discount Rate ("DR") and Exit Capitalisation Rate ("ECR") weighted by GMV. Vacant assets, assets considered at bid value, and assets under restructuring are not included in Min. and Max. calculation. Assets under development or not controlled by URW and the airport activities are not included in this table neither the UK asset.

(a) Average annual rent (minimum guaranteed rent ("MGR") + sales-based rent ("SBR")) per asset per square meter.

(b) Rate used to calculate the net present value of future cash flows.

(c) Rate used to capitalise the exit rent to determine the exit value of an asset.

(d) Compound annual growth rate ("CAGR") of Net Rental Income ("NRI") determined by the appraiser (duration of the DCF model used either 6 or 10 years).

...

The tables below show the sensitivity on URW's Shopping Centres portfolio value for assets fully consolidated, excluding assets under development and the airport activities.

The percentages below are indicative of evolutions in case of various evolutions of NIY, DR, ECR and appraisers' Estimated Rental Value (ERV).

Sensitivity	Impact in € Mn	Impact in %
+25 bps in NIY	(1,466)	(4.5)%
+25 bps in DR	(522)	(1.6)%
+10 bps in ECR	(395)	(1.2)%
-5% in appraisers' ERV	(1,270)	(3.9)%
Sensitivity	Impact in € Mn	Impact in %
-25 bps in NIY	+1,612	+5.0%
-25 bps in DR	+534	+1.6%
-10 bps in ECR	+420	+1.3%
+5% in appraisers' ERV	+1,031	+3.2%

OFFICES & OTHERS

Appraisers value the Group's Offices & Others using the DCF and yield methodologies.

The tables below show the sensitivity on URW's Offices & Others portfolio value for assets fully consolidated, excluding assets under development.

The percentages below are indicative of evolutions in case of various evolutions of NIY.

Sensitivity	Impact in € Mn	Impact in %
+25 bps in NIY	(82)	(4.5)%
-25 bps in NIY	+90	+4.9%

CONVENTION & EXHIBITION

The table shows below the sensitivity of the C&E portfolio related to the weighted average cost of capital ("WACC").

Sensitivity	Impact in € Mn	Impact in %
+25 bps in "WACC"	(77)	(3.7)%
-25 bps in "WACC"	+82	+4.0%

5.1.3 INVESTMENT PROPERTIES UNDER CONSTRUCTION AT COST – IFRS BASIS

(1) Capitalised expenses mainly refer to investments in Westfield Hamburg.
(2) Includes mainly the reclassification of Westfield Hamburg from IPUC at cost to IPUC at fair value.
(3) Impairment mainly relates to Sisters in La Défense.

After providing the minimum disclosures required by IFRS 13 and other IFRS accounting standards, such as IAS 1, an entity must assess whether additional information must be disclosed in order to help financial statement users better understand and evaluate the quantitative information provided by the entity (see Chapter 15). [IFRS 13.92]. This assessment requires judgement and will depend on the specific facts and circumstances of the entity and the needs of the users of its financial statements. For example, if climate risk factors have a material impact on the fair value measurements, an entity might disclose whether and how climate-related factors have been incorporated within the methodologies and inputs.

12.1.2 Level of disaggregation for IFRS 13 disclosures

IFRS 13 disclosures are required for each class of assets (and liabilities). These classes are determined based on:

- The nature, characteristics and risks of the asset or liability
And
- The level of the fair value hierarchy within which the fair value measurement is categorised [IFRS 13.94]

The determination of the appropriate class of assets will require significant judgement. See Chapter 15 for further discussion on this determination.

At one end of the spectrum, the properties in an operating segment (as defined by IFRS 8 *Operating Segments*) may be a class of assets for the purpose of the disclosures required by IFRS 13. This may be the case if the properties have the same risk profile (for example, the segment comprises residential properties in countries with property markets of similar characteristics) even if there are a large number of properties in the segment.

At the other end of the spectrum, IFRS 13 disclosures may be required for individual properties or small groups of properties if the individual properties or groups of properties have different risk profiles (for example, a real estate entity with two properties - an office building in a developed country and a shopping centre in a developing country).

The number of classes may need to be greater for fair value measurements categorised within Level 3 of the fair value hierarchy because those measurements have a greater degree of uncertainty and subjectivity.

A class of assets and liabilities will often require greater disaggregation than the line items presented in the statement of financial position. However, sufficient information must be provided to permit reconciliation to the line items presented in the statement of financial position.

When determining the appropriate classes, entities must also consider all of the following:

- The level of detail necessary to satisfy the disclosure requirements
- How much emphasis to place on each of the various requirements
- How much aggregation or disaggregation to undertake
And
- Whether users of financial statements need additional information to evaluate the quantitative information disclosed [IFRS 13.92]

Determining appropriate classes of assets and liabilities for which disclosures about fair value measurements must be provided requires considerable judgement. [IFRS 13.94].

12.1.3 Disclosure of direct operating expenses

As set out in section 12.1 above, entities are required to disclose both the direct operating expenses arising from investment property that generated rental income during the period and the amounts arising from investment property that did not generate rental income during the period.

How we see it

In practice, the disclosure requirement referred to above can be interpreted in different ways and the outcome will depend upon a number of judgements, for example, the unit of account for the investment property. In the instance of a multi-tenanted property, the relevant unit may be considered either the entire building or a separately let floor.

It will therefore be necessary for an entity to interpret this requirement and apply that interpretation, as an accounting policy and judgement, consistently.

12.2 Additional disclosures for the fair value model

A reconciliation between the carrying amounts of investment property at the start and end of the period must be given showing the following:

- Additions, disclosing separately those additions resulting from acquisitions and those resulting from subsequent expenditure recognised in the carrying amount of an asset
- Additions resulting from acquisitions through business combinations
- Assets classified as held for sale or included in a disposal group classified as held for sale in accordance with IFRS 5 and other disposals
- Net gains or losses from fair value adjustments
- The net exchange differences arising on the translation of the financial statements into a different presentation currency, and on translation of a foreign operation into the presentation currency of the reporting entity
- Transfers to and from inventories and owner-occupied property
- And
- Other changes [IAS 40.76]

When a valuation obtained for investment property is adjusted significantly for the purpose of the financial statements, for example to avoid double-counting of assets or liabilities that are recognised separately (see section 6.1.4 above), the entity must disclose a reconciliation between the valuation obtained and the adjusted valuation included in the financial statements, showing separately the aggregate amount of any recognised lease liabilities that have been added back, and any other significant adjustments. [IAS 40.77]. Practical example 6-3 above provides an example of such disclosure.

12.2.1 Presentation of changes in fair value

Neither IAS 1 nor IAS 40 specifies how changes in the fair value of investment property must be presented in the income statement. The Practical examples below show two different approaches. In Practical example 12-2 below the change in fair value is presented together with the profit or loss on disposal of properties (here referred to as a “Loss on revaluation and profit on sale of investment property”) with an analysis of the components included in the notes to the financial statements. By contrast, in Practical example 12-3 below, the change in fair value is analysed and presented separately from the profit or loss on disposal of properties.

Practical example 12-2: Shaftesbury Capital PLC (2023)

United Kingdom

2023 Annual Report [extract]

NET OPERATING RESULT		(968.9)	545.0

...

(1) The result on disposal of investment properties includes both the result on disposal of assets and the result on disposal of shares.

...

When it is relevant to an understanding of the entity's financial performance, additional line items, headings and subtotals are presented in the income statement. [IAS 1.85]. Some companies may elect to disclose the results of operating activities, or a similar line item, even though this term is not defined. In such cases, the Board notes that the entity should ensure that the amount disclosed is representative of activities that would normally be regarded as 'operating' (see Chapter 3). [IAS 1.BC56]. Accordingly, the same analysis is applied when presenting changes in the fair value of investment properties in the income statement. An entity that presents a measure of operating profit in its income statement must determine whether changes in the fair value of its investment property form part of operating activities of the entity and therefore, include such changes in fair value in that measure.

In line with this, it is worth noting that one European regulator has concluded that fair value changes arising from investment property must be taken into account when determining operating results. This decision was reported in the European Securities and Markets Authority's ('ESMA') *Report - 11th Extract from the EECS's Database of Enforcement (ESMA/2011/265)*. The regulator's rationale for this decision was that fair value changes in investment property are a normal part of the activities of a real estate company and feature in the description of the business model of that real estate business.¹⁸

As discussed in section 12 above, once IFRS 18 is effective, it might have an impact on the income statement presentation of fair value changes arising from investment property. For example, if an entity invests in investment property as a main business activity (such as investment property holding companies), it is required to classify remeasurement of fair value of its investment property in the operating category of the income statement. Otherwise, if investing in investment property is not a main activity of an entity, such remeasurements of fair value of investment property will be classified in the investing category of the income statement (see Chapter 4). IFRS 18 was issued by the IASB in April 2024 and will supersede IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

12.2.2 Extra disclosures where fair value cannot be determined reliably

If an entity chooses the fair value model, but in an exceptional case cannot measure the fair value of the property reliably and accounts for the property under the cost model in IAS 16 or in accordance with IFRS 16, the reconciliation described in section 12.2 above must disclose the amounts for such investment property separately from amounts relating to other investment property. In addition to this, the following must be disclosed:

- A description of the investment property
- An explanation of why fair value cannot be measured reliably
- If possible, the range of estimates within which fair value is highly likely to lie
- And
- On disposal of investment property not carried at fair value:
 - The fact that the entity has disposed of investment property not carried at fair value
 - The carrying amount of that investment property at the time of sale
 - And
 - The amount of gain or loss recognised [IAS 40.78]

The standard makes it clear that this situation, at least for completed investment property, would be exceptional (see section 6.2 above). The situation for investment property under construction is discussed in section 6.3 above.

18 [Report: 11th Extract from the EECS's Database of Enforcement \(ESMA/2011/265\)](#), ESMA, August 2011, paras. 76-81. Available on the ESMA's website.

12.3 Additional disclosures for the cost model

If investment property is measured using the cost model, the following disclosures are required by IAS 40 in addition to those in section 12.1 above: [IAS 40.79]

Extract from IAS 40

Cost model

- 79 In addition to the disclosures required by paragraph 75, an entity that applies the cost model in paragraph 56 shall disclose:
- (a) the depreciation methods used;
 - (b) the useful lives or the depreciation rates used;
 - (c) the gross carrying amount and the accumulated depreciation (aggregated with accumulated impairment losses) at the beginning and end of the period;
 - (d) a reconciliation of the carrying amount of investment property at the beginning and end of the period, showing the following:
 - (i) additions, disclosing separately those additions resulting from acquisitions and those resulting from subsequent expenditure recognised as an asset;
 - (ii) additions resulting from acquisitions through business combinations;
 - (iii) assets classified as held for sale or included in a disposal group classified as held for sale in accordance with IFRS 5 and other disposals;
 - (iv) depreciation;
 - (v) the amount of impairment losses recognised, and the amount of impairment losses reversed, during the period in accordance with IAS 36;
 - (vi) the net exchange differences arising on the translation of the financial statements into a different presentation currency, and on translation of a foreign operation into the presentation currency of the reporting entity;
 - (vii) transfers to and from inventories and owner-occupied property; and
 - (viii) other changes.
 - (e) the fair value of investment property. In the exceptional cases described in paragraph 53, when an entity cannot measure the fair value of the investment property reliably, it shall disclose:
 - (i) a description of the investment property;
 - (ii) an explanation of why fair value cannot be measured reliably; and
 - (iii) if possible, the range of estimates within which fair value is highly likely to lie.

12.4 Presentation of sales proceeds

IAS 16 requires an entity that, in the course of its ordinary activities, routinely sells items of property, plant and equipment that it has held for rental to transfer such assets to inventories at their carrying amount when they cease to be rented and become held for sale. The proceeds from the sale of such assets are then recognised as revenue in accordance with IFRS 15 (see Chapter 19). [IAS 16.68A].

How we see it

However, investment property, by definition, is held to earn rentals or for capital appreciation rather than for sale in the ordinary course of business. Consequently, we consider that the accounting treatment set out in IAS 16.68A, as described above, must not be applied by analogy to IAS 40 and proceeds from the sale of investment property would not be presented as revenue.

Despite this, however, it may be appropriate to present separately, the material gains or losses on retirement or disposal of investment property elsewhere in the financial statements, either as part of the income statement or in the notes. [IAS 1.97]. For example, Unibail-Rodamco-Westfield SE has chosen to present proceeds from disposal of investment properties, together with the carrying amount derecognised and the net gain/loss on disposal on the face of its statement of comprehensive income (see Practical example 12-3 above).

As discussed in section 12 above, once IFRS 18 is effective, it might have an impact on the income statement presentation of gains and losses arising from disposal of investment property. For example, if an entity invests in investment property as a main business activity (such as investment property holding companies), it is required to classify gains and losses on disposal of investment property in the operating category of the income statement. Otherwise, if investing in investment property is not a main activity of an entity, such gains and losses arising from disposal of investment property will be classified in the investing category of the income statement (see Chapter 4). IFRS 18 was issued by the IASB in April 2024 and will supersede IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

Extract from IAS 40

Definitions

- 5 The following terms are used in this Standard with the meanings specified:
- Carrying amount* is the amount at which an asset is recognised in the statement of financial position.
- Cost* is the amount of cash or cash equivalents paid or the fair value of other consideration given to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRSs, eg IFRS 2 *Share-based Payment*.
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*).
- Investment property* is property (land or a building - or part of a building - or both) held (by the owner or by the lessee as a right-of-use asset) to earn rentals or for capital appreciation or both, rather than for:
- (a) use in the production or supply of goods or services or for administrative purposes; or
 - (b) sale in the ordinary course of business.
- Owner-occupied property* is property held (by the owner or by the lessee as a right-of-use asset) for use in the production or supply of goods or services or for administrative purposes.

Overview

This chapter addresses the requirements of the IFRS accounting standard IAS 36 *Impairment of Assets* (the standard). IAS 36 sets out the procedures that entities must apply to ensure that those assets in the scope of the standard are carried at no more than the amounts expected to be recovered through the use or sale of the assets. If circumstances arise which indicate assets could be impaired, the standard requires a review of their cash generating abilities (an impairment test). Irrespective of whether there is any indication of impairment, IAS 36 requires that certain assets (goodwill, intangible assets not yet available for use and intangible assets with indefinite useful life) be tested for impairment at least annually. In many cases, individual assets will not have individually identifiable and independent cash inflows and therefore would need to be assessed for impairment on a cash-generating unit (CGU) level. An impairment test would require an entity to determine the recoverable amount which is the higher of fair value less costs of disposal (FVLCD) and value in use (VIU) of the asset/CGU. The recoverable amount is compared with the assets'/CGUs carrying value, and if the carrying value is higher, the difference must be written off as an impairment loss in the statement of comprehensive income. The provisions within IAS 36 that set out exactly how this is to be done, and how the figures involved are to be calculated, are detailed and quite complex and discussed in detail in this chapter. While the detailed guidance around the calculation of VIU is covered in IAS 36, IFRS 13 *Fair Value Measurement* deals with the detailed guidance around determining fair values (see Chapter 15).

The final section of this chapter addresses the IASB's project on goodwill and impairment and the potential consequences for IAS 36.

Differences between the IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter as the accounting standards are not converged.

What you need to know

- IAS 36 sets out the requirements to account for and report impairment of most non-current non-financial assets.
- IAS 36 specifies when an entity needs to perform an impairment test, how to perform it, the recognition and reversal of any impairment losses and the related disclosures.
- IAS 36 requires entities to test all assets that are within its scope for potential impairment when indicators of impairment exist or, at least, annually for goodwill, intangible assets not yet available for use and intangible assets with indefinite useful lives.
- IAS 36 requires that assets be carried at no more than their recoverable amount, which is defined as the higher of fair value less costs of disposal and value in use.
- In many cases assets will be tested for impairment on a CGU level.
- While the main principles of IAS 36 are very clear, the practical application of IAS 36 is proving to be challenging, due to the judgements and estimates required in assessing whether there are indications of impairment, in identifying the CGUs and in determining the recoverable amount of assets.

1 Introduction

1.1 The theory behind the standard

The purpose of the standard is to ensure that intangible assets, including goodwill, and tangible assets are not carried at a figure greater than their recoverable amount (RA). This recoverable amount is compared with the carrying value (or carrying amount (CA)) of the asset to determine if the asset is impaired.

[IAS 36.1].

Recoverable amount is defined as the higher of fair value less costs of disposal (FVLCD) and value in use (VIU); the underlying concept being that an asset cannot be carried at more than the amount it could raise, either from selling it now or from using it. [IAS 36.74].

Fair value less costs of disposal essentially means what the asset could be sold for, having deducted costs of disposal (incrementally incurred direct selling costs). Value in use is defined in terms of discounted future cash flows, as the present value of the cash flows expected from the future use and eventual sale of the asset at the end of its useful life. As the recoverable amount is to be expressed as a present value, not in nominal terms, discounting is a central feature of the impairment test.

Diagrammatically, this comparison between carrying value and recoverable amount, and the definition of recoverable amount, can be portrayed as follows:

It will not always be necessary to identify both VIU and FVLCD, as if either of VIU or FVLCD is higher than the carrying amount then there is no impairment, and no impairment loss is recognised. Thus, if FVLCD is greater than the carrying amount then no further consideration need be given to VIU, or to the need to recognise an impairment loss. The more complex issues arise when the FVLCD is not greater than the carrying value, and so a VIU calculation is necessary.

1.2 Key features of the standard

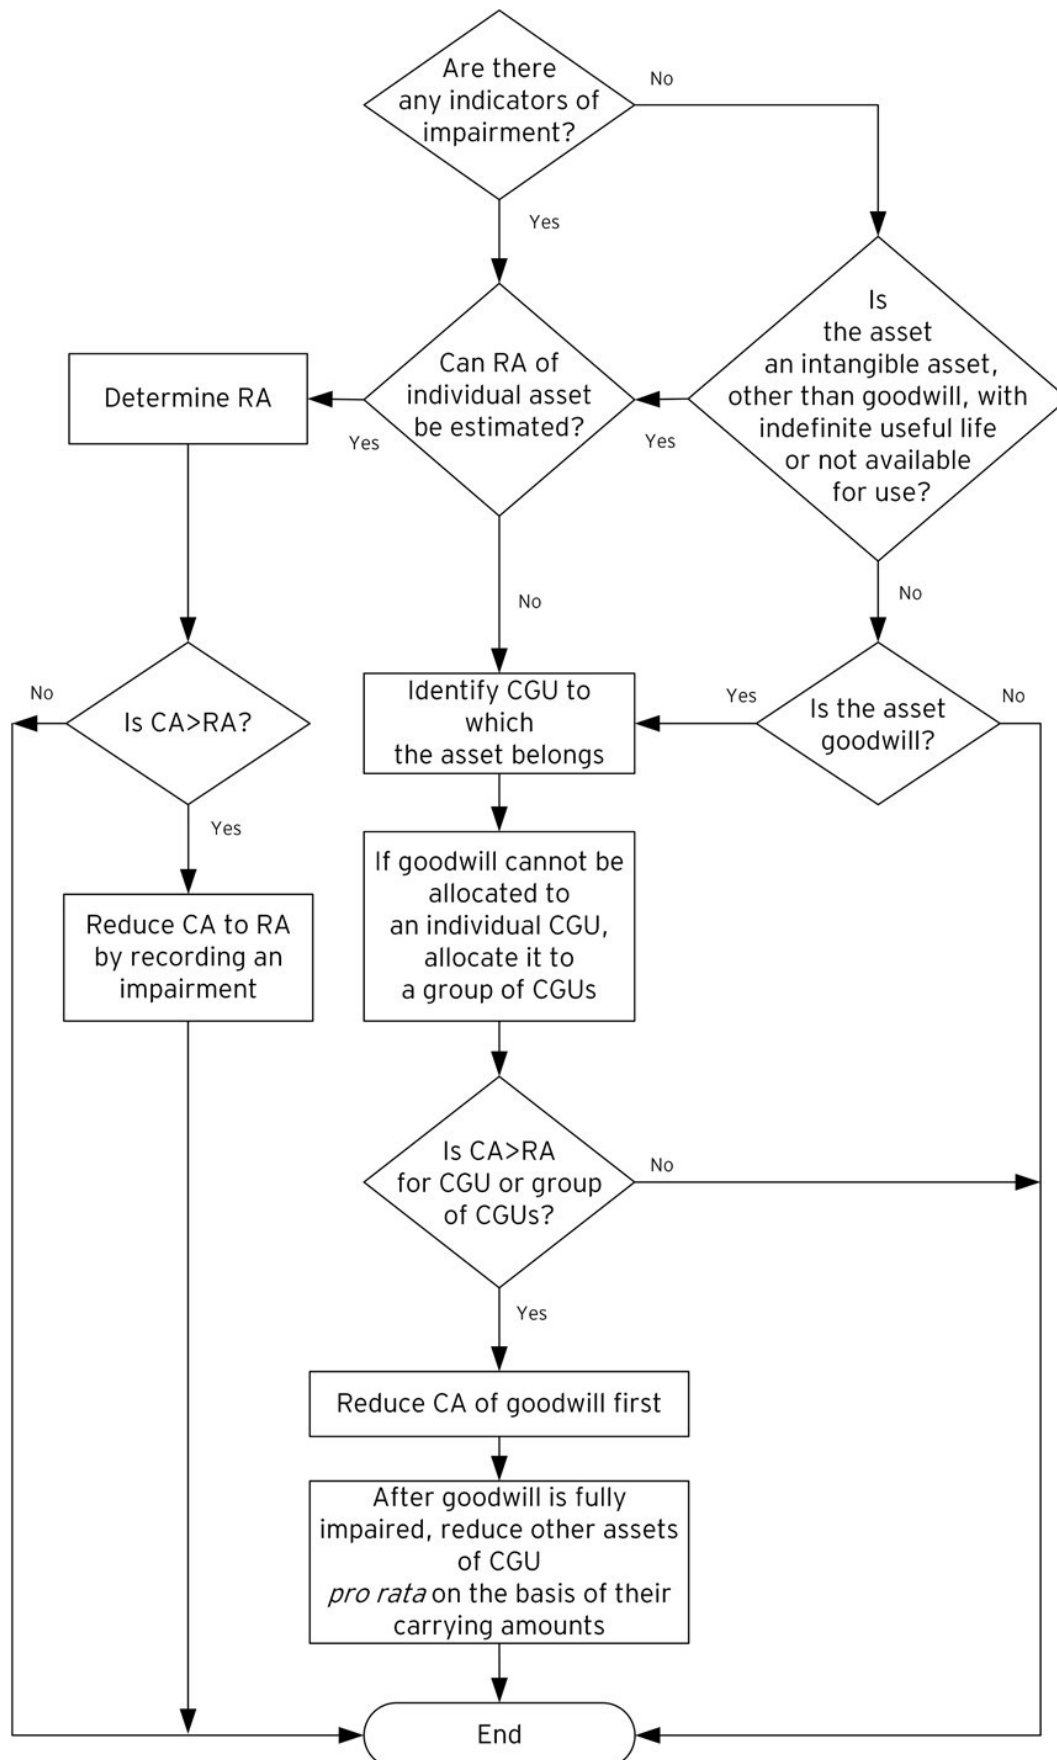

Although an impairment test can theoretically be conducted on individual assets, this will not always be possible. Goodwill does not have a separate FVLCD at all. Even if FVLCDs can be obtained for individual items of property, plant and equipment, estimates of VIUs usually cannot be. This is because the cash flows necessary for the VIU calculation are not usually generated by single assets, but by groups of assets being used together.

Often, therefore, the impairment test cannot be done at the level of the individual asset, and it must be applied to a group of assets. IAS 36 uses the term cash-generating unit (CGU) for the smallest identifiable group of assets that together have cash inflows that are largely independent of the cash inflows from other assets and that therefore can be the subject of a VIU calculation. This focus on the CGU is fundamental, as it has the effect of making the impairment test essentially a business-value test. Goodwill cannot always be allocated to an individual CGU, but to a group of CGUs. IAS 36 has detailed guidance in respect of the level at which goodwill is tested for impairment which is discussed in section 8 below.

Most assets and CGUs need only be tested for impairment if there are indicators of impairment. The 'indications' of impairment relate to either the assets themselves or to the economic environment in which they are operated. IAS 36 gives examples of indications of impairment, but makes it clear this is not an exhaustive list, and states explicitly that the entity can identify other indications that an asset is impaired, that would equally trigger an impairment test. [IAS 36.13]. There are more onerous requirements for goodwill, intangible assets with an indefinite useful life and intangible assets that are not yet available for use on the reporting date. These must be tested for impairment at least on an annual basis, irrespective of whether there are any impairment indicators. This is because the first two, goodwill and intangible assets with indefinite useful lives, are not subject to annual amortisation while it is argued that intangible assets are intrinsically subject to greater uncertainty before they are available for use. Impairment losses are recognised as expenses in profit or loss except in the case of an asset carried at a revalued amount where the impairment loss is recorded first against any previously recognised revaluation gains in respect of that asset in other comprehensive income.

Figure 1-1 below illustrates the key stages in the process of measuring and recognising impairment losses under IAS 36. The key components of the diagram are discussed in detail in the remainder of this chapter.

Figure 1-1: Determining and accounting for impairment

The entity assesses at each reporting date, whether an impairment assessment is required and acts accordingly:

- If there is an indication that an asset could be impaired, an impairment test is required.
- For goodwill, intangible assets with an indefinite useful life and intangible assets that are not yet available for use on the reporting date an annual impairment test is required.
- An asset is assessed for impairment either at an individual asset level or the level of a CGU depending on the level at which the recoverable amount can be determined, meaning the level at which independent cash inflows are generated.
- If the impairment test is performed at a CGU level, the entity needs to be divided into CGUs.
- After the identification of the CGUs, the carrying amount of the CGUs is determined.
- If goodwill is not monitored at the level of an individual CGU, then it is allocated to the group of CGUs that represent the lowest level within the entity at which goodwill is monitored for internal management purposes, but not at a level that is larger than an operating segment.
- The recoverable amount of the asset or CGU assessed for impairment is established and compared with the carrying amount.
- The asset or CGU is impaired if its carrying amount exceeds its recoverable amount, defined as the higher of FVLCD and VIU.
- For assets carried at cost, any impairment loss is recognised as an expense in profit or loss.
- For assets carried at revalued amount, any impairment loss is recorded first against any previously recognised revaluation gains in other comprehensive income in respect of that asset.
- Impairment losses in a CGU are first recorded against goodwill and second, if the goodwill has been written off, on a *pro rata* basis to the carrying amount of other assets in the CGU. However, the carrying amount of an asset cannot be reduced below the highest of its FVLCD, VIU or zero. If the preceding rule is applied, further allocation of the impairment loss is made *pro rata* to the other assets of the unit (group of units).
- Extensive disclosure is required for the impairment test and any impairment loss that has been recognised.
- An impairment loss for an asset other than goodwill recognised in prior periods must be reversed if there has been a change in the estimates used to determine the asset's recoverable amount.

The application of the guidance in IAS 36 may require significant judgement, for example in relation to the determination of the recoverable amount. Where this does not result in a materially different outcome, simplifications and approximations are applied in practice to reduce the complexity of the exercise. Some of these will be addressed in more detail in the relevant sections of the chapter.

1.3 Scope

The standard is a general impairment standard, and its provisions are referred to in other IFRS accounting standards, for example IAS 16 *Property, Plant and Equipment*, IAS 38 *Intangible Assets*, IFRS 16 *Leases* and IFRS 3 *Business Combinations*, where impairment is to be considered.

The standard has a general application to all assets, but scopes out certain assets. This is set out in IAS 36.2: [IAS 36.2]

Extract from IAS 36

- 2 This Standard shall be applied in accounting for the impairment of all assets, other than:**
- (a) inventories (see IAS 2 *Inventories*);
 - (b) contract assets and assets arising from costs to obtain or fulfil a contract that are recognised in accordance with IFRS 15 *Revenue from Contracts with Customers*;
 - (c) deferred tax assets (see IAS 12 *Income Taxes*);
 - (d) assets arising from employee benefits (see IAS 19 *Employee Benefits*);
 - (e) financial assets that are within the scope of IFRS 9 *Financial Instruments*;
 - (f) investment property that is measured at fair value (see IAS 40 *Investment Property*);
 - (g) biological assets related to agricultural activity within the scope of IAS 41 *Agriculture* that are measured at fair value less costs to sell;
 - (h) contracts within the scope of IFRS 17 *Insurance Contracts* that are assets and any assets for insurance acquisition cash flows as defined in IFRS 17; and
 - (i) non-current assets (or disposal groups) classified as held for sale in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*.

This, the standard states, is because these assets are subject to specific recognition and measurement requirements. [IAS 36.3]. The effect of these exclusions is to reduce the scope of IAS 36.

While investment properties measured at fair value are exempt, investment properties not carried at fair value are in the scope of IAS 36.

If a company has recorded oil and mineral exploration and evaluation assets and has chosen to carry them at cost, then these assets are to be tested under IAS 36 for impairment, once they have been assessed for impairment indicators in accordance with IFRS 6 *Exploration for and Evaluation of Mineral Resources*.

[IFRS 6.2(b)].

Financial assets classified as subsidiaries as defined in IFRS 10 *Consolidated Financial Statements*, joint ventures as defined in IFRS 11 *Joint Arrangements* and associates as defined in IAS 28 *Investments in Associates and Joint Ventures* are within its scope. [IAS 36.4]. This will generally mean only those investments in the separate financial statements of the parent. However, interests in joint ventures and associates included in the consolidated accounts by way of the equity method are brought into scope by IAS 28. [IAS 28.42].

The standard applies to assets carried at revalued amounts, e.g., under IAS 16 (or rarely IAS 38). See section 6.1.3 below. [IAS 36.5].

A lessee shall apply IAS 36 to determine whether a right-of-use asset is impaired and to account for any impairment loss identified. [IFRS 16.33].

Contracts within the scope of IFRS 17 are excluded from the scope of IAS 36. See Chapter 51 for more information on the scope of IFRS 17.

Unlike biological assets within the scope of IAS 41, items of property, plant and equipment within the scope of IAS 16 are not scoped out of IAS 36. See Chapter 38 for more information on the application of IAS 36 to bearer plants in the scope of IAS 16.

2 When an impairment test is required

There is an important distinction in IAS 36 between assessing whether there are indications of impairment and actually carrying out an impairment test. The standard has two requirements governing when an impairment test has to be carried out:

- For goodwill and all intangible assets with an indefinite useful life the standard requires an annual impairment test, even if there is no indication of impairment. The impairment test can be performed at any time in the annual reporting period, but it must be performed at the same time every year. Different intangible assets can be tested for impairment at different times. [IAS 36.10].
In addition, the carrying amount of an intangible asset that is not yet available for use must be tested for impairment at least annually. This, the standard argues, is because intangible assets are intrinsically subject to greater uncertainty before they are available for use. [IAS 36.11].
- For all (groups of) assets or CGUs within the scope of IAS 36, the entity is required to assess at each reporting date (at year-end and at any interim period end) whether there are any indications of impairment. If at a reporting date any indication is present, an entity is required to perform an impairment test, even if the entity already performed an impairment test during that reporting period (for example when the mandatory impairment test on goodwill was performed at a different time). [IAS 36.8, IAS 36.9].

The particular requirements of IAS 36 concerning the impairment testing of goodwill and of intangible assets with an indefinite useful life or not yet available for use are discussed separately in section 8 below (goodwill) and section 10 below (intangible assets with indefinite useful life or not yet available for use), however the methodology used is identical for all types of assets.

For all assets (including goodwill and intangible assets), an impairment test, i.e., a formal estimate of the asset's recoverable amount as set out in the standard, must be performed if indications of impairment exist. [IAS 36.9]. The only exception is where there was sufficient headroom in a previous impairment calculation that would not have been eroded by subsequent events or the asset or CGU is not sensitive to a particular indicator; the indicators and these exceptions are discussed further in the following section. [IAS 36.15].

2.1 Indicators of impairment

Identifying indicators of impairment is a crucial stage in the impairment assessment process. IAS 36 lists examples of indicators but stresses that they represent the minimum indicators and that the list is not exhaustive. [IAS 36.12, IAS 36.13]. They are divided into external and internal indicators.

External sources of information:

- (a) A decline in an asset's value during the period that is significantly more than would be expected from the passage of time or normal use.
- (b) Significant adverse changes that have taken place during the period, or will take place in the near future, in the technological, market, economic or legal environment in which the entity operates or in the market to which an asset is dedicated.
- (c) An increase in the period in market interest rates or other market rates of return on investments if these increases are likely to affect the discount rate used in calculating an asset's value in use and decrease the asset's recoverable amount materially.
- (d) The carrying amount of the net assets of the entity exceeds its market capitalisation.

Internal sources of information:

- (e) Evidence of obsolescence or physical damage of an asset.
- (f) Significant changes in the extent to which, or manner in which, an asset is used or is expected to be used, that have taken place in the period or soon thereafter and that will have an adverse effect on it. These changes include the asset becoming idle, plans to dispose of an asset sooner than expected, reassessing its useful life as finite rather than indefinite or plans to restructure the operation to which the asset belongs.
- (g) Internal reports that indicate that the economic performance of an asset is, or will be, worse than expected. [IAS 36.12].

The standard amplifies and explains relevant evidence from internal reporting that indicates that an asset can be impaired:

- (a) Cash flows for acquiring the asset, or subsequent cash needs for operating or maintaining it, are significantly higher than originally budgeted
 - (b) Operating profit or loss or actual net cash flows are significantly worse than those budgeted
 - (c) A significant decline in budgeted net cash flows or operating profit, or a significant increase in budgeted loss
- Or
- (d) Operating losses or net cash outflows for the asset, if current period amounts are aggregated with budgeted amounts for the future [IAS 36.14]

The presence of indicators of impairment will not necessarily mean that the entity has to calculate the recoverable amount of the asset in accordance with IAS 36. A previous calculation can have shown that an asset's recoverable amount was significantly greater than its carrying amount and it can be clear that subsequent events have been insufficient to eliminate this headroom. Similarly, previous analysis can show that an asset's recoverable amount is not sensitive to one or more of these indicators. [IAS 36.15].

If there are indications that the asset is impaired, it can also be necessary to examine the remaining useful life of the asset, its residual value and the depreciation method used, to consider whether these need to be adjusted even if no impairment loss is recognised (see Chapter 19). [IAS 36.17].

The complete destruction of a non-current asset would result in the derecognition of that asset rather than an impairment. That is because the complete destruction of an asset means that no future economic benefits are expected either from its use or disposal (except for disposal benefits, e.g., from metal content in the scrap). See Chapter 19 for more information on the derecognition guidance in IAS 16.

2.1.1 Market capitalisation

If market capitalisation is lower than the carrying value of equity, this is a powerful indicator of impairment as it suggests that the market considers that the business value is less than the carrying value. However, the market can have taken account of factors other than the return that the entity is generating on its assets. For example, an individual entity with a high level of debt that it is unable to service fully. A market capitalisation below equity will not necessarily be reflected in an equivalent impairment loss. An entity's response to this indicator depends very much on facts and circumstances. Most entities cannot avoid examining their CGUs in these circumstances unless there was sufficient headroom in a previous impairment calculation that would not have been eroded by subsequent events or none of the assets or CGUs is sensitive to market capitalisation as an indicator. If a formal impairment test is required when the market capitalisation is below equity, great care must be taken to ensure that the discount rate used to calculate VIU is consistent with current market assessments. IAS 36 does not require a formal reconciliation between market capitalisation of the entity, FVLCD and VIU. However, entities need to be able to understand the reason for the shortfall and consider whether they have made sufficient disclosures describing those factors that could result in an impairment in the next periods. [IAS 36.134(f)].

2.1.2 Future performance

Another significant element is an explicit reference in (b), (c) and (d) above to internal evidence that future performance will be worse than expected. Thus IAS 36 requires an impairment test to be undertaken if performance is or will be significantly below that previously budgeted. In particular, there can be indicators of impairment even if the asset is profitable in the current period if budgeted results for the future indicate that there will be losses or net cash outflows when these are aggregated with the current period results.

2.1.3 Individual assets or part of CGU?

Some of the indicators are aimed at individual fixed assets rather than the CGU of which they are a part, for example a decline in the value of an asset or evidence that it is obsolete or damaged. Such indicators can also imply that a wider impairment test of the business or CGU is required. However, this is not always the case. For example, if there is a slump in property prices and the market value of the entity's new head office falls below its carrying value this would constitute an indicator of impairment and trigger an impairment test. At the level of the individual asset, as FVLCD is below carrying amount, this can indicate that a write-down is necessary. However, the building's recoverable amount has to be considered in the context of a CGU of which it is a part. In this example it is not necessary to re-estimate an asset's recoverable amount if it is obvious that the CGU has suffered no impairment. In short, it can be irrelevant to the recoverable amount of the CGU that it contains a head office whose market value has fallen. Similarly, if a machine has been damaged but continues to form part of a factory, being the CGU (i.e., the damage did not result in the asset's derecognition), no impairment loss will be recognised as long as the factory is not impaired.

2.1.4 Interest rates

Including interest rates as indicators of impairment could imply that assets are judged to be impaired if they are no longer expected to earn a market rate of return, even though they generate the same cash flows as before. However, an upward movement in general interest rates will not give rise to a write-down in assets if they do not affect the rate of return expected from the asset or CGU itself. The standard indicates that it is possible that the asset's recoverable amount is not sensitive to a particular indicator.

The discount rate used in a VIU calculation has to be based on the rate specific for the asset. An entity is not required to make a formal estimate of an asset's recoverable amount if the discount rate used in calculating the asset's VIU is unlikely to be affected by the increase in market rates. For example, it is possible that the recoverable amount for an asset with a long remaining useful life is not materially affected by increases in short-term rates. Further an entity is not required to make a formal estimate of an asset's recoverable amount if previous sensitivity analyses of the recoverable amount showed that it is unlikely that there will be a material decrease in the recoverable amount because future cash flows are also likely to increase to compensate for the increase in market rates. Consequently, the potential decrease in the recoverable amount can simply be unlikely to result in a material impairment loss. [IAS 36.16].

Geopolitical events (such as a war) can result in a significant increase in interest rates in the affected countries. This may affect an entity's discount rate when using a discounted cash flow model, as it could impact current market assessments of the time value of money and the risks specific to the asset(s) or cash-generating unit(s) for which the future cash flow estimates have not been adjusted.

3 Dividing the entity into cash-generating units (CGUs)

If an impairment assessment is required, one of the first tasks will be to identify the individual assets affected and if those assets do not have individually identifiable and independent cash inflows, to divide the entity into CGUs. The standard requires the group of assets that is considered together to be as small as is reasonably practicable, i.e., the entity must be divided into as many CGUs as possible, and an entity must identify the lowest aggregation of assets that generate largely independent cash inflows. [IAS 36.6, IAS 36.68].

It must be stressed that CGUs are identified from cash inflows, not from net cash flows or indeed from any basis on which costs can be allocated (this is discussed further below).

The existence of a degree of flexibility over what constitutes a CGU is obvious. Indeed, the standard acknowledges that the identification of CGUs involves judgement. [IAS 36.68]. The guidance offered by the standard is that CGU selection will be influenced by “how management monitors the entity’s operations (such as by product lines, businesses, individual locations, districts or regional areas) or how management makes decisions about continuing or disposing of the entity’s assets and operations”.

How we see it

While monitoring by management and how management makes decisions about continuing or disposing of the entity’s assets and operations helps identifying CGUs, in our view it does not override the requirement that the identification of CGUs is based on the lowest level at which largely independent cash inflows are generated.

Illustration 3-1: Identification of CGUs and largely independent cash inflows

An entity obtains a contract to deliver mail to all users within a country, for a price that depends solely on the weight of the item, regardless of the distance between sender and recipient. It makes a significant loss in deliveries to outlying regions. Because of the entity’s contractual service obligations, the CGU is the whole region covered by its mail services.

The division cannot go beyond the level at which each income stream is capable of being separately monitored. For example, it can be difficult to identify a level below an individual factory as a CGU but of course an individual factory can or cannot be a CGU.

An entity can identify independent cash inflows for individual factories or other assets or groups of assets such as offices, retail outlets or assets that directly generate revenue such as those held for rental or hire.

Intangible assets such as brands, customer relationships and trademarks used by an entity for its own activities are unlikely to generate largely independent cash inflows and will therefore be tested together with other assets at a CGU level. This is also the case with intangible assets with indefinite useful lives and those that are not yet available for use, even though the carrying amount must be tested at least annually for impairment (see section 2 above).

Focusing on cash inflows avoids a common misconception in identifying CGUs. Management can argue that the costs for each of their retail outlets are not largely independent because of purchasing synergies and therefore these outlets cannot be separate CGUs. In fact, this will not be the deciding feature. IAS 36 explicitly refers to the allocation of cash outflows that are necessarily incurred to generate the cash inflows. If they are not directly attributed, cash outflows can be ‘allocated on a reasonable and consistent basis’. [IAS 36.39(b)]. Goodwill and corporate assets have to be allocated to CGUs as described in sections 8.1 and 4.2 below.

Management can consider that the primary way in which they monitor their business is for the entity as a whole or on a regional or segmental basis, which could result in CGUs being set at too high a level. It is undoubtedly true, in one sense, that management monitors the business as a whole but in most cases, they also monitor at a lower level that can be identified from the lowest level of independent cash inflows. For example, while management of a chain of cinemas will make decisions that affect all the cinemas such as the selection of films and catering arrangements, it will also monitor individual cinemas. Management of a chain of branded restaurants will monitor both the brand and the individual restaurants. In both cases, it is possible that management monitors at an intermediate level, e.g., a level based on regions. In most cases, each restaurant or cinema will be a CGU, as illustrated in Illustration 3-2 - Scenario B below, because each will generate largely independent cash inflows, but it is possible that brands and goodwill are tested at a higher level.

In Illustration 3-2 below, Scenario A illustrates a practical approach which involves working down to the smallest group of assets for which a stream of cash inflows can be identified. These groups of assets will be CGUs unless the performance of their cash inflow-generating assets is dependent on those generated by other assets, or their cash inflows are affected by those of other assets. If the cash inflows generated by the group of assets are not largely independent of those generated by other assets, other assets must be added to the group to form the smallest collection of assets that generates largely independent cash inflows.

Illustration 3-2: Identification of CGUs

Scenario A - newspapers

An entity publishes 10 suburban newspapers, each with a different masthead, across 4 distinct regions within a city centre. The price paid for a purchased masthead is recognised as an intangible asset. The newspapers are distributed to residents free of charge. No newspaper is distributed outside its region. All of the revenue generated by each newspaper comes from advertising sales. An analysis of advertising sales shows that for each masthead:

- Approximately 90% of sales come from advertisers purchasing 'bundled' advertisements that appear in all those newspapers published in one particular region of the city
 - Approximately 6% of sales come from advertisers purchasing 'bundled' advertisements that appear in all 10 newspapers in the city centre
- And
- Approximately 4% of sales come from advertisers purchasing advertisements that appear in one newspaper only

What is the CGU for an individual masthead?

Identify the smallest aggregation of assets for which a stream of cash inflows can be identified.

The fact that it is possible to use a *pro rata* allocation basis to determine the cash inflows attributable to each newspaper means that each masthead is likely to represent the smallest aggregation of assets for which a stream of cash inflows can be identified.

Are the cash inflows generated by an individual masthead largely independent of those of other mastheads and, conversely, is that individual masthead affecting the cash inflows generated by other mastheads?

As approximately 96% of cash inflows for each masthead arise from 'bundled' advertising sales across multiple mastheads, the cash inflows generated by an individual masthead are not largely independent.

Therefore, the individual mastheads would most likely need to be aggregated to form the smallest collection of assets that generates largely independent cash inflows. On the basis that approximately 90% of cash inflows for each masthead arise from 'bundled' advertising sales across all of the newspapers published in a particular region, it is likely that those mastheads published in one region will together form a CGU.

Scenario B - retail outlets

An entity has a chain of retail outlets located in the same country. The business model of the entity is highly integrated and the majority of the entity's revenue generating decisions, such as decisions about investments and monitoring of performance, are carried out at an entity level by the executive committee, with some decisions (such as product range and marketing) delegated to the regional or store levels. The majority of the operations, such as purchasing, are centralised. Management operates its business on a regional basis; but sales are monitored at the individual store level.

The outlets are usually bought and sold in packages of outlets that are subject to common economic characteristics, e.g., outlets of similar size or location such as a shopping centre or city or region. Only in rare situations has the entity sold or closed down an individual outlet.

The determining factor for CGUs is the level at which largely independent cash inflows are generated, and not the manner in which the entity's operations are organised and monitored. The fact that operations and costs are managed centrally does not in itself affect the source and independence of the cash inflows. The interdependence of cash outflows is unlikely to be relevant to the identification of CGUs.

The key issue in deciding whether CGUs must be identified at the level of the individual store as opposed to a group of stores is whether, if a store is closed down, all the customers of that store would seek out another of the entity's stores such that there is no significant 'leakage' of customers from the store closure. Unless the customers transfer their business to another of the entity's stores, the individual stores are separate CGUs.

Management in Scenario B can consider that the primary way in which they monitor their business is on a regional or segmental basis, but cash inflows are monitored at the level of an individual store. Individual stores generate independent cash inflows in most circumstances and the overriding requirement under IAS 36 is that the identification of CGUs is based on largely independent cash inflows. This means that in many circumstances an entity will need to conclude that an individual store represents a separate CGU.

3.1 Omni-channel business model in the retail sector

The business models of some retailers have significantly changed over the last years and with the increased importance of internet sales will probably further change in the years ahead. The following Illustration shows a new evolving omni-channel business model and its potential impact on the identification of CGUs in the retail sector.

Illustration 3-3: Omni-channel business model

Retailer A sells a wide range of general household merchandise online and through its retail stores which are located in most large and medium-sized cities in the same country. In order to cater to the changing habits of consumers and significant growth of online shoppers, A established an online platform. Retailer A offers the same products in each of its stores and on the online platform.

A uses the 'click and collect' business model. With 'click and collect' a customer is able to place an order online for items and then choose from which store to collect. If the preferred store runs out of an item, the customer can choose another store in the same city instead of waiting until the item arrives in its preferred store. This is the case for both customers buying online for store collection and for customers wanting to purchase the product directly in the store. The customer could either choose to pay online for the goods or make payment in store at the point of pick up. The customer could also purchase an item online and wait for it to be delivered in 3 working days. Sales generated online account for a significant portion of total sales, ranging from 20% to 25% depending on the city, and are projected to grow steadily in the coming years. The stores also serve as a point of return for products that customers ordered online. A product purchased online or in a store can be returned in any store and experience shows that customers make use of this option by returning products to stores in the same city where the product was originally purchased, picked up or delivered. The customers can exchange the products returned with products from the store shelves or they can purchase other products within the store when picking up or returning products. Hence, the activity of picking up and returning products also triggers sales in the stores. Retailer A considers the stores as well as showrooms for the online business whereby customers get professional buying advice and are able to experience the look and feel of the products, but then acquire the products only later through the online platform. For supply chain optimisation purposes Retailer A through its store personnel also encourages its customers to order online.

The performance of the stores together with the relevant online sales is assessed by city and not on an individual store-level. The employees of the stores are paid on an hourly basis and have performance-based compensation which is based on sales in all stores in one city together with online sales generated by customers located in the same city.

In assessing the CGU level for impairment purposes the key question is at which level of the retailer's organisation are independent cash inflows generated? In the specific fact pattern above, customers treat stores in the same city as an alternative means of making purchases and transacting returns which seems to indicate that all stores in one city represent a single CGU. In addition, in the above described integrated omni-channel business model, the cash-inflows generated by stores and the cash-inflows generated by the online channel are not largely independent from each other as the online revenues influence the store revenues and *vice versa*. Online customers treat stores as a collection and return point for online sales and as showrooms to experience the products. All of this together, as well as the fact that the performance of the stores and of the employees is assessed by city including online sales for the city, suggests that independent cash inflows are generated at the city level. Therefore, in the specific fact pattern above, it would be reasonable to treat the stores in a city together with the allocated assets of the online sales channel as one CGU for impairment testing purposes. The recoverable amount would consider the sales in the stores in a city plus the online sales to customers in the city.

Alternatively, if the sales generated online are an insignificant component of total sales and stores are not treated to a large extent as substitutes for each other by customers, then each single store will be considered a CGU for impairment testing purposes, even if the performance of the stores are monitored together at a higher level.

As explained above, IAS 36 states that the identification of CGUs involves judgement and that in identifying CGUs an entity considers various factors including how management monitors the entity's operations (such as by product line, business, individual location, district or regional area) or how management makes decisions about continuing or disposing of the entity's assets and operations. [IAS 36.68, IAS 36.69].

Applying this guidance, the following quantitative and qualitative criteria can be considered in determining the appropriate CGUs in an omni-channel business model for impairment testing purposes:

- Whether the interdependency of the revenues from different sales channels (online, stores) is evidenced in the business model (examples of questions to consider include: are online sales fulfilled through store shipments, store collections or through a central distribution centre? Can online sales be returned or exchanged in any store? Will online sales picked up, returned or exchange in stores result in additional sales in stores?).
- Whether the retailer is able to measure the interdependencies of the revenues (i.e., online and stores).
- Whether the business model provides evidence that the sales channels are monitored together (e.g., on the level of customers allocated based on ZIP-Codes to stores in an area).
- Whether the profitability as well as the remuneration system are monitored/assessed on the combined basis of online and store revenues on a regional level (e.g., cities in Illustration 3-3 above).
- Whether in deciding about store openings and closures, the revenues of the online business in the region (city in the Illustration 3-3 above) are considered.
- Whether online revenues are reaching a significant quantitative proportion of the overall revenues of the retailer's CGUs. It is important to note that IAS 36 does not give any specific guidance on when cash inflows are largely independent and therefore judgement is required. The level of interdependent online sales in Illustration 3-3 above is not meant to be a bright line but rather part of the specific fact pattern in the Illustration and in practice the determination of CGUs will have to be made in the context of the overall facts and circumstances.

In most circumstances individual stores generate largely independent cash inflows, therefore each store would be a separate CGU (see Illustration 3-2 Scenario B - retail outlets above). However, most retailers do offer nowadays customers the possibility to place online orders with different means to obtain, exchange or return the goods purchased. This raises the question how different business models impact the CGU identification and the determination of recoverable amounts. The following table gives examples of possible business models:

Business model	CGU identification and determination of recoverable amount considerations
<p>The company has two independently operating sales channels:</p> <ul style="list-style-type: none"> ▪ The online sales platform where all sales and returns are managed from a central distribution centre dedicated to the online sales channel. ▪ Brick-and-mortar stores, which only fulfil physical sales from their shelves and are serviced by a separate central distribution centre. The stores are all located in different cities. While some store customers would buy online if a store is closed down, significant 'leakage' of customers occurs in practice when a store is closed. 	<p>The online sales platform and the individual stores are generating largely independent cash inflows. Store closures result in significant loss of customers. Consequently, a separate CGU exists for each individual store. In addition, the online sales channel forms a separate CGU.</p>
<p>The company's sales channels include the online sales platform and brick-and-mortar stores located in different cities.</p> <p>Online sales are being fulfilled by individual stores located closest to the customers by either delivering goods from the stores shelves or by offering customers collections (click-and-collect) of goods from its shelves. A customer can just choose to click-and-collect or have an item delivered from a store if the individual store has the item in its inventory. Online sales fulfilled by stores range between 10-20% of total sales per store.</p> <p>Goods purchased in store and online can only be returned to the store from which the sale was made, delivered or picked-up. When customers collect or return goods purchased online, there are significant purchases of additional items displayed in the store.</p> <p>As the stores are all located in different cities, significant 'leakage' of customers occurs in practice when a store is closed.</p>	<p>Individual stores generate largely independent cash inflows. While the online sales are centrally captured through the online sales platform, the actual fulfilment is at an individual store level.</p> <p>Consequently, each individual store is a separate CGU. Assets from the online sale platform would need to be allocated on a reasonable and consistent basis to the CGUs (see section 4.2 below). The recoverable amount of each store CGU would consider the sales in the store plus the online sales shipped or collected from this store.</p>

Business model	CGU identification and determination of recoverable amount considerations
<p>The company's sales channels include the online sales platform and brick-and-mortar stores located in different cities.</p> <p>Online sales and returns are managed from a central distribution centre dedicated to the online sales channel. Customers have the option to place an order online to collect (click-and-collect) at a store. In such a case the good is dispatched from the central distribution centre dedicated to the online sales channel to the store for customer collection. The click-and-collect online sales do not represent a significant proportion of the stores' activities in comparison with the physical sales of the individual stores and no significant number of additional purchases are generated in stores by customers collection of goods purchased online.</p> <p>As the stores are all located in different cities, significant 'leakage' of customers occurs in practice when a store is closed.</p>	<p>The online sales platform and the individual stores are generating largely independent cash inflows. Consequently, a separate CGU exists for each individual store. In addition, the online sales channel forms a separate CGU.</p> <p>Click-and-collect online sales are most likely to be allocated to the online sales channel. In such a case it can be appropriate to consider arm's length intragroup-recharges for the click-and-collect services the stores provide for the online sales channel (see section 3.6.2 below).</p>
<p>Same as previous fact pattern with the additional fact pattern that online sales can be returned/exchanged in any store without resulting in a significant number of additional purchases. The online sales/returns do not represent a significant proportion of the stores' activities in comparison with the physical sales of the individual stores.</p>	<p>Same as previous fact pattern.</p>
<p>The company runs its operations as an omni-channel. See Illustration 3-3: Omni-channel business model above.</p>	<p>See Illustration 3-3: Omni-channel business model above.</p>
<p>The company's main sales channel is the online sales platform. While the company has a few stores located in major cities, these stores act exclusively as showrooms to display items for customers that want to experience the product before buying it online. Customers cannot place orders in the showrooms. All sales are made via the online sales platform with deliveries, returns and collections fulfilled through one central distribution centre. The percentage of customers visiting showrooms before placing an order online is low in comparison to overall sales.</p> <p>Important to note: this fact pattern is different to one where orders are placed in stores, with bulky merchandise being fulfilled through a warehouse, in which case the respective store can be a separate CGU.</p>	<p>The online sales platform represents a CGU as it generates independent cash inflows.</p> <p>As the showrooms will not generate any cash inflows, the showrooms would meet the definition of a corporate asset and assessed for impairment as such (see section 4.2 below) together with the online sales platform CGU.</p>

The table above gives only some of the examples which can be encountered in practice, and differences in facts and circumstances can result in different conclusions being reached. Significant judgement can be required in the determination of the CGU.

3.2 Grouping of assets

As shown in Illustration 3-4 below, it is possible that the entity is capable of identifying individual cash inflows from assets. However, as stated in section 3 above, the process to identify a CGU is based on the presence of individually identifiable and independent cash inflows. It is possible that the individually identifiable cash inflows are not independent when the allocation of cash inflows to individual assets is solely based on a management decision.

Illustration 3-4: Identification of CGUs - grouping of assets

Scenario A - A tour operator's hotels

A tour operator owns three hotels of a similar class near the beach at a large holiday resort. These hotels are advertised as alternatives in the operator's brochure, at the same price. Holidaymakers are frequently transferred from one to another and there is a central booking system for independent travellers. In this case, the hotels can be regarded as offering genuinely substitutable products by a sufficiently high proportion of potential guests and can be grouped together as a single CGU. Effectively, the hotels are being run as a single hotel on three sites. The entity will have to bear in mind that disposal decisions can still be made on a hotel-by-hotel basis and have to weigh this appropriately in its determination of its CGUs.

Scenario B - Container ships

A shipping company operates a series of container vessels of similar size in a specific region that it considers to be a single CGU. As well as this shipping business, it has other types and regions of shipping operations where CGUs are established on an appropriate basis.

Management can identify the actual cash inflows from the individual vessels, but it determines that the following are the principal features that indicate that these container ships comprise a single CGU:

- The vessels are interchangeable within the contracts and none is on a long-term hire to any individual client
- The pricing of the contract is not vessel specific
- A reasonable portion of the contracts require the operator to have a certain level of capacity available, comprising multiple vessels
- The investment, continuance and disposal decisions are made by class of vessel and not linked to the actual revenue generated by that vessel
- The class of vessels has a clear and distinctive market and management views and makes decisions by reference to the CGU, not individual assets

The fact that one or more of the assets could be used individually, i.e., taken out of the 'pool', would not in itself prevent the assets being considered part of a single CGU. Management concluded that, as the allocation of contracts to individual vessels is solely based on a management decision, the individual container vessel does not generate independent cash inflows. The container vessels therefore need to be tested together at a CGU level.

An example of Scenario B is given in Practical example 3-1 below by A.P. Møller - Mærsk A/S. The following extract from the annual report of A.P. Møller - Mærsk A/S refers to the judgement applied in determination of cash-generating units.

Determination of cash-generating units

Judgement is applied in the determination of cash-generating units of which goodwill is allocated to impairment testing and in the selection of methodologies and assumptions applied in impairment tests.

The determination of cash-generating units differs based on the business area. Ocean operates its fleet of container vessels and hub terminals in an integrated network. Consequently, the Ocean activities are tested for impairment as a single cash-generating unit.

Logistics & Services, including intermodal activities, is considered one cash-generating unit as a result of the continued integration within the business. Management views the Logistics & Services products as an integrated network, with the activities tested for impairment as a single cash-generating unit.

In Terminals, each terminal is considered an individual cash-generating unit for impairment tests, except when the capacity is managed as a portfolio.

Towage & Maritime Services includes towage activities made up of two separate cash-generating units as well as several individual businesses which are each considered one cash-generating unit.

In Scenario B above, an analogy can be made to the conclusion in illustrative example IE11-IE16 of IAS 36 that plants B and C of entity M are part of one CGU which is illustrated in the following Illustration 3-5:

Illustration 3-5: Identification of CGUs - single product entity

Entity M produces a single product and owns plants A, B, C. Each plant is located in a different continent. A produces a component that is assembled in either B or C. The combined capacity of B and C is not fully utilised. M's products are sold worldwide from either plant B or C. For example, B's product can be sold in C's continent if the products can be delivered faster from B than from C. Utilisation levels from B and C depend on the allocation of sales between the two sites. There is no active market for A's products.

Most likely A, B and C together, therefore M as a whole, are the smallest identifiable group of assets that generates cash inflows that are largely independent. This is due to:

(a) A's cash inflows depending on sales of the final product by B and C

And

(b) Cash inflows for B and C depend on the allocation of the production across the two sites

As explained in section 3.3 below, the conclusion would be different if an active market for A's product existed, resulting in A being one CGU and B and C together another CGU.

As a result of applying the methodology illustrated in Illustration 3-2 above, an entity could identify a large number of CGUs. However, the standard allows reasonable approximations and one way in which entities can apply this in practice is to group together assets that are separate CGUs, but which if considered individually for impairment would not be material. Retail outlets, usually separate CGUs, can be grouped if they are all subject to the same economic circumstances and grouping them together rather than examining them individually will have an immaterial effect. However, the entity will still have to scrutinise the individual CGUs to ensure that those that it intends to sell or that have significantly underperformed are not supported by the others with which they are grouped. They would need to be identified and dealt with individually.

In practice, different entities will inevitably have varying approaches when determining their CGUs. There is judgement to be exercised in determining an income stream and in determining whether it is largely independent of other streams. Given this, entities tend towards larger rather than smaller CGUs, to keep the complexity of the process within reasonable bounds.

IAS 36 also requires that identification of CGUs be consistent from period to period unless the change is justified; if changes are made and the entity records or reverses an impairment, disclosures are required. [IAS 36.72, IAS 36.73].

Assets held for sale cannot remain part of a CGU. They generate independent cash inflows being the proceeds expected to be generated by sale. Once they are classified as held for sale, they will be accounted for in accordance with IFRS 5 and carried at an amount that cannot exceed their FVLCD (see section 5.1 below and Chapter 5 for a further discussion of IFRS 5's requirements).

3.3 CGUs and intangible assets

IAS 36 requires certain intangible assets to be tested at least annually for impairment (see section 2 above). These are intangible assets with an indefinite useful life and intangible assets that are not yet available for use. [IAS 36.10, IAS 36.11].

Although these assets must be tested for impairment at least once a year, this does not mean that they have to be tested by themselves. The same requirements apply as for all other assets. The recoverable amount is the higher of the FVLCD or VIU of the individual asset or of the CGU to which the asset belongs (see section 3 above). If the individual intangible asset's FVLCD is lower than the carrying amount and it does not generate largely independent cash inflows, the CGU to which it belongs will be reviewed for impairment.

Many intangible assets do not generate independent cash inflows as individual assets and so they are tested for impairment with other assets of the CGU of which they are part. A trademark, for example, will generate largely independent cash inflows if it is licensed to a third party but more commonly it will be part of a CGU.

If impairment is tested by reference to the FVLCD or VIU of the CGU, impairment losses, if any, will be allocated in accordance with IAS 36. Any goodwill allocated to the CGU has to be written off first. After that, the other assets of the CGU, including the intangible asset, will be reduced *pro rata* based on their carrying amount (see section 11.2 below). [IAS 36.104]. However, the carrying amount of an asset cannot be reduced below the highest of its FVLCD, VIU or zero. If the preceding rule is applied, further allocation of the impairment loss is made *pro rata* to the other assets of the unit (group of units).

If the intangible asset is no longer useable then it must be written off, e.g., an in-process research and development project that has been abandoned, so it is no longer part of the larger CGU, and its own recoverable amount is nil. Intangible assets held for sale are treated in the same way as all other assets held for sale, see section 5.1 below.

3.3.1 Intangible assets as corporate assets

As discussed in section 3.1 above, many intangible assets do not generate independent cash inflows as individual assets and must therefore be tested for impairment with other assets of the CGU of which they are part. However, one question an entity would need to assess beforehand, is whether the intangible asset in question meets the corporate assets definition of IAS 36 “...assets other than goodwill that contribute to the future cash flows of both the cash-generating unit under review and other cash-generating units” or whether the intangible asset is a core asset to the cash-generating nature of a CGU? The judgement made in this respect can have a significant impact on the level at which CGUs are identified and therefore at which level assets are assessed for impairment. A careful consideration of all facts and circumstances is required to avoid carrying out impairment tests at a level that is too high with the result of masking potential impairments.

Assume a scenario where entity A acquires entity B. Entity B operates in a different industry to A. The reason for the acquisition was diversification with no expected cross synergies between A’s and B’s operations. Entity B sells product X under a European wide well-known brand and operates across Europe. Each country has its own manufacturing site from which mainly small local companies in the same country are served. Before the acquisition, entity B concluded that every manufacturing site in each country is a separate CGU. On acquisition of entity B an intangible asset for the brand is recorded in entity’s A group financial statements. No goodwill was recorded. At which level is entity A required to set the CGUs for the acquired business? In this specific example, the single brand would not result in a determination that the CGU(s) of entity B’s business are at the overall level of B. There are individual production sites in each European country from which customers in the same country are served and there is no cross selling of products to customers in other European countries, therefore independent cash inflows can be identified on a country level resulting in the identification of CGUs on a country level. The treatment of the brand would follow the guidance as set out in section 4.2 below for corporate assets, either because the brand is considered to be a corporate asset or by analogy.

On the other hand, if in the example above B was a professional services company operating across Europe and entity B’s brand identifies entity B as one integrated pan-European service provider and markets itself to customers as such, the determination of CGU(s) of entity B’s business at an overall level of B including the brand can be appropriate, particularly where a majority of the customers have a presence in multiple European countries and are looking for one supplier that can serve each local presence.

As explained above, the identification of CGUs involves judgement and a careful consideration of all facts and circumstances is required.

How we see it

In our view, significant judgement can be required when making the distinction between what constitutes a corporate asset and what is a core asset to the cash-generating nature of a group of assets. This is particularly true when it comes to intangible assets. Careful consideration of all facts and circumstances is required. When it comes to intangible assets like (corporate) brands and trademarks an entity often concludes that their nature is more akin to corporate assets to avoid setting the CGU level too high with the potential risk of masking impairments. This together with the requirement to allocate corporate assets to CGUs would avoid as well that these intangible assets are tested at a level that is too high.

On the other hand, an entity can have a brand driven business model and previous business acquisitions that resulted in the recognition of significant amounts of intangible assets with indefinite useful lives for brands and trademarks. In such a case, an entity can conclude that the main drivers for the CGU definition are the (individual) brands and trademarks. It is important to note that this does not mean that the brands and trademarks are tested on a stand-alone basis, they would rather be the driver for the CGU identification with allocation of all other assets needed to generate the largely independent cash inflows.

3.4 Leased assets and CGUs

Many right-of-use assets recorded under IFRS 16 will be assessed for impairment on a CGU level rather than on individual asset level. While there can be instances where leased assets generate largely independent cash inflows, many leased assets will be used by an entity as an input in its main operating activities whether these are service providing or production of goods related. If a right-of-use asset is tested on a stand-alone basis and is fully impaired, the entity would have to assess the need to recognise an additional onerous lease provision for amounts not already recognised in the lease liability (see Chapter 27).

One question that can arise, particularly in relation to real estate leases, is what the unit of account for impairment purposes is. In other words, whether the right-of-use asset(s) resulting from a lease governed by one lease contract needs to be assessed and treated consistently on the overall contract level or whether for example the usage of different areas or floors of a leased building for different purposes could result in separate right-of-use assets for impairment assessments. Next to the general principle in IAS 36 on how assets contribute to the generation of independent cash inflows (individual asset, part of a CGU or as corporate asset), the answer to this question depends on whether the lease contract is over identifiable asset(s) portions that are physically distinct and therefore could effectively be separate units of account. In making this assessment, the guidance in IFRS 16.B20, IFRS 16.B32 (see Chapter 24) and IAS 40.10 (see Chapter 20) could be considered. For leased assets/buildings that are used in parts for different purposes and where these portions are physically distinct, the usage and therefore the generation of independent cash inflows will drive the considerations under IAS 36. Judgement can be needed to determine the units of accounts of the right-of-use asset(s), and their allocation to different CGUs. This is shown in the following illustration:

Illustration 3-6: Identification of CGUs - leased assets

Retail store chain M leases 5 floors in a 10-storey building. The floors are used as follows by M:

- Ground floor: used for M's store X, leasehold improvements were made at the beginning of the lease
- First floor and second floor: used for M's HR and marketing department
- Third floor: originally it was planned that the space would be utilised together with the fourth floor for the payroll department, but then floor four was sub-let to a law firm
- Fourth floor: currently unoccupied. While M tried to lease this floor, it has been difficult to find a tenant and M now expects that the floor will be empty through the end of the lease

Entity M signed one lease contract with the lessor for the five floors. The lease specifies the rent per floor, which equals the stand-alone price per floor. The building is configured in a way that every floor could be closed off, leased and used separately from the rest of the building.

As the five leased floors are used by entity M for different purposes and each floor is a physically distinguishable unit, M concluded that it needs to assess them separately in its CGU determination exercise.

In identifying CGUs for the stores, M considers whether, for example

- (a) Internal management reporting is organised to measure performance on a store-by-store basis
- (b) The business is run on a store-by-store profit basis or on a region/city basis

The leased ground floor is used for retail store X. The ground floor does not generate largely independent cash inflows from the store and is therefore assessed for impairment together with the store. All M's stores are in different neighbourhoods and were determined to have different customer bases. Although store X is managed at a corporate level, X generates cash inflows that are largely independent of those of M's other stores. M therefore concluded that store X is a separate CGU.

The leased first and second floor are used for marketing and human resources corporate functions. The part of the right-of-use-asset in relation to these floors is a corporate asset and is allocated on a reasonable and consistent basis to the CGUs to which it relates (see section 4.2.1 below).

The leased third floor is sub-let to a law firm. M assessed under the guidance of IFRS 16 whether the sublease is classified as a finance lease, resulting in de-recognition of the right-of-use asset and recording of a lease receivable equal to the amount of the net investment in the lease, or an operating lease, with continuing recognition of the right-of-use asset (see Chapter 24). M's assessment classified the sub-lease as an operating lease. M elects to account for the investment property in relation to third floor under the cost model (see Chapter 20). Due to the sub-lease, this part of the right-of-use-asset generates largely independent cash inflows and must be assessed for impairment on a stand-alone basis. Floor four is unoccupied and not used for M's operating activities. M therefore determines that this part of the right-of-use asset needs to be assessed for impairment on a stand-alone basis by comparing the carrying amount with the recoverable amount (higher of VIU and FVLCD). As the floor is expected to be unoccupied through the end of the lease the VIU will be zero. The fact that M expects not to use the fourth floor or is no longer looking for a tenant does not necessarily mean the FVLCD is zero. M would need to determine the fair value under consideration of IFRS 13 (see Chapter 15) and in addition M would need to consider the need for any accelerated depreciation.

3.4.1 Decision to change the use of or abandon a right-of-use asset

When entities decide to change the use of or abandon right-of-use assets, they need to consider how such a decision must be assessed from an IAS 36 point of view. As highlighted in section 2 above, IAS 36.12(f) states that significant changes in the manner in which an asset is used, or expected to be used, is an internal source of information for indication of impairment. The entity's decision to change the use of the right-of-use asset (or the entity's conclusion that it has no realistic alternative but to do so) would, therefore, also indicate that an asset, a group of assets or CGU(s) can be impaired. This is particularly true when a store is to be closed or where the decision impacts the level at which the right-of-use asset is assessed for impairment. The existence of an impairment indicator would require an entity to perform an impairment test for the asset or CGU.

To perform an impairment test, an entity would first need to assess at which level such an impairment test must be performed. An entity's decision to change the expected use of a right-of-use asset raises the question of whether the expected use has changed in such a way that it affects the composition of the CGU and, if it does, when this change in the CGU determination is reflected. A decision to abandon or sublease a right-of-use asset impacts the CGU identification differently depending on the nature of the asset and how it is used by the entity. For example, each retail store is often determined to be a separate CGU. In contrast, administrative offices are often tested together with other assets in a CGU or classified as corporate assets and allocated on a reasonable and consistent basis to the CGUs to which they belong.

If an entity concludes that it needs to update its CGU(s), the entity first has to assess when the expected change in use would impact the CGU determination. One important consideration is whether and when the decision to change the use has been made by the level of management that is authorised to make such decisions. This will often be executive management and/or the board of directors. In addition, it would need to be assessed whether the entity has the ability to change the use in the expected manner or whether the lessor's approval is required.

The impact of the change in use will be different depending on the timing of the decision. In particular for real estate leases used as part of a larger CGU, it is important to consider how long the right-of-use asset is expected to be used within the current CGU and, therefore, continues to support the generation of cash inflows of the CGU. In addition, entities have to take into account the length of the remaining lease term and any other facts and circumstances that are relevant to the CGU assessment. Significant judgement will often be required and can, therefore, warrant additional disclosures in the financial statements.

The guidance in IAS 36.22(b), which requires an entity to determine the recoverable amount for an individual asset, even where an asset does not generate largely independent cash inflows, if the asset's value in use (VIU) can be estimated to be close to its fair value less costs of disposal (FVLCD) and its FVLCD can be measured, is of particular importance when it comes to real estate leases. [IAS 36.22]. In many jurisdictions, the real estate market is well developed and, therefore, the FVLCD of a right-of-use asset for real estate can be measured. The condition in IAS 36.22(b) that VIU can be estimated to be close to FVLCD for a right-of-use asset for real estate can be judged to be fulfilled where a right-of-use asset is to be used within its current CGU for only a short period of time before the abandonment or sublease occurs. In such circumstances, the right-of-use asset will have to be tested for impairment on a stand-alone basis.

When the right-of-use asset is to be used within the original CGU for only a short period of time before the abandonment or sublease occurs, one can, depending on facts and circumstances, also judge that the right-of-use asset and the CGU generate largely independent cash inflows. This would also mean that the right-of-use asset has to be tested for impairment on a stand-alone basis.

The longer the time between the decision to abandon or sublease the right-of-use asset and the actual change in use occurring, the less likely it is that the decision will immediately impact the level at which any impairment assessment has to be performed. The shorter the time between making the decision and the expected change in use occurring, the more likely it is that the expected change in use currently has to be reflected in the CGU determination and the resulting impairment test. If, having considered all facts and circumstances, it is concluded that the decision will not immediately impact the level at which any impairment assessment is performed, then an entity would still need to reassess the useful lives and residual values of the affected assets.

Illustration 3-7: Decision to change the use of or abandon a right-of-use asset**Scenario A - Abandonment of a right-of-use real estate asset**

Entity X ('the entity') recognises a right-of-use asset for a building that it currently occupies as office space. The entity has occupied the building for nine years and has three years remaining on the original 12-year lease. The lease does not include an option to extend or terminate the lease. The right-of-use asset was always tested for impairment as part of CGU 1 as it was not generating largely independent cash inflows. There is significant headroom (i.e., the amount by which the recoverable amount exceeds the carrying amount) in CGU 1. As such, no impairment is identified at the level of CGU 1. It is assumed that the FVLCD of the right-of-use asset is measurable. With many employees working from home, the space is used in a substantially reduced way. Immediately prior to Entity X's year-end of 31 December 20X2, its board (in conjunction with management) made a final decision to permanently cease using the space. There will be a period of five months before the entity vacates the property where the space will continue to be used by CGU 1 to facilitate the transition. Entity X is not able to sublease the space given the location, relatively short remaining lease term and market conditions for office space.

The entity concludes that the decision is an impairment trigger for the right-of-use asset at the balance sheet date as it is considered an internal indicator of impairment as per IAS 36.12(f). In this fact pattern, a final decision to vacate the space has been made. The period between the decision and the date at which the entity will vacate the property is short and, therefore, its contribution to the cash inflows of the CGU is not expected to be significant. As the property cannot be subleased for the remaining lease term, the entity concludes that the right-of-use asset's FVLCD is also not expected to be significant and is expected to be close to the right-of-use asset's value in use. Therefore, the entity concludes that the right-of-use asset has to be tested separately from CGU 1 when the decision to vacate is made.

Scenario B - Subleasing of a right-of-use real estate asset

Entity X ('the entity') recognises a right-of-use asset for a building that it currently occupies as office space. The entity has occupied the building for nine years and has eleven years remaining on the original 20-year lease. The lease does not include an option to extend or terminate the lease. The right-of-use asset was always tested for impairment as part of CGU 1 as it was not generating largely independent cash inflows. There is significant headroom (i.e., the amount by which the recoverable amount exceeds the carrying amount) in CGU 1. As such, no impairment is identified at the level of CGU 1. It is assumed that the FVLCD of the right-of-use asset is measurable. With many employees working from home, the space is used in a substantially reduced way. Immediately prior to Entity X's year-end of 31 December 20X2, its board (in conjunction with management) made a final decision to permanently cease using the space. There will be a period of five months before the entity vacates the property where the space will continue to be used by CGU 1 to facilitate the transition. Entity X is permitted to sublease the property and has therefore engaged a property consultant who confirmed that there is a strong demand for properties in the area of the leased property.

The entity concludes that the decision is an impairment trigger for the right-of-use asset at the balance sheet date as it is considered an internal indicator of impairment as per IAS 36.12(f). In this fact pattern, a final decision to vacate the space has been made. The period between the decision and the date at which the entity will vacate the property is short and, therefore, its contribution to the cash inflows of the CGU are not expected to be significant as such the VIU of the right-of-use asset will mainly be driven by the achievable sublease rental income. The entity concludes that the right-of-use asset's FVLCD is expected to be close to the right-of-use asset's value in use. Therefore, the entity concludes that the right-of-use asset has to be tested separately from CGU 1 when the decision to vacate is made. Alternatively, due to the short period of own use of five months, the entity can also conclude that the right-of-use asset and the CGU generate largely independent cash inflows and therefore that the right-of-use asset has to be tested on a stand-alone basis for impairment.

The conclusion would likely be different, if in Scenario B the fact pattern were that the entity expected to use the right-of-use asset for another 30 months before vacating it and the start of a potential lease.

How we see it

Entities need to assess the potential impact of their decision to change the use of a right-of-use asset on their CGUs and, therefore, the level at which impairment assessments are performed. A decision to change the use of a right-of-use asset can result in the need to test the right-of-use asset on a stand-alone basis and, as such, can result in impairment. The shorter the time between the decision and the actual change in use occurring, the more likely the decision will impact the CGU identification.

3.5 Active markets and identifying CGUs

The standard stresses the significance of an active market for the output of an asset or group of assets in identifying a CGU. An active market is a market in which transactions take place with sufficient frequency and volume to provide pricing information on an ongoing basis. [IFRS 13 Appendix A]. If there is an active market for the output produced by an asset or group of assets, the assets concerned are identified as a CGU, even if some or all of the output is used internally. [IAS 36.70]. The reason given for this rule is that the existence of an active market means that the assets or CGU could generate cash inflows independently from the rest of the business by selling on the active market. [IAS 36.71]. It is important to note that IAS 36.71 states “.... if the entity could sell the output on an active market...” thereby making the ability of the entity to access the active market and sell its output on it an important consideration. If substantial restrictions to accessing the active market exist, then this must be considered when assessing the CGU determination and the relevant guidance of IAS 36.70 to 71. For example, if an output could not be sold on an active market without having essential infrastructure in place that would take significant time and effort to be developed, then this would impact the entity's ability to sell on the active market.

How we see it

When assessing the active market guidance of IAS 36.70 and the impact it has on the CGU determination, an entity would, in our view, need to consider substantial restrictions that exists which impacts the entity's ability to sell its output on an active market. While any restriction must be considered in determining whether the entity could sell its output on an active market, the restriction would need to be substantive to override IAS 36.70.

There are active markets for many metals, energy products (various grades of oil product, natural gas) and other commodities that are freely traded.

When estimating cash inflows for the selling CGU or cash outflows for the buying CGU, the entity will replace internal transfer prices with management's best estimate of the price in a future arm's length transaction. Note that this is a general requirement for all assets and CGUs subject to internal transfer pricing (see section 7.1.6 below).

Scenario A below, based on Example IE5 in IAS 36's accompanying section of illustrative examples, illustrates the point. Scenario B below describes circumstances in which the existence of an active market does not necessarily lead to the identification of a separate CGU.

Illustration 3-8: Identification of CGUs - internally-used products

Scenario A - Production of electricity for internal consumption

In the context of an entity's energy transition, an entity makes significant investments to create plant X, a solar photovoltaic power plant. The electricity produced by plant X will be used in plant Y's production process. X's output is sold to Y at an internal price that passes all margins to X. Transfer pricing is discussed in section 7.1.6 below.

If X can sell its electricity in an active market and generate cash inflows that are largely independent of the cash inflows from Y, it is likely that X is a CGU even though its electricity is used by Y. Therefore, its cash inflows can be regarded as being largely independent. It is likely that Y is also a separate CGU. However, internal transfer prices do not reflect market prices for X's electricity. Therefore, in determining value in use of both X and Y, the entity adjusts financial budgets/forecasts to reflect management's best estimate of future prices that could be achieved in arm's length transactions for those of X's products that are used internally.

If, on the other hand, X does not have the ability to sell its electricity on an active market, it is likely that the recoverable amount of each plant cannot be assessed independently of the recoverable amount of the other plant. The majority of X's production is used internally and cannot be sold in an active market. Cash inflows of X depend on demand for Y's products. Therefore, X cannot be considered to generate cash inflows that are largely independent of those of Y. In addition, the two plants are managed together. As a consequence, it is likely that X and Y together are the smallest group of assets that generates cash inflows that are largely independent. [IAS 36.IE5-10].

Scenario B - 'Market' for intermediate product not relevant to identification of a separate CGU

A vertically integrated operation located in Australia produces an intermediate product that is fully used internally to manufacture the end product. The Australian market is the principal market for the intermediate product and there is no active market as defined by IFRS 13 (see Chapter 15) for it in Australia. The entity has only one other competitor in Australia, which is also vertically integrated and, likewise, uses the intermediate product internally. Both entities are, and have always been, very profitable when looking at their vertically integrated manufacturing processes to the end-stage product.

There is an active market for the intermediate product in China, but the prices at which the product can be sold are so low that a company based in Australia whose sole activity is to sell the intermediate product into China would never be profitable and a company would never set up manufacturing operations in Australia in order to sell into China.

Each of the Australian companies will occasionally sell small surpluses of their intermediate products into the active market in China, rather than make that product available to their competitor in Australia.

The existence of an active market for the intermediate product in China suggests that the operations involved have to be treated as a separate CGU. However, the mere existence of an active market somewhere in the world does not mean that the asset or CGU could realistically generate cash inflows independently from the rest of the business by selling on that active market. If such sales are a genuine incidental activity (i.e., if it is genuinely a case of obtaining some proceeds from excess product that would otherwise be scrapped), it can be appropriate not to regard that market as an active market for the intermediate product for IAS 36 purposes.

If the market is not regarded as an active market for IAS 36 purposes, the assets/operations involved in producing the intermediate product will not be treated as a separate CGU.

3.6 Flagship stores

Retailers can open and run so-called flagship stores in which case questions can arise on whether these stores are separate cash-generating units for the purpose of impairment testing and which cash flows to include in the test. While no formal definition of flagship stores exists, the retail sector identifies them as such as they share some common characteristics and purpose. In particular, these stores are frequently different from other stores in terms of location, size, decor, product offerings, services, purpose they serve and expectations about direct returns.

Flagship stores are seen to play a key role in a company's brand strategy and are the lead stores for retailers acting as a showcase for the brand. Over and above making sales, their purpose is to attract customers to the brand, create brand awareness, customer loyalty and to act as a marketing instrument. In addition, they are often used to test the market, re-position the brand, trial new products, assess retail store design concepts and act as a host venue for a range of promotional activities.

Common key characteristics are:

- Often the largest stores in a retailer's chain
- Situated in a prestigious location or high footfall area
- Experimental, inspirational and/or luxurious/opulent
- The size of the store, capital expenditures to build out the store and its operating costs are often significantly in excess of the retailer's other stores and often not justified by the level of expected direct sales from the store
- Inflow of economic benefits from flagship stores can be expected in the retailer's other stores or via online sales (see above Illustration 3-3: Omni-channel business model)

Not all of the above characteristics need to be present for a store to be considered a flagship store and it is possible that some are present to a larger or smaller extent.

Retailers can have more than one flagship store, whether that's one in each territory, or even more than one in the same city covering different prime locations. While some flagship stores do generate sufficient cash inflows to support the amounts spent on setting up and running the store and to generate a profit, many are budgeted to be loss making from the outset or do not require the same return as other stores.

Testing flagship stores for impairment is faced with the challenge of the dual nature of the stores, i.e., as a sales-generating unit and also playing a key role in a company's overall brand strategy. This dual nature can require a significant level of management judgement when assessing flagship stores for impairment.

3.6.1 Flagship store - CGU considerations

While flagship stores often play a key role in a company's overall brand strategy, their sales generating nature would need to be assessed under the IAS 36 definition of cash-generating unit.

How we see it

In our view, a flagship store generating largely independent cash inflows would need to be considered to be a separate CGU as the definition of a CGU under IAS 36 would be met.

It can be possible to argue for the aggregation of a flagship store with other stores in the area, the same neighbourhood or the same city into a single CGU, if the store has a local function to enhance the image of the brand, and therefore provides benefits to these stores as the cash inflows from these stores are not considered to be largely independent of each other. In rare circumstances, flagship stores are set up in a way that no or negligible independent cash inflows are generated via the store. For example, this is the case for experimental stores where the main purpose is for customers to experience an entity's new innovative products, but sales are expected to be generated via other channels. In such a case the flagship store would meet the definition of a corporate asset and assessed for impairment as such (see section 4.2 below).

3.6.2 Flagship store - Recoverable amount considerations - VIU

As mentioned above, some flagship stores are budgeted to be loss-making from the outset or do not require the same return as other stores. Management's investment decision for setting up the stores in such cases is in general supported by the benefits these stores provide to the overall business. This raises the question whether and how the provision of additional benefits to the overall business has to be considered in determining the VIU of a flagship store that is a separate CGU.

One can take the view that the added function of flagship stores does not have to be considered in determining the recoverable amount as it is largely marketing. As marketing expenditures are in general expensed when incurred, it would not necessarily be inconsistent to take an impairment loss when flagship stores are budgeted to be loss making. Under this view, an entity has to consider whether it must capitalise the costs of the flagship stores in the first place.

Alternatively, one can take the view that management's business rationale for setting up the stores could be considered in determining the VIU. In such a case, it can be appropriate to include arm's length charges in the VIU calculation for the services provided to other CGUs using the guidance in IAS 36.71. This is to reflect the amounts the flagship store could generate if it were to recharge for the benefits provided to other CGUs. To ensure consistency the benefiting CGUs would need to incorporate these charges in their recoverable amount model as well. Careful consideration would be required to determine which CGUs benefit from the flagship store and therefore which could be recharged for the services provided. While some flagship stores provide some level of benefit to the overall business of an entity, it is more likely that they support the territory they are located in especially for businesses that have more than one flagship store. In such a case we would expect the incorporation of the recharge to be limited to those stores.

How we see it

When assessing a flagship store for impairment, an entity could in our view incorporate arm's length charges in the value in use calculation to reflect the service provided to other CGUs. To ensure consistency an entity would need to reflect these recharges as costs when determining the VIU of the benefiting CGUs.

We would expect that the basis of an entity's impairment testing a flagship store is well documented from the outset, this is particularly important for cases where it is assumed that the strategy and corporate function of the flagship store warrants the inclusion of intragroup recharges. We would not expect a store to become a flagship store later in life of the store.

The following table provides an overview of the discussion above:

	Flagship store budgeted to generate largely independent cash inflows sufficient to support the amounts spent on setting up and running the store	Flagship store generates cash inflows interdependently with other stores in close vicinity	Flagship store generates largely independent cash inflows, but is budgeted to be loss making or much lower expected return than usual and provides benefits to the wider business	Flagship store does not generate largely independent cash inflows
Separate CGU?	Yes	No	Yes	No
Separate impairment test of flagship store?	Yes	No	Yes	No
Separate impairment test for non-flagship stores?	Yes	No, for the ones in close vicinity	Yes	Yes
Incorporation of intercompany recharges?	No	No	View A: No View B: Yes, can be appropriate to impute arm's length intragroup recharges.	No
Impairment test on a combined basis of flagship store and other stores?	No	Yes, with the ones in close vicinity	No	Yes, under consideration of the corporate asset guidance (see section 4.2 below).

4 Identifying the carrying amount of CGU assets

After an entity has established its CGU(s) for the impairment assessment, it needs to determine the carrying amount of the CGU(s). The carrying amount must be determined on a basis that is consistent with the way in which the recoverable amount is determined. [IAS 36.75].

The carrying amount of a CGU includes only those assets that can be attributed directly or allocated on a reasonable and consistent basis. These must be the assets that will generate the future cash inflows used in determining the CGU's recoverable amount. It does not include the carrying amount of any recognised liability, unless the recoverable amount of the cash-generating unit cannot be determined without taking it into account. Both FVLCD and VIU of a CGU are determined excluding cash flows that relate to assets that are not part of the cash-generating unit and liabilities that have been recognised. [IAS 36.76].

The standard emphasises the importance of completeness in the allocation of assets to CGUs. Every asset used in generating the cash flows of the CGU being tested must be included in the CGU; otherwise, an impaired CGU can appear to be unimpaired, as its carrying value would be understated by having missed out assets. [IAS 36.77].

There are exceptions to the rule that recognised liabilities are not included in arriving at the CGU's carrying value or VIU. If the buyer would have to assume a liability if it acquired an asset or group of assets, then the FVLCD would be the price to sell the assets or group of assets and the liability together. The liability would then need to be deducted from the CGU's carrying amount and VIU. This will enable a meaningful comparison between carrying amount and recoverable amount, whether the latter is based on FVLCD or VIU. [IAS 36.78]. See section 4.1.1 below.

For practical reasons the entity can determine the recoverable amount of a CGU after taking into account assets and liabilities such as receivables or other financial assets, trade payables, pensions and other provisions that are outside the scope of IAS 36 and therefore not part of the CGU. [IAS 36.79]. If the VIU calculation for a CGU or its FVLCD are determined taking into account these sorts of items, then it is essential that the carrying amount of the CGU is determined on a consistent basis. However, this frequently causes confusion in practice, as described in section 4.1 below.

It is possible that other assets such as goodwill and corporate assets cannot be attributed on a reasonable and consistent basis. The standard has separate rules regarding their treatment. The allocation of goodwill is dealt with separately in section 8.1 below and corporate assets in section 4.2 below.

4.1 Consistency and the impairment test

Consistency is a very important principle underlying IAS 36. In testing for impairment entities must ensure that the carrying amount of the CGU is consistent for VIU and FVLCD calculations. In calculating VIU, or using a discounted cash flow methodology for FVLCD, entities must ensure that there is consistency between the assets and liabilities of the CGU and the cash flows taken into account, as there must also be between the cash flows and discount rate.

There are exceptions to the rule that recognised liabilities are not included in arriving at the CGU's carrying value. If the buyer would have to assume a liability if it acquired an asset or group of assets (CGU), then the fair value less costs of disposal of the CGU would be the price to sell the assets of the CGU and the liability together, less the costs of disposal. [IAS 36.78]. To provide a meaningful comparison this liability must then be deducted as well from the VIU and the carrying amount of the asset or group of assets (CGU).

The requirement in IAS 36 to deduct the liability from both the CGU's carrying amount and from its VIU avoids the danger of distortion that can arise when cash flows that will be paid to settle the contractual obligation are included in the VIU discounted cash flow calculation. If the liability cash flows are included in the VIU discounted cash flow calculation, they would potentially be discounted using a different discount rate to the rate used to calculate the carrying value of the liability causing distortion. See section 4.1.1 below for further discussion.

From a practical point of view an entity could simply calculate the VIU of a CGU excluding the liability cash outflows and compare that to the CGU carrying amount excluding the liability. While this would mean that the VIU is not comparable to the FVLCD, this would not cause an issue as long as the calculated VIU is above the CGU's carrying amount, therefore providing evidence that the CGU is not impaired.

It is also accepted in IAS 36 that an entity for practical reasons determines the recoverable amount of a CGU after taking into account assets and liabilities such as receivables or other financial assets, trade payables, pensions and other provisions that are outside the scope of IAS 36.

In all cases:

- The carrying amount of the CGU must be calculated on the same basis for VIU and FVLCD, i.e., including the same assets and liabilities.
- And
- It is essential that cash flows are prepared on a consistent basis to the assets and liabilities within CGUs.

In addition, some of these assets and liabilities have themselves been calculated using discounting techniques. Therefore, a danger of distortion arises resulting from differing discount rates, as discussed above.

4.1.1 Environmental provisions and similar provisions and liabilities

Paragraph 78 of IAS 36 illustrates liabilities that must be deducted from the carrying amount of the assets of a CGU because a buyer would assume the liability using an example of a mine in a country in which there is a legal obligation for the owner to restore the site by replacing the overburden. The restoration provision, which is the present value of the restoration costs, has been provided for and deducted from the carrying value of the assets of the CGU. It will be taken into account in the estimation of FVLCD but must also be deducted in arriving at VIU so that both methods of estimating recoverable amount are calculated on a comparable basis that aligns with the carrying amount of the CGU. [IAS 36.78].

There are other provisions for liabilities that would be taken over by the purchaser of a CGU, e.g., property dilapidations or similar contractual restoration provisions. The provision will be accrued as the 'damage' is incurred and hence expensed over time rather than capitalised. If the provision is deducted from the assets of the CGU, then it must also be deducted in arriving at VIU and it has to be taken into account in the estimation of FVLCD.

Indeed, many provisions made in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* can be reflected in the CGU's carrying amount as long as they will be treated appropriately in arriving at the recoverable amount of the CGU.

Including the cash outflows that will be paid to settle the contractual obligation in the VIU discounted cash flow calculation bears the danger of distortion as the cash flows for impairment purposes will be discounted using a different rate to the rate used to calculate the provision itself. The carrying amount of this class of liability will reflect a discount rate suitable for provisions, based on the time value of money and the risks relating to the provisions. This is likely to be considerably lower than a suitable discount rate for an asset and the distortion caused by this would have to be considered and adjusted if the effect is significant. A simple illustration is that the present value of a cash outflow of CU100 in 10 years' time is CU39 discounted at 10% but CU68 if a discount rate of 4% is used. Deducting the respective cash flows discounted at the asset discount rate could result in an overstatement of the CGU's recoverable amount.

Therefore, to avoid the danger of distortion and to allow for a meaningful comparison between the carrying amount of the CGU and the recoverable amount, IAS 36 requires the carrying amount of the provision to be deducted in determining both the CGU's carrying amount and its VIU. [IAS 36.78].

In 2015, the IFRS IC received a request to clarify the application of IAS 36.78. The submitter observed that the approach of deducting the liability from both the VIU and the CGU's carrying amount would produce a null result and therefore asked whether this was really the intention or whether an alternative approach was required.

In its November 2015 meeting, the IFRS IC observed that when the CGU's fair value less costs of disposal (FVLCD) considers a recognised liability then IAS 36.78 requires both the CGU's carrying amount and its VIU to be adjusted by the carrying amount of the liability. In the IFRS IC's view this approach provides a straightforward and cost-effective method to perform a meaningful comparison of the recoverable amount and the carrying amount of the CGU. Moreover, it observed that this approach is consistent with the requirement in IAS 36 to reflect the risks specific to the asset in the present value measurement of the assets in the CGU and the requirements in IAS 37 to reflect the risk specific to the liability in the present value calculation of the liability.

The IFRS IC therefore decided that neither an interpretation nor an amendment to a Standard was necessary and did not add this issue to its agenda.

As mentioned in section 4.1 above from a practical point of view an entity could calculate the VIU of a CGU without deducting the liability cash outflow and compare that to the CGU excluding the liability. As long as the calculated VIU is above the CGU's carrying amount no impairment would be required and the lack of comparability to the FVLCD would not cause an issue.

4.1.2 Lease liabilities under IFRS 16

A CGU can include a right-of-use asset recorded under IFRS 16. Right-of-use assets are assessed for impairment by applying IAS 36.

When it comes to lease arrangements, in most cases a CGU would be disposed of together with the associated lease arrangements. FVLCD for the CGU would consider the associated lease arrangements and therefore the need to make the contractual lease payments. This would require deducting the carrying amount of the lease liabilities when determining the carrying amount of the CGU.

It is important to note that lease payments reflected in the lease liability recorded in the statement of financial position will have to be excluded from the VIU calculation. If the carrying amount of the lease liabilities is deducted to arrive at the carrying amount of the CGU, the same carrying amount of the lease liabilities would need to be deducted from the VIU. IAS 36 does not allow the calculation of the VIU on a net basis directly, through reducing the future cash flows by the lease payments as this bears the risk of distortion that will arise due to the difference in the discount rate used for the VIU calculation and the discount rate used to calculate the carrying amount of the lease liability. [IAS 36.78]. See section 7.1.8 below for further discussion around VIU and lease payments.

4.1.3 Trade debtors and creditors

Whether an entity includes or excludes trade debtors and creditors in the assets of the CGU, it must avoid double counting the cash flows that will repay the receivable or pay those liabilities. This can be tricky because cash flows do not normally distinguish between cash flows that relate to working capital and other items. A practical solution often applied is to include working capital items in the carrying amount of the CGU and include the effect of changes in the working capital balances in the cash flow forecast.

The following simplified example is based on a finite life CGU and illustrates the effects of including and excluding initial working capital items.

Illustration 4-1: The effects of working capital on impairment tests

At the end of the year, Entity A's net assets comprise:

	CU
Carrying value of assets in CGU	100,000
Working capital: net liability	(800)

Its budgeted cash flows before interest and tax for the following five years, including and excluding changes in working capital, and their net present value using a 10% discount rate are as follows:

Year	1	2	3	4	5	6
	CU	CU	CU	CU	CU	CU
Pre-tax cash flow ⁽¹⁾	10,000	20,000	30,000	40,000	50,000	
Opening working capital	(800)	(1,500)	(3,000)	(4,500)	(6,000)	(7,500)
Closing working capital	(1,500)	(3,000)	(4,500)	(6,000)	(7,500)	
Change in working capital	700	1,500	1,500	1,500	1,500	(7,500)

Notes

(1) Cash flow before interest, excluding working capital changes

Year 5's closing working capital is treated as a cash outflow in year 6.

Cash flow including opening working capital	10,700	21,500	31,500	41,500	51,500	(7,500)
NPV at 10% discount rate	107,251					
Cash flow excluding opening working capital	11,500	21,500	31,500	41,500	51,500	(7,500)
NPV at 10% discount rate	107,979					

Including opening working capital:

	CU
Carrying value of CGU net of working capital	99,200
NPV of cash flow including opening working capital	107,251
Headroom	8,051

Excluding working capital:

	CU
Carrying value of CGU	100,000
NPV of cash flow excluding opening changes in working capital	107,979
Headroom	7,979

Note that the headroom is not exactly the same in both cases, due to the discounting effect of differences in the periods in which cash flows are incurred. Typically, the distortion caused by discounting will not be significant in relation to short-term working capital items. However, if significant, such distortion has to be adjusted.

Any other combination will not treat assets and cash flows consistently and will either overstate or understate headroom, e.g., it would be incorrect to compare the carrying value of the CGU net of the working capital (99,200) and the cash flows excluding the opening changes in working capital (107,979).

Illustration 4-1 above is based on a limited life CGU and therefore considers a cash outflow in the last year to settle the negative working capital balance. For a CGU with an indefinite life for which the value in use calculation includes a terminal value, a sustainable level of working capital investment in the terminal year of the cash flow forecast would need to be assumed.

In some industries it is common for companies to operate on a negative working capital basis. Negative working capital provides a cash flow benefit in earlier years that reverses in later years, and at the latest at the end of its life for a limited life CGU. This increases the value of the CGU in question. For a CGU for which the value in use calculation includes a terminal value, effectively assuming a perpetual life, careful consideration is required in determining the extent to which negative working capital balances are expected to continue into perpetuity and in determining a sustainable level of negative working capital balances to avoid overstating the value in use for the CGU in question.

4.1.4 Pensions

As mentioned in section 4 above, recognised liabilities are in general not included in arriving at the recoverable amount or carrying amount of a CGU.

Paragraph 79 of IAS 36 mentions pension obligations as items that for practical reasons can be included in calculating the recoverable amount of a CGU. In such a case, the carrying amount of the CGU is decreased by the carrying amount of those liabilities. [IAS 36.79].

In practice, including cash flows for a pension obligation in the recoverable amount could be fraught with difficulty, especially if it is a defined benefit scheme, as there can be so many differences between the measurement basis of the pension liability and the cash flows that relate to pensions. Deducting the carrying amount of the pension obligation from both the value in use and the carrying amount of the CGU avoids this issue. If the pension liability is excluded from the carrying amount of the CGU, then any cash flows in relation to it cannot be considered in the value in use calculation and the pension liability cannot be deducted from the VIU.

Cash flows in relation to future services on the other hand, whether for defined contribution or defined benefit arrangements, always have to be included in calculating the recoverable amount as these are part of the CGU's ongoing employee costs. In practice, it can be difficult to distinguish between cash flows reflecting repayment of the pension liability and cash flows that are future employee costs of the CGU.

4.1.5 Cash flow hedges

In the case of a cash flow hedge in relation to highly probable forecasted transactions, it often makes no significant difference for short-term hedging arrangements if the hedging asset or liability and the hedging cash flows are included in the calculation of recoverable amount. The result is to gross up or net down the assets of the CGU and the relevant cash flows by an equivalent amount, after taking account of the distorting effects of differing discount rates. However, some entities argue to take into account cash flows from instruments hedging their sales or purchases that are designated as cash flow hedges under IFRS 9 because not to do so misrepresents their economic position. In order to do this, entities include the cash flows and either exclude the derivative asset or liability from the CGU or, alternatively, include the derivative asset or liability and reflect the related cash flow hedge reserve in the CGU as well (this latter treatment would not be a perfect offset to the extent of ineffectiveness). They argue that the cash flow hedges protect the fair value of assets through their effect on price risk. They also note that not taking cash flows from instruments hedging their sales or purchases introduces a profit or loss mismatch by comparison with instruments that meet the 'normal purchase/normal sale' exemption under which the derivative remains off balance sheet until exercised.

Although logical from an income perspective, IAS 36 does not support these arguments. The derivative asset or liability can only be included in the CGU as a practical expediency and the hedge reserve is neither an asset nor liability to be reflected in the CGU. As the carrying amount of the hedge instrument is a net present value, any impairment loss can be similar to that calculated by excluding the derivative financial instrument and its cash flows. However, there can be a difference between the two due to different discount rates being applied in the determination of the derivative's fair value and the determination of the VIU. IFRS 9 would not permit an entity to mitigate the effects of impairment by recycling the appropriate amount from the hedging reserve. Finally, entities must be aware that cash flow hedges can have negative values as well as positive ones.

Illustration 4-2: Cash flow hedges and testing for impairment

Entity A, which only has one CGU, enters into derivative contracts to hedge its commodity sales. These derivatives are accounted for as cash flow hedges and there is no ineffectiveness.

The entity is required to perform an impairment test.

Entity A's statement of financial position as at the impairment testing date is as follows:

	CU
Asset/CGU	3,000
Derivatives fair value	1,125
Equity - other reserves	(3,000)
Equity - cash flow hedge reserve	(1,125)

As at the impairment testing date, the entity's cash flow forecasts are as follows:

Year	20X0	20X1	20X2	20X3
	CU	CU	CU	CU
Forecast sales cash inflows		750	750	750
Forecast hedge cash inflows		450	450	450
Total cash inflows		1,200	1,200	1,200
NPV sales cash inflows	1,875	1,307	684	0
NPV total cash inflows (sales plus hedge cash inflows)	3,000	2,091	1,094	0
Fair value of hedge	1,125	784	410	0

IAS 36 requires the entity to exclude the cash flows from hedge transactions when calculating VIU. The carrying amount of the derivative is therefore excluded from the carrying amount of the cash-generating unit. The entity recognises an impairment loss of CU1,125 as follows:

	CU
Asset carrying amount	3,000
Recoverable amount (VIU)	1,875
Impairment loss	(1,125)

The entity is not prohibited from including within the VIU calculation the cash flows from a hedge instrument, provided the instrument's carrying amount is included within the carrying amount of the cash-generating unit and the effects of discounting are taken into account, thereby ensuring that the cash flows and carrying amount are consistently discounted. This approach would result in the same impairment of CU1,125.

4.2 Corporate assets

An entity can have assets that do not generate cash inflows independently of other assets or groups of assets and that contribute to more than one CGU, such as headquarters buildings or central IT facilities. IAS 36 calls such assets corporate assets. Corporate assets are defined as "...assets other than goodwill that contribute to the future cash flows of both the cash-generating unit under review and other cash-generating units". Corporate assets can include intangible assets like brands and trademarks (see section 3.3.1 above).

The characteristics that distinguish corporate assets are that they do not generate cash inflows independently of other assets or groups of assets and their carrying amount cannot be fully attributed to the CGU under review. [IAS 36.100]. Nevertheless, in order to test properly for impairment, the corporate asset's carrying value has to be tested for impairment along with the CGUs. Corporate assets therefore have to be allocated to the CGUs to which they belong and then tested for impairment along with those CGUs. [IAS 36.101].

This presents a problem in the event of those assets themselves showing indications of impairment. It also raises a question of what those indications can be, in the absence of cash inflows directly relating to this type of asset. Some, but not all, of these assets can have relatively easily determinable fair values but while this is usually true of a headquarters building, it could not be said for a central IT facility. We have already noted in section 2.1.3 above that a decline in value of the asset itself does not always trigger a need for an impairment test, in particular when it is obvious that the CGUs of which corporate assets are a part are not showing any indications of impairment - unless, of course, management has decided to dispose of the asset. It is most likely that a corporate asset will show indications of impairment if the CGU or group of CGUs to which it relates are showing indications and this is reflected in the methodology by which corporate assets are tested.

If possible, the corporate assets are to be allocated to individual CGUs on a 'reasonable and consistent basis'. [IAS 36.102]. This is not expanded upon and affords some flexibility, although consistency is vital; the same criteria must be applied at all times. If the carrying value of a corporate asset can be allocated on a reasonable and consistent basis between individual CGUs, each CGU has its impairment test done separately and its carrying value includes its share of the corporate asset. When allocating corporate assets, entities should ensure there is no double counting by eliminating any intra-group charges for the use of the corporate assets from the CGU's cash flows. Some entities include a charge for the use of corporate assets rather than allocating the assets to CGUs or groups of CGUs. This is an acceptable approximation as long as entities ensure that the allocation is reasonable and that the total charge has the same NPV as the carrying amount of those assets and there is no impairment. Otherwise, there could be double counting or the omission of assets or cash outflows from CGUs or the misallocation of impairment to the assets of the CGU. Overheads are discussed further in section 7.1.7 below.

If the corporate asset's carrying value cannot be allocated on a reasonable and consistent basis to an individual CGU, there are three steps to consider:

- (1) The CGU (excluding the corporate asset) is tested for impairment and any impairment is recognised.
- (2) The smallest group of CGUs is identified to which, as a group, all or part of the carrying value of the corporate asset can be allocated on a reasonable and consistent basis. This group must include the CGU that was the subject of the first test.
- (3) All CGUs in this group have to be tested to determine if the group's carrying value (including the allocation of the corporate asset's carrying value) is in excess of the group's recoverable amount. [IAS 36.102]. If it is not sufficient, the impairment loss will be allocated *pro rata*, subject to the limitations of IAS 36.105, to all assets in the group of CGUs and the allocated portion of the corporate asset, as described in section 11.2 below.

In IAS 36's accompanying section of illustrative examples, Example 8 has a fully worked example of the allocation of corporate assets and calculation of a VIU. [IAS 36.IE69-IE79]. The table below is included in the example, and serves to illustrate the allocation of the corporate asset to CGUs:

Illustration 4-3: Allocation of corporate assets

An entity comprises three CGUs and a headquarters building. The carrying amount of the headquarters building of 150 is allocated to the carrying amount of each individual cash-generating unit. A weighted allocation basis is used because the estimated remaining useful life of A's cash-generating unit is 10 years, whereas the estimated remaining useful lives of B and C's cash-generating units are 20 years.

Schedule 1. Calculation of a weighted allocation of the carrying amount of the headquarters building

End of 20X0	A	B	C	Total
Carrying amount	CU100	CU150	CU200	CU450
Remaining useful life	10 years	20 years	20 years	
Weighting based on useful life	1	2	2	
Carrying amount after weighting	CU100	CU300	CU400	CU800
<i>Pro rata</i> allocation of the building	(100 ÷ 800)= 12%	(300 ÷ 800)= 38%	(400 ÷ 800)= 50%	100%
Allocation of the carrying amount of the building (based on <i>pro rata</i> above)	CU19	CU56	CU75	CU150
Carrying amount (after allocation of the building)	CU119	CU206	CU275	CU600

The standard does not require the allocation to be based on carrying value. In certain circumstances, financial measures such as revenue, employee numbers or a time basis are considered a valid basis.

One effect of this *pro rata* allocation process is that the amount of the head office allocated to each CGU will change as the useful lives and carrying values change. In the above example, the allocation of the head office to CGU A will be redistributed to CGUs B and C as A's remaining life shortens. Similar effects will be observed if the sizes of any other factor on which the allocation to the CGUs is made change relative to one another.

4.2.1 Leased corporate assets

Companies frequently enter into lease arrangements on a corporate level, such as a leased corporate headquarters or leased IT equipment. Under IFRS 16 these lease arrangements will result in the recognition of right-of-use assets. Similar to other corporate assets, the right-of-use assets carrying values have to be tested for impairment along with the CGUs they serve. An entity will frequently need to allocate the carrying amount of corporate right-of-use assets to (groups of) CGUs when performing the impairment test. As discussed in section 4.2 above, some entities include a charge for the use of corporate assets rather than allocating the assets to CGUs or groups of CGUs.

5 Recoverable amount

The standard requires the carrying amount of the asset or CGU to be compared with the recoverable amount, which is the higher of VIU and FVLCD. [IAS 36.18]. If either the FVLCD or the VIU is higher than the carrying amount, no further action is necessary as the asset is not impaired. [IAS 36.19].

Recoverable amount is calculated for an individual asset, unless that asset does not generate cash inflows that are largely independent of those from other assets or groups of assets, in which case the recoverable amount is determined for the CGU to which the asset belongs. When the asset's value in use can be estimated to be close to its fair value less costs of disposal and the asset's fair value less costs of disposal can be measured, the recoverable amount of the individual asset must be determined. [IAS 36.22].

Recoverable amount is the higher of FVLCD and VIU. IAS 36 defines VIU as the present value of the future cash flows expected to be derived from an asset or CGU. FVLCD is the fair value as defined in IFRS 13, being the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date, less the costs of disposal. [IAS 36.6].

Estimating the VIU of an asset involves estimating the future cash inflows and outflows that will be derived from the use of the asset and from its ultimate disposal and discounting them at an appropriate rate. [IAS 36.31]. There are complex issues involved in determining the cash flows and choosing a discount rate and often there is no agreed methodology to follow (see sections 7.1 and 7.2 below for a discussion of some of these difficulties).

Entities can estimate FVLCD, even in the absence of quoted prices in an active market for an identical asset. However, if there is no basis for making a reliable estimate then the value of an asset must be based on its VIU. [IAS 36.20].

There are two practical points to emphasise. First, IAS 36 allows the use of estimates, averages and computational shortcuts to provide a reasonable approximation of FVLCD or VIU. [IAS 36.23]. Second, if the FVLCD is greater than the asset's/CGU's carrying value, no VIU calculation is necessary. It is not uncommon for the FVLCD of an asset to be readily obtainable while the asset itself does not generate largely independent cash inflows, as is the case with many property assets held by entities. If the FVLCD of the asset is lower than its carrying value, then the recoverable amount will have to be calculated by reference to the CGU of which the asset is a part. However, as explained in section 2.1.3 above, it can be obvious that the CGU to which the property belongs has not suffered an impairment. In such a case it would not be necessary to assess the recoverable amount of the CGU.

5.1 Impairment of assets held for sale

The standard describes circumstances in which it is appropriate to use an asset or CGU's FVLCD without calculating its VIU, as the measure of its recoverable amount. If there is no significant difference between FVLCD and VIU, the asset's FVLCD must be used as its recoverable amount. This is the case, for example, if management is intending to dispose of the asset or CGU, as apart from its disposal proceeds there will be few if any cash flows from further use. [IAS 36.21].

The asset can also be held for sale as defined by IFRS 5, by which stage it will be outside the scope of IAS 36, although IFRS 5 requires such assets to be measured immediately before their initial classification as held for sale 'in accordance with applicable IFRS accounting standards'. [IFRS 5.18]. A decision to sell is a triggering event for an impairment test, which means that any existing impairment will be recognised at the point of classification and not be rolled into the gain or loss on disposal of the asset. See Chapter 5 for a description of the subsequent measurement of the carrying amounts of the assets.

Clearly IFRS 5's requirement to test for impairment prior to reclassification is intended to avoid impairment losses being recognised as losses on disposal. However, one effect is that this rule can result in the recognition of impairment losses on individual assets that form part of a single disposal group subsequently sold at a profit, as in the following Illustration.

Illustration 5-1: Impairment of assets held for sale

Entity A decided to sell three assets in one transaction to the same acquirer. Each asset had been part of a different CGU. The decision to sell was made on 20 December 20X0, just prior to Entity A's year end of 31 December. The assets met IFRS 5's requirements for classification as a disposal group on 10 January 20X1. The information about the carrying amounts and fair values less cost of disposal of individual assets on 20 December 20X0 and the disposal group on 10 January 20X1 is summarised below. There was no change in the fair values of these assets between the two dates.

Asset	Carrying amount	FVLCD of separate assets	Aggregate of the lower of the carrying amount and FVLCD	Fair value of the group
	CU	CU	CU	CU
X	4,600	4,300	4,300	n/a
Y	5,700	5,800	5,700	n/a
Z	2,400	2,500	2,400	n/a
Total	12,700	12,600	12,400	12,600

Although these assets were classified as held for sale subsequent to the year end, the decision to sell them was an indicator of impairment. Accordingly, it is necessary to determine whether the three assets together comprise a new CGU. If so, impairment would be assessed on the three assets together, prior to reclassification and remeasurement under IFRS 5.

If the three assets together do not comprise a CGU, they would have to be tested for impairment individually at the year end, which would result in an impairment loss on Asset X of CU300. As there is no change in the recoverable amount between the year end and immediately before the classification under IFRS 5, the aggregate value of these assets prior to classification under IFRS 5 would be CU12,400 (4,300 + 5,700 + 2,400). The FVLCD of the disposal group at the date of the first application of IFRS 5 (10 January 20X1) is CU12,600. Therefore, according to the measurement criteria under IFRS 5 the carrying amount of the disposal group remains at CU12,400.

IAS 36 does not allow an asset to be written down below the higher of its VIU or FVLCD. [IAS 36.105]. An entity can, however, expect to sell a CGU for less than the apparent aggregate FVLCD of individual assets, e.g., because the potential buyer expects further losses. If this happens, the carrying amount of the disposal group under IFRS 5 is capped at the FVLCD of the disposal group as a whole so the impairment loss is allocated to all non-current assets, even if their carrying amounts are reduced below their individual FVLCD. See Chapter 5.

6 Fair value less costs of disposal (FVLCD)

IFRS 13 specifies how to measure fair value but does not change when fair value is required or permitted under IFRS accounting standards. IFRS 13 is discussed in detail in Chapter 15.

The standard defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. It is explicitly an exit price. [IFRS 13.2]. When measuring FVLCD, fair value is measured in accordance with IFRS 13. Costs of disposal are calculated in accordance with IAS 36.

IFRS 13 specifically excludes VIU from its scope. [IFRS 13.6].

Fair value, like FVLCD, is not an entity-specific measurement but is focused on market participants' assumptions for a particular asset or liability. [IFRS 13.11]. For non-financial assets, fair value has to take account of the highest and best use by a market participant to which the asset could be put. [IFRS 13.27]. An entity's current use of a non-financial asset is presumed to be its highest and best use unless market or other factors suggest that a different use by market participants would maximise the value of the asset. [IFRS 13.29].

Entities are exempt from the disclosures required by IFRS 13 when the recoverable amount is FVLCD. [IFRS 13.7(c)]. IAS 36's disclosure requirements are broadly aligned with those of IFRS 13. See IAS 36's disclosure requirements in section 13 below.

While IFRS 13 makes it clear that transaction costs are not part of a fair value measurement, in all cases, FVLCD must take account of estimated disposal costs. IAS 36 defines costs of disposal as incremental costs directly attributable to the disposal of an asset or cash-generating unit, excluding finance costs and income tax expense. [IAS 36.6]. These include legal costs, stamp duty and other transaction taxes, costs of removing the asset and direct incremental costs to bring an asset into condition for its sale. Business reorganisation costs and employee termination costs (as defined in IAS 19, see Chapter 31) cannot be treated as costs of disposal. [IAS 36.28].

If the disposal of an asset would entail the buyer assuming a liability and there is only a single FVLCD for both taken together, then, to enable a meaningful comparison, the obligation must also be taken into account in calculating VIU and the carrying value of the asset. This is discussed in section 4.1 above.

[IAS 36.29, IAS 36.78].

6.1 Estimating FVLCD

IFRS 13 does not limit the types of valuation techniques an entity can use to measure fair value but instead focuses on the types of inputs that will be used. The standard requires the entity to use the valuation technique that is "...maximising the use of relevant observable inputs and minimising the use of unobservable inputs". [IFRS 13.61]. The objective is that the best available inputs are used in valuing the assets. These inputs could be used in any valuation technique provided they are consistent with one of the three valuation approaches in the standard: the market approach, the cost approach and the income approach. [IFRS 13.62]. IFRS 13 does not place any preference on the techniques that are used as long as the entity achieves the objective of a fair value measurement, which means it must use the best available inputs. In some cases, a single valuation technique will be appropriate, while in other cases, multiple valuation techniques will need to be used to meet this objective. An entity must apply the valuation technique(s) consistently. A change in a valuation technique is considered a change in an accounting estimate in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*.¹ [IFRS 13.66].

The market approach uses prices and other relevant information generated by market transactions involving identical or comparable (i.e., similar) assets, liabilities or a group of assets and liabilities, such as a business. [IFRS 13.B5]. For items within scope of IAS 36, market techniques will usually involve market transactions in comparable assets or, for certain assets valued as businesses, market multiples derived from comparable transactions. [IFRS 13.B5, IFRS 13.B6].

¹ The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

The cost approach reflects the amount that would be required currently to replace the service capacity of an asset (i.e., current replacement cost). It is based on what a market participant buyer would pay to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence. Obsolescence includes physical deterioration, technological (functional) and economic obsolescence so it is not the same as depreciation under IAS 16. [IFRS 13.B8, IFRS 13.B9]. See also section 6.1.2 below.

The income approach converts future amounts (e.g., cash flows or income and expenses) to a single discounted amount. The fair value reflects current market expectations about those future amounts. This will usually mean using a discounted cash flow technique or one of the other techniques that fall into this classification (e.g., option pricing and multi-period excess earnings methods). [IFRS 13.B10, IFRS 13.B11].

See Chapter 15 for a further discussion of these valuation approaches.

The inputs used in these valuation techniques to measure the fair value of an asset have a hierarchy. Those that are quoted prices in an active market for identical assets (Level 1) have the highest priority, followed by inputs, other than quoted prices, that are observable (Level 2). The lowest priority inputs are those based on unobservable inputs (Level 3). [IFRS 13.72]. The valuation techniques, referred to above, will use a combination of inputs to determine the fair value of the asset.

An active market is a market in which transactions take place with sufficient frequency and volume to provide pricing information on an ongoing basis. [IFRS 13 Appendix A].

Using the approach in IFRS 13, most estimates of fair value for IAS 36 purposes will use Level 2 inputs that are directly or indirectly observable and Level 3 inputs that are not based on observable market data but reflect assumptions used by market participants, including risk.

If Level 2 information is available then entities must take it into account in calculating FVLCD because this is a relevant observable input. Entities cannot base their valuation on Level 3 information only if Level 2 information is available.

IFRS 13 allows entities to use unobservable inputs, which can include the entity's own data, to calculate fair value, as long as the objectives (an exit price from the perspective of a market participant) and assumptions about risk are met. [IFRS 13.87, IFRS 13.88, IFRS 13.89]. This means that a discounted cash flow technique can be used if this is commonly used in that industry to estimate fair value. Cash flows used when applying the model can only reflect cash flows that market participants would take into account when assessing fair value. This includes the type, e.g., future capital expenditure, as well as the estimated amount of such cash flows. For example, an entity would like to take into account cash flows relating to future capital expenditure, which are not permitted for a VIU calculation (see section 7.1.2 below). These cash flows must be included if, and only if, other market participants would consider them when evaluating the asset. It is not permissible to include assumptions about cash flows or benefits from the asset that would not be available to or considered by a typical market participant.

The entity cannot ignore external evidence. It must use the best information that is available to it and adjust its own data if "...reasonably available information indicates that other market participants would use different data or there is something particular to the entity that is not available to other market participants such as an entity-specific synergy". An entity need not undertake exhaustive efforts to obtain information about market participant assumptions. "However, an entity shall take into account all information about market participant assumptions that is reasonably available." [IFRS 13.89]. This means using a relevant model, which requires consideration of industry practice. For example, multiples based on occupancy, revenue and EBITDA can be inputs in estimating the fair value of a hotel, but the value of an oilfield would depend on its reserves. The fair value of an oil field would include the costs that would be incurred in accessing those reserves based on the costs a market participant expects to incur instead of the entity's own specific cost structure.

IAS 36 notes that sometimes it is not possible to obtain reliable evidence regarding the assumptions and techniques that market participants would use (IAS 36 uses the phrase "...no basis for making a reliable estimate..."); if so, the recoverable amount of the asset must be based on its VIU. [IAS 36.20]. Therefore, the IASB accepts that there are some circumstances in which market conditions are such that it will not be possible to calculate a reliable estimate of the price at which an orderly transaction to sell the asset would take place under current market conditions. [IAS 36.20]. IFRS 13 includes guidance for identifying transactions that are not orderly. [IFRS 13.B43]. These are discussed in Chapter 15.

6.1.1 FVLCD and the unit of account

In determining FVLCD it is critical to determine the relevant unit of account appropriately. This issue is discussed in detail in Chapter 15.

6.1.2 Depreciated replacement cost or current replacement cost as FVLCD

Cost approaches, e.g., depreciated replacement cost (DRC) or current replacement cost, are one of the three valuation approaches that IFRS 13 considers to be appropriate for establishing FVLCD. Yet, the Basis for Conclusions of IAS 36 indicates that DRC is not suitable:

“Some argue that the replacement cost of an asset should be adopted as a ceiling for its recoverable amount. They argue that the value of an asset to the business would not exceed the amount that the enterprise would be willing to pay for the asset at the balance sheet date.”

“IASB believed that replacement cost techniques are not appropriate to measuring the recoverable amount of an asset. This is because replacement cost measures the cost of an asset and not the future economic benefits recoverable from its use and/or disposal.” [IAS 36.BCZ28, IAS 36.BCZ29].

We do not consider that this means that FVLCD cannot be based on DRC. Rather, this means that DRC can only be used if it meets the objective of IFRS 13 by being a current exit price and not the cost of an asset. If the entity can demonstrate that the price that would be received for the asset is based on the cost to a market participant buyer to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence, then (and only then) is DRC an appropriate basis for FVLCD. See Chapter 15.

6.1.3 FVLCD consideration for assets that are carried at revalued amount

As stated in section 1.3 above, IAS 36 applies to assets carried at revalued amounts, e.g., under IAS 16 (or rarely IAS 38). The standard highlights that the only difference between an asset's fair value and its fair value less costs of disposal is the incremental costs directly attributable to the disposal of the asset. It further explains that if the disposal costs are negligible, the recoverable amount of the revalued asset is necessarily close to, or greater than, its revalued amount. In this case, after revaluation requirements have been applied, it is unlikely that the revalued asset is impaired and recoverable amount need not to be estimated. On the other hand, if the disposal costs are not negligible, the FVLCD is necessarily less than its fair value. Therefore, it cannot be concluded whether the revalued asset is impaired. In this case, after the revaluation requirements have been applied, an entity applies IAS 36 to assess whether the asset has indications of impairment and, if necessary, the CGU identification and VIU. [IAS 36.5].

7 Determining value in use (VIU)

IAS 36 defines VIU as the present value of the future cash flows expected to be derived from an asset or CGU. The following IAS 36 extract states the required elements an entity would need to reflect in the VIU calculation: [IAS 36.30]

Extract from IAS 36

- 30** The following elements shall be reflected in the calculation of an asset's value in use:
- (a) an estimate of the future cash flows the entity expects to derive from the asset;
 - (b) expectations about possible variations in the amount or timing of those future cash flows;
 - (c) the time value of money, represented by the current market risk-free rate of interest;
 - (d) the price for bearing the uncertainty inherent in the asset; and
 - (e) other factors, such as illiquidity, that market participants would reflect in pricing the future cash flows the entity expects to derive from the asset.

The calculation requires the entity to estimate the future cash flows and discount them at an appropriate rate. [IAS 36.31]. It also requires uncertainty as to the timing of cash flows or the market's assessment of risk in those assets ((b), (d) and (e) above) to be taken into account either by adjusting the cash flows or the discount rate. [IAS 36.32]. The intention is that the VIU represents the expected present value of those future cash flows.

If possible, recoverable amount is calculated for the individual asset. However, it will frequently be necessary to calculate the VIU of the CGU of which the asset is a part. [IAS 36.66]. This is because the single asset often does not generate largely independent cash inflows. [IAS 36.67].

Goodwill cannot be tested by itself, so it always has to be tested as part of a CGU or group of CGUs (see section 8 below).

Where a CGU is being reviewed for impairment, this will involve calculation of the VIU of the CGU as a whole unless a reliable estimate of the CGU's FVLCD can be made and the resulting FVLCD is above the total carrying amount of the CGU's net assets.

VIU calculations at the level of the CGU will thus be required when no satisfactory FVLCD is available or FVLCD is below the CGU's carrying amount and one of the following three apply:

- The CGU includes goodwill, intangibles with indefinite useful lives or intangibles not yet available for use which must be tested annually for impairment.
 - A CGU itself is suspected of being impaired.
- Or
- Intangible assets or other fixed assets are suspected of being impaired and individual future cash flows cannot be identified for them.

The standard contains detailed requirements concerning the data to be assembled to calculate VIU that can best be explained and set out as a series of steps. The steps also contain a discussion of the practicalities and difficulties in determining the VIU of an asset. The steps in the process are:

- (1) Dividing the entity into CGUs (see section 3 above).
- (2) Allocating goodwill to CGUs or groups of CGUs (see section 8.1 below).
- (3) Identifying the carrying amount of CGU assets (see section 4 above).
- (4) Estimating the future pre-tax cash flows of the CGU under review (see section 7.1 below).
- (5) Identifying an appropriate discount rate and discounting the future cash flows (see section 7.2 below).
- (6) Comparing carrying value with VIU (assuming FVLCD is lower than carrying value) and recognising impairment losses (if any) (see sections 11.1 and 11.2 below).

Although this process describes the determination of the VIU of a CGU, steps 3 to 6 are the same as those that would be applied to an individual asset if it generated cash inflows independently of other assets. Impairment of goodwill is discussed in section 8 below.

7.1 Estimating the future pre-tax cash flows of the CGU under review

In order to calculate the VIU the entity needs to estimate the future cash flows that it will derive from its use and consider possible variations in their amount or timing. [IAS 36.30]. In estimating future cash flows the entity must consider the following guidance in IAS 36: [IAS 36.33]

Extract from IAS 36

33 In measuring value in use an entity shall:

- (a) base cash flow projections on reasonable and supportable assumptions that represent management's best estimate of the range of economic conditions that will exist over the remaining useful life of the asset. Greater weight shall be given to external evidence.
- (b) base cash flow projections on the most recent financial budgets/forecasts approved by management, but shall exclude any estimated future cash inflows or outflows expected to arise from future restructurings or from improving or enhancing the asset's performance. Projections based on these budgets/forecasts shall cover a maximum period of five years, unless a longer period can be justified.
- (c) estimate cash flow projections beyond the period covered by the most recent budgets/forecasts by extrapolating the projections based on the budgets/forecasts using a steady or declining growth rate for subsequent years, unless an increasing rate can be justified. This growth rate shall not exceed the long-term average growth rate for the products, industries, or country or countries in which the entity operates, or for the market in which the asset is used, unless a higher rate can be justified.

7.1.1 Budgets and cash flows

The standard describes in some detail the responsibilities of management towards the estimation of cash flows. Management is required to ensure that the assumptions on which its current cash flow projections are based are consistent with past actual outcomes by examining the causes of differences between past cash flow projections and actual cash flows. If actual cash flows have been consistently below projected cash flows, then management has to investigate the reason for it and assess whether the current cash flow projections are realistic or require adjustment. [IAS 36.34].

IAS 36 states that the cash flows must be based on the most recent budgets and forecasts for a maximum of five years because reliable forecasts are rarely available for a longer period. If management is confident that its projections are reliable and can demonstrate this from past experience, it can use a longer period. [IAS 36.35]. In using budgets and forecasts, management is required to consider whether these really are the best estimate of economic conditions that will exist over the remaining useful life of the asset. [IAS 36.38]. In particular the standard observes that estimated cash flows and discount rates must be free from both bias and factors unrelated to the asset in question. [IAS 36.A3].

An example of the use of cash flow projections for a period shorter than five years is given by Crayon Group Holding ASA. The following extract from the annual report of Crayon Group Holding ASA refers to the financial budget covering a single year.

Practical example 7-1: Crayon Group Holding ASA (2023)

Norway

Annual Report 2023 [extract]

Financials [extract]

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS [extract]

NOTE 9 Goodwill [extract]

Budget and forecast period

The basis for the projection of the future cash flows estimated is based on the financial budget of one year. The budget in combination with the forecasts represent management's best estimate of the range of economic conditions that will exist over the remaining useful life of the asset. Previous year budgets are tested for reliability and adjusted in case of underperformance. The remaining four years of the forecast period are estimated based on budget and projected performance.

How we see it

While IAS 36 requires cash flow projections to be based on the most recent financial budgets/forecasts approved by management, in our view it is usually appropriate and required to revise forecasts where the economic environment or conditions have changed since the most recent financial budgets and forecasts were approved by management. As the frequency and impact of revisions increases, entities need to consider reducing the period included in the cash flow projections.

This stage of the impairment test illustrates the point that it is not only fixed assets that are being assessed. The future cash flows to be forecast are all cash flows - receipts from sales, purchases, administrative expenses, etc. It is akin to a free cash flow valuation of a business with the resulting valuation then being compared to the carrying value of the assets in the CGU.

As explained in the following standard extract, the cash flow forecast must include three elements:

[IAS 36.39]

Extract from IAS 36

- 39** Estimates of future cash flows shall include:
- (a) projections of cash inflows from the continuing use of the asset;
 - (b) projections of cash outflows that are necessarily incurred to generate the cash inflows from continuing use of the asset (including cash outflows to prepare the asset for use) and can be directly attributed, or allocated on a reasonable and consistent basis, to the asset; and
 - (c) net cash flows, if any, to be received (or paid) for the disposal of the asset at the end of its useful life.

Cash flows can be estimated by taking into account general price changes caused by inflation (nominal terms), or on the basis of stable prices (real terms). If inflation is excluded from the cash flow, then the discount rate selected must also be adjusted to remove the inflationary effect. [IAS 36.40]. Generally, entities will use whichever method is most convenient to them that is consistent with the method they use in their budgets and forecasts. It is, of course, fundamental that cash flows and discount rate are both estimated on a consistent basis.

An example of the inclusion of general price changes caused by inflation is given by CARLSBERG A/S. The following extract from the annual report of Carlsberg A/S refers to the effects of inflationary pressure on both sales prices and input costs.

Practical example 7-2: CARLSBERG A/S (2023)

Denmark

ANNUAL REPORT 2023 [extract]**CONSOLIDATED FINANCIAL STATEMENTS [extract]****Notes [extract]****SECTION 2 ASSET BASE AND RETURNS [extract]****SECTION 2.2 IMPAIRMENT [extract]****2.2.3 IMPAIRMENT TEST OF GOODWILL [extract]****ACCOUNTING ESTIMATES AND JUDGEMENTS [extract]****Key assumptions [extract]****Sales prices**

The level of market premiumisation and the locally available portfolio are key drivers in identifying price points. When planning pricing structures, factors including price elasticity, local competition and inflation expectations can also impact the projection. Increases in excise duties are typically passed on to the customers immediately or with a delay of no more than a few months. Since the increase is a pass-through cost and thereby compensated for by price increases at the time of implementation, it does not impact the long-term sales price growth and is therefore not taken into consideration in the projections unless circumstances specifically indicate otherwise. No changes to duties in the short or medium term are taken into consideration unless there is a firm plan to introduce changes.

Recent significant inflationary pressure has meant revenue growth compensating for rising input costs, especially in Europe. The short- and medium-term forecast includes the risk of delays in increasing sales prices to compensate for future rises in input costs.

Input costs

Input costs in the budget and target plans are based on past experience and on:

- Contracted raw and packaging materials
- Contracted services within sales, marketing, production and logistics
- Planned commercial investments
- Cost optimisations not related to restructurings
- Expected inflation

The recent years' elevated level of inflation has increased the overall input cost level, especially in Europe. The short- and medium-term forecast incorporates continued pressure on input costs.

In the long term, projections follow the level of inflation unless long-term contracts are in place.

Whereas IAS 36 requires the cash flow projections to be based on the most recent financial budgets/forecasts approved by management, significant adjustments can be necessary to ensure the resulting future cash flows satisfy the requirements of the standard (for example the exclusion of lease payments included in lease liabilities or cash flows that are expected to arise from improving or enhancing the asset's performance). Depending on the entity's facts and circumstances, these adjustments can require significant effort and judgement. It is important for entities to consider materiality when determining the extent to which the task can be simplified.

In some cases, entities are receiving government grants and these cash flows are part of the recoverable amount, for example government grants intended to compensate the asset or CGU's operating costs such as employee benefits or commodities. Entities should carefully consider the conditions of any government grant in order to assess whether the inclusion of such amounts in the impairment test is based on reasonable and supportable assumptions that represent management's best estimate of the range of economic conditions that will exist over the remaining useful life of the asset or CGU.

To avoid the danger of double counting, the future cash flows exclude those relating to financial assets, including receivables and liabilities such as payables, pensions and provisions. [IAS 36.43]. However, section 4 above notes that IAS 36.79 allows the inclusion of such assets and liabilities for practical reasons, in which case the cash flows must be reflected as well, and includes a discussion of some of the assets and liabilities that entities can choose to reflect together with the implications of doing so. [IAS 36.79].

The expected future cash flows of the CGU being assessed for impairment must not include cash inflows or outflows from financing activities (including lease payments included in lease liabilities) or tax receipts or payments. This is because financing costs are considered by discounting the estimated future cash flows (hence, the time value of money is already considered), hence including cash inflows or outflows from financing activities would result in double counting. [IAS 36.50, IAS 36.51].

7.1.2 Cash inflows and outflows from improvements and enhancements

Whilst a part-completed asset must have the costs to complete it included in the cash flows, [IAS 36.42], the general rule is that future cash flows must be forecasted for CGUs or assets in their current condition. Forecasts must not include estimated future cash inflows or outflows that are expected to arise from improving or enhancing the asset's performance. [IAS 36.44]. Projections of cash flow must include costs of day-to-day servicing that can be reasonably attributed to the use of the asset (for overheads see section 7.1.7 below). [IAS 36.41].

While the restriction on enhanced performance is understandable, it adds an element of unreality that is hard to reconcile with other assumptions made in the VIU process. For example, the underlying future cash flows that the standard requires management to use will obviously be based on the business as it is actually expected to develop in the future, growth, improvements and all. Producing a special forecast based on unrealistic assumptions, even for this limited purpose, can be difficult.

Nevertheless, IAS 36.48 explicitly states that improvements to the current performance of an asset cannot be included in the estimates of future cash flows until the entity incurs the expenditure that provides those improvements. The treatment of such expenditure is illustrated in Example 6 in the standard's accompanying section of illustrative examples. [IAS 36.48]. The implication of this requirement is that if an asset is impaired, and even if the entity is going to make the future expenditure to reverse that impairment, the asset will still have to be written down. Subsequently, the asset's impairment can be reversed, to the degree appropriate, after the expenditure has taken place. Reversal of asset impairment is discussed in section 11.4 below.

IAS 36 makes it clear that for a part-completed asset, all expected cash outflows required to make the asset ready for use or sale must be considered in the estimate of future cash flows and mentions a building under construction or a development project as examples. [IAS 36.42]. The standard is also clear that the estimate of future cash flows must not include the estimated future cash inflows that are expected to arise from the increase in economic benefits associated with cash outflows to improve or enhance an asset's performance until an entity incurs these cash outflows. [IAS 36.48]. This raises the question of what to do once a project to enhance or improve the performance of an asset or a CGU has commenced, and it has started to incur cash outflows.

How we see it

In our view, once an entity is committed to a future restructuring or an asset is under construction (but not yet ready for use or sale), an entity must consider future cash inflows that are expected to arise from the increase in economic benefits associated with the cash outflows to improve or enhance the asset. Important to note is that it must take into consideration all future cash outflows required to complete the project and any risks in relation with the project, reflected either in the cash flows or the discount rate.

An assumption of new capital investment is in practice intrinsic to the VIU test. What has to be assessed are the future cash flows of a productive unit such as a factory or hotel. The cash flows, out into the far future, will include the sales of product, cost of sales, administrative expenses, etc. They must necessarily include capital expenditure as well, at least to the extent required to keep the CGU functioning as forecast. This is explicitly acknowledged in the standard: [IAS 36.49]

Extract from IAS 36

49 Estimates of future cash flows include future cash outflows necessary to maintain the level of economic benefits expected to arise from the asset in its current condition. When a cash-generating unit consists of assets with different estimated useful lives, all of which are essential to the ongoing operation of the unit, the replacement of assets with shorter lives is considered to be part of the day-to-day servicing of the unit when estimating the future cash flows associated with the unit. Similarly, when a single asset consists of components with different estimated useful lives, the replacement of components with shorter lives is considered to be part of the day-to-day servicing of the asset when estimating the future cash flows generated by the asset.

Accordingly, some capital expenditure cash flows must be built into the future cash flows. Whilst improving capital expenditure cannot be recognised, routine or replacement capital expenditure necessary to maintain the function of the asset or assets in the CGU has to be included. Entities must therefore distinguish between maintenance, replacement and enhancement expenditure. This distinction is not always easy to draw in practice, as shown in the following Illustration.

Illustration 7-1: Distinguishing enhancement and maintenance expenditure

A telecommunications company provides fixed line, telephone, television and internet services. It must develop its basic transmission infrastructure (by overhead wires or cables along streets or railway lines, etc.) and in order to service a new customer it will have to connect the customer's home via cable and other equipment. It will extend its network to adjoining areas and perhaps acquire an entity with its own network. It will also reflect changes in technology, e.g., fibre optic cables replacing copper ones.

Obviously, when preparing the budgets which form the basis for testing the network for impairment, it will make assumptions regarding future revenue growth and will include the costs of connecting those customers. However, its infrastructure maintenance spend will inevitably include replacing equipment with the current technology. There is no option of continuing to replace equipment with something that has been technologically superseded. Once this technology exists, it will be reflected in the entity's budgets and taken into account in its cash flows when carrying out impairment tests, even though this new equipment will enhance the performance of the transmission infrastructure.

How we see it

Where an asset is damaged, IAS 36 considers this physical damage as an indicator of impairment. As a second step, in some cases, as noted above, the replacement or repair of the asset is considered to meet the definition of maintenance expenditure that is included in the future cash flows. We believe in that case any related insurance recoveries should also be included in the future cash flows in case this relates to the repair or replacement of the damaged asset and the inclusion of such amounts in the impairment test is based on reasonable and supportable assumptions that represent management's best estimate of the range of economic conditions that will exist over the remaining useful life of the asset.

Illustration 7-2: Insurance recovery for damage incurred**Directors' report - Material business risks**

The entity's operating facility is located in an area prone to flooding, which could significantly damage the asset. To manage this exposure, the entity enters into insurance contracts.

Financial statements - Impairment

The entity has a 31 December 20X1 financial year end. In November 20X1, the entity's operating facility was physically damaged due to a flood.

The carrying value of the operating facility was reduced following the derecognition of the damaged components. Although the entity has insurance covering the damage, on 31 December 20X1, it was not virtually certain this would be received (e.g., subject to the insurer accepting the claim). Therefore, the entity has not recognised an insurance receivable.

Management identified the impact of the flooding as an impairment indicator and used a value in use calculation to determine the recoverable amount. For impairment testing purposes, management determined the operating facility doesn't generate largely independent cash inflows from other production assets. Hence, the impairment test is performed at the level of the whole production site, being the smallest identifiable CGU.

The cash flow forecast considered the impact of flooding by:

- increasing insurance premiums,
- expense to repair damage caused to bring the asset back into the same state as before the damage (i.e., not enhancing the asset), and
- insurance recovery.

The cash flow forecast is based on reasonable and supportable assumptions that represent management's best estimate of the range of economic conditions that will exist over the remaining useful life of the operating facility.

When the entity repairs the operating facility, it accounts for the expenses in accordance with IAS 16. Once the entity becomes virtually certain of being reimbursed by the insurer, it recognises a receivable in accordance with IAS 37.

At the next reporting period end, the entity again identifies impairment indicators and performs an impairment test. The carrying value of the CGU containing the operating facility is assumed to have increased because of the capitalisation of the replacement components. The receipt of insurance proceeds decreases the recoverable amount. The reason is that the cashflow forecast no longer includes the cash inflows from the insurance proceeds as they are now received and recognised as a receivable. If consequently the recoverable value of the CGU has reduced below its carrying value, an impairment expense needs to be recognised.

Further examples indicate another problem area - the effects of future expenditure that the entity has identified but which the entity has not yet incurred. One example is an entity that has acquired an asset with the intention of enhancing it in future and, therefore, has paid for future synergies which will be reflected in the calculation of goodwill. Another example is an entity with plans for an asset that involve expenditure that will enhance its future performance and without which the asset is impaired.

Examples could include:

- A social media company that, in acquiring another, would expect to pay for the future right to migrate users from the competing platform to its own platform.
- Or
- An aircraft manufacturer that expects to be able to use one of the acquired plants for a new model at a future point, a process that will involve replacing much of the current equipment.

In both cases the long-term plans reflect both the capital spent and the cash flows that will flow from it. There is no obvious alternative to recognising an impairment when calculating the VIU of the CGU or group of CGUs as IAS 36 insists that the impairment test has to be performed for the asset in its current condition. This means that it is not permitted to include the benefit of improving or enhancing the asset's performance in calculating its VIU.

An entity in this situation can avoid or reduce an impairment loss by calculating the appropriate FVLCD, as this is not constrained by rules regarding future capital expenditure. As discussed above, these cash flows can be included only to the extent that other market participants would consider them when evaluating the asset. It is not permissible to include assumptions about cash flows or benefits from the asset that would not be available to or considered by a typical market participant.

An example of the inclusion of capital expenditure cash flows in the forecasted cash flows is given by ArcelorMittal. The following extract from the annual report of ArcelorMittal refers to the inclusion of future decarbonization capital expenditures.

Practical example 7-3: ArcelorMittal (2023)

Luxembourg

Annual Report 2023 [extract]

Consolidated Financial Statements [extract]

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS [extract]

NOTE 5: GOODWILL, INTANGIBLE AND TANGIBLE ASSETS [extract]

5.3 Impairment of intangible assets, including goodwill, and tangible assets [extract]

The Company considered its exposure to certain climate-related risks which could affect its estimates of future cash flow projections applied for the determination of the recoverable amount of its GCGUs and CGUs. With the switch to electric vehicles and the move to wind and solar power generation, the Company sees also additional opportunities as customers deepen their understanding of embedded and lifecycle emissions of the materials where steel compares favorably.

The Company is committed to the objectives of the Paris agreement and announced its ambition to reduce carbon emissions by 35% in Europe and 25% group-wide by 2030 and achieve group-wide carbon neutrality by 2050. These announced goals will require significant long-term investments which require global level playing field, access to abundant and affordable clean energy, facilitating necessary energy infrastructure, access to sustainable finance for low-emissions steelmaking and accelerated transition to a circular economy. In addition, the Company considered the legal obligation of carbon neutrality by 2050 effective within the EU and in Canada following adoption of the Climate Law and the Net Zero Emission Accountability Act, respectively. Accordingly, with respect to its flat steel operations in the EU and in Canada, ArcelorMittal concluded that future decarbonization capital expenditures, which correspond essentially to the construction of DRI-EAF facilities, are necessary to maintain the level of economic benefits expected to arise from the assets in their current condition and should therefore be included in the Company's assumptions for future cash flows of the recoverable amount of the respective GCGUs and CGUs. At the same time, the Company is engaged in developing in the near to medium term a range of innovative low-emission technologies for the transition to decarbonized steel including the Smart Carbon route and the Hydrogen-DRI route and required investments are considered in the Company's future cash flow projections. ArcelorMittal acknowledges that CGUs and GCGUs applying the BF-BOF route in other jurisdictions than the EU and Canada will apply decarbonization at a different pace. They may also not yet be subject to a legal obligation of carbon neutrality, as a result of which the future estimated decarbonization cost for such operations is reflected through an additional risk premium embedded in discount rates until they are able to accelerate their decarbonization strategy to meet the 2050 carbon neutrality objective and a legal obligation arises in the relevant jurisdiction.

...

7.1.3 Restructuring

The standard contains similar rules with regard to any future restructuring that affects the VIU of the asset or CGU. The prohibition on including the results of restructuring applies only to those plans to which the entity is not committed. Again, this is because of the general rule that the cash flows must be based on the asset in its current condition so future events that change that condition are not to be taken into account. [IAS 36.44, IAS 36.45]. When an entity becomes committed to a restructuring (as set out in IAS 37 see Chapter 27), IAS 36 then allows an entity's estimates of future cash inflows and outflows to reflect the cost savings and other benefits from the restructuring, based on the most recent financial budgets/forecasts approved by management. [IAS 36.46, IAS 36.47]. Treatment of such a future restructuring is illustrated by Example 5 in the standard's accompanying section of illustrative examples. The standard specifically points out that the increase in cash inflows as a result of such a restructuring is not taken into account until after the entity is committed to the restructuring. [IAS 36.47].

Entities will sometimes be required to recognise impairment losses that will be reversed once the expenditure has been incurred and the restructuring completed.

7.1.4 Future cash flows after the forecast period

In the case of non-current assets, a large component of value attributable to an asset or CGU arises from its terminal value, which is the net present value of all of the forecasted free cash flows that are expected to be generated by the asset or CGU after the explicit forecast period. IAS 36 includes specific requirements if the asset is to be sold at the end of its useful life. The disposal proceeds and costs must be based on current prices and costs for similar assets, adjusted if necessary for price level changes if the entity has chosen to include this factor in its forecasts and selection of a discount rate. The entity must take care that its estimate is based on a proper assessment of the amount that would be received in an arm's length transaction. [IAS 36.52, IAS 36.53].

Whether the life of an asset or CGU is considered to be finite or indefinite will have a material impact on the terminal value. It is therefore of the utmost importance for management to assess carefully the cash generating ability of the asset or CGU and whether the period over which this asset or CGU is capable of generating cash flows is defined or not. While many CGUs containing goodwill will have an indefinite life, the same is not necessarily true for CGUs without allocated goodwill. For example, if a CGU has one main operating asset with a finite life, as in the case of a mine, the cash flow period needs to be limited to the life of the mine. Whether it would be reasonable to assume that an entity would replace the principal assets of a CGU and therefore whether it would be appropriate to calculate the terminal value under consideration of cash flows into perpetuity will depend on the specific facts and circumstances.

In the case of assets or CGUs with indefinite useful lives, the terminal value is calculated by having regard to the forecasted maintainable cash flows that are expected to be generated by the assets or CGUs in the final year of the explicit forecast period ('the terminal year'). It is essential that the terminal year cash flows reflect maintainable cash flows as otherwise any material one-off or abnormal cash flows that are forecast for the terminal year will inappropriately increase or decrease the valuation.

The maintainable cash flow expected to be generated by the asset or CGU is then capitalised by a perpetuity factor based on either:

- The discount rate if cash flows are forecast to remain relatively constant
- Or
- The discount rate less the long-term growth rate if cash flows are forecast to grow

Care is required in assessing the growth rate to ensure consistency between the long-term growth rate used and the assumptions used by the entity generally in its business planning. IAS 36 requires an entity to use in the VIU calculation a steady or declining growth rate for subsequent years, unless an increasing rate can be justified. This growth rate must not exceed the long-term average growth rate for the products, industries, or country or countries in which the entity operates, or for the market in which the asset is used, unless a higher rate can be justified. [IAS 36.33].

Only in exceptional circumstances can an increasing growth rate be used or can the period before a steady or declining growth rate be assumed to extend to more than the next five years. This five-year rule is based on general economic theory that postulates above-average growth rates will only be achievable in the short-term, because such above-average growth will lead to competitors entering the market. This increased competition will, over a period of time, lead to a reduction of the growth rate, towards the average for the economy as a whole. IAS 36 suggests that entities will find it difficult to exceed the average historical growth rate for the products, countries or markets over the long-term, say twenty years. [IAS 36.37].

7.1.5 Foreign currency cash flows

Foreign currency cash flows are first estimated in the currency in which they will be generated and then discounted using a discount rate appropriate for that currency. An entity translates the present value calculated in the foreign currency using the spot exchange rate at the date of the value in use calculation. [IAS 36.54]. This is to avoid the problems inherent in using forward exchange rates, which are based on differential interest rates. Using such a rate would result in double-counting the time value of money, first in the discount rate and then in the forward rate. [IAS 36.BCZ49]. However, the method requires an entity to perform, in effect, separate impairment tests for cash flows generated in different currencies but make them consistent with one another so that the combined effect is meaningful. This is an extremely difficult exercise. Many different factors need to be taken into account including relative inflation rates and relative interest rates as well as appropriate discount rates for the currencies in question. Because of this, the possibility for error is great and the greatest danger is understating the present value of cash outflows by using too high a discount rate. In practice, valuers can assist entities to obtain a sufficiently accurate result by assuming that cash flows are generated in a single currency even though they are received or paid in another. Significantly, the rate used to translate the cash flows could well be different from that used to translate the foreign currency assets, goodwill and liabilities of a subsidiary at the period end. For example, a non-monetary asset such as an item of property, plant and equipment can be carried at an amount based on exchange rates on the date on which it was acquired but generates foreign currency cash flows. In order to determine its recoverable amount if there are indicators of impairment, IAS 21 *The Effects of Changes in Foreign Exchange Rates* states that the recoverable amount will be calculated in accordance with IAS 36 and the present value of the cash flows translated at the exchange rate at the date when that value was determined. [IAS 21.25]. IAS 21 notes that this can be the rate at the reporting date. The VIU is then compared to the carrying value and the item is then carried forward at the lower of these two values.

7.1.6 Internal transfer pricing

If the cash inflows generated by the asset or CGU are based on internal transfer pricing, the best estimate of an external arm's length transaction price must be used in estimating the future cash flows to determine the asset's or CGU's VIU. [IAS 36.70]. Note that this applies to any cash inflow once a CGU has been identified; it is not restricted to CGUs that have been identified because there is an active market for their outputs, which are described in section 3.3 above.

In practice, transfer pricing can be based on estimated market values, perhaps with a discount or other adjustment, be a cost-based price or be based on specific negotiation between the group companies. Transfer prices will reflect the taxation consequences to the transferring and acquiring companies and the prices can be agreed with the relevant taxation authorities. This is especially important to multinational companies but can also affect transfer prices within a single jurisdiction.

Transfer pricing is extremely widespread. The following Illustration describes a small number of bases for the pricing and the ways entities verify whether they approximate an arm's length transaction price. Even where the methodology is appropriate, it is still necessary to ensure that the inputs into the calculation are reasonable. It is possible that an arm's length price is not a particular price point but rather a range of prices.

Illustration 7-3: Internal transfer prices in the future cash flows to determine the VIU

A vehicle manufacturer, Entity A has a CGU that manufactures parts, transferring them to the vehicle assembly division. The parts are specific to the manufacturer's vehicles and the manufacturer cannot immediately source them on the open market. However, Entity A and other manufacturers in the sector do enter into parts supply arrangements with third parties, which set up the specific tooling necessary to manufacture the parts and could provide an external comparable transaction to help validate that the parts' internal transfer price is equivalent to an arm's length transaction. If not, the forecasts must be adjusted.

Entity B is an oil company that transfers crude oil from the drilling division to the refinery, to be used in the production of gasoline. There are market prices for crude oil that can be used to estimate cash inflows in the drilling division CGU and cash outflows for the refinery CGU.

7.1.7 Overheads

When calculating the VIU, entities include projections of cash outflows that are:

- (i) Necessarily incurred to generate the cash inflow from continuing use of the asset (or CGU)

And

- (ii) Can be directly attributed, or allocated on a reasonable and consistent basis to the asset (or CGU)

[IAS 36.39(b)]

Projections of cash outflows include those for the day-to-day servicing of the asset/CGU as well as future overheads that can be attributed directly, or allocated on a reasonable and consistent basis, to the use of the asset/CGU. [IAS 36.41].

How we see it

In our view, all overhead costs must be considered, and most must be allocated to CGUs when testing for impairment. Judgements can however be required to determine how far down to allocate some overhead costs and in determining an appropriate allocation basis. This is particularly important when it comes to stewardship costs and overhead costs incurred at a far higher level in a group to the CGU/asset assessed for impairment. Careful consideration of the entity's specific relevant facts and circumstances and cost structure is needed.

Generally, overhead costs that provide identifiable services to a CGU (e.g., IT costs from a centralised function) as well as those that would be incurred by a CGU if it needed to perform the related tasks when operating on a 'stand-alone basis' (e.g., financial reporting function) must be allocated to the CGU being tested for impairment.

Conversely, overhead costs that are incurred with a view to acquire and develop a new business (e.g., costs for corporate development such as M&A activities) would generally not be allocated. These costs are similar in nature to future cash inflows and outflows that are expected to arise from improving or enhancing a CGU's performance which are not considered in the VIU according to IAS 36.44. [IAS 36.44].

The selection of a reasonable and consistent allocation basis of overhead costs will require analysis of various factors including the nature of the CGU itself. A reasonable allocation basis for identifiable services can be readily apparent, for example in some cases volume of transaction processing for IT services or headcount for human resource services can be appropriate. However, a reasonable allocation basis for stewardship costs that are determined to be necessarily incurred by the CGU to generate cash inflows can require more analysis. For example, an allocation basis for stewardship costs such as revenue or headcount can be inappropriate when CGUs have different regulatory environments, (i.e., more regulated CGUs can require more governance time and effort) or maturity stages (i.e., CGUs in mature industries can require less governance effort). The allocation basis can differ by type of cost and in some cases can reflect an average metric over a period of time rather than a metric for a single period or can reflect future expected, rather than historic, metrics.

Overheads not fully pushed down to the lowest level of CGUs need to be included in an impairment test at a higher-level group of CGUs if it can be demonstrated that the overhead costs are necessarily incurred and can be attributed directly or allocated on a reasonable and consistent basis at that higher level. After a careful analysis, there could be instances when certain overhead costs are excluded from cash flow projections on the basis that they do not meet the criteria under IAS 36.39(b).

Many entities make internal charges, often called 'management charges', which purport to transfer overhead charges to other group entities. Care must be taken before using these charges as a surrogate for actual overheads as they are often based on what is permitted, (e.g., by the taxation authorities), rather than actual overhead costs. There is also the danger of double counting if a management charge includes an element for the use of corporate assets that have already been allocated to the CGU being tested, e.g., an internal rent charge.

In certain situations, it can be argued that some stewardship costs are already included in the impairment test through the discount rate used. This would among other factors depend on the way the discount rate has been determined, and whether the relevant stewardship cost is regarded more as a shareholder cost covered in the shareholders' expected return rather than a cost necessarily incurred by the CGU to generate the relevant cash flows. Due to the complexity of such an approach, it would need to be applied with appropriate care.

7.1.8 Share-based payments

In many jurisdictions employees' remuneration packages include share-based payments. Share-based payments are cash-settled, equity-settled or give the entity or the counterparty the choice of settlement in equity or in cash. In practice, many share-based payment transactions undertaken by entities are awards of equity-settled shares and options. This gives the entity the possibility of rewarding employees without incurring any cash outflows and instead the cash costs are ultimately borne by the shareholders through dilution of their holdings.

When it comes to impairment assessment, a question that entities often face is whether and how to consider share-based payments in the recoverable amount, in particular the VIU calculation. IAS 36 itself does not provide any specific guidance as to whether or how share-based payments are considered in determining the recoverable amount.

As IAS 36 focuses on cash flows in determining VIU, it seems that expected cash outflows in relation to cash-settled share-based payments would need to be reflected in the VIU calculation. As noted in section 4.1 above, consistency is a very important principle underlying IAS 36. Therefore, in relation to cash-settled share-based payments, entities must be consistent in the extent to which cash flows resulting from these arrangements are included in the carrying amount of the CGU and the cash flows used to determine the value in use. Where the future expected cash flows used in determining the value in use are limited to the expected cash outflows in excess of the liability already recognised at that date in the VIU calculation, the liability already recognised at the date of the VIU determination cannot be included in the carrying amount of the CGU. In contrast, if the entity includes all the future expected cash outflows in determining the value in use, the liability already recognised at the date of the VIU determination must be included in the carrying amount of the CGU in order to be consistent.

Assume for example a cash-settled share-based payment plan with total expected cash outflow of CU90 of which CU30 has already been recognised in a liability. If CU60 is included in the cash flows used to determine the value in use, the liability of CU30 cannot be included in the carrying amount of the CGU. If on the other hand CU90 is included in the cash flows used to determine the value in use, the liability of CU30 must be included in the carrying amount of the CGU.

While theoretically this seems to be straight forward, in practice it can be quite a challenging and judgemental task, in particular when the entity consists of a large number of CGUs. Share-based payments are in general awarded by the parent to employees within the group. It is possible that there is no correlation between any change in the value of share-based payments after the grant date and the performance of the employing CGU. This can be relevant in assessing whether and how such changes in value and the ultimate expected cash flows are allocated to a specific CGU.

What is even less clear is how an entity reflects equity-settled share-based payments in the VIU calculation. Such share-based payment transactions may never result in any cash outflows for the entity - for example when newly issued shares are used to settle the equity-settled share-based payment plan, and therefore a literal reading of IAS 36 can indicate that they can be ignored in determining the recoverable amount. However, some argue an entity must appropriately reflect all share-based payments in the VIU calculation, whether or not these result in a real cash outflow to the entity. They note that share-based payments are part of an employee's remuneration package and therefore represent costs (in line with the treatment under IFRS 2 *Share-based Payment*) incurred by the entity for services from the employee. Others argue that they need to be considered through adjusting the discount rate in order to reflect a higher return to equity holders to counter the dilutive effects of equity settled share-based payment awards. This also depends on the way the discount rate is determined, and whether the level of equity-settled share-based plans are in line with the peer group used to determine the discount rate. If this is not the case it is likely adjustments are needed in order to reflect the higher return in the current market assessment. In practice this can be very difficult and judgmental to determine.

IAS 36 mentions averages, and computational short cuts may provide reasonable approximations of the detailed computations. In certain situations, IAS 36 allows for elements to be included either in the discount rate or in the cash flows. Based on this it might be possible to adjust the cash flows in order to get to a reasonable approximation of the effect on value in use. [IAS 36.23, IAS36.32].

The time span over which the recoverable amount is calculated is often much longer than the time period for which share-based payments have been awarded. Companies and their employees would often expect that further share-based payment awards will be made in the future during the time period used for the recoverable amount calculation. Depending on the respective facts and circumstances an entity would need to consider how to include the effect of share-based payments over a longer period, considering the discussion above.

How we see it

IAS 36 itself does not provide any specific guidance as to whether or how share-based payments are considered in determining the recoverable amount. As IAS 36 focuses on cash flows in determining VIU, it is our view that share-based payments that result in cash outflows (for example cash-settled share-based payments) would need to be reflected in the VIU calculation.

What is less clear in our view is how an entity reflects equity-settled share-based payments in the VIU calculation when these will not result in a cash outflow for the entity (for example where employees receive newly issued shares of the entity to settle equity-settled share-based payments). A significant amount of judgement can be required to assess how to appropriately reflect such share-based payments in VIU calculations, either by adjusting the cash flows or adjusting the discount rate.

7.1.9 Lease payments

7.1.9.A Lease payments during the lease term

As mentioned in section 4.1.2 above, the VIU calculation does not consider any cash flows for lease liabilities recorded in the statement of financial position. If the carrying amount of the lease liability is deducted to arrive at the carrying value of the CGU, the same carrying amount of the lease liability would need to be deducted from the VIU. [IAS 36.78].

It is important to note that, while under IFRS 16 in-substance fixed lease payments in connection with lease arrangements are reflected in the lease liability, other lease payments are not. Variable lease payments that do not depend on an index or a rate, such as those based on performance or usage of the underlying asset, are not reflected in the recognised lease liability. These contractual payments therefore would still need to be reflected in the cash flow forecast used for the VIU calculation.

An entity accounts for each non-lease component within a contract separately from the lease component of the contract, unless the lessee applies the practical expedient in IFRS 16.15. Therefore, unless the practical expedient is applied, the non-lease components would need to be considered in the VIU calculation. If the practical expedient in IFRS 16.15 is applied, then the same guidance as discussed above for variable lease payments would apply to variable payments in relation to non-lease components.

In addition, IFRS 16 has certain exemptions for low-value assets and short-term leases. If a lessee elects to use these exemptions and therefore not to record a right-of-use asset and a lease liability on the balance sheet for these leases, then the cash flows in relation to these leases would still need to be included in the VIU cash flow forecast.

7.1.9.B Lease payments beyond the current lease term

When testing (groups) of CGUs it will frequently occur that cash flow forecasts in a VIU model are for a longer period than the lease term of the right-of-use assets included in the carrying amount of the CGU.

An assumption of new capital investments is in practice intrinsic to the VIU test. What has to be assessed are the future cash flows of the CGU. The cash flows, out into the future, will include sales of products or services, the cost of sales or services and all other cash flows necessary to generate independent cash inflows. They must necessarily include capital expenditure as well, at least to the extent required to keep the CGU functioning as forecasted.

In cases where the cash flows of the CGU are dependent on the underlying right-of-use assets, but the lease term will end during the cash flow forecast period, renewal, extension or replacement of the underlying right-of-use asset will have to be assumed. This can be done either by assuming a new lease will be entered into and therefore considering lease payments for this replacement lease in the cash flow forecast or terminal value or by assuming a replacement asset will be purchased. This will depend on the entity's planned course of action, including the consideration of any already committed leases that have not yet commenced. It would be inappropriate not to reflect such replacement needs in the CGU's cash flows if the CGU's future cash inflows depend thereon.

Special attention is required when a terminal value calculation is used, where the terminal value is calculated before the end of the lease term. For example, the terminal value can be based on the extrapolation of the cash flow expected for year 5, while the lease term ends at the end of year 8. This means that the cash flow at the end of year 5 does not represent a sustainable cash flow going forward. This can be addressed by including replacement leases or capital expenditures in the terminal year, and separately calculating an adjustment to reflect that some of these expenditures will only start after year 8 (if material).

7.1.10 Events after the reporting period

Events after the reporting period and information received after the end of the reporting period must be considered in the impairment assessment only if changes in assumptions provide additional evidence of conditions that existed at the end of the reporting period. Judgement of all facts and circumstances is required to make this assessment.

Information available after the year end can provide evidence that conditions were much worse than assumed. Whether an adjustment to the impairment assessment would be required or not would depend on whether the information casts doubt on the assumptions made in the estimated cash flows for the impairment assessment.

Competitive pressures resulting in price reductions after the year end do not generally arise overnight but normally occur over a period of time and can represent a reaction to conditions that already existed at the year-end in which case management would reflect this in the year end impairment assessment.

IAS 10 *Events after the Reporting Period* distinguishes events after the reporting period between adjusting and non-adjusting events (see Chapter 34). IAS 10 mentions abnormally large changes after the reporting period in asset prices or foreign exchange rates as examples of non-adjusting events and therefore these changes would in general not be a reason to update year end impairment calculations. The standard implies that abnormally large changes must be due to an event that occurred after the period end and therefore more or less assumes that the cause of such abnormally large changes are not conditions that already existed at the year-end. However, management would need to carefully assess the reason for the abnormally large change and consider whether it is due to conditions which already existed at the period end.

As stated in section 7.1 above, cash flow projections used for the impairment test are based on recent financial budgets/forecasts approved by management. This begs the question what to do if a new budget/forecast is approved by management after the reporting period end but before the accounts are authorised for issue? A similar question arises in group scenarios where subsidiaries' accounts are authorised for issue a significant time after the group accounts were authorised for issue. In both scenarios the same general considerations as explained above would apply. An entity would need to assess whether the revised budget/forecast is due to conditions that already existed at the reporting period end and therefore would need to be considered in the impairment assessment, or whether the change in budget/forecast is due to circumstances that arose after the end of the reporting period and therefore would only be considered in subsequent impairment tests. In a group scenario, this could lead to a situation where the revised budget/forecast would need to be considered on a subsidiary level when the subsidiaries' accounts are authorised for issue after the revised budget was approved, despite the fact that the group accounts were already authorised for issue based on the previous budget.

7.1.11 Risk in present value: 'traditional' and 'expected cash flow' approaches

The elements that must be taken into account in calculating VIU are described in section 7 above. IAS 36 requires an estimate of the future cash flows the entity expects to derive from the asset and the time value of money, represented by the current market risk-free rate of interest, to be reflected in the VIU calculation. However, the other elements that must be taken into account, all of which measure various aspects of risk, are dealt with either as adjustments to the discount rate or to the cash flows. These elements are:

- Expectations about possible variations in the amount or timing of those future cash flows
- The price for bearing the uncertainty inherent in the asset
- And
- Other factors, such as illiquidity that market participants would reflect in pricing the future cash flows the entity expects to derive from the asset [IAS 36.30]

Adjusting for these factors in the discount rate is termed the 'traditional approach' in Appendix A to IAS 36. Alternatively, under the 'expected cash flow' approach these adjustments are made in arriving at the risk-adjusted cash flows. Either method can be used to compute the VIU of an asset or CGU. [IAS 36.A2].

The traditional approach uses a single set of estimated cash flows and a single discount rate, often described as 'the rate commensurate with the risk'. This approach assumes that a single discount rate convention can incorporate all expectations about the future cash flows and the appropriate risk premium and therefore places most emphasis on the selection of the discount rate. [IAS 36.A4].

Due to the problems and difficulties around capturing and reflecting all of the variables into a single discount rate (for example, when there is significant uncertainty related to future events), IAS 36 notes that the expected cash flow approach could be the more effective measurement tool. [IAS 36.A6, IAS 36.A7].

The expected cash flow approach is a probability weighted net present value approach. This approach uses all expectations about possible cash flows instead of a single most likely cash flow and assigns probabilities to each cash flow scenario to arrive at a probability weighted net present value. The use of probabilities is an essential element of the expected cash flow approach. [IAS 36.A10]. The discount rate then considers the risks and variability for which the cash flows have not been adjusted. Appendix A notes some of the downsides of this approach, e.g., that the probabilities are highly subjective and that it can be inappropriate for measuring a single item or one with a limited number of outcomes. Nonetheless, it considers the most valid objection to the method to be the costs of obtaining additional information when weighed against its 'greater reliability'. [IAS 36.A10, IAS 36.A11, IAS 36.A12, IAS 36.A13].

Even where an expected cash flow approach is used, an entity would still need to consider adjusting the discount rate for the general uncertainties and risks not reflected in the cash flows. The key message is therefore that an entity needs to ensure that consistent assumptions are used for the estimation of cash flows and the selection of an appropriate discount rate in order to avoid any double-counting or omissions. [IAS 36.51].

An example of the use of the expected cash flow approach is given by Tesco PLC. The following extract from the annual report of Tesco PLC refers to scenarios reflecting different outcomes from risks presented by Brexit, COVID-19, a macroeconomic downturn and climate change.

Practical example 7-4: Tesco PLC (2022)	United Kingdom
Annual Report 2022 Notes to the Group financial statements [extract] Note 15 Impairment of non-current assets [extract] Impairment methodology [extract] Value in use [extract] Retail [extract]	
<p>The Group applies an expected cash flow approach by probability-weighting different cash flow scenarios. The greatest probability weighting is applied to the cash flows derived from the three-year internal forecasts. Additional scenarios take account of the risks presented by macroeconomic downturns, global supply pressures and climate change, consistent with the viability statement scenarios (see the Longer term viability statement in the Strategic report) as well as an upside scenario.</p> <p>...</p>	

7.2 Identifying an appropriate discount rate and discounting the future cash flows

The present value of the future cash flows of the CGU is determined by allocating the future cash flows to different periods and then determining their current value by applying a discount rate. IAS 36 defines the discount rate as a pre-tax rate that reflects current market assessments of the time value of money and the risks specific to the asset for which the future cash flow estimates have not been adjusted. [IAS 36.55].

This means the discount rate to be applied is an estimate of the rate that the market would expect on an equally risky investment. The standard states:

"A rate that reflects current market assessments of the time value of money and the risks specific to the asset is the return that investors would require if they were to choose an investment that would generate cash flows of amounts, timing and risk profile equivalent to those that the entity expects to derive from the asset." [IAS 36.56].

Therefore, if at all possible, the rate is to be obtained from market transactions or market rates, which means the rate implicit in current market transactions for similar assets or the weighted average cost of capital (WACC) of a listed entity that has a single asset (or a portfolio of assets) with similar service potential and risks to the asset under review. [IAS 36.56]. If such a listed entity could be found, care would have to be taken in using its WACC as, to determine the VIU, the standard requires the use of a pre-tax discount rate that is independent of the entity's capital structure and the way it financed the purchase of the asset (see section 7.2.1 below). The effect of gearing and its effect on calculating an appropriate WACC is illustrated in Illustration 7-4 below.

Only in rare cases (e.g., property assets) can such market rates be obtained. If an asset-specific rate is not available from the market, surrogates are to be used. [IAS 36.A16]. The discount rate that investors would require if they were to choose an investment that would generate cash flows of amounts, timing and risk profile equivalent to those that the entity expects to derive from the asset will not be easy to determine. IAS 36 suggests that, as a starting point, the entity takes into account the following rates: [IAS 36.A17]

Extract from IAS 36

- A17 As a starting point in making such an estimate, the entity might take into account the following rates:
- (a) the entity's weighted average cost of capital determined using techniques such as the Capital Asset Pricing Model;
 - (b) the entity's incremental borrowing rate; and
 - (c) other market borrowing rates.

Appendix A also gives the following guidelines for selecting the appropriate discount rate:

- It must be adjusted to reflect the specific risks associated with the projected cash flows (such as country, currency, price and cash flow risks) and to exclude risks that are not relevant. [IAS 36.A18].
 - To avoid double counting, the discount rate does not reflect risks for which future cash flow estimates have been adjusted. [IAS 36.A18].
 - The discount rate is independent of the entity's capital structure and the way it financed the purchase of the asset. [IAS 36.A19].
 - If the basis for the rate is post-tax (such as a weighted average cost of capital), it is adjusted for the VIU calculation to reflect a pre-tax rate. [IAS 36.A20].
- And
- Normally the entity uses a single discount rate, but it must use separate discount rates for different future periods if the VIU is sensitive to different risks for different periods or to the term structure of interest rates. [IAS 36.A21].

The discount rate specific for the asset or CGU will take account of the period over which the asset or CGU is expected to generate cash inflows and it is possible that the rate is not sensitive to changes in short-term rates - this is discussed in section 2.1.4 above. [IAS 36.16].

It is suggested that the incremental borrowing rate of the business is relevant to the selection of a discount rate. This could only be a starting point as the appropriate discount rate must be independent of the entity's capital structure or the way in which it financed the purchase of the asset (including the use of leases to finance its operations). In addition, the incremental borrowing rate includes an element of default risk for the entity as a whole, which is not relevant in assessing the return expected from the assets.

IAS 36 requires that the future cash flows are before tax and finance costs, though it is more common in discounted cash flow valuations to use cash flows after tax. However, as pre-tax cash flows are being used, the standard requires a pre-tax discount rate to be used. [IAS 36.55]. This will theoretically involve discounting higher future cash flows (before deduction of tax) with a higher discount rate. This higher discount rate is the post-tax rate adjusted to reflect the specific amount and timing of the future tax flows. In other words, the pre-tax discount rate is the rate that gives the same present value when discounting the pre-tax cash flows as the post-tax cash flows discounted at the post-tax rate of return. [IAS 36.BCZ85].

When the post-tax discount rate is determined, the pre-tax discount rate can be calculated. If a simple gross up is appropriate, it can be calculated by applying the fraction $1/(1-t)$. Thus, if the post-tax discount rate is assumed to be 10%, the pre-tax discount rate will be 10% divided by 0.7, if the relevant tax rate for the reporting entity is 30%, which will give a pre-tax rate of 14.3%. However, the standard warns that in many circumstances a gross up will not give a good enough answer as the pre-tax discount rate also depends on the timing of future tax cash flows and the useful life of the asset; these tax flows can be scheduled and an iterative process used to calculate the pre-tax discount rate. [IAS 36.BCZ85]. The relationship between pre- and post-tax rates is discussed further in section 7.2.2 below.

The selection of discount rates leaves considerable room for judgement in the absence of more specific guidance, and it is likely that many very different approaches will be applied in practice, even though this is not always evident from the financial statements. However, once the discount rate has been chosen, the future cash flows are discounted in order to produce a present value figure representing the VIU of the CGU or individual asset that is the subject of the impairment test. [IAS 36.55].

7.2.1 Discount rates and the weighted average cost of capital

In practice, many entities use the weighted average cost of capital (WACC) to estimate the appropriate discount rate. The appropriate way to calculate the WACC is an extremely technical subject, and one about which there is much academic literature and no general agreement. The selection of the rate is obviously a crucial part of the impairment testing process and in practice, it will probably not be possible to obtain a theoretically perfect rate. The objective, therefore, must be to obtain a rate which is sensible and justifiable. There are probably a number of acceptable methods of arriving at the appropriate rate and one method is set out below.

While this Illustration appears to be quite complex, it has been written at a fairly general level. Where entities find the calculation of the appropriate discount rate to be difficult, we recommend seeking specialist advice.

Illustration 7-4: Calculating a discount rate

This example illustrates how to estimate a discount rate (WACC) for a CGU. As it is highly unlikely that a listed company with a similar risk profile to the CGU in questions exists, the WACC has to be simulated by looking at a hypothetical company with a similar risk profile.

When estimating the WACC for the CGU, the following three elements need to be determined; Gearing (i.e., the ratio of market value of debt to market value of equity), Cost of debt and Cost of equity. The three elements are discussed in more detail below.

Gearing

Gearing can best be obtained by reviewing quoted companies operating predominantly in the same industry as the CGU and identifying an average level of gearing for such companies. The companies need to be quoted so that the market value of equity can be readily determined.

Cost of debt

Where companies in the sector typically have quoted debt, the cost of such debt can be determined directly. In order to calculate the cost of debt for bank loans and borrowings more generally (including lease liabilities), one method is to take the rate implicit in fixed interest government bonds - with a period to maturity similar to the expected life of the assets being reviewed for impairment - and to add to this rate a bank's margin, i.e., the commercial premium that would be added to the bond rate by a bank lending to the hypothetical company in this sector. In some cases, the margin being charged on existing borrowings to the company in question will provide evidence to help with establishing the bank's margin. Obviously, the appropriateness of this will depend upon the extent to which the risks facing the CGU being tested are similar to the risks facing the company or group as a whole.

The additional bank's margin to add would be a matter for judgement but would vary according to the ease with which the sector under review was generally able to obtain bank finance and, as noted above, there can be evidence from the borrowings actually in place of the likely margin that would be chargeable. In general, the presence of tangible assets such as properties that are readily available as security for borrowings is expected to result in a lower margin.

Cost of equity

Cost of equity is the hardest component of the cost of capital to determine. One technique referred to in the standard, frequently used in practice and written up in numerous textbooks is the 'Capital Asset Pricing Model' (CAPM). The theory underlying this model is that the cost of equity is equal to the risk-free rate plus a market risk premium multiplied by a systematic risk factor, known as the beta, representing in total the equity risk premium. The risk-free rate is usually the same as that used to determine the nominal cost of debt and described above as being obtainable from government bond yields with an appropriate period to redemption. The market risk premium is the premium that investors require for investing in equities rather than government bonds. In certain cases, the equity risk premium is increased, for instance to take account of specific risks in the CGU in question that are not reflected in its market sector generally. Such increases are typically made when determining the cost of equity for a small company or to reflect differences in liquidity. The beta for a quoted company is a number that is greater or less than one according to whether market movements generally are reflected in a proportionately greater (beta more than one) or smaller (beta less than one) movement in the particular stock in question.

Various bodies, such as The London Business School, publish betas on a regular basis both for individual stocks and for industry sectors in general. Published betas are in general levered, i.e., they reflect the level of gearing in the company or sector concerned (although unlevered betas (based on risk as if financed with 100% equity) are also available and care must be taken not to confuse the two).

In addition to the volatility expressed in the beta, investors also reflect the exposure of the stock to a limited niche sector or exposure to a limited customer base. As a result, size premium could be required when the CGU is smaller than its direct competitors.

The cost of equity for the hypothetical company having a similar risk profile to the CGU is:

Cost of equity = risk-free rate + (levered beta × market risk premium) + size premium (if deemed required)

Having determined the component costs of debt and equity and the appropriate level of gearing, the WACC for the hypothetical company having a similar risk profile to the CGU in question is:

$$WACC = (1 - t) \times D \times \frac{g}{1 + g} + E \times \left[1 - \frac{g}{1 + g} \right]$$

Where:

- D Is the cost of debt
- E Is the cost of equity
- g Is the gearing level (i.e., the ratio of debt to equity) for the sector
- And
- t Is the rate of tax relief available on the debt servicing payments

Use of the WACC is usually acceptable to auditors as it is supported by valuation experts and is an accepted methodology based on a well-known formula and widely available information. In addition, many entities already know their own WACC. However, it can only be used as a starting point for determining an appropriate discount rate and some of the issues that must be taken into account are as follows:

- The WACC is a post-tax rate and IAS 36 requires VIU to be calculated using pre-tax cash flows and a pre-tax rate. In the majority of cases, converting the former into the latter is not simply a question of grossing up the post-tax rate by the effective tax rate.
- An entity's own WACC is not suitable as a discount rate if there is anything atypical about the entity's capital structure compared with 'typical' market participants (for example the extent to which debts are used to finance the operations may deviate from market practice).
- The WACC must reflect the risks specific to the asset and not the risks relating to the entity as a whole, such as default risk.
- And
- The entity's WACC is an average rate derived from its existing business, yet entities frequently operate in more than one sector. Within a sector, different types of projects can have different levels of risk (e.g., a start-up as against an established product).

These issues are discussed further below.

One of the most difficult areas in practice is the effect of taxation on the WACC. In order to determine an appropriate pre-tax discount rate, it is likely to be necessary to adjust the entity's actual tax cash flows.

Ultimately, the appropriate discount rate to select is one that reflects current market assessments of the time value of money and the risks specific to the asset in question, including taxation. Such a rate is one that reflects "...the return that investors would require if they were to choose an investment that would generate cash flows of amounts, timing and risk profile equivalent to those that the entity expects to derive from the asset". [IAS 36.56].

An example of the determination of the WACC is given by Eni SpA. The following extract from the annual report of Eni SpA explains how its discount rate is determined.

Practical example 7-5: Eni SpA (2023)

Italy

Annual Report 2023 [extract]**CONSOLIDATED FINANCIAL STATEMENTS [extract]****NOTES ON CONSOLIDATED FINANCIAL STATEMENTS [extract]****15 Reversals (Impairments) of tangible and intangible assets and right-of-use-assets. Sensitivity of outcomes to decarbonisation scenarios [extract]**

...

The discount rate of the future cash flows of the CGUs was estimated as the weighted average cost of equity (Ke) and net borrowings, based on the Capital Asset Pricing Model methodology. Specifically, the cost of equity considers both a premium for the non-diversifiable market risk measured on the basis of the long-term returns of the S&P500, and an additional premium that considers exposure to operational risks of the countries of activity and the risks of the energy transition. For 2023, a Group cost of capital ("WAAC") of approximately 7% was estimated and was substantially unchanged compared to 2022 due to a lower cost of equity as a consequence of the reduction in the company's financial risk, which offset the increased yields on risk-free assets. The Group WACC is adjusted to account for the specific operational risks of each geography against the average portfolio, where oil&gas activities are conducted, by adding a corrective factor (WACC adjusted on a Country-by-Country basis).

...

7.2.2 Calculating a pre-tax discount rate

VIU is primarily an accounting concept rather than a business valuation of the asset or CGU. One fundamental difference is that IAS 36 requires pre-tax cash flows to be discounted using a pre-tax discount rate. Why not calculate VIU on a post-tax basis? The reason is the complexities created by tax losses carried forward, temporary tax differences and deferred taxes.

The standard explains in the Basis for Conclusions that future income tax cash flows can affect recoverable amount. It is convenient to analyse future tax cash flows into two components:

- (a) The future tax cash flows that would result from any difference between the tax base of an asset (the amount attributed to it for tax purposes) and its carrying amount, after recognition of any impairment loss. Such differences are described in IAS 12 as 'temporary differences'.

And

- (b) The future tax cash flows that would result if the tax base of the asset were equal to its recoverable amount. [IAS 36.BCZ81].

The concept is complex but refers to the following issues.

An impairment test, say at the end of 20X1, takes account of estimated future cash flows. The actual tax cash flows that an entity expects to pay in future years can depend on tax depreciation that the entity has already taken (or is yet to take) in respect of the asset or CGU being tested for impairment. The value of the asset to the business on a post-tax basis must take account of all tax effects including those relating to the past and not only those that will only arise in future.

Although these 'temporary differences' are accounted for as deferred taxation, IAS 12:

- Does not allow entities to recognise all deferred tax liabilities or deferred tax assets
- Does not recognise deferred tax assets using the same criteria as deferred tax liabilities

And

- Does not recognise deferred tax on a discounted basis

Therefore, deferred taxation as provided in the income statement and statement of financial position is not sufficient to take account of the actual temporary differences relating to the asset or CGU.

At the same time, an asset valuation implicitly assumes that the carrying amount of the asset is deductible for tax. For example, if the tax rate is 25%, an entity must receive pre-tax cash flows with a present value of 400 in order to recover a carrying amount of 300. [IAS 36.BCZ88]. In principle, therefore, VIU on a post-tax basis would include the present value of the future tax cash flows that would result if the tax base of the asset were equal to its value in use. Hence, IAS 36 indicates that the appropriate tax base to calculate VIU in a post-tax setting, is the VIU itself. [IAS 36.BCZ84]. Therefore, the calculated VIU must also be used to derive the pre-tax discount rate. It follows from this that the 'tax cash flows' to be taken into account will be those reflected in the post-tax VIU, so they will be neither the tax cash flows available in relation to the asset (based on its cost) nor the actual tax cash flows payable by the entity.

For these reasons, the IASC (which was replaced by the IASB in 2001) decided to require an entity to determine value in use by using pre-tax future cash flows and a pre-tax discount rate.

This means that there is a different problem, calculating an appropriate pre-tax discount rate because there are no observable pre-tax discount rates. Two important points must be taken into account:

- The pre-tax discount rate is not always the post-tax discount rate grossed up by a standard rate of tax. There are some circumstances in which a gross-up will give a reasonable approximation, discussed further in section 7.2.4 below.
- The pre-tax discount rate is not the post-tax rate grossed up by the effects of the entity's actual tax cash flows. As discussed above, a post-tax discount rate such as the WACC is based on certain assumptions about the tax-deductibility of the asset and not the actual tax cash flows experienced by the entity.

Recognising this, IAS 36.BCZ85 states that "...in theory, discounting post-tax cash flows at a post-tax discount rate and discounting pre-tax cash flows at a pre-tax discount rate should give the same result, as long as the pre-tax discount rate is the post-tax discount rate adjusted to reflect the specific amount and timing of the future tax cash flows". [IAS 36.BCZ85].

Therefore, the only accurate way to calculate a pre-tax WACC is to calculate the VIU by applying a post-tax rate to post-tax cash flows, tax cash flows being based on the allowances and charges available to the asset and to which the revenue is subject (see discussion in section 7.2.3 below). The effective pre-tax rate is calculated by removing the tax cash flows and, by iteration, one can identify the pre-tax rate that makes the present value of the adjusted cash flows equal the VIU calculated using post tax cash flows.

Paragraph BCZ85 includes an example of how to calculate a pre-tax discount rate where the tax cash flows are irregular because of the availability of tax deductions for the asset's capital cost. See also the calculations in Illustration 7-5 below - (a) illustrates a calculation of a pre-tax discount rate. This is a relatively straightforward calculation for a single asset at the inception of the relevant project.

It can be far more complex at a later date. This is the case when entities attempt to calculate a discount rate starting with post-tax cash flows and a post-tax discount rate at a point in time when there are already temporary differences relating to the asset. A discount rate based on an entity's prospective tax cash flows under- or overstates IAS 36's impairment charge unless it reflects these previous allowances or disallowances. This is the same problem that will be encountered if an entity attempts to test VIU using post-tax cash flows as described in section 7.2.3 below.

A notional adjustment will have to be made if the entity is not paying tax because it is making, or has made, tax losses. It is unwarranted to assume that the post- and pre-tax discount rates will be the same if the entity pays no tax because of its own tax losses as this will be double counting. It is taking advantage of the losses in the cash flows but excluding that value from the assets of the CGU.

Entities can attempt to deal with the complexity of determining a pre-tax rate by trying to calculate VIU on a post-tax basis but this approach means addressing the many difficulties that have been identified by the IASB and the reasons why it mandated a pre-tax approach in testing for impairment in the first place.

Some approximations and short cuts that can give an acceptable answer in practice are dealt with in section 7.2.4 below.

7.2.3 Calculating VIU using post-tax cash flows

Because of the challenges in calculating an appropriate pre-tax discount rate and because it aligns more closely with their normal business valuation approach, some entities attempt to perform a VIU calculation based on a post-tax discount rate and post-tax cash flows.

In support of the post-tax approach, the example in IAS 36.BCZ85, which explains how to calculate a pre-tax discount rate, is mistakenly understood as a methodology for a post-tax VIU calculation using an entity's actual tax cash flows.

Entities that try a post-tax approach generally use the year-end WACC and estimated post-tax cash flows for future years that reflect the actual tax that they expect to pay in those years. A calculation on this basis will only by chance correspond to an impairment test in accordance with IAS 36 because it is based on inappropriate assumptions, i.e., it does not take account of the temporary differences that affect the entity's future tax charges and will not be based on the assumption that the VIU is tax deductible. Some include in the post-tax calculation the benefit of tax deductions or tax losses by bringing them into the cash flows in the years in which the tax benefit is expected to be received. In these cases, the calculation will not correctly take account of the timing differences reflected in the tax cash flows and not accurately reflect the differences created by the assumption that the VIU is tax deductible.

In order to calculate a post-tax VIU that is the equivalent to the VIU required by IAS 36, an entity will usually have to make adjustments to the actual tax cash flows or otherwise adjust its actual post-tax cash flows.

There are two approaches that can give a post-tax VIU that is equivalent to IAS 36's pre-tax calculation:

- (1) Post-tax cash flows based on notional tax cash flows. The assumptions that need to be made are the same as those used in calculating a pre-tax discount rate as described in IAS 36.BCZ85. Therefore, there must be no temporary differences associated with the asset which means including only the future cash flows that would result if the tax base of the asset were equal to its VIU. In addition, no account is taken of the existing tax losses of the entity. Both of these assumptions will probably mean making appropriate notional adjustments.
- (2) Post-tax cash flows reflecting actual tax cash flows. The relevant deferred tax asset or liability, discounted as appropriate, must be treated as part of the net assets of the relevant CGU.

It is very important to note that these are methodologies to determine IAS 36's required VIU, and they will only be acceptable if the result can be shown to be materially the same as a pre-tax impairment calculation as required by IAS 36.

How we see it

When measuring the value in use using post-tax inputs, there are two approaches, in our view, that can give a post-tax VIU that is equivalent to IAS 36's pre-tax calculation. Either using post-tax cash flows based on notional tax cash flows that would result if the tax base of the asset were equal to its VIU or post-tax cash flows reflecting actual tax cash flows with inclusion of the discounted deferred tax asset or liability as part of the carrying value of the CGU.

Note that for illustrative purposes all of the following Illustrations assume that there is no headroom, i.e., the NPV of the relevant cash flows is exactly equal to the carrying value of the asset. This is to make it easier to observe the relationship between pre- and post-tax calculations. See section 7.2.5 below for worked examples including headroom.

Illustration 7-5: Impairment calculations using pre- and post-tax cash flows and discount rates

The following examples illustrate impairment calculations using pre- and post-tax cash flows and discount rates.

(a) Comparing pre- and post-tax rates

An entity has invested CU2,139 in a facility with a 10-year useful life. Revenue and operating costs are expected to grow by 5% annually. The net present value of the post-tax future cash flows, discounted at the WACC of 8.1%, is equal to the cost of the plant.

The budgeted pre-tax cash flows are as follows:

Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Revenues	500	525	551	579	608	638	670	703	739	776
Operating expenses	(200)	(210)	(220)	(232)	(243)	(255)	(268)	(281)	(296)	(310)
Pre-tax cash flow	300	315	331	347	365	383	402	422	443	466

The following tax amortisation and tax rate apply to the business:

Tax and accounting depreciation	straight line
Tax rate	30%

These apply to the budgeted cash flows as follows:

Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Tax amortisation	214	214	214	214	214	214	214	214	214	214
Taxation	(26)	(30)	(35)	(40)	(45)	(51)	(56)	(62)	(69)	(75)
Post-tax cash flow	274	285	296	307	320	332	346	360	374	391

The pre-tax rate can be calculated using an iterative calculation and this can be compared to a gross up using the standard rate of tax. The NPV using these two rates is as follows:

Pre-tax rate (day 1) - iterative calculation	10.92%
Cost of investment at NPV future cash flows	CU2,139
Standard gross up (day 1) (8.1% ÷ 70%).	11.57%
NPV at standard gross up	CU2,077

The NPV of the pre-tax cash flows at 11.57% is CU2,077. This is only 2.9% lower than the number calculated using the true pre-tax rate. In many circumstances, this difference would not have a material effect.

If the tax and accounting depreciation are straight line then the distortion introduced by a standard gross-up can be relatively small and could be of less significance to an impairment test than, for example, the potential variability in cash flows. See also section 7.2.4 below.

(b) Comparing pre- and post-tax rates when the asset is impaired

Assume that the facility is much less successful than had previously been assumed and that the revenues are 20% lower than the original estimates. The pre- and post-tax cash flows are as follows:

Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Revenues	400	420	441	463	486	511	536	563	591	621
Operating expenses	(200)	(210)	(220)	(231)	(243)	(256)	(268)	(282)	(296)	(311)
Pre-tax cash flow	200	210	221	232	243	255	268	281	295	310
Tax amortisation	214	214	214	214	214	214	214	214	214	214
Taxation	4	1	(2)	(5)	(9)	(12)	(16)	(20)	(24)	(29)
Post-tax cash flow	204	211	219	227	234	243	252	261	271	281

The asset is clearly impaired as the previous cash flows were just sufficient to recover the carrying amount of the investment. If these revised cash flows are discounted using the pre- and post-tax discount rates discussed above, the resulting impairment is as follows:

	NPV	Impairment	Deferred tax	Net loss
	CU	CU	CU	CU
Original investment	2,139			
Pre-tax cash flows, discounted at pre-tax discount rate	1,426	713	214	499
Post-tax cash flows discounted at post-tax discount rate	1,569	570	171	399

Unless adjustments are made to the post-tax calculation, it will understate the impairment loss by 143 (pre-tax) and 100 (post-tax, assuming full provision for the deferred tax asset). This difference is the present value of the deferred tax on the actual impairment loss, a point explored in more detail in (d) below.

(c) Impairment and variable tax cash flows

The assumption of straight-line amortisation for taxation and accounting purposes does not reflect the circumstances of certain sectors, particularly where there are significant deductions for tax for the cost of the asset being tested for impairment, e.g., in the extractive sector. Impairment tests have to be calculated on assets with finite useful lives and variable tax cash flows. In many jurisdictions there are, or have been, substantial tax allowances for the construction of the asset but high rates of tax in the production phase.

The following example assumes that the entity gets a tax deduction for the cost of the asset in year 1. Once again, this assumes that in year 1 the cost of the investment is equal to the NPV of the cash flows.

Year	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
Revenues	500	525	551	579	608	638	670	704	739	776
Operating expenses	(200)	(210)	(220)	(232)	(243)	(255)	(268)	(281)	(296)	(310)
Pre-tax cash flow	300	315	331	347	365	383	402	422	443	465
Tax amortisation	2,367									
Taxation	620	(95)	(99)	(104)	(109)	(115)	(121)	(127)	(133)	(140)
Post-tax cash flow	920	220	232	243	256	268	281	295	310	325

Assuming the same post-tax WACC of 8.1%, the pre-tax WACC is now considerably lower owing to the effect of the tax deduction in the first year. It can be calculated using an iterative process at 8.76%, rather than 10.92%, which is the pre-tax rate in (a) and (b) above. Therefore, the NPV of the pre- and post-tax cash inflows is CU2,367 rather than CU2,139 - the first-year tax allowances enhance the VIU of the project. If the entity discounted the pre-tax cash flows at 11.57%, the post-tax rate grossed up at the standard rate of taxation, these cash flows would have a NPV of CU2,077, which is approximately 12% lower than the actual NPV. It is clear that a standardised gross up will not give a reasonable approximation in these circumstances.

(d) Correctly measuring impairment using post-tax information

If an entity applies a post-tax rate to post-tax cash flows, what can it do to ensure that impairment is correctly measured in accordance with IAS 36?

Assume, in example (c) above, that cash inflows decline by 20% commencing at the beginning of year 2. The net present value of the pre-tax cash flows at 8.76% is CU1,516.

Year	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU
Pre-tax cash flow	210	221	232	243	255	268	281	295	310
Taxation	(63)	(66)	(69)	(73)	(77)	(80)	(84)	(89)	(93)
Post-tax cash flows	147	155	163	170	178	188	197	206	217

The asset's book value at the end of year 1, assuming straight line depreciation over 10 years, is CU2,130. Impairment calculated using pre-tax cash flows and discount rates is as follows:

	CU
Original investment	2,367
Net book value (end of year 1)	2,130
Pre-tax cash flows, discounted at pre-tax discount rate	8.76% 1,516
Impairment	614
Deferred tax asset (reduction in deferred tax liability)	(184)
Net impairment loss	430

A post-tax calculation overstates the impairment, as follows:

	CU
Original investment	2,367
Net book value (end of year 1)	2,130
Post-tax cash flows, discounted at post-tax discount rate	8.1% 1,092
Impairment - overstated by 424	1,038
Deferred tax asset (reduction in deferred tax liability)	(311)
Net impairment loss - overstated by 297	727

It can be seen that unless adjustments are made to the post-tax calculation, it will overstate the impairment loss. There are two ways in which the post-tax calculation can be adjusted so as to give the right impairment charge.

Method (1): Post-tax cash flows based on notional tax cash flows. The assumptions that need to be made are the same as those used in calculating a pre-tax discount rate. Therefore, there must be no temporary

differences associated with the asset which means including only the future cash flows that would result if the tax base of the asset were equal to its VIU.

This means assuming that the VIU of the asset (1,516) is deductible for tax purposes in year 2. This would usually be calculated iteratively.

Year	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU
Pre-tax cash flow	210	221	232	243	255	268	281	295	310
Deemed tax amortisation	1,516								
Taxation	392	(66)	(69)	(73)	(77)	(80)	(84)	(89)	(93)
Post-tax cash flows	602	155	163	170	178	188	197	206	217

The present value of the notional post-tax cash flows at the post-tax discount rate of 8.1% is now CU1,516, i.e., the VIU of the asset is fully deductible for tax purposes, so the impairment charge, before taxation, is CU614, which is the same impairment as calculated above under the pre-tax cash flow model.

Method (2): Post-tax cash flows reflecting actual tax cash flows as adjusted for deferred tax. Again, this is an iterative calculation.

Year	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU
Pre-tax cash flow	210	221	232	243	255	268	281	295	310
Deferred tax	(455)								
Taxation	(63)	(66)	(69)	(73)	(77)	(80)	(84)	(89)	(93)
Post-tax cash flows	147	155	163	170	178	188	197	206	217
Post-tax cash flows as adjusted for deferred tax	602	155	163	170	178	188	197	206	217

The net present value of the post-tax cash flows at the post-tax discount rate is CU1,092. The NPV of the post-tax cash flows as adjusted for deferred tax (see bottom line in the table), which is the VIU of the asset being tested for impairment, is CU1,516 and the gross deferred tax liability relating to the asset is 1,516 at 30%, i.e., CU455. The NPV of CU455, discounted for one year at the post-tax discount rate of 8.1%, is CU424. The deferred tax liability is discounted for one year due to the assumption used that all tax cash flows take place at the end of the year. Revised, the post-tax calculation is as follows:

	CU
Original investment	2,367
Net book value (end of year 1)	2,130
Post-tax cash flows, discounted at post-tax discount rate	8.1% 1,092
Discounted deferred tax	424
Impairment (2,130 - (1,092 + 424))	614

The impairment loss will impact the deferred tax calculation in the usual way, i.e., 614 at 30% = CU184.

It will rarely be practicable to apply this methodology to calculate a discount rate for a CGU, as so many factors need to be taken into account. Even if all assets within the CGU are individually acquired or self-constructed, they can have a range of useful lives for depreciation and tax amortisation purposes, up to and including indefinite useful lives.

If goodwill is being tested, it has an indefinite useful life. However, the underlying assets in the CGU or group of CGUs to which it has been allocated will usually have finite useful lives. It is likely that a reasonable approximation to the 'true' discount rate is the best that can be achieved, and this is discussed further below.

7.2.4 Approximations and short cuts

The examples in Illustration 7-5 in section 7.2.3 above are of course simplified, and in reality, it is unlikely that entities will need to schedule all of the tax cash flows and tax consequences in order to calculate a pre-tax discount rate every time they perform an impairment test. In practice, it will probably not be possible to obtain a rate that is theoretically perfect - the task is just too intractable for that. The objective, therefore, must be to obtain a rate which is sensible and justifiable. Some of the following can make the exercise a bit easier.

An entity can calculate a pre-tax rate using adjusted tax cash flows based on the methods and assumptions described above and then apply that rate to discount pre-tax cash flows for the VIU calculation. This pre-tax rate will only need to be reassessed in following years when there is an external factor that affects risks, relevant market rates or the taxation basis of the asset or CGU.

The market can conclude that the risks relating to a particular asset are higher or lower than had previously been assumed. Such risk adjustments can occur if, for example, a new project, process or product proves to be successful or if there were previously unforeseen problems with an activity. Relevant changes in market rates are those for instruments with a period to maturity similar to the expected useful life of the assets being reviewed for impairment, so these will not necessarily need to be recalculated every time an impairment test is carried out. Short-term market rates can increase or decrease without affecting the rate of return that the market would require on long-term assets. Significant changes in the basis of taxation could also affect the discount rate, e.g., if tax deductions are applied or removed for all of a class of asset or activity. The discount rate will not necessarily be affected if the entity ceases to make taxable profits.

Valuation practitioners often use approximations when computing tax cash flows that can also make the task more straightforward. It is often a valid approximation to assume that the tax amortisation of assets equals their accounting depreciation. Tax cash flows will be based on the relevant corporate tax rate and the forecast earnings before interest and taxation to give post-tax 'cash flows' that can then be discounted using a post-tax discount rate. The circumstances in which this could lead to a material distortion (perhaps in the case of an impairment test for an individual asset) will probably be obvious. This approach is consistent with the overall requirement of IAS 36, which is that the appropriate discount rate to select is one that reflects current market assessments of the risks specific to the asset in question.

The circumstances in which a standardised gross up at the corporation tax rate will give the relevant discount rate are:

- No growth in cash flows
- A perpetuity calculation
- And
- Tax cash flows that are a constant percentage of total cash flows

As long as these conditions remain unchanged, it will be straightforward to determine the discount rate for an impairment test at either the pre- or post-tax level.

A close approximation to these criteria is possible for some CGUs, particularly if accounting and tax amortisation of assets is similar. This is illustrated in Illustration 7-6 below - see the comparison of discount rates at the end of the example. A simple gross up can be materially correct. The criteria are unlikely to apply to the VIU of individual assets because these are rarely perpetuity calculations, and it is possible that the deductibility for tax purposes does not resemble accounting depreciation. If it is inappropriate to make such a gross up, an iterative calculation can be necessary to compute the appropriate pre-tax discount rate.

7.2.5 Disclosing pre-tax discount rates when using a post-tax methodology

If an entity calculates impairment using a post-tax methodology, it must still disclose the appropriate pre-tax discount rate. [IAS 36.134(d)(v)]. There is a widely held view that the relevant pre-tax discount rate is the rate that will discount the pre-tax cash flows to the same VIU as the post-tax cash flows discounted using the post-tax discount rate. This will not necessarily give an answer that is consistent with IAS 36, which makes it clear that pre- and post-tax discount rates will only give the same answer if "the pre-tax discount rate is the post-tax discount rate adjusted to reflect the specific amount and timing of the future tax cash flows". [IAS 36.BC285]. It is no different in principle whether grossing up for a pre-tax rate or grossing up for disclosure purposes.

IAS 36 indicates that the appropriate tax base to calculate VIU in a post-tax setting, is the VIU itself. Therefore, the calculated (post-tax) VIU also has to be used to derive the pre-tax discount rate. Depreciation for tax purposes must also be based on the calculated VIU.

Assuming that there is no impairment, the post-tax VIU will be higher than the carrying value of the asset. To calculate the pre-tax rate, the tax amortisation must be based on this figure. If tax amortisation is based on the cost of the asset, the apparent pre-tax discount rate will show a rising trend over the useful life of the asset as the ratio of pre- to post-tax cash flows changes and the effect of discounting becomes smaller. These effects can be very marked.

Illustration 7-6: Calculating pre-tax discount rates from post-tax VIUs

The assumptions underlying these calculations are as follows:

	CU
Tax rate	25%
Post-tax discount rate	10%
Carrying amount beginning of year 1	1,500
Remaining useful life (years)	5
Straight line tax amortisation	

If the tax amortisation is based on the cost of the asset, the apparent pre-tax discount rate in each of the five years is as follows:

Year	1	2	3	4	5
	CU	CU	CU	CU	CU
Revenue	1,000	1,020	1,040	1,061	1,082
Pre-tax cash flow	500	510	520	531	541
Tax amortisation	(300)	(300)	(300)	(300)	(300)
Taxation	50	53	55	58	60
Post-tax cash flows	450	457	465	473	481
NPV of post-tax cash flows using a 10% discount rate	1,756	1,484	1,175	827	437

The apparent pre-tax discount rate in any year will be the rate that discounts the pre-tax cash flows to the same NPV as the post-tax cash flows using the post-tax discount rate.

Apparent pre-tax discount rate	14.4%	15.4%	16.7%	19.1%	23.8%
--------------------------------	-------	-------	-------	-------	-------

It is quite clear that these apparent pre-tax discount rates are incorrect. Although pre-tax rates are not observable in the market, they are derived from market rates and would not increase in a mechanical fashion over the useful life of the asset.

The correct way to calculate the tax amortisation is based on the VIU. Years 1 and 2 are illustrated in the following table:

Year	1	2	3	4	5
	CU	CU	CU	CU	CU
Revenue	1,000	1,020	1,040	1,061	1,082
Pre-tax cash flow	500	510	520	531	541
Year 1					
Notional tax amortisation (VIU 1,819 ÷ 5)	(364)	(364)	(364)	(364)	(364)
Taxation	34	37	39	42	44
Post-tax cash flows	466	473	481	489	497
Year 2					
Notional tax amortisation (VIU 1,554 ÷ 4)		(389)	(389)	(389)	(389)
Taxation		30	33	36	38
		480	487	495	503

The NPV of the post-tax cash flows, which is the VIU of the asset being tested for impairment, is CU1,819 in year 1 and CU1,554 in year 2, and the tax base allowing for a tax amortisation is based on these VIUs as well, both solved iteratively. Years 3, 4 and 5 are calculated in the same way, with tax amortisation based on the VIUs in the following table:

Year	1	2	3	4	5
VIU (NPV of post-tax cash flows)	CU1,819	CU1,554	CU1,247	CU890	CU478
Annual depreciation for remaining term	CU364	CU389	CU416	CU445	CU478
	(1,819 ÷ 5)	(1,554 ÷ 4)	(1,247 ÷ 3)	(890 ÷ 2)	478
Pre-tax discount rate	13.1%	13.1%	13.2%	13.3%	13.3%

We can now compare the correct and incorrectly computed pre-tax discount rates. A rate based on grossing up the post-tax rate at the standard rate of tax is included for comparison.

Year	1	2	3	4	5
Post-tax discount rate	10%	10%	10%	10%	10%
Pre-tax discount rate - correct	13.1%	13.1%	13.2%	13.3%	13.3%
Pre-tax discount rate - incorrect, based on cost	14.4%	15.4%	16.7%	19.1%	23.8%
Pre-tax rate - approximation based on gross-up	13.3%	13.3%	13.3%	13.3%	13.3%

Note that in circumstances where tax amortisation is equal to accounting depreciation, a straightforward gross-up at the tax rate can give a satisfactory discount rate.

A rate based on actual post-tax cash flows will also vary from year to year depending on the tax situation. Neither of these distortions is consistent with the principle that the pre-tax discount rate is the rate that reflects current market assessments of the time value of money and the risks specific to the asset. [IAS 36.55].

7.2.6 Determining pre-tax rates taking account of tax losses

A common problem relates to the effect of tax losses on the impairment calculation, as they can reduce the total tax paid in the period under review or even eliminate it altogether. As noted above, however, a post-tax discount rate is based on certain assumptions about the tax-deductibility of the asset and not the actual tax cash flows. It is therefore unwarranted to assume that the post- and pre-tax discount rates will be the same if the entity pays no tax because of its own tax losses. As the pre-tax rate does not include the benefit of available tax benefits, any deferred tax asset arising from tax losses carried forward at the reporting date must be excluded from the assets of the CGU if the impairment test is based on VIU. Similarly, if the entity calculates a post-tax VIU (see section 7.2.3 above), it will also make assumptions about taxation and not base the calculation on the actual tax cash flows.

In many circumstances, the past history of tax losses affects the level of risk in the cash flows in the period under review, but one must take care not to increase the discount rate to reflect risks for which the estimated cash flows have been adjusted. [IAS 36.A15]. To do so would be to double count.

How we see it

In our view, tax losses carried forward, whether recognised as a deferred tax asset or unrecognised at the reporting date, do not impact the outcome of an impairment test. Recognised deferred tax assets are tested separately under the requirements of IAS 12. Any difference in value between otherwise identical CGUs, with or without tax losses, relates to the value of the tax losses and not to the assets within the CGU. The existing tax assets (related to current or past tax losses, regardless of whether recognised or unrecognised) are excluded from the assets tested as part of the CGU and therefore the cash flows relating to the losses brought forward at the reporting date must also be excluded from the impairment test. For the avoidance of doubt, expected future tax losses (that at a future point are expected to result in recognised or unrecognised tax assets) are included within the impairment test.

7.2.7 Entity-specific WACCs and different project risks within the entity

The entity's WACC is an average rate derived from its existing business, yet entities frequently operate in more than one sector. Within a sector, different types of projects can have different levels of risk, e.g., a start-up against an established product. Therefore, entities must ensure that the different business risks of different CGUs are properly taken into account when determining the appropriate discount rates.

It must be noted that these areas of different risk will not always coincide with the assets or CGUs that are being tested for impairment as this is a test for impairment and not necessarily a determination of business value.

Illustration 7-7: Different project risks and CGUs

An aircraft manufacturer makes both civilian and military aircraft. The risks for both sectors are markedly different as they are much lower for defence contractors than for the civilian market. The assembly plants for civilian and military aircraft are separate CGUs. In this sector there are entities that are based solely in one or other of these markets, i.e., they are purely defence or civilian contractors, so there will be a basis for identifying the different discount rates for the different activities. If the entity makes its own components, then the defence CGU or CGUs could include the manufacturing activity if defence is vertically integrated and components are made solely for military aircraft. Manufacturing could be a separate CGU if components are used for both activities and there is an external market for the products.

A manufacturer of soft drinks uses the same plant to produce various flavours of carbonated and uncarbonated drinks. Because the market for traditional carbonated drinks is declining, it develops and markets a new uncarbonated 'health' drink, which is still produced using the same plant. The risks of the product are higher than those of the existing products, but it is not a separate CGU.

Many sectors generate many new products but have a high attrition rate as most of their new products fail (pharmaceuticals and biotechnology, for example) and this is likely built into industry WACCs. If the risk of failure is not reflected in the industry WACC because the entity is not typical of the industry, then either the WACC or the cash flows ought to be adjusted to reflect the risk (but not so as to double count).

7.2.8 Entity-specific WACCs and capital structure

The discount rate is a pre-tax rate that reflects current market assessments of the time value of money and the risks specific to the asset for which the future cash flow estimates have not been adjusted. [IAS 36.55]. An entity's own WACC is not suitable as a discount rate if there is anything atypical about the entity's capital structure compared with 'typical' market participants (for example, the entity's use of leases to finance its operations). In other words, would the market assess the cash flows from the asset or unit as being riskier or less risky than the entity-wide risks reflected in the entity-wide WACC? Some of the risks that need to be thought about are country risk, currency risks and price risk.

Country risk will reflect the area in which the assets are located. In some areas assets are frequently nationalised by governments or the area is politically unstable and prone to violence. In addition, the potential impact of physical instability such as weather or earthquakes, and the effects of currency volatility on the expected return from the asset, must be considered.

Two elements of price risk are the gearing ratio of the entity in question (if, for example, it is much more or less geared than average) and any default risk built into its cost of debt. However, IAS 36 explicitly notes that the discount rate is independent of the entity's capital structure and the way the entity financed the purchase of the asset, because the future cash flows expected to arise from an asset do not depend on these features. [IAS 36.A19].

Illustration 7-8: Effect of entity default risk on its WACC

The formula for calculating the (post tax) WACC, as given in Illustration 7-4 in section 7.2 above, is:

$$\text{WACC} = (1 - t) \times D \times \frac{g}{1 + g} + E \times \left[1 - \frac{g}{1 + g} \right]$$

Where:

t Is the rate of tax relief available on the debt servicing payments

D Is the pre-tax cost of debt

E Is the cost of equity

And

g Is the gearing level (i.e., the ratio of debt to equity) for the sector

The cost of equity is calculated as follows:

Cost of equity = risk-free rate + (levered beta (β^*) \times market risk premium) + size premium (if deemed required)

Assume that the WACC of a typical sector participant is as follows:

Cost of equity

Risk free rate	4%
Levered beta (β)	1.1
Market risk premium	6%
Cost of equity after tax (market risk premium $\times \beta$ + risk-free rate)	10.6%

Cost of debt

Risk free rate	4%
Credit spread	3%
Tax rate	25%
Cost of debt (pre-tax)	7%
Cost of debt (post-tax)	5.25%

Capital structure

Debt \div (debt + equity)	25%
Equity \div (debt + equity)	75%
Post-tax cost of equity (10.6 \times 75%)	8%
Post-tax cost of debt (5.25 \times 25%)	1.3%

WACC (Post tax, nominal) 9.3%

* The beta is explained in Illustration 7-4 in section 7.2 above.

However, the company has borrowed heavily and is in some financial difficulties. Its gearing ratio is 75% and its actual cost of debt, based on the market price of its listed bonds, is 18% (13.5% after taking account of tax at 25%). This makes its individual post-tax WACC 12.8% (10.6 \times 25% + 13.5 \times 75%). As a matter of fact, the entity's individual post-tax WACC can be even higher than 12.8% as this rate is based on a levered beta for a typical sector participant, while the entity's own beta will probably be higher. Having said this, the entity's WACC is not an appropriate WACC for impairment purposes because it does not represent a market rate of return on the assets. Its entity WACC has been increased by default risk.

Ultimately, it can be acceptable to use the entity's own WACC, but an entity cannot conclude on this without going through the exercise of assessing for risk each of the assets or units and concluding on whether or not they contain additional risks that are not reflected in the WACC.

7.2.9 Use of discount rates other than the WACC

IAS 36 allows an entity to use rates other than the WACC as a starting point in calculating the discount rate. These include:

- The entity's incremental borrowing rate
And
- Other market borrowing rates [IAS 36.A17]

If borrowing rates (which are, of course, pre-tax) were used as a starting point, could this avoid some of the problems associated with adjusting the WACC for the effects of taxation? Unfortunately, this is unlikely. Debt rates reflect the entity's capital structure and do not reflect the risk inherent in the asset. A pure asset/business risk would be obtained from an entity funded solely by equity and equity risk premiums are always observed on a post-tax basis. Therefore, the risk premium that must be added to reflect the required (increased) return over and above a risk-free rate by an investor will always have to be adjusted for the effects of taxation.

It must be stressed that the appropriate discount rate, which is the one that reflects current market assessments of the time value of money and the risks specific to the asset in question, ought to be the same whatever the starting point for the calculation of the rate.

7.3 Differences between fair value and value in use

IFRS 13 is explicit that it does not apply to value in use, noting that its measurement and disclosure requirements do not apply to “measurements that have some similarities to fair value, such as ... value in use ...”. [IFRS 13.6(c)]. IAS 36 includes an explanation of the ways in which fair value is different to value in use. Fair value, it notes, “reflects the assumptions market participants would use when pricing the asset. In contrast, value in use reflects the effects of factors that may be specific to the entity and not applicable to entities in general.” [IAS 36.53A]. It gives a number of specific examples of factors that are excluded from fair value to the extent that they would not be generally available to market participants: [IAS 36.53A]

- The additional value derived from the grouping of assets. IAS 36’s example is of the creation of a portfolio of investment properties in different locations
 - Synergies between the asset being measured and other assets
 - Legal rights or legal restrictions that are specific only to the current owner of the asset
- And
- Tax benefits or tax burdens that are specific to the current owner of the asset

By contrast, an entity calculating FVLCD includes cash flows that are not permitted in a VIU calculation but only to the extent that other market participants would consider them when evaluating the asset. For example, cash inflows and outflows relating to future capital expenditure could be included if they would be taken into account by market participants (see section 7.1.2 above).

8 Impairment of goodwill

8.1 Goodwill and its allocation to cash-generating units

By definition, goodwill can only generate cash inflows in combination with other assets which means that an impairment test cannot be carried out on goodwill alone. Testing goodwill for impairment requires it to be allocated to a CGU or to a group of CGUs of the acquirer. This is quite different to the process by which CGUs themselves are identified as that depends on identifying the smallest group of assets generating largely independent cash inflows. The cash flows of the CGU, or those of a group of CGUs if appropriate, must be sufficient to support the carrying value both of the assets and any allocated goodwill.

IFRS 3 states that the acquirer measures goodwill acquired in a business combination at the amount recognised at the acquisition date less any accumulated impairment losses and refers to IAS 36.

[IFRS 3.B63(a)]. Initial recognition and measurement of goodwill acquired in a business combination is discussed in Chapter 10.

From the acquisition date, acquired goodwill is to be allocated to each of the acquirer's CGUs, or to a group of CGUs, that are expected to benefit from the synergies of the combination. This is irrespective of whether other assets or liabilities of the acquiree are assigned to those CGUs or group of CGUs. [IAS 36.80].

IAS 36 does not provide any methods for allocating goodwill. This means that once the acquirer's CGUs or groups of CGUs that benefit from the synergies have been identified, discussed in section 8.1.2 below, the entity must use an appropriate methodology to allocate that goodwill between them. Some approaches are described in section 8.1.3 below.

The standard recognises that goodwill sometimes cannot be allocated on a non-arbitrary basis to an individual CGU, so permits it to be allocated to a group of CGUs. However, the standard states that each CGU or group of CGUs to which the goodwill is so allocated must:

- (a) Represent the lowest level within the entity at which the goodwill is monitored for internal management purposes
And
- (b) Not be larger than an operating segment determined in accordance with IFRS 8 *Operating Segments* before aggregation [IAS 36.80, IAS 36.81]

How we see it

Groups that do not have publicly traded equity or debt instruments are not required to apply IFRS 8. However, in our view, these entities are still obliged to allocate goodwill to CGUs or groups of CGUs in the same way as entities that have to apply IFRS 8 as the restriction in IAS 36 refers to the definition of operating segment in IFRS 8, not to entities within the scope of that standard.

All CGUs or groups of CGUs to which goodwill has been allocated have to be tested for impairment on an annual basis.

The standard takes the view that applying these requirements results in goodwill being tested for impairment at a level that reflects the way an entity manages its operations and with which the goodwill would naturally be associated. Therefore, the development of additional reporting systems is typically not necessary. [IAS 36.82].

This is, of course, consistent with the fact that entities do not monitor goodwill directly. Rather, they monitor the business activities, which means that goodwill allocated to the CGUs or groups of CGUs that comprise those activities will be 'monitored' indirectly. This also means, because goodwill is measured as a residual, that the goodwill balance in the statement of financial position can include elements other than goodwill relating to synergies. Some of these issues and their implications are discussed in section 8.1.1 below. It also means that internally generated goodwill will be taken into account when calculating the recoverable amount because the impairment test itself does not distinguish between purchased and internally generated goodwill.

How we see it

In our view, the difficulties with the concept of monitoring goodwill do not mean that entities can default to testing at an arbitrarily high level, e.g., at the operating segment level or for the entire entity by arguing that goodwill is not monitored. Entities do often ‘monitor’ goodwill indirectly by monitoring the business activities to which goodwill belongs. This would need to be considered when assessing the level at which goodwill will be tested for impairment.

IAS 36 emphasises that a CGU to which goodwill is allocated for the purpose of impairment testing can differ from the level at which goodwill is allocated in accordance with IAS 21 for the purpose of measuring foreign currency gains and losses (see Chapter 16). [IAS 36.83]. In many cases, the allocation under IAS 21 will be at a lower level. This will apply not only on the acquisition of a multinational operation but could also apply on the acquisition of a single operation where the goodwill is allocated to a larger cash-generating unit under IAS 36 that is made up of businesses with different functional currencies. However, IAS 36 clarifies that the entity is not required to test the goodwill for impairment at that same level unless it also monitors the goodwill at that level for internal management purposes. [IAS 36.83].

8.1.1 The composition of goodwill

IAS 36 requires an entity to allocate goodwill to the CGUs that are expected to benefit from the synergies of the business combination, a challenging task because, in accounting terms, goodwill is measured as a residual (see Chapter 10). This means that in most cases goodwill includes elements other than the synergies on which the allocation to CGUs is based.

The IASB and FASB argue that what it refers to as ‘core goodwill’ is an asset. [IFRS 3.BC323].

Core goodwill, conceptually, comprises two components: [IFRS 3.BC313]

- (a) The fair value of the going concern element of the acquiree’s existing business. It is stated in IFRS 3.BC313 “The going concern element represents the ability of the established business to earn a higher rate of return on an assembled collection of net assets than would be expected if those net assets had to be acquired separately. That value stems from the synergies of the net assets of the business, as well as from other benefits (such as factors related to market imperfections, including the ability to earn monopoly profits and barriers to market entry - either legal or because of transaction costs - by potential competitors)”.

And

- (b) The fair value of the expected synergies and other benefits from combining the acquirer’s and acquiree’s net assets and businesses. Those synergies and other benefits are unique to each combination, and different combinations would produce different synergies and, hence, different values.

The problem for the allocation process is, firstly, that (a) relates to the acquired business taken as a whole and any attempt to allocate it to individual CGUs or groups of CGUs in the combined entity can be futile. IFRS 3 refers to part of element (a) above, the value of an assembled workforce, which is not recognised as a separate intangible asset. This is the existing collection of employees that permits the acquirer to continue to operate an acquired business from the acquisition date without having to hire and train a workforce. [IFRS 3.B37]. This has to be allocated to all the CGUs or groups of CGUs that benefit from the synergies.

Secondly, synergies themselves fall into two broad categories, operating synergies, which allow businesses to increase their operating income, e.g., through economies of scale or higher growth, or financial synergies that result in a higher cash flow or lower cost of capital and includes tax benefits. Some financial synergies are quite likely to relate to the combined business rather than individual CGUs or groups of CGUs. Even though the expected future cash flows of the CGU being assessed for impairment cannot include cash inflows or outflows from financing activities or tax receipts, [IAS 36.50, IAS 36.51], there is no suggestion in IAS 36 that these synergies cannot be taken into account in allocating goodwill.

In addition, goodwill measured as a residual can include amounts that do not represent core goodwill. IFRS 3 attempts to minimise these amounts by requiring an acquirer:

- To measure the consideration accurately, thus reducing any overvaluation of the consideration paid
 - To recognise the identifiable net assets acquired at their fair values rather than their carrying amounts
- And
- To recognise all acquired intangible assets meeting the relevant criteria so that they are not subsumed into the amount initially recognised as goodwill [IFRS 3.BC317]

However, this process is not perfect. The acquirer can for example attribute value to potential contracts the acquiree is negotiating with prospective customers at the acquisition date, but these are not recognised under IFRS 3 and neither are contingent assets, so their fair value is subsumed into goodwill. [IFRS 3.B38, IFRS 3.BC276]. Employee benefits and share-based payments are not recognised at their fair value. [IFRS 3.26, IFRS 3.30]. In practice, the most significant mismatch arises from deferred taxation, which is not recognised at fair value and can lead to the immediate recognition of goodwill. This is discussed in section 8.3.1 below. In summary, this means that the goodwill that is allocated to a CGU or group of CGUs can include an element that relates to the whole of the acquired business or to an inconsistency in the measurement process as well as the synergies that follow from the acquisition itself. This point has been acknowledged by the IASB during the development of the standard:

“However, the Board was concerned that in the absence of any guidance on the precise meaning of ‘allocated on a reasonable and consistent basis’, some might conclude that when a business combination enhances the value of all of the acquirer’s pre-existing cash-generating units, any goodwill acquired in that business combination should be tested for impairment only at the level of the entity itself. The Board concluded that this should not be the case.” [IAS 36.BC139].

In spite of the guidance in the standard, the meaning of the monitoring of goodwill as well as the allocation process remains somewhat elusive. Nevertheless, all goodwill arising in a business combination must be allocated to CGUs or groups of CGUs that benefit from the synergies, none can be allocated to CGUs or groups of CGUs that do not benefit and entities are not permitted to test at the level of the entity as a whole as a default. This means that identifying CGUs and groups of CGUs that benefit from the synergies is a crucial step in the process of testing goodwill for impairment.

8.1.2 Identifying synergies and identifying CGUs or groups of CGUs for allocating goodwill

IAS 36 requires goodwill to be allocated to CGUs or groups of CGUs that are expected to benefit from the synergies of the combination and only to those CGUs or groups of CGUs. This is irrespective of whether other assets or liabilities of the acquiree are assigned to those CGUs or group of CGUs. [IAS 36.80].

Operating synergies fall into two broad groups, those that improve margin (e.g., through cost savings and economies of scale) and those that give an opportunity for future growth (e.g., through the benefits of the combined talent and technology).

Illustration 8-1: Identifying synergies

In all of the following cases, the acquiring entity can identify the synergies and the CGU or group of CGUs that benefits from them. Goodwill will be allocated to the relevant CGU or group of CGUs.

- A mining entity (group) extracts a metal ore that does not have an active market until it has been through a smelting and refining process. The entity considers the CGU to comprise the smelter together with the individual mines. When the entity acquires a mine, the synergies relate to cost savings as the mine’s fixed costs are already covered by the existing refining operations. Goodwill is therefore allocated to the CGU comprising the smelter, the existing mines and the newly acquired mine.
- An airline is subject to cost pressures common in the sector. It acquires another operation with similar international operations on the basis that it can reduce its workforce and asset base. It will combine its operational management, including its sales, reporting and human resources functions, into one head office and consolidate all aircraft maintenance in a single site that currently has capacity. These cost savings are the synergies of the business combination and goodwill would therefore be allocated to the CGU or group of CGUs that benefit from these cost savings.
- A global consumer products company, which allocates goodwill at the operating segment level, purchases a company best-known for razors and razor blades. It has not previously manufactured razors although its ‘grooming products’ operating segment does manufacture other shaving products. The acquirer expects that it will be able to increase sales of its shaving products through association with the target company’s razors and through branding. No assets of the acquired business are allocated to the grooming products operating segment, but this segment will benefit from the synergies of the business combination and therefore goodwill from the acquisition will be allocated to it.

The process is further shown in the following Illustration which shows the differences for the purposes of testing impairment between the CGU/groups of CGUs to which goodwill is allocated and the identification of CGUs.

Illustration 8-2: Allocating goodwill and identifying CGUs

Entity A operates three different types of fish restaurant: fifteen restaurants, twenty-five pubs that contain restaurants serving fish and forty fish bars. Each is separately branded, although the brand is clearly identified with the Entity A identity, e.g., the restaurant range is branded 'Fish by A'. Each brand is identified as a separate operating segment: restaurants, pubs and fish bars.

Entity A acquired Entity B, which had a similar range of restaurants and bars (thirty in total) although that entity had not applied any branding to the types of restaurants.

Entity A recognised goodwill on acquisition and determined that ten of Entity B's outlets were to be allocated to each of its brands where they would be rebranded and included in the relevant operating segment.

Each restaurant, pub or fish bar is a separate CGU because it has separately identifiable largely independent cash inflows.

Management notes that it manages the 'A' brand at group (entity) level. This is not appropriate for testing goodwill as IAS 36 states that CGUs or groups of CGUs to which goodwill is allocated cannot be larger than an operating segment determined in accordance with IFRS 8. Also, management monitors operating segments that correspond to the three individual brands to which it has allocated the acquired outlets.

There are costs that cannot be clearly identified as relating to an individual restaurant, including marketing costs, sourcing of fish for the different brands and bulk purchasing. However, these costs are related to the brands which underlie Entity A's operating segments and the branding is evidence that there are synergies at this level. It is appropriate to allocate goodwill to the operating segments in order to test it for impairment.

This does not prevent the separate outlets being identified as CGUs as IAS 36 allows an apportionment of costs. The independence of cash inflows is decisive.

8.1.3 Measuring the goodwill allocated to CGUs or groups of CGUs

Although goodwill has to be allocated, IAS 36 does not provide any allocation methodologies. One allocation method is a 'direct' method, which is based on the difference between the fair value of the net assets and the fair value of the acquired business (or portion thereof) to be assigned to the CGUs, thereby calculating goodwill directly by reference to the allocated net assets. However, this method will not allocate any goodwill to a CGU if no assets or liabilities are assigned to the CGU and, arguably, it will allocate too little goodwill to CGUs that benefit disproportionately because of synergies with the acquired business. A method that does not have these shortcomings is a 'with and without' method that requires the entity to calculate the fair value of the CGU or groups of CGUs that are expected to benefit before and after the acquisition; the difference represents the amount of goodwill to be allocated to that reporting unit. This will take account of buyer-specific synergies that relate to a CGU or group of CGUs. These methods are shown in the following Illustration.

Illustration 8-3: Allocating goodwill to more than one CGU

Entity A acquires Entity B for CU50 million, of which CU35 million is the fair value of the identifiable assets acquired and liabilities assumed. The acquisition is to be integrated into two of Entity A's CGUs with the net assets being allocated as follows:

	CGU 1	CGU 2	Total
	CU m	CU m	CU m
Acquired identifiable tangible and intangible assets	25	10	35

In addition to the net assets acquired that are assigned to CGU 2, the acquiring entity expects CGU 2 to benefit significantly from certain synergies related to the acquisition (e.g., CGU 2 is expected to realise higher sales of its products because of access to the acquired entity's distribution channels), while CGU 1 is expected to benefit from synergies to a lesser extent. There is no synergistic goodwill attributable to other CGUs.

Entity A calculates that the fair value of the acquired businesses allocated to CGU 1 and CGU 2 is CU33 million and CU17 million respectively. If goodwill is allocated to the CGUs based on the difference between the fair value of the net assets and the fair value of the acquired business, i.e., the direct method, the allocation would be as follows:

	CGU 1	CGU 2	Total
	CU m	CU m	CU m
Acquired identifiable tangible and intangible assets	25	10	35
Fair value of acquired business allocated based on direct method	33	17	50
Goodwill assigned to CGUs	8	7	15

Alternatively, Entity A assigns goodwill to the CGUs based on the difference between the fair value of the net assets to be assigned and the fair value of the acquired business (or portion thereof), including the significant beneficial synergies that CGU 2 is expected to achieve. In this case, the fair value of the acquired business (or portion thereof) is determined using a 'with and without' method.

	CGU 1	CGU 2	Total
	CU m	CU m	CU m
Fair value of CGU after acquisition	90	85	175
Fair value of CGU prior to acquisition	(62)	(63)	(125)
Fair value of acquired business allocated based on the 'with and without' method	28	22	50
Acquired identifiable tangible and intangible assets	(25)	(10)	(35)
Goodwill assigned to CGUs	3	12	15

In this case, the 'with and without' method can be more appropriate, but this would depend on the availability and reliability of inputs. The 'direct' method can give in other circumstances a reasonable allocation of goodwill.

8.1.4 The effect of IFRS 8 *Operating Segments* on impairment tests

Goodwill to be tested for impairment cannot be allocated to a CGU or group of CGUs larger than an operating segment as defined by IFRS 8. [IAS 36.80, IAS 36.81, IFRS 8.11, IFRS 8.12]. IFRS 8 is discussed in Chapter 32.

Organisations managed on a matrix basis cannot test goodwill for impairment at the level of internal reporting, if this level crosses more than one operating segment as defined in IFRS 8. [IFRS 8.5]. In addition, it is possible that the operating segments selected by the entities does not correspond with their CGUs.

Matrix organisations manage their businesses simultaneously on two different bases. For example, some managers are responsible for different product and service lines while others are responsible for specific geographical areas. IFRS 8 notes that the characteristics that define an operating segment can apply to two or more overlapping sets of components for which managers are held responsible. Financial information can be available for both, and the chief operating decision maker can regularly review both sets of operating results of components. In spite of this, IFRS 8 requires the entity to characterise one of these bases as determining its operating segments. [IFRS 8.10]. In doing so, entities should consider IFRS 8's intention that, for those entities that monitor goodwill at or below the segment level, there should be a link between the level at which goodwill is tested for impairment and the level of internal reporting that reflects the way an entity manages its operations. [IAS 36.BC140].

8.1.4.A Changes to operating segments

Changes to the way in which an entity manages its activities can result in changes to its operating segments. It is possible that an entity needs to reallocate goodwill if it changes its operating segments, particularly if the entity has previously allocated goodwill at or close to segment level. Such a reallocation of goodwill is due to a change in circumstances and therefore will not be a change in accounting policy under IAS 8. [IAS 8.34]. This means that the previous impairment test will not need to be re-performed retrospectively.

In two situations, the disposal of an operation within a CGU and a change in the composition of CGUs due to a reorganisation, which are described in section 8.5 below, IAS 36 proposes a reallocation based on relative values, unless another basis is more appropriate. [IAS 36.86, IAS 36.87].

How we see it

A reallocation of goodwill driven by the identification of new operating segments is another form of reorganisation of the reporting structure, therefore the same methodology is appropriate in our view. The entity is required to use a relative value approach, unless it can demonstrate that some other method better reflects the goodwill associated with the reorganised units (see section 8.5.1 below).

This means a method based on the activities in their current state, e.g., an entity is not allowed to revert to the historical goodwill as it arose on the various acquisitions.

Generally, an impairment test would be performed prior to the reallocation of goodwill.

An important issue in practice is the date from which the revised goodwill allocation applies. The goodwill allocation must be based on the way in which management is actually monitoring activities and cannot be based on management intentions. Under IFRS 8, operating segments are identified on the basis of internal reports that are regularly reviewed by the entity's chief operating decision maker in order to allocate resources to the segment and assess its performance. [IFRS 8.5]. Therefore, goodwill cannot be allocated to the revised operating segments until it can be demonstrated that the chief operating decision maker is receiving the relevant internal reports for the revised segments.

8.1.4.B Aggregation of operating segments for disclosure purposes

IFRS 8 allows an entity to aggregate two or more operating segments into a single reporting segment if this is 'consistent with the core principles' and, in particular, if the segments have similar economic characteristics. [IFRS 8.12]. Whilst this is specifically in the context of segmental reporting, in isolation, it can be interpreted as suggesting that individual operating segments could also be aggregated to form one operating segment that would also apply for impairment purposes. However, the 'unit of accounting' for goodwill impairment is before any aggregation. [IAS 36.80(b)].

8.1.5 Goodwill initially unallocated to cash-generating units

IFRS 3 allows a 'measurement period' after a business combination to provide the acquirer with a reasonable time to obtain the information necessary to identify and measure all of the various components of the business combination as of the acquisition date in accordance with the standard. [IFRS 3.46]. The measurement period ends as soon as the acquirer receives the information it is seeking and cannot exceed one year from the acquisition date. [IFRS 3.45].

IAS 36 recognises that in such circumstances, it is possible that the initial allocation of the goodwill to a CGU or group of CGUs for impairment purposes cannot be completed before the end of the annual period in which the combination is effected. [IAS 36.85]. Where this is the case the goodwill (or part of it) is left unallocated for that period. Goodwill must then be allocated before the end of the first annual period beginning after the acquisition date. [IAS 36.84]. The standard requires disclosure of the amount of the unallocated goodwill together with an explanation as to why that is the case (see section 13.3 below).

The question arises as to whether the entity ought to test, in such circumstances, the goodwill acquired during the current annual period before the end of the current annual period or in the following year if the annual impairment testing date is before the allocation of goodwill is completed.

It will depend on whether an entity is able during the 'measurement period' and until the initial allocation of goodwill is completed to quantify goodwill with sufficient accuracy and allocate goodwill on a provisional basis to CGUs or group of CGUs.

If the entity is able to quantify goodwill with sufficient accuracy, a provisional allocation of goodwill could be made in the following circumstances:

- The entity knows that all goodwill relates to a single CGU or to a group of CGUs no larger than a single operating segment.
- Or
- The entity knows that the initial accounting for the combination is complete in all material respects, although some details remain to be finalised.

In circumstances where a provisional allocation of goodwill could be made, an entity is required to test this provisional goodwill for impairment in accordance with IAS 36 during the annual period in which the acquisition occurred and in the following year's annual impairment test, even if this is before the allocation of goodwill is completed.

In addition, an entity is required to carry out an impairment test where there are indicators of impairment. This is the case even if the fair values have not been finalised and the goodwill amount is only provisional or goodwill has not necessarily been allocated to the relevant CGUs or groups of CGUs and the test therefore has to be carried out at a higher, potentially even at the reporting entity level.

An entity would not need to test the goodwill for impairment until the allocation of goodwill has been finalised, if a provisional allocation of goodwill could not be made and there are no indications of impairment.

How we see it

In our view, an entity needs to consider performing an impairment test on goodwill even where the initial allocation of the goodwill to a CGU or group of CGUs is not completed. Although the standard does not deal with an interim reporting period in this regard, we believe the same considerations would need to be applied at each reporting date and not just the annual reporting periods.

When the allocation of goodwill is only finalised in the first annual period after the acquisition date, the entity must consider appropriate actions for each (annual and interim) reporting date between the acquisition date and the date the goodwill is finalised.

In some circumstances, the acquirer is required to test the final allocated goodwill for impairment retrospectively, on the basis that the test on provisional goodwill was in fact the first impairment test applying IAS 36. In the following cases an entity must update the prior year's impairment test retrospectively:

- If the entity allocated provisional goodwill to CGUs, although it had not completed its fair value exercise, and tested provisional goodwill of impairment in accordance with IAS 36.
- Or
- If the entity did not allocate provisional goodwill to the related CGUs but there were indicators of impairment and the entity tested the provisional goodwill potentially at a different level to the ultimate allocation and the impairment test resulted in an impairment.

If the entity did not allocate provisional goodwill to CGUs, there were indicators of impairment and the impairment test at a higher, potentially entity level, did not result in an impairment, the entity can choose whether to update the prior year's impairment test retrospectively, but is not required to do so.

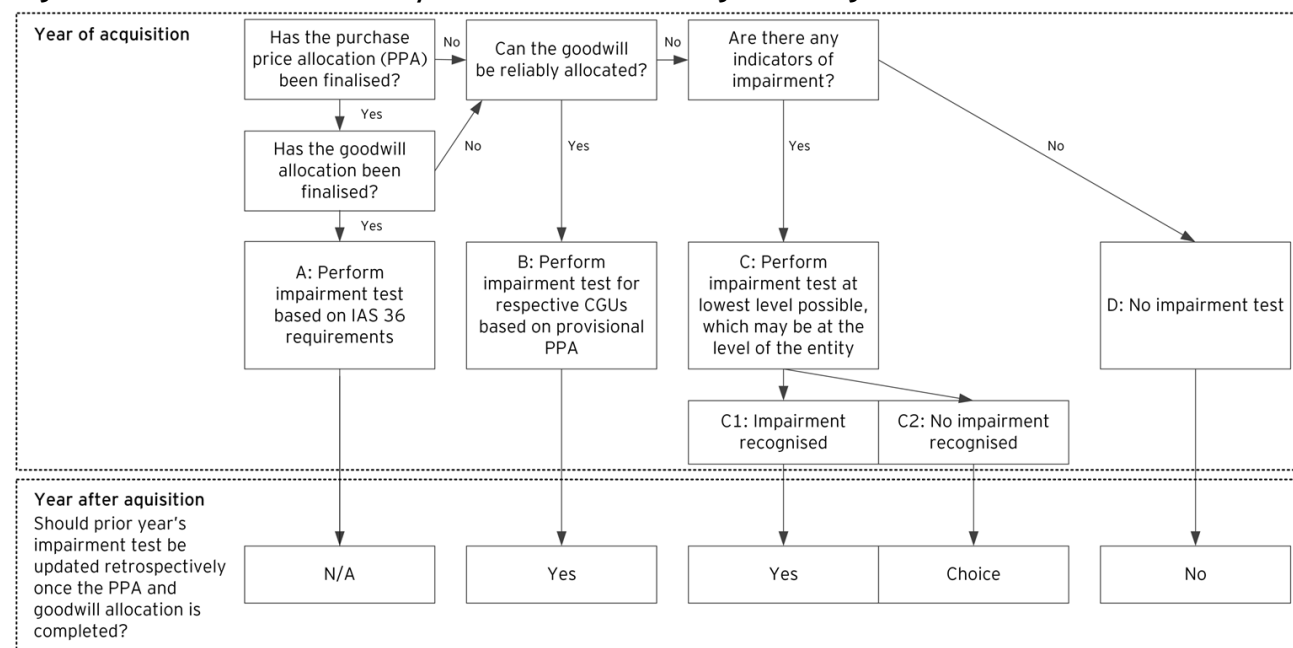

In all other scenarios, the acquirer performs only a current year impairment test (i.e., after the allocation has been completed) on a prospective basis.

How we see it

If the acquirer updates the prior year's impairment test as outlined above, this update could decrease the original goodwill impairment recognised. In our view, such a decrease is an adjustment to the original goodwill impairment. This will not qualify as a reversal and does not violate the prohibition on reversing any goodwill impairments in IAS 36.124. (See section 11.3 below).

The above explained approach is illustrated below:

Figure 8-1: Goodwill initially unallocated to cash-generating units

If an entity were to change its annual reporting date, it could mean that it has a shorter period in which to allocate goodwill as IAS 36 requires that allocation of goodwill for impairment purposes is completed by the end of the first annual period after the acquisition and not within 12 months as required by IFRS 3.

[IAS 36.84].

Illustration 8-4: Impact of shortened accounting period

Entity A prepares its financial statements for annual periods ending on 31 December. It acquired Entity B on 30 September 20X0. In accounting for this business combination in its financial statements for the year ended 31 December 20X0, Entity A has only been able to determine the fair values to be assigned to Entity B's assets, liabilities and contingent liabilities on a provisional basis and has not allocated the resulting provisional amount of goodwill arising on the acquisition to any CGU (or group of CGUs). During 20X1, Entity A changes its annual reporting date to June and is preparing its financial statements as at its new period end of 30 June 20X1. IFRS 3 does not require the fair values assigned to Entity B's net assets (and therefore the initial amount of goodwill) to be finalised by that period end, since Entity A has until 30 September 20X1 to finalise the values. However, IAS 36 would appear to require the allocation of the goodwill to CGUs for impairment purposes be completed by the date of the 30 June 20X1 financial statements since these are for the first annual period beginning after the acquisition date, despite the fact that the initial accounting under IFRS 3 is not yet complete. The entity would therefore need to test goodwill for impairment for the financial reporting period ending 30 June 20X1.

8.2 When to test cash-generating units with goodwill for impairment

IAS 36 requires a CGU or group of CGUs to which goodwill has been allocated to be tested for impairment annually by comparing the carrying amount of the CGU or group of CGUs, including the goodwill, with its recoverable amount. [IAS 36.90]. The requirements of the standard in relation to the timing of such an annual impairment test (which need not be at the period end) are discussed below. This annual impairment test is not a substitute for management being aware of events occurring or circumstances changing between annual tests that suggest that goodwill is impaired. [IAS 36.BC162]. IAS 36 requires an entity to assess at each reporting date whether there is an indication that a CGU may be impaired. [IAS 36.9]. So, whenever there is an indication that a CGU or group of CGUs may be impaired it is to be tested for impairment by comparing the carrying amount, including the goodwill, with its recoverable amount. [IAS 36.90].

If the carrying amount of the CGU (or group of CGUs), including the goodwill, exceeds the recoverable amount of the CGU (or group of CGUs), then an impairment loss has to be recognised in accordance with IAS 36.104 (see section 11.2 below). [IAS 36.90].

8.2.1 Timing of impairment tests

IAS 36 requires an annual impairment test of CGUs or groups of CGUs to which goodwill has been allocated. The impairment test does not have to be carried out at the end of the reporting period. The standard permits the annual impairment test to be performed at any time during an annual period, provided the test is performed at the same time every year. Different CGUs can be tested for impairment at different times. However, if some or all of the goodwill allocated to a CGU or group of CGUs was acquired in a business combination during the current annual period, that unit must be tested for impairment before the end of the current annual period. [IAS 36.96].

The IASB observed that acquirers can sometimes ‘overpay’ for an acquiree, so that the amount initially recognised for the business combination and the resulting goodwill exceeds the recoverable amount of the investment. The Board was concerned that without this requirement it is possible for entities to delay recognising such an impairment loss until the annual period after the business combination. [IAS 36.BC173].

It has to be said that the wording of the requirement does not achieve that result if the goodwill is not allocated to a CGU in the period in which the business combination occurs. The time allowed for entities to allocate goodwill can mean that this is not completed until the period following the business combination. [IAS 36.84]. The potential consequences of this are discussed in section 8.1.5 above.

Consider also the following Illustration.

Illustration 8-5: Testing for impairment of goodwill allocated in the period after acquisition after the annual impairment testing date

Entity A prepares its financial statements for annual reporting periods ending on 31 December. It performs its annual impairment test for all cash-generating units (CGUs) to which it has allocated goodwill on 30 September.

On 31 October 20X0, Entity A acquires Entity B. Entity A completes the initial allocation of goodwill to CGUs on 31 October 20X1, before the end of the annual reporting period on 31 December 20X1. Therefore, Entity A does not allocate the goodwill until after its annual date for testing goodwill, 30 September 20X1.

There are no indicators of impairment of goodwill on 31 December 20X0. If there is any such indicator, Entity A is required to test goodwill for impairment at that date, regardless of the date of its annual impairment test. On 31 December 20X0, the entity had not yet allocated its goodwill and did not test it for impairment, because there were no impairment indications at that time. During 20X1, Entity A receives the information it was seeking about facts and circumstances that existed as of the acquisition date, but it does not finalise the fair values assigned to Entity B’s net assets (and therefore the initial amount of goodwill) until 31 October 20X1. IAS 36 requires Entity A to allocate the goodwill to CGUs by the end of the financial year. It does this by December 20X1.

In this case, at the time of carrying out its annual impairment tests on 30 September 20X1, Entity A has not yet allocated the goodwill relating to Entity B; therefore no impairment test of that goodwill needs to be carried out at that time, provided there are no indicators of impairment. When it does allocate the goodwill by December 20X1, the requirement to perform an impairment test for the CGUs to which this goodwill is allocated does not seem to be applicable since the goodwill does not relate to a business combination during the current annual period. It actually relates to a business combination in the previous period; it is just that it has only been allocated for impairment purposes in the current period. Nevertheless, Entity A must perform an updated impairment test for the CGUs to which this goodwill is allocated for the purposes of its financial statements for the year ended 31 December 20X1 since this would seem to be the intention of the IASB. Not to do so, would mean that the goodwill would not be tested for impairment until 30 September 20X2, nearly 2 years after the business combination.

IAS 36 requires the annual impairment test for a CGU to which goodwill has been allocated to be performed at the same time every year but is silent on whether an entity can change the timing of the impairment test.

How we see it

In our view, a change in timing of the annual impairment test is acceptable if there are valid reasons for the change, the period between impairment tests does not exceed 12 months and the change is not made to avoid an impairment charge. The requirement that the period between impairment tests cannot exceed 12 months could mean that an entity would need to test a CGU twice in a year if, for example, it wanted to change the date of the test from October to December. In our view, it would in general not be appropriate to change the date of the impairment test again in consecutive years.

8.2.2 Sequence of impairment tests for goodwill and other assets

When a CGU to which goodwill has been allocated is tested for impairment, there can also be an indication of impairment of an asset within the unit. IAS 36 requires the entity to test the asset for impairment first and recognise any impairment loss on it before carrying out the impairment test for the goodwill, although this is unlikely to have any practical impact as the assets within the CGU by definition will not generate separate cash flows. An entity will have to go through the same process if there is an indication of an impairment of a CGU within a group of CGUs containing the goodwill. The entity must test the CGU for impairment first, and recognise any impairment loss for that CGU, before testing the group of CGUs to which the goodwill is allocated. [IAS 36.97, IAS 36.98].

8.2.3 Carry forward of a previous impairment test calculation

IAS 36 permits the most recent detailed calculation of the recoverable amount of a CGU or group of CGUs to which goodwill has been allocated to be carried forward from a preceding period provided certain criteria are met (see the following IAS 36 extract): [IAS 36.99]

Extract from IAS 36

- 99** The most recent detailed calculation made in a preceding period of the recoverable amount of a cash-generating unit to which goodwill has been allocated may be used in the impairment test of that unit in the current period provided all of the following criteria are met:
- (a) the assets and liabilities making up the unit have not changed significantly since the most recent recoverable amount calculation;
 - (b) the most recent recoverable amount calculation resulted in an amount that exceeded the carrying amount of the unit by a substantial margin; and
 - (c) based on an analysis of events that have occurred and circumstances that have changed since the most recent recoverable amount calculation, the likelihood that a current recoverable amount determination would be less than the current carrying amount of the unit is remote.

The Basis for Conclusions indicates that the reason for this dispensation is to reduce the costs of applying the impairment test, without compromising its integrity. [IAS 36.BC177]. However, clearly it is a matter of judgement as to whether each of the criteria is actually met.

8.2.4 Reversal of impairment loss for goodwill prohibited

Once an impairment loss has been recognised for goodwill, IAS 36 prohibits its reversal in a subsequent period. [IAS 36.124]. The standard justifies this on the grounds that any reversal “is likely to be an increase in internally generated goodwill, rather than a reversal of the impairment loss recognised for the acquired goodwill”, and IAS 38 prohibits the recognition of internally generated goodwill. [IAS 36.125]. The impairment test itself though does not distinguish between purchased and internally generated goodwill.

8.3 Impairment of assets and goodwill recognised on acquisition

There are a number of circumstances in which the fair value of assets or goodwill acquired as part of a business combination is measured at a higher amount through recognition of deferred tax or notional tax benefits. This raises the question of how to test for impairment and even whether there is, in fact, a ‘day one’ impairment in value. In other circumstances, deferred tax assets can or cannot be recognised as part of the fair value exercise and this, too, can affect subsequent impairment tests of the assets and goodwill acquired as part of the business combination.

8.3.1 Testing goodwill ‘created’ by deferred tax for impairment

As described in Chapter 29, the requirement of IAS 12 to recognise deferred tax on all temporary differences arising on net assets acquired in a business combination can have an impact on the amount of goodwill recognised. In a business combination, there is no initial recognition exemption for deferred tax and the corresponding accounting entry for a deferred tax asset or liability forms part of the goodwill arising or the bargain purchase gain recognised. [IAS 12.22(a)]. Where an intangible asset, which was not recognised in the acquiree’s financial statements, is acquired in a business combination and the intangible asset’s tax base is zero, a deferred tax liability based on the fair value of the intangible asset and the prevailing tax rate will be recognised. The corresponding debit entry will increase goodwill. This then begs

the question of how to consider this in the VIU when performing an impairment test on that goodwill and whether there is indeed an immediate impairment that would need to be recognised. We explore the issues in the following Illustrations.

Illustration 8-6: Apparent 'day one' impairment arising from recognition of deferred tax in a business combination

Entity A, which is taxed at 40%, acquires Entity B for CU100m in a transaction that is a business combination. For simplicity assume the only asset of the entity is an intangible asset with a fair value of CU60m.

It is assumed that the entity cannot get a deduction for tax purposes for the goodwill and the intangible asset, as is often the case for assets that arise only on consolidation. It is also assumed that the fair value of the intangible asset does not reflect the benefits of any tax deductions had the asset been tax deductible, which can be an inappropriate assumption and is discussed further below.

The fair value and tax base of the intangible are as follows:

	Fair value	Tax base
	CU m	CU m
Intangible asset	60	nil

This will give rise to the following initial entries on consolidation:

	CU m	CU m
Dr Goodwill (balance)	64	
Dr Intangible asset	60	
Cr Deferred tax liability ¹		24
Cr Cost of investment		100

¹ 40% of CU60m

Of the goodwill of CU64m, CU24m is created through deferred tax on the intangible asset.

The carrying value of the consolidated assets of the subsidiary (excluding deferred tax) is now CU124m consisting of goodwill of CU64m and the intangible asset of CU60m. However, the fair value of the subsidiary is only CU100m. Clearly CU24m of the goodwill arises solely from the recognition of deferred tax. However, IAS 36.50, explicitly requires tax to be excluded from the estimate of future cash flows used to calculate any impairment. This raises the question of whether there must be an immediate impairment write-down of the assets to CU100m.

We think that immediately recognising an impairment loss on goodwill created by deferred tax arising from fair value adjustments in a business combination, is unlikely to have been the intention of IAS 36. In order to remove the tax effects, the carrying amount of goodwill that relates to taxation and was created via the related deferred tax liability would be removed when comparing the carrying value of the CGU with the recoverable amount to determine any potential impairment. This means, in effect, that at the point of acquisition, the goodwill can be reduced by the deferred tax liability arising from fair value adjustments in a business combination in order to measure any impairment. As a result, the entity does not have to recognise an immediate impairment loss. Important to note is that this would not override the general IAS 36 requirement of impairing (all) goodwill first, when in subsequent period an impairment is identified.

How we see it

In our view, a day one impairment cannot arise purely because of recognised deferred tax liabilities in a business combination. To avoid an immediate impairment, goodwill would be reduced by the nominal versus fair value difference of the deferred tax liability when measuring any impairment. Alternatively, an entity could measure the recoverable amount based on fair value less costs of disposal.

Not recognising an immediate impairment loss is consistent with the fact that the goodwill due to deferred tax that is being recognised as part of this acquisition is not part of 'core goodwill' (see section 8.1.1 above), but is a consequence of the exceptions in IFRS 3 to the basic principle that assets and liabilities be measured at fair value, deferred tax being one of these exceptions (see section 8.1.1 above and Chapter 10).

Another way of describing this is that the lack of tax basis inherent in the asset has already been reflected in the fair value assigned to the asset. As a result, the incremental fair value of the deferred tax liability is nil. Goodwill is reduced by the nominal versus fair value difference of the deferred tax liability which in this case is the full amount of the deferred tax liability related to the intangible.

Continuing with this simplified example, if it is assumed that the intangible asset is amortised over a finite useful life then the deferred tax relating to that asset (CU24m in this example) will be released over that useful life with the effect that the net amount charged to the income statement of CU36m (total amortisation less deferred tax, CU60m - CU24m) will be the same as if the amortisation charge were tax deductible.

At future impairment testing dates, one would adjust for any remaining deferred tax liability at the impairment testing date that resulted in an increase in goodwill at the acquisition date.

In many jurisdictions the amortisation of intangible assets is deductible for tax purposes. This generates additional benefits, called tax amortisation benefit (TAB), impacting the fair value of the intangible. Therefore, the fair value as part of a business acquisition for many intangible assets includes assumptions about the tax amortisation benefit that would be available if the asset were acquired separately. For example, the value of a trademark using the 'relief from royalty' method would be assumed to be the net present value of post-tax future royalty savings, under consideration of TAB, in the consolidated financial statements, based on the hypothetical case of not owning the trademark. In order to reach the fair value of the asset, its value before amortisation would be adjusted by a tax amortisation factor reflecting the corporate tax rate, a discount rate and a tax amortisation period (this is the period allowed for tax purposes, which is not necessarily the useful life for amortisation purposes of the asset). In a market approach, fair value is estimated from market prices paid for comparable assets and the prices will contain all benefits of owning the assets, including any tax amortisation benefit.

This means that the difference between the tax amortisation benefit and the gross amount of the deferred tax liability remains part of goodwill.

This is demonstrated in the following Illustration:

Illustration 8-7: Impairment testing assets whose fair value reflects tax amortisation benefits

Assume that the entity in Illustration 8-6 above has acquired an intangible asset that would be tax deductible if separately acquired but that has a tax base of zero.

The entity concludes that the fair value of the intangible will reflect the tax benefit, whose gross amount is CU40m ($\text{CU60m} \times 40\% \div 60\%$) but in calculating the fair value this will be discounted to its present value - say CU30m. The initial entry is now as follows:

	CU m	CU m
Dr Goodwill (balance)	46	
Dr Intangible asset ($\text{CU}(60\text{m} + 30\text{m})$)	90	
Cr Deferred tax liability ¹		36
Cr Cost of investment		100

1 40% of CU90m

Overall, the assets that cost CU100m will now be recorded at CU136m, as against the total of CU124m in Illustration 8-6. This increase has come about because of recognition of deferred tax of CU12m, which is 40% of CU30m, the assumed tax amortisation benefit.

In this example, only CU6m goodwill results from the recognition of deferred tax [$\text{CU46m} - (\text{CU100m} - \text{CU60m})$] and its treatment is discussed above. The CU6m represents the difference between the nominal amount of deferred tax of CU36m and the fair value of the tax amortisation benefit included in the intangible asset of CU30m.

Unlike goodwill, the intangible asset will only have to be tested for impairment if there are indicators of impairment, if it has an indefinite useful life or if it is not yet available for use. [IAS 36.10]. If the intangible asset is being tested by itself for impairment, i.e., not as part of a CGU, its FVLCD would need to be determined on the same basis as for the purposes of the business combination, making the same assumptions about taxation. If FVLCD exceeds the carrying amount, there is no impairment.

However, as mentioned in section 3.1 above, many intangible assets do not generate independent cash inflows as individual assets and so they are tested as part of a CGU. Assuming there is no goodwill in the CGU being tested, then the VIU of the CGU can be calculated on an after-tax basis using notional tax cash flows assuming the asset's tax basis is equal to its VIU as discussed in section 7.2.3 above.

When goodwill is included in the CGU, the carrying amount of goodwill that results from the recognition of deferred tax (e.g., the CU6m in Illustration 8-7 above) must be removed for impairment testing purposes. At future impairment testing dates, one must adjust for any remaining difference between the nominal deferred tax liability at the impairment testing date and the original fair value of the assumed tax basis embedded in the intangible asset carrying value that remains at the impairment testing date. This is consistent with the assumption that it could not have been the IASB's intention to have an immediate impairment at the time of acquisition and the same logic and approach is being carried forward from day 1 to future impairment tests.

Another way of describing this is that the fair value of the deferred tax liability in the above example is equal to 30, being the tax amortisation benefit embedded in the fair value of the intangible asset. This tax amortisation benefit does not actually exist given the intangible asset's tax basis is in fact nil. Goodwill is reduced by the nominal versus fair value difference of the deferred tax liability which in this case is 6. If one tests the CGU (including both the intangible asset and goodwill) for impairment, when calculating the VIU following the approach in section 7.2.3 above on an after-tax basis (using notional tax cash flows assuming a tax basis equal to VIU) this cannot lead to day 1 impairment, given the VIU calculation assumes a full tax basis similar to that assumed in the intangible carrying value, as goodwill has been reduced by the nominal versus fair value difference of the deferred tax liability of 6.

An entity cannot continue to make this adjustment if it becomes impracticable to identify reliably the amount of the adjustment, in which case the entity would use VIU without this adjustment or use FVLCD of the CGU as the recoverable amount.

This is shown in the following Illustration:

Illustration 8-8: Impairment testing assets whose fair value reflects tax amortisation benefits (continued)

Assume that the entity in Illustration 8-7 above amortises the intangible asset on a straight-line basis over 10 years. When the entity performs its impairment test at the end of year one the carrying amount of the deferred tax liability and remaining fair value of the tax benefits embedded in the carrying amount of the intangible are as follow:

	Acquisition date	Amortisation year 1	End of year 1
	CU m	CU m	CU m
Intangible asset	60.0	6.0	54.0
Tax amortisation benefit (TAB)	30.0	3.0	27.0
Carrying value of intangible asset incl. TAB	90.0	9.0	81.0
Deferred tax ¹	36.0	3.6	32.4

¹ Year 1: 40% of CU90m and end of year 1 40% of CU81m

In the impairment test at the end of year 1, goodwill would be adjusted for the difference between the remaining nominal deferred tax liability of CU32.4m and the remaining tax benefit reflected in the carrying value of the intangible asset of CU27m resulting in an adjustment of CU5.4m to goodwill. The impairment test would therefore incorporate goodwill of CU40.6m (CU46m - CU5.4m).

The disclosure requirements of IAS 36 including the pre-tax discount rate, principally described in section 13.3 below, will apply.

8.3.2 Deferred tax assets and losses of acquired businesses

Deferred tax assets arising from tax losses carried forward at the reporting date must be excluded from the assets of the CGU for the purpose of calculating its VIU. However, it is possible that tax losses do not meet the criteria for recognition as deferred tax assets in a business combination, which means that their value is initially subsumed within goodwill. Under IFRS 3 and IAS 12, only acquired deferred tax assets that are recognised within the measurement period (through new information about circumstances at the acquisition date) are to reduce goodwill, with any excess once goodwill has been reduced to zero being taken to profit or loss. After the end of the measurement period, all other acquired deferred tax assets are taken to profit or loss. [IFRS 3.67, IAS 12.68].

Unless and until the deferred tax asset is recognised, this raises the same problems as in section 8.3.1 above. Certain assumptions regarding future taxation are built into the carrying value of goodwill and one must consider excluding these amounts from the carrying amount of the CGU when testing for impairment. However, if at a later date it transpires that any tax losses carry forwards subsumed in goodwill cannot be utilised, then excluding these amounts from the carrying amount of the CGU for impairment testing is not appropriate and can lead to an impairment.

8.4 Impairment testing when a CGU crosses more than one operating segment

While IAS 36 is clear that goodwill cannot be tested at a level that is larger than an operating segment determined in accordance with IFRS 8, it does not contain similar guidance for other assets. Therefore, the basic principle of IAS 36 applies, meaning assets or a group of assets are tested at the lowest level at which largely independent cash inflows can be identified. In practice a CGU determined based on the lowest level of independent cash inflows could be larger than an operating segment and therefore could cross more than one operating segment. For example, in the telecom industry, the entire telecom fixed line network can be one CGU, while at the same time an entity can identify its operating segments based on types of clients (e.g., individual clients, business clients, other operators, etc.). The general guidance in IAS 36 would require an entity to assess at each reporting date whether there are impairment indicators for the CGU and if such impairment indicators exist, perform a formal impairment assessment at CGU level. Regardless of whether a CGU crosses more than one operating segment, goodwill would need to be tested at a lower operating segment level. For this operating segment level impairment test, the assets of the larger CGU, in particular the cross operating segment assets e.g., the fixed line network, would need to be allocated to the operating segments. The application of these principles in practice can be complex and require judgement.

8.5 Disposal of operation within a cash-generating unit to which goodwill has been allocated

If goodwill has been allocated to a CGU (or a group of CGUs) and the entity disposes of an operation within that CGU, IAS 36 requires that the goodwill associated with the operation disposed of is included in the carrying amount of the operation when determining the gain or loss on disposal. For that purpose, the standard requires that the amount to be included is measured on the basis of the relative values of the operation disposed of and the portion of the CGU retained, unless the entity can demonstrate that some other method better reflects the goodwill associated with the operation disposed of. [IAS 36.86].

The standard refers to the 'relative values' of the parts without specifying how these are to be calculated. The recoverable amount of the part that it has retained will be based on the principles of IAS 36, i.e., at the higher of FVLCD and VIU. This means that it is possible that the VIU or FVLCD of the part retained has to be calculated as part of the allocation exercise on disposal.

In addition, the VIU and FVLCD of the part disposed of will be materially the same. This is because the VIU will consist mainly of the net disposal proceeds; it cannot be based on the assumption that the sale would not take place.

Illustration 8-9: Goodwill attributable to the disposal of an operation based on relative values

An entity sells for CU100 an operation that was part of a CGU to which goodwill of CU60 has been allocated. The goodwill allocated to the CGU cannot be identified or associated with an asset group at a level lower than that CGU, except arbitrarily. The recoverable amount of the portion of the CGU retained is CU300. Because the goodwill allocated to the CGU cannot be non-arbitrarily identified or associated with an asset group at a level lower than that CGU, the goodwill associated with the operation disposed of is measured on the basis of the relative values of the operation disposed of and the portion of the CGU retained. Therefore, 25% of the goodwill allocated to the CGU, i.e., CU15 is included in the carrying amount of the operation that is sold.

It will not necessarily follow, for example, that the business disposed of generated 25% of the net cash flows of the combined CGU. Therefore, the relative value method suggested by the standard to be applied in most circumstances can be based on a mismatch in the valuation bases used on the different parts of the business, reflecting the purchaser's assessment of the value of the part disposed of at the point of sale rather than that of the vendor at purchase.

The standard allows the use of some other method if it better reflects the goodwill associated with the part disposed of. The IASB had in mind a scenario in which an entity buys a business, integrates it with an existing CGU that does not include any goodwill in its carrying amount and immediately sells a loss-making part of the combined CGU. It is accepted that in these circumstances it is reasonable to conclude that no part of the carrying amount of the goodwill has been disposed of. [IAS 36.BC156]. The loss-making business being disposed of could, of course, have been owned by the entity before the acquisition or it could be part of the acquired business. However, the standard is not clear in what other circumstances a base other than relative values would better reflect the goodwill associated with the part disposed of. Any other method must take account of the basic principle, which is that this is an allocation of the carrying amount of goodwill and not an impairment test. It is not relevant, for example, that the part retained has sufficient headroom for all of the goodwill without any impairment. One has to bear in mind that any basis of allocation of goodwill on disposal other than that recommended by the standard could be an indication that goodwill must have been allocated on a different basis on acquisition. It could suggest that there was a reasonable basis of allocating goodwill to the CGUs within a group of CGUs.

However, as demonstrated in Illustration 8-11 below, in some circumstances the allocation based on relative values can lead to an immediate impairment which is not intuitive and therefore an alternative method can, depending on facts and circumstances, better reflect the goodwill associated with the operation disposed of.

How we see it

In our view, an approach that is based on current relative values of notional goodwill in the part disposed of and the part retained could, depending on facts and circumstances, be seen as an acceptable alternative for the goodwill allocation as illustrated in section 8.5.1 below.

8.5.1 Changes in composition of cash-generating units

If an entity reorganises the structure of its operations in a way that changes the composition of one or more CGUs to which goodwill has been allocated, IAS 36 requires that the goodwill be reallocated to the units affected. For this purpose, the standard requires the reallocation to be performed using a relative value approach similar to that discussed above when an entity disposes of an operation within a CGU, unless the entity can demonstrate that some other method better reflects the goodwill associated with the reorganised units. [IAS 36.87]. Generally, an impairment test would need to be performed prior to the reallocation of goodwill. As a result, if the reorganisation is triggered by underperformance in any of the affected operations, it cannot mask any impairment.

Illustration 8-10: Reallocation of goodwill to CGUs based on relative values

Goodwill of CU160 had previously been allocated to CGU A. A is to be divided and integrated into three other CGUs, B, C and D. Because the goodwill allocated to A cannot be non-arbitrarily identified or associated with an asset group at a level lower than A, it is reallocated to CGUs B, C and D on the basis of the relative values of the three portions of A before those portions are integrated with B, C and D. The recoverable amounts of these portions of A before integration with the other CGUs are CU200, CU300 and CU500 respectively. Accordingly, the amounts of goodwill reallocated to CGUs B, C and D are CU32, CU48 and CU80 respectively.

When goodwill is reallocated based on relative values, it can be necessary to assess impairment immediately following the reallocation, as the recoverable amount of the CGUs will be based on the principles of IAS 36 and the reallocation could lead to an immediate impairment.

Again, the standard gives no indication as to what other methods better reflect the goodwill associated with the reorganised units.

As illustrated in Illustration 8-11 below, the reallocation based on relative values could lead to an immediate impairment after the reallocation. This is not intuitive given that an impairment test would have been performed immediately before the goodwill reallocation and the restructuring of a business would not be expected to result in an impairment of goodwill.

As stated in section 8.5 above, an allocation based on the relative current value of notional goodwill could, depending on facts and circumstances, be seen as an acceptable alternative to the IAS 36 suggested approach of relative values. This method calculates the current value of notional goodwill in each of the components to be allocated to new CGUs by performing a notional purchase price allocation for each affected CGU. To do this the components fair value is compared with the fair value of the net identifiable assets to obtain the current value of notional goodwill. The carrying amount of the goodwill to be reallocated is then allocated to the new CGUs based on the relative current values of notional goodwill. This approach together with an example of circumstances under which the approach can be acceptable is illustrated in Illustration 8-11:

Illustration 8-11: Reallocation of goodwill to CGUs based on relative current values of notional goodwill

A US company acquired a European sub-group in 20X0 and recorded goodwill of CU30 million. At the time Europe was a new market for the company and goodwill was fully allocated to one CGU A based on the geographic location Europe. Two years later the group fundamentally restructured its business in Europe. The restructuring resulted in the split of the existing CGU into three new CGUs B, C and D based on products. The goodwill of CU30 million was assessed for impairment immediately prior to the restructuring and no impairment was identified.

The recoverable amounts of the net identifiable assets and the recoverable amounts of each new CGU are given in the following table:

CGU	B	C	D	Total
	CU m	CU m	CU m	
Fair value of net identifiable assets	20	40	40	100
Book value of net identifiable assets	10	35	35	80
Recoverable amount	40	80	40	160

The allocation based on the relative values of the three components of A allocated to B, C and D, as the required default method by the standard, would result in the following allocation of goodwill:

CGU	B	C	D	Total
	CU m	CU m	CU m	
Goodwill allocation	7.5	15	7.5	30
Book value of net identifiable assets	10	35	35	80
Total	17.5	50	42.5	110
Recoverable amount	40	80	40	160
Immediate impairment	-	-	2.5	2.5

Goodwill of CU7.5m (goodwill of CU30m × recoverable amount CU40m ÷ overall recoverable amount CU160m) is allocated to CGU B and D and CU15m (goodwill of CU30m × recoverable amount CU80m ÷ overall recoverable amount CU160m) to CGU C. As can be seen, the relative value approach would result in an immediate impairment of CU2.5m in CGU D. This is not intuitive, given that no impairment existed immediately prior to the restructuring and the restructuring of the business would not be expected to result in an immediate impairment. Another method of allocation can therefore better reflect the goodwill associated with the reorganised units. An allocation based on relative current values of notional goodwill could be an acceptable alternative method in this case. This would lead to the following allocation:

CGU	B	C	D	Total
	CU m	CU m	CU m	
CGU's fair value	40	80	40	160
Fair value net identifiable assets	20	40	40	100
Current value of notional goodwill	20	40	-	60
Historic goodwill allocated	10	20	-	30

This would allocate goodwill of CU10m (goodwill of CU30m × relative current value of notional goodwill CU20 ÷ overall current value of notional goodwill CU60m) to CGU B, CU20m (goodwill of CU30m × relative current value of notional goodwill CU40 ÷ overall current value of notional goodwill CU60m) to CGU C and CU0m (goodwill of CU30m × relative current value of notional goodwill CU0 ÷ overall current value of notional goodwill CU60m) to CGU D. This allocation would not cause an immediate impairment directly after the reallocation as the following table shows.

CGU	B	C	D	Total
	CU m	CU m	CU m	
Goodwill allocation	10	20	-	30
Book value of net identifiable assets	10	35	35	80
Total	20	55	35	110
Recoverable amount	40	80	40	160
Immediate impairment	-	-	-	-

The above example is based on a fact pattern where an existing CGU is split into three new CGUs. However, the method could be applied as well in circumstances where components of an existing CGU are allocated to other existing CGUs. The current values of notional goodwill used for reallocation purposes in such a case would need to be based only on the goodwill in the components being reallocated ignoring any goodwill in the existing CGUs to which the components are being allocated.

While the method illustrated above can be seen as an alternative method for goodwill reallocation it requires an entity to perform notional purchase price allocations for the components of each affected CGU and therefore potentially involves a significant time, effort and cost commitment. It is important to note that IAS 36 is not entirely clear whether an entity would need to use an alternative method that better reflects the goodwill associated with the reorganised units, if the entity is aware of it, or whether an entity could always just default to the IAS 36.87 stated relative value method.

In practice, situations can be considerably more complex than Illustration 8-9, Illustration 8-10 and Illustration 8-11 above. For example, when, after an acquisition, a combination of disposal of acquired businesses together with a reorganisation and integration arises. The entity can sell some parts of its acquired business immediately but also use the acquisition in order to replace part of its existing capacity, disposing of existing elements. In addition, groups frequently undertake reorganisations of their statutory entities. It is often the case that CGUs do not correspond to these individual entities and the reorganisations can be undertaken for taxation reasons so the ownership structure within a group does not correspond to its CGUs. This makes it clear how important it is that entities identify their CGUs and the allocation of goodwill to them, so that they already have a basis for making any necessary allocations when an impairment issue arises or there is a disposal.

9 Non-controlling interests - the impact on goodwill impairment testing

The amount of goodwill recorded by an entity when it acquires a controlling stake in a subsidiary that is less than 100% of its equity depends on which of the two following methods have been used to calculate it.

Under IFRS 3 an entity has a choice between two methods:

- Goodwill attributable to the non-controlling interests is not recognised in the parent's consolidated financial statements as the non-controlling interest is stated at its proportion of the net fair value of the net identifiable assets of the acquiree.
- Or
- The non-controlling interest is measured at its acquisition-date fair value, which means that its share of goodwill will also be recognised.

Under the first method above the carrying amount of that CGU comprises:

- The parent's interest and the non-controlling interest in the identifiable net assets of the CGU.
- And
- The parent's interest in goodwill.

But part of the recoverable amount of the CGU determined in accordance with IAS 36 is attributable to the non-controlling interest in goodwill.

IFRS 3 allows both measurement methods. The choice of method is to be made for each business combination, rather than being a policy choice, and could have a significant effect on the amount recognised for goodwill. [IFRS 3.19, IAS 36.C1].

Previous acquisitions under IFRS 3 (2007) were required to be accounted for using the first method above and were not restated on transition to the revised standard. [IFRS 3.64].

These methods are described in more detail in Chapter 10.

The IASB itself has noted that there are likely to be differences arising from measuring the non-controlling interest at its proportionate share of the acquiree's net identifiable assets, rather than at fair value. First, the amounts recognised in a business combination for the non-controlling interest and goodwill are likely to be lower (as shown in the Illustration given in Chapter 10). Second, if a CGU to which the goodwill has been allocated is subsequently impaired, any impairment of goodwill recognised through income is likely to be lower than it would have been if the non-controlling interest had been measured at fair value.

The Standard is clear that not all of the goodwill arising will necessarily be allocated to a CGU or group of CGUs which includes the subsidiary with the non-controlling interest. [IAS 36.C2].

Guidance is given on the allocation of impairment losses:

- If a subsidiary, or part of a subsidiary, with a non-controlling interest is itself a CGU, the impairment loss is allocated between the parent and the non-controlling interest on the same basis as that on which profit or loss is allocated. [IAS 36.C6].
- If it is part of a larger CGU, goodwill impairment losses are allocated to the parts of the CGU that have a non-controlling interest and the parts that do not on the following basis: [IAS 36.C7]
 - To the extent that the impairment relates to goodwill in the CGU, the relative carrying values of the goodwill of the parts before the impairment.
 - To the extent that the impairment relates to identifiable assets in the CGU, the relative carrying values of these assets before the impairment. Any such impairment is allocated to the assets of the parts of each unit *pro rata* on the basis of the carrying amount of each asset in the part.

In those parts that have a non-controlling interest the impairment loss is allocated between the parent and the non-controlling interest on the same basis as that on which profit or loss is allocated.

However, it is not always clear how an entity tests for impairment when there is NCI. The issues include:

- Calculating the 'gross up' of the carrying amount of goodwill because NCI is measured at its proportionate share of net identifiable assets and hence its share of goodwill is not recognised (see section 9.1 below)
- Allocation of impairment losses between the parent and NCI
- Reallocation of goodwill between NCI and controlling interests after a change in a parent's ownership interest in a subsidiary that does not result in a loss of control

Each of these issues arises in one or more of the following situations:

- NCI is measured on a proportionate share, rather than fair value
- Because of the existence of a control premium there are indications that it would be appropriate to allocate goodwill between the parent and NCI on a basis that is disproportionate to the percentage of equity owned by the parent and the NCI shareholders
- There are subsequent changes in ownership between the parent and NCI shareholders, but the parent maintains control

Increases in the parent's share are discussed in section 9.1.1 below, as is the sale of an interest without the loss of control.

The IFRS IC considered these issues in 2010 but declined to propose an amendment to IAS 36 as part of the Annual Improvements. They were concerned that there could be possible unintended consequences of making any changes, and recommended that the Board considers the implication of these issues as part of the IFRS 3 post-implementation review.² While these issues were not specifically addressed in the IFRS 3 post-implementation review, participants informed the Board that in their view the required impairment test is complex, time-consuming and expensive and involves significant judgements.

How we see it

In the absence of any guidance, we consider that an entity is not precluded from grossing up goodwill on a basis other than ownership percentages if to do so is reasonable. A rational gross up will result in a goodwill balance that most closely resembles the balance that would have been recorded had non-controlling interest been recorded at fair value. This is explored further in section 9.3 below.

9.1 Testing for impairment in entities with non-controlling interests measured at the proportionate share of net identifiable assets

If an entity measures NCI at its proportionate interest in the net identifiable assets of a subsidiary at the acquisition date, rather than at the fair value, goodwill attributable to the NCI is included in the recoverable amount of the CGU but is not recognised in the consolidated financial statements. To enable a like-for-like comparison, IAS 36 requires the carrying amount of a non-wholly owned CGU to be notionally adjusted by grossing up the carrying amount of goodwill allocated to the CGU to include the amount attributable to the non-controlling interest. This notionally adjusted carrying amount is then compared with the recoverable amount. [IAS 36.C3, IAS 36.C4]. If there is an impairment, the entity allocates the impairment loss as usual, first reducing the carrying amount of goodwill allocated to the CGU (see section 11.2 below). However, because only the parent's goodwill is recognised, the impairment loss is apportioned between that attributable to the parent and that attributable to the non-controlling interest, with only the former being recognised. [IAS 36.C8].

If any impairment loss remains, it is allocated in the usual way to the other assets of the CGU *pro rata* on the basis of the carrying amount of each asset in the CGU (the allocation of impairment losses to CGUs is discussed in section 11.2 below). [IAS 36.104].

² [IFRIC Update](#), September 2010, available on the IFRS Foundation's website.

These requirements are shown in the following Illustration. [IAS 36.1E62-68]. Note that in these examples goodwill allocation and impairment is based on the ownership interests. In section 9.3 below we discuss alternative allocation methodologies when there is a control premium.

Illustration 9-1: A CGU with goodwill and non-controlling interest

Entity X acquires an 80% ownership interest in Entity Y for CU1,600 on 1 January 20X0. At that date, Entity Y's identifiable net assets have a fair value of CU1,500. Entity X recognises in its consolidated financial statements:

- (a) Goodwill of CU400, being the difference between the cost of the business combination of CU1,600 and the non-controlling interest of CU300 (20% of CU1,500) and the identifiable net assets of Entity Y of CU1,500
- (b) Entity Y's identifiable net assets at their fair value of CU1,500
- (c) A non-controlling interest of CU300

At the end of 20X0 the carrying amount of Entity Y's identifiable assets has reduced to CU1,350 (excluding goodwill) and Entity X determines that the recoverable amount of CGU Y is CU1,000.

The carrying amount of CGU Y must be notionally adjusted to include goodwill attributable to the non-controlling interest, before being compared with the recoverable amount of CU1,000. Goodwill attributable to Entity X's 80% interest in Entity Y at the acquisition date is CU400. Therefore, goodwill notionally attributable to the 20% non-controlling interest in Entity Y at the acquisition date is CU100, being $(CU400 \div 80\% \times 20\%)$.

Testing CGU Y for impairment at the end of 20X0 gives rise to an impairment loss of CU850 calculated as follows:

	Goodwill	Identifiable net assets	Total
	CU	CU	CU
Carrying amount	400	1,350	1,750
Unrecognised non-controlling interest	100	-	100
Notionally adjusted carrying amount	500	1,350	1,850
Recoverable amount			1,000
Impairment loss			850

The impairment loss of CU850 is allocated to the assets in the CGU by first reducing the carrying amount of goodwill to zero. Therefore, CU500 of the CU850 impairment loss for the CGU is allocated to the goodwill. However, because Entity X only holds an 80% ownership interest in Entity Y, it recognises only 80% of that goodwill impairment loss (i.e., CU400). The remaining impairment loss of CU350 is recognised by reducing the carrying amounts of Entity Y's identifiable assets, as follows:

	Goodwill	Identifiable net assets	Total
	CU	CU	CU
Carrying amount	400	1,350	1,750
Impairment loss	(400)	(350)	(750)
Carrying amount after impairment loss	-	1,000	1,000

Of the impairment loss of CU350 relating to Entity Y's identifiable assets, CU70 (i.e., 20% thereof) would be attributed to the non-controlling interest.

In this example the same result would have been achieved by just comparing the recoverable amount of CU1,000 with the carrying amount of CU1,750. However, what if the recoverable amount of the CGU had been greater than the carrying amount of the identifiable net assets prior to recognising the impairment loss?

Assume the same facts as above, except that at the end of 20X0, Entity X determines that the recoverable amount of CGU Y is CU1,400. In this case, testing CGU Y for impairment at the end of 20X0 gives rise to an impairment loss of CU450 calculated as follows:

	Goodwill	Identifiable net assets	Total
	CU	CU	CU
Carrying amount	400	1,350	1,750
Unrecognised non-controlling interest	100	-	100
Notionally adjusted carrying amount	500	1,350	1,850
Recoverable amount			1,400
Impairment loss			450

All of the impairment loss of CU450 is allocated to the goodwill. However, Entity X recognises only 80% of that goodwill impairment loss, i.e., CU360. This allocation of the impairment loss results in the following carrying amounts for CGU Y in the financial statements of Entity X at the end of 20X0:

	Goodwill	Identifiable net assets	Total
	CU	CU	CU
Carrying amount	400	1,350	1,750
Impairment loss	(360)	-	(360)
Carrying amount after impairment loss	40	1,350	1,390

Of the impairment loss of CU360, none of it is attributable to the non-controlling interest since it all relates to the majority shareholder's goodwill.

In this case the total carrying amount of the identifiable net assets and the goodwill has not been reduced to the recoverable amount of CU1,400, but is actually less than the recoverable amount. This is because the recoverable amount of goodwill relating to the non-controlling interest (20% of [CU500 - CU450]) is not recognised in the consolidated financial statements.

9.1.1 Acquisitions or sale of non-controlling interests measured at the proportionate share of net identifiable assets

As described in section 9.1 above, in order to enable a like-for-like comparison, IAS 36 requires the carrying amount of a non-wholly-owned CGU to be notionally adjusted by grossing up the carrying amount of goodwill allocated to the CGU to include the amount attributable to the non-controlling interest.

What happens if the non-controlling interest is acquired by the entity so that it is now wholly owned? IFRS 10 requires these purchases to be reflected as equity transactions, which means that there is no change to goodwill. [IFRS 10.23]. Other methods can have been used in the past that can still be reflected in the carrying amounts of goodwill. These methods could have partially or wholly reflected the fair value of the additional interest acquired.

No notional adjustment to goodwill is required when the remaining non-controlling interest is acquired.

In situations where only a portion but not the full outstanding non-controlling interest is acquired or where a portion of an existing holding is sold without loss of control, the question is whether goodwill must be grossed up based on the new non-controlling interest percentage after the transaction or the original percentage. The answer to this question depends on whether a purchase of an additional non-controlling interest or a sale of a portion of an existing holding occurred.

Assume a situation where entity A owns 80% of entity B, goodwill was recorded at 80 and the non-controlling interest was measured at the proportionate interest in the net identifiable assets. In previous impairment tests goodwill would have been grossed up to 100 ($80 \times 100\% \div 80\%$). When entity A later acquires 10% of the remaining ownership interest in Entity B, leaving a non-controlling interest of 10%, must goodwill for future impairment assessments be grossed up using the current 10% or the previous 20% non-controlling interest? Using the current non-controlling interest holding of 10% would lead to grossed up goodwill of 88.9 ($80 \times 100\% \div 90\%$). This would make an impairment less likely. The alternative is to gross up goodwill with the original non-controlling interest percentage of 20% meaning goodwill could continue to be grossed up to 100.

How we see it

We believe both approaches (using the current or the initial rate of non-controlling interest) are acceptable in practice in situations where an additional non-controlling interest is acquired.

However, if instead entity A sold 20% of the ownership in entity B, resulting in a non-controlling interest of 40% the answer is different. The original non-controlling interest percentage of 20% must be used leading to grossed up goodwill of 100. Using an approach where goodwill is grossed up with the new non-controlling interest percentage, would lead to a goodwill of 133.3 ($80 \times 100\% \div 60\%$). We do not believe it would be appropriate to use this grossed up amount, as no additional goodwill was created through the transaction.

Grossing up of goodwill can be complex in situations where subsequent transactions occur which can entail a combination of non-controlling interests measured initially at fair value and at proportionate interest of net identifiable assets or where there are multiple subsequent transactions involving non-controlling interests. Careful consideration of all facts and circumstances are required to come to an appropriate solution in such cases.

9.2 Testing for impairment in entities with non-controlling interests initially measured at fair value

The following Illustrations in which the non-controlling interest is initially measured at fair value, are based on the Examples 7B and 7C in IAS 36's Illustrative Examples and illustrate the requirements for testing for impairment when non-controlling interest is initially measured at fair value. Note that in these examples goodwill impairment is allocated on the basis of the ownership interests. In section 9.3 below we discuss alternative allocation methodologies when there is a control premium.

Illustration 9-2: Non-controlling interests measured initially at fair value

Entity X acquires an 80% ownership interest in Entity Y for CU2,100 on 1 January 20X0. At that date, Entity Y's identifiable net assets have a fair value of CU1,500. Entity X chooses to measure the non-controlling interests at its fair value of CU350. Goodwill is CU950, which is the aggregate of the consideration transferred and the amount of the non-controlling interests (CU2,100 + CU350) less the net identifiable assets (CU1,500).

(a) The acquired subsidiary is a stand-alone CGU

Entity Y is a CGU, but part of the goodwill is allocated to other CGUs of Entity X that are expected to benefit from the synergies of the combination. Of the total goodwill of CU950 (CU2,450 - CU1,500), CU450 is allocated to the Entity Y CGU and CU500 to the other CGUs.

At the end of 20X0, the carrying amount of Entity Y's identifiable assets excluding goodwill has reduced to CU1,350 and Entity X determines that the recoverable amount of CGU Y is CU1,650.

	Goodwill	Identifiable net assets	Total
	CU	CU	CU
Carrying amount	450	1,350	1,800
Recoverable amount			1,650
Impairment loss			150

Of the goodwill impairment loss of CU150, CU30 (20%) will be allocated to the non-controlling interest because the goodwill is allocated to the controlling interest and non-controlling interest on the same basis as profit or loss.

(b) The acquired subsidiary is part of a larger CGU

Entity Y becomes part of a larger CGU, Z. As before, CU500 of the goodwill is allocated to other CGUs of Entity X that are expected to benefit from the synergies of the combination. Goodwill of CU450 is allocated to Z. Z's goodwill related to previous business combinations is CU800.

At the end of 20X0, Parent determines that the recoverable amount of the Z CGU is CU3,300. The carrying amount of its net assets excluding goodwill is CU2,250.

	Goodwill	Identifiable net assets	Total
	CU	CU	CU
Carrying amount	1,250	2,250	3,500
Recoverable amount			3,300
Impairment loss			200

All of the impairment loss of CU200 is allocated to the goodwill. As the partially owned subsidiary forms part of a larger CGU, the goodwill impairment loss must be allocated first to the parts of the cash-generating unit Z, and then to the controlling and non-controlling interests of Entity Y.

The impairment loss is allocated on the basis of the relative carrying values of the goodwill of the parts before the impairment. Entity Y is allocated 36% of the impairment ($450 \div 1,250$), in this case CU72, of which CU14.40 (20%) will be allocated to the non-controlling interest.

9.3 Testing for impairment in entities with non-controlling interests: alternative allocation methodologies

In section 9 above we noted that in the absence of any guidance, we consider that an entity is not precluded from grossing up goodwill on a basis other than ownership percentages if to do so is reasonable. A rational gross up will result in a goodwill balance that most closely resembles the balance that would have been recorded had non-controlling interest been recorded at fair value.

There are therefore two broad methods of grossing up goodwill for impairment testing purposes when non-controlling interest is measured at its proportionate interest in the net identifiable assets of the subsidiary at the acquisition date:

- A 'mechanical' gross up of the controlling interest's goodwill on the basis of ownership interests
And
- A 'rational' gross up of the controlling interest's goodwill that takes into account the acquirer's control premium, if any

Similarly, there are two broad methods of allocating goodwill impairment:

- A 'mechanical' allocation in which the impairment loss is allocated on the basis of ownership interests.
And
- A 'rational' allocation, in which the entity applies an allocation methodology that recognises the disproportionate sharing of the controlling and non-controlling interests in the goodwill book value. The rational allocation takes into account the acquirer's control premium, if any.

When non-controlling interest is measured at its proportionate interest in the net identifiable assets of the subsidiary, there are alternatives for both the gross up and allocation methods. The following are all acceptable:

- Rational gross up and rational allocation
- Rational gross up and mechanical allocation
And
- Mechanical gross up and mechanical allocation

A mechanical gross up and a rational allocation is not appropriate because a mechanical gross up results in the controlling and non-controlling interests having goodwill carrying values which are proportionate to their ownership interests.

Although the above methods of allocating goodwill and grossing up the NCI are acceptable, entities would be expected to be consistent year on year in the approach that they apply in testing any particular CGU or group of CGUs. This does not prevent an entity from applying different approaches to different CGUs or groups of CGUs, if that is appropriate in the circumstances. Both Illustration 9-1 and Illustration 9-2 in sections 9.1 and 9.2 above are examples of mechanical allocation of impairment losses. In Illustration 9-2 the NCI is recorded initially at fair value, so there is no gross up methodology for goodwill but in Illustration 9-1, goodwill is grossed up mechanically.

The examples below illustrate the various methods. Depending on the circumstances, the gross up and allocation process could be much more complex than in the Illustration below. For example, where goodwill is being tested for impairment for a group of CGUs with multiple non-controlling interests measured at both fair value and proportionate interest in net identifiable assets, other (practical) approaches, not illustrated below can result in a reasonable measurement and allocation of goodwill impairment. Also, it is possible that detailed records need to be maintained to facilitate the gross up and allocation process.

Illustration 9-3: Measurement and allocation of goodwill impairment losses when there are non-controlling interests

An entity purchases 80% of a business for CU160. The controlling and non-controlling interests share in profits on the basis of their ownership interests. The fair value of the net identifiable assets is CU140, and the fair value of the non-controlling interest is CU36. Goodwill is fully allocated to the business acquired.

Subsequent to the acquisition, the entity performs an impairment test and determines that the recoverable amount of the CGU is CU160.

Scenario 1 - Non-controlling interest recorded at fair value

The entity elects to record the non-controlling interest at fair value, rather than the non-controlling interest's proportionate share of the recognised amounts of the acquiree's identifiable net assets. Accordingly, goodwill of CU56 is recorded ($= \text{CU160} + \text{CU36} - \text{CU140}$).

The initial carrying amount of the CGU is CU196 ($= \text{CU140} + \text{CU56}$). Assuming for simplicity that at the time of the impairment test the carrying amounts are unchanged, there is impairment of CU36 ($= \text{CU196} - \text{CU160}$). The entire impairment loss is applied against the goodwill balance of CU56, reducing recorded goodwill to CU20. The entity is required to allocate the impairment loss between the controlling and non-controlling interests.

Rational allocation: the goodwill impairment loss is allocated on a rational basis using a methodology that recognises the disproportionate sharing of the controlling and non-controlling interests in the goodwill book value. The rational allocation takes into account the acquirer's control premium, if any. Goodwill of CU48 ($= \text{CU160} - (\text{CU140} \times 80\%)$) relates to the controlling interest and goodwill of CU8 ($= \text{CU36} - (\text{CU140} \times 20\%)$) relates to the non-controlling interest. Therefore, a rational allocation method would result in impairment of $\text{CU48} \div \text{CU56} \times \text{CU36} = \text{CU31}$ being allocated to the controlling interest and impairment of $\text{CU8} \div \text{CU56} \times \text{CU36} = \text{CU5}$ being allocated to the non-controlling interest.

Mechanical allocation: the goodwill impairment loss is allocated on the basis of ownership interests. Therefore, impairment of CU29 ($= \text{CU36} \times 80\%$) is allocated to the controlling interest while impairment of CU7 ($= \text{CU36} \times 20\%$) is allocated to the non-controlling interest [Note 1].

Scenario 2 - Non-controlling interest recorded at its proportionate share of fair value of identifiable assets

The entity elects to record non-controlling interest at its proportionate share of the fair value of the acquiree's identifiable net assets, i.e., CU28 ($= \text{CU140} \times 20\%$). Therefore, goodwill of CU48 is recorded ($= \text{CU160} + \text{CU28} - \text{CU140}$). In this case, the carrying amount of the CGU is CU188 ($= \text{CU140} + \text{CU48}$). The entity is required to gross up the carrying amount of the CGU for the purposes of determining whether the CGU is impaired.

Rational gross up and rational allocation: goodwill attributable to the non-controlling interest is calculated by grossing up the recognised goodwill using a factor which takes into account the premium, if any, relating to the fact that the entity has a controlling 80% interest. Assume the relevant gross up factor results in goodwill attributable to the non-controlling interest of CU8 [Note 2]. Therefore, the adjusted carrying value of the reporting unit is CU196 ($= \text{CU188} + \text{CU8}$). There is impairment of CU36 ($= \text{CU196} - \text{CU160}$). The total impairment of CU36 is then allocated between the controlling and non-controlling interest on a rational basis. Using the same rational allocation methodology as in Scenario 1 results in impairment of CU31 being allocated to the controlling interest and impairment of CU5 being allocated to the non-controlling interest. The impairment of CU5 associated with the non-controlling interest is not recognised because no goodwill is recorded in the financial statements relating to the non-controlling interest.

Rational gross up and mechanical allocation: as above, assume the relevant gross up factor results in goodwill attributable to the non-controlling interest of CU8 and the adjusted carrying value of the reporting unit is CU196 (= CU188 + CU8). The total impairment of CU36 is then allocated between the controlling and non-controlling interest based on their ownership interests, resulting in impairment of CU29 (= CU36 × 80%) being allocated to the controlling interest and impairment of CU7 (= CU36 × 20%) being allocated to the non-controlling interest. The impairment of CU7 associated with the non-controlling interest is not recognised because no goodwill is recorded in the financial statements relating to the non-controlling interest.

Mechanical gross up and mechanical allocation: goodwill attributable to the non-controlling interest is CU12 (= CU48 ÷ (80 ÷ 20)). Therefore, the adjusted carrying value of the reporting unit is CU200 (= CU188 + CU12). There is impairment of CU40 (= CU200 (adjusted carrying value) less CU160 (= recoverable amount)). Impairment of CU32 (= 80% × CU40) is allocated to the controlling interest and impairment of CU8 (= 20% × CU40) is allocated to the non-controlling interest. The impairment of CU8 associated with the non-controlling interest is not recognised because no goodwill is recorded in the financial statements relating to the non-controlling interest.

Note [1]: As a further illustration of the difference between the two methods, suppose that the entity determined that the recoverable amount was nil. In this case, under the rational allocation in Scenario 1, the non-controlling interest of CU36 would be reduced to zero, as an impairment of CU8 to goodwill and an impairment of CU28 (= 20% of CU140) to other identifiable assets would be each allocated to non-controlling interest. However, under mechanical allocation in Scenario 1, the non-controlling interest would be reduced by CU39 (= 20% of the carrying value of CU196) with the result being a non-controlling interest debit balance of CU3.

Note [2]: Note that this results in total adjusted goodwill of CU56, which is the same goodwill figure that is recorded in Scenario 1 when non-controlling interest is recorded at fair value.

10 Impairment of intangible assets with an indefinite useful life or not yet available for use

IAS 38 makes the point that 'indefinite' does not mean 'infinite', and unforeseeable factors can affect the entity's ability and intention to maintain the asset at its standard of performance assessed at the time of estimating the asset's useful life. [IAS 38.91]. The requirements of IAS 36 for this type of asset can be summarised as follows:

- All intangible assets with indefinite useful lives must be tested for impairment at least once per year and at the same time each year. [IAS 36.10].
 - Any intangible asset with an indefinite useful life recognised during the reporting period must be tested for impairment before the end of the period. [IAS 36.10].
 - Any intangible asset (regardless of whether it has an indefinite useful life or not) that is not yet available for use recognised during the reporting period must be tested for impairment before the end of the period. [IAS 36.10, IAS 36.11].
 - If an intangible asset that has an indefinite useful life or is not yet available for use can only be tested for impairment as part of a CGU, then that CGU must be tested for impairment at least annually. [IAS 36.89].
 - If there are indicators of impairment a period end test must also be performed. [IAS 36.9].
- And
- For an intangible asset that has an indefinite useful life that is part of a CGU, there are specific concessions, discussed below, allowing an impairment test in a previous period to be used if that test showed sufficient headroom. [IAS 36.24].

Any intangible asset not yet available for use must be tested annually because its ability to generate sufficient future economic benefits to recover its carrying amount is usually subject to greater uncertainty before the asset is available for use than after it is available for use. [IAS 36.11].

This will obviously affect any entity that capitalises development expenditure in accordance with IAS 38 where the period of development can cover more than one accounting period. The requirement will also apply to in-process research and development costs recognised in a business combination (see Chapter 10).

When an intangible asset with an indefinite useful life generates independent cash inflows as an individual asset, the impairment testing procedure for a single asset as set out in section 7 above applies. However, most intangible assets form part of the assets within a CGU, in which case the procedures relevant to testing a CGU as set out above apply. In particular IAS 36 makes it clear that if an intangible asset with an indefinite useful life, or any intangible asset not yet available for use, is included in the assets of a CGU, then that CGU has to be tested for impairment annually. [IAS 36.89]. As with other assets, it is possible that the FVLCD of the intangible asset with an indefinite useful life can be ascertained but the asset itself does not generate largely independent cash flows. If its individual FVLCD is lower than the carrying amount, this does not necessarily mean that the asset is impaired. The impairment test is still based on the CGU of which the asset is a part, and if the recoverable amount of the CGU is higher than the carrying amount of the CGU, there is no impairment loss.

IAS 36 allows a concession that applies to those intangible assets with an indefinite useful life that form part of a CGU, which is similar to the concession for goodwill. It allows the most recent detailed calculation of such an asset's recoverable amount made in a preceding period to be used in the impairment test in the current period if certain criteria are met. The IAS 36 guidance is set out in the following IAS 36 extract: [IAS 36.24]

Extract from IAS 36

Measuring the recoverable amount of an intangible asset with an indefinite useful life

- 24 Paragraph 10 requires an intangible asset with an indefinite useful life to be tested for impairment annually by comparing its carrying amount with its recoverable amount, irrespective of whether there is any indication that it may be impaired. However, the most recent detailed calculation of such an asset's recoverable amount made in a preceding period may be used in the impairment test for that asset in the current period, provided all of the following criteria are met:
- (a) if the intangible asset does not generate cash inflows from continuing use that are largely independent of those from other assets or groups of assets and is therefore tested for impairment as part of the cash-generating unit to which it belongs, the assets and liabilities making up that unit have not changed significantly since the most recent recoverable amount calculation;
 - (b) the most recent recoverable amount calculation resulted in an amount that exceeded the asset's carrying amount by a substantial margin; and
 - (c) based on an analysis of events that have occurred and circumstances that have changed since the most recent recoverable amount calculation, the likelihood that a current recoverable amount determination would be less than the asset's carrying amount is remote.

Thus, if there was sufficient headroom on the last calculation and little has changed in the CGU to which the asset belongs, it can be revisited and re-used rather than having to start entirely from scratch, which considerably reduces the work involved in the annual test. The impairment test cannot be rolled forward forever, of course, and an entity will have to take a cautious approach to estimating when circumstances have changed sufficiently to require a new test.

Impairment losses experienced on intangible assets are recognised exactly as set out in section 11 below, either as an individual asset or as part of a CGU, depending upon whether the intangible concerned is part of a CGU or not. Note that there is an important distinction concerning the allocation of losses in a CGU between the treatment of goodwill and that of intangible assets. If goodwill forms part of the assets of a CGU, any impairment loss first reduces the goodwill and thereafter the remaining assets are reduced *pro rata*. However, if an intangible asset is part of a CGU that is impaired, entities are not allowed to allocate impairment losses to the intangible asset before the other assets in the CGU, rather impairment losses are allocated to all assets *pro rata*. For the *pro rata* allocation, it is important to keep in mind that the carrying amount of an asset cannot be reduced below the highest of its fair value less costs of disposal, value in use or zero. If the preceding rule is applied, further allocation of the impairment loss is made *pro rata* to the other assets of the unit (group of units).

11 Recognising and reversing impairment losses

If the carrying value of an individual asset or of a CGU is equal to or less than its calculated VIU, there is no impairment. On the other hand, if the carrying value of the CGU is greater than its recoverable amount, an impairment write-down must be recognised.

There are three scenarios: an impairment loss on an individual asset, an impairment loss on an individual CGU and an impairment loss on a group of CGUs. The last of these occurs where there are corporate assets (see section 4.2 above) or goodwill (see section 11.2 below) that have been allocated to a group of CGUs rather than to individual ones.

11.1 Impairment losses on individual assets

For individual assets IAS 36 states: [IAS 36.59, IAS 36.60]

Extract from IAS 36

- | | |
|----|--|
| 59 | If, and only if, the recoverable amount of an asset is less than its carrying amount, the carrying amount of the asset shall be reduced to its recoverable amount. That reduction is an impairment loss. |
| 60 | An impairment loss shall be recognised immediately in profit or loss, unless the asset is carried at revalued amount in accordance with another Standard (for example, in accordance with the revaluation model in IAS 16). Any impairment loss of a revalued asset shall be treated as a revaluation decrease in accordance with that other Standard. |

If there is an impairment loss on an asset that has not been revalued, it is recognised in profit or loss. An impairment loss on a revalued asset is first used to reduce the revaluation surplus in other comprehensive income for that asset. Only when the impairment loss exceeds the amount in the revaluation surplus for that same asset is any further impairment loss recognised in profit or loss. [IAS 36.63].

IAS 36 does not require impairment losses to be shown in any particular position in the income statement, although the requirements of IAS 1 *Presentation of Financial Statements*³ must always be considered. An entity is required to add an appropriate line item in profit or loss if it is relevant for an understanding of the entity's financial performance. [IAS 1.85].

Any amounts written off a fixed asset must be shown as part of the accumulated depreciation when an entity discloses the gross carrying amount and the accumulated depreciation at the beginning and the end of the period. [IAS 16.73(d)]. In the reconciliation required by IAS 16.73(e) any impairment recognised or reversed through profit and loss must be shown in a separate line item. If the asset is held at revalued amount, then any impairment losses recognised or reversed must be shown in the reconciliation in one line item together with the revaluations. [IAS 16.73(e)(iv)].

An impairment loss greater than the carrying value of the asset does not give rise to a liability unless another standard requires it, presumably as this would be equivalent to providing for future losses. [IAS 36.62]. An impairment loss will reduce the depreciable amount of an asset and the revised amount will be depreciated or amortised prospectively over the remaining useful life. [IAS 36.63]. However, an entity ought also to review the useful life and residual value of its impaired asset, as it is possible that both of these have to be revised. The circumstances that give rise to impairments frequently affect these as well.

³ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted), was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

Finally, an impairment loss will have implications for any deferred tax calculation involving the asset. The standard makes clear that if an impairment loss is recognised then any related deferred tax assets or liabilities are determined in accordance with IAS 12, by comparing the revised carrying amount of the asset with its tax base. [IAS 36.64]. Example 3 in the standard's accompanying section of illustrative examples, on which the following is based, illustrates the possible effects.

Illustration 11-1: Recognition of an impairment loss creates a deferred tax asset

An entity has an asset with a carrying amount of CU2,000 whose recoverable amount is CU1,300. The tax rate is 30% and the tax base of the asset is CU1,500. Impairment losses are not deductible for tax purposes. The effect of the impairment loss is as follows:

	Before impairment	Effect of impairment	After impairment
	CU	CU	CU
Carrying amount	2,000	(700)	1,300
Tax base	1,500	-	1,500
Taxable (deductible) temporary difference	500	(700)	(200)
Deferred tax liability (asset) at 30%	150	(210)	(60)

The entity will recognise the deferred tax asset to the extent that the respective recognition criteria of IAS 12 are met.

11.2 Impairment losses and CGUs

Impairment losses in a CGU can occur in two ways:

- An impairment loss is incurred in a CGU on its own, and that CGU can have corporate assets or goodwill included in its carrying value.
- An impairment loss is identified that must be allocated across a group of CGUs because a corporate asset or goodwill is involved whose carrying value could only be allocated to a group of CGUs as a whole, rather than to individual CGUs (the allocation of corporate assets to CGUs is discussed in section 4.2 above, and goodwill is discussed in section 8 above). Note that if there are indicators of impairment in connection with a CGU with which goodwill is associated, i.e., the CGU is part of a group of CGUs to which the goodwill is allocated, this CGU must be tested and any necessary impairment loss taken, before goodwill is tested for impairment (see section 8.2.2 above). [IAS 36.88].

The relevant paragraphs from the standard deal with both instances but are readily understandable only if the above distinction is appreciated. The standard lays down that impairment losses in CGUs must be recognised to reduce the carrying amount of the assets of the unit (group of units) in the following order:

- First, to reduce the carrying amount of any goodwill allocated to the CGU or group of units.
- Second, if the goodwill has been written off, to reduce the other assets of the CGU (or group of CGUs) *pro rata* to their carrying amount, subject to the limitation that the carrying amount of an asset cannot be reduced below the highest of fair value less costs of disposal, value in use or zero. [IAS 36.104, IAS 36.105].

The important point is to be clear about the order set out above. Goodwill must be written down first, and if an impairment loss remains, the other assets in the CGU or group of CGUs are written down *pro rata* to their carrying values subject to the limitation that the carrying amount of an asset cannot be reduced below the highest of fair value less costs of disposal, value in use or zero.

This pro-rating is in two stages if a group of CGUs is involved:

- The loss reduces goodwill (which by definition in this instance is unallocated to individual CGUs in the group).
- Any remaining loss is pro-rated between the carrying values of the individual CGUs in the group and within each individual CGU the loss is again pro-rated between the individual assets' carrying values.

Unless it is possible to estimate the recoverable amount of each individual asset within a CGU, it is necessary to allocate impairment losses to individual assets in such a way that the revised carrying amounts of these assets correspond with the requirements of the standard. Therefore, the entity does not reduce the carrying amount of an individual asset below the highest of its FVLCD or VIU (if these can be established), or zero. The amount of the impairment loss that would otherwise have been allocated to the asset is then allocated *pro rata* to the other assets of the CGU or group of CGUs. [IAS 36.105]. The standard argues that this arbitrary allocation to individual assets when their recoverable amount cannot be individually assessed is appropriate because all assets of a CGU ‘work together’. [IAS 36.106].

If corporate assets are allocated to a CGU or group of CGUs, then any remaining loss (i.e., after allocation to goodwill) is pro-rated against the allocated share of the corporate asset and the other assets in the CGU.

This process, then, writes down the carrying value attributed or allocated to a CGU until the carrying value of the net assets is equal to the computed recoverable amount. Due to the restriction of not reducing the carrying amount of an asset below its FVLCD or VIU, it is logically possible, after all assets and goodwill are either written off or down to their FVLCD or VIU, for the carrying value of the CGU to be higher than the computed recoverable amount. There is no suggestion that the net assets must be reduced any further because at this point the FVLCD would be the relevant impairment figure. The remaining amount will only be recognised as a liability if that is a requirement of another standard. [IAS 36.108].

IAS 36 includes in the standard’s accompanying section of illustrative examples Example 2 which illustrates the calculation, recognition and allocation of an impairment loss across CGUs.

However, the standard stresses that no impairment loss can be reflected against an individual asset if the CGU to which it belongs has not been impaired, even if its carrying value exceeds its FVLCD. This is expanded in the following illustration, based on that in IAS 36.107:

Illustration 11-2: Individually impaired assets within CGUs

A machine has suffered physical damage but is still working, although not as well as before it was damaged. The machine’s FVLCD is less than its carrying amount. The machine does not generate independent cash inflows. The smallest identifiable group of assets that includes the machine and generates cash inflows that are largely independent of the cash inflows from other assets is the production line to which the machine belongs. The recoverable amount of the production line shows that the production line taken as a whole is not impaired.

Assumption 1: budgets/forecasts approved by management reflect no commitment of management to replace the machine.

The recoverable amount of the machine alone cannot be estimated because its VIU is different from its FVLCD (because the entity is going to continue to use it) and can be determined only for the CGU to which it belongs (the production line).

As the production line is not impaired, no impairment loss is recognised for the machine. Nevertheless, the entity needs to reassess the depreciation period or the depreciation method for the machine. Perhaps a shorter depreciation period or a faster depreciation method is required to reflect the expected remaining useful life of the machine or the pattern in which economic benefits are expected to be consumed by the entity.

Assumption 2: budgets/forecasts approved by management reflect a commitment of management to replace the machine and sell it in the near future.

Cash flows from continuing use of the machine until its disposal are estimated to be negligible. The machine’s VIU can be estimated to be close to its FVLCD. Therefore, the recoverable amount of the machine can be determined, and no consideration is given to the CGU (the production line) to which it belongs. As the machine’s carrying amount exceeds its FVLCD, an impairment loss is recognised to write it down to FVLCD. [IAS 36.107].

Note that it is assumed that the asset is still useable (otherwise it would not be contributing to the cash flows of the CGU and would have to be written off) and that it is not held for sale as defined by IFRS 5. If the asset is no longer part of the CGU, it will have to be tested for impairment on a stand-alone basis. For IFRS 5’s requirements when an asset is held for sale, see section 5.1 above.

11.3 Reversal of impairment loss relating to goodwill prohibited

As mentioned in section 8.2.4 above, IAS 36 does not permit an impairment loss on goodwill to be reversed under any circumstances. [IAS 36.124]. The standard justifies this on the grounds that such a reversal would probably be an increase in internally generated goodwill, rather than a reversal of the impairment loss recognised for the acquired goodwill, and that recognition of internally generated goodwill is prohibited by IAS 38. [IAS 36.125].

Illustration 11-3: Impairment of goodwill

Company A has a CGU that has a carrying value of CU2,000,000 on 31 December 20X0. This carrying value comprises CU500,000 relating to goodwill and CU1,500,000 relating to net tangible assets.

In 20X1, as a result of losses, net tangible assets have decreased to CU1,400,000 reducing the total carrying value of the unit to CU1,900,000. Changes in the regulatory framework surrounding its business mean that the cash-generating unit has a recoverable amount of CU1,600,000 and has thus suffered an impairment loss of CU300,000. This is charged to profit or loss. The carrying value of goodwill is reduced to CU200,000.

In 20X2 the company develops a new product with the result that the recoverable amount of the cash-generating unit rises to CU1,700,000. Net tangible assets have remained at CU1,400,000. Despite the recoverable amount of the business unit now being CU1,700,000 compared to its carrying value of CU1,600,000, it is not possible to reverse any portion of the prior year's impairment loss of CU300,000, as this would represent a reversal of impairment losses on goodwill.

11.4 Reversal of impairment losses relating to assets other than goodwill

For all other assets, including intangible assets with an indefinite useful life or not yet available for sale, IAS 36 requires entities to assess at each reporting date whether there is any indication that an impairment loss no longer exists or has decreased. If there is any such indication, the entity has to recalculate the recoverable amount of the asset. [IAS 36.110].

Therefore, if there are indications that a previously recognised impairment loss has disappeared or reduced, it is necessary to determine again the recoverable amount (i.e., the higher of FVLCD or VIU) so that the reversal can be quantified. The standard sets out examples of what it notes are in effect 'reverse indications' of impairment. [IAS 36.111]. These are the reverse of those set out in IAS 36.12 as indications of impairment (see section 2.1 above). [IAS 36.112]. They are arranged, as in IAS 36.12, into two categories: [IAS 36.111]

External sources of information:

- (a) A significant increase in the asset's value.
- (b) Significant changes during the period or expected in the near future in the entity's technological, market, economic or legal environment that will have a favourable effect.
- (c) Decreases in market interest rates or other market rates of return on investments and those decreases are likely to affect the discount rate used in calculating the asset's value in use and increase the asset's recoverable amount materially.

Internal sources of information:

- (d) Significant changes during the period or expected in the near future that will affect the extent to which, or manner in which, the asset is used. These changes include costs incurred during the period to improve or enhance the asset's performance or restructure the operation to which the asset belongs.
- (e) Evidence from internal reporting that the economic performance of the asset is, or will be, better than expected.

Compared with IAS 36.12, there are two notable omissions from this list of 'reverse indicators', one external and one internal.

The external indicator not included is the mirror of the impairment indicator "the carrying amount of the net assets of the reporting entity is more than its market capitalisation". No explanation is provided as to why, if a market capitalisation below shareholders' funds is an indication of impairment, its reversal is not automatically an indication of a reversal. However, the most likely reason is that all of the facts and circumstances need to be considered before assuming that an impairment has reversed.

The internal indicator omitted from the list of 'reverse indicators' is that evidence of obsolescence or physical deterioration has been reversed. Once again, no reason is given. It is possible that the standard-setters have assumed that no such reversal could take place without the entity incurring costs to improve or enhance the performance of the asset or the CGU so that this is, in effect, covered by indicator (d) above.

The standard also reminds preparers that a reversal, like an impairment, is evidence that the depreciation method or residual value of the asset must be reviewed and possibly adjusted, whether or not the impairment loss is reversed. [IAS 36.113].

A further restriction is that impairment losses are reversed only if there has been a change in the estimates used to determine the impairment loss, e.g., a change in cash flows or discount rate (for VIU) or a change in FVLCD. The 'unwinding' of the discount will increase the present value of future cash flows as they become closer, but IAS 36 does not allow the mere passage of time to trigger the reversal of an impairment. In other words, the 'service potential' of the asset must genuinely improve if a reversal is to be recognised. [IAS 36.114, IAS 36.115, IAS 36.116]. However, this inability to recognise the rise in value can lead to what is in effect a double recognition of losses, which can seem illogical, as demonstrated by the following Illustration:

Illustration 11-4: Double counted losses

At the end of 20X0, an entity with a single CGU is carrying out an impairment test. The discounted future cash flows for years 20X2 and onwards would be just enough to support the carrying value of the entity's assets. However, 20X1 is forecasted to produce a loss and net cash outflow. The discounted value of this amount is accordingly written off the carrying value of the fixed assets in 20X0 as an impairment loss. It is then suffered again in 20X1 (at a slightly higher amount being now undiscounted) as the actual loss. Once that loss is past, the future cash flows are sufficient to support the original unimpaired value of the fixed assets. Nevertheless, the assets cannot be written back up through profit or loss to counter the double counting effect as the increase in value does not derive from a change in economic conditions or in the expected use of an asset.

In this type of scenario, which is common in practice, the entity will only 'benefit' as the assets are depreciated or amortised at a lower amount.

Subsequent depreciation or amortisation can result in a scenario where the VIU in subsequent years is higher than the carrying amount of the asset/CGU. However, the requirement of improvement to the asset's 'service potential' to reverse an impairment, means that subsequent depreciation or amortisation on its own cannot be considered to be an indication of impairment reversal.

If, on the other hand, the revival in cash flows is the result of expenditure by the entity to improve or enhance the performance of the asset or the CGU or of a restructuring of the CGU, there can be an obvious improvement in the service potential that allows the entity to reverse some or all of the impairment losses.

If, and only if, an entity concludes that there are impairment reversal indicators due to the increase in service potential of the asset or CGU in questions, it would measure the impairment reversal by the amount by which the recoverable amount exceeds the carrying amount asset or CGU. It would not need to distinguish which portion results from the increase of the service potential of the assets or CGU, e.g., improvement in the cash flow forecast, and which portion is due to passage of time or subsequent depreciation or amortisation.

In the event of an individual asset's impairment being reversed, the reversal cannot raise the carrying value above the carrying amount that would have been determined (net of amortisation or depreciation), if no impairment had originally been recognised. [IAS 36.117]. Any increase above this figure would really be a revaluation, which would have to be accounted for in accordance with the standard relevant to the asset concerned. [IAS 36.118].

Illustration 11-5: Reversal of impairment losses

At the beginning of year 1 an entity acquires an asset with a useful life of 10 years for CU1,000. The asset generates net cash inflows that are largely independent of the cash inflows of other assets or groups of assets. At the end of year 3, when the carrying amount after depreciation is CU700, the entity recognises that there has been an impairment loss of CU210. The entity writes the asset down to CU490. As the useful life is not affected, the entity commences amortisation at CU70 per annum which, if applied in each of the years 4-10, would amortise the carrying value over the remaining useful life, as follows:

Table 1	Year									
	1	2	3	4	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU	CU	CU	CU	CU
NBV - beginning of the year	1,000	900	800	490	420	350	280	210	140	70
Depreciation	100	100	100	70	70	70	70	70	70	70
Impairment			210							
NBV - end of the year	900	800	490	420	350	280	210	140	70	-
NBV without impairment	900	800	700	600	500	400	300	200	100	-

At the beginning of year 5, before depreciation for the year, the asset's carrying value is CU420. Thanks to improvements in technology, the entity is able to increase the asset's VIU to CU550 by spending CU120 on parts that improve and enhance its performance.

At the end of year 5, the asset can therefore be written up to the *lower* of:

- CU600, which is the net book value of the asset after the additional expenditure, assuming that there had never been any impairment. This is the balance brought forward at the beginning of year 5 of CU600 (Table 1 bottom row) plus expenditure of CU120 less depreciation for the year of $(720 \div 6) = \text{CU}120$.
And
- CU550, which is the VIU at the end of year 5.

Therefore, it can write the asset's net book value back up to CU550. The entity can reverse CU100 of the impairment loss and amortise the remaining net book value of the asset of CU550 to zero over the remaining five years, year 6 to year 10, at CU110 per annum (see Table 2 below).

Table 2	Year					
	5	6	7	8	9	10
	CU	CU	CU	CU	CU	CU
Cost	1,000	1,120	1,120	1,120	1,120	1,120
Expenditure in the year	120					
Cost carried forward	1,120	1,120	1,120	1,120	1,120	1,120
Accumulated depreciation brought forward	580	570	680	790	900	1,010
Charge for the year $(70 + 20 (120 \div 6))$	90	110	110	110	110	110
Reversal of impairment	(100)					
Accumulated depreciation carried forward	570	680	790	900	1,010	1,120
NBV	550	440	330	220	110	-

The standard includes an illustration of the reversal of an impairment loss in Example 4 of the standard's accompanying section of illustrative examples.

All reversals are to be recognised in the income statement immediately, except for revalued assets which are dealt with in section 11.4.2 below. [IAS 36.119].

If an impairment loss is reversed against an asset, its depreciation or amortisation is adjusted to allocate its revised carrying amount less residual value over its remaining useful life. [IAS 36.121].

11.4.1 Reversals of impairments - cash-generating units

Where an entity recognises a reversal of an impairment loss on a CGU, the increase in the carrying amount of the assets of the unit must be allocated by increasing the carrying amount of the assets, other than goodwill, in the unit on a *pro rata* basis. However, the carrying amount of an individual asset cannot be increased above the lower of its recoverable amount (if determinable) and the carrying amount that would have resulted had no impairment loss been recognised in prior years. Any 'surplus' reversal is to be allocated to the remaining assets *pro rata*, always remembering that goodwill, if allocated to an individual CGU, cannot be increased under any circumstances. [IAS 36.122, IAS 36.123].

11.4.2 Reversals of impairments - revalued assets

If an asset is recognised at a revalued amount under another standard, any reversal of an impairment loss must be treated as a revaluation increase under that other standard. Thus, a reversal of an impairment loss on a revalued asset is credited to other comprehensive income. However, to the extent that an impairment loss on the same revalued asset was previously recognised as an expense in the income statement, a reversal of that impairment loss is recognised as income in the income statement. [IAS 36.119, IAS 36.120].

As with assets carried at cost, after a reversal of an impairment loss is recognised on a revalued asset, the depreciation charge must be adjusted in future periods to allocate the asset's revised carrying amount, less any residual value, on a systematic basis over its remaining useful life. [IAS 36.121].

12 Subgroup and separate financial statement issues

The application of IAS 36 in group situations is not always straight forward and can give rise to a number of challenging questions. We explore some of these questions in the following sections, including:

- How to identify CGUs and relevant cash flows in the financial statements of an individual entity within a group, the consolidated financial statements of a subgroup, or when impairment testing equity accounted investments or those carried at cost.
- And
- Whether the cash flows mentioned above need to be on an arm's length basis, i.e., at fair value, and the extent the restrictions imposed by IAS 36 need to be applied.

Note that we have used the term 'individual financial statements' for any stand-alone financial statements that apply IFRS accounting standards, prepared by any entity within a group, whether or not those financial statements are within scope of IAS 27 *Separate Financial Statements*. The term 'individual financial statements' includes separate financial statements, individual financial statements for subsidiary companies with no investments and, for a subsidiary that does not have any subsidiaries, unconsolidated financial statements whose associates and joint ventures are accounted for using the equity method.

The distinction between individual financial statements and 'separate financial statements', a term that applies only to financial statements prepared in accordance with the provisions of IAS 27, is explained in Chapter 9.

12.1 VIU: intra-group transactions (transfer pricing)

When required by the relevant IFRS, an impairment test is performed to:

- Equity accounted investments
- Investments in subsidiaries, associates or joint ventures carried at cost in the separate financial statements of the parent
- Or
- Assets/CGUs in an individual group company's or subgroup's financial statements

When performing those impairment tests, the key questions are how to determine the cash flows for intra-group transactions and whether those cash flows need to be on an arm's length basis.

Many individual group companies or subgroups do not have truly independent cash flows because of the way in which groups allocate activities between group entities. Transactions between a parent entity and its subsidiaries, between subsidiaries within a group or between subsidiaries/parents and investments in associates and joint ventures can be carried out at terms that differ from an arm's length basis. Entities can benefit from transactions entered into by others that are not reflected in their financial statements, e.g., management and other facilities provided by another group company, or can incur those expenses on their behalf without recharge.

In the context of impairment testing, this means that an entity needs to consider whether the relevant cash flows are those actually generated by the asset (investment in subsidiary, joint venture, associate or individual asset or CGU) or those that it could generate on an arm's length basis. IAS 36 gives no clear answer to this question. There are two broad approaches, and preference for one from the other will often depend on local jurisdictions. Either:

- The VIU must be based on the cash flows directly generated under current arrangements, e.g., those received and receivable.
- Or
- The cash flows must take into consideration the manner in which the group has organised its activities and make notional adjustments to reflect arm's length amounts.

Those arguing that notional adjustments are required, refer to the IAS 36 requirement to replace transfer prices with arm's length prices for CGUs within the same reporting entity/group once a CGU has been identified (see section 7.1.6 above). [IAS 36.70]. The argument is that the same principle applies in intra-group arrangements and therefore the internal transfer prices of the group entities in question must be substituted with arm's length prices. This is not always straightforward in practice, as it can be difficult to allocate arm's length prices in intra-group arrangements where there is often a 'bundle' of goods and services and where some transactions do not have commercial equivalents.

When making these adjustments, one method that can work in practice, as it reflects the arm's length prices of inputs and outputs, and therefore the substitution of transfer prices, is to start from the VIU of the CGU in the consolidated financial statements, of which the subsidiary being tested for impairment is a part, and allocate it to the various subsidiaries. This, however, is not a straightforward exercise. It is necessary to avoid potential pitfalls:

- Taking account of a notional increase in income or VIU to one subsidiary but neglecting to reflect the notional increase in costs or loss of VIU to another.
- Including benefits or costs that cannot be converted into cash flows to the entity. This can be particularly problematic when testing goodwill, including the carrying value of investments when the purchase price reflects goodwill on acquisition. Most would consider this a constraint on the cash flows reflected in this impairment test. This can be revealed if there is a major difference between the subsidiary-based and CGU-based recoverable amount as there could be cash flows or synergies elsewhere in the group that cannot be reasonably attributed to the subsidiary or subgroup in question.
- As explained in section 12.4.2.B below, the entity's investment reflects the net assets of the subsidiary while the CGU reflects the assets and liabilities on a gross basis, so appropriate adjustments will have to be made.

Those arguing notional adjustments are not required refer to the lack of guidance in IAS 36. The argument is that it is not clear that the same principle must apply, particularly in circumstances when using the contractual agreed cash flows would lead to an impairment which would be avoided by substitution of contractual agreed cash flows with arm's length prices.

How we see it

As we believe IAS 36 gives no clear answer, it is important for an entity to disclose sufficient information to enable users of financial statements to understand which approach was applied and how this impacted the entity's financial statements. These disclosures may include a description of the entity's facts and circumstances, how the approach was applied, the basis for selecting an approach and the impact on the financial statements.

12.2 Testing goodwill in a group company's or subgroup's financial statements

In many jurisdictions, subsidiary entities are not exempt from preparing financial statements and these can be required to comply with IFRSs. These can be consolidated accounts for the subgroup that it heads. When such individual financial statements or the consolidated financial statements of a subgroup include goodwill, an annual impairment test is required. Along with the question of whether intra-group cash flows need to be on an arm's length basis for impairment testing purposes, as discussed in section 12.1 above, other principal questions are:

- How to treat synergies arising outside of the reporting entity/subgroup (see section 12.2.1 below)?
 - Whether the guidance in IFRS 8 applies in determining the level at which goodwill has to be tested for impairment in the consolidated financial statements of the subgroup or in individual financial statements (see section 12.2.2 below)?
- And
- How to deal with goodwill, arising at a subgroup level, in the group financial statements (see section 12.2.3 below)?

12.2.1 Goodwill synergies arising outside of the reporting entity/subgroup

If goodwill is being tested in the consolidated financial statements of a subgroup or individual financial statements, it is possible that the synergies that gave rise to the goodwill are in another part of the larger group because the subgroup is part of a CGU containing other subsidiary companies. It is possible that some synergies such as economies of scale cannot be translated into cash flows to the entity or subgroup in question. Although there is no impairment at the level of the CGU in the group consolidated financial statements, it is possible that the entity cannot avoid writing down the goodwill in the individual financial statements or consolidated financial statements of a subgroup statements at the time the first impairment test is performed in the year of the acquisition.

How we see it

In our view, it is not appropriate to consider synergies arising outside the individual financial statements or consolidated financial statements of a subgroup when testing impairment in the individual financial statements or consolidated financial statements of a subgroup unless these synergies are available to market participants and therefore are built into the FVLCD. Whether this impairment loss needs to be recorded in the statement of profit or loss or whether it is appropriate to treat it as an equity transaction in the form of a distribution to the parent is a matter of judgement.

12.2.2 The effect of IFRS 8 *Operating Segments* when allocating goodwill to CGUs in individual financial statements or consolidated financial statements of a subgroup

As discussed in section 8.1 above, goodwill is not necessarily tested at the lowest level of CGUs (however defined in the context of these group entities or subgroups), but at the level of a group of CGUs at which goodwill is monitored. However, that group of CGUs cannot be larger than an operating segment before aggregation (see section 8.1.4 above). [IAS 36.80].

How we see it

We believe that for the purposes of testing goodwill in the individual financial statements or the consolidated financial statements of a subgroup, companies must apply the guidance in IFRS 8 to determine its operating segments even if IFRS 8 is not applicable because the subsidiary (subgroup) is not public.

Therefore, if the application of IFRS 8 would result in the identification of separate operating segments in the individual financial statements or consolidated financial statements of a subgroup, goodwill cannot be tested for impairment at a level above the operating segments in those financial statements (i.e., the operating segments would serve as a ceiling). It would not be appropriate to apply IAS 36.80 in these circumstances based on the operating segments as determined by the ultimate parent entity for its consolidated financial statements.

However, the CGU/group of CGUs for the purposes of goodwill impairment testing could be at a level lower than the subgroup's operating segments.

Illustration 12-1: A subgroup with goodwill that is not an operating segment for the group

A mining entity (group) extracts a metal ore that does not have an active market until it has been through a smelting and refining process. Each mine is held in a separate subsidiary, as is the refinery, and in two joint ventures. The refinery, subsidiaries and joint ventures are located in several different countries. The entity considers the CGU to comprise the subsidiary that holds the smelter together with the subsidiaries that hold the individual mines and the interests in the joint ventures.

The entity acquires a group of mine-holding subsidiaries in a country where there is a requirement to prepare consolidated financial statements at the highest level within that country. These consolidated financial statements, which are prepared using the acquisition method by the relevant intermediate parent, include goodwill. The entity does not consider the subgroup to be an operating segment. However, in the subgroup's consolidated financial statements, first of all the relevant operating segments would need to be determined from the subgroup's perspective. If it was concluded that from the subgroup's perspective there was only one operating segment, this would be the maximum level at which goodwill is tested for impairment in the subgroup's consolidated financial statements.

12.2.3 Acquisitions by subsidiaries and determining the level at which the group tests goodwill for impairment

IAS 36 requires goodwill to be allocated to the lowest level within the entity at which the goodwill is monitored for internal management purposes. If a subsidiary undertakes acquisitions and recognises goodwill in its own financial statements, the level at which the subsidiary's management monitors the goodwill can differ from the level at which the parent's or group's management monitors goodwill from the group's perspective.

If a subsidiary's management monitors its goodwill at a lower level than the level at which the parent's or group's management monitors its goodwill, a key issue is whether that lower level must, from the group's perspective, be regarded as the 'lowest level within the entity at which the goodwill is monitored for internal management purposes'? The answer is not necessarily, as is demonstrated in the following Illustration.

Illustration 12-2: Monitoring goodwill arising from acquisitions by subsidiaries

A parent acquired 100% of the issued shares of a company that operates autonomously and is required to prepare IFRS-compliant financial statements. The subsidiary has acquired various businesses both before and after becoming part of the group. Those business combinations have included significant amounts of goodwill.

The subsidiary's management monitors its acquired goodwill at the level of the subsidiary's operating segments identified in accordance with IFRS 8. However, management of the parent/group monitors its acquired goodwill at the level of the group's operating segments, which is a higher level than the subsidiary's operating segments. The subsidiary's operations form part of two of the group's six operating segments.

The subsidiary's goodwill comprises goodwill arising on its acquisitions, some of which took place *before*, and some *after*, the subsidiary became part of the group.

In contrast, the goodwill recognised by the group comprises:

- Goodwill acquired by the parent in the acquisition of the subsidiary
- Goodwill acquired by the subsidiary since becoming part of the group
- Goodwill acquired by the parent in other operating combinations (i.e., goodwill that relates to other subsidiaries and businesses that make up the group)

The goodwill acquired in the acquisition of the subsidiary that is recognised by the parent in its consolidated financial statements is therefore different from the goodwill recognised by the subsidiary (which relates only to the acquisitions made by the subsidiary itself and was measured at the date of the acquisition concerned, as any other goodwill would be internally generated goodwill from the subsidiary's perspective and therefore not recognised by the subsidiary).

In such circumstances the actions of the subsidiary's management in deciding the level at which it tests its goodwill for impairment will *not* cause the group to be 'locked in' to testing goodwill at the same level in the consolidated financial statements.

Rather, the group must test its goodwill for impairment at the level at which management of the group (i.e., of the parent) monitors its various investments in goodwill, namely, in this example, at the group's operating segment level.

12.3 Intra-group transfer of investments in subsidiaries

A common form of group reorganisation involves the transfer of the entire business of a subsidiary to another subsidiary of the same parent. These transactions often take place at the book value of the transferor's assets rather than at fair value. If the original carrying value was a purchase price that included an element of goodwill, the remaining 'shell', i.e., an entity that no longer has any trade or activities, can have a carrying value in the parent company's statement of financial position in excess of its net worth/recoverable amount. It could be argued that as the subsidiary is now a shell with no possibility in its current state of generating sufficient profits to support its value, a loss must be recognised by the parent in its separate financial statements to reduce its investment in the shell company to its net worth/recoverable amount. However, the transfer of part of the group's business from one controlled entity to another has no substance from the perspective of the group and will have no effect in the consolidated accounts. There has also been no loss overall to the parent as a result of this reorganisation as the loss in net worth/recoverable amount in one subsidiary results in an increase in the net worth/recoverable amount in the other subsidiary.

This is, of course, a transaction between companies under common control as all of the combining entities or businesses are ultimately controlled by the same party or parties both before and after the business combination, and that control is not transitory. [IFRS 3.B1]. This means that the treatment by the acquirer is scoped out of IFRS 3.

From the transferor entity's perspective, the transaction combines a sale of its assets at an undervalue to the acquirer, by reference to the fair value of the transferred assets, and a distribution of the shortfall in value to its parent. It is possible that the fair value of those assets to the parent is not reflected in the transferor's own statement of financial position because there is no push-down accounting under IFRS. The transferor is not obliged to record the 'distribution' to its parent at fair value. IFRIC 17 *Distributions of Non-cash Assets to Owners* requires gains or losses measured by reference to fair value of the assets distributed to be taken to profit or loss but, amongst other restrictions, excludes from its scope non-cash distributions made by wholly-owned group companies (see Chapter 9).

This interpretation of the transferor's transaction (as a sale at an undervalue and a deemed distribution to the parent) is wholly consistent with a legal analysis in some jurisdictions, for example the United Kingdom, where a company that does not have zero or positive distributable reserves is unable to sell its assets at an undervalue because it cannot make any sort of distribution.

The parent, in turn, could be seen as having made a capital contribution of the shortfall in value to the acquirer. The parent can choose to record the distribution from the transferor (and consequent impairment in its carrying value) and the contribution to the acquirer (and consequent increase in its carrying value). This is consistent with our analysis in Chapter 9 regarding intra-group transactions.

The acquirer will not necessarily record the capital contribution even if this is an option available to it.

However, the underlying principles are not affected by whether or not the acquirer makes this choice - there has been a transfer of value from one subsidiary to another. This demonstrates why the business transfer alone does not necessarily result in an impairment charge in the parent entity.

If the above analysis is not supportable in a particular jurisdiction, then an impairment loss has to be recognised.

Actual circumstances can be less straightforward. In particular, when the transferor and the acquirer are not held directly by the same parent. This can make it necessary to record an impairment against the carrying value of the transferor ('shell') company in its intermediate parent to reflect its loss in value, which will be treated as an expense or as a distribution, depending on the policy adopted by the entity and the relevant facts and circumstances. See Chapter 9 for a discussion of the policy choices available to the entity. There can be another, higher level within the group at which the above arguments against impairment will apply.

Illustration 12-3: Group reorganisations and impairment

Topco has two directly held subsidiaries, Tradeco and Shellco. It acquired Shellco for CU30 million and immediately thereafter transferred all of its trade and assets to its fellow subsidiary Tradeco for book value of CU10 million with the proceeds being left outstanding on intercompany account. Shellco now has net assets of CU10 million (its intercompany receivable) but a carrying value in Topco of CU30 million. On the other hand, the value of Tradeco has been enhanced by its purchase of the business at an undervalue.

There are two acceptable ways in which Tradeco can account for this. The cost of the investment in Tradeco's individual financial statements can be the fair value of the cash given as consideration, i.e., CU10 million. Alternatively, it is the fair value of the cash given as consideration (CU10 million), together with a deemed capital contribution received from Topco for the difference up to the fair value of the business of Shellco of CU20 million, which will be recognised in equity, giving a total consideration of CU30 million.

The capital contribution measured under the second method represents the value distributed by Shellco to its parent Topco and thence to Tradeco. Meanwhile Topco could record a transfer of CU20 million from the carrying value of Shellco to the carrying value of Tradeco.

If there is an intermediate holding company between Topco and Shellco but all other facts remain the same, then it would appear that an impairment ought to be made against the carrying value of Shellco in its immediate parent, which will be treated as an expense or as a distribution, depending on the policy adopted by the entity and the relevant facts and circumstances. The argument against impairment would still apply in Topco.

12.4 Investments in subsidiaries, associates and joint ventures

Investments in subsidiaries, associates and joint ventures carried at cost in separate financial statements of the parent and equity accounted investments are within the scope of IAS 36.

However, IAS 27 also permits entities to account for investments in subsidiaries, associates and joint ventures in separate financial statements in accordance with IFRS 9 or by applying the equity method.

[IAS 36.4, IAS 27.10].

The recoverable amount for investments carried at cost or under the use of the equity method is the higher of FVLCD and VIU. Specific questions around FVLCD are dealt with in section 12.4.1 below. Challenges in respect of VIU for investments carried at cost or under the equity method are dealt with in section 12.4.2 below.

It is important to note that testing an investment in an associate or joint venture carried under the equity method using IAS 28 in group financial statements cannot always provide assurance about the recoverability of the cost of shares in the investor's separate financial statements, if they are carried at cost. [IAS 27.10(a)]. Accounting for the group's share of losses can take the equity interest below cost and an impairment test could reveal no need for an impairment loss in the consolidated financial statements. This does not necessarily provide any assurance about the (higher) carrying value of the shares in the separate financial statements.

12.4.1 Fair value less costs of disposal (FVLCD) for investments in subsidiaries, associates and joint ventures

In order to establish FVLCD an entity must apply IFRS 13's requirements as outlined in section 6 above and described in detail in Chapter 15.

If an entity holds a position in a single asset or liability that is traded in an active market, IFRS 13 requires an entity to measure fair value using that price, without adjustment. This requirement is accepted when the asset or liability being measured is a financial instrument in the scope of IFRS 9. However, when an entity holds an investment in a subsidiary, joint venture or associate the question is what the unit of account is, the individual shares or the investment as a whole, and whether it would be appropriate to include a control premium when determining fair value provided that market participants take this into consideration when pricing the asset. See section 6.1.1 above and Chapter 15 for considerations and recent developments in respect of this.

Unlike investments with quoted prices, discussed above, there are less issues if FVLCD is used to determine the recoverable amount of an asset that does not have a quoted price in an active market and is either:

- An investment in a subsidiary, joint venture or associate
- Or
- A CGU comprising the investment's underlying assets

Using FVLCD can avoid some of the complexities of determining appropriate cash flows related to transfer pricing and other intra-group transaction issues, described in section 12.1 above and section 12.4.2 below.

12.4.2 VIU for investments in subsidiaries, associates and joint ventures

Unlike most other assets, an investment in a subsidiary, joint venture or associate can be viewed as either:

- An individual asset that can generate income, e.g., in the form of dividends
- Or
- As an asset that represents the underlying assets and liabilities that are under the control of the subsidiary, joint venture or the associate

IAS 28 acknowledges this by stating:

"...In determining the value in use of the investment, an entity estimates:

"(a) its share of the present value of the estimated future cash flows expected to be generated by the associate or joint venture, including the cash flows from the operations of the associate or joint venture and the proceeds on the ultimate disposal of the investment; or

"(b) the present value of the estimated future cash flows expected to arise from dividends to be received from the investment and from its ultimate disposal.

"Under appropriate assumptions, both methods give the same result." [IAS 28.42].

This means that there are broadly two approaches in testing for impairment: one focuses on the investment and the cash flows the parent receives (dividends and ultimate disposal proceeds) and the other considers the recoverable amount of the underlying assets of the investment and the cash flows generated by these assets. These two approaches are considered in sections 12.4.2.A and 12.4.2.B below respectively.

Whichever view is taken, the entity needs to ensure that the cash flows are appropriate (see section 12.1 above in respect of considerations around intra-group transfer pricing).

It is important to note that, whether an entity calculates VIU using its share of the present value of estimated cash flows of the underlying assets or the dividends expected to be received, it is necessary to adjust them to reflect IAS 36 restrictions, e.g., those in respect of improvements and enhancements (see section 7.1.2 above), restructuring (see section 7.1.3 above), growth (see sections 7.1 and 7.1.1 above) and discount rates (see section 7.2 above). It can be a practical challenge to obtain sufficiently detailed information to make such adjustments for investments in entities that are not controlled by the parent, in which case it is possible that the entity needs to use FVLCD to establish the recoverable amount.

12.4.2.A VIU of investments in subsidiaries, associates and joint ventures using dividend discount models

IAS 28 allows the VIU of the equity accounted interest to be based on the present value of the estimated future cash flows expected to arise from dividends to be received from the investment. [IAS 28.42]. This describes in broad terms what is also known as a dividend discount model (DDM). DDMs are financial models frequently used by financial institutions to value shares at the discounted value of future dividend payments. These models value a company on the basis of future cash flows that are expected to be distributed to the shareholders in compliance with the capital requirements provided by law, discounted at a rate expressing the cost and risk of capital. By analogy this approach can be used to calculate the VIU for investments in subsidiaries, associates and joint ventures carried at cost in the separate financial statements of a parent and for equity accounted investments.

The IFRS IC considered the use of DDMs in testing for impairment under IAS 36. The IFRS IC rejected 'in general' the use of DDMs as an appropriate basis for calculating the VIU of a CGU in consolidated financial statements.⁴ It was of the view that calculations using DDMs can be appropriate when calculating the VIU of a single asset, for example when determining whether an investment is impaired in the separate financial statements of an entity. It did not consider whether the cash flows used in the DDMs must be adjusted to reflect IAS 36 assumptions and restrictions, as discussed more fully in section 12.4.2 above. However, in order to use a DDM for calculating VIU, IAS 36's requirements must be reflected in the future dividends calculated for use in the model.

12.4.2.B VIU of investments in subsidiaries, associates and joint ventures based on cash flows generated by underlying assets

When testing investments in subsidiaries, associates and joint ventures based on cash flows generated by underlying assets entities need to ensure that the cash flows are appropriate (see section 12.1 above in respect of intra-group transfer pricing) and that the restrictions of IAS 36 are appropriately applied (see section 12.4.2 above).

If an entity is testing its investments in subsidiaries, associates and joint ventures for impairment and it can demonstrate that the investment contains one or more CGUs in their entirety then it can in some circumstances be able to use the results of the group impairment tests of the underlying CGUs to test the investment for impairment. If the aggregate VIU (or FVLCD) of the CGU or CGUs is not less than the carrying value of the investment, this can be an indication that the investment is not impaired. Note that the entity's investment reflects the net assets of the subsidiary, associates or joint venture while the CGU reflects the assets and liabilities on a gross basis, so appropriate adjustments will have to be made (one example are financing liabilities, however section 4.1 also refers to receivables or other financial assets, trade payables, pensions and other provisions, as examples of items that may warrant closer attention). In addition, when it comes to investments in associates and joint ventures, an investor with a minority holding will need to assess the impact of holding a minority stake without control.

It is not always so straightforward in practice. There are particular problems if the asset (the investment) and the underlying CGU are not the same. CGUs can overlap individual subsidiaries so, for example, a single CGU contains more than one such subsidiary. Even if the CGU and investment coincide, it is possible that the shares have been acquired in a business combination. It is quite possible that the synergies that gave rise to goodwill on acquisition are in another part of the group not controlled by the intermediate parent in question. In such a case it is possible that an entity is not able to use the result of the group impairment test and so would have to calculate the recoverable amount of the investment.

⁴ [IFRIC Update](#), September 2010, available on the IFRS Foundation's website.

12.4.3 Equity accounted investment and indicators of impairment

In connection with issuing IFRS 9, the IASB amended IAS 28 to include the impairment indicators an entity needs to use to determine whether it is necessary to recognise any additional impairment loss once it has accounted for losses, if any, under IAS 28. [IAS 28.40, IAS 28.41A].

The indicators of impairment require “objective evidence of impairment as a result of one or more events that have occurred after the initial recognition”. [IAS 28.41A]. However, one would not expect any significant difference in the impairment indicators under IAS 36 and IAS 28 because both look for objective evidence, sometimes in virtually identical terms and neither claims that its list of indicators is exclusive. [IAS 36.13, IAS 28.41A]. This means that an impairment test cannot be avoided because an impairment indicator is not mentioned specifically in IAS 28.

If an entity has reason to believe that the carrying amount of an investment in an associate or joint venture is higher than the recoverable amount, this is most likely a sufficient indicator on its own to require an impairment test.

12.4.4 Equity accounted investments and long-term loans

Investors frequently make long-term loans to associates or joint ventures that, from their perspective, form part of the net investment in the associate or joint venture. In October 2017, the IASB issued *Long-term Interests in Associates and Joint Ventures* (Amendments to IAS 28) to clarify that an entity applies IFRS 9, in addition to IAS 28, to long-term interests that form part of the net investment. [IAS 28.14A].

To illustrate how entities apply the requirements in IAS 28 and IFRS 9 with respect to long-term interests, the Board also published an illustrative example when it issued the amendments.

These requirements are described in detail in Chapter 12. The illustrative example is shown in Illustration 10-2 of that section.

12.4.5 Equity accounted investments and CGUs

IAS 28 states that the recoverable amount of an investment in an associate or a joint venture must be assessed for each associate or joint venture, unless it does not generate cash inflows from continuing use that are largely independent of those from other assets of the entity. [IAS 28.43]. This means that each associate or joint venture is a separate CGU unless it is part of a larger CGU including other assets, which could include other associates or joint ventures.

Illustration 12-4: Joint ventures are part of larger CGU

A mining entity (group) extracts a metal ore that does not have an active market until it has been through a smelting and refining process. Each mine is held in a separate subsidiary, as is the refinery, and in two joint ventures. The refinery, subsidiaries and joint ventures are located in several different countries. The entity considers the CGU to comprise the subsidiary that holds the smelter together with the subsidiaries that hold the individual mines and the interests in the joint ventures.

If there is goodwill in the carrying amount of an associate or joint venture, this is not tested separately. [IAS 28.42]. However, there can be additional goodwill in the group that will be allocated to a CGU that includes an associate or joint venture, that will be tested for impairment by reference to the combined cash flows of assets and associates and joint ventures.

12.4.6 Equity accounted investments and testing goodwill for impairment

When calculating its share of an equity accounted investee's results, an investor makes adjustments to the investee's profit or loss to reflect depreciation and impairments of the investee's identifiable assets based on their fair values at the date the investor acquired its investment. This is covered in IAS 28 which states that:

“Appropriate adjustments to the investor's share of the associate's or joint venture's profits or losses after acquisition are also made to account, for example, for depreciation of the depreciable assets, based on their fair values at the acquisition date. Similarly, appropriate adjustments to the investor's share of the associate's or joint venture's profits or losses after acquisition are made for impairment losses recognised by the associate, such as for goodwill or property, plant and equipment.” [IAS 28.32].

Although this refers to 'appropriate adjustments' for goodwill impairment losses, this does not mean requiring the investor to recalculate the goodwill impairment on a similar basis to depreciation and impairment of tangible and intangible assets. The 'appropriate adjustment' is to reverse that goodwill impairment that relates to pre-acquisition goodwill in the investee before calculating the investor's share of the investee's profit. After application of the equity method the entire equity-accounted carrying amount of the investor's investment, including the goodwill included in that carrying amount, is tested for impairment in accordance with IAS 28. [IAS 28.40, IAS 28.41, IAS 28.42, IAS 28.43]. Note that there is no requirement to test investments in associates or joint ventures for impairment annually but only when there are indicators of impairment. These requirements are described in detail in Chapter 12.

Impairment write-offs made against investments accounted for under the equity method can be reversed if an impairment loss no longer exists or has decreased (see section 11.4 above). Although IAS 36 does not allow impairments of goodwill to be reversed, [IAS 36.124], this impairment is not a write-off against goodwill, but a write-off against the equity investment, so this prohibition does not apply. IAS 28 states that 'an impairment loss recognised in those circumstances is not allocated to any asset, including goodwill, that forms part of the carrying amount of the investment in the associate or joint venture. Accordingly, any reversal of that impairment loss is recognised in accordance with IAS 36 to the extent that the recoverable amount of the investment subsequently increases'. [IAS 28.42].

13 Disclosures required by IAS 36

13.1 Introduction

This section sets out the principal disclosures for impairment required in financial statements as set out in IAS 36. Any disclosures required relating to impairment by other IFRS accounting standards are dealt with in the chapters concerned. Disclosures required by other authorities such as national statutes or listing authorities are not included.

In particular, we refer to the general requirement in IAS 1 on the disclosure of information about the assumptions concerning the future, and other major sources of estimation uncertainty at the end of the reporting period, that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year (see Chapter 3). [IAS 1.125].

13.2 IAS 36 disclosures

The disclosures required fall into two broad categories:

- (i) Disclosures concerning any actual impairment losses or reversals made in the period, that are obviously only required if such a loss or reversal has occurred, regardless of the type of asset involved. [IAS 36.126-132].
And
- (ii) Yearly disclosures concerning the annual impairment tests required for goodwill and intangible assets with an indefinite useful life, that are required regardless of whether an impairment adjustment to these types of assets has occurred or not. [IAS 36.133, IAS 36.134, IAS 36.135, IAS 36.136].

13.2.1 Disclosures required for impairment losses or reversals

For each class of assets, the entity must disclose: [IAS 36.126, IAS 36.127, IAS 36.128, IAS 36.129]

Extract from IAS 36

- 126** An entity shall disclose the following for each class of assets:
- (a) the amount of impairment losses recognised in profit or loss during the period and the line item(s) of the statement of comprehensive income in which those impairment losses are included.
 - (b) the amount of reversals of impairment losses recognised in profit or loss during the period and the line item(s) of the statement of comprehensive income in which those impairment losses are reversed.
 - (c) the amount of impairment losses on revalued assets recognised in other comprehensive income during the period.
 - (d) the amount of reversals of impairment losses on revalued assets recognised in other comprehensive income during the period.
- 127** A class of assets is a grouping of assets of similar nature and use in an entity's operations.
- 128** The information required in paragraph 126 may be presented with other information disclosed for the class of assets. For example, this information may be included in a reconciliation of the carrying amount of property, plant and equipment, at the beginning and end of the period, as required by IAS 16.
- 129** An entity that reports segment information in accordance with IFRS 8 shall disclose the following for each reportable segment:
- (a) the amount of impairment losses recognised in profit or loss and in other comprehensive income during the period.
 - (b) the amount of reversals of impairment losses recognised in profit or loss and in other comprehensive income during the period.

13.2.2 Material impairments

If an impairment loss for an individual asset or a cash-generating unit is recognised or reversed during the period and is material to the financial statements of the reporting entity as a whole, the following disclosures are required: [IAS 36.130]

Extract from IAS 36

- 130** An entity shall disclose the following for an individual asset (including goodwill) or a cash-generating unit, for which an impairment loss has been recognised or reversed during the period:
- (a) the events and circumstances that led to the recognition or reversal of the impairment loss.
 - (b) the amount of the impairment loss recognised or reversed.
 - (c) for an individual asset:
 - (i) the nature of the asset; and
 - (ii) if the entity reports segment information in accordance with IFRS 8, the reportable segment to which the asset belongs.
 - (d) for a cash-generating unit:
 - (i) a description of the cash-generating unit (such as whether it is a product line, a plant, a business operation, a geographical area, or a reportable segment as defined in IFRS 8);
 - (ii) the amount of the impairment loss recognised or reversed by class of assets and, if the entity reports segment information in accordance with IFRS 8, by reportable segment; and
 - (iii) if the aggregation of assets for identifying the cash-generating unit has changed since the previous estimate of the cash-generating unit's recoverable amount (if any), a description of the current and former way of aggregating assets and the reasons for changing the way the cash-generating unit is identified.
 - (e) the recoverable amount of the asset (cash-generating unit) and whether the recoverable amount of the asset (cash-generating unit) is its fair value less costs of disposal or its value in use.
 - (f) if the recoverable amount is fair value less costs of disposal, the entity shall disclose the following information:
 - (i) the level of the fair value hierarchy (see IFRS 13) within which the fair value measurement of the asset (cash-generating unit) is categorised in its entirety (without taking into account whether the 'costs of disposal' are observable);
 - (ii) for fair value measurements categorised within Level 2 and Level 3 of the fair value hierarchy, a description of the valuation technique(s) used to measure fair value less costs of disposal. If there has been a change in valuation technique, the entity shall disclose that change and the reason(s) for making it; and
 - (iii) for fair value measurements categorised within Level 2 and Level 3 of the fair value hierarchy, each key assumption on which management has based its determination of fair value less costs of disposal. Key assumptions are those to which the asset's (cash-generating unit's) recoverable amount is most sensitive. The entity shall also disclose the discount rate(s) used in the current measurement and previous measurement if fair value less costs of disposal is measured using a present value technique.
 - (g) if recoverable amount is value in use, the discount rate(s) used in the current estimate and previous estimate (if any) of value in use.

It is logically possible for impairment adjustments in aggregate to be material, yet no single one material in itself, in which case the previous requirement that relates to individual assets or CGUs could theoretically be circumvented. Therefore, the following 'catch all' requirement is added: [IAS 36.131]

Extract from IAS 36

- 131** An entity shall disclose the following information for the aggregate impairment losses and the aggregate reversals of impairment losses recognised during the period for which no information is disclosed in accordance with paragraph 130:
- (a) the main classes of assets affected by impairment losses and the main classes of assets affected by reversals of impairment losses.
 - (b) the main events and circumstances that led to the recognition of these impairment losses and reversals of impairment losses.

In addition, in these circumstances, if there are any cases of impairment adjustments where intangible assets with indefinite useful life and goodwill are not involved, IAS 36 encourages the disclosure of key assumptions made in the recoverable amount calculations used to determine any impairments recognised in the period. [IAS 36.132]. However, as set out below, an entity is required to give this type of disclosure when goodwill or intangible assets with an indefinite useful life are tested for impairment.

13.3 Annual impairment disclosures required for goodwill and intangible assets with an indefinite useful life

Paragraph 84 of IAS 36 accepts the possibility that following a business combination the entity was not able to allocate all the goodwill to individual CGUs or groups of CGUs by the end of the period in which the acquisition has been made (see section 8.1.5 above). In these circumstances the standard requires that the amount of any such unallocated goodwill be disclosed, together with the reasons why it has not been allocated. [IAS 36.133].

The annual disclosures are intended to provide the user with information about the types of estimates that have been used in arriving at the recoverable amounts of goodwill and intangible assets with an indefinite useful life, that are included in the assets of the entity at the period end. They are divided into two broad categories:

- (i) Those concerning individual CGUs or group of CGUs in which the carrying amount of goodwill or of intangible assets with an indefinite useful life is 'significant' in comparison with the entity's total carrying amount of these items. In this category disclosures are to be made separately for each significant CGU or group of CGUs. [IAS 36.134].
- (ii) Those concerning CGUs or groups of CGUs in which the carrying amount of goodwill or of intangible assets with an indefinite useful life is not 'significant' individually in comparison with the entity's total carrying amount of these items. In this case the disclosures can be made in aggregate. [IAS 36.135].

For each cash-generating unit or group of units for which the carrying amount of goodwill or intangible assets with indefinite useful lives allocated to that unit or group of units is significant, the following disclosures are required every year: [IAS 36.134]

Extract from IAS 36

- 134** An entity shall disclose the information required by (a)-(f) for each cash-generating unit (group of units) for which the carrying amount of goodwill or intangible assets with indefinite useful lives allocated to that unit (group of units) is significant in comparison with the entity's total carrying amount of goodwill or intangible assets with indefinite useful lives:
- (a) the carrying amount of goodwill allocated to the unit (group of units).
 - (b) the carrying amount of intangible assets with indefinite useful lives allocated to the unit (group of units).
 - (c) the basis on which the unit's (group of units') recoverable amount has been determined (i.e. value in use or fair value less costs of disposal).

- (d) if the unit's (group of units') recoverable amount is based on value in use:
 - (i) each key assumption on which management has based its cash flow projections for the period covered by the most recent budgets/forecasts. Key assumptions are those to which the unit's (group of units') recoverable amount is most sensitive.
 - (ii) a description of management's approach to determining the value(s) assigned to each key assumption, whether those value(s) reflect past experience or, if appropriate, are consistent with external sources of information, and, if not, how and why they differ from past experience or external sources of information.
 - (iii) the period over which management has projected cash flows based on financial budgets/forecasts approved by management and, when a period greater than five years is used for a cash-generating unit (group of units), an explanation of why that longer period is justified.
 - (iv) the growth rate used to extrapolate cash flow projections beyond the period covered by the most recent budgets/forecasts, and the justification for using any growth rate that exceeds the long-term average growth rate for the products, industries, or country or countries in which the entity operates, or for the market to which the unit (group of units) is dedicated.
 - (v) the discount rate(s) applied to the cash flow projections.
- (e) if the unit's (group of units') recoverable amount is based on fair value less costs of disposal, the valuation technique(s) used to measure fair value less costs of disposal. An entity is not required to provide the disclosures required by IFRS 13. If fair value less costs of disposal is not measured using a quoted price for an identical unit (group of units), an entity shall disclose the following information:
 - (i) each key assumption on which management has based its determination of fair value less costs of disposal. Key assumptions are those to which the unit's (group of units') recoverable amount is most sensitive.
 - (ii) a description of management's approach to determining the value (or values) assigned to each key assumption, whether those values reflect past experience or, if appropriate, are consistent with external sources of information, and, if not, how and why they differ from past experience or external sources of information.
 - (iiA) the level of the fair value hierarchy (see IFRS 13) within which the fair value measurement is categorised in its entirety (without giving regard to the observability of 'costs of disposal').
 - (iiB) if there has been a change in valuation technique, the change and the reason(s) for making it.

If fair value less costs of disposal is measured using discounted cash flow projections, an entity shall disclose the following information:

 - (iii) the period over which management has projected cash flows.
 - (iv) the growth rate used to extrapolate cash flow projections.
 - (v) the discount rate(s) applied to the cash flow projections.
- (f) if a reasonably possible change in a key assumption on which management has based its determination of the unit's (group of units') recoverable amount would cause the unit's (group of units') carrying amount to exceed its recoverable amount:
 - (i) the amount by which the unit's (group of units') recoverable amount exceeds its carrying amount.
 - (ii) the value assigned to the key assumption.
 - (iii) the amount by which the value assigned to the key assumption must change, after incorporating any consequential effects of that change on the other variables used to measure recoverable amount, in order for the unit's (group of units') recoverable amount to be equal to its carrying amount.

As set out above, there are separate disclosure requirements for those CGUs or groups of CGUs that taken individually do not have significant amounts of goodwill in comparison with the total carrying value of goodwill or of intangible assets with an indefinite useful life. [IAS 36.135].

Extract from IAS 36

- 135** If some or all of the carrying amount of goodwill or intangible assets with indefinite useful lives is allocated across multiple cash-generating units (groups of units), and the amount so allocated to each unit (group of units) is not significant in comparison with the entity's total carrying amount of goodwill or intangible assets with indefinite useful lives, that fact shall be disclosed, together with the aggregate carrying amount of goodwill or intangible assets with indefinite useful lives allocated to those units (groups of units). In addition, if the recoverable amounts of any of those units (groups of units) are based on the same key assumption(s) and the aggregate carrying amount of goodwill or intangible assets with indefinite useful lives allocated to them is significant in comparison with the entity's total carrying amount of goodwill or intangible assets with indefinite useful lives, an entity shall disclose that fact, together with:
- (a) the aggregate carrying amount of goodwill allocated to those units (groups of units).
 - (b) the aggregate carrying amount of intangible assets with indefinite useful lives allocated to those units (groups of units).
 - (c) a description of the key assumption(s).
 - (d) a description of management's approach to determining the value(s) assigned to the key assumption(s), whether those value(s) reflect past experience or, if appropriate, are consistent with external sources of information, and, if not, how and why they differ from past experience or external sources of information.
 - (e) if a reasonably possible change in the key assumption(s) would cause the aggregate of the units' (groups of units') carrying amounts to exceed the aggregate of their recoverable amounts:
 - (i) the amount by which the aggregate of the units' (groups of units') recoverable amounts exceeds the aggregate of their carrying amounts.
 - (ii) the value(s) assigned to the key assumption(s).
 - (iii) the amount by which the value(s) assigned to the key assumption(s) must change, after incorporating any consequential effects of the change on the other variables used to measure recoverable amount, in order for the aggregate of the units' (groups of units') recoverable amounts to be equal to the aggregate of their carrying amounts.

Example 9 in IAS 36's Illustrative Examples gives an indication of the types of assumptions and other relevant information the IASB envisages being disclosed under this requirement. The IASB expects disclosure of: budgeted gross margins, average gross margins, expected efficiency improvements, whether values assigned to key assumptions reflect past experience, what improvements management believes are reasonably achievable each year, forecast exchange rates during the budget period, forecast consumer price indices during the budget period for raw materials, market share and anticipated growth in market share.

If a reasonably possible change in a key assumption would cause the CGU's carrying amount to exceed its recoverable amount, then the standard requires an entity to disclose the value assigned to this key assumption and the amount by which the value assigned to the key assumption must change in order to cause an impairment. This is particularly relevant to cases where the CGU's carrying amount is equal to its recoverable amount, as any negative change to the recoverable amount would result in the recognition of an impairment loss. [IAS 36.134(f)(ii)].

How we see it

When the CGU's carrying amount is equal to its recoverable amount, entities should consider whether the disclosure requirements of IAS 1 would require additional disclosures if this represents a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year.

As explained in sections 8.2.3 and 10 above, the standard allows to carry forward a previous impairment test when certain criteria are met. The standard makes it clear that when this is the case, the information for that asset or CGU that is incorporated into the disclosures as required by IAS 36.134 and 135 relates to the carried forward calculation of the recoverable amount. [IAS 36.136].

An example of disclosures including key assumptions used in determining the value in use and sensitivities is given by Vodafone Group Plc. The following extract from the annual report of Vodafone Group Plc focuses on the current period disclosures. While disclosures for comparative years are required and given by Vodafone Group Plc in the annual report, these were not included in the following extract for simplicity purposes.

Practical example 13-1: Vodafone Group Plc (2023)

United Kingdom

Annual Report 2023 [extract]

Financials [extract]

Notes to the consolidated financial statements [extract]

4. Impairment losses [extract]

Goodwill

The remaining carrying value of goodwill at 31 March was as follows:

	2023 €m	2022 €m
Germany	20,335	20,335
Italy	2,481	2,481
Vantage Towers Germany	—	2,565
Other	4,799	6,503
	27,615	31,884

Key assumptions used in the value in use calculations

The key assumptions used in determining the value in use are:

Assumption	How determined
Projected adjusted EBITDAaL	<p>Projected adjusted EBITDAaL has been based on past experience adjusted for the following:</p> <ul style="list-style-type: none"> - In Europe, mobile revenue is expected to benefit from increased usage as customers transition to higher data bundles, and new products and services are introduced. Fixed revenue is expected to continue to grow as penetration is increased and more products and services are sold to customers; - Outside of Europe, revenue is expected to continue to grow as the penetration of faster data-enabled devices rises along with higher data bundle attachment rates, and new products and services are introduced; and - Margins are expected to be impacted by negative factors such as the cost of acquiring and retaining customers in increasingly competitive markets and by positive factors such as the efficiencies expected from the implementation of Group initiatives.
Projected capital expenditure	<p>The cash flow forecasts for capital expenditure are based on past experience and include the ongoing capital expenditure required to maintain our networks, provide products and services in line with customer expectations, including of higher data volumes and speeds, and to meet the population coverage requirements of certain of the Group's licences. In Europe, capital expenditure is required to roll out capacity-building next generation 5G and gigabit networks. Outside of Europe, capital expenditure will be required for the continued rollout of current and next generation mobile networks in emerging markets. Capital expenditure includes cash outflows for the purchase of owned property, plant and equipment and computer software.</p>
Projected licence and spectrum payments	<p>To enable the continued provision of products and services, the cash flow forecasts for licence and spectrum payments for each relevant cash-generating unit include amounts for expected renewals and newly available spectrum. Beyond the five year forecast period, a long-run cost of spectrum is assumed.</p>
Long-term growth rate	<p>For the purposes of the Group's value in use calculations, a long-term growth rate into perpetuity is applied immediately at the end of the five year forecast period and is based on the lower of:</p> <ul style="list-style-type: none"> - the nominal GDP growth rate forecasts for the country of operation; and - the long-term compound annual growth rate in adjusted EBITDAaL as estimated by management. <p>Long-term compound annual growth rates determined by management may be lower than forecast nominal GDP growth rates due to the following market-specific factors: competitive intensity levels, maturity of business, regulatory environment or sector-specific inflation expectations.</p>
Pre-tax discount rate	<p>The pre-tax discount rate for each cash-generating unit is derived such that when applied to pre-tax cash flows it gives the same result as when the observable post-tax weighted average cost of capital is applied to post-tax cash flows.</p> <p>The assumptions used to develop discount rates for each cash-generating unit are benchmarked to externally available data.</p> <ul style="list-style-type: none"> - The risk free rate is derived from an average yield of a ten year bond issued by the government in each cash-generating unit's respective country of operations. - The forward-looking equity market risk premium (an investor's required rate return over and above a risk free rate) is based on studies by independent economists, the long-term average equity market risk premium and the market risk premiums typically used by valuation practitioners. - The asset beta reflecting the systematic risk of the telecommunications segment relative to the market as a whole is determined from betas observed for comparable listed telecommunications companies. - The region-specific leverage ratios are estimated from ratios observed for comparable listed telecommunications companies. <p>Each cash-generating unit's discount rate is determined in nominal terms in order to match their nominal estimates of future cash flows.</p> <p>Rising risk free interest rates and lower asset betas have, respectively, increased and decreased the cash-generating unit discount rates in the current year.</p>

Year ended 31 March 2023

The Group performs its annual impairment test for goodwill and indefinite lived intangible assets at 31 March and when there is an indicator of impairment of an asset. At each reporting period date judgement is exercised by management in determining whether any internal or external sources of information observed are indicative that the carrying amount of any of the Group's cash generating units is not recoverable. For changes to the Group's cash-generating units in the current year see note 27 'Acquisitions and disposals'.

Climate change

As a large owner of infrastructure and consumer of energy, the Group has exposure to climate change related risks such as energy cost increases, asset damage and service disruption. The long range plans used in the Group's impairment testing include forecast energy costs and other costs that are embedded in the planning process to deliver the Group's zero carbon targets. The long range plans also include capital expenditure in relation to the Group's use of durable and energy efficient infrastructure and the costs of the Group's extensive and ongoing network maintenance programme. Climate change has not had a material impact on the outcome of the Group's impairment testing.

Indus Towers Limited

The Group's investment in Indus Towers was tested for impairment at 31 March 2023 following a decline in Indus Towers' quoted share price in the current year. Management concluded that fair value less costs of disposal is the appropriate basis to determine the recoverable amount of the Group's investment. Indus Towers' share price is observable in a quoted market and is considered a level 1 input under the IFRS 13 fair value hierarchy. The share price of INR143.00 per share implied a recoverable amount of INR 81 billion (€0.9 billion) which was lower than the carrying value of the investment at the same date. An impairment charge of €64 million was recognised to reduce the carrying value of the Group's investment to the recoverable amount in the Group's consolidated statement of financial position.

Value in use assumptions

The table below shows key assumptions used in the value in use calculations, and separately presented cash-generating units for which the carrying amount of goodwill is significant in comparison with the Group's total carrying amount of goodwill:

	Assumptions used in value in use calculations	
	Germany %	Italy %
Pre-tax discount rate	7.8	8.9
Long-term growth rate	0.6	1.5
Projected adjusted EBITDAaL CAGR ¹	1.8	1.0
Projected capital expenditure ²	19.4-19.8	16.5-17.9

Sensitivity analysis

The estimated recoverable amounts of the Group's operations in Germany, Italy, the UK, and Spain exceed their carrying values by €3.2 billion, €0.2 billion, €1.3 billion, and €0.4 billion respectively. If the assumptions used in the impairment review were changed to a greater extent than as presented in the following table, the changes would, in isolation, lead to an impairment loss being recognised for the year ended 31 March 2023.

	Change required for carrying value to equal recoverable amount			
	Germany pps	Italy pps	UK pps	Spain pps
Pre-tax discount rate	0.6	0.2	1.6	0.5
Long-term growth rate	(0.6)	(0.2)	(1.9)	(0.6)
Projected adjusted EBITDAaL CAGR ¹	(1.8)	(0.5)	(4.1)	(1.5)
Projected capital expenditure ²	5.5	0.9	4.2	2.2

Notes:

1 Projected adjusted EBITDAaL CAGR is expressed as the compound annual growth rates in the initial five years for all cash-generating units of the plans used for impairment testing.

2 Projected capital expenditure, which excludes licences and spectrum, is expressed as capital expenditure as a percentage of revenue in the initial five years for all cash-generating units of the plans used for impairment testing.

For the Group's operations in Italy and Spain management has prepared the following sensitivity analysis for changes in pre-tax discount rate and projected adjusted EBITDAaL CAGR¹ assumptions. The associated impact of the change in each key assumption does not consider any consequential impact on other assumptions used in the impairment review.

	Recoverable amount less carrying value	
	Italy €bn	Spain €bn
Base case as at 31 March 2023	0.2	0.4
Change in pre-tax discount rate		
Decrease by 1pps	1.4	1.3
Increase by 1pps	(0.8)	(0.3)
Change in projected adjusted EBITDAaL CAGR ¹		
Decrease by 5pps	(1.6)	(0.8)
Increase by 5pps	2.3	1.8

Note:

1 Projected adjusted EBITDAaL CAGR is expressed as the compound annual growth rates in the initial five years for all cash-generating units of the plans used for impairment testing.

An example of disclosures including key assumptions used in determining the fair value less costs of disposal and sensitivities is given by Vicinity Limited.

FINANCIAL REPORT [extract]

NOTES TO THE FINANCIAL STATEMENTS [extract]

OTHER DISCLOSURES [extract]

17. INTANGIBLE ASSETS [extract]

Impairment testing

The recoverable amount of the SP CGU is determined using a fair value less cost of disposal (fair value) approach. This is performed using a collective discounted cash flow (DCF) valuation of the cash flows generated from external asset and funds management contracts which is based on the following key assumptions:

Key assumption	30 Jun 22	30 Jun 21
Post-tax external management contract cash flows	5 years	5 years
Terminal value growth rate	2.10%	2.10%
Post-tax discount rate range	6.55% – 7.05%	6.69% – 7.19%

The impairment test at 30 June 2022 determined that the recoverable amount of the SP CGU exceeded its carrying value and no impairment was required.

Sensitivity to changes in assumptions

Sensitivities to the key assumptions within the external management contracts DCF were also tested and the Group has determined that due to the long-term nature of the asset management contracts and associated cashflows, no reasonably possible changes would give rise to impairment at 30 June 2022. A disposal of a significant value of directly owned or equity accounted investment property assets, where the Group also gives up any future management rights under existing finite or indefinite life contracts, may lead to the full or partial derecognition of the intangible asset balance, as external asset management fees earned by the Group may no longer be sufficient to support the current carrying value of these intangible assets.

Process for determination of key assumptions

The key inputs, which are considered Level 3 in the fair value hierarchy, used in determining the recoverable amounts were determined as follows:

- The discount rates were calculated based on the Group's estimated weighted average cost of capital, with reference to the Group's long-term average cost of debt and estimated cost of equity which is derived with reference to external sources of information and the Group's target gearing ratio, adjusted for specific risk factors to the relevant CGU.
- Terminal value growth rates were estimated with reference to long-term expectations of macro-economic conditions (including consideration of equity analyst estimates) and the Group's expected long-term earnings growth.
- Five year forecast operating, asset and funds management cash flows based on the values determined by the Group's budgeting and planning process. Given the uncertainty as to the impacts of the COVID-19 pandemic over the short, medium and long-term, the Group assessed the outcomes of a number of cash flow scenarios particularly with varying degree of reduction in property management fees over the forecast period, when conducting impairment testing at 30 June 2022.

The determination of the key assumptions and inputs to the impairment testing process as outlined above requires a significant level of estimation. As a result, the recoverable amount of the SP CGU (as determined by the impairment testing processes outlined above) are subject to variability in these key assumptions or inputs. A change in one or more of the key assumptions or inputs could result in a change in assessed recoverable amount.

14 Developments

In response to feedback received from the Post-Implementation Review of IFRS 3, the IASB launched a goodwill and impairment research project. In accordance with the project's objectives set by the Board in July 2018, the discussions were focused on the following areas:

- Better disclosures for business combinations
- Reintroduction of amortisation of goodwill
- Presentation of total equity before goodwill subtotal
- Relief from mandatory annual impairment test
- Considering cash flows from a future restructuring or a future enhancement in value in use calculations
- And
- Removal of the explicit requirement to use pre-tax inputs and pre-tax discount rates in the value in use calculation

In March 2020, the IASB issued the Discussion Paper *Business Combinations-Disclosures, Goodwill and Impairment*. The IASB's preliminary views included that it should not reintroduce amortisation of goodwill. The stakeholder feedback to this view was mixed.

In March 2024, the IASB issued the Exposure Draft *Business Combinations - Disclosures, Goodwill and Impairment*. The IASB confirmed its preliminary review on retaining the current model in IAS 36. In addition, the IASB is proposing amendments to IFRS 3 and IAS 36 that primarily relate to:

- The disclosure requirements in IFRS 3 - in particular, to require entities to report information about the performance of business combinations and quantitative information about the synergies expected to arise from a business combination. However, entities would not be required to disclose information that could compromise their acquisition-date key objectives.
- The impairment test in IAS 36 - in particular, to make targeted amendments relating to the calculation of value in use, the allocation of goodwill to cash-generating units, and the disclosure requirements.

For a discussion on the proposed changes to IFRS 3, we refer to Chapter 10.

The IASB proposed to amend IAS 36 by:

- clarifying how an entity allocates goodwill to CGUs that is expected to help reduce shielding;
- requiring an entity to disclose in which reportable segment a CGU or group of CGUs containing goodwill is included that should help improve the application of IAS 36 and mitigate concerns about management over-optimism in relation to the assumptions used in the impairment test; and
- changing the calculation of value in use by:
 - removing the restriction on including cash flows from uncommitted future restructurings or asset enhancements; and
 - removing the requirement to calculate value in use on a pre-tax basis.

The IASB believed that the changes to the calculation of value in use would bring inputs used in the impairment test closer to the information used by management, which should result in investors receiving more relevant information.

The feedback in comment letters was summarised as follows in a paper for an IASB meeting:⁵

- Allocating goodwill to a CGU: Many respondents agree that the proposal could reduce shielding, however many disagree and say the change would have a limited effect on reducing shielding.
- Requiring an entity to disclose in which reportable segment a CGU or group of CGUs containing goodwill is included: Most respondents agree and say the information would be useful and/or would not be costly to disclose.
- Removing the requirement on restructuring and asset enhancement cash flows in calculating VIU: Most respondents agree with removing this requirement for reasons consistent with those considered by the IASB.
- Removing the requirement to use pre-tax cash flows and pre-tax discount rates: Almost all respondents agree.

At the time of writing, the IASB is redeliberating the proposals in the Exposure Draft in light of the comments received and expects to make decisions on the project direction in H2 2026.

Illustration 11-2:	Individually impaired assets within CGUs	1635
Illustration 11-3:	Impairment of goodwill	1636
Illustration 11-4:	Double counted losses	1637

Illustration 11-5:	Reversal of impairment losses	1638
Illustration 12-1:	A subgroup with goodwill that is not an operating segment for the group	1642
Illustration 12-2:	Monitoring goodwill arising from acquisitions by subsidiaries	1643
Illustration 12-3:	Group reorganisations and impairment	1644
Illustration 12-4:	Joint ventures are part of larger CGU	1647

Appendix B - Definitions

Extract from IAS 36

Definitions

- 6 The following terms are used in this Standard with the meanings specified:
- Carrying amount* is the amount at which an asset is recognised after deducting any accumulated depreciation (amortisation) and accumulated impairment losses thereon.
- A cash-generating unit* is the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets.
- Corporate assets* are assets other than goodwill that contribute to the future cash flows of both the cash-generating unit under review and other cash-generating units.
- Costs of disposal* are incremental costs directly attributable to the disposal of an asset or cash-generating unit, excluding finance costs and income tax expense.
- Depreciable amount* is the cost of an asset, or other amount substituted for cost in the financial statements, less its residual value.
- Depreciation (Amortisation)* is the systematic allocation of the depreciable amount of an asset over its useful life.¹
- Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13 *Fair Value Measurement*.)
- An *impairment loss* is the amount by which the carrying amount of an asset or a cash-generating unit exceeds its recoverable amount.
- The *recoverable amount* of an asset or a cash-generating unit is the higher of its fair value less costs of disposal and its value in use.
- Useful life* is either:
- (a) the period of time over which an asset is expected to be used by the entity; or
 - (b) the number of production or similar units expected to be obtained from the asset by the entity.
- Value in use* is the present value of the future cash flows expected to be derived from an asset or cash-generating unit.

¹ In the case of an intangible asset, the term 'amortisation' is generally used instead of 'depreciation'. The two terms have the same meaning.

Overview

This chapter covers the requirements of IAS 23 *Borrowing Costs* and particularly under which circumstances borrowing costs must be capitalised as part of the cost of an asset. Borrowing costs include interest and other costs that an entity incurs in connection with borrowing funds such as interest expense calculated using the effective interest method, interest in respect of lease liabilities and exchange differences arising from foreign currency borrowings that are considered to be an adjustment to interest costs.

Borrowing costs must be included as part of the cost of a qualifying asset to the extent that they are considered directly attributable to the acquisition, construction or production of the qualifying asset.

Not all assets would be considered a qualifying asset under IAS 23. A qualifying asset is an asset that necessarily takes a substantial period of time to get ready for its intended use or sale.

The chapter highlights key considerations when:

- Identifying qualifying assets
- Determining when borrowing costs are eligible for capitalisation or when capitalisation needs to be suspended or ceased altogether
- Applying disclosure requirements

What you need to know

- IAS 23 deals with the treatment of borrowing costs in general, rather than solely focusing on capitalising borrowing costs as part of the carrying value of assets.
- IAS 23 mandates capitalisation of borrowing costs directly attributable to the acquisition, construction or production of a qualifying asset. However, IAS 23 allows, but does not require entities to capitalise eligible borrowing costs to qualifying assets measured at fair value and to certain inventories that would otherwise be qualifying assets but are routinely manufactured or produced in large quantities on a repetitive basis.
- IAS 23 prescribes separate requirements for borrowing costs incurred from specific borrowings and general borrowings.
- Applying the standard sometimes requires significant judgement, particularly when identifying a direct relationship between particular borrowings and a qualifying asset and when evaluating whether the borrowings could otherwise have been avoided.

1 Introduction

A common question when determining the initial measurement of an asset is whether or not finance costs incurred on its acquisition or during the period of its construction must be capitalised. There have always been a number of strong arguments in favour of the capitalisation of directly attributable finance costs. For example, it is argued that they are just as much a cost as any other directly attributable cost; that expensing finance costs distorts the choice between purchasing and constructing an asset; that capitalising the costs leads to a carrying value that is far more akin to the market value of the asset; and that the financial statements are more likely to represent the true results of the project.

IAS 23, as issued by the IASB in March 2007, mandates capitalisation of borrowing costs directly attributable to the acquisition, construction or production of a qualifying asset. This was done to achieve convergence in principle with US GAAP. [IAS 23.BC2]. It thereby eliminated some (but not all) of the differences with SFAS 34 *Capitalization of Interest Cost*.¹

Differences between the IFRS accounting standards and US GAAP guidance on this topic are generally not addressed in detail in this chapter as the standards are not fully converged. Therefore, differences between IFRS accounting standards and US GAAP could exist that are not discussed in this chapter.

1 Effective from 15 September 2009, FASB Statement No. 34 (SFAS 34) *Capitalization of Interest Cost* was superseded by FASB Accounting Standards Codification (ASC) Topic 835-20 *Capitalization of Interest*, a subtopic to FASB ASC Topic 835 - Interest.

2 The requirements of IAS 23

2.1 Core principle

IAS 23 requires borrowing costs to be capitalised if they are directly attributable to the acquisition, construction or production of a qualifying asset (whether or not the funds have been borrowed specifically to finance these activities). These borrowing costs are included in the cost of the qualifying asset; all other borrowing costs are recognised as an expense in the period in which they are incurred. [IAS 23.1, IAS 23.8].

2.2 Scope

IAS 23 deals with the treatment of borrowing costs in general, rather than solely focusing on capitalising borrowing costs as part of the carrying value of assets. [IAS 23.2].

The standard does not deal with the actual or imputed costs of equity, including preferred capital and other financial instruments not classified as a liability, that are used to fund the acquisition or construction of an asset. [IAS 23.3]. This means that any distributions or other payments made in respect of equity instruments, as defined by IAS 32 *Financial Instruments: Presentation*, are not within the scope of IAS 23. Conversely, interest and dividends payable on instruments that are legally equity but classified as financial liabilities under IAS 32 appear to be within the scope of the standard (see section 5.5.4 below).

An entity is not required to apply the standard (i.e., application is optional) to borrowing costs directly attributable to the acquisition, construction or production of:

- A qualifying asset measured at fair value (see section 3.2 below)
- Or
- Inventories that are manufactured, or otherwise produced, in large quantities on a repetitive basis (see section 3.1 below) [IAS 23.4]

3 Qualifying assets

Determining whether an asset is considered a qualifying asset is a key step when evaluating whether borrowing costs must be capitalised. IAS 23 defines a qualifying asset as follows: [IAS 23.5]

Extract from IAS 23

5 This Standard uses the following terms with the meanings specified:

...

A *qualifying asset* is an asset that necessarily takes a substantial period of time to get ready for its intended use or sale.

How we see it

IAS 23 does not define 'substantial period of time' and this will therefore require the exercise of judgement after considering the specific facts and circumstances. In our view, an asset that normally takes twelve months or more to be ready for its intended use or sale will usually be a qualifying asset.

The standard indicates that, depending on the circumstances, the following could be qualifying assets: manufacturing plants, power generation facilities, investment properties, inventories, intangible assets and bearer plants. [IAS 23.7].

Assets that are ready for their intended use or sale when acquired are not qualifying assets. [IAS 23.7].

3.1 Inventories

Inventories are within the scope of IAS 23 as long as they meet the definition of a qualifying asset and require a substantial period of time to bring them to a saleable condition. This means inventories that are manufactured, or otherwise produced, over a short period of time are not qualifying assets and are out of scope of IAS 23. [IAS 23.7]. However, even if inventories meet the definition of a qualifying asset and take a substantial period of time to get ready for sale, an entity is not required to apply the standard to borrowing costs directly attributable to the acquisition, construction or production of inventories if these are routinely manufactured or otherwise produced in large quantities on a repetitive basis. [IAS 23.4(b), IAS 23.BC6].

Therefore, an entity could choose whether to apply the requirements of IAS 23 to such inventories as a matter of accounting policy. This optional scope exemption has been allowed because of the difficulty of determining the amount to be capitalised to such inventories and continuously monitoring these borrowing costs until the inventory is sold, i.e., the costs of capitalisation are likely to exceed the potential benefits. [IAS 23.BC6]. There are many examples of such inventories, including large manufactured or constructed items that take some time to complete but are routinely sold as standard items, such as aircraft and large items of equipment, or food and drink that take a long time to mature, such as cheese or alcohol that matures in bottle or cask.

Conversely, IAS 23 is required to be applied to bespoke inventories (i.e., those made according to the unique specifications of a particular customer) that are occasionally manufactured or produced on a single item by item basis and take a substantial period of time to get ready for sale.

See also further discussion in Chapter 28.

3.2 Assets measured at fair value

IAS 23 does not require entities to capitalise borrowing costs directly attributable to the acquisition, construction or production of assets measured at fair value that would otherwise be qualifying assets, for example, biological assets within the scope of IAS 41 *Agriculture*. [IAS 23.4(a)]. If the assets are held under a fair value model (or a fair value less costs to sell model) with all changes included in profit or loss, then capitalisation would not affect measurement of such assets in the statement of financial position and would involve no more than a reallocation between finance costs and the fair value movement in profit or loss. However, this scope exemption is optional and would still allow an entity to choose whether to apply the requirements of IAS 23 to such assets as a matter of accounting policy.

IAS 23 does not restrict the exemption to assets where the fair value movement is included in profit or loss. Assets measured at fair value that fall under the revaluation model of IAS 16 *Property, Plant and Equipment* are also eligible for this scope exemption even though the revaluation gain or loss is included in other comprehensive income, not profit or loss (see Chapter 19). While such assets could be subject to the scope exemption, the revaluation model in IAS 16 is only applied subsequent to initial recognition. [IAS 16.31]. Therefore, such assets might be qualifying assets at initial recognition, but subject to the scope exemption subsequently.

For example, assume that an entity borrows specific funds to construct a building, that the building is a qualifying asset and that the entity has a policy of revaluing all its land and buildings. When the constructed building is initially recognised, it will be measured at cost, which would include the directly attributable borrowing costs. [IAS 16.15, IAS 16.16(b)]. Assume that the entity subsequently renovates the building, that the renovation takes a substantial amount of time to complete and that those costs qualify for capitalisation under IAS 16. Since the asset is being revalued it would fall under the scope exemption in IAS 23. Therefore, the entity would not be required to capitalise any directly attributable borrowing costs relating to this subsequent renovation even if it takes a substantial amount of time to complete.

However, for disclosure purposes, an entity will still need to monitor the carrying amount of such an asset, including those borrowing costs that would have been recognised had such an asset been carried under the cost model.

In May 2014 the IFRS IC received a request for clarification as to whether an entity is required to reflect the capitalisation of borrowing costs to meet the disclosure requirement of IAS 16 for assets stated at revalued amounts (see Chapter 19) and for which borrowing costs are not capitalised. Since, as discussed above, the capitalisation of borrowing costs for such assets is not required, the determination of the amount of borrowing costs that would have been capitalised under a cost model - solely to meet a disclosure requirement - might be considered burdensome.

The IFRS IC noted that the requirements in IAS 16.77(e) are clear. This paragraph requires an entity to disclose the amount at which assets stated at revalued amounts would have been stated had those assets been carried under the cost model. The amount to be disclosed includes borrowing costs capitalised in accordance with IAS 23. [IAS 16.77(e)].

The IFRS IC determined that, in the light of the existing IFRS accounting standard requirements, neither an interpretation nor an amendment to a standard was necessary and consequently decided not to add this issue to its agenda.²

3.3 Financial assets

IAS 23 excludes all financial assets from the definition of qualifying assets. [IAS 23.7].

How we see it

We consider that financial assets include equity accounted investments and these are therefore, also excluded from the definition of qualifying assets.

3.4 Transfer of constructed asset over time

In November 2018, the IFRS IC discussed a request it received about the capitalisation of borrowing costs in relation to the construction of a residential multi-unit real estate development (building). In the fact pattern described in the request:

- A real estate developer (entity) constructs the building and sells the individual units in the building to customers.
- The entity borrows funds specifically for the purpose of constructing the building and incurs borrowing costs in connection with that borrowing.
- Before construction begins, the entity signs contracts with customers for the sale of some of the units in the building (sold units).
- The entity intends to enter into contracts with customers for the remaining part-constructed units (unsold units) as soon as it finds suitable customers.
- The terms of, and relevant facts and circumstances relating to, the entity's contracts with customers (for both the sold and unsold units) are such that, applying paragraph 35(c) of IFRS 15 *Revenue from Contracts with Customers* the entity transfers control of each unit over time and, therefore, recognises revenue over time (see Chapter 28). The consideration promised by the customer in the contract is in the form of cash or another financial asset. [IFRS 15.35(c)].

The request asked whether the entity has a qualifying asset as defined in IAS 23 and, therefore, capitalises any directly attributable borrowing costs.

² [IFRIC Update](#), May 2014, available on the IFRS Foundation's website.

Applying IAS 23.8 an entity capitalises borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset as part of the cost of that asset (see section 5.1 below). [IAS 23.8]. Paragraph 5 of IAS 23 defines a qualifying asset as “an asset that necessarily takes a substantial period of time to get ready for its intended use or sale” (see section 3 above). [IAS 23.5].

Accordingly, the entity assesses whether, in the fact pattern described in the request, it recognises an asset that necessarily takes a substantial period of time to get ready for its intended use or sale. Depending on the particular facts and circumstances, the entity might recognise a receivable, a contract asset and/or inventory.³

The IFRS IC concluded that, in the fact pattern described in the request:

- A receivable that the entity recognises is not a qualifying asset. Paragraph 7 of IAS 23 specifies that financial assets are not qualifying assets (see section 3.3 above). [IAS 23.7].
- A contract asset that the entity recognises is not a qualifying asset. The contract asset (as defined in Appendix A to IFRS 15 - see Chapter 28 at Appendix C) would represent the entity's right to consideration that is conditional on something other than the passage of time in exchange for transferring control of a unit. The intended use of the contract asset - to collect cash or another financial asset - is not a use for which it necessarily takes a substantial period of time to get ready.
- Inventory (work-in-progress) for unsold units under construction that the entity recognises is not a qualifying asset. In the fact pattern described in the request, this asset is ready for its intended sale in its current condition (such an asset is not a qualifying asset, see sections 3 and 3.1 above) - i.e., the entity intends to sell the part-constructed units as soon as it finds suitable customers and, on signing a contract with a customer, will transfer control of any work-in-progress relating to that unit to the customer.

The IFRS IC concluded that the principles and requirements in IAS 23 provide an adequate basis for an entity to determine whether to capitalise borrowing costs in the fact pattern described in the request. Consequently, in March 2019, the IFRS IC decided not to add this matter to its standard-setting agenda.⁴ See also further discussion in Chapter 28.

⁴ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

4 Definition of borrowing costs

4.1 The definition of borrowing costs in IAS 23

The definition of borrowing costs in IAS 23 is broad and includes all costs incurred as a result of borrowing funds. The standard does however provide specific examples as to what could be considered borrowing costs.

Extract from IAS 23

- 5 This Standard uses the following terms with the meanings specified:
Borrowing costs are interest and other costs that an entity incurs in connection with the borrowing of funds.
- ...
- 6 Borrowing costs may include:
- (a) interest expense calculated using the effective interest method as described in IFRS 9;
 - (b) [deleted]
 - (c) [deleted]
 - (d) interest in respect of lease liabilities recognised in accordance with IFRS 16 *Leases*; and
 - (e) exchange differences arising from foreign currency borrowings to the extent that they are regarded as an adjustment to interest costs.

The definition requires careful consideration on when interest and other costs would be considered borrowing costs and eligible for capitalisation.

The standard addresses whether or not to capitalise borrowing costs as part of the cost of the asset. [IAS 23.8, IAS 23.9]. The identification and measurement of finance costs are not dealt with in IAS 23 (see section 4.2 below).

The treatment of exchange differences arising from foreign currency borrowings to the extent that they are regarded as an adjustment to interest costs is discussed in section 5.4 below. [IAS 23.5, IAS 23.6].
